Publish DITA Content to WebHelp Output

Oxygen XML Responsive WebHelp for DITA

Oxygen XML WebHelp for DITA features a very flexible layout and is designed to adapt to any device and screen size to provide an optimal viewing and interaction experience.

Easy Customization with Publishing Templates

The WebHelp Responsive system relies on a publishing template mechanism that allows you to control the position of various functional components in the output to suit your needs. You can select from several different styles of layouts and each includes a collection of skins that you can choose from, or you can even customize your own.

Integration with Oxygen Feedback

Oxygen Feedback is a modern comments management platform that offers an efficient way for your community to interact and offer feedback. It includes a user-friendly admin interface, it is very easy to integrate into WebHelp output, and it displays a comments area at the bottom of each page where readers can add new comments or reply to existing ones.

Integration with Oxygen XML Editor / Author

An add-on is also available that contributes a Feedback Comments Manager view in Oxygen XML Editor/Author where the documentation team can see all the comments added in your WebHelp output. This means they can react to user feedback by making corrections and updating the source content without leaving the application.

Customize the look and feel of your PDF output generated from DITA with the **Oxygen Styles Basket** visual customization tool based on galleries
