XV
Chapter 1

Introduction

Oxygen XML Editor is a cross-platform application designed to accommodate all of your XML editing, authoring, developing, and publishing needs. It is the best XML editor available for document development using structured mark-up languages such as XML, XSD, Relax NG, XSL, DTD. It is a comprehensive solution for authors who want to edit XML documents visually, with or without extensive knowledge about XML and XML-related technologies. The WYSIWYG-like editor is driven by CSS stylesheets associated with the XML documents and offers many innovative, user-friendly authoring features that make XML authoring easy and powerful.

It offers developers and authors a powerful Integrated Development Environment and the intuitive Graphical User Interface of Oxygen XML Editor is easy to use and provides robust functionality for content editing, project management, and validation of structured mark-up sources. Coupled with XSLT and FOP transformation technologies, Oxygen XML Editor offers support for generating output to multiple target formats, including: PDF, PS, TXT, HTML, JavaHelp, WebHelp, and XML.

This user guide is focused on describing features, functionality, the application interface, and to help you quickly get started. It also includes a vast amount of advanced technical information and instructional topics that are designed to teach you how to use Oxygen XML Editor to accomplish your tasks. It is assumed that you are familiar with the use of your operating system and the concepts related to XML technologies and structured mark-up.
Chapter 2

Getting Started

Topics:

- What is Oxygen XML Editor
- Getting Familiar with the Layout
- Supported Document Types
- Resources to Help You Get Started Using Oxygen XML Editor
- Your First Document or Project
- Getting Help
- Frequently Used Shortcut Keys

This section provides a variety of resources to help you get the most out of the application. Typically, the first step of getting started with Oxygen XML Editor would be to install the software. For detailed information about that process, see the Installation chapter.

After installation, when you launch Oxygen XML Editor for the first time, you are greeted with a Welcome dialog box. It presents upcoming events, useful video demonstrations, helpful resources, the tip of the day, and also gives you easy access to recently used files and projects and to create new ones.

![Welcome Dialog Box]

Figure 1: Welcome Dialog Box

If you do not want it to be displayed every time you launch Oxygen XML Editor, disable the Show at startup option in the bottom-left corner of the dialog box. To display it any time, go to Help > Welcome.
What is Oxygen XML Editor

Oxygen XML Editor is the best XML editor available and is a complete XML development and authoring solution. It is designed to accommodate a large number of users, ranging from beginners to XML experts. It is the only XML tool that supports all of the XML schema languages and provides a large variety of powerful tools for editing and publishing XML documents.

You can use Oxygen XML Editor to work with most XML-based standards and technologies. It is a cross-platform application available on all the major operating systems (Windows, Mac OS X, Linux, Solaris) and can be used either as a standalone application or as an Eclipse plugin.

For a list of many of the features and technologies that are included in Oxygen XML Editor, see the oXygen Website.

Getting Familiar with the Layout

Oxygen XML Editor includes several perspectives and editing modes to help you accomplish a wide range of tasks. Each perspective and editing mode also includes a large variety of helper view, menu actions, toolbars, and contextual menu functions.

Regardless of the perspective or editing mode that you are working with, the default layout is comprised of the following areas:

**Menus**

Menu driven access to all the features and functions available in Oxygen XML Editor. Most of the menus are common for all types of documents, but Oxygen XML Editor also includes some context-sensitive and framework-specific menus and actions that are only available for a specific context or type of document.

**Toolbars**

Easy access to common and frequently used functions. Each icon is a button that acts as a shortcut to a related function. Some of the toolbars are common for all perspectives, editing modes, and types of documents, while others are specific to the particular perspective or mode. Some toolbars are also framework-specific, depending on the type of document that is being edited. All the toolbars can be configured to suit your specific needs.

**Helper Views**

Oxygen XML Editor includes a large variety of views to assist you with editing, viewing, searching, validating, transforming, and organizing your documents. Many of the views also contain useful contextual menu actions, toolbar buttons, or menus. The most commonly used views for each perspective and editing mode are displayed by default and you can choose to display others to suit your specific needs. The layout of the views can also be configured according to your preferences.

**Editor Pane**

The main editing area in the center of the application. Each editing mode provides a main editor pane where you spend most of your time reading, editing, applying markup, and validating your documents. The editor pane in each editing mode also includes a variety of contextual menu actions and other features to help streamline your editing tasks.

**Perspectives**

Oxygen XML Editor includes several different perspectives that you can use to work with your documents. The Editor perspective is the most commonly used perspective used for displaying and editing the content of your XML documents, and it is the default perspective when you start Oxygen XML Editor for the first time. Oxygen XML Editor also includes a Database perspective that allows you to manage databases and their connections and a few debugging perspectives that allow you to detect problems in XSLT or XQuery transformations.

**Status Bar**

The status bar at the bottom of the application contains some useful information when you are working with documents. It includes the following information, in the order it is displayed from left to right:

- The path of the current document.
- The Unicode value for the character directly to the right of the current cursor position.
- The status of the current document. The status of Modified is displayed for documents that have not yet been saved. Otherwise, this section is left blank.
- In Text editing mode, the current line and character position is displayed.
- If the Check for notifications option is enabled, this section will show you when new messages have been received. The types of messages include the addition of new videos on the Oxygen XML Editor website, the announcement of upcoming webinars and conferences where the Oxygen XML Editor team will participate, and more.
• The memory consumption, including the memory used by the application and the maximum amount that is allocated to the application.
• If the Show memory status option is enabled, a Free unused memory icon is displayed in the bottom-right corner and you can use this icon to free up unused memory.

Supported Document Types

You can use the main editing pane in Oxygen XML Editor to edit a large variety of document types. The supported document types include the following:

•  - XML documents
•  - XSLT stylesheets
•  - XML Schema
•  - DTD (Document Type Definition) schemas
•  - RELAX NG full syntax schemas
•  - RELAX NG compact syntax schemas
•  - NVDL (Namespace-based Validation Dispatching Language) schemas
•  - XSL:FO documents
•  - XQuery documents
•  - WSDL documents
•  - Schematron documents
•  - JavaScript documents
•  - Python documents
•  - CSS documents
•  - LESS documents
•  - XProc scripts
•  - SQL documents
•  - JSON documents
•  - Ant build scripts
•  - Markdown documents

Resources to Help You Get Started Using Oxygen XML Editor

Configuring Oxygen XML Editor

There are numerous ways that you can configure Oxygen XML Editor to accommodate your specific needs.

• See the Configuring Oxygen section for details on the various ways that you can configure the application and its features.
Video Tutorials

The Oxygen XML Editor website includes numerous video demonstrations and webinars that present many of the features that are available in Oxygen XML Editor and show you how to complete specific tasks or how to use the various features.

- Go to the Oxygen XML Editor Videos Page to see the list of video tutorials and webinars.

Oxygen XML Editor Documentation

The Oxygen XML Editor documentation includes a plethora of sections and topics to provide you with a variety of information, ranging from basic authoring tasks to advanced developer techniques. You can, of course, search through the documentation using standard search mechanisms, but you can also place the cursor in any particular position in the interface and use the F1 key to open a dialog box that presents a section in the documentation that is appropriate for the context of the current cursor position. Aside from the other topics in this Getting Started section, the following are links to other sections of the documentation that might be helpful for your specific needs:

- **Text Editing Mode Section** - Provides information about the Text editor.
- **Author Editing Mode Section** - Provides information about the visual WYSIWYG-like Author editing mode.
- **Editing Documents Section** - Includes information about editing numerous different types of documents.
- **DITA Authoring and Publishing Section** - Provides information about using DITA to edit and structure your content.
- **WebHelp System Output Section** - Provides information about the WebHelp system that can be used for publishing content.
- **Importing Data Section** - Provides information about importing data from text files, MS Excel files, database data, and HTML files.

Sample Documents

Your installation of Oxygen XML Editor includes a large variety of sample documents and projects that you can use as templates to get started and to experiment with the various features and technologies. They are located in the samples folder that is located in the installation directory of Oxygen XML Editor. You will find files and folders for various types of documents, including the following:

- **sample.xpr file** - A sample project file that will allow you to experiment with how projects can be structured and used. When you open this project file, you will be able to see all the sample files and folders in the Project view.
- **personal files** - A collection of interrelated sample files that will allow you to experiment with the structure and relationship between XML files, stylesheets, and schemas.
- **Various document type folders** - The various folders contain sample files for numerous document types, such as CSS, DITA, DocBook, ePub, TEI, XHTML, and many others.

Other Resources

The following list includes links to various other resources that will help you get started using the features of Oxygen XML Editor:

- See the Oxygen XML Editor Blog Site for a large variety of current and archived blogs in regards to numerous features, requests, and instructional topics.
- Take advantage of the Oxygen XML Editor Forum to see various announcements and learn more about specific issues that other users have experienced.
- If you are using DITA, see the incredibly helpful DITA Style Guide Best Practices for Authors.
- To learn about the WebHelp features in Oxygen XML Editor, see the Publishing DITA and DocBook to WebHelp section of the website.
- For more information about various additional tools that are integrated into Oxygen XML Editor, see the Tools section.
- See the External Resource Page for links to various other helpful resources, such as discussion lists, external tutorials, and more.
- See the oXygen SDK section for details about the SDK that allows you to extend and develop Oxygen XML Editor frameworks and plugins, and to integrate Eclipse plugins.
- For a list of new features that were implemented in the latest version of Oxygen XML Editor, see the What's New Section of the Website.
- You can select the Tip of the Day action in the Help menu to display a dialog box that includes a variety of tips for using Oxygen XML Editor.
Your First Document or Project

This section includes several topics that will help you get started with your first document or project.

Your First XML Document

To create your first XML document, select File > New or click the New button on the toolbar. The New document wizard is displayed:

![New Document Wizard](image)

Figure 2: New Document Wizard

You can either create a new XML document from scratch by choosing one of the available types in the wizard. You can also create one from a template by choosing a template from the Global templates or Framework templates folders. If you are looking for a common document type, such as DITA or DocBook, you can find templates for these document types in the Framework templates folder. If your company has created its own templates, you can also find them there. After you use this dialog box to create a few documents, those document types will appear in the Recently used folder, which allows you to easily create other new documents of those types.

For some document types, you may find a lot of different templates. For example, there are numerous templates for DocBook documents, and DITA topic types and maps. Choose the template that best meets your needs.

Writing Your First Document

Depending on the type of document you choose, the Oxygen XML Editor interface changes to support editing that document type. This may include new menus, toolbar buttons, and items in the contextual menus.

Also, depending on the type of document you choose, Oxygen XML Editor may open your document in Text or Author mode. Text mode shows the raw XML source file, while Author mode shows a graphical view of the document.

The availability of Author mode for your document type depends on the type you choose and if there is a CSS stylesheet available to create the Author mode. Oxygen XML Editor includes default Author mode views for most of the document types it supports. If your company has created its own document types, Author mode stylesheets may have also been created for that type. However, if you create a plain XML file, or one based on a schema that is not included in the Oxygen XML Editor built-in support, you need to edit it in Text mode or create your own Author mode style sheet for it.

You can switch back and forth between Author mode and Text mode at any time by clicking the buttons at the bottom left of the editor window. You do not lose any formatting when switching from Author to Text mode. Text and Author modes are just different views for the same XML document. There is also a Grid mode available, which is useful for certain kinds of
documents, particularly those that are structured like databases. You can also use it to sort things such as list items and table rows.

If you use Author mode, you might find that it is similar to word processors that you are used to. Likewise, the Text mode is similar to many typical text editors. If you are new to XML, the biggest difference is that XML documents have a particular structure that you have to follow. Oxygen XML Editor assists you with a continuous validation of the XML markup.

**Structuring Your First Document**

Each XML document type has a particular structure that you have to follow as you write and edit the document. Some document types give you a lot of choices, while others give you very few. In either case, you need to make sure that your document follows the particular structure for the document type you are creating. This means:

- At any given location in the document, there are only certain XML elements allowed. Oxygen XML Editor helps you determine which elements are allowed. In Author mode, when you press Enter, Oxygen XML Editor assumes that you want to enter a new element and shows you a list of elements that can be created in this location. Keep typing until the element you want is highlighted and press Enter to insert the element. If you want to view the overall structure of a document and see what is allowed (and where), you can use the Model view (Window > Show View > Model).

- When you create certain elements, you may find that your text gets a jagged red underline and you get a warning that your content is invalid. This is usually because the element you have just created requires certain other elements inside of it. Your document will be invalid until you create those elements. Oxygen XML Editor does its best to help you with this. If there is only one possible element that can go inside the element you just created, Oxygen XML Editor creates it for you. However, if there is more than one possibility, you have to create the appropriate elements yourself. In many cases, Oxygen XML Editor presents XML Quick Fixes that help you resolve errors by offering proposals to quickly fix problems such as missing required attributes or invalid elements.

**Editing Your First Document**

Once you have completed the first draft of your document, you may need to edit it. As with any editor, Oxygen XML Editor provides the normal cut, copy, and paste options as well as drag and drop editing. However, when you are editing an XML document, you have to make sure that your edits respect the structure of the XML document type. In fact, you are often editing the structure as well as the content of your document.

Oxygen XML Editor provides many tools to help you edit your structure and to keep your structure valid while editing text.

**The Document Breadcrumbs**

Across the top of the editor window, there is a set of breadcrumbs that shows you exactly where the insertion point is in the structure of the document. You can click any element in the breadcrumbs to select that entire element in the document.

**Showing Tags**

To see exactly where you are in the structure of the document, you can show the tags graphically in the Author view. There are several levels of tag visibility that you can choose using the Display tags mode drop-down menu on the toolbar (the button may look a little different than this, as it changes to reflect the level of tags currently displayed).

**Outline View**

The Outline view shows you the structure of your document in outline format. You can use it to select elements, or to move elements around in the document.
You can configure the Outline view to determine what is shown, such as element names, attributes, and comments. Certain choices may work better for particular document types. You can also filter the Outline view to show only elements with a certain name.

Cut and Paste, Drag and Drop

You can cut and paste or drag and drop text, just as you would in any other editor. However, when you do this in Author view, it is important to remember that you are actually moving blocks of XML. When you cut and paste or drag and drop a block of XML, the result has to be valid both where the content is inserted, and where it is removed from.

A big part of doing this correctly is to make sure that you pick up the right block of text in the first place. Using the breadcrumbs or Outline view, or showing tags and using them to select content, can help ensure that you are selecting the right chunk of XML.

If you do try to paste or drop a chunk of XML somewhere that is not valid, Oxygen XML Editor warns you and tries to suggest actions that make it valid (such as by removing surrounding elements from the chunk you are moving, by creating a new element at the destination, or by inserting it in a nearby location).

If you are using Author mode, you can also switch to Text mode to see exactly which bits of XML you are selecting and moving.

Refactoring actions

You can perform many common structure edits, such as renaming an element or wrapping text in an element, using the actions in the Refactoring menu of the contextual menu (or the Document > Markup menu). More advanced refactoring operations are also available using the XML Refactoring tool that is available in the Tools menu.
Validating Your First Document

Validation is the process of making sure that an XML document abides by the rules of its schema. If Oxygen XML Editor knows how to find the schema, it validates the document for you as you type. Oxygen XML Editor finds the schema automatically for most of the document types created from templates. However, in some cases you may have to tell it how to find the schema.

When Oxygen XML Editor validates as you type, there is a small bar at the right edge of the editor that shows you if the document is invalid and where errors are found. If the indicator at the top of that bar is green, your document is valid. If the document is invalid, the indicator turns red and a red flag shows you where the errors are found. Click that flag to jump to the error. Remember that sometimes your document is invalid simply because the structure you are creating is not yet complete.

In addition to problems with the validity of the XML document itself, Oxygen XML Editor also reports warnings for a number of conditions, such as if your document contains a cross reference that cannot be resolved, or if Oxygen XML Editor cannot find the schema specified by the document. The location of these warnings is marked in yellow on the validation bar. If the document contains warnings, but no errors, the validity indicator turns yellow.

You can also validate your document at any time by selecting the Validate action from the Validation toolbar drop-down menu or the Document > Validate menu. When you validate in this manner, if errors are found, the validation result opens in a new pane at the bottom of the editor that shows each validation error on a separate line. Clicking the error takes you to the location in your document where the error was detected.

Note: Be aware that the problem is sometimes in a different location from where the validator detects the error. To get more information about a validation error, right-click a validation error message, and select Show Message.

Proofing Your First Document

Oxygen XML Editor includes an automatic (as-you-type) spell checking feature, as well as a manual spell checking action. To check the spelling of your document manually, use the Check Spelling action on the toolbar or from the Edit menu.

Transforming Your First Document

An XML document must be transformed to be published. Transformations are specific to the particular type of document you have created. For example, a DITA transformation cannot be used on a DocBook file, or vice versa. A single document type may have many multiple transformations that produce different kinds of outputs. For some document types, such as DITA, many different content files may be combined together by a transformation. You need to locate and launch a transformation that is appropriate for your document type and the kind of output you want to generate.

Oxygen XML Editor uses transformation scenarios to control the transformation process. Depending on the document type you have created, there may be several transformation scenarios already configured for your use. This may include the default transformation scenarios supplied by Oxygen XML Editor or ones created by your organization.

To see the list of transformations available for your document, select the Apply Transformation Scenario(s) action from the toolbar or the Document > Transformation menu. A list of available transformation scenarios are displayed. Choose one or more scenarios to apply, and click Apply associated. Exactly how your transformed content appears depends on how the transformation scenario is configured.

Your First DITA Topic

To create your first DITA topic, select File > New or click the New button on the toolbar. The New Document Wizard is displayed:
Go to Framework templates > DITA > topic and select the type of topic that you want to create.

**Note:** If your organization has created DITA customizations, the appropriate template files may be in another location, and various types of topics may be provided for your use. Check with the person who manages your DITA system to see if you should be using templates from another directory.

Your DITA topic is an XML document, thus all **the editing features that Oxygen XML Editor provides for editing XML documents** also apply to DITA topics. Oxygen XML Editor also provides extensive additional support for **editing DITA topics, their associated DITA maps**, and for **creating DITA output**.

**Understanding DITA Topics**

It is important to understand the role that a **DITA topic plays in a DITA project**. A DITA topic is not associated with a single published document. It is a separate entity that can potentially be included in many different books, help systems, or websites. Therefore, when you write a DITA topic you are not writing a book, a help system, or a website. You are writing an individual piece of content. This affects how you approach the writing task and how Oxygen XML Editor works to support you as you write.

Most of your topics are actually related to other topics, and those relationships can affect how you write and handle things such as links and content reuse. Oxygen XML Editor helps you manage those relationships. Depending on how your topics are related, you can use the tools provided in Oxygen XML Editor, along with the features of DITA, in a variety of ways.

**Role of Maps**

The basic method that DITA uses to express the relationship between topics is **through a DITA map**. Other relationships between topics, such as cross references, generally need to be made between topics in the same map. DITA uses maps to determine which topics are part of any output that you create. While customized DITA solutions can use other mechanisms, generally DITA is not used as a way to publish individual topics. Output is created from a map and includes all the topics referenced by the map.

A publication is not always represented by a single map. For instance, if you are writing a book, you might use a map to create each chapter and then organize the chapters in another map to create the book. If you are writing help topics, you might use a map to combine several DITA topics to create a single help topic and then create another map to organize your help topics in a help system. This allows you to reuse the content of a map in multiple projects.
Creating a Map

To add topics to a map, you must first create the map. A map is an XML document, similar to a topic. To create a map, select File > New or click the New button on the toolbar, go to Framework templates > DITA Map > map and select the type of map you want to create. Oxygen XML Editor asks if you want to open your map in the editor or in the DITA Maps Manager. Usually, opening it in the DITA Maps Manager is the best choice, but you can also open the map in the editor from the DITA Maps Manager. The DITA Maps Manager presents a view of the DITA map that is similar to a table of contents.

![Figure 6: DITA Maps Manager View](image)

Adding Topics to a Map

To add a topic to a map, add a topic reference to the map using a topicref element. The easiest way to do this is to open the topic in the editor, then right-click the DITA map in the DITA Maps Manager view and choose Reference to the currently edited file from the Append child or Insert After submenus. This opens the Insert Reference dialog box with all of the required fields already filled in for you. You can fill in additional information in the various tabs in this dialog box or add it to the map later. When you select Insert and close, a reference to your topic is added to the map.
If you want to see what the resulting map looks like in XML, save your map and then double-click the DITA map in the DITA Maps Manager view. The XML version of the map opens in the editor.

As you add topics to your map, you may want to make a topic the child or sibling of another topic. This is usually done at the map level. To create a child topic reference, right-click the parent topic in the DITA Maps Manager view and choose Append child. To create a sibling topic reference, right-click a topic in the DITA Maps Manager view and choose Insert After. From either of these submenus you can then choose one of the following options:

- **New** - Opens the New file wizard for creating a new topic.
- **Reference** - Opens the Insert Reference dialog box that allows you to create a reference to an existing topic.
- **Reference to the currently edited file** - Opens the Insert Reference dialog box that helps you to easily create a reference to the file that is currently opened in the editor.

You can also change the order and nesting of topics in the DITA Maps Manager view by doing either of the following:

- Select the topic to move while holding down the Alt key and use the arrow keys to move it around.
- Use the mouse to drag and drop the topic to the desired location.

The way your parent and child topics are organized in any particular output depends on both the configuration of those topics in the map and the rules of the output transformation that is applied to them. Do not assume that your topics must have the same organization for all output types. The map defines the organization of the topics, not the topics themselves. It is possible to create a variety of maps, each with different organization and configuration options to produce a variety of outputs.

### Child Maps

If you have a large set of information, such as a long book or extensive help system, a single map can become long and difficult to manage. To make it easier to manage, you can break up the content into smaller submaps. A submap might represent a chapter of a book, a section of a user manual, or a page on a website.

To build a publication out of these smaller maps, you must add them to a map that represents the overall publication. To add a child map to the current map, right-click the parent DITA map and choose Append child > Map reference.
Validating a Map

Just as it is with your individual topics, it is important to validate your maps. Oxygen XML Editor provides a validation function for DITA maps that does more than simply validating that the XML is well formed. It also does the following:

- Validates all of the relationships defined in the maps.
- Validates all of the files that are included in the map.
- Validates all of the links that are expressed in the files.

Validating the map that describes your entire publication validates all the files that make up the publication and all of the relationships between them. To validate a map, click the Validate and Check for Completeness button in the DITA Maps Manager view.

Publishing Your Topics

As noted previously, in DITA standards you usually do not publish output from an individual topic. Instead, you create published output by running a DITA transformation on a map. This collects all the topics that are referenced in the map, organizes them, and produces output in a particular format. By default, Oxygen XML Editor uses the transformations provided by the DITA Open Toolkit for publishing to various output formats (such as PDF, WebHelp or EPUB). Your organization may have created various custom transformations or modified the built-in DITA Open Toolkit transformations. In either case, Oxygen XML Editor manages them by using transformation scenarios.

To publish output for a map, select the transformation scenario you want to run and set any of the parameters it requires. To select a transformation, click the Configure Transformation Scenario(s) button in the DITA Maps Manager view. This opens the Configure Transformation Scenario(s) dialog box.

Figure 8: Configure Transformation Scenarios Dialog Box
Choose the transformation scenarios you want to apply and click *Apply associated*. Depending on the configuration of the transformation scenario, when the transformation is finished, your output may automatically be opened in the appropriate application. To change or view the configuration or storage options for a transformation scenario, select the transformation and click *Edit*.

**Related information**

- *DITA Authoring and Publishing* on page 1511
- *Editing XML Documents in Author Mode* on page 313

### Creating a New Project

Oxygen XML Editor allows you to organize your XML-related files into projects. This helps you manage and organize your files and also allows you to perform batch operations (such as validation and transformation) over multiple files. You can also *share your project settings and transformation/validation scenarios* with other users. Use the *Project view* to manage projects, and the files and folders contained within.

#### Creating a New Project

To create a new project, select ![New Project](image) from the *Project* menu, the *New* menu in the contextual menu, or the drop-down menu at the top-left of the *Project view*. This opens a dialog box that allows you to assign a name to the new project and adds it to the structure of the project in the *Project view*.

#### Adding Items to the Project

To add items to the project, select any of the following actions that are available when invoking the contextual menu in the *Project view*:

- **New > ![File](image)**: Opens a *New file* dialog box that helps you create a new file and adds it to the project structure.

- **New > ![Folder](image)**: Opens a *New Folder* dialog box that allows you to specify a name for a new folder and adds it to the structure of the project.

The project itself is considered a logical folder. You can add a logical folder, or content to a logical folder, by using one of the following actions that are available in the contextual menu, when invoked from the *project root*:

- **New > ![Logical Folder](image)**: Creates a logical folder in the tree structure (the icon is a magenta folder on Mac OS X - ![Folder](image)).

- **New > Logical Folders from Web**: Replicates the structure of a remote folder accessible over FTP/SFTP/WebDAV, as a structure of logical folders. The newly created logical folders contain the file structure of the folder it points to.

- **Add Folder**: Adds a link to a physical folder, whose name and content mirror a real folder that exists in the local file system (the icon of this action is different on Mac OS X ![Folder](image)).

- **Add Files**: Adds links to files on the local file system.

- **Add Edited File**: Adds a link to the currently edited file in the project.

#### Using Linked Folders (Shortcuts)

Another easy way to organize your XML working files is to place them in a directory and then to create a corresponding linked folder in your project. If you add new files to that folder, you can simply use the *Refresh (F5)* action from the toolbar or contextual menu and the *Project view* will display the existing files and subdirectories. If your files are scattered amongst several folders, but represent the same class of files, you might find it useful to combine them in a logical folder.
You can create linked folders (shortcuts) by dragging and dropping folders from the Windows Explorer (Mac OS X Finder) to the project tree, or by selecting Add Folder in the contextual menu from the project root. Linked folders are displayed in the Project view with bold text. To create a file inside a linked folder, select the New > File action from the contextual menu. The linked files presented in the Project view are marked with a special icon.

Note: Files may have multiple instances within the folder system, but cannot appear twice within the same folder.

For more information on managing projects and their content, see Project View on page 179.

For more details about how you can share projects with other users, see Sharing a Project - Team Collaboration on page 270.

Using Projects to Group Documents on page 262

Getting Help

If you run into specific problems while using Oxygen XML Editor you can take advantage of a variety of support related resources. Those resources include the following:

- The Oxygen XML Editor Support Section of the Website
- The Oxygen XML Editor Forum
- The Oxygen XML Editor Video Tutorials
- The Common Problems and Solutions Section of the User Manual
- The Online Technical Support Form

The application also includes various specific help-related resources in the Help menu.

Help Menu

The Oxygen XML Editor Help menu provides various resources to assist you with your tasks.

This menu includes the following actions or options:

Welcome
   This option opens the Welcome screen that includes some resources to assist you with using Oxygen XML Editor.

Help (F1)
   Use this action (or the F1 key) to open a dialog box that presents a section in the User Manual that is appropriate for the context of the current cursor position. If the Use online help option is enabled, this action will open the User Manual in an online mode.

Use online help
   If this option is enabled, the Help (F1) action will open the Oxygen XML Editor User Manual in an online mode.

Show Dynamic Help view
   Use this action to open a view that loads the latest online WebHelp version of the Oxygen XML Editor User Manual, and dynamically opens a topic that is relevant to the focused editor, view, or dialog box. It requires Java 1.8 and an online connection. In Windows, if a Java 1.8 version is not detected, you will be advised to upgrade, while in Linux and Mac OS X with Java 1.7 and lower, Oxygen XML Editor will attempt to load an offline version of the documentation. In all three operating systems, with Java 1.8, if an online connection is not detected, you will receive an error message advising you to check your proxy settings.

Install new add-ons
   Opens a dialog box that allows you to install new add-ons to extend the functionality of Oxygen XML Editor.

Check for add-ons updates
   Opens a dialog box that allows you to check for updates on installed add-ons.

Manage add-ons
   Opens a dialog box that allows you to manage installed add-ons.

Check for a New Version
   Use this action to view information about the latest version of Oxygen XML Editor.
Browse <oXygen/> Website

Opens the Oxygen XML Editor website in your default internet browser.

Register

If you encounter problems with your Oxygen XML Editor license, you can use this option to open a dialog box that provides options for obtaining or using a license key.

Report problem

You can use this option to open a dialog box that allows you to write the description of a problem that was encountered while using the application. You can also select additional information to be sent to the technical support team in the five tabs:

- **General info** - You can edit your contact details in case you want to be contacted for further details or to be notified of a resolution.
- **Class Loader URLs** - You can choose whether or not to include the listed Class Loader URLs with your report.
- **System properties** - You can choose whether or not to include the listed system property details with your report.

Tip: You are able to change the URL where the reported problem is sent by using the `com.oxygenxml.report.problems.url` system property. The report is sent in XML format through the `report` parameter of the POST HTTP method.

- **Plugins** - You can choose whether or not to include details about your installed plugins with your report.
- **Frameworks** - You can choose whether or not to include details about your installed frameworks with your report.

Support Center

Use this option to open the Oxygen XML Editor Support Section of the Website.

Support Tools > Clipboard Inspector

Opens a dialog box that displays extensive details of all the transferable objects from the clipboard. This is helpful if you experience problems while copying content from other applications and pasting it into Oxygen XML Editor. You can use the Copy button to copy all of this data and then paste it into an email to be sent to the oXygen support team.

Support Tools > Randomize XML text content

Use this action when you need to send samples to the oXygen support team and you want to keep the text content confidential. It opens a dialog box that allows you to select the resources for which the text content will be randomized. You can then save the resources and send them to the oXygen support team without fear of compromising sensitive or private data.

Warning: Before using this action, you need to copy the XML resources and save them in a separate folder. Otherwise, you may lose your original content.

Tip of the Day

Opens a dialog box that offers tips for using Oxygen XML Editor.

About

Use this option to open a dialog box that contains information about Oxygen XML Editor and the installed version. This dialog box includes the following tabs:

- **Copyright** - This tab contains general information about the product and the version of the product you are using, along with contact details and the SGN number. Details regarding the memory usage are also presented at the bottom of the dialog box.
- **Libraries** - This tab presents the list of third party libraries that Oxygen XML Editor uses. To view the End User Licence Agreement of each library, double-click it.
- **Frameworks** - This tab contains a list with the frameworks that are bundled with Oxygen XML Editor.
- **System Properties** - This tab contains a list with system properties and their values. The contextual menu allows you to select and copy the properties.

Frequently Used Shortcut Keys

Oxygen XML Editor includes numerous shortcut keys that are assigned to actions to help you edit content. All the shortcuts that are assigned to actions are displayed in the table in the Menu Shortcut Keys preference page.

For information about how to assign or configure shortcut keys, see How to Assign a Shortcut Key or Edit an Existing Shortcut on page 144.

| Zoom Out                      | Ctrl + NumPad-                | Command + NumPad-      | Zooms out (decrease font size)         |
This chapter includes information about installing and licensing Oxygen XML Editor on various platforms. Oxygen XML Editor is available on Windows, Linux, and Mac OS X and there are a variety of methods and options for installing and running Oxygen XML Editor on your system or server. This section also includes information about registering, transferring, or releasing licenses, upgrading, installing add-ons, and uninstalling.
Installation Options for Oxygen XML Editor

Choosing how Oxygen XML Editor runs
You can install Oxygen XML Editor to run in a number of ways:

• As a desktop application (running standalone or as an Eclipse plugin) on Windows, Linux, or Mac.
• As a desktop application (running standalone or as an Eclipse plugin) on a Unix or Linux server or on Windows Terminal Server.
• From within a browser through the Java Web Start technology.

Choosing an installer
You have a choice of installers;

• The native installer for your platform. On Windows and Linux, the native installer can run also in unattended mode.

The installation packages were checked before publication with an antivirus program to make sure they are not infected with viruses, trojan horses, or other malicious software.

Choosing a license option
You must obtain and register a license key to run Oxygen XML Editor.

You can choose from two kinds of license:

• A named-person license, which can be used by a single person on multiple computers.
• A floating license, which can be used by different people at different times. Only one person can use a floating license at a time.

Upgrading, transferring, and uninstalling.
You can also upgrade Oxygen XML Editor, transfer a license, or uninstall Oxygen XML Editor.

Getting help with installation
If you need help at any point during these procedures, please send us an email at support@oxygenxml.com.

Install Oxygen XML Editor on Windows

Choosing an Installer
You can install Oxygen XML Editor on Windows using one of the following methods:

• Windows installer
• Windows installer in unattended mode

System Requirements
System requirements for a Windows install:

Operating systems

CPU
• Minimum - Intel Pentium III™/AMD Athlon™ class processor, 1 GHz
• Recommended - Dual Core class processor
Memory

- Minimum - 2 GB of RAM
- Recommended - 4 GB of RAM

Storage

- Minimum - 400 MB free disk space
- Recommended - 1 GB free disk space

Java

Oxygen XML Editor requires Java. If you use the native Windows installer, Oxygen XML Editor will be installed with its own copy of Java. If you use the all platforms installer, your system must have a compatible Java virtual machine installed.

Oxygen XML Editor only supports official and stable Java Virtual Machines with the version number 1.6.0 or later (the recommended version is 1.7) from Oracle available at http://www.oracle.com/technetwork/java/javase/downloads/index.html. Oxygen XML Editor may work with JVM implementations from other vendors, but there is no guarantee that those implementations will work with future Oxygen XML Editor updates and releases.

Oxygen XML Editor uses the following rules to determine which installed version of Java to use:

1. If you install using the native Windows installer, which installs a version of Java as part of the Oxygen XML Editor installation, the version in the \jre subdirectory of the installation directory is used.
2. Otherwise, if the Windows environment variable JAVA_HOME is set, Oxygen XML Editor uses the Java version pointed to by this variable.
3. Otherwise, the version of Java pointed to by your PATH environment variable is used.

If you run Oxygen XML Editor using the batch file, oxygen.bat, you can edit the batch file to specify a particular version to use.

Install Using the Windows Installer

To install Oxygen XML Editor using the Windows installer, follow these steps:

1. Make sure that your system meets the system requirements.
2. Download the Windows installer.
3. Validate the integrity of the downloaded file by checking it against the MD5 sum published on the download page.
4. Run the installer and follow the instructions in the installation program.
5. Start Oxygen XML Editor using one of the following methods:
   - Using one of the shortcuts created by the installer.
   - By running oxygen.bat, which is located in the install folder.
6. To license your copy of Oxygen XML Editor go to Help > Register and enter your license information.

Unattended Installation

You can run the installation in unattended mode by running the installer from the command line with the -q parameter. By default, running the installer in unattended mode installs Oxygen XML Editor with the default options and does not overwrite existing files. You can change many options for the unattended installer using the installer command line parameters.

Install Oxygen XML Editor on Mac OS X

Choosing an Installer

You can install Oxygen XML Editor on Mac OS X using one of the following methods:

- Install using the Mac OS X installation package, oxygen.dmg.

System Requirements

System requirements for a Mac OS X install:
Operating system

OS X version 10.8 64-bit or later

CPU

- Minimum - Intel-based Mac, 1 GHz
- Recommended - Dual Core class processor

Memory

- Minimum - 2 GB of RAM
- Recommended - 4 GB of RAM

Storage

- Minimum - 400 MB free disk space
- Recommended - 1 GB free disk space

Java

Oxygen XML Editor requires Java to run. OS X includes Java by default or it will install it on the first attempt to run a Java application.

Oxygen XML Editor only supports official and stable Java Virtual Machines with the version number 1.6.0 or later (the recommended version is 1.6.0 from Apple). Oxygen XML Editor may work with JVM implementations from other vendors, but there is no guarantee that other implementations will work with future Oxygen XML Editor updates and releases.

Oxygen XML Editor uses the following rules to determine which installed version of Java to use:

1. If you start Oxygen XML Editor with the application launcher (.app) file then:
   a. If you use the zip distribution for OS X Oxygen XML Editor uses the Apple Java SE 6 available on your Mac computer
   b. If you use the tar.gz distribution that contains a bundled JRE then Oxygen XML Editor will use that bundled JRE

2. If you start Oxygen XML Editor using a startup .sh script then:
   a. If a bundled JRE is available then it will be used
   b. Otherwise, if the JAVA_HOME environment variable is set then the Java distribution indicated by it will be used
   c. Otherwise, the version of Java pointed to by your PATH environment variable will be used

If you run Oxygen XML Editor using the oxygen.sh script, you can change the version of Java used by editing to script file. Go to the Java command at the end of the script file and specify the full path to the Java executable of the desired JVM version. For example:

/System/Library/Frameworks/JavaVM.framework/Versions/1.6.0/Home/bin/java
"-Xdock:name= ..."
Notice: You can start multiple instances on the same computer by running the following command for each new instance:

```
open -n Oxygen.app
```

6. To license your copy of Oxygen XML Editor, go to Help > Register to enter your license key.

Install Oxygen XML Editor on Linux

Choosing an Installer

You can install Oxygen XML Editor on Linux using any of the following methods:

- Install using the Linux installer.
- Install using the Linux installer in unattended mode.

System Requirements

System requirements for a Linux install:

Operating system

Any Unix/Linux distribution with an available Java SE Runtime Environment version 1.6.0 or later from Oracle

CPU

- Minimum - Intel Pentium III™/AMD Athlon™ class processor, 1 GHz
- Recommended - Dual Core class processor

Memory

- Minimum - 2 GB of RAM
- Recommended - 4 GB of RAM

Storage

- Minimum - 400 MB free disk space
- Recommended - 1 GB free disk space

Java

Oxygen XML Editor requires Java. Oxygen XML Editor only supports official and stable Java Virtual Machines with the version number 1.6.0 or later (the recommended version is 1.6.0) from Oracle available at http://www.oracle.com/technetwork/java/javase/downloads/index.html. Oxygen XML Editor may work with JVM implementations from other vendors, but there is no guarantee that other implementations will work with future Oxygen XML Editor updates and releases. Oxygen XML Editor does not work with the GNU libgcj Java Virtual Machine.

Oxygen XML Editor uses the following rules to determine which installed version of Java to use:

1. If you used the Linux installer, which installs a version of Java as part of the Oxygen XML Editor installation, the version in the jre subdirectory of the installation directory is used.
2. Otherwise, if the Linux environment variable JAVA_HOME is set, Oxygen XML Editor uses the Java version pointed to by this variable.
3. Otherwise the version of Java pointed to by your PATH environment variable is used.

You can also change the version of the Java Virtual Machine that runs Oxygen XML Editor by editing the script file, oxygen.sh. Go to the Java command at the end of the script file and specify the full path to the Java executable of the desired JVM version. For example:

```
/usr/bin/jre1.6.0_45/bin/java -Xmx256m ...
```

Linux Installation

Linux installation procedure.
To install Oxygen XML Editor on Linux, follow these steps:

1. Download the Linux installer.
2. Optionally, you can validate the integrity of the downloaded file by checking it against the MD5 sum published on the download page.
3. Run the installer that you downloaded.
   For example, open a shell, cd to the installation directory, and at the prompt type `sh ./oxygen-32bit.sh` or `sh ./oxygen-64bit.sh`, depending on which installer you downloaded.
4. Start Oxygen XML Editor using one of the following methods:
   • Use the `oxygen` shortcut created by the installer.
   • From a command line, type `sh oxygen.sh`. This file is located in the installation folder.
5. To license your copy of Oxygen XML Editor go to Help > Register and enter your license key.

**Unattended Installation**

You can run the installation in unattended mode by running the installer from the command line with the `-q` parameter. By default, running the installer in unattended mode installs Oxygen XML Editor with the default options and does not overwrite existing files. You can change many options for the unattended installer using the installer command line parameters.

**Installing Oxygen XML Editor on Windows Server**

**Choosing an Installer**

You can install Oxygen XML Editor on Windows using one of the following methods:

- Windows installer
- Windows installer in unattended mode

**System Requirements**

System requirements for a Windows Server install:

**Operating systems**

**CPU**

- Minimum - Intel Pentium III™/AMD Athlon™ class processor, 1 GHz
- Recommended - Dual Core class processor

**Memory**

- Minimum values per user - 512 MB of RAM
- Recommended values per user - 2 GB of RAM

**Storage**

- Minimum - 400 MB free disk space
- Recommended - 1 GB free disk space

**Java**

Oxygen XML Editor requires Java. If you use the native Windows installer, Oxygen XML Editor will be installed with its own copy of Java. If you use the all platforms installer, your system must have a compatible Java virtual machine installed.

Oxygen XML Editor only supports official and stable Java Virtual Machines with the version number 1.6.0 or later (the recommended version is 1.7) from Oracle available at [http://www.oracle.com/technetwork/java/javase/downloads/index.html](http://www.oracle.com/technetwork/java/javase/downloads/index.html). Oxygen XML Editor may work with JVM implementations from other vendors, but there is no guarantee that those implementations will work with future Oxygen XML Editor updates and releases.

Oxygen XML Editor uses the following rules to determine which installed version of Java to use:
1. If you install using the native Windows installer, which installs a version of Java as part of the Oxygen XML Editor installation, the version in the jre subdirectory of the installation directory is used.
2. Otherwise, if the Windows environment variable JAVA_HOME is set, Oxygen XML Editor uses the Java version pointed to by this variable.
3. Otherwise, the version of Java pointed to by your PATH environment variable is used.

If you run Oxygen XML Editor using the batch file, oxygen.bat, you can edit the batch file to specify a particular version to use.

Install Using the Windows Installer

To install Oxygen XML Editor using the Windows installer, follow these steps:

1. Make sure that your system meets the system requirements.
2. Download the Windows installer.
3. Validate the integrity of the downloaded file by checking it against the MD5 sum published on the download page.
4. Run the installer and follow the instructions in the installation program.
5. Start Oxygen XML Editor using one of the following methods:
   - Using one of the shortcuts created by the installer.
   - By running oxygen.bat, which is located in the install folder.
6. To license your copy of Oxygen XML Editor go to Help > Register and enter your license information.

Configuring Windows Terminal Server

Windows Terminal Server configuration procedure:

1. Install Oxygen XML Editor on the server and make its shortcuts available to all users.
2. If you need to run multiple instances of Oxygen XML Editor, make sure you add the -Dcom.oxygenxml.MultipleInstances=true parameter in the .bat startup script.
3. Make sure you allocate sufficient memory to Oxygen XML Editor by adding the -Xmx parameter either in the .bat startup script, or in the .vmoptions configuration file (if you start it from an executable launcher).

Installing Oxygen XML Editor on a Linux / UNIX Server

Choosing an Installer

You can install Oxygen XML Editor on Linux using any of the following methods:

- Install using the Linux installer.
- Install using the Linux installer in unattended mode.

System Requirements

System requirements for a Linux install:

Operating system

Any Unix/Linux distribution with an available Java SE Runtime Environment version 1.6.0 or later from Oracle

CPU

- Minimum - Intel Pentium III™/AMD Athlon™ class processor, 1 GHz
- Recommended - Dual Core class processor

Memory

- Minimum - 2 GB of RAM
- Recommended - 4 GB of RAM
Storage

- Minimum - 400 MB free disk space
- Recommended - 1 GB free disk space

Java

Oxygen XML Editor requires Java. Oxygen XML Editor only supports official and stable Java Virtual Machines with the version number 1.6.0 or later (the recommended version is 1.6.0) from Oracle available at http://www.oracle.com/technetwork/java/javase/downloads/index.html. Oxygen XML Editor may work with JVM implementations from other vendors, but there is no guarantee that other implementations will work with future Oxygen XML Editor updates and releases. Oxygen XML Editor does not work with the GNU libgcj Java Virtual Machine.

Oxygen XML Editor uses the following rules to determine which installed version of Java to use:

1. If you used the Linux installer, which installs a version of Java as part of the Oxygen XML Editor installation, the version in the jre subdirectory of the installation directory is used.
2. Otherwise, if the Linux environment variable JAVA_HOME is set, Oxygen XML Editor uses the Java version pointed to by this variable.
3. Otherwise the version of Java pointed to by your PATH environment variable is used.

You can also change the version of the Java Virtual Machine that runs Oxygen XML Editor by editing the script file, oxygen.sh. Go to the Java command at the end of the script file and specify the full path to the Java executable of the desired JVM version. For example:

/usr/bin/jre1.6.0_45/bin/java -Xmx256m ...

Linux Installation

Linux installation procedure.

To install Oxygen XML Editor on Linux, follow these steps:

1. Download the Linux installer.
2. Optionally, you can validate the integrity of the downloaded file by checking it against the MD5 sum published on the download page.
3. Run the installer that you downloaded.
   For example, open a shell, cd to the installation directory, and at the prompt type sh ./oxygen-32bit.sh or sh ./oxygen-64bit.sh, depending on which installer you downloaded.
4. Start Oxygen XML Editor using one of the following methods:
   - Use the oxygen shortcut created by the installer.
   - From a command line, type sh oxygen.sh. This file is located in the installation folder.
5. To license your copy of Oxygen XML Editor go to Help > Register and enter your license key.

Unix / Linux Server Configuration

To install Oxygen XML Editor on a Unix / Linux server:

1. Install Oxygen XML Editor on the server and make sure the oxygen.sh script is executable and the installation directory is in the PATH of the users that need to use the application.
2. Make sure you allocate sufficient memory to Oxygen XML Editor by setting an appropriate value for the -Xmx parameter in the .sh startup script.
   The default value of the -Xmx parameter is 512 MB. To avoid performance issues with large documents, you may need to adjust it.
3. Make sure the X server processes located on the workstations allow connections from the server host. For this, use the xhost command.
4. Start telnet (or ssh) on the server host.
5. Start an xterm process with the display parameter set on the current workstation. For example: xterm -display workstationip:0.0.
6. Start Oxygen XML Editor by typing `sh oxygen.sh` from the command line. This file is located in the installation folder.

### Installing Oxygen XML Editor using the Java Web Start (JWS) Installer

Oxygen XML Editor provides the tools to create your own JWS distribution that can be installed on a custom web server. The advantages of a JWS distribution include:

- Oxygen XML Editor is run locally, not inside a web browser, overcoming many of the browser compatibility problems common to applets.
- JWS ensures that the most current version of the application will be deployed, as well as the correct version of JRE.
- Applications launched with Java Web Start are cached locally. Thus, an already downloaded application is launched on par with a traditionally installed application.
- You can preconfigure Oxygen XML Editor and the rest of your team will use the same preferences and frameworks.

**Important:** If you want to create your own JWS distribution package, please contact Syncro Soft for permission through a Value Added Reseller Agreement.

**Note:** A code signing certificate is needed to sign the JWS distribution. The following procedure assumes that you already have such a certificate (for example, Thawte™, or Verisign™).

The following schematics depicts the Oxygen XML Editor Java Web Start deployment procedure:

![Java Web Start Deployment Procedure](image)

**Figure 9: Java Web Start Deployment Procedure**

To deploy an Oxygen XML Editor installation on a server.

1. Go to [https://www.oxygenxml.com/InstData/Editor/All/oxygen.tar.gz](https://www.oxygenxml.com/InstData/Editor/All/oxygen.tar.gz) and download the All Platforms Installation package to a local drive.
2. Expand the archive to a temporary location. The `oxygen` folder is created.
3. Optionally, you can customize the content of the frameworks folder.

4. Edit the oxygen\tools\jwsPackager\packager.properties configuration file. Adjust the following properties appropriately for your server:
   - **codebase** - Represents the location of the future JWS distribution.
   - **keystore** - The keystore location path.
   - **storepass** - The password for keystore integrity.
   - **storetype** - The type of the certificate file, such as PKCS12 or JKS.
   - **alias** - The keystore alias.
   - **optionsDir** - Points to the options directory that may be distributed with the JWS installer. If the directory contains an XML document named options.xml or default.xml containing exported options, these options will be used. Otherwise, the structure of the options folder has to match the structure of a stand alone application options folder.

   **Note:** This property is optional. It is provided only if custom options need to be delivered to the end users.

   The values of keystore, storepass, and alias properties are all provided by the code signing certificate. For more information, please check the documentation for your jarsigner tool.

5. If you want to modify the default settings, edit the JNLP oxygen\tools\jwsPackager\dist\javawebstart\oxygen\oxygen.jnlp template file. You can specify the list of files opened at startup by modifying the <argument> list. To pass system properties directly to Oxygen XML Editor when it is started, add the oxy prefix to them (for example: <property name="oxyPropertyName" value="testValue"/>). The system property is passed to Oxygen XML Editor with the prefix stripped.

6. Open a command-line console and run ant in the oxygen\tools\jwsPackager folder. The ant process creates the oxygen\tools\jwsPackager\dist\InstData\oxygenJWS.zip archive that contains the actual remote JWS installer.

7. Copy the expanded content of the archive to the folder specified in the codebase property, previously set in the packager.properties file.

8. Using your favorite web browser, go to the address specified in the codebase property or to its parent folder and start the remote installer.

   **Important:** When running the Java Web Start distribution on OS X, due to changes in this security release, clicking the link to the JNLP file does not start the application. The selected JNLP is downloaded locally. Right-click it and choose to open the resource.

---

**Group Deployment**

If you are deploying Oxygen XML Editor for a group, there are a number of things you can do to customize Oxygen XML Editor for your users and to make the deployment more efficient.

**Creating custom default options**

You can create a custom set of default options for Oxygen XML Editor. These will become the default options for each of your users, replacing the normal default settings. Users can still set options to suit themselves in their own copies of Oxygen XML Editor, but if they choose to reset their options to defaults, the custom defaults that you set will be used.

**Creating default project files**

Oxygen XML Editor project files are used to configure a project. You can create and deploy default project files for your projects so that your users will have a preconfigured project file to begin work with.

**Shared project files**

Rather than each user having their own project file, you can create and deploy shared project files so that all users share the same project configuration and settings and automatically inherit all project changes.

**Using the unattended installer**

You can speed up the installation process by using the unattended installer for Windows or Linux installs.

**Using floating licenses**

If you have a number of people using Oxygen XML Editor on a part-time basis or in different time zones, you can use a floating license so that multiple people can share a license.
Obtaining and Registering a License Key for Oxygen XML Editor

Oxygen XML Editor is not free software. To activate and use Oxygen XML Editor, you need a license.

For demonstration and evaluation purposes, a time limited license is available upon request at https://www.oxygenxml.com/register.html. This license is supplied at no cost for a period of 30 days from the date of issue. During this period, the software is fully functional, enabling you to test all its functionality. To continue using the software after the trial period, you must purchase a permanent license.

Choosing a License Type

You can use one of the following license types with Oxygen XML Editor:

1. A **Named-User License** may be used by a single *Named User* on one or more computers. Named-user licenses are not transferable to a new *Named User*. If you order multiple named-user licenses, you will receive a single license key good for a specified number of named users. It is your responsibility to keep track of the named users that each license is assigned to.

2. A **Floating License** may be used by any user on any machine. However, the total number of copies of Oxygen XML Editor in use at one time must not be more than the number of floating licenses available. A user who runs two different distributions of Oxygen XML Editor (for example, Standalone and Eclipse Plugin) at the same time on the same computer, consumes a single floating license.

3. A **Subscription** license that allows you to use the application for a specific period of time (either 6 months or 1 year). This type of license is user-based and is covered by a Support and Maintenance Pack, which means that during the subscription period you will get free upgrades to all major and minor releases and priority technical support.

4. A special **Academic Group License** (*Classroom*, *Department*, or *Site* license) may be used by students and teachers in academic institutions. These licenses provide a cost effective way of getting access to Oxygen XML Editor for learning purposes.

For definitions and legal details of the license types, consult the End User License Agreement available at https://www.oxygenxml.com/eula.html.

Obtaining a License

You can obtain a license for Oxygen XML Editor in one of the following ways:

- You can purchase one or more licenses from the Oxygen XML Editor website at https://www.oxygenxml.com/buy.html. A license key will be sent to you by email.
- If your company or organization has already purchased licenses, please contact your license administrator to obtain a license key.
- If you purchased a subscription and you received a registration code, you can use it to obtain a license key from https://www.oxygenxml.com/registerCode.html. A license key will be sent to you by email.
- If you want to evaluate the product, you can obtain a trial license key for 30 days from the Oxygen XML Editor website at https://www.oxygenxml.com/register.html.

Register a Named-User or Subscription License

To register a **Named-User License** or **Subscription License** on a machine owned by the *Named User*, follow these steps:

1. Purchase a license from the Oxygen XML Editor website. You will receive an email that contains your license key.
2. Save a backup copy of your email message that contains the new license key.
3. Start Oxygen XML Editor.
   - If this is a new install of Oxygen XML Editor, the registration dialog box is displayed. If the registration dialog box is not displayed, go to Help > Register.
4. Select **Use a license key** as licensing method.

5. Paste your license key into the registration dialog box. The license key is composed of nine lines of text between two text markers.

6. Press **OK**.

### Registering a Floating License

How you register to use a floating license will depend on how floating licenses are managed in your organization.

- If the machines that share the pool of floating licenses are on multiple network segments, someone in your company will need to set up a license server. Consult that person to determine if they have set up a license server as a **TCP** or **HTTP** server as the registration process is different for each.

- If all the machines sharing a pool of floating licenses are on the same network segment, you will register your licence the same way you register a Named-User Licence. Oxygen XML Editor will use your connection to a local area network, without additional notice, to automatically connect to other running instances of Oxygen XML Editor. These connections may transmit your IP address to the local network.

  **Note:** [For System Administrators] Multiple running instances of Oxygen XML Editor communicate with each other using UDP broadcast on the 59153 port, to the 239.255.255.255 group.

  **Warning:** This mechanism was deprecated starting with version 17.0 and it is scheduled for removal in a future version. It is recommended to switch to the license server licensing mechanism.

### Request a Floating License from a TCP License Server

Use this procedure if your company uses an Oxygen XML Editor TCP license server and the license server has already been set up by your server administrator:

1. Contact your server administrator to get network address and login details for the license server.

2. Start Oxygen XML Editor.

3. Go to **Help > Register**.
The license registration dialog box is displayed.

4. Choose **Use a license server** as licensing method.
5. Select **TCP server** as server type.
6. In the **Host** field, enter the host name or IP address of the license server.
7. In the **Port** field, enter the port number used to communicate with the license server.
8. Click the **OK** button.

If a floating license is available, it is registered in Oxygen XML Editor. To display the license details, open the **About** dialog box from the **Help** menu. If a floating license is not available, you will get a message listing the users currently using floating licenses.

**Related tasks**

* Setting up a TCP Floating License Server Using a 32-bit Windows Installer* on page 37
  Setting up the TCP floating license server as a Windows process.
* Setting up a TCP Floating License Server Using All-Platforms Distribution* on page 39
  This installation method can be used for running the TCP license server on any platform where a Java virtual machine can run (OS X, Linux/Unix, Windows).

**Request a Floating License from an HTTP License Server**

Use this procedure if your company uses an Oxygen XML Editor HTTP license server and the license server has already been set up by your server administrator:

1. Contact your server administrator to get network address and login details for the license server.
2. Start Oxygen XML Editor.
3. Go to **Help > Register**.
   The license registration dialog box is displayed.
4. Choose **Use a license server** as licensing method.
5. Select **HTTP/HTTPS Server** as server type.
6. In the **URL** field, enter the address of the license server.
   The URL address has the following format:
   `http://hostName:port/oXygenLicenseServlet/license-servlet`
7. Complete the **User** and **Password** fields.
8. Click the **OK** button.

If a floating license is available, it is registered in Oxygen XML Editor. To display the license details, open the **About** dialog box from the **Help** menu. If a floating license is not available, you will get a message listing the users currently using floating licenses.

**Related information**

* Setting up an HTTP Floating License Server* on page 34

**Release a Floating License**

The floating license you are using will be released and returned to the pool if any of the following occur:

- The connection with the license server is lost.
- You exit the application running on your machine, and no other copies of Oxygen XML Editor running on your machine are using your floating license.
- You register a **Named User** license with your copy of Oxygen XML Editor, and no other copies of Oxygen XML Editor running on your machine are using your floating license.

To release a floating license on demand, follow these steps:

1. Go to **Help > Register**.
   The license registration dialog box is displayed.
2. The license key field should be empty (this is normal). If it is not empty, delete any text in the field.
3. Make sure the **Use a license key** option is selected.
4. Click **OK**.
   A dialog box is displayed asking if you want to reset your license key.

5. Select between:
   - **Use the last one** - Falls back to your previous license key. Use this option if you want to release a floating license and revert to a *Named User* license.
   - **Reset** - Removes your license key from your user account on the current computer.

   The **Reset** button erases all the licensing information. To complete the reset operation, close and restart Oxygen XML Editor.

**Register a Floating License for Multiple Users**

If you are an administrator registering floating licenses for multiple users, you can avoid having to open Oxygen XML Editor on each machine and configuring the registration details by using the following procedure:

1. Reset the registration details:
   a. Select **Register** from the **Help** menu.
   b. Click **OK** without entering any information in this dialog box.
   c. Click **Reset** and restart the application.

2. Register the license using one of the *floating license registration procedures*.
3. Copy the `license.xml` file from the Oxygen XML Editor *preferences directory* to the installation folder on each installation to be registered.

**Setting Up a Floating License Server**

**Installing a License Server to Manage Floating Licenses**

If you are using floating licenses for Oxygen XML Editor, you must set up an Oxygen XML Editor floating license server. A floating license server can be installed as one of the following:

- An **HTTP server**. This is the recommended method.
- A **TCP server** (deprecated).

**Note:** Oxygen XML Editor version 17 or higher requires a license server version 17 or higher. License servers version 17 or higher can be used with any version of a floating license key.

**Activating Floating License Keys**

To help you comply with the Oxygen XML Editor EULA (terms of licensing), all floating licenses require activation. This means that the license key will be locked to a particular license server deployment and no multiple uses of the same license key are possible.

During the activation process, a code that uniquely identifies your license server deployment is sent to the Oxygen XML Editor servers, which in turn will sign the license key.

**Split or Combine License Keys to Work with Your License Servers**

A license server can only manage one license key (which can cover any number of floating licenses). If you have multiple license keys for the same Oxygen XML Editor version and you want to have all of them managed by the same server, or if you have a multiple-user floating license and you want to split it between two or more license servers, please contact support@oxygenxml.com and ask for a new license key.
Setting up an HTTP Floating License Server

The Oxygen XML Editor license server is available in several distributions, tailored for covering a variety of deployment configurations:

- **Windows installer** - Easy-to-use Windows installation wizard. Requires elevated permissions to run it.
- **All-platform distribution** - Script-based deployment that does not require elevated permissions to run it. Provides scripts for Windows, Mac, and Linux.
- **Web Archive (WAR) distribution** - Provides more flexibility in your deployment configuration, but it requires an existing HTTP server (such as Apache Tomcat).

### Installation Steps for the HTTP License Server Installer Distribution for Windows

1. Download the HTTP license server installer from the *Oxygen XML Editor website*.
2. Run the installer and follow the on-screen instructions.
3. You need to configure two sets of credentials:
   - **Administrator credentials** - used for accessing the Oxygen XML Editor license server administrative interface. Optionally you can choose to change the standard 8080 port.
   - **Standard user credentials** - used by an Oxygen XML Editor application to connect to the license server.
4. Optionally you can choose to install the server as a Windows service. In this case, you can choose the name of the Windows service.

### Installation Steps for the HTTP License Server All-Platform Distribution

1. Download the HTTP license server all-platform archive from the *Oxygen XML Editor website*.
2. Unpack the archive.
3. Run the license server scripts suitable for your operating system (licenseServer.bat for Windows or licenseServer.sh for Linux and Mac).

   **Note:** To specify a different port (other than the default 8080), you can pass the new port number as an argument to the scripts (for example, licenseServer.bat 8082).

4. On the first run, you will be prompted to set two sets of credentials:
   - **Administrator credentials** - used for accessing the Oxygen XML Editor license server administrative interface.
   - **Standard user credentials** - used by an Oxygen XML Editor application to connect to the license server.

### Installation Steps for the HTTP License Server WAR Distribution

1. Make sure that Apache Tomcat 5.5 or higher is running on the machine you have selected to be the license server. To get it, go to *http://tomcat.apache.org*.
2. Download the HTTP license server Web ARchive (.war) from the Oxygen XML Editor website.

3. Configure two Tomcat users:
   a. One user with the role user, used by an Oxygen XML Editor application to connect to the license server. In the subsequent example, this user name is John.
   b. Another user with the roles admin and manager-gui, used for accessing the Oxygen XML Editor license server administrative interface and the Tomcat management interface. In the subsequent example, this user name is Mary.

A typical way to achieve this is to edit the tomcat-users.xml file from your Tomcat installation (if using a Tomcat zip/tar.gz distribution, by default this configuration file is found in the /TomcatInstallFolder/conf/ directory). After adding the two users, the configuration file might look like this:

```xml
<tomcat-users xmlns="http://tomcat.apache.org/xml"
    xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xsi:schemaLocation="http://tomcat.apache.org/xml tomcat-users.xsd"
    version="1.0">
    <!-- ... other user and role definitions ... -->
    <role rolename="user"/>
    <role rolename="admin"/>
    <role rolename="manager-gui"/>
    <user username="John" password="user_pass" roles="user"/>
    <user username="Mary" password="admin_pass" roles="admin,manager-gui"/>
</tomcat-users>
```

4. Go to the Tomcat Web Application Manager page and log-in with the user you configured with the manager-gui role (Mary in the example above). In the WAR file to deploy section, choose the WAR file and click the Deploy button. The oXygenLicenseServlet application is now up and running, but the license key is not yet registered.

5. Go to the oXygen license server administration page by clicking the oXygenLicenseServlet link in the manager page. You will need to authenticate with the user configured with the admin role (Mary in our example).

6. Activate the floating license key. This process involves binding your license key to your license server deployment. Once the process is completed you cannot activate the floating license with another license server. Follow these steps to activate the license:
   a. Access the HTTP license server by following the link provided by the Tomcat Web Application Manager page. If prompted for authentication, use the credentials configured for the admin or manager users.

    **Result:** A page is displayed that prompts for a license key.

   b. Paste your floating license key into the form and press Submit. The browser used in the activation process needs to have Internet access.

    **Result:** You will be redirected to an online form hosted on the Oxygen XML Editor website. This form is pre-filled with an activation code that uniquely identifies your license server deployment, and your license key.

    **Note:** If, for some reason, your browser does not take you to this activation form, refer to the Manual Activation Procedure.

   c. Press Activate.

    If the activation process is successfully completed, your license server is running. Follow the on-screen instructions to configure the Oxygen XML Editor client applications.

7. By default, the license server logs its activity in the TomcatInstallDir/logs/oxygenLicenseServlet.log file. To change the log file location, edit the log4j.appender.R2.File property from the TomcatInstallDir/webapps/oXygenLicenseServlet/WEB-INF/lib/log4j.properties configuration file.

**Manual License Activation Procedure**

1. Access the HTTP license server by following the link provided by the Tomcat Web Application Manager page. You will be taken to the license registration page.

2. Copy the license server activation code.

4. Paste the license server activation code and floating license key in the displayed form, then click Activate.

5. The activated license key is displayed on-screen. Copy the activated license key and paste it in the license registration page of the HTTP server.
Automatic Subscription Renewal

If the HTTP license server is configured with a subscription license, then the license server will automatically check to see if a new subscription license was purchased and will automatically download and install it for you.

⚠️ Important: This automatic checking procedure implies a connection to a web service located at oxygenxml.com. You can deactivate this automatic behavior by disabling the Automatically check for subscription renewal option from the main management page of the license server.

If the automatic renewal process fails, you can try either of the following possible solutions:

- If your server uses a proxy to connect to the Internet, go to the main management page of the license server and configure the proxy settings by clicking the Proxy settings link in the Management tasks section.
- Manually replace the floating license key.

Upgrading Your HTTP Floating License Server

The goal of the following procedure is to help you minimize the downtime when you upgrade the Oxygen XML Editor HTTP floating license server to its latest version.

Follow this procedure:

1. Access the license server by following the link provided by the Tomcat Web Application Manager page. If prompted for authentication, use the admin or manager credentials.
2. Click the View license key link and copy the displayed license key to a file for later use.
3. Go to the Tomcat Web Application Manager page, log in with the user you configured with the manager role, and Undeploy the floating license server.
4. Go to Oxygen XML Editor website and download the HTTP license server.
5. Deploy the downloaded license server.
6. Access the license server by following the link provided by the Tomcat Web Application Manager page. If prompted for authentication, use the credentials configured for the admin or manager users.
7. Paste the license key into the form and register it.

Replacing a Floating License Key in an HTTP Floating License Server

The following procedure assumes that your Oxygen XML Editor HTTP floating license server contains a previously activated license key and provides instructions for replacing it with another one. The goal of the procedure is to allow you to activate and configure the new license key without any downtime.

This is useful if, for instance, you want to upgrade your existing license to the latest version or if you receive a new license key that accommodates a different number of users.

To replace a floating license key that is activated on your HTTP floating license server with a new one, follow these steps:

1. Access the license server by following the link provided by the Tomcat Web Application Manager page.
2. Click the Replace license key link. This will open a page that contains details about the license currently in use.
3. Click the Yes button to begin the replacement procedure.
4. Paste the new floating license key in the displayed form, then click Submit. The browser used in the process needs to have Internet access.

You will be redirected to an online form hosted on the Oxygen XML Editor website. This form is pre-filled with an activation code that uniquely identifies your license server deployment and your license key.

⚠️ Note: If for some reason your browser does not take you to this activation form, refer to the Manual Activation Procedure.

5. Press Activate.

If the activation process is completed successfully, your license server is now running using the new license key. You can click View license key to inspect the key currently used by the license server.
Getting More Information From the Report Page

You can access a license server activity report at http://hostName:port/oXygenLicenseServlet/license-servlet/report.

It displays the following real time information:

- **License load** - A graphical indicator that shows how many licenses are available. When the indicator turns red, there are no more licenses available.

- **Floating license server status** - General information about the license server status, including the following information:
  - server start time
  - license count
  - rejected and acknowledged requests
  - average usage time
  - license refresh and timeout intervals
  - location of the license key
  - server version

- **License key information** - License key data, including the following information:
  - licensed product
  - registration name
  - company name
  - license category
  - number of floating users
  - Maintenance Pack validity

- **Current license usage** - Lists all currently acknowledged users, including the following information:
  - user name
  - date and time when the license was granted
  - name and IP address of the computer where Oxygen XML Editor runs
  - MAC address of the computer where Oxygen XML Editor runs

*Note:* The report is also available in XML format at http://hostName:port/oXygenLicenseServlet/license-servlet/report-xml.

Setting up a TCP Floating License Server Using a 32-bit Windows Installer

Setting up the TCP floating license server as a Windows process.

**Figure 12:** TCP Floating License Server (Process in Windows)

**Installation Steps**

1. Download the license server installation kit for Windows from the [Oxygen XML Editor website](http://example.com).
2. Run the downloaded installer and follow the on-screen instructions.
By default, the installer installs the license server as a Windows service. Optionally, you have the ability to start the Windows service automatically at Windows startup or create shortcuts on the Start menu for starting and stopping the Windows service manually. If you want to manually install, start, stop, or uninstall the server as a Windows service, run the following scripts from a command line as an Administrator:

- `installWindowsService.bat [serviceName]` - Installs the server as a Windows service with the name `serviceName`. The parameters for the license key folder and the server port can be set in the `oXygenLicenseServer.vmoptions` file.
- `startWindowsService.bat [serviceName]` - Starts the Windows service.
- `stopWindowsService.bat [serviceName]` - Stops the Windows service.
- `uninstallWindowsService.bat [serviceName]` - Uninstalls the Windows service.

**Note:** If you do not provide the `serviceName` argument, the default name `oXygenLicenseServer` is used.

If the license server is installed as a Windows service, the output and error messages are automatically redirected to the following log files that are created in the install folder:

- `outLicenseServer.log` - Standard output stream of the server.
- `errLicenseServer.log` - Standard error stream of the server.

3. Manually add the `oXygenLicenseServer.exe` file in the Windows Firewall list of exceptions. Go to Control Panel > System and Security > Windows Firewall > Allow a program or feature through Windows Firewall > Allow another program and browse for `oXygenLicenseServer.exe` from the Oxygen XML Editor License Server installation folder.

4. Floating licenses require activation prior to use. More details are available either on-screen (if the license server is started in a command line interface) or in the `outLicenseServer.log` log file.

**Note:** A license server can only manage one license key (which can cover any number of floating licenses). If you have multiple license keys for the same Oxygen XML Editor version and you want to have all of them managed by the same server, or if you have a multiple-user floating license and you want to split it between two or more license servers, please contact support@oxygenxml.com and ask for a new license key.

**Upgrading Your TCP Floating License Server**

The goal of the following procedure is to help you minimize the downtime generated when you upgrade the Oxygen XML Editor floating license server to its newest version.

Follow this procedure:

1. Go to the Oxygen XML Editor website and download the latest floating license server.
2. Run the installation kit.
3. Leave the default Update the existing installation option enabled. This will ensure that some options set in the previous version (namely the installation folder, port number, and the floating license key in use) of the license server will be preserved.
4. Follow the on-screen instructions to complete the installation process.

**Replacing a Floating License Key in a TCP Floating License Server**

The following procedure assumes that your Oxygen XML Editor TCP floating license server contains a previously activated license key and provides instructions for replacing the activated license key with another one. The goal of the procedure is to minimize the license server downtime during the activation step of the new license key.

This is useful if, for instance, you want to upgrade your existing license to the latest version or if you receive a new license key that accommodates a different number of users.

To replace a floating license key that is activated on your floating license server with a new one, follow these steps:

1. Stop the service that runs the floating license server.
2. Locate the folder that holds the previous activated license key (by default, it is named license and it is located in the installation directory of the license server).
3. Remove the `license.txt` file and try to restart the server. Since the file that stores the license key is missing, the server will fail to start.
4. Find the license activation procedure in the on-screen instructions (if the license server is started in a command line interface) or in the `outLicenseServer.log` log file.
5. After you copy the activated license key in the license.txt file, restart the license server.

**Common Problems**

This section includes some common problems that may appear when setting up a TCP floating license server.

**Windows Service Reports 'Incorrect Function When Started'**

The "Incorrect Function" error message when starting the Windows service usually appears because the Windows service launcher cannot locate a Java virtual machine on your system.

Make sure that you have installed a 32-bit Java SE from Oracle (or Sun) on the system:

**Windows Service Reports 'Error 1067: Process Terminated Unexpectedly'**

This error message appears if the Windows service launcher quits immediately after being started.

This problem usually happens because the license key has not been correctly deployed (license.txt file in the license folder). For more information, see the Setting up a Floating License Server section.

**Setting up a TCP Floating License Server Using All-Platforms Distribution**

This installation method can be used for running the TCP license server on any platform where a Java virtual machine can run (OS X, Linux/Unix, Windows).

![Figure 13: TCP Floating License Server (All-Platforms Distribution)](image)

**Installation Steps**

1. Ensure that a Java runtime version 6 or later is installed on the server machine.
2. Download the license server installation kit for your platform from the Oxygen XML Editor website.
3. Unzip the installation kit into a new folder.
4. Start the server using the startup script from a command line console.

   The startup script is called licenseServer.sh for OS X and Unix/Linux or licenseServer.bat for Windows. The following parameters are accepted:
   - licenseDir - The path of the directory where the license files will be placed. The default value is license.
   - port - The TCP port number used to communicate with Oxygen XML Editor instances. The default value is 12346.

   The following is an example of the command line for starting the license server on Unix/Linux and OS X:

   ```
   sh licenseServer.sh myLicenseDir 54321
   ```

5. Floating licenses require activation prior to use. Follow the on-screen instruction to complete the license activation process.

**Upgrading Your TCP Floating License Server**

The goal of the following procedure is to help you minimize the downtime generated when you upgrade the Oxygen XML Editor TCP floating license server to its newest version.

Follow this procedure:
1. Stop the current license server process.
2. Locate and open the floating server startup script. It should look like this:

   ```bash
   sh licenseServer.sh pathToLicenseDir 54321
   ```
3. Make a note of the path to the license directory (in our example is `pathToLicenseDir`) and the port number (in our example is `54321`).
4. Go to the license directory and copy the license key file (`license.txt`) for later use.
5. Go to the Oxygen XML Editor website and download the *all-platforms floating license server installation kit*.
6. Unzip the archive and overwrite the content of your current floating license server installation.
7. Copy the license key file (`license.txt`) saved in step 4 to `license` directory of the floating license server installation.
8. Edit the floating server startup script and configure with the info you made note of in step 3.
9. Start the floating license server process.

**Replacing a Floating License Key in a TCP Floating License Server**

The following procedure assumes that your Oxygen XML Editor TCP floating license server contains a previously *activated license key* and provides instructions for replacing the activated license key with another one. The goal of the procedure is to minimize the HTTP license server downtime during the activation step of the new license key.

This is useful if, for instance, you want to upgrade your existing license to the latest version or if you receive a new license key *that accommodates a different number of users*.

To replace a floating license key that is activated on your floating license server with a new one, follow these steps:

1. Stop the process that runs the floating license server.
2. Locate the folder that holds the previous activated license key (by default, it is named `license` and it is located in the installation directory of the license server).
3. Remove the `license.txt` file and try to restart the server. Since the file that stores the license key is missing, the server will fail to start.
4. Find the license activation procedure in the on-screen instructions.
5. After you copy the activated license key in the `license.txt` file, restart the license server.

---

**Transferring a License Key**

If you want to transfer your Oxygen XML Editor license key to another computer (for example, if you are disposing of your old computer or transferring it to another person), you must first unregister your license. You can then *register your license* on the new computer in the normal way.

1. Go to `Help > Register`.
   The license registration dialog box is displayed.
2. The license key field should be empty (this is normal). If it is not empty, delete any text in the field.
3. Make sure the *Use a license key* option is selected.
4. Click `OK`.
   A dialog box is displayed asking if you want to reset your license key.
5. Select between:
   - *Use the last one* - Falls back to your previous license key, if applicable.
   - *Reset* - Removes your license key from your user account on the current computer.

The `Reset` button erases all the licensing information. To complete the reset operation, close and restart Oxygen XML Editor.

---

**Upgrading Oxygen XML Editor**

From time to time, upgrade and patch versions of Oxygen XML Editor are released to provide enhancements that fix problems, and add new features.
Checking for New Versions of Oxygen XML Editor

Oxygen XML Editor checks for new versions automatically at start up. To disable this check, open the Preferences dialog box (Options > Preferences), go to Global, and uncheck Automatic Version Checking.

To check for new versions manually, go to Help > Check for New Versions.

What is Preserved During an Upgrade?

When you install a new version of Oxygen XML Editor, some data is preserved and some is overwritten. If there is a previous version of Oxygen XML Editor already installed on your computer, it can coexist with the new one, which means you do not have to uninstall it.

If you install over a previously installed version:
- All the files from its install directory will be removed, including any modification in document type (framework) files, XSLT stylesheets, XML catalogs, and templates.
- All global user preferences are preserved in the new version.
- All project preferences will be preserved in their project files.
- Any custom frameworks that were stored outside the installation directory (as configured in Document type associations > Locations) will be preserved and will be found by the new installation.

If you install in a new directory:
- All the files from the old install directory will be preserved, including any modification in document type (framework) files, XSLT stylesheets, XML catalogs, and templates. However, these modifications will not be automatically imported into the new installation.
- All global user preferences are preserved in the new version.
- All project preferences will be preserved in their project files.
- Any custom frameworks that were stored outside the installation directory (as configured in Document type associations > Locations) will be preserved and will be found by the new installation.

Upgrading the Standalone Application

1. Upgrading to a new version might require a new license key. To check if your license key is compatible with the new version, select Help > Check for New Version. Note that the application needs an Internet connection to check the license compatibility.
2. Download and install the new version according to the instructions for your platform and the type of installer you selected.
3. If you installed from an archive (as opposed to an executable installer) you may have to update any shortcuts you have created or modify the system PATH to point to the new installation folder.
4. Start Oxygen XML Editor.
5. If you require an new license for your upgrade, install it now according to the procedure for your platform and the type of installer you selected.

Installing and Updating Add-ons in Oxygen XML Editor

Oxygen XML Editor provides an add-on mechanism that can automatically discover and install frameworks and plugins from a remote location.

Note: Frameworks that you install through the add-ons system are read-only.

Installing Add-ons

To install a new add-on, follow these steps:
1. Go to Help > Install new add-ons.
2. In the displayed dialog box, fill-in the Show add-ons from with the update site that hosts add-ons. If you want to see all Oxygen XML Editor default add-ons, choose the ALL AVAILABLE SITES option from the Show add-ons from drop down. The add-ons list contains the name, status, update version, Oxygen XML Editor version, and the type of the add-on (either framework, or plugin). A short description of each add-on is presented under the add-ons list.
Note: To see all the add-ons from the remote update site, disable Show only compatible add-ons and Show only the latest version of the add-ons. Incompatible add-ons are shown only to acknowledge their presence on the remote update site. You cannot install an incompatible add-on.

3. By default, only the latest versions of the add-ons that are compatible with the current version of Oxygen XML Editor are displayed.
4. Choose the add-ons you want to install, press the Next button, then follow the on-screen instructions.

Note: Accepting the license agreement of the add-on is a mandatory step in the installation process.

Note: All add-ons are installed in the extensions directory inside the Oxygen XML Editor preferences directory.

Managing installed add-ons

To manage the installed add-ons, follow these steps:

1. Go to Help > Manage add-ons
2. The displayed dialog box presents a list of the available updates (compatible with the current version of Oxygen XML Editor) and with the already installed updates. Under the updates list, Oxygen XML Editor presents a short description of each update.
3. Check for box for a specific add-on, then press Update to update it (or Uninstall to remove it). If there is a newer version of the add-on available, Oxygen XML Editor will download the package and install it. Follow the on-screen instructions to complete the installation process.

Note: Accepting the license agreement of the add-on is a mandatory step in the installation process.

Checking for add-on updates

To check if there are available updates for the installed add-ons, go to Help > Check for add-ons updates. This action only displays updates that are compatible with the current Oxygen XML Editor version.

To watch a video demonstration about the add-ons support in Oxygen XML Editor, go to https://www.oxygenxml.com/demo/AddonsSupport.html.

Related information

Packing and Deploying Plugins or Frameworks as Add-ons on page 1141

Uninstalling Oxygen XML Editor

Uninstalling the Oxygen XML Editor Standalone

CAUTION: The following procedure will remove Oxygen XML Editor from your system. All data stored in the installation directory will be removed, including any customizations or any other data you have stored within that directory. Make a back up of any data you want to keep before uninstalling Oxygen XML Editor.

1. Backup any data you want to keep from the Oxygen XML Editor installation folder.
2. Remove the application.
   - On Windows use the appropriate uninstaller shortcut provided with your OS.
   - On OS X and Unix manually delete the installation folder and all its contents.
3. If you want to remove the user preferences:
   - On Windows Vista/7/8/10, remove the directory: %APPDATA%\Roaming\com.oxygenxml (usually %APPDATA% has the value: [user-home-dir]\Application Data). Note that this directory is hidden.
   - On Windows XP, remove the directory: %APPDATA%\com.oxygenxml (usually %APPDATA% has the value: [user-home-dir]\Application Data).
   - On Linux, remove the directory: .com.oxygenxml from the user home directory.
- On OS X, remove the directory: Library/Preferences/com.oxygenxml of the user home folder.

**Unattended Uninstall**

The unattended uninstall procedure is available only on Windows and Linux.

Run the uninstaller executable from command line with the -q parameter.

The uninstaller executable is called `uninstall.exe` on Windows and `uninstall` on Linux and is located in the application's install folder.

**Oxygen XML Editor Installer Command Line Reference**

The Oxygen XML Editor installers for Windows and Linux creates a file called `response.varfile`, which records the choices that the user made when running the installer interactively. You can use a `response.varfile` to set the options for an unintended install. Here is an example of a `response.varfile`:

```
#install4j response file for Oxygen XML Editor 18.0
#Fri Jul 18 21:52:15 EDT 2014
sys.adminRights$Boolean=true
sys.programGroupDisabled$Boolean=true
autoVersionChecking=true
sys.fileAssociation.launchers$StringArray="19","19","19","19","19","19",
   "19","19","19","19","19","19","19","19","19",
   "19","19","19","19","19","19",
sys.programGroupAllUsers$Boolean=true
reportProblem=true
downloadResources=true
sys.languageId=en
sys.installationDir=C:\\Program Files (x86)\\Oxygen XML Editor 18
createQuicklaunchIconAction$Boolean=true
sys.programGroupName=Oxygen XML Editor 18.0
executeLauncherAction$Boolean=true
sys.fileAssociation.extensions$StringArray="xml","dita","ditamap","ditaval",
   "xsl","xslt","xspec","xsd","rng","sch","ddc","ent","nvdl","ifo",
   "wsdl","xquery","xq","xqm","xpl","css","json","xpr"
```

The following table describes some of the settings that can be used in the `response.varfile`:

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>autoVersionChecking</code></td>
<td>Automatic version checking.</td>
<td><code>true/false</code>. Default setting is true.</td>
</tr>
<tr>
<td><code>reportProblem</code></td>
<td>Allows you to report a problem encountered while using Oxygen XML Editor.</td>
<td><code>true/false</code>. Default setting is true.</td>
</tr>
<tr>
<td><code>downloadResources</code></td>
<td>Allows Oxygen XML Editor to download resources (links to video demonstrations, webinars and upcoming events) from <a href="https://www.oxygenxml.com">https://www.oxygenxml.com</a> to populate the application welcome screen.</td>
<td><code>true/false</code>. Default setting is true.</td>
</tr>
</tbody>
</table>

The Oxygen XML Editor installation uses the install4j installer. A description of the `response.varfile` format can be found on the install4j site.

**Command line parameters**

The Oxygen XML Editor installer supports the following command line parameters:
<table>
<thead>
<tr>
<th>Option</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>-q</code></td>
<td>Run the installer in unattended mode. The installer will not prompt the user for input during the install. Default settings will be used for all options unless a response.varfile is specified using the <code>-varfile</code> option or individual settings are specified using - on Windows: oxygen.exe -q - on Linux: oxygen.sh -q</td>
</tr>
<tr>
<td><code>-overwrite</code></td>
<td>In unattended mode, the installer does not overwrite files with the same name if a previous version of the Oxygen XML Editor is installed in the same folder. The <code>-overwrite</code> parameter added after the <code>-q</code> parameter forces the overwriting of these files. - on Windows: oxygen.exe -q -overwrite - on Linux: oxygen.sh -q -overwrite</td>
</tr>
<tr>
<td><code>-console</code></td>
<td>To display a console for the unattended installation, add a <code>-console</code> parameter to the command line. - on Windows: start /wait oxygen.exe -q -console - Note: The use of start /wait on Windows is required to make the installer run in the foreground. It you run it without start /wait, it will run in the background. - on Linux: oxygen.sh -q -console</td>
</tr>
<tr>
<td><code>-varfile</code></td>
<td>Points to the location of a response.varfile to be used during an unattended installation. For example: - on Windows: oxygen.exe -q -varfile response.varfile - on Linux: oxygen.sh -q -varfile response.varfile</td>
</tr>
<tr>
<td><code>-V</code></td>
<td>Is used to define a variable to be used by an unattended installation. For example: - on Windows: oxygen.exe -q -VusageDataCollector=false - on Linux: oxygen.sh -q -VusageDataCollector=false</td>
</tr>
</tbody>
</table>

The Oxygen XML Editor installation uses the install4j installer. A full list of the command line parameters supported by the install4j installer can be found on the install4j site.
Chapter 4

Configuring Oxygen XML Editor

Topics:
- Preferences
- Configuring Options
- Associating a File Extension with Oxygen XML Editor
- Configuring the Layout of the Views and Editors
- Configure Toolbars
- Scenarios Management
- Editor Variables
- Custom System Properties
- Localizing the User Interface
- Setting a Java Virtual Machine Parameter when Launching Oxygen XML Editor

This chapter presents all the user preferences and options that allow you to configure various features and aspects of the application itself. It also includes information about storing and sharing options, importing and exporting options or scenarios, customizing system properties, setting startup parameters, and the editor variables that are available for customizing user-defined commands.
Preferences

You can configure Oxygen XML Editor options using the Preferences dialog box.

To open the preferences dialog box, go to Options > Preferences.

You can select the preference page you are interested in from the tree on the left of the Preferences dialog box. You can filter the tree by using the filter text box and the following buttons are available to the right of the text box:

- Expand All - Expands the structure of the tree to show all preference pages.
- Collapse All - Collapses the structure of the tree to show only the 1st level preference pages.
- Project-Level Options Only - If toggled on, it filters the tree to only show the preference pages that are saved at project level.

Figure 14: Preferences Dialog Box

Press F1 or F1 for help on any preferences page.

Some preference pages include a option to control how the options are stored, either as Global Options or Project Options.

Figure 15: Controlling the Storage of the Preferences

You can restore options to their default values by pressing the Restore Defaults button, available in each preferences page.
Preferences Directory Location

A variety of resources (such as global options, license information, and history files) are stored in a preferences directory (com.oxygenxml) that is in the following locations:

- **Windows (Vista, 7, 8, 10)** - \[user_home_directory]\AppData\Roaming\com.oxygenxml
- **Windows XP** - \[user_home_directory]\Application Data\com.oxygenxml
- **Mac OS X** - \[user_home_directory]/Library/Preferences/com.oxygenxml
- **Linux/Unix** - \[user_home_directory]/.com.oxygenxml

Global Preferences

The global options cover a number of aspects of the overall operation of Oxygen XML Editor. To configure the Global options, open the Preferences dialog box (Options > Preferences) and go to Global.

The following options are available in the Global preferences page:

**Automatic Version Checking**

If this option is enabled, Oxygen XML Editor will check for a new version on startup.

**Check for notifications**

If enabled, the application will check for various types of messages from the Oxygen XML Editor website and they will be displayed in the status bar. The types of messages include the addition of new videos on the website, the announcement of upcoming webinars and conferences where the Oxygen XML Editor team will participate, and more. This option is enabled by default.

**Language**

This option specifies the language used in the user interface. You can choose between English, French, German, Dutch, or Japanese. You must restart Oxygen XML Editor for the change to take effect.

**Other language**

This option sets the language used in the user interface using an interface localization file. For details about creating this file, see Localizing the User Interface on page 167. You can use this option to set the language of the user interface to a language that is not shipped with Oxygen XML Editor.

**Line separator**

This option sets the line separator used when saving files. Use System Default to select the normal line separator for your OS. If you want the existing file separator of a file to be maintained, regardless of your current OS, check Detect the line separator on file open.

**Detect the line separator on file open**

When this option is selected, the editor detects the line separator when a file is loaded and it uses it when the file is saved. New files are saved using the line separator defined by the Line separator option.

**Default Internet browser**

This option sets the Web browser that Oxygen XML Editor will use to do the following:

- Open (X)HTML or PDF transformation results.
- Open a web page (for example, pointing to specific paragraphs in the W3C recommendation of XML Schema if there are XML Schema validation errors).

If you leave this setting blank, the system default browser will be used.

**Open last edited files from project**

When this option is enabled, Oxygen XML Editor opens the files you had open the last time you used a project whenever you open the application or switch to that project.

**Beep on operation finished**

When this option is selected, Oxygen XML Editor beeps when a validation or transform action ends. Different tones are used for success and failure. The tones used may depend on the sound settings in your operating system.
Show memory status
When this option is selected, the memory Oxygen XML Editor uses is displayed in the status bar. To free memory, click the `Free unused memory` button located at the right side of the status bar. The memory status bar turns yellow or red when Oxygen XML Editor uses too much memory. You can change the amount of memory available to Oxygen XML Editor by changing the parameters of the application launcher.

Check opened files for file system changes
When this option is selected, Oxygen XML Editor checks the content of the all opened editors to see if they have been updated by another application. If the file has changed, Oxygen XML Editor will ask you if you want to reload the file.

Auto update unmodified editors on file system changes
If this option is selected, Oxygen XML Editor automatically updates unmodified editors if the edited file changes externally.

Show Java vendor warning at startup
If this option is selected, Oxygen XML Editor displays a warning on startup if a non-recommended version of the Java virtual machine is being used.

File Chooser Dialog
This options specifies the directory that will be shown when the `Open file dialog box` is displayed. You can choose between:

- Last visited directory - The last visited folder will be displayed.
- Directory of the edited file - The folder where the currently edited file is stored will be displayed.

Show hidden files and directories
If this option is selected, Oxygen XML Editor shows system hidden files and folders in the file browser dialog box and the folder browser dialog box. This setting is not available on OS X.

Appearance Preferences
This preferences page contains various options that allow you to change the appearance of the user interface of Oxygen XML Editor. To configure the Appearance options, open the Preferences dialog box (`Options > Preferences`) and go to Appearance.

The following options are available in the Appearance preferences page:

Look and Feel
This option allows you to change the graphic style (look and feel) of the user interface. Depending on the operating system, you can choose between various predefined style options.

Theme
This option allows you to choose predefined color themes that will be applied over the entire user interface. You can select between the following:

- **Light** (default theme in Windows)
- **Classic** (default theme in MAC OS)

Note: In Windows, if a high contrast theme is detected and the Theme option is set to Classic and the Look and Feel option is set to Default or Windows, Oxygen XML Editor inherits the high contrast theme colors that are set in the operating system.

- Graphite
- Ultramarine

You can also change various appearance related options in other preference pages for the selected theme by clicking on the various links in this section.

Custom Themes
You can also create custom themes to share with others or use in other installations of Oxygen XML Editor. To create a custom theme, follow these steps:

1. Select a Theme to use as a base.
2. Configure the desired options in any of the option pages listed in this preferences page.
3. Click **Export** and specify a name for your custom theme. If you save the theme to the default file path, your custom theme will immediately appear in the **Theme** drop-down list. Otherwise, if you save it to another location, you can use the **Import** button to make it appear in the drop-down list.

   **Note:** In OS X (starting with Yosemite), if you choose **Graphite** for the **Theme**, it is recommended that you enable the *Use dark menu and Dock* option that is found in **System Preferences > General**.

**Theme preview area**

Displays a preview of the current **Theme selection** (available for predefined color themes).

**Theme management section**

- **Reset**
  - Resets the theme to its default values (this option is available when the theme is modified).
- **Rename**
  - Changes the name of the theme (not available for default or predefined themes).
- **Delete**
  - Removes the selected theme (not available for default or predefined themes).
- **Import**
  - Allows you to import a color theme from an XML theme file. You can use this option to load an exported custom theme.
- **Export**
  - Allows you to export the current color theme into an XML theme file that can then be shared with others or imported into another installation of Oxygen XML Editor.

**Configure icon saturation and brightness link**

This link is available if you are using a dark theme (such as **Graphite** or **Ultramarine**). It opens a dialog box that allows you to configure the saturation and brightness for all the icons in Oxygen XML Editor.

![](image)

**Figure 16: Configure Icon Saturation and Brightness Dialog Box**

**Colors Preferences**

Oxygen XML Editor allows you configure the colors for frames, dialog boxes, controls, and commands. To configure the **Colors**, open the **Preferences** dialog box (**Options > Preferences**) and go to **Appearance > Colors**.

Clicking the color button for any of the options opens a Choose color dialog box. It includes several tabs that allow you to configure the color in numerous ways. This page allows you to select and configure the color for the following:

**Background Colors**

- **Background**
  - Background color for various general user interface items.
Components background
Background color for various components (such as text fields, views, tables, and dialog boxes).

Components selection background
Background color for the current selections in certain components, such as some views and panes.

Components inactive selection background
Background color for a selection in a view that is not the current focus.

Menus, toolbars and frame background
Background color for specific components such as menus, toolbars, and the application frame.

Menus and toolbars selection background
(This option is not available for Mac OS) Background color for menu selections and toolbar buttons.

View titles background
Background color for the titles of view and tabs.

Status bar background
Background color of the status bar at the bottom of the editor.

Foreground Colors

Foreground
Foreground color for various general user interface items.

Component selection foreground
Foreground color for the current selection.

Disabled foreground
Foreground color for various components that are not the current focus (such as views other than the currently selected one).

Link foreground
Foreground color for links in views and dialog boxes.

View titles foreground
Foreground color for the title bar of views.

Status bar foreground
Foreground color for the text in the status bar at the bottom of the editor.

Other Colors

Borders and table grids
Color for certain borders and table grid lines.

Text component border
Color for the borders of text fields and drop-down lists.

View/Editor tabs border
Color for the borders of views and tabs.

Scroll bars, chevrons
Color for scroll bars (navigation bars) and chevrons (button to expand a non-visible area).

Separator
Color for the separators in toolbars, menus, and dialog boxes.

Note: You must restart the application for your changes to be applied.

Fonts Preferences

Oxygen XML Editor allows you to choose the fonts to be used in the Text, Design, and Grid editor modes, and fonts for the Author mode that are not specified in the associated CSS stylesheet. To configure the font options, open the Preferences dialog box (Options > Preferences) and go to Appearance > Fonts.

The following options are available:
Editor

Allows you to choose the font that will be used in the editor.

Note: On Mac OS X, the default font, Monaco, cannot be rendered in bold.

Author mode default font

This option allows you to choose the default font that will be used in Author mode. The default font will be overridden by the fonts specified in any CSS file associated with the opened document.

Schema default font

This option allows you to choose the font to be used in:

• The Design mode of the XML Schema editor.
• Images with schema diagram fragments that are included in the HTML documentation generated from an XML Schema.

Text antialiasing

This option allows you to set the text anti-aliasing behavior:

• Default - Allows the application to use the setting of the operating system, if available.
• On - Sets the text anti-aliasing to pixel level.
• Off - Disables text anti-aliasing.
• Sub-pixel anti-aliasing modes, such as GASP, LCD_HRGB, LCD_HBGR, LCD_VRGB, and LCD_VBGR.

Text components

This option allows you to choose the font to be used in text boxes within the interface.

GUI

This option allows you to choose the font to be used for user interface labels.

View titles font

This option allows you to choose the font to be used in the titles of the various views that are opened within the interface.

Note: You must restart the application for your changes to be applied.

Related information

Changing the Font Size in the Editor on page 278

Application Layout Preferences

Oxygen XML Editor offers various perspectives and views that you can arrange in a variety of layouts to suit your needs.

To configure the application layout options, open the Preferences dialog box (Options > Preferences) and go to Application Layout. The following options are available:

Select application layout

You can choose between the following three layouts:

• Default - Uses the default layout for all perspectives. Any modification of this layout (such as closing views, displaying views, or a new view arrangement) is saved on exit and reloaded at start-up.
• Predefined - Allows you to choose one of the predefined layouts:
  • Advanced - All views are displayed.
  • Author - An authoring-oriented layout that displays views such as Project, Archive Browser, DITA Maps Manager, Outline, Attributes, Model, and Elements.
  • Basic - Only the Project view and the Outline view are visible. Recommended when you edit XML content and you need maximum screen space.
  • Schema development - The Project, Component Dependencies, Resource Hierarchy/Dependencies, Outline, Palette, and Attributes views are displayed.
  • XQuery development - The Project, Outline, Transformation Scenarios, XSLT/XQuery input views are displayed.
  • XSLT development - The Project, Component Dependencies, Resource Hierarchy/Dependencies, Outline, Attributes, Model, XSLT/XQuery input, XPath Builder, and Transformation Scenarios views are displayed.
• **Custom** - Allows you to specify a custom layout to be used. You can save your preferred layout using **Window > Export Layout**, then enter the location of the saved layout file in this setting.

**Reset layout at startup**

When this option is enabled, Oxygen XML Editor forgets any changes made to the layout during a session and reloads the default layout the next time it is started. This is useful when you want to keep a fixed layout from one session to another.

**Remember layout changes for each project**

When this option is enabled, Oxygen XML Editor saves layouts individually for each project. When you switch projects, the layout you last used for that project is loaded automatically.

**Allow detaching of editors from main window**

When this option is enabled, you can drag and drop an editor window outside of the main screen. This is useful especially when you are using two monitors and you want to view files side by side.

> **Note:** If the main screen is maximized, you cannot drag and drop an editor outside of it.

**View tab placement**

Specifies whether the **View** tabs are located at the top or bottom of the window.

**Editor tab placement**

Specifies whether the **Editor** tabs are located at the top or bottom of the window.

The changes you make to any layout are preserved between working sessions. The predefined **layout** files are saved in the **preferences** directory of Oxygen XML Editor.

To watch our video demonstration about configuring the user interface of Oxygen XML Editor, go to [https://www.oxygenxml.com/demo/Dockable_Views.html](https://www.oxygenxml.com/demo/Dockable_Views.html).

### Add-ons Preferences

You can use add-ons to enhance the functionality of Oxygen XML Editor. To configure the **Add-ons** options, open the **Preferences dialog box (Options > Preferences)** and go to **Add-ons**.

The following options are available in this preferences page:

**Enable automatic updates checking**

When this option is selected, Oxygen XML Editor will automatically search for available updates.

**Add-on Sites URLs**

This is a list of the URLs for the add-on sites. You can add, edit, and delete sites in this list by using the buttons below the list.

### Document Type Association Preferences

Oxygen XML Editor uses document type associations to associate a **document type** with a set of functionality provided by a framework. To configure the **Document Type Association** options, open the **Preferences dialog box (Options > Preferences)** and go to **Document Type Association**.

The following actions are available in this preferences page:

**Discover more frameworks by using add-ons update sites**

Click on this link to specify URLs for framework add-on update sites.

**Document Type Table**

This table presents the currently defined document type associations (frameworks), sorted by priority and alphabetically. Each edited document type has a set of association rules (used by the application to detect the proper document type association to use for an opened XML document). A rule is described by:

- **Namespace** - Specifies the namespace of the root element from the association rules set (* (any) by default). If you want to apply the rule only when the root element has no namespace, leave this field empty (remove the **ANY_VALUE** string).
- **Root local name** - Specifies the local name of the root element (* (any) by default).
- **File name** - Specifies the name of the file (* (any) by default).
- **Public ID** - Represents the Public ID of the matched document.
• **Java class** - Presents the name of the Java class, which is used to determine if a document matches the rule. This Java class should implement the ro.sync.ecss.extensions.api.DocumentTypeCustomRuleMatcher interface.

**New**

Opens a *Document type configuration dialog box* that allows you to add a new association.

**Edit**

Opens a *Document type configuration dialog box* that allows you to edit an existing association.

**Note:** If you try to edit an existing association type when you do not have write permissions to its store location, a dialog box will be shown asking if you want to extend the document type.

**Duplicate**

Opens a *Document type configuration dialog box* that allows you to duplicate the configuration of an existing document type association. This will create a snapshot of the framework in its current form. It is merely a copy of the document type and will not *evolve* along with the base document type like the *Extend* action does.

**Extend**

Opens a *Document type configuration dialog box* that allows you to extend an existing document type. You can add or remove functionality starting from a base document type. All of these changes will be saved as a patch. When the base document type is modified and evolves (for example, from one application version to another) the extension will evolve along with the base document type, allowing it to use the new actions added in the base document type.

**Delete**

Deletes the selected document type associations.

**Enable DTD/XML Schema processing in document type detection**

When this option is enabled (default value), the matching process also examines the DTD/XML Schema associated with the document. For example, the fixed attributes declared in the DTD for the root element are also analyzed, if this is specified in the association rules. This is especially useful if you are writing DITA customizations. DITA topics and maps are also matched by looking for the DITAArchVersion attribute of the root element. This attribute is specified as default in the DTD and it is detected in the root element, helping Oxygen XML Editor to correctly match the DITA customization.

**Only for local DTDs/XML Schemas**

When this option is enabled (default value), only the local DTDs / XML Schemas will be processed.

**Enable DTD/XML Schema caching**

When this option is enabled (default value), the associated DTDs or XML Schema are cached when parsed for the first time, improving performance when opening new documents with similar schema associations.

**Related information**

*Extending and Sharing a Document Type (Framework)* on page 1181

**Locations Preferences**

Oxygen XML Editor allows you to change the location where *document types (frameworks)* are stored, and to specify additional framework directories. The *Locations* preferences page allows you to specify the main *frameworks* folder location. You can choose between the *Default* directory ([OXYGEN_INSTALL_DIR]/frameworks) or a *Custom* specified directory. You can also change the current frameworks folder location value using the com.oxygenxml.editor.frameworks.url system property set in either the .vmoptions configuration files or in the startup scripts.

A list of additional *frameworks* directories can also be specified. The application will look in each of those folders for additional document type configurations to load. Use the *Add*, *Edit* and *Delete* buttons to manage the list of folders.

A document type (configuration) can be loaded from the following locations:

- Internal preferences - The document type configuration is stored in the application *Internal preferences*.
- Additional frameworks directories - The document type configuration is loaded from one of the specified *Additional frameworks directories* list.
- Add-ons - An add-on can contribute a framework. You can manage the add-ons locations in the *Add-ons preferences page*.
- The frameworks folder - The main folder containing framework configurations.
All loaded document type configurations are first sorted by priority, then by document type name and then by load location (in the exact order specified above). When an XML document is opened, the application chooses the first document type configuration from the sorted list that matches the specific document.

All loaded document type configurations are first sorted by priority, then by document type.

**Document Type Configuration Dialog Box**

The Document type configuration dialog box allows you to create or edit a Document Type Association (framework). It is displayed when you use the New, Edit, Duplicate, or Extend buttons in the Document Type Association preferences page (open the Preferences dialog box (Options > Preferences) and go to Document Type Association).

The configuration dialog box includes the following fields and sections:

- **Name** - The name of the Document Type Association.
- **Priority** - Depending on the priority level, Oxygen XML Editor establishes the order in which the existing document type associations are evaluated to determine the type of a document you are opening. It can be one of the following: Lowest, Low, Normal, High, or Highest. You can set a higher priority to Document Type Associations you want to be evaluated first.
- **Description** - A detailed description of the framework.
- **Storage** - Displays the type of location where the framework configuration file is stored. Can be one of: External (framework configuration is saved in a file) or Internal (framework configuration is stored in the application's internal options).
  
  **Note:** If you set the Storage to Internal and the document type association settings are already stored in a framework file, the file content is saved in the application's internal options and the file is removed.

- **Initial edit mode** - Sets the default edit mode when you open a document for the first time.
- **Configuration Tabs** - The bottom section of the dialog box includes various tabs where you can configure numerous options for the framework.

**Related information**

*Document Type Sharing* on page 1180

**Association Rules Tab**

By combining multiple association rules you can instruct Oxygen XML Editor to identify the type of a document. An Oxygen XML Editor association rule holds information about Namespace, Root local name, File name, Public ID, Attribute, and Java class. Oxygen XML Editor identifies the type of a document when the document matches at least one of the association rules. This tab give you access to a Document type rule dialog box that you can use to create association rules that activate on any document matching all the criteria defined in the dialog box.

To open the Association Rules tab of the Document type configuration dialog box, open the Preferences dialog box (Options > Preferences), go to Document Type Association, use the New, Edit, Duplicate, or Extend button, and click on the Association Rules tab.

In the Association rules tab you can perform the following actions:

- **New**
  
  Opens the Document type rule dialog box allowing you to create association rules.

- **Edit**
  
  Opens the Document type rule dialog box allowing you to edit the properties of the currently selected association rule.

- **Delete**
  
  Deletes the currently selected association rules from the list.

- **Move Up**
  
  Moves the selected association rule up one spot in the list.

- **Move Down**
  
  Moves the selected association rule down one spot in the list.
Schema Tab

In the Schema tab, you can specify a schema that Oxygen XML Editor uses if an XML document does not contain a schema declaration and no default validation scenario is associated with it.

To open the Schema tab of the Document type configuration dialog box, open the Preferences dialog box (Options > Preferences), go to Document Type Association, use the New, Edit, Duplicate, or Extend button, and click on the Schema tab.

This tab includes the following options for defining a schema to be used if no schema is detected in the XML file:

Schema type

- Use this drop-down list to select the type of schema.

Schema URI

- You can specify the URI of the schema file. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables button, or the browsing tools in the Browse drop-down list.

  Tip: It is a good practice to store all resources in the framework directory and use the $(framework) editor variable to reference them. This is a recommended approach to designing a self-contained document type that can be easily maintained and shared between multiple users.

Classpath Tab

The Classpath tab displays a list of folders and JAR libraries that hold implementations for API extensions, implementations for custom Author mode operations, various resources (such as stylesheets), and framework translation files. Oxygen XML Editor loads the resources looking in the folders in the order they appear in the list.

To open the Classpath tab of the Document type configuration dialog box, open the Preferences dialog box (Options > Preferences), go to Document Type Association, use the New, Edit, Duplicate, or Extend button, and click on the Classpath tab.

The Classpath tab includes the following actions:

- **New**
  - Opens a dialog box that allows you to add a resource to the table in the Classpath tab. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables button, or the browsing tools in the Browse drop-down list.
  
  Tip: The path can also contain wildcards (for example, $(framework)/lib/*.jar).

- **Edit**
  - Opens a dialog box that allows you to edit a resource in the Classpath tab. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables button, or the browsing tools in the Browse drop-down list.
  
  Tip: The path can also contain wildcards (for example, $(framework)/lib/*.jar).

- **Delete**
  - Deletes the currently selected resource from the list.

- **Move Up**
  - Moves the selected resource up one spot in the list.

- **Move Down**
  - Moves the selected resource down one spot in the list.

**Use parent classloader from plugin with ID**

- Use this option to specify the ID of a plugin. The current framework has access to the classes loaded for the plugin.

- Author Tab on page 56
- Localizing Frameworks on page 1140
Author Tab

The Author tab is a container that holds information regarding the CSS file used to render a document in the Author mode, and regarding framework-specific actions, menus, contextual menus, toolbars, and content completion list of proposals.

To open the Author tab of the Document type configuration dialog box, open the Preferences dialog box (Options > Preferences), go to Document Type Association, use the New, Edit, Duplicate, or Extend button, and click on the Author tab.

The options that you configure in the Author tab are grouped in subtabs.

CSS Subtab

The CSS subtab contains the CSS files that Oxygen XML Editor uses to render a document in the Author mode. In this subtab, you can set main and alternate CSS files. When you are editing a document in the Author mode, you can switch between these CSS files from the Styles drop-down menu on the Author Styles toolbar.

To open the CSS subtab, open the Preferences dialog box (Options > Preferences), go to Document Type Association, use the New, Edit, Duplicate, or Extend button, click on the Author tab, and then the CSS subtab.

The following actions are available in the CSS subtab:

New
Opens a dialog box that allows you to add a CSS file. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables button, or the browsing tools in the Browse drop-down list.

Edit
Opens a dialog box that allows you to edit the current selection.

Delete
Deletes the currently selected CSS file.

Move Up
Moves the selected CSS file up in the list.

Move Down
Moves the selected CSS file down in the list.

Enable multiple selection of alternate CSSs
Allows users to apply multiple alternate styles, as layers, over the main CSS style. This option is enabled by default for DITA document types.

If there are CSSs specified in the document then

You can choose between the following options for controlling how the CSS files that are set in this subtab will be handled if a CSS is specified in the document itself:

- Ignore CSSs from the associated document type - The CSS files set in this CSS subtab are overwritten by the CSS files specified in the document itself.
- Merge them with CSSs from the associated document type - The CSS files set in this CSS subtab are merged with the CSS files specified in the document itself.

Selecting and Combining Multiple CSS Styles on page 1197

Actions Subtab

The Actions subtab contains a sortable table that includes all the framework-specific actions. Each action has a unique ID, a name, a description, and a shortcut key.

To open the Actions subtab, open the Preferences dialog box (Options > Preferences), go to Document Type Association, use the New, Edit, Duplicate, or Extend button, click on the Author tab, and then the Actions subtab.

The following actions are available in this subtab:
New
Opens the Action dialog box that allows you to add an action.

Duplicate
Duplicates the currently selected action.

Edit
Opens the Action dialog box that allows you to edit the existing action.

Delete
Deletes the currently selected action.

Action Dialog Box

To edit an existing document type action or create a new one, open the Preferences dialog box (Options > Preferences), go to Document Type Association, use the New, Edit, Duplicate, or Extend button, click on the Author tab, and then the Actions subtab. At the bottom of this subtab, click ✪ New to create a new action, or ✗ Edit to modify an existing one.

Figure 17: Action Dialog Box

The following options are available in the Action dialog box:

ID
Specifies a unique action identifier.

Name
Specifies the name of the action. This name is displayed as a tooltip or as a menu item.
Tip: You can use the \{i18n('key')\} editor variable to allow for multiple translations of the name.

Menu access key
In Windows, you can access menus by holding down Alt and pressing the keyboard key that corresponds to the Letter that is underlined in the name of the menu. Then, while still holding down Alt, you can select submenus and menu actions the same way by pressing subsequent corresponding keys. You can use this option to specify the Letter in the name of the action that can be used to access the action.

Description
A description of the action. This description is displayed as a tooltip when hovering over the action.

Tip: You can use the \{i18n('key')\} editor variable to allow for multiple translations of the description.

How to translate frameworks link
Use this link to see more information about Localizing Frameworks on page 1140.

Large icon
Allows you to select an image for the icon that Oxygen XML Editor uses for the toolbar action.

Tip: A good practice is to store the image files inside the framework directory and use the \{frameworks\} editor variable to make the image relative to the framework location. If the images are bundled in a jar archive (for instance, along with some Java operations implementation), it is convenient to reference the images by their relative path location in the class-path.

Small icon
Allows you to select an image for the icon that Oxygen XML Editor uses for the contextual menu action.

Note: If you are using a Retina or HiDPI display, Oxygen XML Editor automatically searches for higher resolution icons in the path specified in both the Large icon and Small icon options. For more information, see Adding Retina/HiDPI Icons in a Framework on page 1133.

Shortcut key
This field allows you to configure a shortcut key for the action that you are editing. The + character separates the keys.

Enable platform-independent shortcut keys
If this checkbox is enabled, the shortcut that you specify in this field is platform-independent and the following modifiers are used:

- M1 represents the Command key on MacOS X, and the Ctrl key on other platforms.
- M2 represents the Shift key.
- M3 represents the Option key on MacOS X, and the Alt key on other platforms.
- M4 represents the Ctrl key on MacOS X, and is undefined on other platforms.

Operations section
In this section of the Action dialog box, you configure the functionality of the action that you are editing. An action has one or more operation modes. The evaluation of an XPath expression activates an operation mode. The first enabled operation mode is activated when you trigger the action. The scope of the XPath expression must consist only of element nodes and attribute nodes of the edited document. Otherwise, the XPath expression does not return a match and does not fire the action. For more details see: Activate Multiple Functions for Actions using XPath Expressions on page 59.

The following options are available in this section:

Activation XPath
An XPath 2.0 expression that applies to elements and attributes. For more details see: Activate Multiple Functions for Actions using XPath Expressions on page 59.

Operation
Specifies the invoked operation.

Arguments
Specifies the arguments of the invoked operation. The Edit at the bottom of the table allows you to edit the arguments of the operation.
Operation priority

Increases or decreases the priority of an operation. The operations are invoked in the order of their priority. If multiple XPath expressions are true, the operation with the highest priority is invoked.

- **Add** - Adds an operation.
- **Remove** - Removes an operation.
- **Duplicate** - Duplicates an operation.

Evaluate activation XPath expressions even in read-only contexts

If this checkbox is enabled, the action can be invoked even when the cursor is placed in a read-only location.

Activate Multiple Functions for Actions using XPath Expressions

An **Author** mode action can have multiple functions, each function invoking an **Author** mode operation with certain configured parameters. Each function of an action has an XPath 2.0 expression for activating it.

For each function of an action, the application will check if the XPath expression is fulfilled (when it returns a not empty nodes set or a `true` result). If it is fulfilled, the operation defined in the function will be executed.

Three special XPath extension functions are provided:

- **oxy:allows-child-element()** - You can use this function to check whether or not an element is valid child element in the current context, according to the associated schema.
- **oxy:allows-global-element()** - You can use this function to check whether or not an element is a valid global element for the current framework, according to the associated schema.
- **oxy:current-selected-element()** - You can use this function to get the currently selected element.

**oxy:allows-child-element() Function**

The **oxy:allows-child-element()** function allows you to check whether or not an element that matches the arguments of the function is valid as a child of the element at the current cursor position, according to the associated schema. It is evaluated at the cursor position and has the following signature:

```xml
oxy:allows-child-element($childName, ($attributeName, $defaultAttributeValue, $contains?)?)
```

The following parameters are supported:

**childName**

The name of the element that you want to check if it is valid in the current context. Its value is a string that supports the following forms:

- The child element with the specified local name that belongs to the default namespace.
  ```xml
  oxy:allows-child-element("para")
  ```
  The above example verifies if the para element (of the default namespace) is allowed in the current context.

- The child element with the local name specified by any namespace.
  ```xml
  oxy:allows-child-element("*:para")
  ```
  The above example verifies if the para element (of any namespace) is allowed in the current context.

- A prefix-qualified name of an element.
  ```xml
  oxy:allows-child-element("prefix:para")
  ```
  The prefix is resolved in the context of the element where the cursor is located. The function matches on the element with the para local name from the previous resolved namespace. If the prefix is not resolved to a namespace, the function returns a value of `false`.

- A specified namespace-URI-qualified name of an element.
  ```xml
  oxy:allows-child-element("{namespaceURI}para")
  ```
  The namespaceURI is the namespace of the element. The above example verifies if the para element (of the specified namespace) is allowed in the current context.
Any element.

`oxy:allows-child-element("*")`

The above function verifies if any element is allowed in the current context.

**Note:** A common use case of `oxy:allows-child-element("*")` is in combination with the `attributeName` parameter.

**attributeName**

The attribute of an element that you want to check if it is valid in the current context. Its value is a string that supports the following forms:

- The attribute with the specified name from no namespace.

`oxy:allows-child-element("*", "class", " topic/topic ")`

The above example verifies if an element with the `class` attribute and the default value of this attribute (that contains the `topic/topic` string) is allowed in the current context.

- The attribute with the local name specified by any namespace.

`oxy:allows-child-element("*", ":localname", " topic/topic ")`

- A qualified name of an attribute.

`oxy:allows-child-element("*", "prefix:localname", " topic/topic ")`

The prefix is resolved in the context of the element where the cursor is located. If the prefix is not resolved to a namespace, the function returns a value of false.

**defaultAttributeValue**

A string that represents the default value of the attribute. Depending on the value of the next parameter, the default value of the attribute must either contain this value or be equal with it.

**contains**

An optional boolean. The default value is true. For the true value, the default value of the attribute must contain the `defaultAttributeValue` parameter. If the value is false, the two values must be the same.

`oxy:allows-global-element() Function`

The `oxy:allows-global-element()` function allows you to check whether or not an element that matches the arguments of the function is valid for the current framework, according to the associated schema. It has the following signature:

`oxy:allows-global-element($elementName, ($attributeName, $defaultAttributeValue, $contains?)?)`

The following parameters are supported:

**elementName**

The name of the element that you want to check if it is valid in the current framework. Its value is a string that supports the following forms:

- The element with the specified local name that belongs to the default namespace.

`oxy:allows-global-element("para")`

The above example verifies if the para element (of the default namespace) is allowed in the current framework.

- The element with the local name specified by any namespace.

`oxy:allows-global-element("*:para")`

The above example verifies if the para element (of any namespace) is allowed in the current framework.

- A prefix-qualified name of an element.

`oxy:allows-global-element("prefix:para")`
The prefix is resolved in the context of the framework. The function matches on the element with the para local name from the previous resolved namespace. If the prefix is not resolved to a namespace, the function returns a value of false.

- A specified namespace-URI-qualified name of an element.

```xml
oxy:allows-global-element("{namespaceURI}para")
```

The namespaceURI is the namespace of the element. The above example verifies if the para element (of the specified namespace) is allowed in the current framework.

- Any element.

```xml
oxy:allows-global-element("*")
```

The above function verifies if any element is allowed in the current framework.

**attributeName**

The attribute of an element that you want to check if it is valid in the current framework. Its value is a string that supports the following forms:

- The attribute with the specified name from no namespace.

```xml
oxy:allows-global-element("*", "class", " topic/topic ")
```

The above example verifies if an element with the class attribute and the default value of this attribute (that contains the topic/topic string) is allowed in the current framework.

- The attribute with the local name specified by any namespace.

```xml
oxy:allows-global-element("*", "prefix:localname", " topic/topic ")
```

- A qualified name of an attribute.

```xml
oxy:allows-global-element("*", "prefix:localname", " topic/topic ")
```

The prefix is resolved in the context of the framework. If the prefix is not resolved to a namespace, the function returns a value of false.

**defaultAttributeValue**

A string that represents the default value of the attribute. Depending on the value of the next parameter, the default value of the attribute must either contain this value or be equal with it.

**contains**

An optional boolean. The default value is true. For the true value, the default value of the attribute must contain the defaultAttributeValue parameter. If the value is false, the two values must be the same.

**oxy:current-selected-element() Function**

This function returns the fully selected element. If no element is selected, the function returns an empty sequence.

```xml
oxy:current-selected-element() [self::p]/b
```

This example returns the b elements that are children of the currently selected p element.

**Localizing Frameworks**

Oxygen XML Editor supports framework localization (translating framework actions, buttons, and menu entries to various languages). This lets you develop and distribute a framework to users that speak other languages without changing the distributed framework. Changing the language used in Oxygen XML Editor in the Global preferences page is enough to set the right language for each framework.

To localize the content of a framework, create a translation.xml file that contains all the translation (key, value) mappings. The translation.xml has the following format:

```xml
<translation>
  <languageList>
    <language description="English" lang="en_US"/>
  </languageList>
</translation>
```
Oxygen XML Editor matches the GUI language with the language set in the translation.xml file. If this language is not found, the first available language declared in the languageList tag for the corresponding framework is used.

Add the directory where this file is located to the Classpath list corresponding to the edited document type.

After you create this file, you can use the keys defined in it to customize the name and description of the following:

- Framework actions
- Menu entries
- Contextual menus
- Toolbars
- Static CSS content

For example, if you want to localize the bold action, open the Preferences dialog box (Options > Preferences) and go to Document Type Association. Use the New or Edit button to open the Document type configuration dialog box, go to Author > Actions, and rename the bold action to `${i18n(translation_key)}`. Actions with a name format other than `${i18n(translation_key)}` are not localized. Translation_key corresponds to the key from the translation.xml file.

Now open the translation.xml file and edit the translation entry if it exists or create one if it does not exist. This example presents an entry in the translation.xml file:

```xml
<key value="translation_key">
    <comment>Bold action name.</comment>
    <val lang="en_US">Bold</val>
    <val lang="de_DE">Bold</val>
    <val lang="fr_FR">Bold</val>
</key>
```

To use a description from the translation.xml file in the Java code used by your custom framework, use the new `ro.sync.ecss.extensions.api.AuthorAccess.getAuthorResourceBundle()` API method to request the associated value for a certain key. This allows all the dialog boxes that you present from your custom operations to have labels translated in multiple languages.

You can also reference a key directly in the CSS content:

```css
title:before{
  content:'${i18n(title.key)} : '; 
}
```

Note: You can enter any language you want in the languageList tag and any number of keys.

The translation.xml file for the DocBook framework is located here: `${OXYGEN_INSTALL_DIR}/frameworks/docbook/i18n/translation.xml`. In the Classpath list corresponding to the DocBook document type the following entry was added:

```java
${framework}/i18n.
```

To see how the DocBook actions are defined to use these keys for their name and description, open the Preferences dialog box (Options > Preferences) and go to Document Type Association > Author > Actions. If you look in the Java class `ro.sync.ecss.extensions.docbook.table.SADocbookTableCustomizerDialog` available in the `oxygen-sample-framework` module of the Oxygen SDK Maven archetype, you can see how the new `ro.sync.ecss.extensions.api.AuthorResourceBundle` API is used to retrieve localized descriptions for various keys.

---

Configuring Oxygen XML Editor 62
Menu Subtab

In the Menu subtab, you can configure which actions will appear in the framework-specific menu. The subtab is divided into two sections: Available actions and Current actions.

To open the Menu subtab, open the Preferences dialog box (Options > Preferences), go to Document Type Association, use the New, Edit, Duplicate, or Extend button, click on the Author tab, and then the Menu subtab.

The Available actions section presents a table that displays the actions defined in the Actions subtab, along with their icon, ID, and name. The Current actions section holds the actions that are displayed in the Oxygen XML Editor menu. To add an action in this section as a sibling of the currently selected action, use the Add as sibling button. To add an image in this section as a child of the currently selected action use the Add as child button.

The following actions are available in the Current actions section:

- Edit
  Edits an item.
- Remove
  Removes an item.
- Move Up
  Moves an item up.
- Move Down
  Moves an item down.

Contextual Menu Subtab

In the Contextual menu subtab you configure what framework-specific action the Content Completion Assistant proposes. The subtab is divided into two sections: Available actions and Current actions.

To open the Contextual Menu subtab, open the Preferences dialog box (Options > Preferences), go to Document Type Association, use the New, Edit, Duplicate, or Extend button, click on the Author tab, and then the Contextual Menu subtab.

The Available actions section presents a table that displays the actions defined in the Actions subtab, along with their icon, ID, and name. The Current actions section contains the actions that are displayed in the contextual menu for documents that belong to the edited framework.

The following actions are available in this subtab:

- Edit
- Remove
- Move Up
- Move Down
Add as sibling
Adds the selected action or submenu from the Available actions section to the Current actions section as a sibling of the selected action.

Add as child
Adds the selected action or submenu from the Available actions section to the Current actions section as a child of the selected action.

Edit
This option is available for container (submenu) items that are listed in the Current actions section. It opens a configuration dialog box that allows you to edit the selected container (submenu).

Figure 19: Menu Action Configuration Dialog Box
The following options are available in this dialog box:

Name
Specifies the name of the action. This name is displayed as a tooltip or as a menu item.

Tip: You can use the $i18n('key') editor variable to allow for multiple translations of the name.

Menu access key
In Windows, you can access menus by holding down Alt and pressing the keyboard key that corresponds to the Letter that is underlined in the name of the menu. Then, while still holding down Alt, you can select submenus and menu action the same way by pressing subsequent corresponding keys. You can use this option to specify the Letter in the name of the action that can be used to access the action.

Menu icon
Allows you to select an image for the icon that Oxygen XML Editor uses for the container (submenu).

Promote items when in a table context
If this option is enabled, when invoking the contextual menu from within a table, all the actions in this container (submenu) will be promoted to the main level in the contextual menu. Actions and submenus that are not promoted are still available in the Other actions submenu when invoking the contextual menu within a table.

Remove
Removes the selected action or submenu from the Current actions section.

Move Up
Moves the selected item up in the list.

Move Down
Moves the selected item down in the list.

Toolbar Subtab
In the Toolbar subtab you configure what framework-specific action the Oxygen XML Editor toolbar holds. The subtab is divided in two sections: Available actions and Current actions.

To open the Toolbar subtab, open the Preferences dialog box (Options > Preferences), go to Document Type Association, use the New, Edit, Duplicate, or Extend button, click on the Author tab, and then the Toolbar subtab.
The **Available actions** section presents a table that displays the actions defined in the **Actions** subtab, along with their icon, ID, and name. The **Current actions** section holds the actions that are displayed in the Oxygen XML Editor toolbar when you work with a document belonging to the edited framework. To add an action in this section as a sibling of the currently selected action, use the ✅ **Add as sibling** button. To add an action in this section as a child of the currently selected action use the ✅ Add as child button.

The following actions are available in the **Current actions** section:

- **Edit**
  - Edits an item.
- **Remove**
  - Removes an item.
- **Move Up**
  - Moves an item up.
- **Move Down**
  - Moves an item down.

### Content Completion Subtab

In the **Content Completion** subtab you configure what framework-specific the **Content Completion Assistant** proposes. The subtab is divided in two sections: **Available actions** and **Current actions**.

To open the **Content Completion** subtab, open the Preferences dialog box (Options > Preferences), go to Document Type Association, use the **New, Edit, Duplicate, or Extend button**, click on the Author tab, and then the **Content Completion** subtab.

#### Available and Current Actions

The **Available actions** section presents a table that displays the actions defined in the **Actions** subtab, along with their icon, ID, and name. The **Current actions** section holds the actions that the **Content Completion Assistant** proposes when you work with a document belonging to the edited framework. To add an action in this section as a sibling of the currently selected action, use the ✅ **Add as sibling** button. To add an action in this section as a child of the currently selected action use the ✅ Add as child button.

The following actions are available in the **Current actions** section:

- **Edit**
  - Edits an item.
- **Remove**
  - Removes an item.
- **Move Up**
  - Moves an item up.
- **Move Down**
  - Moves an item down.

### Filter Table

The **Filter** section presents a table that allows you to add elements to be filtered from the **Content Completion Assistant** or from some specific helper views or menus. Use the ✅ **Add** button to add more filters to the table, the ✅ **Edit** button to modify an existing item in the table, or the ✗ **Remove** button to remove a filtered item. The ✅ Add and ✅ Edit buttons open a **Remove item** dialog box.
Use this dialog box to add or configure the elements that will be filtered:

**Item name**

Use this text field to enter the name of the element to be filtered. The drop-down list also includes a few special content completion actions that can be filtered (\texttt{<SPLIT>} and \texttt{<ENTER>}).

**Remove item from**

You can choose to filter the element from any of the following:

- **Content Completion Window** - The element will not appear in the Content Completion Assistant.
- **Elements View** - The element will not appear in the Elements view.
- **Element Insert Menus** - The element will not appear in the Append Child, Insert Before, or Insert After menus that are available in certain contextual menus (for example, the contextual menu of the Outline view).
- **Entities View** - The element will not appear in the Entities view.

**Related information**

*Customizing the Content Completion Assistant* on page 1182

**Templates Tab**

The Templates tab specifies a list of directories where new file templates are located. These file templates are gathered from all the document types and presented in the various folders inside the Framework templates folder in the New document wizard.

To open the Templates tab of the Document type configuration dialog box, open the Preferences dialog box (Options > Preferences), go to Document Type Association, use the New, Edit, Duplicate, or Extend button, and click on the Templates tab.

The Templates tab includes the following actions:

**New**

Opens a dialog box that allows you to specify the path to the directory of the template. You can specify the path by using the text field, its history drop-down, the \texttt{Insert Editor Variables} button, or the browsing tools in the \texttt{Browse} drop-down list.

\textbf{Tip}: The path can also contain wildcards. For example, using \texttt{{$\{frameworkDir\}/templates/*}} would add all the template folders found inside the templates directory.

**Edit**

Opens a dialog box that allows you to edit the path of the selected template. You can specify the path by using the text field, its history drop-down, the \texttt{Insert Editor Variables} button, or the browsing tools in the \texttt{Browse} drop-down list.

\textbf{Tip}: The path can also contain wildcards. For example, using \texttt{{$\{frameworkDir\}/templates/*}} would add all the template folders found inside the templates directory.
Delete
  Deletes the currently selected template from the list.

Move Up
  Moves the selected template up one spot in the list.

Move Down
  Moves the selected template down one spot in the list.

Catalogs Tab
The Catalogs tab specifies a list of XML catalogs, specifically for the edited framework, that are added to list of catalogs that Oxygen XML Editor uses to resolve resources.

To open the Catalogs tab of the Document type configuration dialog box, open the Preferences dialog box (Options > Preferences), go to Document Type Association, use the New, Edit, Duplicate, or Extend button, and click on the Catalogs tab.

You can perform the following actions:

Add
  Opens a dialog box that allows you to add a catalog to the list. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables button, or the browsing tools in the Browse drop-down list.

Edit
  Opens a dialog box that allows you to edit the path of an existing catalog.

Delete
  Deletes the currently selected catalog from the list.

Move Up
  Moves the selected catalog up one spot in the list.

Move Down
  Moves the selected catalog down one spot in the list.

Transformation Tab
In the Transformation tab, you can configure the transformation scenarios associated with the particular framework you are editing. These transformation scenarios are presented in the Configure Transformation Scenarios dialog box when transforming a document and you can specify which scenarios will be used by default for a particular document type.

To open the Transformation tab of the Document type configuration dialog box, open the Preferences dialog box (Options > Preferences), go to Document Type Association, use the New, Edit, Duplicate, or Extend button, and click on the Transformation tab.

The Transformation tab offers the following options:

Default checkbox
  You can set one or more of the scenarios listed in this tab to be used as the default transformation scenario when another specific scenario is not specified. The scenarios that are set as default are rendered bold in the Configure Transformation Scenarios dialog box.

New
  Opens the New scenario dialog box allowing you to create a new transformation scenario for the particular document type.

Duplicate
  Allows you to duplicate the configuration of an existing transformation scenario. It opens the Edit scenario dialog box where you can configure the properties of the duplicated scenario.

Edit
  Opens the Edit scenario dialog box allowing you to edit the properties of the currently selected transformation scenario.
Delete
Deletes the currently selected transformation scenario.

Import scenarios
Imports transformation scenarios.

Export selected scenarios
Exports transformation scenarios.

Move Up
Moves the selection to the previous scenario.

Move Down
Moves the selection to the next scenario.

Validation Tab
In the Validation tab, you can configure the validation scenarios associated with the particular framework you are editing. These validation scenarios are presented in the Configure Validation Scenarios dialog box when validating a document and you can specify which scenarios will be used by default for a particular document type.

Note: If a master file is associated with the current file, the validation scenarios defined in the master file are used and take precedence over the default scenarios defined for the particular framework. For more information on master files, see Master Files Support on page 272 or Working with Modular XML Files in the Master Files Context on page 457.

To open the Validation tab of the Document type configuration dialog box, open the Preferences dialog box (Options > Preferences), go to Document Type Association, use the New, Edit, Duplicate, or Extend button, and click on the Validation tab.

The Validation tab offers the following options:

Default checkbox
You can set one or more of the scenarios listed in this tab to be used as the default validation scenario when another specific scenario is not specified in the validation process. The scenarios that are set as default are rendered bold in the Configure Validation Scenarios dialog box.

New
Opens the New scenario dialog box allowing you to create a new validation scenario.

Duplicate
Allows you to duplicate the configuration of an existing validation scenario. It opens the Edit scenario dialog box where you can configure the properties of the duplicated scenario.

Edit
Opens the Edit scenario dialog box allowing you to edit the properties of the currently selected validation scenario.

Delete
Deletes the currently selected validation scenario.

Import scenarios
Imports validation scenarios.

Export selected scenarios
Exports validation scenarios.

Move Up
Moves the selected scenario up one spot in the list.

Move Down
Moves the selected scenario down one spot in the list.

Extensions Tab
The Extensions tab specifies implementations of Java interfaces used to provide advanced functionality to the document type.
To open the Extensions tab of the Document type configuration dialog box, open the Preferences dialog box (Options > Preferences), go to Document Type Association, use the New, Edit, Duplicate, or Extend button, and click on the Extensions tab.

Libraries containing the implementations must be present in the classpath of your document type. The Javadoc available at https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ contains details about how each API implementation functions.

Encoding Preferences

Oxygen XML Editor lets you configure how character encodings are recognized when opening files and which encodings are used when saving files. To configure encoding options, open the Preferences dialog box (Options > Preferences) and go to Encoding.

The following encoding options are available:

Fallback character encoding

Specifies the default character encoding of non-XML documents if their character encoding cannot be determined from other sources (for example, it is not specified in the document or determined by the file type).

Note: For certain document types, the following encoding detection rules are used:

- For XML, DTD, and CSS documents, Oxygen XML Editor tries to collect the character encoding from the document. If no such encoding is found, then UTF-8 is used.
- For JavaScript, JSON, SQL, XQuery, and RNC, the UTF-8 encoding is used.

UTF-8 BOM handling

This setting specifies how to handle the Byte Order Mark (BOM) when Oxygen XML Editor saves a UTF-8 XML document:

- Keep (default) - Do not alter the BOM declaration of the currently open file.
- Write - Save the BOM bytes.
- Don't Write - Do not save the BOM bytes. Loaded BOM bytes are ignored.

Note: The UTF-16 BOM is always preserved. UTF-32 documents have a big-endian byte order.

Encoding errors handling

This setting specifies how to handle characters that cannot be represented in the character encoding that is used when the document is opened. The available options are:

- REPORT (default) - Displays an error identifying the character that cannot be represented in the specified encoding. Unrecognized characters are rendered as an empty box.
- REPLACE - The character is replaced with a standard replacement character. For example, if the encoding is UTF-8, the replacement character has the Unicode code \uFFFD, and if the encoding is ASCII, the replacement character code is 63.
- IGNORE - The error is ignored and the character is not included in the document displayed in the editor.

Attention: If you edit and save the document, the characters that cannot be represented in the specified encoding are dropped.

Encoding for Base64, Base32, Hex conversions

Specifies the encoding to be used when invoking the Encode Selection or Decode Selection actions for Base64, Base32, or Hex conversions. The default setting is UTF-8.

Editor Preferences

Oxygen XML Editor lets you configure the appearance of various components and features of the main editor. To access these options, open the Preferences dialog box (Options > Preferences) and go to Editor.

The following options are available:

Selection background color

Allows you to set the background color of selected text.
Selection foreground color
Allows you to set the color of selected text.

Completion proposal background
Allows you to set the background color of the Content Completion Assistant.

Completion proposal foreground
Allows you to set the color of the text in the Content Completion Assistant.

Documentation window background
Allows you to set the background color of the documentation of elements suggested by the Content Completion Assistant.

Documentation window foreground
Allows you to set the color of the text for the documentation of elements suggested by the Content Completion Assistant.

Find highlight color
Allows you to set the color of the highlights generated by the Find and Find all actions.

XPath highlight color
Allows you to set the color of the highlights generated when you run an XPath expression.

Declaration highlight color
Allows you to set the color of the highlights generated by the Find declaration action.

Reference highlight color
Allows you to set the color of the highlights generated by the Find reference action.

Maximum number of highlights
Allows you to set the maximum number of highlights that Oxygen XML Editor displays.

Show TAB/NBSP/EOL/EOF marks
Makes the TAB/NBSP/EOL/EOF characters visible in the editor. You can use the color picker to choose the color of the marks.

Show SPACE marks
Makes the space character visible in the editor.

Can edit read-only files
If this option is selected, Oxygen XML Editor will let you edit read-only files. When you try to save them, a Save As dialog box will be displayed to avoid overwriting the initial resource. If the option is not selected, a warning message is displayed when you try to edit a read-only file.

Display quick-assist and quick-fix side hints
Displays the Quick Assist icon (💡) and Quick Fix icon (💡) in the line number stripe on the left side of the editor.

Undo history size
Allows you to set the maximum amount of undo operations you can perform in any of the editor modes (Text, Author, Design, Grid).

Enable mouse-wheel zooming
If enabled, you can use Ctrl + MouseWheelForward (Command + MouseWheelForward on OS X) to increase the editor font (zoom in) or Ctrl + MouseWheelBackwards (Command + MouseWheelBackwards on OS X) to decrease the editor font (zoom out). This option is enabled by default on Windows and Linux, while it is disabled by default on Mac OS X, due to the way inertia affects the mouse wheel on this operating system.

Print Preferences
Oxygen XML Editor lets you configure how files are printed out of the editor. Note that these setting cover how files are printed directly from Oxygen XML Editor itself, not how they are printed after the XML source has been transformed by a publishing stylesheet. To configure the Print options, open the Preferences dialog box (Options > Preferences) and go to Editor > Print.

This page allows you to customize the headers and footers added to a printed page when you print from the Text mode or Author mode editors. These settings do not apply to the Grid and schema Design mode.

You can specify what is printed on the Left, Middle, and Right of the header and footer using plain text of any of the following variables:
• ${currentFileURL} - Current file as URL, that is the absolute file path of the current edited document represented as URL.
• ${cfne} - Current file name with extension. The current file is the one currently opened and selected.
• ${cp} - Current page number. Used to display the current page number on each printed page in the Editor / Print Preferences page.
• ${tp} - Total number of pages in the document. Used to display the total number of pages on each printed page in the Editor / Print Preferences page.
• ${env(VAR_NAME)} - Value of the VAR_NAME environment variable. The environment variables are managed by the operating system. If you are looking for Java System Properties, use the ${system(var.name)} editor variable.
• ${system(var.name)} - Value of the var.name Java System Property. The Java system properties can be specified in the command line arguments of the Java runtime as -Dvar.name=var.value. If you are looking for operating system environment variables, use the ${env(VAR_NAME)} editor variable instead.
• ${date(pattern)} - Current date. The allowed patterns are equivalent to the ones in the Java SimpleDateFormat class. Example: yyyy-MM-dd;

Note: This editor variable supports both the xs:date and xs:datetime parameters. For details about xs:date, go to http://www.w3.org/TR/xmlschema-2/#date. For details about xs:datetime, go to http://www.w3.org/TR/xmlschema-2/#dateTime.

For example, to show the current page number and the total number of pages in the top right corner of the page, write the following pattern in the Right text area of the Header section: ${cp} of ${tp}.

You can also set the Color and Font used in the header and footer. Default font is SansSerif.

You can place a line below the header or above the footer by selecting Underline/Overline.

Edit Modes Preferences

Oxygen XML Editor lets you configure which edit mode a file is opened in the first time it is opened. This setting only applies the first time a file is opened. The current editing mode of each file is saved when the file is closed and restored the next time it is opened. To configure the options for editing modes, open the Preferences dialog box (Options > Preferences) and go to Editor > Edit Modes.

Allow Document Type specific edit mode setting to override the general mode setting

If selected, the initial edit mode setting set in the Document Type configuration dialog box overrides the general edit mode setting from the table below.

Select the initial edit mode (page) for each editor

This table specifies the default editing mode that will be opened for each type of document when the Allow Document Type specific edit mode setting to override the general mode setting option is not selected. Use the Edit button to change the initial edit mode for each type of document (editor). The initial edit mode can be one of the following:

• Text
• Author
• Grid
• Design (available only for the XSD editor).
Text Preferences

Oxygen XML Editor lets you configure how the Text mode editor appears. To configure these options, open the Preferences dialog box (Options > Preferences) and go to Editor > Edit modes > Text.

The following options are available:

Editor background color
- Sets the background color for the Text editing mode, Outline view, and some external tool editors (Large File Viewer, Compare Files, Compare Directories).

Editor cursor color
- Sets the color for the cursor in Text mode.

Highlight current line
- If enabled, the current line is highlighted with the foreground color specified with the color chooser.

Show line numbers
- If enabled (default value), line numbers are shown in the editor panels and in the Results view of the debugger perspectives. You can also specify the color for the line numbers using the color chooser. Printed output will also include the line numbers.

Show print margin
- If enabled, it allows you to set a safe print limit in the form of a vertical line displayed in the right side of the editor pane. You can also customize the print margin line color.

Print margin column
- Allows you to specify a limit for the print width, measured in the number of characters.

Line wrap
- If enabled, long lines are automatically wrapped in edited documents. The line wrap does not alter the document content since the application does not use newline characters to break long lines.

Cut / Copy whole line when nothing is selected
- If enabled, Cut and Copy actions operate on the entire current line when nothing is selected in the editor.

Enable folding
- If enabled (default value), the vertical stripe that holds the folding markers is displayed in Text mode.

Highlight matching tag
- If enabled, when you place the cursor on a start or end tag, Oxygen XML Editor highlights the corresponding member of the pair. You can also customize the highlight color.

Lock the XML tags
- If enabled, XML are locked and cannot be edited in Text mode.
Diagram Preferences

For certain XML languages, Oxygen XML Editor provides a diagram view as part of the text mode editor. To configure the Diagram preferences, open the Preferences dialog box (Options > Preferences) and go to Editor > Edit modes > Text > Diagram.

The following options are available in this preference page:

Show Full Model XML Schema diagram

When this option is selected, the Text mode editor for XML Schemas includes a split screen view that shows a diagram of the schema structure. This is useful for seeing the effects of schema changes you make. For editing a the schema using a diagram instead of text, use the schema Design view.

Note: When handling very large schemas, displaying the schema diagram might affect the performance of your system. In such cases, disabling the schema diagram view improves the speed of navigation through the edited schema.

Enable Relax NG diagram and related views

Enables the Relax NG schema diagram and synchronization with the related views (Attributes, Model, Elements, Outline).

Show Relax NG diagram

Displays the Relax NG schema diagram in the split screen views (Full Model View and Logical Model View).

Enable NVDL diagram and related views

Enables the NVDL schema diagram and synchronization with the related views (Attributes, Model, Elements, Outline).

Show NVDL diagram

Displays the NVDL schema diagram in the split screen views (Full Model View and Logical Model View).

Location relative to editor

Allows you to specify the location of the schema diagram panel relative to the diagram Text editor.

Show/Hide Annotations link

Use this link to navigate to the Schema Design preferences page where you can choose to show or hide annotations in schema diagrams.

Zoom link

Use this link to navigate to the Schema Design preferences page where you can adjust the default zoom level of schema diagrams.

Grid Preferences

Oxygen XML Editor provides a Grid view of an XML document. To configure the Grid options, open the Preferences dialog box (Options > Preferences) and go to Editor > Edit modes > Grid.

The following options are available:

Compact representation

If selected, the compact representation of the grid is used: a child element is displayed beside the parent element. In the non-compact representation, a child element is nested below the parent.

Format and indent when passing from grid to text or on save

If selected, the content of the document is formatted and indented each time you switch from the Grid view to the Text view.

Default column width (characters)

Sets the default width (in characters) of a table column of the grid. A column may contain the following:

- Element names
- Element text content
- Attribute names
- Attribute values

If the total width of the grid structure is too large you can resize any column by dragging the column margins with the mouse pointer, but the change is not persistent. To make it persistent, set the new column width with this option.

Configuring Oxygen XML Editor
Active cell color
Allows you to set the background color for the active cell of the grid. There is only one active cell at a time. The keyboard input always goes to the active cell and the selection always contains it.

Selection color
Allows you to set the background color for the selected cells of the grid except the active cell.

Border color
Allows you to set the color used for the lines that separate the grid cells.

Background color
Allows you to set the background color of grid cells that are not selected.

Foreground color
Allows you to set the text color of the information displayed in the grid cells.

Row header colors
  Background color
  Allows you to set the background color of row headers that are not selected.
  Active cell color
  Allows you to set the background color of the row header cell that is currently active.
  Selection color
  Allows you to set the background color of the header cells corresponding to the currently selected rows.

Column header colors
The column headers are painted with two color gradients, one for the upper 1/3 part of the header and the other for the lower 2/3 part. The start and end colors of the first gradient are set with the first two color buttons. The start and end colors of the second gradient are set with the last two color buttons.

  Background color
  Allows you to set the background color of column headers that are not selected.
  Active cell color
  Allows you to set the background color of the column header cell that is currently active.
  Selection color
  Allows you to set the background color of the header cells corresponding to the currently selected columns.

Author Preferences
Oxygen XML Editor provides an Author editing mode that provides a configurable graphical interface for editing XML documents. To configure the options for the Author mode, open the Preferences dialog box (Options > Preferences) and go to Editor > Edit modes > Author.

The following options are available:

Author default background color
Sets the default background color of the Author editing mode. The background-color property set in the CSS file associated with the currently edited document overwrites this option.

Author default foreground color
Sets the default foreground color of the Author editing mode. The color property set in the CSS file associated with the current edited document overwrites this option.

Show XML comments
When this option is selected, XML comments are displayed in Author mode. Otherwise, they are hidden.

Show processing instructions
When this option is selected, XML processing instructions are displayed in Author mode. Otherwise they are hidden.

Show doctype
When this option is selected, the doctype declaration is displayed in Author mode. Otherwise it is hidden.
Show placeholders for empty elements
When this option is selected, placeholders are displayed for elements with no content to make them clearly visible. The placeholder is rendered as a light gray box and displays the element name.

Show Author layout messages
When this option is selected, all errors reported while rendering the document in Author mode are presented in the Errors view at the bottom of the editor.

Show block range
When this option is selected, a block range indicator is displayed in a stripe located in the left side of the editor. It is displayed as a heavy line that spans from the first line to the last line of the block.

Display referenced content (entities, XInclude, DITA conref, etc.)
When enabled, the references (such as entities, XInclude, DITA conrefs) also display the content of the resources they reference. If you toggle this option while editing, you need to reload the file for the modification to take effect.

Images Section
The following options in regards to images in Author mode are available in this section:

Auto-scale images wider than (pixels)
Sets the maximum width that an image will be displayed. Wider images will be scaled to fit.

Show very large images
When this option is selected, images larger than 6 megapixels are displayed in Author mode. Otherwise, they are not displayed.

Important: If you enable this option and your document contains many such images, Oxygen XML Editor may consume all available memory, throwing an OutOfMemory error. To resolve this, increase the available memory limit.

Tags Section
In this section you can configure the following options in regards to tags that are displayed in Author mode:

Tags display mode
Sets the default display mode for element tags presented in Author mode. You can choose between the following:

- Full Tags with Attributes - All XML tags are displayed, with attribute names and values, making it easier to transition from a Text-based editing to Author mode editing.
- Full Tags - All XML tags are displayed, but without attributes.
- Block Tags - The XML tags that enclose block elements are displayed in full. Compact tags (no element names) are displayed for inline elements.
- Inline Tags - The XML tags that enclose inline elements are displayed in full. Block tags are not displayed.
- Partial Tags - Partial tags (no names) are displayed for all elements.
- No Tags - No tags are displayed. This representation is as close as possible to a word-processor view.

Tags background color
Sets the Author mode tags background color.

Tags foreground color
Sets the Author mode tags foreground color.

Tags font
Allows you to change the font used to display tags text in the Author visual editing mode. The [Default] font is computed based on the setting of the Author default font option.

Compact tag layout
When you deselect this option, the Author mode displays the tags in a more decompressed layout, where block tags are displayed on separate lines.

Serialization Section
In this section you can configure options in regards to the formatting and indenting that is applied when a document is saved in Author mode, or when switching the editing mode from Author to Text. The following options are available:
Format and indent

Use this option to specify what should be formatted and indented when you save a document (or switch from Author to Text mode). You can choose between the following two options:

**Only the modified content**

The Save operation only formats the nodes that were modified in the Author mode. The rest of the document preserves its original formatting.

Note: This option also applies to the DITA maps opened in the DITA Maps Manager.

**The entire document**

The Save operation applies the formatting to the entire document regardless of the nodes that were modified in Author mode.

**Also apply 'Format and Indent' action as in 'Text' edit mode**

If this option is enabled, the content of the document is formatted by applying the Format and Indent rules from the Editor/Format/XML option page. In this case, the result of the Format and indent operation will be the same as when it is applied in Text editing mode.

Compatibility with other tools

Use this option to control how line breaks are handled when a document is serialized. This will help to obtain better compatibility with other tools. You can choose one of the following:

- **None** - Choose this option if compatibility with other tools can be ignored.
- **Do not break lines, do not indent** - Choose this option to avoid breaking lines after element start or end tags and indenting will not be used.

Note: New lines that are added by the user in elements where the xml:space attribute is set to preserve (such as pre elements in HTML, or codeblock elements in DITA) are still inserted. Also, selecting this option automatically disables the Also apply 'Format and Indent' action as in 'Text' edit mode option, since the formatting from Text mode does not take the CSS styles into account.

- **Break lines only after elements displayed as blocks, do not indent** - Choose this option to instruct Oxygen XML Editor to insert new lines only after elements that have a CSS display property set to anything other than inline or none (for example, block, list-item, table, etc.) and indenting will not be used. When selecting this option, the formatting is dictated by the CSS.

Note: New lines that are added by the user in elements where the xml:space attribute is set to preserve (such as pre elements in HTML, or codeblock elements in DITA) are still inserted. Also, selecting this option automatically disables the Also apply 'Format and Indent' action as in 'Text' edit mode option, since the formatting from Text mode does not take the CSS styles into account.

For advanced Author configuration see the Document Type Association settings

Click this link to open the Document Type Association preferences page.

Cursor Navigation Preferences

Oxygen XML Editor allows you to configure the appearance and behavior of the cursor in the Author mode editor. To set cursor navigation preferences, open the Preferences dialog box (Options > Preferences) and go to Author > Cursor Navigation.

The following options are available:

**Highlight elements near cursor**

When this option is enabled, the element containing the cursor is highlighted. You can use the color picker to choose the color of the highlight.

**Show cursor position tooltip**

Oxygen XML Editor uses tool tips in Author mode to indicate the position of the cursor in the element structure of the underlying document. Depending on context, the tool tips may show the current element name or the names of the elements before and after the current cursor position.
Show location tooltip on mouse move

When this option is enabled, Oxygen XML Editor displays Location Tooltips when you are editing the document in certain tags display modes (Inline Tags, Partial Tags, No Tags) or when the mouse pointer is moved between block elements.

Quick up/down navigation

This option is disabled by default and this means that when you navigate using the up and down arrow keys in Author mode, the cursor is placed within each of the underlying XML elements between two blocks of text (the cursor changes to a horizontal line when it is between blocks of text). This allows you to easily insert elements and manage the structure of your XML content. However, if this option is enabled, the cursor ignores the XML structure and jumps from one line of text to another, similar to how the cursor behaves in a word processor.

Quick navigation in tables

This option is enabled by default and this means that when navigating between table cells with the arrow keys, the cursor jumps from one cell to another. If this option is disabled, the cursor navigates between XML nodes when navigating between table cells with the arrow keys.

Arrow keys move the cursor in the writing direction

This setting determines how the left and right arrow keys behave in Author mode for bidirectional (BIDI) text. When this option is enabled (default value), the right arrow key advances the cursor in the reading direction and the left arrow moves it in the opposite direction. When this option is disabled, pressing the right arrow will simply move the cursor to the right (and the left arrow moves it to the left), regardless of the text direction.

Schema Aware Preferences

Oxygen XML Editor can use the schema of your XML language to improve the way the Author mode editor handles your content. To configure the Schema Aware options, open the Preferences dialog box (Options > Preferences) and go to Editor > Edit modes > Author > Schema Aware.

The following options are available:

Schema aware normalization, format, and indent

When you open or save a document in Author mode, white space is normalized using the display property of the current CSS stylesheet and the values of the settings for Preserve space elements, Default space elements, and Mixed content elements. When this option is selected, the schema will also be used to normalize white space, based on the content model (element-only, simple-content, or mixed). Note that the schema information takes precedence.

Indent blocks-only content

To avoid accidentally introducing inappropriate white space around inline elements, Oxygen XML Editor does not normally apply indenting to the source of an element with mixed content. If this option is selected, Oxygen XML Editor will apply indenting to the source of mixed content elements that only contain block elements.

Schema Aware Editing

The options in this section determine how Oxygen XML Editor will use the schema of a document to control the behavior of the Author mode.

• **On** - Enables all schema-aware editing options.
• **Off** - Disables all schema-aware editing options.
• **Custom** - Allows you to select custom schema-aware editing options from the following:

Schema Aware Actions section

Delete element tags with backspace and delete

Controls what happens when you attempt to delete an element tag. The two options are:

• **Smart delete** - If deleting the tag would make the document invalid, Oxygen XML Editor will attempt to make the document valid by unwrapping the current element or by appending it to an adjacent element where the result would be valid. For instance, if you delete a bold tag, the content can be unwrapped and become part of the surrounding paragraph, but if you delete a list item tag, the list item content cannot become part of the list container. However, the content could be appended to a preceding list items.
• **Reject action when its result is invalid** - A deletion that would leave the document in an invalid state is rejected.

Paste and Drag and Drop

Controls the behavior for paste and drag and drop actions. Available options are:
• **Smart paste and drag and drop** - If the content inserted by a paste or drop action is not valid at the cursor position, according to the schema, Oxygen XML Editor tries to find an appropriate insert position. The possibilities include:
  • Creating a sibling element that can accept the content (for example, if you tried to paste a paragraph into an existing paragraph).
  • Inserting the content into a parent or child element (for example, if you tried to paste a list item into an existing list item, or into the space above or below and existing list).
  • Inserting the content into an ancestor element where it would be valid.

• **Reject action when its result is invalid** - If enabled, Oxygen XML Editor will not let you paste content into a position where it would be invalid.

**Typing**
Controls the behavior that takes place when typing. Available options are:

• **Smart typing** - If typed characters are not allowed in the element at the cursor position, but the previous element does allow text, then a similar element will be inserted, along with your content.

• **Reject action when its result is invalid** - If checked, and the result of the typing action is invalid, the action will not be performed.

**Content Completion**
Controls the behavior that takes place when inserting elements using content completion. Available options are:

• **Press ENTER to show available content completion proposals** - If selected, pressing Enter will open the *Content Completion Assistant in Author mode*. If deselected, there are three possibilities:
  • The current element will be split (if possible).
  • A new element with the same name will be inserted (if possible).
  • Otherwise, a new paragraph will be inserted.

• **Show all possible elements in the content completion list** - If selected, the content completion list will show all the elements in the schema, even those that cannot be entered validly at the current position. If you select an element that is not valid at the current position, Oxygen XML Editor will attempt to find a valid location to insert it and may present you with several options.

• **Allow only insertion of valid elements and attributes** - If selected, the content completion list shows only the elements that can be inserted at the current position and will not allow you to enter any other element.

• **Allow only insertion of valid attribute values** - If selected, you cannot enter an attribute value that is not valid (according to the schema) in the *Attributes view* or *In-place Attributes Editor*. If the attribute has a choice of values, you can select a possible value from a drop-down list in the combo box, but you cannot enter a value manually.

**Warn on invalid content when performing action**
A warning message will be displayed when performing an action that will result in invalid content. Available options are:

• **Delete Element Tags** - If selected, a warning message will be displayed if the *Delete Element Tags* action will result in an invalid document. You will be asked to confirm the deletion.

• **Join Elements** - If selected, a warning message will be displayed if the *Join Elements* action will result in an invalid document. You will be asked to confirm the join.

**Automatically apply the best schema-aware insertion operation**
If enabled, Oxygen XML Editor automatically uses what it considers to be the best insertion solution, when there is an attempt to insert content that is not valid in a specific context. If disabled, Oxygen XML Editor will ask the user to choose from a list of proposed solutions.

**Convert external content on paste**
If selected, the *smart paste* feature is enabled when external content is pasted in *Author* mode.

**Convert even when pasting inside space-preserve elements**
If enabled, the *smart paste* feature will be used even when external content is pasted inside a *space-preserve* element (such as a codeblock).
Convert pasted URLs to links

If selected, when a URL is pasted into Author mode, a link will be inserted (the type of link depends on the type of document). For example, in DITA documents, an xref is inserted.

Smart Paste Support on page 327
Customizing Smart Paste Support on page 1154

Review Preferences

Oxygen XML Editor lets you enter review comments and track changes in your documents. The Review preferences page allows you to control how the Oxygen XML Editor review features work. To configure these options, open the Preferences dialog box (Options > Preferences) and go to Editor > Edit modes > Author > Review.

The available options are as follows:

Author

Specifies the name to be attached to all comments and to changes made while Track Changes is active. By default, Oxygen XML Editor uses the system user name.

Track Changes section (applies for all authors)

Initial State

Specifies whether or not Track Changes is enabled when you open a document. You may have the Track Changes feature enabled in some documents and disabled in others, or you can choose to always enable or disable the feature for all documents. You can choose between the following options:

- **Stored in document** - The current state of track changed is stored in the document itself, meaning that track changes are on or off depending on the state the last time the document was saved. This is the recommended setting when multiple authors work on the same set of documents as it will make it obvious to other authors that changes have been made in the document.
- **Always On** - The Track Changes feature is always on when you open a document. You can turn it off for an opened document, but it will be turned on for the next document you open.
- **Always Off** - The Track Changes feature is always off when you open a document. You can turn it on for an opened document, but it will be turned off for the next document you open.

Display changed lines marker

A changed line maker is a vertical line on the left side of the editor window indicating where changes have been made in the document. To hide the changed lines marker, disable this option.

Inserted content color

When Track Changes option is on, the newly inserted content is highlighted with an insertion marker that uses a color to adjust the following display properties of the inserted content: foreground, background, and underline. This section allows you to customize the following color options:

- **Automatic** - If this option is selected, Oxygen XML Editor automatically assigns a color to each user who inserted content in the current document. The colors are picked from the Colors for automatic assignment list, the priority being established by the type of change (deletion, insertion, or comment) and in the order that you see in the list.
- **Fixed** - If this option is selected, Oxygen XML Editor uses the specified color for all insertion markers, regardless of who the author is.
- **Use same color for text foreground** - If enabled, Oxygen XML Editor uses the color defined above (Automatic or Fixed) to render the foreground of the inserted content.
- **Use same color for background** - If enabled, Oxygen XML Editor uses the color defined above (Automatic or Fixed) to render the background of the inserted content. A slider control allows you to set the transparency level of the background.

Deleted content color

When Track Changes option is on, the deleted content is highlighted with a deletion marker that uses a color to adjust the following display properties of the deleted content: foreground, background, and strikethrough. This section allows you to customize the following color options:
• **Automatic** - If this option is selected, Oxygen XML Editor automatically assigns a color to each user who deleted content in the current document. The colors are picked from the *Colors for automatic assignment list*, the priority being established by the type of change (deletion, insertion, or comment) and in the order that you see in the list.

• **Fixed** - If this option is selected, Oxygen XML Editor uses the specified color for all deletion markers, regardless of who the author is.

• **Use same color for text foreground** - If enabled, Oxygen XML Editor uses the color defined above (*Automatic* or *Fixed*) to render the foreground of the deleted content.

• **Use same color for background** - If enabled, Oxygen XML Editor uses the color defined above (*Automatic* or *Fixed*) to render the background of the deleted content. A slider control allows you to set the transparency level of the background.

**Comments color section (applies for all authors)**

Sets the background color of the text that is commented on. The options are:

• **Automatic** - If this option is selected, Oxygen XML Editor automatically assigns a color to each user who adds a comment in the current document. The colors are picked from the *Colors for automatic assignment list*, the priority being established by the type of change (deletion, insertion, or comment) and in the order that you see in the list.

• **Fixed** - If this option is selected, Oxygen XML Editor uses the specified color for all changes, regardless of who the author is. A slider control allows you to set the transparency level of the background.

**Colors for automatic assignment list**

These are the colors that will be automatically assigned for tracked insertion changes, tracked deletion changes, and comments if the *Automatic* option is selected in any of the sections in this preferences page. The colors are assigned in the order that you see in this list. You can use the Add, Edit, or Remove buttons to modify the list of colors.

**Related information**

*Reviewing Documents* on page 340

**Callouts Preferences**

Oxygen XML Editor can display callouts for *review items such as comments and tracked changes*. To customize options for review callouts, open the *Preferences dialog box (Options > Preferences)* and go to Editor > Edit modes > Author > Review > Callouts.

The available options are as follows:

**Show review callouts for:**

- **Comments**
  - If enabled, callouts are displayed for comments, including comments that are added to tracked changes. This option is enabled by default.

- **Track Changes deletions**
  - If enabled, callouts are displayed for tracked change deletions and the following additional option becomes available:
    - **Show deleted content in callout**
      - If enabled, the deleted content is also displayed in the callout.

- **Track Changes insertions**
  - If enabled, callouts are displayed for tracked change insertions and the following additional option becomes available:
    - **Show inserted content in callout**
      - If enabled, the inserted content is also displayed in the callout.

**Rendering section**

- **Show review time**
  - When enabled, timestamp information is displayed in callouts.

- **Show all connecting lines**
  - When enabled, lines are shown that connect the callout to the location of the change.

- **Initial width (px)**
  - Specifies the initial width of the callouts each time the document is opened. The default is 250 pixels.
Text lines count limit

Specifies the maximum number of lines to be shown in the callouts. The default is 5 lines. Note that this does not limit the number of lines in the actual comment. It only limits the number of lines shown without opening or editing it. To see the full comment, right-click on the callout and select Edit Comment or Show Comment.

Profiling/Conditional Text Preferences

Oxygen XML Editor lets you configure how profiling and conditional text is displayed in Author mode. It has built-in support for the standard conditional text features of DITA and DocBook that you can customize for your own projects. You can also add conditional support for other XML vocabularies, including your custom vocabularies.

To configure Profiling/Conditional Text options, open the Preferences dialog box (Options > Preferences) and go to Editor > Edit modes > Author > Profiling/Conditional Text.

Note: Note the following when configuring these settings:

- This preferences page is used to define how profiled elements are treated in Author mode. It does not create profiling or conditional text attributes or values in the underlying XML vocabulary. It just changes how the editor displays them.
- This preferences page should be used for profiling / conditional text elements only. To change how other types of attributes are displayed in the text, use a CSS file.
- If you are using the DITA XML vocabulary and a DITA Subject Scheme Map is defined in the root map of your document, it will be used in place of anything defined using this dialog box.

This preferences page contains the following options and sections:

Import from DITAVAL

This button allows you to import profiling attributes from .ditaval files. You can merge these new profiling attributes with the existing ones, or replace them completely. If the imported attributes conflict with the existing ones, Oxygen XML Editor displays a dialog box that contains two tables. The first one previews the imported attributes and the second one previews the already defined attributes. You can choose to either keep the existing attributes or replace them with the imported ones.

Note: When importing profiling attributes from DITAVAL files, Oxygen XML Editor automatically creates condition sets based on these files.

Profiling Attributes section

Allows you to specify a set of allowable values for each profiling or conditional attribute. You can use the New button at the bottom of the table to add profiling attributes, the Edit button to edit existing ones, or the Delete button to delete entries from the table. Use the Up and Down buttons to change the priority of the entries. If you have multiple entries with identical names that match the same document type, Oxygen XML Editor uses the one that is positioned highest in the table.

Report invalid profiling attribute values

If selected, it means the following:

- In DITA, the automatic validation will display a warning when a value that is not defined is found in the document.
- In the DITA Validate and Check for Completeness dialog box, the Report attributes and values that conflict with profiling preferences option is not displayed. This means that the validation will behave the same as if that option was selected and it will always report such values.

Allow contributing extra profiling attribute values

This option is selected by default, which means that users are allowed to add values that are not defined in preferences to profiling attributes. If a user inserts such a value, when invoking the Edit Profiling Attributes action from the contextual menu in Author mode (or for DITA topics, the Edit Properties action in the DITA Maps Manager), the Profiling Values Conflict dialog box will appear and it includes an Add these values to the configuration action that will automatically add the new value to the particular profiling attribute. If deselected, Oxygen XML Editor behaves as if the Preserve the configuration option has been chose in the Profiling Values Conflict dialog box and that dialog box will never appear.

Configure profiling colors and styles link

Use this link to open the profiling Colors and Styles preference page.
**Profiling Condition Sets section**

Allows you to specify a specific set of profiling attributes to be used to specify a particular build configuration for your content. You can use the **New** button at the bottom of the table to add condition sets, the **Edit** button to edit existing ones, or the **Delete** button to delete entries from the table. Use the **Up** and **Down** buttons to change the priority of the entries. If you have multiple entries with identical names that match the same document type, Oxygen XML Editor uses the one that is positioned highest in the table.

**Colors and Styles Preferences**

Oxygen XML Editor lets you set the colors and styles used to display **profiling / conditional text** in the **Author mode editor**. To set Colors and Styles preferences, open the **Preferences** dialog box (Options > Preferences) and go to Editor > Edit modes > Author > Profiling/Conditional Text > Colors and Styles.

The preference page includes the following options and sections:

**Import from DITAVAL**

Allows you to import profiling styles from .ditaval files. You can merge these new profiling styles with the existing ones, or replace them completely. If the imported styles conflict with the existing ones, Oxygen XML Editor displays a dialog box containing two tables: the first one previews the imported styles and the second one previews the already defined styles. You can choose to either keep the existing styles or replace them with the imported ones.

**Profiling Colors and Styles Table**

You can use buttons below this table to set specific colors and styles for the listed profiling attribute values. The table includes two categories:

- **Defined attributes values** - Contains the styles for profiling attribute values defined in the Profiling / Conditional Text preferences page. Each profiling attribute value has an associated style. To ease the process of customizing styles, the **Defined attributes values** category contains by default the list of empty styles. All you have to do is to adjust the colors and decorations, thus skipping the process of manually defining the association rules (document type, attribute name and value). This is the reason why a style from this category can only be reset, not deleted.

- **Other** - This category contains styles for attribute values that are not marked as profiling values, in the Profiling / Conditional Text preferences page. In this category are listed:
  - All the styles that were defined in other projects (with other profiling attribute value sets).
  - All the styles set for the profiling attributes defined in a subject scheme map.

**Automatic styling button**

If you click this button, Oxygen XML Editor will apply automatic styling to the profiling attribute values that do not have a style defined.

**New button**

Opens the Add Profiling Style dialog box that allows you to associate a set of coloring and styling properties to a profiling value.

**Note:** You can define a default style for a specific attribute by setting the **Attribute value** field to <ANY>. This style is applied for attribute values that do not have a specific style associated with it.

**Edit button**

Open the Edit Profiling Style dialog box that allows you to edit the colors or style for an existing profiling value. You can also double-click the value to open this dialog box.

**Clear style button**

Resets the style for the selected value to its default setting (no color or decoration).

**Delete button**

Delete the selected style from the **Other** category.

**Related information**

- Styling the Rendering of Profiled Content Using a DITAVAL File on page 1613

Attributes Rendering Preferences
Oxygen XML Editor lets you display the profiling attributes applied to your content in the Author mode editor. To configure how the profiling attributes appear, open the Preferences dialog box (Options > Preferences) and go to Editor > Edit modes > Author > Profiling/Conditional Text > Attributes Rendering. When the Show Profiling Attributes option is enabled, the Author mode displays conditional text markers at the end of conditional text blocks. Use the options in this page to customize the rendering of these text markers.

The following options are available:

Show profiling attribute name
If checked, the names of the profiling attributes are displayed with their values. If unchecked, only the values are displayed.

Background color
Sets the background color used to display the profiling attributes.

Attribute name foreground color
Sets the foreground color used to display the names of the profiling attributes.

Attribute values foreground color
Sets the foreground color used to display values of the profiling attributes.

Border color
Sets the color of the border of the block that displays the profiling attributes.

MathML Preferences
Oxygen XML Editor allows you to edit MathML equations and displays the results in a preview window. For a more specialized MathML editor, you can install Design Science MathFlow, which is a commercial product that requires a separate license.

To configure the MathML editor or to enter your MathFlow license information, open the Preferences dialog box (Options > Preferences) and go to Editor > Edit modes > Author > MathML.

You can configure the following options:

Equation minimum font size
The minimum size of the font used for rendering mathematical symbols when editing in the Author mode.

MathFlow installation directory
The installation folder for the MathFlow components product (MathFlow SDK).

MathFlow license file
The license file for the MathFlow components product (MathFlow SDK).

MathFlow preferred editor
A MathML formula can be edited in one of three editors of MathFlow components product (MathFlow SDK).

- Structure Editor (default selection) - Targets professional XML workflow users.
- Style Editor - Tailored to the needs of content authors.
- Simple Editor - Designed for applications where end-users can enter mathematical equations without prior training and only the meaning of the math matters.

Save special characters
Specifies how special characters are saved in the XML file.

- As entity names - Saves the characters in &name; format. It refers to a character by the name of the entity that has the desired character as its replacement text. For example, the Greek Omega character is saved as &Omega;.
- As character entities (default selection) - Saves the characters in a hexadecimal value, using the &#xNNN format. For example, the Greek Omega character is saved as Ω.
- As character values - Saves the characters as the actual symbol. For example, the Greek Omega character is saved as Ω.

More documentation is available on the Design Science MathFlow website.

AutoCorrect Preferences
Oxygen XML Editor includes an option to automatically correct misspelled words as you type in Author mode. To enable and configure this feature, open the Preferences dialog box (Options > Preferences) and go to Editor > Edit Modes > Author > AutoCorrect.
The following options are available:

**Enable AutoCorrect**
This option is enabled by default. When enabled, while editing in **Author** mode, if you type anything that is listed in the **Replace** column of the Replacements table displayed in this preferences page, Oxygen XML Editor will automatically replace it with the value listed in the **With** column.

**Use additional suggestions from the spell checker**
If enabled, in addition to anything listed in the Replacements table displayed in this preferences page, Oxygen XML Editor will also use suggestions from the Spell Checker to automatically correct misspelled words. Suggestions from the Spell Checker will only be used if the misspelled word is not found in the Replacements table.

**Note:** The **AutoCorrect** feature shares the same options configured in the **Language options** and **Ignore elements** sections in the **Spell Check** preferences page.

**Spell Check options link**
Use this link to navigate to the **Spell Check Preferences page**.

**Replacements Table section**
The **AutoCorrect** feature uses the Replacements table to automatically replace anything that is listed in the **Replace** column with the value listed in the **With** column for each language.

**Replacements for language drop-down menu**
You can specify the language for the Replacements table, and for each language, you can configure the items listed in the table. The language selected in this page is not the language that will be used by the **AutoCorrect** feature. It is simply the language for the Replacements table.

**Replacements Table**
You can double-click on cells in either column to edit the listed items. Use the **Add** button to insert new items and the **Remove** button to delete rows from the table.

**Note:** Any changes, additions, or deletions you make to this table are saved to a path that is specified in the **AutoCorrect Dictionaries preferences page**.

**Smart quotes section**
You can also choose to automatically convert double and single quotes to a quotation characters of your choice by using the following options in the **Smart quotes** section:

- **Replace "Single quotes"** - Replaces single quotes with the quotation symbols you select with the **Start quote** and **End quote** buttons.
- **Replace "Double quotes"** - Replaces double quotes with the quotation symbols you select with the **Start quote** and **End quote** buttons.

**Global Options**
If this option is selected, the options are stored on your local computer, in a folder that is not accessible to other users.

**Project Options**
If this option is selected, the options are stored in the project file and can be shared with other users. Selecting **Project Options** will only save your selections in **Enable AutoCorrect**, **Use additional suggestions from the spell checker**, and the options in the **Smart quotes section**. Changes to the Replacements table are not saved in this page. To save changes to the Replacements table at project level you need to specify a custom location in the **User-defined replacements section of the AutoCorrect Dictionaries preferences page** and select **Project Options** from that preferences page instead.

**Restore Defaults**
Restores the options in this preferences page to their default values and also deletes any changes you have made to the **Replacements table**.

AutoCorrect Dictionaries Preferences
To set the Dictionaries preferences for the **AutoCorrect** feature, **open the Preferences dialog box (Options > Preferences)** and go to **Editor > Edit Modes > Author > AutoCorrect > Dictionaries**. This page allows you to specify the location of the dictionaries that Oxygen XML Editor uses for the **AutoCorrect** feature and the location for saving user-defined replacements.

The following options are available in this preferences page:
Dictionaries default folder

Displays the default location where the dictionaries that Oxygen XML Editor uses for the AutoCorrect feature are stored.

Include dictionaries from

Selecting this option allows you to specify a location where you have stored AutoCorrect dictionaries that you want to include, along with the default ones.

Important: Consider the following notes in regards to this option:

• The AutoCorrect mechanism takes into account AutoCorrect dictionaries collected both from the default and custom locations and multiple dictionaries from the same language are merged (for example, en_UK.dat from the default location is merged with en_US.dat from a custom location).

• If you have a generic AutoCorrect dictionary file (one that just has a two letter language code for its file name, such as en.dat) saved in either the default or custom location, the other more specific dictionaries (for example, en_UK.dat and en_US.dat) will not be merged and the existing generic dictionary will simply be used instead.

• If the additional location contains a file with the same name as one from the default location, the file in the additional location takes precedence over the file from the default location.

How to add more dictionaries link

Use this link to open a topic in the Oxygen XML Editor User Guide that explains how to add dictionaries for the AutoCorrect feature.

Save user-defined replacements in the following location

Specifies the target where added, edited, or deleted replacements are saved. By default, the target is the application preferences folder, but you can also choose a custom location.

Tip: To save changes to the Replacement table (in the AutoCorrect preferences page) at project level, select a custom location for the User-defined replacements and select Project Options at the bottom of the page.

Related tasks

Add Dictionaries for the AutoCorrect Feature on page 687

Schema Design Preferences

Oxygen XML Editor provides a graphical schema design editor to make editing XML Schema easier. To configure the Schema Design options, open the Preferences dialog box (Options > Preferences) and go to Editor > Edit modes > Schema Design.

The following options are available in the Schema Design preferences page:

Show annotation in the diagram

When selected, Oxygen XML Editor displays the content of xs:documentation elements in schema diagrams.

When trying to edit components from another schema

The schema diagram editor will combine schemas imported by the current schema file into a single schema diagram. You can choose what happens if you try to edit a component from an imported schema. The options are:

• Always go to its definition - Oxygen XML Editor opens the imported schema file so that you can edit it.

• Never go to its definition - The imported schema file is not opened and the component cannot be edited in place.

• Always ask - Oxygen XML Editor asks if you want to open the imported schema file.

Zoom

Allows you to set the default zoom level of the schema diagram.

Properties Preferences

Oxygen XML Editor lets you control which properties to display for XML Schema components in the XML Schema Design view. To configure the schema design properties displayed, open the Preferences dialog box (Options > Preferences) and go to Editor > Edit modes > Schema Design > Properties.

This preferences page contains the following:
Show additional properties in the diagram
If this option is selected, the properties selected in the property table are shown in the XML Schema Design mode. This option is selected by default.

Properties Table

Show
Use this column in the table to select the properties that you want to be displayed in the XML Schema Design mode.

Only if specified
Use this column to select if you want the property to be displayed only if it is defined in the schema.

Spell Check Preferences
Oxygen XML Editor provides support for spell checking in the Text and Author editing modes. To configure the Spell Check options, open the Preferences dialog box (Options > Preferences) and go to Editor > Spell Check.

The following options are available:

Automatic spell check
This option is disabled by default. When enabled, Oxygen XML Editor automatically checks the spelling as you type and highlights misspelled words in the document.

• Select editors - You can select which editors (and therefore which file types) will be automatically spelled checked. File types (such as CSS and DTD), in which automatic spell checking is not usually helpful, are excluded by default.

Spell check highlight color
Use this option to set the color used by the spell check engine to highlight spelling errors.

Language options section
This section includes the following language options:

Default language
The default language list allows you to choose the language used by the spell check engine when the language is not specified in the source file. You can add additional dictionaries to the spell check engines.

Use "lang" and "xml:lang" attributes
When this option is selected, the contents of an element with one of the lang or xml:lang attributes is checked in that language. Choose between the following two options for instances when these attributes are missing:

• Use the default language - If the lang and xml:lang attributes are missing, the selection in the Default language list is used.
• Do not check - If the lang and xml:lang attributes are missing, the element is not checked.

XML spell checking in section
You can choose to check the spelling inside the following XML items:

• Comments
• Attribute values
• Text
• CDATA

Options section
This section includes the following other options:

Check capitalization
When selected, the spell checker reports capitalization errors (for example, a word that starts with lowercase after etc. or i.e.).

Check punctuation
When selected, the spell checker checks punctuation. Misplaced white space and unusual sequences, such as a period following a comma, are highlighted as errors.

Ignore mixed case words
When selected, the spell checker does not check words containing mixed case characters (for example, SpellChecker).
Ignore acronyms
Available only for the Hunspell spell checker. When selected, acronyms are not reported as errors.

Ignore words with digits
When selected, the spell checker does not check words containing digits (for example, b2b).

Ignore duplicates
When selected, the spell checker does not signal two successive identical words as an error.

Ignore URL
When selected, the spell checker ignores words recognized as URLs or file names (for example, www.oxygenxml.com or c:\boot.ini).

Allow compounds words
When selected, all words formed by concatenating two legal words with a hyphen (hyphenated compounds) are accepted. If recognized by the language, two words concatenated without hyphen (closed compounds) are also accepted.

Allow file extensions
When selected, the spell checker accepts any word ending with recognized file extensions (for example, myfile.txt or index.html).

Ignore elements section
You can use the Add and Remove buttons to configure a list of element names or XPath expressions to be ignored by the spell checker. The following restricted set of XPath expressions are supported:

- '/' and '//' separators
- '*' wildcard

An example of an allowed XPath expression is: /a/*//b.

AutoCorrect options link
Use this link to navigate to the AutoCorrect preferences page.

Spell Check Dictionaries Preferences
To set the Dictionaries preferences, open the Preferences dialog box (Options > Preferences) and go to Editor > Spell Check > Dictionaries. This page allows you to configure the dictionaries (.dic files) and term lists (.tdi files) that Oxygen XML Editor uses and to choose where to save new learned words.

The following options are valid when Oxygen XML Editor uses the Hunspell spell checking engine:

Dictionaries and term lists default folder
Displays the default location where the dictionaries and term lists that Oxygen XML Editor uses are stored.

Include dictionaries and term list from
Selecting this option allows you to specify a location where you have stored dictionaries and term lists that you want to include, along with the default ones.

Important: Consider the following notes in regards to this option:

- The spell checker takes into account dictionaries and term lists collected both from the default and custom locations and multiple dictionaries and term lists from the same language are merged (for example, en_UK.dic from the default location is merged with en_US.dic from a custom location).
- If you have a generic dictionary file (one that just has a two letter language code for its file name, such as en.dic) saved in either the default or custom location, the other more specific dictionaries (for example, en_UK.dic and en_US.dic) will not be merged and the existing generic dictionary will simply be used instead.
- If the additional location contains a file with the same name as one from the default location, the file in the additional location takes precedence over the file from the default location.

How to add more dictionaries and term lists link
Use this link to open a topic in the Oxygen XML Editor User Guide that explains how to add more dictionaries and term lists.
Save learned words in the following location

Specifies the target where the newly learned words are saved. By default, the target is the application preferences folder, but you can also choose a custom location.

Delete learned words

Opens the list of learned words, allowing you to select the items you want to remove, without deleting the dictionaries and term lists.

*Adding Spell Check Term Lists* on page 682

Document Checking Preferences

To configure the Document Checking (validation) options, *open the Preferences dialog box (Options > Preferences)* and go to Editor > Document Checking. This page contains preferences for configuring how a document is checked for both well-formedness and validation errors.

The following options are available:

**Maximum number of validation highlights**

If a validation generates more errors than the number specified in this option, only the errors up to this number are highlighted in the editor panel and on the stripe that is displayed at the right side of the editor panel. This option applies to both *automatic validation* and *manual validation*.

**Validation error highlight color**

The color used to highlight validation errors in the document.

**Validation warning highlight color**

The color used to highlight validation warnings in the document.

**Validation info highlight color**

The color used to highlight validation info messages in the document.

**Validation success color**

The color used to highlight the success indicator of the validation operation in the vertical ruler bar.

**Always show validation status**

If this option is enabled, the current validation error or warning is always visible in the message line at the bottom of the editor panel. This is useful when *Automatic validation* is enabled and the vertical scroll bar changes position due to an error message being displayed.

**Enable automatic validation**

This causes the validation to be automatically executed in the background as the document is modified in Oxygen XML Editor.

**Delay after the last key event (s)**

The period of keyboard inactivity before starting a new validation (in seconds).

At the bottom of the preferences page you can choose whether or not the saved options will be shared with other users by selecting *Global* or *Project* storage options.

Format Preferences

This preferences page contains various formatting options that influence editing and formatting in both the *Text* and *Author* editing modes. To control additional options specifically for the *Author* mode editor, see *Whitespace Handling in Author Mode* on page 226.

**Note:** These settings apply to the formatting of source documents. The formatting of output documents is determined by the transformation scenarios that create them.

To configure the Format options, *open the Preferences dialog box (Options > Preferences)* and go to Editor > Format.

The following options are available:
Detect indent on open
If selected, Oxygen XML Editor detects how a document is indented when it is opened. Oxygen XML Editor uses a heuristic method of detection by computing a weighted average indent value from the initial document content. You can deselect this setting if the detected value does not work for your particular case and you want to use a fixed-size indent for all the edited documents. If this option is selected, Oxygen XML Editor detects the following:

• When TAB characters are used to indent content, the size of the TAB characters is used for the indent size.
• Otherwise, the detected size of SPACE characters is used for the indent size.

Tip: If you want to minimize the formatting differences created by the Format and Indent operation in a document edited in the Text edited mode, make sure that both the Detect indent on open and Detect line width on open options are selected.

Use zero-indent, if detected
By default, if no indent was detected in the document, the fixed-size indent is used. Select this option if all your document have no indentation and you want to keep them that way.

Indent with tabs
If selected, indents are created using TAB characters. If unchecked, lines are indented using space characters. Selecting this option automatically disables the Detect indent on open option.

Indent size
The meaning of this setting depends on the following:

• If the Detect indent on open option is selected and TAB characters are detected at the beginning of the line, the indent size is the width of a TAB character. Otherwise, the indent size value is ignored and Oxygen XML Editor uses the number of detected SPACE characters.
• If the Indent with tabs option is selected, the indent size is the width of a TAB character.
• If neither of these options are selected, the indent size is the number of SPACE characters used for indenting the text lines.

For additional information about changing the indent size, see Setting an Indent Size to Zero on page 300.
For information about when this setting is used, see Where Indent Size and Line Width Settings are Used in Oxygen XML Editor on page 90.

Indent on enter
If selected, when you press Enter to insert a line break in the Text editing mode, an indentation will be added to the new line.

Enable smart enter
If selected, when you press the Enter key between a start and an end XML tag in the Text editing mode, the cursor is placed in an indented position on the empty line formed between the start and end tag.

Format and indent the document on open
If selected, an XML document is formatted and indented before opening it in Oxygen XML Editor.

Note: Some specialized types of XML documents do not benefit from this feature, including Relax NG, XSD, XSL, and Ant. However, the feature is available for some non-XML types of documents, such as CSS and JSON.

Detect line width on open
If selected, Oxygen XML Editor automatically detects the line width when the document is opened.

Hard line wrap (Limit to "Line width - Format and Indent")
If selected, when typing content in the Text editing mode and the maximum line width is reached, a line break is automatically inserted.

Line width - Format and Indent
Defines the number of characters after which the Format and Indent (pretty-print) action performs hard line-wrapping. For example, if set to 100, after a Format and Indent action, the longest line will have a maximum of 100 characters. This setting is also used when saving XML content edited in the Author editing mode.
Note: To avoid having an indent that is longer than the line width setting and without having sufficient space available for the text content, the indent limit is actually set at half the value of the Line width - Format and Indent setting. The remaining space is reserved for text.

For information about when this setting is used, see Where Indent Size and Line Width Settings are Used in Oxygen XML Editor.

Clear undo buffer before Format and Indent

The Format and Indent operation can be undone, but if used intensively, a considerable amount of the memory allocated for Oxygen XML Editor will be used for storing the undo states. If this option is selected, Oxygen XML Editor empties the undo buffer before doing a Format and Indent operation. This means you will not be able to undo any changes you made before the format and indent operation. Select this option if you encounter out of memory problems (OutOfMemoryError) when performing the Format and Indent operation.

Where Indent Size and Line Width Settings are Used in Oxygen XML Editor

The values set in the Indent Size and Line Width - Format and Indent options are used in various places in the application, including the following:

- When the Format and Indent action is used in the Text editing mode.
- When you press ENTER to break a line in the Text editing mode.
- When the Hard line wrap (Limit to "Line width - Format and Indent") option is selected and the maximum line width is reached while editing in the Text mode.
- When the XML is serialized by saving content in the Author editing mode.

To watch our video demonstration about the formatting options offered by Oxygen XML Editor, go to https://www.oxygenxml.com/demo/Autodetect_Formatting.html.

XML Preferences

To configure the XML Formatting options, open the Preferences dialog box (Options > Preferences) and go to Editor > Format > XML.

The following options are available:

Format Section

This section includes the following drop-down boxes:

- Preserve empty lines
  The Format and Indent operation preserves all empty lines found in the document.
- Preserve text as it is
  The Format and Indent operation preserves text content as it is, without removing or adding any white space.
- Preserve line breaks in attributes
  Line breaks found in attribute values are preserved.

Note: When this option is enabled, the Break long attributes option is automatically disabled.

Break long attributes

The Format and Indent operation breaks long attribute values.

Indent inline elements

The inline elements are indented on separate lines if they are preceded by white spaces and they follow another element start or end tag. For example:

Original XML:

```xml
<root>
  text <parent> <child></child> </parent>
</root>
```

Indent inline elements enabled:

```xml
<root> text <parent>
  <child/>
</parent>
</root>
```
Indent inline elements disabled:

 Expand empty elements

 The Format and Indent operation outputs empty elements with a separate closing tag (for example, `<a atr1="v1"/>`). When not enabled, the same operation represents an empty element in a more compact form (`<a atr1="v1"/>`).

 Sort attributes

 The Format and Indent operation sorts the attributes of an element lexicographically.

 Add space before slash in empty elements

 Inserts a space character before the trailing `/` and `>` of empty elements.

 Break line before an attribute name

 The Format and Indent operation breaks the line before the attribute name.

 Element Spacing Section

 This section controls how the application handles whitespaces found in XML content. You can Add or Remove element names or simplified XPath expressions in the various tabs.

 The XPath expressions can accept multiple attribute conditions and inside each condition you can use AND/OR boolean operators and parentheses to override the priority.

 You can use one or more of the following attribute conditions (default attribute values are not taken into account):

 - `element[@attr]` - Matches all instances of the specified element that include the specified attribute.
 - `element[not(@attr)]` - Matches all instances of the specified element that do not include the specified attribute.
 - `element[@attr = "value"]` - Matches all instances of the specified element that include the specified attribute with the given value.
 - `element[@attr != "value"]` - Matches all instances of the specified element that include the specified attribute and its value is different than the one given.

 Example: The following is an example of how you could use multiple boolean operators and parentheses inside an attribute condition:

 ![Example XPath expressions](image-url)

 The following are just examples of how simplified XPath expressions might look like:

 - `elementName`
 - `//elementName`
 - `/elementName1/elementName2/elementName3`
 - `//xs:localName`
  
  Note: The namespace prefixes (such as `xs`) are treated as part of the element name without taking its binding to a namespace into account.
 - `//xs:documentation[@lang="en"]`

 The tabs are as follows:

 Preserve space

 List of elements for which the Format and Indent operation preserves the whitespaces (such as blanks, tabs, and newlines).

 Default space

 List of elements for which the content is normalized (multiple contiguous whitespaces are replaced by a single space), before applying the Format and Indent operation.

 Mixed content

 The elements from this list are treated as mixed content when applying the Format and Indent operation. The lines are split only when whitespaces are encountered.
Line break

List of elements for which line breaks will be inserted, regardless of their content. You can choose to break the line before the element, after, or both.

Schema aware format and indent

The Format and Indent operation takes the schema information into account with regards to the space preserve, mixed, or element only properties of an element.

Indent Section

Includes the following options:

Indent (when typing) in preserve space elements

Normally, the Preserve space elements (identified by the xml:space attribute set to preserve or by their presence in the Preserve space tab of the Element Spacing list) are ignored by the Format and Indent operation. When this option is enabled and you edit one of these elements, its content is formatted.

Indent on paste - sections with number of lines less than 300

When you paste a chunk of text that has fewer than 300 lines, the inserted content is indented. To keep the original indent style of the document you copy content from, disable this option.

Whitespaces Preferences

When Oxygen XML Editor formats and indents XML documents, a whitespace normalization process is applied, thus replacing whitespace sequences with single space characters. Oxygen XML Editor allows you to configure which Unicode characters are treated as spaces during the normalization process.

To configure the Whitespace preferences, open the Preferences dialog box (Options > Preferences) and go to Editor > Format > XML > Whitespaces.

This table lists the Unicode whitespace characters. Check any that you want to have treated as whitespace when formatting and indenting an XML document.

The whitespaces are normalized when:

- The Format and Indent action is applied on an XML document.
- You switch from Text mode to Author mode.
- You switch from Author mode to Text mode.

Note: The whitespace normalization process replaces any sequence of characters declared as whitespaces in the Whitespaces table with a single space character (U+0020). If you want to be sure that a certain whitespace character will not be removed in the normalization process, deselect it in the Whitespaces table.

Important: The characters with the codes U+0009 (TAB), U+000A (LF), U+000D (CR) and U+0020 (SPACE) are always considered to be whitespace characters and cannot be deselected.

XQuery Preferences

To configure the XQuery Formatting options, open the Preferences dialog box (Options > Preferences) and go to Editor > Format > XQuery.

The following options are available:

- Preserve line breaks - All initial line breaks are preserved.
- Break line before an attribute name - Each attribute of an XML element is written on a new line and properly indented.

XPath Preferences

To configure the XPath Formatting options, open the Preferences dialog box (Options > Preferences) and go to Editor > Format > XPath.

The following option is available:

- Format XPath code embedded in XSLT, XSD and Schematron files - If enabled, the Format and Indent action applied on an XSD, XSLT, or Schematron document will perform an XPath-specific formatting on the values of the attributes that accept XPath expressions.
Note: For XSLT documents, the formatting is not applied to attribute value templates.

CSS Preferences

Oxygen XML Editor can format and indent your CSS files. To configure the CSS formatting options, open the Preferences dialog box (Options > Preferences) and go to Editor > Format > CSS.

The following options control how your CSS files are formatted and indented:

Class body on new line
  If enabled, the class body (including the curly brackets) is placed on a new line. Disabled by default.

Indent class content
  When enabled, the class content is indented. Enabled by default.

Add space before the value of a CSS property
  When enabled, whitespaces are added between the : (colon) and the value of a style property. Enabled by default.

Add new line between classes
  If enabled, an empty line is added between two classes. Disabled by default.

Preserve empty lines
  When enabled, the empty lines from the CSS content are preserved. Enabled by default.

Allow formatting embedded CSS
  When enabled, CSS content that is embedded in XML is also formatted when the XML content is formatted. Enabled by default.

JavaScript Preferences

To configure the JavaScript format options, open the Preferences dialog box (Options > Preferences) and go to Editor > Format > JavaScript.

The following options control the behavior of the Format and Indent action:

• Start curly brace on new line - Opening curly braces start on a new line.
• Preserve empty lines - Empty lines in the JavaScript code are preserved. This option is enabled by default.
• Allow formatting embedded JavaScript - Applied only to XHTML documents, this option allows Oxygen XML Editor to format embedded JavaScript code, taking precedence over the Schema aware format and indent option. This option is enabled by default.

Content Completion Preferences

Oxygen XML Editor provides a Content Completion Assistant that provides a list of available options at any point in a document and can auto-complete structures, elements, and attributes. To configure the Content Completion preferences, open the Preferences dialog box (Options > Preferences) and go to Editor > Content Completion. These options control how the Content Completion Assistant works.

The following options are available:

Auto close the last opened tag
  When enabled, Oxygen XML Editor automatically closes the last open tag when you type </.

Automatically rename/delete/comment matching tags
  If you rename, delete, or comment out a start tag, Oxygen XML Editor automatically renames, deletes, or comments out the matching end tag.

Note: If you select Toggle comment for multiple starting tags and the matching end tags are on the same line as other start tags, the end tags are not commented.

Enable content completion
  Toggles the content completion feature on or off.

Close the inserted element
  When you choose an entry from the Content Completion Assistant list of proposals, Oxygen XML Editor inserts both start and end tags. The following additional options are available in regards to closing the element:
• **If it has no matching tag** - The end tag of the inserted element is automatically added only if it is not already present in the document.

• **Add element content** - Oxygen XML Editor inserts the required elements specified in the DTD, XML Schema, or RELAX NG schema that is associated with the edited XML document.

• **Add optional content** - If enabled, Oxygen XML Editor inserts the optional elements specified in the DTD, XML Schema, or RELAX NG schema.

• **Add first Choice particle** - If enabled, Oxygen XML Editor inserts the first choice particle specified in the DTD, XML Schema, or RELAX NG schema.

**Case sensitive search**

When enabled, the search in the **Content Completion Assistant** is case-sensitive when you type a character (‘a’ and ‘A’ are different characters).

![Note:](image) This option is ignored when the current language itself is not case sensitive. For example, the case is ignored in the CSS language.

**Position cursor between tags**

When enabled, Oxygen XML Editor automatically moves the cursor between the start and end tag after inserting the element. This only applies to:

- Elements with only optional attributes or no attributes at all.
- Elements with required attributes, but only when the **Insert the required attributes** option is disabled.

**Show all entities**

Oxygen XML Editor displays a list with all the internal and external entities declared in the current document when you type the start character of an entity reference (for example, &).

**Insert the required attributes**

Oxygen XML Editor inserts automatically the required attributes taken from the DTD or XML Schema.

**Insert the fixed attributes**

If enabled, Oxygen XML Editor automatically inserts any **FIXED** attributes from the DTD or XML Schema for an element inserted with the help of the **Content Completion Assistant**.

**Show recently used items**

When enabled, Oxygen XML Editor remembers the last inserted items from the **Content Completion Assistant** window. The number of items to be remembered is limited by the **Maximum number of recent items shown** list box. These most frequently used items are displayed on the top of the content completion window and are separated from the rest of the suggestions by a thin gray line.

**Maximum number of recent items shown**

Specifies the limit for the number of recently used items presented at the top of the **Content Completion Assistant** window.

**Learn attributes values**

When enabled, Oxygen XML Editor learns the attribute values used in a document.

**Learn on open document**

Oxygen XML Editor automatically learns the document structure when the document is opened.

**Learn words (Dynamic Abbreviations, available on CTRL-SPACE (COMMAND-SPACE on OS X))**

When enabled, Oxygen XML Editor learns the typed words and makes them available in a content completion fashion by pressing **Ctrl + Space (Command + Space on OS X)** on your keyboard.

![Note:](image) In order to be learned, the words need to be separated by space characters.

**Activation delay of the proposals window (ms)**

Delay in milliseconds from last key press until the **Content Completion Assistant** is displayed.

**Related information**

*Configuring the Proposals for Attribute and Element Values* on page 1183
Annotations Preferences

Certain types of schemas (XML Schema, DTDs, Relax NG) can include annotations that document the various elements and attributes that they define. Oxygen XML Editor can display these annotations when offering content completion suggestions. To configure the Annotations preferences, open the Preferences dialog box (Options > Preferences) and go to Editor > Content Completion > Annotations.

The following options are available:

Show annotations in Content Completion Assistant

Oxygen XML Editor displays the schema annotations of an element, attribute, or attribute value currently selected in the Content Completion Assistant proposals list.

Show annotations in tooltip

Oxygen XML Editor displays the annotation of elements and attributes as a tooltip when you hover over them with the cursor in the editing area or in the Elements view.

Show annotation in HTML format, if possible

This option allows you to view the annotations associated with an element or attribute in HTML format. It is available when editing XML documents that have associated an XML Schema or Relax NG schema. When this option is disabled the annotations are converted and displayed as plain text.

Prefer DTD comments that start with “doc:” as annotations

To address the lack of dedicated annotation support in DTD documents, Oxygen XML Editor recommends prefixing with the doc: particle all comments intended to be shown to the developer who writes an XML validated against a DTD schema.

When this option is enabled, Oxygen XML Editor uses the following mechanism to collect annotations:

• If at least one doc: comment is found in the entire DTD, only comments of this type are displayed as annotations.
• If no doc: comment is found in the entire DTD, all comments are considered annotations and displayed as such.

When the option is disabled, all comments, regardless of their type, are considered annotations and displayed as such.

Use all Relax NG annotations as documentation

When this option is selected, any element outside the Relax NG namespace, that is http://relaxng.org/ns/structure/1.0, is considered annotation and is displayed in the annotation window next to the Content Completion Assistant window and in the Model view. When this option is not selected, only elements from the Relax NG annotations namespace, that is http://relaxng.org/ns/compatibility/annotations/1.0 are considered annotations.

Related information

Schema Annotations in Text Mode on page 288

XSLT Preferences

XSLT stylesheets are often used to create output in XHTML or XSL-FO. In addition to suggesting content completion options for XSLT stylesheet elements, Oxygen XML Editor can suggest elements from these vocabularies. To configure the XSLT content completion options, open the Preferences dialog box (Options > Preferences) and go to Editor > Content Completion > XSLT.

The following options are available:

Include elements declared in the schema section

This section includes options in regards to detecting elements from the declared schema.

Automatically detect HTML or Formatting Objects

Detects if the output being generated is HTML or FO and provides content completion for those vocabularies. Oxygen XML Editor analyzes the namespaces declared in the root element to find an appropriate schema.

If the detection fails, Oxygen XML Editor uses one of the following options:

• None - The Content Completion Assistant suggests only XSLT elements.
• HTML - The Content Completion Assistant includes HTML elements, including HTML5 elements (such as video, canvas, etc.).
• Formatting objects - The Content Completion Assistant includes Formatting Objects (XSL-FO) elements as substitutes for xsl:element.
• **Custom schema** - If you want content completion hints for another output vocabulary, you can use this option to specify the path to the schema for that vocabulary. The supported schema types are DTD, XML Schema, RNG schema, or NVDL schema for inserting elements from the target language of the stylesheet.

**Documentation schema section**

This section specifies an additional schema that will be used for documenting XSL stylesheets. You can choose between the following:

• **Build-in schema** - Uses the built-in schema for documentation.
• **Custom schema** - Allows you to specify a custom schema for documentation. The supported schema types are XSD, RNG, RNC, DTD, and NVDL.

**XPath Preferences**

Oxygen XML Editor provides content-completion support for XPath expressions. To configure the options for the content completion in XPath expressions, open the Preferences dialog box (Options > Preferences) and go to Editor > Content Completion > XPath.

The following options are available:

• **Enable content completion for XPath expressions** - Enables the Content Completion Assistant in XPath expressions that you enter in the match, select, and test XSL attributes and also in the XPath toolbar.
  • **Include XPath functions** - When this option is selected, XPath functions are included in the content completion suggestions.
  • **Include XSLT functions** - When this option is selected, XSLT functions are included in the content completion suggestions.
  • **Include axes** - When this option is selected, XSLT axes are included in the content completion suggestions.

• **Show signatures of XSLT / XPath functions** - Makes the editor indicate the signature of the XPath function located at the cursor position in a tooltip. See the XPath Tooltip Helper section for more information.
• **Function signature window background** - Specifies the background color of the tooltip window.
• **Function signature window foreground** - Specifies the foreground color of the tooltip window.

**XSD Preferences**

Oxygen XML Editor provides content completion assistance when you are writing XML Schema (XSD). To configure XSD preferences, open the Preferences dialog box (Options > Preferences) and go to Editor > Content Completion > XSD. The option in this preferences page allows you to define additional elements to be suggested by the Content Completion Assistant in xs:appinfo elements (in addition to the elements defined in the XML Schema).

The following option is available:

**When in "xs:appinfo" context, also include elements declared in the schema**

You can choose between the following:

• **None** - The Content Completion Assistant offers only the XML Schema schema information.
• **ISO Schematron** - The Content Completion Assistant also includes ISO Schematron elements in xs:appinfo.
• **Schematron 1.5** - The Content Completion Assistant also includes Schematron 1.5 elements in xs:appinfo.
• **Other** - The Content Completion Assistant also includes elements from an XML Schema identified by a URL in xs:appinfo elements.

**JavaScript Preferences**

Oxygen XML Editor can provide content completion suggestions when you are writing JavaScript files. To configure content completion support for JavaScript, open the Preferences dialog box (Options > Preferences) and go to Editor > Content Completion > JavaScript. You can configure the following options:

**Enable content completion**

Enables the content completion support for JavaScript files.

**Use built-in libraries**

Allows Oxygen XML Editor to include components (object names, properties, functions, and variables) collected from the built-in JavaScript library files when making suggestions.
Use defined libraries

Oxygen XML Editor can also use JavaScript libraries to when making suggestions. List the paths (URIs) of any JavaScript files you want Oxygen XML Editor to use when making suggestions.

Note: The paths can contain editor variables such as ${pdu}, or ${oxygenHome}. You can make these paths relative to the project directory or installation directory.

Syntax Highlight Preferences

Oxygen XML Editor supports syntax highlighting in the Text mode editors for numerous types of documents, including XML, XHTML, JavaScript, XQuery, XPath, PHP, CSS, LESS, Markdown, Text, DTD, RNC, Java, JSON, Ant, and more.

To configure syntax highlighting, open the Preferences dialog box (Options > Preferences) and go to Editor > Syntax Highlight.

To set syntax colors for a language, expand the listing for that language in the top panel to show the list of syntax items for that type of document. Use the color and style selectors to change how each syntax item is displayed. The results of your changes are displayed in the Preview panel. If you do not know the name of the syntax token that you want to configure, click that token in the Preview area to select it.

Note: All default color sets come with a high-contrast variant that is automatically used when you switch to a black-background or white-background high-contrast theme in your Windows operating system settings. The high-contrast theme will not overwrite any default color you set in Editor > Syntax Highlight preferences page.

The settings for XML documents are also used in XSD, XSL, RNG documents and the Preview area has a separate tab for each of them when XML is selected in the top pane.

The Enable nested syntax highlight option controls whether or not content types that are nested in the same file (such as PHP, JS, or CSS scripts inside an HTML file) are highlighted according to the color schemes defined for each content type.

Elements/Attributes by Prefix Preferences

Oxygen XML Editor allows you to specify syntax highlighting colors for XML elements and attributes with specific namespace prefixes. To configure the Elements/Attributes by Prefix preferences, open the Preferences dialog box (Options > Preferences) and go to Editor > Syntax Highlight > Elements/Attributes by Prefix.

To change the syntax coloring for a specific namespace prefix, choose the prefix from the list, or add a new one using the New button, and use the color and style selectors to set the syntax highlighting style for that namespace prefix.

Note: Syntax highlighting is based on the literal namespace prefix, not the namespace that the prefix is bound to in the document.

If you only want the prefix, and not the whole element or attribute name, to be styled with a particular color, enable the Draw only the prefix with a separate color option.

Open/Save Preferences

Oxygen XML Editor lets you control how files are opened and saved. To configure the options for opening and saving documents, open the Preferences dialog box (Options > Preferences) and go to Editor > Open/Save.

The following options are available:

Open section

Lock local resources

When this option is selected and you open a file from the local file system or a shared network drive, Oxygen XML Editor locks the file for the current user and the file becomes read-only for other users while the lock exists. Locked and read-only files have a lock icon (🔒) displayed on their editor tabs. Newly created files are locked when you first save them. If you select this option with files already opened in Oxygen XML Editor, it will lock all the currently opened files. If you deselect this option with files already opened, it will unlock them by deleting the corresponding .lock files. When you try to save locked (read-only) files, a Save As dialog box will be displayed to avoid overwriting the initial resource.
Support for Special Characters section

When bidirectional text, Asian languages, or other special characters are detected

You can choose how you want Oxygen XML Editor to handle bidirectional text, Asian languages, or other special characters when they are detected. You can choose one of the following:

- **Enable support for special characters** - The support for special characters will always be enabled.
- **Disable support for special characters** - The support for special characters will always be disabled.
- **Prompt for each document** - You will be prompted to choose whether or not to enable the support for special characters whenever they are detected in a newly opened document.

Disable special characters support for documents larger than (characters)

Enabling bidirectional text editing support can affect performance on large files. When this option is enabled, bidirectional editing is disabled for files exceeding the specified size, even if the Enable support for special characters option is selected.

Save section

Safe save (only for local files)

In the unlikely event of a failure when attempting a Save action, this option provides increased protection from corruption of the original file. When this option is enabled, it saves the content to a temporary file and if the save is unsuccessful, the editor preserves its unsaved state status.

On Save, make backup copy with extension (only for local files)

If enabled, a backup copy is made when saving the edited document. This option is available only for local files (files that are stored on the local file system). The default backup file extension is .bak, but that can be changed in the text field.

Automatically save the document every

If enabled, your documents are automatically saved after a preset time interval that is specified in the drop-down list.

Save all files before transformation or validation

Saves all opened files before validating or transforming an XML document. This ensures that any dependencies are resolved when modifying the XML document and its XML Schema.

Check errors on save

If enabled, Oxygen XML Editor runs a validation that checks your document for errors before saving it.

Save all files before calling external tools

If enabled, all files are saved before executing an external tool.

Performance section

Optimize loading in the Text edit mode for files over (MB)

File loading is optimized for reduced memory usage for any file whose size is larger than the value specified in this drop-down list. This is useful for editing large files, but there are several restrictions for memory-intensive operations.

Show warning when loading large documents

Oxygen XML Editor will warn you if you open a file that is bigger than the specified size.

Optimize loading for documents with lines longer than (Characters)

Line wrap is automatically performed for documents that contain lines that exceed the length specified in this text field. For a list of the restrictions applied to a document with long lines, see Editing Documents with Long Lines.

Show warning when loading documents with long lines

When selected, Oxygen XML Editor will warn you when you open a file with lines longer than the specified length. To reduce the length of lines in a file, format and indent the document after it is opened in the editor panel. For a list of the restrictions applied to a document with long lines, see Editing Documents with Long Lines on page 689.

Clear undo buffer on save

If selected, Oxygen XML Editor clears its undo buffer when you save a document. Thus, modifications made prior to saving the document cannot be undone. Select this option if you frequently encounter out of memory errors when editing large documents.
Consider application bundles to be directories when browsing (OS X only)

This option is available only on the Mac OS X platform. When selected, the file browser dialog box allows you to browse inside an application bundle, as in a regular folder. Otherwise, it is not allowed (the same as the Finder application on Mac OS X).

Note: The same effect can be obtained by setting the apple.awt.use-file-dialog-packages property to true or false in the Info.plist descriptor file of the Oxygen XML Editor application:

```xml
<key>apple.awt.use-file-dialog-packages</key>
<string>false</string>
```

Save Hooks Preferences

Oxygen XML Editor includes an option for automatically compiling LESS stylesheets. To set this option, open the Preferences dialog box (Options > Preferences) and go to Editor > Open/Save > Save Hooks.

The following option can be enabled or disabled:

**Automatically compile LESS to CSS when saving**

If enabled, when you save a LESS file it will automatically be compiled to CSS (disabled by default).

Important: If this option is enabled, when you save a LESS file, the CSS file that has the same name as the LESS file is overwritten without warning. Make sure all your changes are made in the LESS file. Do not edit the CSS file directly, as your changes might be lost.

Templates Preferences

This page simply allows you to navigate to the preference pages for code templates or document templates.

Code Templates Preferences

*Code templates* are code fragments that can be inserted at the current editing position. Oxygen XML Editor includes a set of built-in templates for CSS, LESS, Schematron, XSL, XQuery, and XML Schema document types. You can also define your own code templates and share them with your colleagues using the template export and import functions.

To configure Code Templates, open the Preferences dialog box (Options > Preferences) and go to Editor > Templates > Code Templates.

This preferences page contains a list of all the available code templates (both built-in and custom created ones) and a code preview area. You can disable any code template by deselecting it.

The following actions are available:

**New**

Opens the Code template dialog box that allows you to define a new code template. You can define the following fields:

- **Name** - The name of the code template.
- **Description** - The description of the code template that will appear in the Code Templates preferences page and in the tooltip message when selecting it from the Content Completion Assistant. HTML markup can be used for better rendering.
- **Associate with** - You can choose to set the code template to be associated with a specific type of editor or for all editor types.
- **Shortcut key** - Allows you to configure a shortcut key that can be used to insert the code template. The + character separates keys. If the Enable platform-independent shortcut keys checkbox is enabled, the shortcut is platform-independent and the following modifiers are used:
  - M1 represents the Command key on MacOS X, and the Ctrl key on other platforms.
  - M2 represents the Shift key.
  - M3 represents the Option key on MacOS X, and the Alt key on other platforms.
  - M4 represents the Ctrl key on MacOS X, and is undefined on other platforms.
- **Content** - Text box where you define the content that is used when the code template is inserted.

**Edit**

Opens the Code template dialog box and allows you to edit an existing code template. You can edit the following fields:
• **Description** - The description of the code template that will appear in the Code Templates preferences page and in the tooltip message when selecting it from the Content Completion Assistant. HTML markup can be used for better rendering.

• **Shortcut key** - Allows you to configure a shortcut key that can be used to insert the code template. The + character separates keys. If the Enable platform-independent shortcut keys checkbox is enabled, the shortcut is platform-independent and the following modifiers are used:
  - M1 represents the Command key on MacOS X, and the Ctrl key on other platforms.
  - M2 represents the Shift key.
  - M3 represents the Option key on MacOS X, and the Alt key on other platforms.
  - M4 represents the Ctrl key on MacOS X, and is undefined on other platforms.

• **Content** - Text box where you define the content that is used when the code template is inserted.

**Duplicate**

Creates a duplicate of the currently selected code template.

**Delete**

Deletes the currently selected code template. This action is disabled for the built-in code templates.

**Export**

Exports a file with code templates.

**Import**

Imports a file with code templates that was created by the Export action.

You can use the following *editor variables* when you define a code template in the Content text box:

- \${variables} - The position where the cursor is located. This variable can be used in a code template, in Author mode operations, or in a selection plugin.
- \${variables} - The current selected text content in the current edited document. This variable can be used in a code template, in Author mode operations, or in a selection plugin.
- \{variables\} - To prompt for values at runtime, use the \{variables\} editor variable. You can set the following parameters:
  - message - The displayed message. Note the quotes that enclose the message.
  - type - Optional parameter, with one of the following values:
    - The title of the dialog box will be determined by the type of parameter and as follows:
      - For url and url_relative parameters, the title will be the name of the parameter and the value of the 'message'.
      - For the other parameters listed below, the title will be the name of that respective parameter.
      - If no parameter is used, the title will be "Input".

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Format: {variables}</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>{variables}</td>
</tr>
</tbody>
</table>

**Example:**

- \{variables\} - The displayed dialog box has the name Input URL. The expected input type is URL.
- \{variables\} - The displayed dialog box has the name Input URL. The expected input type is URL. The input field displays the default value http://www.example.com.

**Note:** The title of the dialog box will be determined by the type of parameter and as follows:

- For url and url_relative parameters, the title will be the name of the parameter and the value of the 'message'.
- For the other parameters listed below, the title will be the name of that respective parameter.
- If no parameter is used, the title will be "Input".

Configuring Oxygen XML Editor 100
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Format: ${\text{ask('message', password, 'default')}}</th>
</tr>
</thead>
</table>
| password  | **Description:** The input is hidden with bullet characters.  
**Example:**  
- $\{\text{ask('Input password', password)}\}$ - The displayed dialog box has the name 'Input password' and the input is hidden with bullet symbols.  
- $\{\text{ask('Input password', password, 'abcd')}\}$ - The displayed dialog box has the name 'Input password' and the input hidden with bullet symbols. The input field already contains the default abcd value. |
| generic   | Format: $\{\text{ask('message', generic, 'default')}\}$  
**Description:** The input is considered to be generic text that requires no special handling.  
**Example:**  
- $\{\text{ask('Hello world!')}\}$ - The dialog box has a Hello world! message displayed.  
- $\{\text{ask('Hello world!', generic, 'Hello again!')}\}$ - The dialog box has a Hello world! message displayed and the value displayed in the input box is 'Hello again!'. |
| relative_url | Format: $\{\text{ask('message', relative_url, 'default')}\}$  
**Description:** Input is considered a URL. Oxygen XML Editor tries to make the URL relative to that of the document you are editing.  
**Note:** If the $\text{ask}$ editor variable is expanded in content that is not yet saved (such as an *untitled* file, whose path cannot be determined), then Oxygen XML Editor will transform it into an absolute URL.  
**Example:**  
- $\{\text{ask('File location', relative_url, 'C:/example.txt')}\}$ - The dialog box has the name 'File location'. The URL inserted in the input box is made relative to the current edited document location. |
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Format: ${ask('message', combobox, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'), 'default'))}</th>
</tr>
</thead>
<tbody>
<tr>
<td>combobox</td>
<td>Description: Displays a dialog box that offers a drop-down menu. The drop-down menu is populated with the given rendered_value values. Choosing such a value will return its associated value (real_value).</td>
</tr>
<tr>
<td></td>
<td>Note: The 'default' parameter specifies the default selected value and can match either a key or a value.</td>
</tr>
</tbody>
</table>

**Example:**

- `${ask('Operating System', combobox, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'osx')}` - The dialog box has the name 'Operating System'. The drop-down menu displays the three given operating systems. The associated value will be returned based upon your selection.

  **Note:** In this example, the default value is indicated by the osx key. However, the same result could be obtained if the default value is indicated by Mac OS X, as in the following example:

  - `${ask('Operating System', combobox, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'Mac OS X')}`

- `${ask('Mobile OS', combobox, ('win':'Windows Mobile';'ios':'iOS';'and':'Android'), 'Android')}`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Format: ${ask('message', editable_combobox, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'), 'default'))}</th>
</tr>
</thead>
<tbody>
<tr>
<td>editable_combobox</td>
<td>Description: Displays a dialog box that offers a drop-down menu with editable elements. The drop-down menu is populated with the given rendered_value values. Choosing such a value will return its associated real value (real_value) or the value inserted when you edit a list entry.</td>
</tr>
<tr>
<td></td>
<td>Note: The 'default' parameter specifies the default selected value and can match either a key or a value.</td>
</tr>
</tbody>
</table>

**Example:**

- `${ask('Operating System', editable_combobox, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'osx')}` - The dialog box has the name 'Operating System'. The drop-down menu displays the three given operating systems and also allows you to edit the entry. The associated value will be returned based upon your selection or the text you input.
| Parameter | Format: ${ask('message', radio, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'), 'default')}

**Description:** Displays a dialog box that offers a series of radio buttons. Each radio button displays a 'rendered_value' and will return an associated real_value.

Note: The 'default' parameter specifies the default selected value and can match either a key or a value.

**Example:**
- ${ask('Operating System', radio, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'osx')}
  - The dialog box has the name 'Operating System'. The radio button group allows you to choose between the three operating systems.
  Note: In this example Mac OS X is the default selected value and if selected it would return osx for the output.

- '${default-value}' - optional parameter. Provides a default value.
- '${timeStamp}' - Time stamp, that is the current time in Unix format. For example, it can be used to save transformation results in multiple output files on each transformation.
- '${uuid}' - Universally unique identifier, a unique sequence of 32 hexadecimal digits generated by the Java UUID class.
- '${id}' - Application-level unique identifier. It is a short sequence of 10-12 letters and digits that is not guaranteed to be universally unique.
- '${cfn}' - Current file name without extension and without parent folder. The current file is the one currently opened and selected.
- '${cfne}' - Current file name with extension. The current file is the one currently opened and selected.
- '${cf}' - Current file as file path, that is the absolute file path of the current edited document.
- '${cfd}' - Current file folder as file path, that is the path of the current edited document up to the name of the parent folder.
- '${frameworksDir}' - The path (as file path) of the [OXYGEN_INSTALL_DIR]/frameworks directory.
- '${pd}' - The path for the parent folder of the current project selected in the Project view.
- '${oxygenInstallDir}' - Oxygen XML Editor installation folder as file path.
- '${homeDir}' - The path (as file path) of the user home folder.
- '${pn}' - Current project name.
- '${env(VAR_NAME)}' - Value of the VAR_NAME environment variable. The environment variables are managed by the operating system. If you are looking for Java System Properties, use the ${system(var.name)} editor variable.
- '${system(var.name)}' - Value of the var.name Java System Property. The Java system properties can be specified in the command line arguments of the Java runtime as -Dvar.name=var.value. If you are looking for operating system environment variables, use the ${env(VAR_NAME)} editor variable instead.
- '${date(pattern)}' - Current date. The allowed patterns are equivalent to the ones in the Java SimpleDateFormat class.
  Example: yyyy-MM-dd;
  Note: This editor variable supports both the xs:date and xs:dateTime parameters. For details about xs:date, go to [http://www.w3.org/TR/xmlschema-2/#date](http://www.w3.org/TR/xmlschema-2/#date). For details about xs:dateTime, go to [http://www.w3.org/TR/xmlschema-2/#dateTime](http://www.w3.org/TR/xmlschema-2/#dateTime).

**Related information**

*Code Templates* on page 293
Document Templates Preferences

Oxygen XML Editor provides a selection of document templates that make it easier to create new documents in a variety of formats. The list of available templates is presented when you create a new document. You can also create your own templates and share them with others. You can store your custom file templates in the existing templates folder in the Oxygen XML Editor installation directory or store them in a custom directory. If you store them in a custom direction, you need to add that directory to the list of template directories that Oxygen XML Editor uses.

To add a template directory, follow these steps:

1. open the Preferences dialog box (Options > Preferences) and go to Editor > Templates > Document Templates.
2. Use the New button to select a location of the new document template folder.

This will add the folder to the list in this preferences page and it will now appear in the New document wizard.

Note: For DITA templates, they will also appear in the dialog box for creating new DITA topics from the DITA Maps Manager, but if you create a corresponding properties file, you need to set the type property to dita.

You can also use the Edit or Delete buttons to manage folders in the list, and you can alter the order in which Oxygen XML Editor looks in these directories by using the Up and Down buttons.

Mark Occurrences Preferences

This preferences page specifies which types of files will have the Highlight IDs Occurrences feature activated. To configure these options, open the Preferences dialog box (Options > Preferences) and go to Editor > Mark Occurrences:

The following options are available in this preferences page:

Highlight component occurrences in the current file for:

- XML files - Activates the Highlight IDs Occurrences feature in XML files.
- XSLT files - Activates the Highlight Component Occurrences feature in XSLT files.
- XML Schema files - Activates the Highlight Component Occurrences feature in XSD files.
- WSDL files - Activates the Highlight Component Occurrences feature in WSDL files.
- RNG files - Activates the highlight component occurrences feature in RNG files.
- Schematron files - Activates the Highlight Component Occurrences feature in Schematron files.
- Ant files - Activates the Highlight Component Occurrences feature in Ant files.

Declaration highlight color

Allows you to choose the color to be used for highlighting component declarations.

Reference highlight color

Allows you to choose the color to be used for highlighting component references.

Custom Validation Engines Preferences

As the name implies, the Custom Validation Engines preferences page displays the list of custom validation engines than can be associated to a particular editor and used for validating documents. To access this page, open the Preferences dialog box (Options > Preferences) and go to Editor > Custom Validation Engines.

If you want to add a new custom validation tool or edit the properties of an exiting one, you can use the Custom Validator dialog box displayed by pressing the New or Edit button.
The **Custom Validator** dialog box allows you to configure the following parameters:

**Name**

Name of the custom validation engine that will be displayed in the **Validation** toolbar drop-down menu.

**Executable path**

Path to the executable file of the custom validation tool. You can specify the path by using the text field, the **Insert Editor Variables** button, or the **Browse** button.

**Working directory**

The working directory of the custom validation tool. You can specify the path by using the text field, the **Insert Editor Variables** button, or the **Browse** button.

**Associated editors**

The editors that can perform validation with the external tool (XML editor, XSL editor, XSD editor, etc.)

**Command line arguments for detected schemas**

Command line arguments used in the commands that validate the currently edited file against various types of schema (W3C XML Schema, Relax NG full syntax, Relax NG compact syntax, NVDL, Schematron, DTD, etc.) The arguments can include any custom switch (such as -rng) and the following editor variables:

- **${cf}** - Current file as file path, that is the absolute file path of the current edited document.
- **${currentFileURL}** - Current file as URL, that is the absolute file path of the current edited document represented as URL.
- **${ds}** - The path of the detected schema as a local file path for the current validated XML document.
- **${dsu}** - The path of the detected schema as a URL for the current validated XML document.

**Related information**

*Editor Variables* on page 159

**Increasing the Stack Size for Validation Engines**

To prevent the appearance of a `StackOverflowError` error, use one of the following methods:
• Use the `com.oxygenxml.stack.size.validation.threads` property to increase the size of the stack for validation engines. The value of this property is specified in bytes. For example, to set a value of one megabyte specify 1x1024x1024=1048576.
• Increase the value of the `-Xss` parameter.

  **Note:** Increasing the value of the `-Xss` parameter affects all the threads of the application.

**Related information**
*Setting a Java Virtual Machine Parameter when Launching Oxygen XML Editor* on page 167

**CSS Validator Preferences**
To configure the CSS Validator preferences, *open the Preferences dialog box (Options > Preferences)* and go to CSS Validator.

You can configure the following options for the built-in CSS Validator of Oxygen XML Editor:
• **Profile** - Selects one of the available validation profiles: CSS 1, CSS 2, CSS 2.1, CSS 3, CSS 3 with Oxygen extensions, SVG, SVG Basic, SVG Tiny, Mobile, TV Profile, ATSC TV Profile. The CSS 3 with Oxygen extensions profile includes all the CSS 3 standard properties plus the CSS extensions specific for Oxygen that can be used in Author mode. That means all Oxygen specific extensions are accepted in a CSS stylesheet by the *built-in CSS validator* when this profile is selected.
• **Media type** - Selects one of the available mediums: all, aural, braille, embossed, handheld, print, projection, screen, tty, tv, presentation, oxygen.
• **Warning level** - Sets the minimum severity level for reported validation warnings. Can be one of: All, Normal, Most Important, No Warnings.
• **Ignore properties** - You can type comma separated patterns that match the names of CSS properties that will be ignored at validation. As wildcards you can use:
  • `*` to match any string.
  • `?` to match any character.
• **Recognize browser CSS extensions (also applies to content completion)** - If checked, Oxygen XML Editor recognizes (no validation is performed) browser-specific CSS properties. The Content Completion Assistant lists these properties at the end of its list, prefixed with the following particles:
  • `~moz` - for Mozilla.
  • `~ms` - for Internet Explorer or Edge.
  • `~o` - for Opera.
  • `~webkit` - for Safari/Webkit.

**XML Preferences**
This section describes the panels that contain the user preferences related with XML.

**XML Catalog Preferences**
To configure the XML Catalog options, *open the Preferences dialog box (Options > Preferences)* and go to XML > XML Catalog.

The following options are available:
• **Prefer**
  Determines whether public identifiers specified in the catalog are used in favor of system identifiers supplied in the document. Suppose you have an entity in your document for which both a public identifier and a system identifier has been specified, and the catalog only contains a mapping for the public identifier (for example, a matching public catalog entry). You can choose between the following:
  • **system** - If selected, the system identifier in the document is used.
  • **public** - If selected, the URI supplied in the matching public catalog entry is used. Generally, the purpose of catalogs is to override the system identifiers in XML documents, so **public** should usually be used for your catalogs.
Note: If the catalog contains a matching system catalog entry giving a mapping for the system identifier, that mapping would have been used, the public identifier would never have been considered, and this setting would be irrelevant.

Verbosity

When using catalogs it is sometimes useful to see what catalog files are parsed, if they are valid or not, and what identifiers are resolved by the catalogs. This option selects the detail level of such logging messages of the XML catalog resolver that will be displayed in the Catalogs table at the bottom of the window. You can choose between the following:

- **None** - No message is displayed by the catalog resolver when it tries to resolve a URI reference, a SYSTEM one or a PUBLIC one with the XML catalogs specified in this panel.
- **Unresolved entities** - Only the logging messages that track the failed attempts to resolve references are displayed.
- **All messages** - The messages of both failed attempts and successful ones are displayed.

Resolve schema locations also through system mappings

If enabled, Oxygen XML Editor analyzes both uri and system mappings to resolve the location of schema.

Note: This option is not applicable for DTD schemas since the public and system catalog mappings are always considered.

Process "schemaLocation" namespaces through URI mappings for XML Schema

If selected, the target namespace of the imported XML Schema is resolved through the uri mappings. The namespace is taken into account only when the schema specified in the schemaLocation attribute was not resolved successfully. If disabled, the system IDs are used to resolve the schema location.

Use default catalog

If this option is enabled and Oxygen XML Editor cannot resolve the catalog mapping with any other means, the default global catalog (listed below this checkbox) is used. For more information, see *How Oxygen XML Editor Determines which Catalog to Use* on page 462.

Catalogs table

You can use this table to add or manage global user-defined catalogs. The following actions are available at the bottom of the table:

- **Add**
  - Opens a dialog box that allows you to add a catalog to the list. You can specify the path by using the text field, its history drop-down, the "Insert Editor Variables" button, or the browsing tools in the "Browse" drop-down list.

- **Edit**
  - Opens a dialog box that allows you to edit an existing catalog. You can specify the path by using the text field, its history drop-down, the "Insert Editor Variables" button, or the browsing tools in the "Browse" drop-down list.

- **Delete**
  - Deletes the currently selected catalog from the list.

- **Up**
  - Moves the selection to the previous resource.

- **Down**
  - Moves the selection to the following resource.

Note: When you add, delete, or edit a catalog in this table, you need to reopen the currently edited files that use the modified catalog or run a manual Validate action so that the XML catalog changes take full effect.

You can also add or configure catalogs at framework level from the Catalogs tab in the Document Type configuration dialog box.

Related information

*Controlling the Catalog Resolver*

*Working with XML Catalogs* on page 460
XML Parser Preferences

To configure the XML Parser options, open the Preferences dialog box (Options > Preferences) and go to XML > XML Parser.

The configurable options of the built-in XML parser are as follows:

**Enable parser caching (validation and content completion)**

Enables re-use of internal models when validating and provides content completion in opened XML files that reference the same schemas (grammars) such as DTD, XML Schema, or RelaxNG.

**Ignore the DTD for validation if a schema is specified**

Forces validation against a referenced schema (W3C XML Schema, Relax NG schema) even if the document includes also a DTD DOCTYPE declaration. This option is useful when the DTD declaration is used only to declare DTD entities and the schema reference is used for validation against a W3C XML Schema or a Relax NG schema.

*Note:* Schematron schemas are treated as additional schemas. The validation of a document associated with a DTD and referencing a Schematron schema is executed against both the DTD and the Schematron schema, regardless of the value of the Ignore the DTD for validation if a schema is specified option.

**Enable XInclude processing**

Enables XInclude processing. If checked, the XInclude support in Oxygen XML Editor is turned on for validation, rendering in Author mode and transformation of XML documents.

**Base URI fix-up**

According to the specification for XInclude, processors must add an xml:base attribute to elements included from locations with a different base URI. Without these attributes, the resulting infoset information would be incorrect.

Unfortunately, these attributes make XInclude processing to not be transparent to Schema validation. One solution to this is to modify your schema to allow xml:base attributes to appear on elements that might be included from different base URIs.

If the addition of xml:base and / or xml:lang is not desired by your application, you can disable this option.

**Language fix-up**

The processor will preserve language information on a top-level included element by adding an xml:lang attribute if its include parent has a different [language] property. If the addition of xml:lang is undesired by your application, you can disable the language fix-up.

**DTD post-validation**

Enable this option to validate an XML file against the associated DTD, after all the content merged to the current XML file using XInclude was resolved. If you disable this option, the current XML file is validated against the associated DTD before all the content merged to the current XML file using XInclude is resolved.

XML Schema Preferences

To configure options in regards to XML Schema, open the Preferences dialog box (Options > Preferences) and go to XML > XML Parser > XML Schema.

This preferences page allows you to configure the following options:

**Default XML Schema version**

Allows you to select the version of W3C XML Schema to be used as the default. You can choose XML Schema 1.0 or XML Schema 1.1.

*Note:* You are also able to set the XML Schema version using the Customize option in the New document wizard.

**Default XML Schema validation engine**

Allows you to select the default validation engine to be used for XML Schema. You can choose Xerces or Saxon EE.

**Xerces validation features section**

**Enable full schema constraint checking**

Sets the schema-full-checking feature to true. This enables a validation of the parsed XML document against a schema (W3C XML Schema or DTD) while the document is parsed.
Enable honour all schema location feature

Sets the *honour-all-schema-location* feature to *true*. All the files that declare W3C XML Schema components from the same namespace are used to compose the validation model. In case this option is disabled, only the first W3C XML Schema file that is encountered in the XML Schema import tree is taken into account.

Enable full XPath 2.0 in assertions and alternative types

When enabled (default value), you can use the full XPath support in assertions and alternative types. Otherwise, only the XPath support offered by the Xerces engine is available.

Assertions can see comments and processing instructions

Controls whether or not comments and processing instructions are visible to the XPath expression used for defining an assertion in XSD 1.1.

Saxon EE validation features section

Multiple schema imports

Forces `xs:import` to fetch the referenced schema document. By default, the `xs:import` fetches the document only if no schema document for the given namespace has already been loaded. With this option in effect, the referenced schema document is loaded unless the absolute URI is the same as a schema document already loaded.

Assertions can see comments and processing instructions

Controls whether or not comments and processing instructions are visible to the XPath expression used to define an assertion. By default, they are not made visible (unlike Saxon 9.3).

Relax NG Preferences

To configure options in regards to Relax NG, open the Preferences dialog box (Options > Preferences) and go to XML > XML Parser > Relax NG.

The following options are available in this page:

Check feasibly valid

Checks if Relax NG documents can be transformed into valid documents by inserting any number of attributes and child elements anywhere in the tree.

Note: Enabling this option disables the Check ID/IDREF option.

Check ID/IDREF

Checks the ID/IDREF matches when a Relax NG document is validated.

Add default attribute values

Default values are given to the attributes of documents validated using Relax NG. These values are defined in the Relax NG schema.

Schematron Preferences

To configure options in regards to Schematron, open the Preferences dialog box (Options > Preferences) and go to XML > XML Parser > Schematron.

The following options are available in this preferences page:

ISO Schematron Section

Optimize (visit-no-attributes)

If your ISO Schematron assertion tests do not contain the attributes axis, you should check this option for faster ISO Schematron validation.

Allow foreign elements (allow-foreign)

Enables support for `allow-foreign` on ISO Schematron. This option is used to pass non-Schematron elements to the generated stylesheet.

Use Saxon EE (schema aware) for xslt2/xslt3 query language binding

When enabled, Saxon EE is used for `xslt2/xslt3` query binding. If this option is disabled, Saxon PE is used.

Enable Schematron Quick Fixes (SQF) support

Allows you to enable or disable the support for quick fixes in Schematron files. This option is enabled by default.
Embedded rules query language binding

You can control the query language binding used by the ISO Schematron embedded rules. You can choose between: `xslt1`, `xslt2`, or `xslt3`.

**Note:** To control the query language binding for standalone ISO Schematron, you need to set the query language to be used with a `queryBinding` attribute on the schema root element.

Message language

This option allows you to specify the language to be used in Schematron validation messages. You can choose between the following:

- **Use the language defined in the application** - The language that is specified in the Global Preferences page will be used and only the validation messages that match that language will be presented. You can use the Change application language link to navigate to the preferences page where you can specify the language to be used in the application.

- **Use the "xml:lang" attribute set on the Schematron root** - The language specified in the `xml:lang` attribute from the Schematron root will be used and only the validation message that match that language will be presented.

- **Ignore the language and show all message** - All messages are displayed in whatever language they are defined within the Schematron schema.

- **Custom** - Use this option to specify a custom language to be used and only the messages that match the specified language will be presented.

**Note:** In all cases, if the selected language is not available for a validation error or warning, all messages will be displayed in whatever language they are defined with in the Schematron schema.

Schematron 1.5 Section

**XPath Version**

Allows you to select the version of XPath for the expressions that are allowed in Schematron assertion tests. You can choose between: 1.0, 2.0, or 3.0. This option is applied in both standalone Schematron 1.5 schemas and embedded Schematron 1.5 rules.

Sample XML Files Generator Preferences

The Generate Sample XML Files tool (available on the Tools menu) allows you to generate XML instance documents based on a W3C XML Schema. There are various options that can be configured within the tool and these options are also available in the Sample XML Files Generator preferences page. This allows you to set default values for these options. To configure the options for generating the XML files, open the Preferences dialog box (Options > Preferences) and go to XML > Sample XML Files Generator.

The following options are available:

**Generate optional elements**

When checked, all elements are generated, including the optional ones (having the `minOccurs` attribute set to 0 in the schema).

**Generate optional attributes**

When checked, all attributes are generated, including the optional ones (having the `use` attribute set to `optional` in the schema).

**Values of elements and attributes**

Controls the content of generated attribute and element values. The following choices are available:

- **None** - No content is inserted.

- **Default** - Inserts a default value depending of data type descriptor of the particular element or attribute. The default value can be either the data type name or an incremental name of the attribute or element (according to the global option from the XML Instances Generator preferences page). Note that type restrictions are ignored when this option is enabled. For example, if an element is of a type that restricts an `xs:string` with the `xs:maxLength` facet to allow strings with a maximum length of 3, the XML instance generator tool may generate string element values longer than 3 characters.

- **Random** - Inserts a random value depending of data type descriptor of the particular element or attribute.
Important: If all of the following are true, the XML Instances Generator outputs invalid values:

- At least one of the restrictions is a regexp.
- The value generated after applying the regexp does not match the restrictions imposed by one of the facets.

Preferred number of repetitions

Allows you to set the preferred number of repeating elements related to minOccurs and maxOccurs facets defined in the XML Schema.

- If the value set here is between minOccurs and maxOccurs, then that value is used.
- If the value set here is less than minOccurs, then the minOccurs value is used.
- If the value set here is greater than maxOccurs, then maxOccurs is used.

Maximum recursion level

If a recursion is found, this option controls the maximum allowed depth of the same element.

Type alternative strategy

Used for the xs:alternative element from XML Schema 1.1. The possible strategies are:

- First - The first valid alternative type is always used.
- Random - A random alternative type is used.

Choice strategy

Used for xs:choice or substitutionGroup elements. The possible strategies are:

- First - The first branch of xs:choice or the head element of substitutionGroup is always used.
- Random - A random branch of xs:choice or a substitute element or the head element of a substitutionGroup is used.

Generate the other options as comments

If enabled, generates the other possible choices or substitutions (for xs:choice and substitutionGroup). These alternatives are generated inside comments groups so you can uncomment and use them later. Use this option with care (for example, on a restricted namespace and element) as it may generate large result files.

Use incremental attribute / element names as default

If checked, the value of an element or attribute starts with the name of that element or attribute. For example, for an a element the generated values are: a1, a2, a3, and so on. If not checked, the value is the name of the type of that element / attribute (for example: string, decimal, etc.)

Maximum length

The maximum length of string values generated for elements and attributes.

Discard optional elements after nested level

The optional elements that exceed the specified nested level are discarded. This option is useful for limiting deeply nested element definitions that can quickly result in very large XML documents.

Related information

Generating Sample XML Files on page 568

XProc Preferences

Oxygen XML Editor includes a built-in XProc engine called Calabash. You can add or configure external XProc engines by using the XProc preferences page. Open the Preferences dialog box (Options > Preferences) and go to XML > XProc.

When Show XProc messages is selected all messages emitted by the XProc processor during a transformation will be presented in the results view.

To add an external engine click the New button. To configure an existing engine, click the Edit button. This opens the Custom Engine dialog box that allows you to configure an external engine.
Figure 23: Creating an XProc external engine

The following options can be configure in this dialog box:

- **Name** - The value of this field will be displayed in the XProc transformation scenario and in the command line that will start it.
- **Description** - A textual description that will appear as a tooltip where the XProc engine will be used.
- **Working directory** - The working directory for resolving relative paths. You can specify the path by using the text field, the Insert Editor Variables button, or the Browse button.
- **Command line** - The command line that will run the XProc engine as an external process. You can specify the path by using the text field, the Insert Editor Variables button, or the Browse button.
- **Output encoding** - The encoding for the output stream of the XProc engine, used for reading and displaying the output messages.
- **Error encoding** - The encoding for the error stream of the XProc engine, used for reading and displaying the messages from the error stream.

**Note:** You can configure the built-in Saxon processor using the saxon.config file. For further details about configuring this file go to http://www.saxonica.com/documentation9.5/index.html#!configuration/configuration-file. You can configure the built-in Calabash processor by using the calabash.config file. These files are located in \[OXYGEN_INSTALL_DIR\]\lib\xproc\calabash\lib. If they do not exist, you have to create them.

**XSLT-FO-XQuery Preferences**

To configure options in regards to XSLT, XQuery, and FO processors, open the Preferences dialog box (Options > Preferences) and go to XML > XSLT-FO-XQuery. This panel contains only the most generic options for working with XSLT/XSL-FO/XQuery processors. The more specific options are grouped in other panels linked as child nodes of this panel in the tree of this Preferences page.

There is only one generic option available:

**Create transformation temporary files in system temporary directory**

It should be selected only when the temporary files necessary for performing transformations are created in the same folder as the source of the transformation (the default behavior when this option is not selected) and this breaks the transformation. An example of breaking the transformation is when the transformation processes all the files located in the same folder as the source of the transformation (including the temporary files) and the result is incorrect or the transformation fails because of this.

**XSLT Preferences**

To configure the XSLT options, open the Preferences dialog box (Options > Preferences) and go to XML > XSLT-FO-XQuery > XSLT.
Oxygen XML Editor offers the possibility of using an XSLT transformer implemented in Java (other than the XSLT transformers that come bundled with Oxygen XML Editor). To use another XSLT transformer, specify the name of the transformer factory class. Oxygen XML Editor sets this transformer factory class as the value of the Java property: `javax.xml.transform.TransformerFactory`.

The XSLT preferences page allows you to customize the following options:

**JAXP XSLT Transformer - Value**
- Allows you to set the value of the `TransformerFactory` Java class.

**Validation engine - XSLT 1.0**
- Allows you to select the XSLT engine to be used for validation of XSLT 1.0 documents.

**Validation engine - XSLT 2.0**
- Allows you to select the XSLT engine to be used for validation of XSLT 2.0 documents.

**Validation engine - XSLT 3.0**
- Allows you to select the XSLT engine to be used for validation of XSLT 3.0 documents.

**Note:** Saxon-HE does not implement any XSLT 3.0 features. Saxon-PE implements a selection of XSLT 3.0 (and XPath 3.0) features, with the exception of schema-awareness and streaming. Saxon-EE implements additional features relating to streaming (processing of a source document without constructing a tree in memory. For further details about XSLT 3.0 conformance, go to [http://www.saxonica.com/documentation/index.html#!conformance/xslt30](http://www.saxonica.com/documentation/index.html#!conformance/xslt30).

**XSLT Editor Content Completion Options link**
- Use this link to switch to the [XSLT Content Completion preferences page](#), where you can configure the XSLT content completion options.

**Saxon6 Preferences**
To configure the Saxon 6 options, open the Preferences dialog box (Options > Preferences) and go to XML > XSLT-FO-XQuery > XSLT > Saxon > Saxon6.

![Saxon 6 XSLT Preferences Panel](image)

**Figure 24: Saxon 6 XSLT Preferences Panel**

The built-in Saxon 6 XSLT processor can be configured with the following options:

- **Line numbering** - Specifies whether or not line numbers are maintained and reported in error messages for the XML source document.
- **Disable calls on extension functions** - If enabled, external function calls are not allowed. Checking this is recommended in an environment where untrusted stylesheets may be executed. It also disables user-defined extension elements and the writing of multiple output files, since they carry similar security risks.
- **Handling of recoverable stylesheet errors** - Allows you to choose how dynamic errors are handled. One of the following options can be selected:
  - **recover silently** - Continue processing without reporting the error.
  - **recover with warnings** - Issue a warning but continue processing.
  - **signal the error and do not attempt recovery** - Issue an error and stop processing.
Saxon-HE/PE/EE Preferences

To configure global options for XSLT transformation and validation scenarios that use the Saxon HE/PE/EE engine, open the Preferences dialog box (Options > Preferences) and go to XML > XSLT-FO-XQuery > XSLT > Saxon > Saxon-HE/PE/EE.

Oxygen XML Editor allows you to configure the following XSLT options for the Saxon 9.6.0.7 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE):

**Use a configuration file ("-config")**
Sets a Saxon 9.6.0.7 configuration file that is executed for XSLT transformation and validation processes.

**Version warnings ("-versmsg")**
Warns you when the transformation is applied to an XSLT 1.0 stylesheet.

**Line numbering ("-l")**
Line numbers where errors occur are included in the output messages.

**Debugger trace into XPath expressions (applies to debugging sessions)**
Instructs the XSLT Debugger to step into XPath expressions.

**Expand attributes defaults ("-expand")**
Specifies whether or not the attributes defined in the associated DTD or XML Schema are expanded in the output of the transformation you are executing.

**DTD validation of the source ("-dtd")**
Specifies whether or not the source document will be validated against their associated DTD. You can choose from the following:

- **On** - Requests DTD validation of the source file and of any files read using the document () function.
- **Off** - (default setting) Suppresses DTD validation.
- **Recover** - Performs DTD validation but treats the errors as non-fatal.

Note: Any external DTD is likely to be read even if not used for validation, since DTDs can contain definitions of entities.

**Recoverable errors ("-warnings")**
Allows you to choose how dynamic errors are handled. The following options can be selected:

- **Recover silently ("silent")** - Continues processing without reporting the error.
- **Recover with warnings ("recover")** - Issues a warning but continues processing.
- **Signal the error and do not attempt recovery ("fatal")** - Issues an error and stops processing.

**Strip whitespaces ("-strip")**
Allows you to choose how the strip whitespaces operation is handled. You can choose one of the following values:

- **All ("all")** - Strips all whitespace text nodes from source documents before any further processing, regardless of any xml:space attributes in the source document.
- **Ignore ("ignorable")** - Strips all ignorable whitespace text nodes from source documents before any further processing, regardless of any xml:space attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
- **None ("none")** - Strips no whitespace before further processing.

**Optimization level ("-opt")**
Allows you to set the optimization level. It is the value is an integer in the range of 0 (no optimization) to 10 (full optimization). This option allows optimization to be suppressed when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

The following options are available for Saxon 9.6.0.7 Professional Edition (PE) and Enterprise Edition (EE) only:

**Allow calls on extension functions ("-ext")**
If checked, the stylesheet is allowed to call external Java functions. This does not affect calls on integrated extension functions, including Saxon and EXSLT extension functions. This option is useful when loading an untrusted stylesheet (such as from a remote site using http://[URL]). It ensures that the stylesheet cannot call arbitrary Java methods and thus gain privileged access to resources on your machine.

Configuring Oxygen XML Editor 114
Register Saxon-CE extension functions and instructions

Registers the Saxon-CE extension functions and instructions when compiling a stylesheet using the Saxon 9.6.0.7 processors.

Note: Saxon-CE, being JavaScript-based, was designed to run inside a web browser. This means that you will use Oxygen XML Editor only for developing the Saxon-CE stylesheet, leaving the execution part to a web browser. See more details about executing such a stylesheet on Saxonica’s website.

The options available specifically for Saxon 9.6.0.7 Enterprise Edition (EE) are as follows:

Validation of the source file ("-val")

Requests schema-based validation of the source file and of any files read using document() or similar functions. It can have the following values:

- **Schema validation ("strict")** - This mode requires an XML Schema and enables parsing the source documents with strict schema-validation enabled.
- **Lax schema validation ("lax")** - If an XML Schema is provided, this mode enables parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

Validation errors in the result tree treated as warnings ("-outval")

Normally, if validation of result documents is requested, a validation error is fatal. Enabling this option causes such validation failures to be treated as warnings.

Write comments for non-fatal validation errors of the result document

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

Generate bytecode ("--generateByteCode:(on|off)"

If you enable this option, Saxon-EE attempts to generate Java bytecode for evaluation of parts of a query or stylesheet that are amenable to such an action. For further details regarding this option, go to http://www.saxonica.com/documentation9.5/index.html#!javadoc.

Saxon-HE/PE/EE Advanced Preferences

To configure the Saxon HE/PE/EE Advanced preferences, open the Preferences dialog box (Options > Preferences) and go to XML > XSLT-FO-XQuery > XSLT > Saxon > Saxon-HE/PE/EE > Advanced.

<table>
<thead>
<tr>
<th>XML / XSLT-FO-XQuery / XSLT / Saxon / Saxon-HE/PE/EE / Advanced</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI Resolver class name (&quot;r&quot;)</td>
</tr>
<tr>
<td>Collection URI Resolver class name (&quot;c&quot;)</td>
</tr>
<tr>
<td>The resolver classes must be present in the scenario extensions.</td>
</tr>
</tbody>
</table>

Figure 25: Saxon HE/PE/EE XSLT Advanced Preferences Panel

- **URI Resolver class name ("-r")** - Specifies a custom implementation for the URI resolver used by the XSLT Saxon 9.6.0.7 transformer (the -r option when run from the command line). The class name must be fully specified and the corresponding jar or class extension must be configured from the dialog box for configuring the XSLT extension for the particular transformation scenario.

- **Collection URI Resolver class name ("-cr")** - Specifies a custom implementation for the Collection URI resolver used by the XSLT Saxon 9.6.0.7 transformer (the -cr option when run from the command line). The class name must be fully specified and the corresponding jar or class extension must be configured from the dialog box for configuring the XSLT extension for the particular transformation scenario.

XSLTProc Preferences

To configure XSLTProc options, open the Preferences dialog box (Options > Preferences) and go to XML > XSLT-FO-XQuery > XSLT > XSLTProc.

The following options are available in this preferences page:

Configuring Oxygen XML Editor 115
• **Enable XInclude processing** - If checked, XInclude references will be resolved when XSLTProc is used as transformer in XSLT transformation scenarios.

• **Skip loading the document's DTD** - If checked, the DTD specified in the DOCTYPE declaration will not be loaded.

• **Do not apply default attributes from document's DTD** - If checked, the default attributes declared in the DTD and not specified in the document are not included in the transformed document.

• **Do not use Internet to fetch DTD's, entities or docs** - If checked, the remote references to DTD's and entities are not followed.

• **Maximum depth in templates stack** - If this limit of maximum templates depth is reached the transformation ends with an error.

• **Verbosity** - If checked, the transformation will output detailed status messages about the transformation process in the Warnings view.

• **Show version of libxml and libxslt used** - If checked, Oxygen XML Editor will display in the Warnings view the version of the libxml and libxslt libraries invoked by XSLTProc.

• **Show time information** - If checked, the Warnings view will display the time necessary for running the transformation.

• **Show debug information** - If checked, the Warnings view will display debug information about what templates are matched, parameter values, and so on.

• **Show all documents loaded during processing** - If checked, Oxygen XML Editor will display in the Warnings view the URL of all the files loaded during transformation.

• **Show profile information** - If checked, Oxygen XML Editor will display in the Warnings view a table with all the matched templates, and for each template will display: the match XPath expression, the template name, the number of template modes, the number of calls, the execution time.

• **Show the list of registered extensions** - If checked, Oxygen XML Editor will display in the Warnings view a list with all the registered extension functions, extension elements and extension modules.

• **Refuses to write to any file or resource** - If checked, the XSLTProc processor will not write any part of the transformation result to an external file on disk. If such an operation is requested by the processed XSLT stylesheet the transformation ends with a runtime error.

• **Refuses to create directories** - If checked, the XSLTProc processor will not create any directory during the transformation process. If such an operation is requested by the processed XSLT stylesheet the transformation ends with a runtime error.

**MSXML Preferences**

To configure the MSXML options, open the Preferences dialog box (Options > Preferences) and go to XML > XSLT-FO-XQuery > XSLT > MSXML.

The options in this preferences page for the MSXML 3.0 and 4.0 processors are as follows:

**Validate documents during parse phase**

If checked, and either the source or stylesheet document has a DTD or schema that its content can be checked against, validation is performed.

**Do not resolve external definitions during parse phase**

By default, MSXML instructs the parser to resolve external definitions such as document type definition (DTD), external subsets or external entity references when parsing the source and style sheet documents. If this option is checked, the resolution is disabled.

**Strip non-significant whitespaces**

If checked, strips non-significant white space from the input XML document during the load phase. Enabling this option can lower memory usage and improve transformation performance while, in most cases, creating equivalent output.

**Show time information**

If checked, the relative speed of various transformation steps can be measured, including:

- The time to load, parse, and build the input document.
- The time to load, parse, and build the stylesheet document.
- The time to compile the stylesheet in preparation for the transformation.
- The time to execute the stylesheet.

**Start transformation in this mode**

Although stylesheet execution usually begins in the empty mode, this default behavior may be changed by specifying another mode. Changing the start mode allows execution to jump directly to an alternate group of templates.
**MSXML.NET Preferences**

To configure the MSXML.NET options, open the Preferences dialog box (Options > Preferences) and go to XML > XSLT-FO-XQuery > XSLT > MSXML.NET.

The options in this preferences page for the MSXML.NET processor are as follows:

**Enable XInclude processing**

If checked, XInclude references will be resolved when MSXML.NET is used as the transformer in the XSLT transformation scenario.

**Validate documents during parse phase**

If checked, and either the source or stylesheet document has a DTD or schema that its content can be checked against, validation is performed.

**Do not resolve external definitions during parse phase**

By default, MSXML instructs the parser to resolve external definitions such as document type definition (DTD), external subsets or external entity references when parsing the source and stylesheets document. If this option is checked, the resolution is disabled.

**Strip non-significant whitespaces**

If checked, strips non-significant white space from the input XML document during the load phase. Enabling this option can lower memory usage and improve transformation performance while, in most cases, creating equivalent output.

**Show time information**

If checked, the relative speed of various transformation steps can be measured, including:

- The time to load, parse, and build the input document.
- The time to load, parse, and build the stylesheet document.
- The time to compile the stylesheet in preparation for the transformation.
- The time to execute the stylesheet.

**Forces ASCII output encoding**

There is a known problem with the .NET 1.X XSLT processor (System.Xml.Xsl.XslTransform class). It does not support escaping of characters as XML character references when they cannot be represented in the output encoding. This means that it will be outputted as `?`. Usually this happens when output encoding is set to ASCII. If this option checked, the output is forced to be ASCII encoded and all non-ASCII characters get escaped as XML character references (`&#nnnn;` form).

**Allow multiple output documents**

This option allows you to create multiple result documents using the `exsl:document extension element`.

**Use named URI resolver class**

This option allows you to specify a custom URI resolver class to resolve URI references in `xsl:import` and `xsl:include` instructions (during XSLT stylesheet loading phase) and in `document()` functions (during XSL transformation phase).

**Assembly file name for URI resolver class**

This option specifies a file name of the assembly where the specified resolver class can be found. The `Use named URI resolver class option` specifies a partially or fully qualified URI resolver class name (for example, Acme.Resolvers.CacheResolver). Such a name requires additional assembly specification using this option or the `Assembly GAC name for URI resolver class option`, but fully qualified class name (which always includes an assembly specifier) is all-sufficient. See MSDN for more info about fully qualified class names.

**Assembly GAC name for URI resolver class**

This option specifies partially or fully qualified name of the assembly in the global assembly cache (GAC) where the specified resolver class can be found. See MSDN for more info about partial assembly names.

**List of extension object class names**

This option allows to specify `extension object` classes, whose public methods then can be used as extension functions in an XSLT stylesheet. It is a comma-separated list of namespace-qualified extension object class names. Each class name must be bound to a namespace URI using prefixes, similar to providing XSLT parameters.
Use specified EXSLT assembly
MSXML.NET supports a rich library of the EXSLT and EXSLT.NET extension functions embedded or in a plugged-in EXSLT.NET library. EXSLT support is enabled by default and cannot be disabled in this version. Use this option if you want to use an external EXSLT.NET implementation instead of a built-in one.

Credential loading source XML
This option allows you to specify user credentials to be used when loading XML source documents. The credentials should be provided in the username:password@domain format (all parts are optional).

Credential loading stylesheet
This option allows you to specify user credentials to be used when loading XSLT stylesheet documents. The credentials should be provided in the username:password@domain format (all parts are optional).

XQuery Preferences
To configure the XQuery options, open the Preferences dialog box (Options > Preferences) and go to XML > XSLT-FO-XQuery > XQuery.

The following generic XQuery preferences are available:

Validation engine
Allows you to select the processor that will be used to validate XQuery documents. If you are validating an XQuery file that has an associated validation scenario, Oxygen XML Editor uses the processor specified in the scenario. If no validation scenario is associated, but the file has an associated transformation scenario, the processor specified in the scenario is used. If the processor does not support validation or if no scenario is associated, then the value from this combo box will be used as validation processor.

Size limit of Sequence view (MB)
When the result of an XQuery transformation is set as a sequence (Present as a sequence option) in the transformation scenario, the size of one chunk of the result that is fetched from the database in lazy mode in one step is set in this option. If this limit is exceeded, go to the Sequence view and click More results available to extract more data from the database.

Format transformer output
Specifies whether or not the output of the transformer is formatted and indented (pretty print).

Note: This option is ignored if you choose Present as a sequence (lazy extract data from a database) from the associated transformation scenario.

Create structure indicating the type nodes
If enabled, Oxygen XML Editor takes the results of a query and creates an XML document containing copies of all items in the sequence, suitably wrapped.

Note: This option is ignored if you choose Present as a sequence (lazy extract data from a database) from the associated transformation scenario.

Saxon-HE/PE/EE Preferences
To configure global options for XQuery transformation and validation scenarios that use the Saxon HE/PE/EE engine, open the Preferences dialog box (Options > Preferences) and go to XML > XSLT-FO-XQuery > XQuery > Saxon-HE/PE/EE.

Oxygen XML Editor allows you to configure the following XQuery options for the Saxon 9.6.0.7 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE):

Use a configuration file ("-config")
Sets a Saxon 9.6.0.7 configuration file that is used for XQuery transformation and validation scenarios.

Recoverable errors ("-warnings")
Allows you to choose how dynamic errors are handled. The following options can be selected:

• Recover silently ("silent") - Continues processing without reporting the error.
• Recover with warnings ("recover") - Issues a warning but continues processing.
• Signal the error and do not attempt recovery ("fatal") - Issues an error and stops processing.

Strip whitespaces ("-strip")
Allows you to choose how the strip whitespaces operation is handled. You can choose one of the following values:
• **All (“all”)** - Strips all whitespace text nodes from source documents before any further processing, regardless of any xml:space attributes in the source document.

• **Ignore (“ignorable”)** - Strips all ignorable whitespace text nodes from source documents before any further processing, regardless of any xml:space attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.

• **None (“none”)** - Strips no whitespace before further processing.

**Optimization level (“-opt”)**

Allows you to set the optimization level. It is the value is an integer in the range of 0 (no optimization) to 10 (full optimization). This option allows optimization to be suppressed when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

**Use linked tree model (“-tree:linked”)**

This option activates the linked tree model.

**Enable XQuery 3.0 support (“-qversion:(1.0|3.0)”)**

If enabled (default value), Saxon runs the XQuery transformation with the XQuery 3.0 support.

The following option is available for Saxon 9.6.0.7 Professional Edition (PE) and Enterprise Edition (EE) only:

**Allow calls on extension functions (“-ext”)**

If checked, calls on external functions are allowed. Checking this option is recommended in an environment where untrusted stylesheets may be executed. It also disables user-defined extension elements and the writing of multiple output files, both of which carry similar security risks.

The options available specifically for Saxon 9.6.0.7 Enterprise Edition (EE) are as follows:

**Validation of the source file (“-val”)**

Requests schema-based validation of the source file and of any files read using document() or similar functions. It can have the following values:

- **Schema validation (“strict”)** - This mode requires an XML Schema and enables parsing the source documents with strict schema-validation enabled.

- **Lax schema validation (“lax”)** - If an XML Schema is provided, this mode enables parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.

- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

**Validation errors in the result tree treated as warnings (“-outval”)**

Normally, if validation of result documents is requested, a validation error is fatal. Enabling this option causes such validation failures to be treated as warnings.

**Write comments for non-fatal validation errors of the result document**

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

**Generate bytecode (“--generateByteCode:(on|off)”)**

If you enable this option, Saxon-EE attempts to generate Java bytecode for evaluation of parts of a query or stylesheet that are amenable to such an action. For further details regarding this option, go to [http://www.saxonica.com/documentation9.5/index.html#javadoc](http://www.saxonica.com/documentation9.5/index.html#javadoc).

**Enable XQuery update (“-update:(on|off)”)**

This option controls whether or not XQuery update syntax is accepted. The default value is off.

**Backup files updated by XQuery (“-backup:(on|off)”)**

If checked, backup versions for any XML files updated with an XQuery Update are generated. This option is available when the Enable XQuery update option is enabled.

---

**Saxon HE/PE/EE Advanced Preferences**

To configure Saxon HE/PE/EE Advanced preferences, open the Preferences dialog box (Options > Preferences) and go to XML > XSLT-FO-XQuery > XQuery > Saxon-HE/PE/EE > Advanced.
The advanced XQuery options that can be configured for the Saxon 9.6.0.7 XQuery transformer (all editions: Home Edition, Professional Edition, Enterprise Edition) are as follows:

- **URI Resolver class name** - Allows you to specify a custom implementation for the URI resolver used by the XQuery Saxon 9.6.0.7 transformer (the `-r` option when run from the command line). The class name must be fully specified and the corresponding jar or class extension must be configured from the dialog box for configuring the XQuery extension for the particular transformation scenario.

  **Note:** If your `URIResolver` implementation does not recognize the given resource, the `resolve(String href, String base)` method should return a null value. Otherwise, the given resource will not be resolved through the XML catalog.

- **Collection URI Resolver class name** - Allows you to specify a custom implementation for the Collection URI resolver used by the XQuery Saxon 9.6.0.7 transformer (the `-cr` option when run from the command line). The class name must be fully specified and the corresponding jar or class extension must be configured from the dialog box for configuring the XQuery extension for the particular transformation scenario.

### Debugger Preferences

To configure the Debugger preferences, open the Preferences dialog box (`Options > Preferences`) and go to `XML > XSLT-FO-XQuery > Debugger`.

The following options are available:

- **Show xsl:result-document output**
  
  If checked, the debugger presents the output of `xsl:result-document` instructions into the debugger output view.

- **Infinite loop detection**
  
  Enable this option to receive notifications when an infinite loop occurs during transformation.

- **Enable Saxon optimizations**
  
  This option is disabled by default and this means that the optimization level for the debugging process is set to zero. If it is enabled, the debugging process will use the optimization level from one of the following:

  - The value specified in the `Optimization level option in an associated XSLT transformation` (or the same `option in an associated XQuery transformation`), if a transformation scenario is used in the debugging process.
  
  - Otherwise, the value specified in the `Optimization level option in the XSLT Saxon-HE/PE/EE preferences page` (or the same `option in the XQuery Saxon HE/PE/EE preferences page`).

- **Maximum depth in templates stack**
  
  Allows you to set how many `xsl:template` instructions can appear on the current stack. This setting is used by the infinite loop detection.

- **Debugger layout**
  
  If you select the `Horizontal` layout, the stack of XML editors is presented on the left half of the editing area while the stack of XSL editors is on the right half. If you select the `Vertical` layout, the stack of XML editors is presented on the upper half of the editing area while the stack of XSL editors is on the lower half.

- **Debugger current instruction pointer**
  
  Allows you to set the background color of the current execution node, both in the document (XML) and XSLT/XQuery views.

- **XWatch evaluation timeout (seconds)**
  
  Allows you to specify the maximum time that Oxygen XML Editor allocates to the evaluation of XPath expressions while debugging.
Messages

Allows you to specify how to handle the debugging process when the source document involved in a debugging session is edited. You can choose one of the following:

- Ask me what to do
- Always stop the debugging session
- Never stop the debugging session

Profiler Preferences

This section explains the settings available for the XSLT/XQuery Profiler. To access and modify these settings, open the Preferences dialog box (Options > Preferences) and go to XML > XSLT-FO-XQuery > Profiler (see Debugger Preferences on page 120).

The following profiler settings are available:

Show time

Shows the total time that was spent in the call.

Show inherent time

Shows the inherent time that was spent in the call. The inherent time is defined as the total time of a call minus the time of its child calls.

Show invocation count

Shows how many times the call was called in this particular call sequence.

Time scale

Determines the unit of time measurement. You can choose between milliseconds or microseconds.

Hotspot threshold

Hotspots are ignored below this specified amount (in milliseconds). For more information, see Hotspots View on page 1106.

Ignore invocation less than

Invocations are ignored below this specified amount (in microseconds). For more information, see Invocation Tree View on page 1105.

Percentage calculation

The percentage base that determines what time span percentages are calculated against. You can choose between the following:

- Absolute - Percentage values show the contribution to the total time.
- Relative - Percentage values show the contribution to the calling call.

FO Processors Preferences

Oxygen XML Editor includes a built-in formatting objects processor (Apache FOP), but you can also configure other external processors and use them in the transformation scenarios for processing XSL-FO documents.

Oxygen XML Editor provides an easy way to add two of the most commonly used commercial FO processors: RenderX XEP and Antenna House Formatter. You can easily add RenderX XEP as an external FO processor if you have the XEP installed. Also, if you have the Antenna House Formatter, Oxygen XML Editor uses the environment variables set by the XSL formatter installation to detect and use it for XSL-FO transformations. If the environment variables are not set for the XSL formatter installation, you can browse and choose the executable file just as you would for XEP. You can use these two external FO processors for DITA OT transformations scenarios and XML with XSLT transformation scenarios.

To configure the options for the FO Processors, open the Preferences dialog box (Options > Preferences) and go to XML > XSLT-FO-XQuery > FO Processors. The FO Processors preferences page is displayed.
Apache FOP Section

In this section you can configure options for the built-in Apache processor. The following options are available:

Use built-in Apache FOP

Instructs Oxygen XML Editor to use the built-in Apache FO processor.

Use other Apache FOP

Instructs Oxygen XML Editor to use another Apache FO processor that is installed on your computer. You can specify the path by using the text field, the 'Insert Editor Variables' button, or the 'Browse' button.

Enable the output of the built-in FOP

All Apache FOP output is displayed in a results pane at the bottom of the Oxygen XML Editor window, including warning messages about FO instructions not supported by Apache FOP.

Memory available to the built-in FOP

If your Apache FOP transformations fail with an Out of Memory error (OutOfMemoryError), use this combo box to select a bigger value for the amount of memory reserved for FOP transformations.

Configuration file for the built-in FOP

Use this option to specify the path to an Apache FOP configuration file (for example, to render to PDF a document containing Unicode content using a special true type font). You can specify the path by using the text field, the 'Insert Editor Variables' button, or the 'Browse' button.

Generates PDF/A-1b output

When selected, PDF/A-1b output is generated.

Note: All fonts have to be embedded, even the implicit ones. More information about configuring metrics files for the embedded fonts can be found in Add a font to the built-in FOP.

Note: You cannot use the <filterList> key in the configuration file since the FOP would generate the following error: The Filter key is prohibited when PDF/A-1 is active.
External FO Processors Section

In this section you can manage the external FO processors you want to use in transformation scenarios. You can use the two options at the bottom of the section to use the RenderX XEP or Antenna House Formatter commercial FO processors.

Add 'XEP' FO processor (executable file is needed)

If RenderX XEP is already installed on your computer, you can use this button to choose the XEP executable script (xep.bat for Windows, xep for Linux).

Add 'Antenna House' FO processor (executable file is needed)

If Antenna House Formatter is already installed on your computer, you can use this button to choose the Antenna House executable script (AHFCmd.exe or XSLCmd.exe for Windows, and run.sh for Linux/Mac OS).

Note: The built-in Antenna House Formatter GUI transformation scenario requires that you configure an external FO processor that runs AHFormatter.exe (Windows only). In the external FO Processor configuration dialog box, you could use "${env(AHF3_64_HOME)}\AHFormatter.exe" -d ${fo} -s for the value in the Command line field, although the environment variable name changes for each version of the AH Formatter and for each system architecture (you can install multiple versions side-by-side). For more information, see https://github.com/AntennaHouse/focheck/wiki/focheck.

You can also add external processors or configure existing ones. Press the New button to open a configuration dialog box that allows you to add a new external FO processor. Use the other buttons (Edit, Duplicate, Delete, Up, Down) to configure existing external processors.

![External FO Processor Configuration Dialog Box](image)

The external FO Processor configuration dialog box includes the following options:

Name
The name that will be displayed in the list of available FO processors on the FOP tab of the transformation scenario dialog box.

Description
A textual description of the FO processor that will be displayed in the FO processors table and in tooltips of UI components where the processor is selected.

Working directory
The directory where the intermediate and final results of the processing is stored. You can specify the path by using the text field, the Insert Editor Variables button, or the Browse button. You can use one of the following editor variables:

- `${homeDir}` - The path to the user home directory.
- `${cfd}` - The path of the current file directory. If the current file is not a local file, the target is the user desktop directory.
- `${pd}` - The project directory.
- `${oxygenInstallDir}` - The Oxygen XML Editor installation directory.
Command line

The command line that starts the FO processor, specific to each processor. You can specify the path by using the text field, the 📝 Insert Editor Variables button, or the 📦 Browse button. You can use one of the following editor variables:

- **${method}** - The FOP transformation method: pdf, ps, or txt.
- **${fn}** - The input FO file.
- **${out}** - The output file.
- **${pd}** - The project directory.
- **${frameworksDir}** - The path of the frameworks subdirectory of the Oxygen XML Editor installation directory.
- **${oxygenInstallDir}** - The Oxygen XML Editor installation directory.
- **${ps}** - The platform-specific path separator. It is used between the library files specified in the class path of the command line.

Output Encoding

The encoding of the FO processor output stream that is displayed in a results panel at the bottom of the Oxygen XML Editor window.

Error Encoding

The encoding of the FO processor error stream that is displayed in a results panel at the bottom of the Oxygen XML Editor window.

XPath Preferences

To configure XPath options, open the Preferences dialog box (Options > Preferences) and go to XML > XSLT-FO-XQuery > XPath.

Oxygen XML Editor allows you to customize the following options:

Unescape XPath expression

When enabled, the entities of an XPath expressions that you type in the XPath/XQuery Builder and the XPath toolbar are unescaped during their execution. For example the expression

```xml
//varlistentry[starts-with(@os,'\x7f')]}
```

is equivalent with:

```xml
//varlistentry[starts-with(@os,'s')]}
```

Multiple XPath results

Enable this option to display the results of an XPath expression in separate tabs in the Results view.

XPath Default Namespace (only for XPath version 2.0)

Specifies the default namespace to be used for unprefixed element names. You can choose between the following four options:

- **No namespace** - If selected, Oxygen XML Editor considers unprefixed element names of the evaluated XPath expressions as belonging to no namespace.
- **Use the default namespace from the root element** (default selection) - Oxygen XML Editor considers unprefixed element names of the evaluated XPath expressions as belonging to the default namespace declared on the root element of the XML document you are querying.
- **Use the namespace of the root** - If selected, Oxygen XML Editor considers unprefixed element names of the evaluated XPath expressions as belonging to the same namespace as the root element of the XML document you are querying.
- **This namespace** - If selected, you can use the corresponding text field to enter the namespace of the unprefixed elements.

Default prefix-namespace mappings

You can use this table to associate prefixes with namespaces. Use these mappings when you want to define them globally (not for each document). Use the New button to add mappings to the list and the Delete button to remove mappings.

Custom Engines Preferences

Oxygen XML Editor allows you to configure custom processors to be used for running XSLT and XQuery transformations.

**Note:** You can not use these custom engines in the Debugger perspective.
To configure the Custom Engines preferences, open the Preferences dialog box (Options > Preferences) and go to XML > XSLT-FO-XQuery > Custom Engines.

The table in this preferences page displays the custom engines that have been defined. Use the New or Edit button at the bottom of the table to open a dialog box that allows you to add or configure a custom engine.

![Custom Engine dialog box](image)

**Figure 29: Parameters of a Custom Engine**

The following parameters can be configured for a custom engine:

**Engine type**
- Specifies the transformer type. You can choose between XSLT and XQuery engines.

**Name**
- The name of the transformer displayed in the dialog box for editing transformation scenarios.

**Description**
- A textual description of the transformer.

**Working directory**
- The start directory of the executable program for the transformer. The following editor variables are available for making the path to the working directory independent of the location of the input files:
  - ${homeDir} - The user home directory in the operating system.
  - ${cwd} - The path to the directory of the current file.
  - ${pd} - The path to the directory of the current project.
  - ${oxygenInstallDir} - The Oxygen XML Editor install directory.

**Command line**
- The command line that must be executed by Oxygen XML Editor to perform a transformation with the engine. The following editor variables are available for making the parameters in the command line (the transformer executable, the input files) independent of the location of the input files:
  - ${xml} - The XML input document as a file path.
  - ${xmlu} - The XML input document as a URL.
  - ${xsl} - The XSL / XQuery input document as a file path.
  - ${xslu} - The XSL / XQuery input document as a URL.
  - ${out} - The output document as a file path.
  - ${outu} - The output document as a URL.
  - ${ps} - The platform separator that is used between library file names specified in the class path.

**Output Encoding**
- The encoding of the transformer output stream.
Error Encoding

The encoding of the transformer error stream.

Ant Preferences

To set Ant preferences, open the Preferences dialog box (Options > Preferences) and go to XML > Ant. This panel allows you to choose the directory containing the Apache Ant libraries (the so-called Ant Home) that Oxygen XML Editor uses to handle Ant build files.

There are two options available:

- **Built-in** - the path to the Ant distribution that comes bundled with Oxygen XML Editor installation kit.
- **Custom** - the path to an Ant distribution of your choice.

Import Preferences

To configure importing options, open the Preferences dialog box (Options > Preferences) and go to XML > Import. This page allows you to configure how empty values and null values are handled when they are encountered in imported database tables or Excel sheets. Also you can configure the format of date / time values recognized in the imported database tables or Excel sheets.

The following options are available:

**Create empty elements for empty values**
- If checked, an empty value from a database column or from a text file is imported as an empty element.

**Create empty elements for null values**
- If checked, null values from a database column are imported as empty elements.

Escape XML content
- Enabled by default, this option instructs Oxygen XML Editor to escape the imported content to an XML-safe form.

Add annotations for generated XML Schema
- If checked, the generated XML Schema contains an annotation for each of the imported table columns. The documentation inside the annotation tag contains the remarks of the database columns (if available) and also information about the conversion between the column type and the generated XML Schema type.

Date / Time Format section

Specifies the format used for importing date and time values from Excel spreadsheets or database tables, and in the generated XML schemas. You can choose from the following format types:

- **Unformatted** - The date and time formats specific to the database are used for import. When importing data from Excel a string representation of date or time values are used. The type used in the generated XML Schema is xs:string.
- **XML Schema date format** - The XML Schema-specific format ISO8601 is used for imported date / time data (yyyy-MM-dd'T'HH:mm:ss for datetime, yyyy-MM-dd for date and HH:mm:ss for time). The types used in the generated XML Schema are xs:datetime, xs:date and xs:time.
- **Custom format** - If selected, you can define a custom format for timestamp, date, and time values or choose one of the predefined formats. A preview of the values is presented when a format is used. The type used in the generated XML Schema is xs:string.

Table 3: Pattern Letters

<table>
<thead>
<tr>

<td>General time zone</td>
<td>Pacific Standard Time; PST; GMT-08:00</td>
</tr>
<tr>
<td>Z</td>
<td>Time zone</td>
<td>RFC 822 time zone</td>
<td>-0800</td>
</tr>
</tbody>
</table>

Pattern letters are usually repeated, as their number determines the exact presentation:

- **Text** - If the number of pattern letters is 4 or more, the full form is used. Otherwise, a short or abbreviated form is used if available.
- **Number** - The number of pattern letters is the minimum number of digits, and shorter numbers are zero-padded to this amount.
- **Year** - If the number of pattern letters is 2, the year is truncated to 2 digits. Otherwise, it is interpreted as a number.
- **Month** - If the number of pattern letters is 3 or more, the month is interpreted as text. Otherwise, it is interpreted as a number.
- **General time zone** - Time zones are interpreted as text if they have names. For time zones representing a GMT offset value, the following syntax is used:
  - **GMTOffsetTimeZone** - GMT Sign Hours : Minutes
  - **Sign** - one of + or -
  - **Hours** - one or two digits
  - **Minutes** - two digits
  - **Digit** - one of 0 1 2 3 4 5 6 7 8 9

  Hours must be between 0 and 23, and Minutes must be between 00 and 59. The format is locale independent and digits must be taken from the Basic Latin block of the Unicode standard.

- **RFC 822 time zone**: The RFC 822 4-digit time zone format is used:
  - **RFC822TimeZone**
  - **TwoDigitHours** (must be between 00 and 23)

**XML Signing Certificates Preferences**

Oxygen XML Editor provides two types of keystores for certificates that are used for digital signatures of XML documents: Java KeyStore (JKS) and Public-Key Cryptography Standards version 12 (PKCS-12). A keystore file is protected by a password. To configure a certificate keystore, open the Preferences dialog box (Options > Preferences) and go to XML > XML Signing Certificates. You can customize the following parameters of a keystore:
Figure 30: Certificates Preferences Panel

- **Keystore type** - The type of keystore that Oxygen XML Editor uses (JKS or PKCS-12).
- **Keystore file** - The location of the imported file.
- **Keystore password** - The password that is used for protecting the privacy of the stored keys.
- **Certificate alias** - The alias used for storing the key entry (the certificate or the private key) inside the keystore.
- **Private key password** - The private key password of the certificate (required only for JKS keystores).
- **Validate** - Press this button to verify the configured keystore and the validity of the certificate.

XML Refactoring Preferences

To specify a folder for loading the custom XML refactoring operations, **open the Preferences dialog box (Options > Preferences)** and go to **XML > XML Refactoring**. The following option is available in this preferences page:

**Load additional refactoring operations from**

Use this text box to specify a folder for loading custom XML refactoring operations. You can specify the path by using the text field, the **Insert Editor Variables** button, or the **Browse** button.

DITA Preferences

To access the DITA Preferences page, **open the Preferences dialog box (Options > Preferences)** and go to **DITA**. This preferences page includes the following sections and options:

### DITA Open Toolkit section

This section allows you to specify the default directory of the DITA Open Toolkit distribution (bundled with the Oxygen XML Editor installation) to be used for validating and publishing DITA content. You can select from the following:

- **Built-in DITA-OT 1.8**
  
  If this is set, all defined DITA transformation scenarios will run with DITA-OT 1.8.5. The built-in DITA OT 1.8.5 directory is: `[OXYGEN_INSTALL_DIR]/frameworks/dita/DITA-OT`.  

- **Built-in DITA-OT 2.x (with support for DITA 1.3 and Lightweight DITA)**
  
  Starting with Oxygen 18.0, this is the default setting. All defined DITA transformation scenarios will run with DITA-OT 2.3.3. This also gives you access to DITA 1.3 file templates when you **create new documents from templates**. The default DITA OT 2.3.3 directory is: `[OXYGEN_INSTALL_DIR]/frameworks/dita/DITA-OT2.x`.  

- **Custom**
  
  Allows you to specify a custom directory for your DITA OT distribution.

- **Location**
  
  You can either provide a new file path for the specific DITA OT that you want to use or select a previously used one from the drop-down list. You can specify the path by using the text field, the **Insert Editor Variables** button, or the **Browse** button.

### DITA Maps file patterns

Allows you to specify the extension types that will be handled as DITA maps when opened in Oxygen XML Editor.

### When opening a map

Oxygen XML Editor can open a DITA map in the regular editor view or in the **DITA Maps Manager**. This options allows you to specify how a map will be opened. You can choose one of the following options:
• **Always open in the DITA Maps Manager** - A DITA map file is always opened in the DITA Maps Manager view.
• **Always open as XML** - A DITA map file is always opened in the XML editor.
• **Always ask** - When opening a DITA map, you are prompted to choose between opening it in the XML editor panel or in the DITA Maps Manager view.

**Prefer navigation title for topicref rendering**
If enabled and there is a `navtitle` attribute set on a `topicref`, then the `navtitle` is used to render the title of the topic in the DITA Maps Manager.

**Insert topic reference section**
Allows you to specify that when inserting a topic reference (using the Insert Reference dialog box and Edit Properties dialog box), the values for certain attributes will always be automatically populated with a detected value (based on the specifications), even if it is the same as the default value. You can choose to always populate the values for the following attributes:

- **Format** - If enabled, the attribute will always be automatically populated with a detected value.
- **Scope** - If enabled, the `sformat:scope` attribute will always be automatically populated with a detected value.
- **Type** - If enabled, the `type` attribute will always be automatically populated with a detected value.
- **Navigation title** - If enabled, the `navtitle` attribute will always be automatically populated with a detected value.

**Insert link section**
Allows you to specify that when a link reference is inserted (using actions in the Link drop-down menu), the values for certain attributes will always be automatically populated with a detected value (based on the specifications), even if it is the same as the default value. You can choose to always populate the values for the following attributes:

- **Format** - If enabled, the `format` attribute will always be automatically populated with a detected value.
- **Scope** - If enabled, the `scope` attribute will always be automatically populated with a detected value.
- **Type** - If enabled, the `type` attribute will always be automatically populated with a detected value.

**Use '.' instead of the ID of the parent topic (DITA 1.3)**
When addressing a non-topic element within the topic that contains the URI reference, the URI reference can use an abbreviated fragment-identifier syntax that replaces the topic ID with `"."` (`.[/elementId]`). For more information, see [https://www.oxygenxml.com/dita/1.3/specs/index.html#archSpec/base/uri-based-addressing.html](https://www.oxygenxml.com/dita/1.3/specs/index.html#archSpec/base/uri-based-addressing.html).

**File name generation rules for new topics section**
The options in this section pertain to the rules that will be used to generate file names in the New DITA File dialog box if the Use the title to generate the file name option is selected.

**Replace spaces with**
If selected, the file name generation mechanism will replace spaces in the title with the character entered in this option.

- **Lower case only**
  Select this option if you want the file name generation mechanism to only use lower case letters.

- **Use camel case**
  If selected, the file name generation mechanism will convert the title to a camel case file name.

- **Upper case first letter**
  Select this option if you want the file name generation mechanism to convert the title to a camel case file name but use an upper case letter for the first word.

**Show console output**
Allows you to specify when to display the console output log. The following options are available:

- **When build fails** - displays the console output log if the build fails.
- **Always** - displays the console output log, regardless of whether or not the build fails.

**Profiling Attributes link**
Link to the Profiling Attributes preferences page, where you can configure how profiling and conditional text is displayed in Author mode.
Data Sources Preferences

To configure the Data Sources preferences, open the Preferences dialog box (Options > Preferences) and go to Data Sources. This preferences page allows you to configure data sources and connections to relational and native XML databases. For a list of drivers that are available for the major database servers, see Download Links for Database Drivers on page 133.

Connection Wizards Section

Create eXist-db XML connection

Click this link to open the dedicated Create eXist-db XML connection dialog box that provides a quick way to create an eXist connection.

Data Sources Section

This section allows you to add and configure data sources.

Figure 31: Data Sources Preferences Panel

The following buttons are available at the bottom of the Data Sources panel:

+ New

Opens the Data Sources Drivers dialog box that allows you to configure a new database driver.

Figure 32: Data Sources Drivers Dialog Box

The following options are available in the Data Source Drivers dialog box:
• **Name** - The name of the new data source driver that will be used for creating connections to the database.
• **Type** - Selects the data source type from the supported driver types.

  • **Help button** - Opens the User Manual at the list of the sections where the configuration of supported data sources is explained and the URLs for downloading the database drivers are specified.

• **Driver files (JAR, ZIP)** - Lists download links for database drivers that are necessary for accessing databases in Oxygen XML Editor.
• **Add Files** - Adds the driver class library.
• **Add Recursively** - Adds driver files recursively.
• **Remove** - Removes the selected driver class library from the list.
• **Detect** - Detects driver file candidates.
• **Stop** - Stops the detection of the driver candidates.
• **Driver class** - Specifies the driver class for the data source driver.

**Edit**

Opens the **Data Sources Drivers** dialog box for editing the selected driver. See above the specifications for the **Data Sources Drivers** dialog box. To edit a data source, there must be no connections using that data source driver.

**Duplicate**

Creates a copy of the selected data source.

**Delete**

Deletes the selected driver. To delete a data source, there must be no connections using that data source driver.

**Connections Section**

This section allows you to add and configure data source connections.

---

**Figure 33: Connections Preferences Panel**

The following buttons and options are available at the bottom of the **Connections** panel:

• **New**

  Opens the **Connection** dialog box that allows you to configure a new database connection.
Figure 34: Connection Dialog Box

The following options are available in the Connection dialog box:

- **Name** - The name of the new connection that will be used in transformation scenarios and validation scenarios.
- **Data Source** - Allows selecting a data source defined in the Data Source Drivers dialog box.

Depending upon the selected data source, you can set some of the following parameters in the Connection details area:

- **URL** - The URL for connecting to the database server.
- **User** - The user name for connecting to the database server.
- **Password** - The password of the specified user name.
- **Host** - The host address of the server.
- **Port** - The port where the server accepts the connection.
- **XML DB URI** - The database URI.
- **Database** - The initial database name.
- **Collection** - One of the available collections for the specified data source.
- **Environment home directory** - Specifies the home directory (only for a Berkeley database).
- **Verbosity** - Sets the verbosity level for output messages (only for a Berkeley database).
- **Use a secure HTTPS connection (SSL)** - Allows you to establish a secure connection to an eXist database through the SSL protocol.

**Edit**

Opens the Connection dialog box, allowing you to edit the selected connection. See above the specifications for the Connection dialog box.

**Duplicate**

Creates a copy of the selected connection.

**Delete**

Deletes the selected connection.

**Move Up**

Moves the selected connection up one row in the list.

**Move Down**

Moves the selected connection down one row in the list.

**Limit the number of cells**

For performance issues, you can set the maximum number of cells that will be displayed in the Table Explorer view for a database table. Leave this field empty if you want the entire content of the table to be displayed. By default, this field is...
set to 2000. If a table that has more cells than the value set here is displayed in the **Table Explorer** view, a warning dialog box will inform you that the table is only partially shown.

**Maximum number of children for container nodes**

In Oracle XML, a container can hold millions of resources. If the node corresponding to such a container in the **Data Source Explorer** view would display all the contained resources at the same time, the performance of the view would be very slow. To prevent this, only a limited number of the contained resources is displayed as child nodes of the container node. Navigation to other contained resources from the same container is enabled by the *Up* and *Down* buttons in the **Data Source Explorer** view. This limited number is set in the field. The default value is 200 nodes.

**Table Filters Preferences**

The Table Filters preferences page allows you to choose the types of tables to be shown in the **Data Source Explorer** view. To open this preferences page, *open the Preferences dialog box (Options > Preferences)* and go to **Data Sources > Table Filters**.

You can choose to display the following types of tables:

- **Alias**
- **Global Temporary**
- **Local Temporary**
- **Synonym**
- **System Table**
- **Table**
- **View**

**Download Links for Database Drivers**

For a list of major relational databases and the drivers that are available for them, see [https://www.oxygenxml.com/database_drivers.html](https://www.oxygenxml.com/database_drivers.html).

In addition, the following is a list of other popular databases along with instructions for getting the drivers that are necessary to access the databases in Oxygen XML Editor:

- **Berkeley DB XML database** - Copy the *jar* files from the Berkeley database install directory into the Oxygen XML Editor install directory as described in *the procedure for configuring a Berkeley DB data source*.
- **IBM DB2 Pure XML database** - Go to the IBM website and in the DB2 Clients and Development Tools category select the *DB2 Driver for JDBC and SQLJ* download link. Fill out the download form and download the zip file. Unzip the zip file and use the db2jcc.jar and db2jcc_license_cu.jar files in Oxygen XML Editor for *configuring a DB2 data source*.
- **eXist database** - Copy the *jar* files from the eXist database install directory to the Oxygen XML Editor install directory as described in *the procedure for configuring an eXist data source*.
- **MarkLogic database** - Download the MarkLogic driver from MarkLogic Community site.
- **PostgreSQL 8.3 database** - Go to [http://jdbc.postgresql.org/download.html](http://jdbc.postgresql.org/download.html) and download the PostgreSQL 8.3 JDBC3 driver.
- **Documentum xDB (X-Hive/DB) 10 XML database** - Copy the *jar* files from the Documentum xDB (X-Hive/DB) 10 database install directory to the Oxygen XML Editor install directory as described in *the procedure* for configuring a Documentum xDB (X-Hive/DB) 10 data source.

**SVN Preferences**

To configure the options for the SVN client tool, *open the Preferences dialog box (Options > Preferences)* and go to **SVN**. Some other preferences for the embedded SVN client tool can be set in the global files called *config* and *servers*. These files contain parameters that act as defaults applied to all the SVN client tools that are used by the same user on their computer login account. To open these files for editing, launch the embedded SVN client tool (Tools > SVN Client) and select **Global**
The following SVN options can be configured in this preferences page:

**Enable symbolic link support (available only on Mac OS X and Linux)**

Apache Subversion™ has the ability to put a symbolic link under version control, via the usual SVN add command. The Subversion repository has no internal concept of a symbolic link. It stores a versioned symbolic link as an ordinary file with a svn:special property attached. On Unix/Linux, the SVN client sees the property and translates the file into a symbolic link in the working copy. If the symbolic link support is disabled, the versioned symbolic links appear as a text file instead of symbolic link.

**Important:** It is recommended to disable symbolic links support if you do not have versioned symbolic links in your repository, since the SVN operations will work faster. However, you should not disable this option when you do have versioned symbolic links in repository. In that case a workaround would be to reference the working copy by its real path, instead of a path that includes a symbolic link.

**Allow unversioned obstructions**

Controls how to handle a situation where working copy resources are ignored / unversioned when performing an update operation and incoming files (from the repository) with the same name and location intersect with those being ignored / unversioned. If the option is enabled, the incoming items will become BASE revisions of the ones already present in the working copy, and those present will be made versioned resources and will be marked as modified (exactly as if the user first made the update operation and then modified the files). If the option is disabled, the update operation will fail when encountering files in this situation, possibly leaving other files not updated. By default, this option is enabled.

**Use unsafe copy operations**

Sometimes when the working copy is accessed through Samba and the SVN client cannot make a safe copy of the committed file due to a delay in getting a write permission, the result is that the committed file will be saved with zero length (the content is removed) and an error will be reported. In this case, this option should be selected so that the SVN client does not try to make the safe copy.

**HTTPS encryption protocols (available if you are using Java version 1.6 or older)**

Sets a specific encryption protocol to be used when the application accesses a repository through HTTPS protocol. You can choose one of the following values:

- SSLv3, TLSv1 (default value)
- SSLv3 only
- TLSv1 only

**Results Console**

Specifies the maximum number of lines displayed in the Console view. The default value is 1000.
Annotations View
Sets the color used in the editor panel for highlighting all the changes contributed to a resource by the revision selected in
the Annotations view.

Revision Graph
Enables caching for the action of computing a revision graph. When a new revision graph is requested, one of the caches
from the previous actions may be used that will avoid running the whole query again on the SVN server. If a cache is used, it will finish the action much faster.

Working Copy Preferences
To configure the Working Copy preferences, open the Preferences dialog box (Options > Preferences) and go to SVN > Working Copy. The options in this preferences page are specific to SVN working copies and they include the following:

Working copies location
Allows you to define a location where you keep your working copies. This location is automatically suggested when you
check out a new working copy.

Working copy administrative directory
 Allows you to customize the directory name where the SVN entries are kept for each directory in the working copy.

When loading an old format working copy
You can instruct the SVN client to do one of the following:

• Always ask - You are notified when such a working copy is used and you are allowed to choose what action to be taken
  - to upgrade or not the format of the current working copy.

• Never upgrade - Older format working copies are left untouched. No attempt to upgrade the format is made.

  Note: SVN 1.6 and older working copies still need to be upgraded before loading them.

Enable working copy caching
If checked, the content of the working copies is cached for refresh operations.

Automatically refresh the working copy
If checked, the working copy is refreshed from cache. Only the new changes (modifications with a date/time that follows
the last refresh operation) are refreshed from disk. Disabled by default.

Allow moving/rename mixed revision directories
If enabled, Oxygen XML Editor will allow you to move or rename a directory even if its child items have a different
revision. Otherwise, an error message is displayed when there are multiple revisions to avoid unnecessary conflicts. It is
recommended to leave this option disabled and to Update the subtree to a single revision before moving or renaming it.

When synchronizing with repository
The action that will be executed automatically after the Synchronize action. The possible actions are:

• Always switch to 'Modified' mode - The Synchronize action is followed automatically by a switch to Modified mode
  of Working Copy view, if All Files mode is currently selected.

• Never switch to 'Modified' mode - Keeps the currently selected view mode unchanged.

• Always ask - The user is always asked if they want to switch to Modified mode.

Application global ignores
Allows you to set file patterns that may include the * and ? wildcards for unversioned files and folders that must be ignored
when displaying the working copy resources in the Working Copy view. These patterns are case-sensitive. For example,
*.txt matches file.txt, but does not match file.TXT.

Diff Preferences
To configure the SVN Diff options, open the Preferences dialog box (Options > Preferences) and go to Diff.

The following option is available:

Compare With External Application
Specifies an external application to be launched for compare operations in the following cases:

• When two history revisions are compared.
• When the working copy file is compared with a history revision.
• When a conflict is edited.

The parameters \$\{firstFile\} and \$\{secondFile\} specify the positions of the two compared files in the command line for the external diff application. The parameter \$\{ancestorFile\} specifies the common ancestor (that is, the BASE revision of a file) in a three-way comparison. The working copy version of a file is compared with the repository version, with the BASE revision (the latest revision read from the repository by an Update or Synchronize operation) being the common ancestor of these two compared versions.

Important: If the path to the external compare application includes spaces (or any of the subsequent options or arguments), then each of these paths or tokens must be double-quoted for the Oxygen XML Editor to correctly parse and identify them. For example, \"C:\Program Files\compareDir\app name.exe\" must be written as "C:\Program Files\compareDir\app name.exe".

Messages Preferences

The Messages preferences page allows you to disable certain warning messages that may appear in the application. To configure these options, open the Preferences dialog box (Options > Preferences) and go to SVN > Messages.

This preferences page allows you to disable the following warning messages:

Show confirmation dialog when using the "Update All" action
Allows you to avoid performing accidental update operations by requesting you to confirm them before execution.

Show confirmation dialog for drag and drop actions in Working Copy
This option avoids doing a drag and drop when you just want to select multiple files in the Working Copy view.

Show warning dialog when editing conflicts
When the Edit Conflicts action is executed, a warning dialog box notifies you that the action overwrites the conflicted version of the file created by an update operation. The conflicted file is overwritten with the version of the same file that existed in the working copy before the update operation and then proceeds with the visual editing of the conflicting file.

Show warning dialog when "svn:externals" definitions are ignored
A warning dialog box is displayed when "svn:externals" definitions are ignored before performing any operation that updates resources of the working copy (such as Update and Override and Update).

Diff Preferences

The Diff Preferences Page has sub-pages for configuring File Comparisons and Directory Comparisons.

Files Comparison Preferences

To configure the Files Comparison options, open the Preferences dialog box (Options > Preferences) and go to Diff > Files Comparison.
This preferences page allows you to configure the following options:

**Ignore Whitespaces**
If enabled, before performing the comparison, the application normalizes the content (collapses any sequence of whitespace characters into a single space) and trims its leading and trailing whitespaces.

**Note:** If the **Ignore Whitespaces** checkbox is selected, comparing the `a b` sequence with `a b`, Oxygen XML Editor finds no differences, because after normalization, all whitespaces from the first sequence are collapsed into a single space character. However, when comparing `a b` with `ab` (no whitespace between `a` and `b`), Oxygen XML Editor signals a difference.

**Two-Way Diff section**

**Default algorithm**
The default algorithm used for comparing two files. The following options are available:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Characters** - Computes the differences at character level, meaning that it compares two files or fragments looking for identical characters.
- **Words** - Computes the differences at word level, meaning that it compares two files or fragments looking for identical words.
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text.
- **Syntax Aware** - Computes differences for the file types or fragments known by Oxygen XML Editor, taking the syntax (the specific types of tokens) into consideration.
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
• **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

**Algorithm strength**

Controls the amount of resources allocated to the application to perform the comparison. The algorithm stops searching more differences when reaches the maximum allowed resources. A dialog box is displayed when this limit is reached and partial results are displayed. Four settings are available: **Low**, **Medium** (default), **High** and **Very High**.

**Three-Way Diff section**

**Default algorithm**

The default algorithm used for performing a three-way comparison. The following options are available:

• **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).

• **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text.

• **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.

• **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

**Algorithm strength**

Controls the amount of resources allocated to the application to perform the comparison. The algorithm stops searching more differences when reaches the maximum allowed resources. A dialog box is displayed when this limit is reached and partial results are displayed. Four settings are available: **Low**, **Medium** (default), **High** and **Very High**.

**Show pseudo conflicts**

Specifies whether or not the file comparison displays pseudo-conflicts. A pseudo-conflict occurs when two users make the same change (for example, when they both add or remove the same line of code).

**XML Diff section**

**Ignore**

Allows you to specify the types of XML nodes that will be ignored in the file comparison for the **XML Fast** and **XML Accurate** algorithms.

**Ignore nodes by XPath**

If enabled, you can enter an **XPath expression** to ignore certain nodes from the comparison. It will be processed as XPath version 2.0. The XPath expression specified in this option is used as the default ignore instructions only when the application is started. If you enter an XPath expression in the similar option on the **Diff Files** toolbar, that expression will be used instead.

**Merge adjacent differences**

If enabled, the application considers two adjacent differences as one when the differences are painted in the side-by-side editors. If disabled, every difference is represented separately.

**Mark end tags as different for modified elements**

If enabled, end tags of modified elements are also presented as differences. Otherwise, only the start tags are presented as differences.

**Ignore expansion state for empty elements**

If enabled, empty elements in both expansion states are considered matched (that is `<element/>` and `<element></element>` are considered equal).

**Appearance Preferences**

To configure the appearance options for the Files Comparison tool, open the **Preferences dialog box (Options > Preferences)** and go to **Diff > Files Comparison > Appearance**. This preferences page offers the following options:
Line wrap
Wraps the lines presented in the two diff panels at the right margin of each panel, so no horizontal scrollbar is necessary.

Incoming color
Specifies the color used on the vertical bar for incoming changes.

Outgoing color
Specifies the color used on the vertical bar for outgoing changes.

Conflict color
Specifies the color used on the vertical bar for conflicts between the compared files.

Directories Comparison Preferences
To configure the Directories Comparison preferences, open the Preferences dialog box (Options > Preferences) and go to Diff > Directories Comparison.

Figure 37: Files Comparison Appearance Preferences Panel

Figure 38: Diff Preferences Page

For the directories comparison, you can specify the following options:

Compare files by
Controls the method used for comparing two files:
- **Content** - The file content is compared using the current *diff algorithm*. This option is applied for a pair of files only if that file type is associated with a built-in editor type (either associated by default or associated by the user when prompted to do so on opening a file of that type for the first time).
  
  You can use the Configure content comparison link to open the Files Comparison preferences page where you can configure options for comparing files. However, the Ignore nodes by XPath option is ignored when using the CompareDirectories tool.

  - **Binary Compare** - The files are compared at byte level.
  - **Timestamp (last modified date / time)** - The files are compared only by their last modified timestamp.
Look in archives
If checked, known archive types are considered directories and their content is compared just like regular files.

Navigation
This options control the behavior of the differences traversal actions (Go to previous modification, Go to next modification) when the first or last difference in a file is reached:

- **Ask what to do next** - A dialog box is displayed asking you to confirm that you want the application to display modifications from the previous or next file.
- **Go to the next/previous file** - The application opens the next or previous file without waiting for your confirmation.
- **Do nothing** - No further action is taken.

Appearance Preferences
To configure the appearance options for the Directories Comparison tool, open the Preferences dialog box (Options > Preferences) and go to Diff > Directories Comparison > Appearance.

![Figure 39: Diff Appearance Preferences Panel](image)

- **Added/Deleted** - Color used for marking added or deleted files and folders.
- **Modified** - Color used for marking modified files.

Archive Preferences
To configure Archive preferences, open the Preferences dialog box (Options > Preferences) and go to Archive.

The following options are available in the Archive preferences page:

**Archive backup options**
Controls if the application makes backup copies of the modified archives. The following options are available:

- **Always create backup copies of modified archives** - When you modify an archive, its content is backed up.
- **Never create backup copies of modified archives** - No backup copy is created.
- **Ask for each archive once per session** - Once per application session for each modified archive, user confirmation is required to create the backup. This is the default setting.

**Note:** Backup files have the name `originalArchiveFileName.bak` and are located in the same folder as the original archive.

**Archive types**
This table contains all known archive extensions mapped to known archive formats. Each row maps a list of extensions to an archive type supported in Oxygen XML Editor. You can use the **Edit** button at the bottom of the table to edit an existing mapping or the **New** button to create a new one and associate your own list of extensions to an archive format.

![Figure 40: Edit Archive Extension Mappings](image)
**Important:** You have to restart Oxygen XML Editor after removing an extension from the table for that extension to not be recognized as an archive extension.

**Store Unicode file names in Zip archives**

Use this option when you archive files that contain international (non-English) characters in file names or file comments. If this option is selected and an archive is modified in any way, UTF-8 characters are used in the names of all files in the archive.

**Plugins Preferences**

You can add plugins that extend the functionality of Oxygen XML Editor. The plugins are shipped as separate packages. To check for new plugins, go to [http://www.oxygenxml.com/oxygen_sdk.html](http://www.oxygenxml.com/oxygen_sdk.html).

A plugin consists of a separate sub-folder in the Plugins folder of the Oxygen XML Editor installation folder. This sub-folder must contain a valid plugin.xml file in accordance with the plugin.dtd file located in the Plugins folder.

Oxygen XML Editor automatically detects and loads plugins installed correctly in the Plugins folder and displays them in the Plugins preferences page. To configure plugins, open the Preferences dialog box (Options > Preferences) and go to Plugins.

You can use the check-boxes in front of each plugin to enable or disable them. To display the properties of a plugin in the second section of the Plugins preferences page, click the name of the plugin.

![Figure 41: Plugins Preferences Panel](image)

Also, you can install a plugin as an add-on. For further details about this, go to *Deploying Add-ons*

**External Tools Preferences**

A command-line tool can be started in the Oxygen XML Editor user interface as if from the command line of the operating system shell. The External Tools preferences page allows you to add and configure these external tools that could be used...
while working with Oxygen XML Editor. To access this preferences page, open the Preferences dialog box (Options > Preferences) and go to External Tools (or select Configure from the Tools > External Tools menu).

This preferences page presents a list of the external tools that have been configured. You can use the buttons at the bottom of the page to configure the items in the list. Once a tool has been configured, you can open it by selecting it from the Tools > External Tools menu or from the External Tools drop-down menu on the toolbar (the Tools toolbar needs to be enabled in the Configure Toolbars dialog box).

How to Configure an External Tool

To configure an external tool in the External Tools preferences page, use any of the following buttons at the bottom of the page:

- **New** - Adds a new external tool to the list.
- **Edit** - Allows you to configure an existing external tool, selected from the list.
- **Duplicate** - Duplicates an existing external tool, selected from the list, to use as a template for configuring a similar tool.

Any of those three buttons opens the External Tools configuration dialog box.

![External Tools Configuration Dialog Box](image)

**Figure 42: External Tools Configuration Dialog Box**

This configuration dialog box includes the following options:

**Name**

The name of tool that will be displayed in the Tools > External Tools menu and in the External Tools drop-down menu on toolbar.

**Description**

A description of the tool displayed as a tooltip where the tool name is used.

**Working directory**

The directory that the external tool will use to store intermediate and final results. You can specify the path by using the text field, the Insert Editor Variables button, or the Browse button. You can use one of the following editor variables: ${cfd}, ${pd}, ${oxygenInstallDir}, ${homeDir}, ${system(var.name)}, ${date(pattern)}, ${xpath_eval(expression)}. You can also use the browsing tools to select the directory.
Command line

The command line that will start the external tool. You can specify the path by using the text field, the Insert Editor Variables button, or the Browse button. You can use one of the following editor variables: $[homeDir], $[home], $[cfn], $[cfne], $[cf], $[currentFileURL], $[cfdu], $[tsf], $[pd], $[pdu], $[oxygenInstallDir], $[oxygenHome], $[frameworksDir], $[frameworks], $[ps], $[timeStamp], $[uuid], $[id], $[afn], $[afne], $[af], $[afa], $[afdu], $[afdu], $[ask('message', type, 'default_value')], $[dbgXML], $[dbgXSL], $[env(VAR_NAME)], $[system(var.name)], $[date(pattern)], and $[xpath_eval(expression)]. You can also use the browsing tools to select a file path.

Show output messages

When this option is enabled, all the messages emitted by the external tool are displayed in the Results view. When this option is disabled, only the error messages are displayed. You can also choose the output encoding and content type:

- **Output encoding** - The encoding of the output stream of the external tool that will be used by Oxygen XML Editor to read the output of the tool.
- **Output content type** - A list of predefined content type formats that instruct Oxygen XML Editor how to display the generated output. For example, setting the Output content type to text/xml enables the syntax coloring of XML output.

Error Encoding

The encoding of the error stream of the external tool that will be used by Oxygen XML Editor to read the error stream.

Shortcut key

You can choose a keyboard shortcut that can be used to launch the external tool.

Menu Shortcut Keys Preferences

You can use the Menu Shortcut Keys preferences page to configure shortcut keys for the actions available in Oxygen XML Editor. The shortcuts assigned to actions are displayed in a table in this preference page. To access the full list of shortcut keys, open the Preferences dialog box (Options > Preferences) and go to Menu Shortcut Keys (or simply go to Options > Menu Shortcut Keys).

For a list of the most commonly used shortcuts, see Frequently Used Shortcut Keys on page 17.

![Menu Shortcut Keys Preferences Page](image)

The Menu Shortcut Keys preferences page also contains the shortcuts that you define at document type level.

Note: A shortcut defined at document type level overwrites a default shortcut.
To find a specific action, you can use the filter to search through any of the columns in the table. You can also click on a column header to sort that column.

The table includes the following columns:

- **Description** - A short description of the action.
- **Category** - A classification of the actions in categories for easier management and more flexibility in assigning multiple keys for the same action. For example, by default, the Remove all action has one shortcut key assigned for bookmarks and another one assigned for breakpoints.
- **Shortcut key** - The combination of keyboard keys that can be used to launch the action. To add or change a shortcut key, you can either double-click a row or select the row and press the **Edit** button.
- **'Home' and 'End' keys are applied at line level** (available on Mac OS X only) - Controls the way the HOME and END keys are interpreted. If enabled, the default behavior of these keys is overridden and the cursor only moves on the current line.

### How to Assign a Shortcut Key or Edit an Existing Shortcut

To assign a shortcut key to an action or edit an existing shortcut configuration, follow these steps:

1. Select the action in the table.
2. Click the **Edit** button.

   **Step Result:** The **Shortcut key** configuration dialog box is displayed.

   ![Shortcut Key Configuration Dialog Box](image)

   **Figure 44: Shortcut Key Configuration Dialog Box**

3. Press the desired shortcut keys on your keyboard.
4. If you need the shortcut to work on multiple platforms, check the **Enable platform-independent shortcut keys** option. In this case, the following modifiers are used:
   - M1 represents the **Command** key on MacOS X, and the **Ctrl** key on other platforms.
   - M2 represents the **Shift** key.
   - M3 represents the **Option** key on MacOS X, and the **Alt** key on other platforms.
   - M4 represents the **Ctrl** key on MacOS X, and is undefined on other platforms.

5. Click **OK** to save your configuration.

### Related information

- *Frequently Used Shortcut Keys* on page 17

### File Types Preferences

Oxygen XML Editor offers built-in editing support for a wide variety of file types, but you can also add new file extensions and associate them with whatever editor type fits your needs. The associations set here between a file extension and the type of editor will determine which editor will be opened for editing purposes when that type of file is created or opened.

To configure the **File Types** options, *open the Preferences dialog box (Options > Preferences)* and go to **File Types**.
Figure 45: File Types Preferences Page

The table contains the following columns:

- **Extension** - The extensions of the files that will be associated with an editor type.
- **Editor** - The type of editor which the extensions will be associated with. Some editors provide easy access to frequent operations via toolbars (XML editor, XSL editor, DTD editor) while others provide just a syntax highlight scheme (Java editor, SQL editor, Shell editor, etc.).

If the editor set here is not one of the XML editors (XML editor, XSL editor, XSD editor, RNG editor, WSDL editor) then the encoding set in the *Encoding for non XML files option* is used for opening and saving a file of this type.

The files that match the **Ant build patterns** will be associated with the Ant editor.

The files that match the **Binary file patterns** patterns are handled as binary and opened in the associated system application. Also, they are excluded from the following actions available in the Project view: File/Replace in Files, Check Spelling in Files, Validate.

Open/Find Resource Preferences Page

You can configure various options that pertain to the *Open/Find Resource dialog box* and *Open/Find Resource view*. To access these options, open the *Preferences dialog box (Options > Preferences)* and go to Open/Find Resource.

The following options are available in this Open/Find Resource preferences page:

**Limit search results to**

Specifies the maximum number of results that are displayed in the Open/Find Resource dialog box/view.

**Enable searching in content**

This option is enabled by default and it allows you to use the Open/Find Resource dialog box/view to search in content or reviews, as well as in file paths. If this option is disabled, you can only use the Open/Find Resource feature to search in file paths.

**Content search scope section**

**Ignore content of these files**

Allows you to select specific directories, files, or file types that are ignored when you perform a search. For example, *.txt* ignores all the .txt files, */topics/* ignores all the files from the topics directory, regardless of their depth, and file:/C:/tmp/* ignores everything from the tmp directory.

**Note:** The specified pattern must begin with the desired protocol (in our case file) and also contain forward slash (/).
Index the content of remote resources

Controls the indexing of resources that are not local. For example, the resources referenced in a DITA map opened from a remote server (from a CMS or from a WebDAV location) are not indexed by default. To index the content of these resources, enable this option.

Note: Enabling this option may lead to delays when the indexing is computed.

Content search options section

Content language

Use this option to specify a language for the search engine to use for the current document. This is helpful if you have multiple languages within the content of a document. The search engine will use a set of stop words and analyzers tuned specifically for that specific language. By default, it is mapped to the UI language. Therefore, you need to change this option only if the language of the text you want to perform the search in differs from the UI language.

Tip: If you select <Generic language (no stemming)> from the drop-down list, no word stemming is performed when creating the index. This might be useful if your content has many technical terms that should be indexed as they are.

Stop words

A list of stop words that will be filtered out of the search processing. The list is automatically populated based upon the specified Content language, but you can add or remove words from the list.

When searching in content, return

This option specifies how matches are returned when doing searches in content. You can choose between two options:

- Exact matches - The search results match the exact whole words that you enter in the search field of the Open/Find Resource dialog box/view.
- Prefix matches (default) - The search results match documents that contain words starting with the search terms. For instance, searching for “pref page” will also find documents containing “preference page”.

Automatically join search terms using:

Allows you to select the default boolean operator that Oxygen XML Editor applies when you perform a search. For example, if the AND operator is selected and you search for “car assembly”, the matches must contain both of the words. If you choose OR, the matches must contain one of the selected search terms and results that contain both words are promoted to the top of the list.

Enable XML-aware searching

When enabled, you can perform XML-specific searches for XML elements and attributes.

Note: Enabling this option may slow down the indexing of your documents and increase the index size on the disk.

Index files with size less than (KB)

Since indexing can be slowed down when the Enable XML-aware searching option is active, you can use this option to set a maximum file size to be indexed.

Stop Words

A list of comma separated stop words, meaning that the words added in this list are filtered out prior to processing a search query.

Open/Find Resource Dialog Box on page 256

Custom Editor Variables Preferences

An editor variable is useful for making a transformation scenario, validation scenario, or other tool independent of its file path. An editor variable is specified as a parameter in a transformation scenario, validation scenario, or command line of an external tool. Such a variable is defined by a name, a string value, and a text description. A custom editor variable is defined by the user and can be used in the same expressions as the built-in editor variables.
Custom editor variables are created and configured in the **Custom Editor Variables** preferences page. To access this page, open the **Preferences dialog box (Options > Preferences)** and go to **Custom Editor Variables**.

This preferences page displays a table of all the custom editor variables that have been defined. The table includes three columns for the editor variable **Name**, its **Value**, and its **Description**. To create a new variable, click the **New** button at the bottom of the table and define your custom editor variable in the subsequent dialog box. To edit an existing custom editor variable, click the **Edit** button and configure the variable in the subsequent dialog box. You can also use the **Delete** button to remove custom editor variables that are no longer needed.

![Custom Editor Variables Table](image)

**Figure 46: Custom Editor Variables Table**

**Network Connection Settings Preferences**

This section presents the options available in the **Network Connection Settings** preferences pages.

**Proxy Preferences**

Some networks use proxy servers to provide internet services to LAN clients. Therefore, clients behind the proxy may only connect to the Internet via the proxy service. If you are not sure if your computer is required to use a proxy server to connect to the Internet or you do not know the proxy parameters, consult your network administrator.

To configure the **Proxy** options, open the **Preferences dialog box (Options > Preferences)** and go to **Network Connection Settings > Proxy**. The following options are available:

**Proxy section**

Specifies how HTTP(S) connections go through the proxy server. You can choose between the following three options:

- **Direct connection** - HTTP(S) connections will go directly to the target host without going through a proxy server.
- **Use system settings** (default setting) - HTTP(S) connections will go through the proxy server set in the operating system.
  
  **Attention:** The system settings for the proxy cannot be read correctly from the operating system on some Linux systems. The system settings option should work properly on Gnome based Linux systems, but it does not work on KDE based ones as the Java virtual machine does not offer the necessary support yet.

- **Manual proxy configuration** - HTTP(S) connections will go through the proxy server specified in the **Web Proxy (HTTP/HTTPS)** section.

**Web Proxy (HTTP/HTTPS) section**

**Address**

The address of the proxy server used for manual configurations.

**Port**

The port of the proxy server used for manual configurations.

**No proxy for**

Specifies the hosts that the connections must not go through a proxy server. A host needs to be written as a fully qualified domain name (for example, myhost.example.com) or as a domain name (for example, example.com). Use a comma to separate multiple hosts.
User
The user name for authentication with the proxy server.

Password
The password for authentication with the proxy server.

SOCKS Proxy section

Address
The address of a SOCKS proxy that all connections will pass through. If this field is empty, the connections do not use a SOCKS proxy.

Port
The port of a SOCKS proxy that all connections will pass through.

Using a Proxy Auto-Configuration Script (PAC)
If you have set up the path to a Proxy auto-configuration script in your system, Oxygen XML Editor cannot detect this setting out of the box.

You can create a new folder ([OXYGEN_INSTALL_DIR]\lib\endorsed) in which you should copy two additional Java libraries: deploy.jar and plugin.jar. These libraries can be found in the [OXYGEN_INSTALL_DIR]\jre\lib folder if the application came with a bundled Java VM (otherwise, in the Java VM installation used to run the application).

HTTP(S)/WebDAV Preferences
To set the HTTP(S)/WebDAV preferences, open the Preferences dialog box (Options > Preferences) and go to Network Connection Settings > HTTP(S)/WebDAV. The following options are available:

Internal Apache HttpClient Version
Oxygen XML Editor uses the Apache HttpClient to establish connections to HTTP servers. For Oxygen XML Editor to benefit from particular sets of features provided by different versions, you may choose between v3 and v4.

Maximum number of simultaneous connections per host
Defines the maximum number of simultaneous connections established by the application with a distinct host. Servers might consider multiple connections opened from the same source to be a Denial of Service attack. You can avoid that by lowering the value of this option.

Note: The minimum value that can be set in this option is 5.

Read Timeout (seconds)
The period (in seconds) after which the application considers that an HTTP server is unreachable if it does not receive any response from that server.

Enable HTTP 'Expect: 100-continue ' handshake (for HTTP/1.1 protocol)
Activates Expect: 100-Continue handshake. The purpose of the Expect: 100-Continue handshake is to allow a client that is sending a request message with a request body to determine if the origin server is willing to accept the request (based on the request headers) before the client sends the request body. The use of the Expect: 100-continue handshake can result in noticeable performance improvement when working with databases. The Expect: 100-continue handshake should be used with caution, as it may cause problems with HTTP servers and proxies that do not support the HTTP/1.1 protocol.

Use the 'Content-Type' header field to determine the content type
When checked, Oxygen XML Editor tries to determine a resource type using the Content-Type header field. This header indicates the Internet media type of the message content, consisting of a type and subtype. For example:

```
Content-Type: text/xml
```

When unchecked, the resource type is determined by analyzing its extension. For example, a file ending in .xml is considered to be an XML file.
Automatic retry on recoverable error
When enabled, if an HTTP error occurs when Oxygen XML Editor communicates with a server via HTTP (for example, sending or receiving a SOAP request to or from a Web services server) and the error is recoverable, Oxygen XML Editor tries to re-send the request to the server.

Automatically accept a security certificate, even if invalid
When enabled, the HTTPS connections that Oxygen XML Editor attempts to establish with will accept all security certificates, even if they are invalid.

Important: By accepting an invalid certificate, you accept (at your own risk) a potential security threat, since you cannot verify the integrity of the certificate's issuer.

Lock WebDAV files on open
If checked, the files opened through WebDAV are locked on the server so that they cannot be edited by other users while the lock placed by the current user still exists on the server.

(S)FTP Preferences
To configure the (S)FTP options, open the Preferences dialog box (Options > Preferences) and go to Network Connection Settings > (S)FTP. You can customize the following options:

Figure 47: (S)FTP Configuration Preferences Panel

- **Encoding for FTP control connection** - The encoding used to communicate with FTP servers: either ISO-8859-1 or UTF-8. If the server supports the UTF-8 encoding Oxygen XML Editor will use it for communication. Otherwise, it will use ISO-8859-1.
- **Public known hosts file** - File containing the list of all SSH server host keys that you have determined are accurate. The default value is ${homeDir}/.ssh/known_hosts.
- **Private key file** - The path to the file containing the private key used for the private key method of authentication of the secure FTP (SFTP) protocol. The user / password method of authentication has precedence if it is used in the Open URL dialog box.
- **Passphrase** - The passphrase used for the private key method of authentication of the secure FTP (SFTP) protocol. The user / password method of authentication has precedence if it is used in the Open URL dialog box.

Trusted Hosts Preferences
This preferences page contains a list of domains that have been identified as trusted. You can add or remove domains from the list and Oxygen XML Editor will allow connections to the listed hosts without requesting user confirmation.

To configure the Trusted Hosts options, open the Preferences dialog box (Options > Preferences) and go to Network Connection Settings > Trusted Hosts. The following options are available:

- **New** - Allows you to manually add a new entry to the list of trusted hosts.

  Tip: You can specify a specific port at the end of the URL (for instance, www.example.com:8080). Otherwise, if no port is specified, connections will be allowed on all ports for the particular host.

- **Delete** - Allows you to remove an entry from the list of trusted hosts.
SSH Preferences
To configure the SSH options, open the Preferences dialog box (Options > Preferences) and go to Connection settings > SSH. The following options are available:

- **SSH** - Specifies the command line for an external SSH client that will be used when connecting to a SVN+SSH repository. Absolute paths are recommended for the SSH client executable and the file paths given as arguments (if any). Depending on the SSH client used and your SSH server configuration, you may need to specify the user name and/or private key/passphrase in the command line. You can also choose whether to use the Default SVN user (the same user name as the SSH client user) or Prompt for a SVN user for SVN repository operations whenever SVN authentication is required. For example, on Windows the following command line uses the plink.exe tool as the external SSH client for connecting to the SVN repository with SVN+SSH:

    C:\plink-install-folder\plink.exe -l username -pw password -ssh -batch host_name_or_IP_address_of_SVN_server

XML Structure Outline Preferences
To configure options in regards to the Outline view, open the Preferences dialog box (Options > Preferences) and go to XML Structure Outline. It contains the following options:

- **Preferred attribute names for display**
  The preferred attribute names when displaying the attributes of an element in the Outline view. If there is no preferred attribute name specified, the first attribute of an element is displayed.

- **Enable outline drag and drop**
  Drag and drop is disabled for the tree displayed in the Outline view only if there is a possibility to accidentally change the structure of the document by such operations.

Views Preferences
The Views preferences page allows you to configure some options in regards to certain views. To edit these options, open the Preferences dialog box (Options > Preferences) and go to Views.

The following options are available:

- **Project view section**
  - **Enable drag-and-drop in Project view**
    Enables drag and drop support in the Project view. It should be disabled only if there is a possibility of accidentally changing the structure of the project by drag and drop actions.

- **Information view section**
  - **Maximum number of lines**
    Specifies the maximum number of lines that can be written in the Information view.

- **Elements view section**
  - **Show only items allowed at cursor position**
    If enabled, when editing in Author mode, only the elements that are allowed at the current cursor position will be listed in the Elements view. If disabled, two additional tabs (Before and After) will be displayed at the bottom of the view (in Author mode only). These tabs list the elements that are allowed before or after the element at the current cursor position.

Messages Preferences
The Messages preference page allows you to specify whether or not certain messages are displayed. To configure these options, open the Preferences dialog box (Options > Preferences) and go to Messages.

The following warning messages can be enabled or disabled:
Show confirmation dialog when moving resources
Specifies whether or not to display a confirmation dialog box when you move a resource in the Project view, Data Source Explorer, and Archive Browser. In the confirmation dialog box, there is an option to choose to not show this dialog box in the future. To reset that behavior, simply select Restore Defaults at the bottom of this preferences page.

Show warning when adding resources already included in the project
Specifies whether or not to display a dialog box that warns you if you try to add files that already exist in your project.

Show warning for document size limit for bidirectional text, Asian languages, and other special characters
Specifies whether or not to display a warning message when an opened file that contains bidirectional characters is too large and bidirectional support is disabled.

Show warning message when changing the text orientation in the editor
Specifies whether or not to display a warning message when you change the text orientation in the editor.

Show warning when editing long expressions in the XPath toolbar
Specifies whether or not to display an information dialog box that allows you to specify if you want to use the XPath/XQuery Builder view when editing long XPath expressions.

Show MathFlow recommendation
Specifies whether or not to display an information dialog box that recommends using the MathFlow Editor to edit MathML equations.

Show SFTP certificate warning dialog
Specifies whether or not to display a warning dialog box each time the authenticity of the SFTP server host cannot be established.

Show Enterprise license related message when trying to connect to a Microsoft SharePoint server
Specifies whether or not to display an error message if you try to connect to a Microsoft SharePoint server without having the proper license.

Convert DB Structure to XML Schema
When tables from a database schema are selected in the Select database table section of the Convert DB Structure to XML Schema dialog box and another database schema is expanded, a confirmation is needed since the previous selection will be discarded. This option specifies whether or not you are always asked if you want the other database schema to always be expanded without asking you, or it is never expanded.

Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions
Specifies whether or not to display a dialog box that allows you to choose a specific encoding whenever you use the Encode Selection or Decode Selection actions for Base64, Base32, or Hex conversions. In the dialog box, there is an option to choose to not show this dialog box in the future. To reset that behavior, simply select Restore Defaults at the bottom of this preferences page.

---

Configuring Options

A set of options controls the behavior of Oxygen XML Editor, allowing you to configure most of the features. To offer you the highest degree of flexibility in customizing the application to fit the needs of your organization, Oxygen XML Editor includes several distinct layers of option values.
Figure 48: Option Lookup Priority

The option layers are as follows (sorted from high priority to low):

- **Project Options**
  Allows project managers to establish a set of rules for a specific project. These rules standardize the information exchanged by the team members (for example, if the project is stored in a repository, a common set of formatting rules avoid conflicts that may appear when documents modified by various team members are committed to the repository).

- **Global Options**
  Allows individual users to personalize Oxygen XML Editor according to their specific needs.

- **Customized Default Options**
  Designed to customize the initial option values for a group of users, this layer allows an administrator to deploy the application preconfigured with a standardized set of option values.

  **Note:** Once this layer is set, it represents the initial state of Oxygen XML Editor when an end-user uses the **Restore defaults** or **Reset Global Options** actions.

- **Default Options**
  The predefined default or built-in values, tuned so that Oxygen XML Editor behaves optimally in most working environments.

  **Important:** If you set a specific option in one of the layers, but it is not applied in the application, make sure that one of the higher priority layers does not overwrite it.

### Customizing Default Options
Oxygen XML Editor has an extensive set of options that you can configure. When Oxygen XML Editor in installed, these options are set to default values. You can provide a different set of default values for an installation using an XML options file.

#### Creating an XML Options File
To create an options file, follow these steps:

1. It is recommended that you use a fresh install for this procedure, to make sure that you do not copy personal or local preferences.
2. Open Oxygen XML Editor and open the **Preferences** dialog box (**Options > Preferences**).
3. Go through the options and set them to the desired defaults. Make sure that **Global Options** is selected in each page.
4. Click **OK** and close the **Preferences** dialog box.
5. Go to **Options > Export Global Options** to create an XML options file.

### Using Customized Default Options
There are two methods that you can use to configure an Oxygen XML Editor installation to use the customized default options from the created XML options file:

- **Copy the XML Options File to the Installation Directory**
In the \[OXYGEN_INSTALL_DIR\], create a folder called preferences and copy the created XML options file into it (for example, \[OXYGEN_INSTALL_DIR\]/preferences/default.xml).

- **Specify a Path to the XML Options File in a Startup Parameter**
  
  Set the path to the XML options file as the value of the \texttt{com.oxygenxml.default.options} system property in the \texttt{startup parameters}. The path can be specified with any of the following:
  
  - A URL or file path relative to the application installation folder. For example:
    
    ```
    -Dcom.oxygenxml.default.options=options/default.xml
    ```
  
  - A system variable that specifies the file path. For example:
    
    ```
    com.oxygenxml.default.options=${system\{CONFIG\}}/default.xml
    ```
  
  - An environmental variable that specifies the file path. For example:
    
    ```
    com.oxygenxml.default.options=${env\{CONFIG\}}/default.xml
    ```

  **Note:** If you are using the \textit{Java Webstart distribution}, use the \textit{optionsDir} property to specify the path of the options file (in this case, the file must be named default.xml), or you can edit the .\textit{jnlp} file that launches the application and set the \texttt{com.oxygenxml.default.options} parameter using a \texttt{property} element, as in the following example:

  ```xml
  <property name="oxy:com.oxygenxml.default.options" value="http://host/path/to/default.xml"/>
  ```

**Storing Global and Project Level Options**

When you configure the Oxygen XML Editor options, you can store them globally or bind them to a specific project by choosing the appropriate setting in the preferences pages. They can then be \textit{shared with others by exporting the global options} or by \textit{sharing the stored project-level files}. The same is true with transformation and validation scenarios.

**Figure 49: Controlling the Storage of the Preferences**

**Global Options**

By default, \textit{Global Options} is selected in the preferences pages, meaning that the options are stored on your computer and are not accessible to other users (unless you \textit{export them into an XML options file that can then be shared}).

Global options are stored locally in option files (for example, oxyOptionsSa18.1.xml for a standalone distribution of Oxygen XML Editor version 18.1) located in the following directories:

- **Windows (Vista, 7, 8, 10)** - \texttt{[user_home_directory]\AppData\Roaming\com.oxygenxml}
- **Windows XP** - \texttt{[user_home_directory]\Application Data\com.oxygenxml}
- **Mac OS X** - \texttt{[user_home_directory]/Library/Preferences/com.oxygenxml}
- **Linux/Unix** - \texttt{[user_home_directory]/.com.oxygenxml}

**Project Options**

If you select \textit{Project Options}, the preferences are stored in the project file and can be \textit{shared with other users}.

**Notice:** Some pages do not have the \textit{Project Options} switch, since the options they host might contain sensitive data (passwords, for example), unsuitable for sharing with other users.

**Note:** If changes have been made to the options in a preferences page and you switch between \textit{Project Options} and \textit{Global Options}, a dialog box will be displayed that allows you to select one of the following:

- **Overwrite** - The existing options from the current preferences page will be overwritten.
- **Preserve** - The existing options from the current preferences page will be preserved.

Sharing Application Settings

There are a variety of ways that you can share the settings in Oxygen XML Editor with other members of your team so that you all use a common set of options. This topic describes various possibilities.

Share Settings Through a Project File

Most of the preference pages in Oxygen XML Editor include a Project Options button that allows you to pass changes to the settings to the current project file that is opened in the Project view. That project file can then be shared with other users. For instance, if your project file is saved on a version control system (such as SVN, CVS, or Source Safe) or in a shared folder, your team will have access to the same option configuration that you stored in the project file.

For more information about sharing projects, see Sharing a Project - Team Collaboration on page 270.

Share Settings by Exporting/Importing Global Options

Oxygen XML Editor includes actions in the Options menu that allow you to export and import the global settings. The Export Global Options action will save the global settings as an XML properties file. You can then share those settings with others by using the Import Global Options action to import that properties file on their computer.

For more information about global options, see Importing/Exporting/Resetting Global Options on page 154.

Share Settings with a Custom Options File During Installation

When Oxygen XML Editor in installed, all the settings are set to default values. You can customize the set of default values by creating an XML options file that you will use when installing Oxygen XML Editor on each computer. You can then copy the XML options file to the installation directory or specify its path in a startup parameter.

For more information about creating and referencing a custom options file, see Customizing Default Options on page 152.

Share Settings by Imposing Fixed Options with an API

The Maven-based Oxygen XML SDK includes a sample plugin called ImposeOptions that imposes a fixed set of options when the application starts. This can be achieved by using the PluginWorkspaceProvider.getPluginWorkspace().setGlobalObjectProperty(key, value) API method.

For more information about this API, see PluginWorkspaceProvider Class.

- Sharing a Document Type (Framework) on page 1180

Importing/Exporting/Resetting Global Options

Actions for importing, exporting, and resetting global options are available in the Options menu. The export operation allow you to save global preferences as an XML properties file and the import operation allows you to load the property file. You can use this file to reload saved options on your computer or to share with others.

The following actions are available in the Options menu:
Reset Global Options

Restores the preference to the factory defaults or to *customized defaults*. This action also resets the transformation and validation scenarios to the default scenarios and clears recently used file templates.

Import Global Options

Allows you to import a set of *Global Options* from an exported XML properties file. You can also select a *project-level options file* (.xpr) to import all the *Global Options* that are set in that project file. After you select a file, the **Import Global Options** dialog box is displayed, and it informs you that the operation will only override the options that are included in the imported file. You can enable the **Reset all other options to their default values** option to reset all options to the default values before the file is imported.

Export Global Options

Allows you to export *Global Options* to an XML properties file. Some user-specific options that are private are not included. For example, passwords and the name of the *Review Author* is not included in the export operation.

Oxygen XML Editor automatically stores your global options in an XML properties file. Depending on the platform you are using, this file is located in the following directories:

- `[user-home-folder]`\AppData\Roaming\com.oxygenxml for Windows Vista/7/8/10
- `[user-home-folder]`\Application Data\com.oxygenxml for Windows XP
- `[user-home-folder]`\Library\Preferences\com.oxygenxml for OS X
- `[user-home-folder]`/.com.oxygenxml for Linux

The name of the options file of Oxygen XML Editor 18.1 is oxyOptionsSa18.1.xml.

### Associating a File Extension with Oxygen XML Editor

To associate a file extension with Oxygen XML Editor on Windows:

1. Go to the Windows **Start** menu and open **Control Panel**.
2. Go to **Default Programs**.
3. Click **Associate a file type or protocol with a program**.
4. Click the file extension you want to associate with Oxygen XML Editor, then click the **Change program** button.
5. In the subsequent dialog box, browse for and choose Oxygen XML Editor.

To associate a file extension with Oxygen XML Editor on Mac OS:

1. In **Finder**, select a file and from the contextual menu select **Get Info**.
2. In the **Open With** subsection, select **Other** from the application combo box.
3. Browse to and select Oxygen XML Editor.
4. Select the **Always Open With** option, then click **Add**.

### Configuring the Layout of the Views and Editors

All the Oxygen XML Editor views available in the **Editor Perspective**, **XSLT Debugger Perspective**, and **XQuery Debugger Perspective** are dockable. To open a view, select it from the **Window > Show View** menu. You can hide a view by closing it with the **X** button at the top-right corner of the view, or with the **Window > Hide current view** action.

**Arranging the Layout**

You can drag any view to any margin of another view or editor inside the Oxygen XML Editor window. Once you create a layout that suites your needs, you can save it from **Window > Export Layout**. Oxygen XML Editor creates a layout file containing the preferences of the saved layout. To load a layout, go to **Window > Load Layout**. To reset it, select **Window > Reset Layout**.

**Note:** The **Load Layout** menu lets you select between the default layout, a predefined layout, or a custom layout. The changes you make using the **Load Layout** menu are also reflected in the **Application Layout** preferences page.
The changes you make to any layout are preserved between working sessions. The predefined layout files are saved in the preferences directory of Oxygen XML Editor.

To gain more editing space in the Oxygen XML Editor window, click Toggle auto-hide in any view. This button sets the view in the auto-hide state, making it visible only as a vertical tab, at the margins of the Oxygen XML Editor window. To display a view in the auto-hide state, hover its side-tab with your cursor, or click it to keep the view visible until you click elsewhere. A view can also be set to a floating state by using the Toggle floating action, making it independent from the rest of the Oxygen XML Editor window.

You can drag the editors and arrange them in any order, both horizontally and vertically.

The following image presents two editors arranged as horizontal tiles. To arrange them vertically, drag one of them on top of the other. In this example, the personal.xml file was dragged over the personal-schema.xml file. When doing this, a dark gray rectangle marks the rearranged layout.

![Figure 50: Drag and Drop Editors](image)

**Tile/Stack Editor Actions**

You can also tile or stack all open editors, both in the Editor Perspective or in the Database Perspective, using the following actions from the Editor toolbar or Window menu:

- **Tile Editors Horizontally**
  Splits the editing area into horizontal tiles, one for each open file.

- **Tile Editors Vertically**
  Splits the editing area into vertical tiles, one for each open file.

- **Stack Editors**
  The reverse of the Tile Editors Horizontally/Vertically actions. Stacks all open editors.

- **Synchronous Scrolling**
  Select this action to scroll through the tiled editors at the same time.
Note: When tiled, you can still drag and drop the editors, but note that they are docked in the same way as a window/view (instead of just tabs). You are actually rearranging the editor windows, so drag the editor tab and drop it to one of the sides of an editor (left/right/top/bottom). While dragging, you will see the dark gray rectangle aligned to one of the sides of the editor, or around the entire editor window. If you drop it to one of the sides it will dock to that side of the editor. If you drop it when the rectangle is around the entire window of the editor it will get stacked on top of that editor. You can also grab one of the stacked editors and tile it to one of the sides.

Split Editor Actions
You can divide the editing area vertically and horizontally using the following actions available in the Editor toolbar and Window menu:

- Split Editor Horizontally - Splits the editor horizontally. This is useful for comparing and merging content between two documents.
- Split Editor Vertically - Splits the editor vertically. This is useful for comparing and merging content between two documents.
- Unsplit Editor - Removes a split action on the editing area.

To maximize or restore the editors, go to Window > Maximize/Restore Editor Area.

Scroll Wheel Actions
When the opened documents titles do not fit in the tab strip, the scroll wheel can be used to scroll the editor title tabs to the left or right, the same as the two arrows on the top-right. You can also switch between edited files by using the Next editor and Previous editor actions from the Window menu, or by using their respective keyboard shortcuts (Ctrl + F6 (Command + F6 on OS X) and Ctrl + Shift + F6 (Command + Shift + F6 on OS X)). These two actions display a small pop-up window that allows you to cycle through all opened files.

To watch our video demonstration about dockable and floating views and editors in Oxygen XML Editor, go to https://www.oxygenxml.com/demo/Dockable_Views.html.

Configure Toolbars
You can configure the toolbars in Oxygen XML Editor to personalize the interface for your specific needs. You can choose which toolbars to show or hide in the current editor mode (Text, Author, Design, or Grid) and in the current perspective (Editor, XSLT Debugger, XQuery Debugger, or Database). You can also choose which actions to display in each toolbar, add actions to toolbars, and customize the layout of the toolbars.

To configure the toolbars, open the Configure Toolbars dialog box by doing one of the following:

- Right-click any toolbar and select Configure Toolbars.
- Select Configure Toolbars from the Window menu.
Figure 51: Configure Toolbars Dialog Box

The Configure Toolbars dialog box provides the following features:

Filter Text Box
You can use the filter text box at the top of the dialog box to search for a specific toolbar or action.

Show or Hide Toolbars
You can choose whether to show or hide a toolbar by using the checkbox next to the toolbar name. This checkbox is only available for toolbars that are available for the current perspective and editing mode.

Show or Hide Actions in a Toolbar
To show or hide actions in a toolbar, expand it by clicking the arrow next to the toolbar name, then use the checkbox to select or deselect the appropriate actions. The toolbar configuration changes in the Preview column according to your changes.

Add Actions to a Toolbar
Use the Add Actions button to open the Add Actions dialog box that displays all the actions that can be added to any of the toolbars, with the exception of those that are contributed from frameworks (document type associations) or 3rd party plugins.

Remove Actions from a Toolbar
You can remove actions that you have previously added to toolbars by using the Remove Action button.

Move Actions in a Toolbar
Use the Move Up and Move Down actions to change the order of the actions in a toolbar.

The Configure Toolbars dialog box also provides a variety of other ways to customize the layout in Oxygen XML Editor.

Customize My Toolbar
You can customize the My Toolbar to include your most commonly used actions. By default, this toolbar is listed first. Also, it is hidden until you add actions to it and you can easily hide it with the Hide "My Toolbar" Toolbar action that is available when you right-click anywhere in the toolbar area.

Drop-down Menu Actions
Composite actions that are usually displayed as a drop-down menu can only be selected in one toolbar at a time. These actions are displayed in the Configure Toolbars dialog box with the name in brackets.
Configure External Tools Action

There is a **Configure external tools** composite action that appears in the toolbar called **Tools**. It is a drop-down menu that contains any external tools that are configured in the **External Tools** preferences page.

**Note:** If no external tools are configured, this drop-down menu is not shown in the toolbar.

Additional actions are available from the **Window** menu or contextual menu when invoked from a toolbar that allows you to further customize your layout. These actions include:

**Reset Toolbars**
To reset the layout of toolbars to the default setting, select the **Reset Toolbars** action from the contextual menu or **Window** menu.

**Reset Layout**
To reset the entire layout (including toolbars, editing modes, views, etc.) to the default setting, select **Reset Layout** from the contextual menu or **Window** menu.

**Export Layout**
You can use the **Export Layout** action that is available in the **Window** menu to export the entire layout of the application to share it with other users.

**Hide Toolbars**
You can use the **Hide Toolbar** action from the contextual menu to easily hide a displayed toolbar. When you right-click a toolbar it will be highlighted to show you which actions are included in that toolbar.

---

**Scenarios Management**

You can export global transformation and validation scenarios into specialized **scenarios** files. You can import transformation and validation scenarios from various sources (such as project files, framework option files, or exported scenario files). The import and export scenario actions are available in the **Options** menu. The following actions are available:

**Import Transformation Scenarios**
Loads a set of transformation scenarios from a project file, framework options file, or exported scenarios file.

**Export Global Transformation Scenarios**
Stores a set of global (not project-level) transformation scenarios in a specialized **scenarios** file.

**Import Validation Scenarios**
Loads a set of validation scenarios from a project file, framework options file, or exported scenarios file.

**Export Global Validation Scenarios**
Stores a set of global (not project-level) Validation scenarios in a specialized **scenarios** file.

The **Export Global Transformation Scenarios** and **Export Global Validation Scenarios** options are used to store all the scenarios in a separate file. Associations between document URLs and scenarios are also saved in this file. You can load the saved scenarios using the **Import Transformation Scenarios** and **Import Validation Scenarios** actions. To distinguish the existing scenarios and the imported ones, the names of the imported scenarios contain the word *import*.

---

**Editor Variables**

An editor variable is a shorthand notation for context-dependent information, such as a file or folder path, a time-stamp, or a date. It is used in the definition of a command (for example, the input URL of a transformation, the output file path of a transformation, or the command line of an external tool) to make a command or a parameter generic and re-usable with other input files. When the same command is applied to multiple files, the notation is expanded at the execution of the command so that the same command has different effects depending on the actual file.

Oxygen XML Editor includes a variety of built-in editor variables. You can also create your own *custom editor variables* by using the **Custom Editor Variables** preferences page.

You can use the following editor variables in Oxygen XML Editor commands of external engines or other external tools, in transformation scenarios, **Author** mode operations, and in validation scenarios:
• $\{af\}$ - The local file path of the ZIP archive that includes the current edited document.
• $\{afd\}$ - The local directory path of the ZIP archive that includes the current edited document.
• $\{afdu\}$ - The URL path of the directory of the ZIP archive that includes the current edited document.
• $\{afn\}$ - The file name (without parent directory and without file extension) of the zip archive that includes the current edited file.
• $\{afne\}$ - The file name (with file extension, for example .zip or .epub, but without parent directory) of the zip archive that includes the current edited file.
• $\{afu\}$ - The URL path of the ZIP archive that includes the current edited document.
• $\{ask\}\langle message \rangle$, type, ('real_value1': 'rendered_value1'; 'real_value2': 'rendered_value2'; ...), 'default_value'\rangle - To prompt for values at runtime, use the $\{ask\}\langle message \rangle$, type, ('real_value1': 'rendered_value1'; 'real_value2': 'rendered_value2'; ...), 'default_value'\rangle editor variable. You can set the following parameters:
  • 'message' - The displayed message. Note the quotes that enclose the message.
  • type - Optional parameter, with one of the following values:

**Note:** The title of the dialog box will be determined by the type of parameter and as follows:

- For url and url_relative parameters, the title will be the name of the parameter and the value of the 'message'.
- For the other parameters listed below, the title will be the name of that respective parameter.
- If no parameter is used, the title will be "Input".

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Format: ${ask}\langle message \rangle$, url, 'default_value'\rangle</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>Description: Input is considered a URL. Oxygen XML Editor checks that the provided URL is valid.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
</tr>
<tr>
<td></td>
<td>• ${ask}\langle Input URL \rangle$, url\rangle - The displayed dialog box has the name Input URL. The expected input type is URI.</td>
</tr>
<tr>
<td></td>
<td>• ${ask}\langle Input URL \rangle$, url, '<a href="http://www.example.com'%5Crangle">http://www.example.com'\rangle</a> - The displayed dialog box has the name Input URL. The expected input type is URI. The input field displays the default value <a href="http://www.example.com">http://www.example.com</a>.</td>
</tr>
<tr>
<td>password</td>
<td>Format: ${ask}\langle message \rangle$, password, 'default_value'\rangle</td>
</tr>
<tr>
<td></td>
<td>Description: The input is hidden with bullet characters.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
</tr>
<tr>
<td></td>
<td>• ${ask}\langle Input password \rangle$, password\rangle - The displayed dialog box has the name 'Input password' and the input is hidden with bullet symbols.</td>
</tr>
<tr>
<td></td>
<td>• ${ask}\langle Input password \rangle$, password, 'abcd'\rangle - The displayed dialog box has the name 'Input password' and the input hidden with bullet symbols. The input field already contains the default abcd value.</td>
</tr>
<tr>
<td>generic</td>
<td>Format: ${ask}\langle message \rangle$, generic, 'default_value'\rangle</td>
</tr>
<tr>
<td></td>
<td>Description: The input is considered to be generic text that requires no special handling.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
</tr>
<tr>
<td></td>
<td>• ${ask}\langle Hello world! \rangle$\rangle - The dialog box has a Hello world! message displayed.</td>
</tr>
<tr>
<td></td>
<td>• ${ask}\langle Hello world! \rangle$, generic, 'Hello again!'\rangle - The dialog box has a Hello world! message displayed and the value displayed in the input box is 'Hello again!'</td>
</tr>
<tr>
<td>Parameter</td>
<td>Format: ${ask('message', relative_url, 'default')}</td>
</tr>
<tr>
<td>-------------</td>
<td>--------------------------------------------------</td>
</tr>
</tbody>
</table>
| relative_url| **Description:** Input is considered a URL. Oxygen XML Editor tries to make the URL relative to that of the document you are editing.  
   **Note:** If the $ask editor variable is expanded in content that is not yet saved (such as an untitled file, whose path cannot be determined), then Oxygen XML Editor will transform it into an absolute URL.  
   **Example:**  
   - `${ask('File location', relative_url, 'C:/example.txt')}` - The dialog box has the name 'File location'. The URL inserted in the input box is made relative to the current edited document location. |
| comboobox    | **Description:** Displays a dialog box that offers a drop-down menu. The drop-down menu is populated with the given rendered_value values. Choosing such a value will return its associated value (real_value).  
   **Note:** The 'default' parameter specifies the default selected value and can match either a key or a value.  
   **Example:**  
   - `${ask('Operating System', comboobox, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'osx')}` - The dialog box has the name 'Operating System'. The drop-down menu displays the three given operating systems. The associated value will be returned based upon your selection.  
   **Note:** In this example, the default value is indicated by the osx key. However, the same result could be obtained if the default value is indicated by Mac OS X, as in the following example:  
   `${ask('Operating System', comboobox, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'Mac OS X'))`  
   - `${ask('Mobile OS', comboobox, ('win':'Windows Mobile';'ios':'iOS';'and':'Android'), 'Android'))` |
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Format: ${ask('message', editable_combobox, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'), 'default'))</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description:</td>
<td>Displays a dialog box that offers a drop-down menu with editable elements. The drop-down menu is populated with the given rendered_value values. Choosing such a value will return its associated real value (real_value) or the value inserted when you edit a list entry.</td>
</tr>
<tr>
<td>Note:</td>
<td>The 'default' parameter specifies the default selected value and can match either a key or a value.</td>
</tr>
<tr>
<td>Example:</td>
<td>• ${ask('Operating System', editable_combobox, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'osx'}) - The dialog box has the name 'Operating System'. The drop-down menu displays the three operating systems and also allows you to edit the entry. The associated value will be returned based upon your selection or the text you input.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Format: ${ask('message', radio, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'), 'default'))</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description:</td>
<td>Displays a dialog box that offers a series of radio buttons. Each radio button displays a 'rendered_value and will return an associated real_value.</td>
</tr>
<tr>
<td>Note:</td>
<td>The 'default' parameter specifies the default selected value and can match either a key or a value.</td>
</tr>
<tr>
<td>Example:</td>
<td>• ${ask('Operating System', radio, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'osx'}) - The dialog box has the name 'Operating System'. The radio button group allows you to choose between the three operating systems.</td>
</tr>
<tr>
<td>Note:</td>
<td>In this example Mac OS X is the default selected value and if selected it would return osx for the output.</td>
</tr>
</tbody>
</table>

- 'default-value' - optional parameter. Provides a default value.
- ${caret} - The position where the cursor is located. This variable can be used in a code template, in Author mode operations, or in a selection plugin.
- ${cf} - Current file as file path, that is the absolute file path of the current edited document.
- ${cfd} - Current file folder as file path, that is the path of the current edited document up to the name of the parent folder.
- ${cfdu} - Current file folder as URL, that is the path of the current edited document up to the name of the parent folder, represented as a URL.
- ${cfn} - Current file name without extension and without parent folder. The current file is the one currently opened and selected.
- ${cfne} - Current file name with extension. The current file is the one currently opened and selected.
- ${configured.ditaot.dir} - The default directory of the DITA Open Toolkit distribution, as configured in the DITA preferences page.
- ${cp} - Current page number. Used to display the current page number on each printed page in the Editor / Print Preferences page.
• ${currentFileURL} - Current file as URL, that is the absolute file path of the current edited document represented as URL.
• ${date(pattern)} - Current date. The allowed patterns are equivalent to the ones in the Java SimpleDateFormat class. 
  
  Example: yyyy-MM-dd;

  Note: This editor variable supports both the xs:date and xs:datetime parameters. For details about xs:date, go to 
  http://www.w3.org/TR/xmlschema-2/#date. For details about xs:datetime, go to 
  http://www.w3.org/TR/xmlschema-2/#dateTime.

• ${dbgXML} - The local file path to the XML document that is current selected in the Debugger source combo box (for tools 
  started from the XSLT/XQuery Debugger).
• ${dbgXSL} - The local file path to the XSL/XQuery document that is current selected in the Debugger stylesheet combo 
  box (for tools started from the XSLT/XQuery Debugger).
• ${dita.dir.url} - A special local contextual editor variable that gets expanded only in the Libraries dialog box that is 
  accessible from the Advanced tab of DITA transformation scenarios. The Libraries dialog box allows you to specify 
  additional libraries (jar files or additional class paths) to be used by the transformer. This ${dita.dir.url} editor variable gets 
  expanded to the value of the dita.dir parameter from the Parameters tab of the DITA transformation scenario.
• ${ds} - The path of the detected schema as a local file path for the current validated XML document.
• ${dsu} - The path of the detected schema as a URL for the current validated XML document.
• ${env(VAR_NAME)} - Value of the VAR_NAME environment variable. The environment variables are managed by the 
  operating system. If you are looking for Java System Properties, use the ${system(var.name)} editor variable.
• ${framework(fr_name)} - The path (as URL) of the fr_name framework.
• ${framework} - The path (as URL) of the current framework, as part of the [OXYGEN_INSTALL_DIR]/frameworks directory.
• ${frameworkDir(fr_name)} - The path (as file path) of the fr_name framework.

  Note: Since multiple frameworks might have the same name (although it is not recommended), for both 
  ${framework(fr_name)} and ${frameworkDir(fr_name)} editor variables Oxygen XML Editor employs the following 
  algorithm when searching for a given framework name:

  • All frameworks are sorted, from high to low, according to their Priority setting from the Document Type 
    configuration dialog box. Only frameworks that have the Enabled checkbox set are taken into account.
  • Next, if the two or more frameworks have the same name and priority, a further sorting based on the Storage 
    setting is made, in the exact following order:
    • Frameworks stored in the internal Oxygen XML Editor options.
    • Additional frameworks added in the Locations preferences page.
    • Frameworks installed using the add-ons support.
    • Frameworks found in the main frameworks location (Default or Custom).

• ${frameworkDir} - The path (as file path) of the current framework, as part of the 
  [OXYGEN_INSTALL_DIR]/frameworks directory.
• ${frameworks} - The path (as URL) of the [OXYGEN_INSTALL_DIR] directory.
• ${frameworksDir} - The path (as file path) of the [OXYGEN_INSTALL_DIR]/frameworks directory.
• ${home} - The path (as URL) of the user home folder.
• ${homeDir} - The path (as file path) of the user home folder.
• ${i18n(key)} - Editor variable used only at framework level to allow translating names and descriptions of Author 
  mode actions in multiple actions. For more details, see Localizing Frameworks on page 1140.
• ${id} - Application-level unique identifier. It is a short sequence of 10-12 letters and digits that is not guaranteed to be 
  universally unique.
• ${makeRelative(base,location)} - Takes two URL-like paths as parameters and tries to return a relative path. A use-case 
  would be to insert content references to a certain reusable component when defining code templates.

  Example:

  ${makeRelative(${currentFileURL}, ${dictionaryURL}#gogu)}

• ${oxygenHome} - Oxygen XML Editor installation folder as URL.
• ${oxygenInstallDir} - Oxygen XML Editor installation folder as file path.
• `${pd}` - The file path for the parent folder of the current project selected in the **Project** view.
• `${pdu}` - The URL for the parent folder of the current project selected in the **Project** view.
• `${pn}` - Current project name.
• `${ps}` - Path separator, which is the separator that can be used on the current platform (Windows, OS X, Linux) between library files specified in the class path.
• `${selection}` - The current selected text content in the current edited document. This variable can be used in a code template, in **Author** mode operations, or in a selection plugin.
• `${system(var.name)}` - Value of the `var.name` Java System Property. The Java system properties can be specified in the command line arguments of the Java runtime as `-Dvar.name=var.value`. If you are looking for operating system environment variables, use the `${env(VAR_NAME)}` editor variable instead.
• `${timeStamp}` - Time stamp, that is the current time in Unix format. For example, it can be used to save transformation results in multiple output files on each transformation.
• `${tp}` - Total number of pages in the document. Used to display the total number of pages on each printed page in the **Editor** / **Print** Preferences page.
• `${tsf}` - The transformation result file path. If the current opened file has an associated scenario that specifies a transformation output file, this variable expands to it.
• `${uuid}` - Universally unique identifier, a unique sequence of 32 hexadecimal digits generated by the Java **UUID** class.
• `${xpath_eval(expression)}` - Evaluates an XPath 3.0 expression. Depending on the context, the expression can be:
  
  - **static** - When executed in a non-XML context. For example, you can use such static expressions to perform string operations on other editor variables for composing the name of the output file in a transformation scenario's **Output** tab.

  **Example:**

  ```text
  ${xpath_eval(upper-case(substring('${cfn}', 1, 4)))}
  ```

  - **dynamic** - When executed in an XML context. For example, you can use such dynamic expression in a code template or as a value of a parameter of an **Author** mode operation.

  **Example:**

  ```text
  ${ask('Set new ID attribute', generic, '${xpath_eval(@id)})')}
  ```

Related concepts

*Selection Plugin Extension* on page 1287
This type of plugin allows you to manage selections of text.

Related information

*Code Templates* on page 293
*Installing and Updating Add-ons in Oxygen XML Editor* on page 41

**Custom Editor Variables**

An editor variable can be created and included in any user-defined expression where a built-in editor variable is also allowed. For example, a custom editor variable may be necessary for configuring the command line of an external tool, the working directory of a custom validator, the command line of a custom XSLT engine, or a custom FO processor.

You can create or configure custom editor variables in the **Custom Editor Variables preferences page**. To create a custom editor variable, follow these steps:

1. Open the **Preferences** dialog box (**Options > Preferences**) and go to **Custom Editor Variables**.
2. Click the **New** button at the bottom of the table.
3. Use the subsequent dialog box to specify the **Name**, **Value**, and **Description** for the new editor variable.
4. Click **OK** to save your configuration.

Related information

*Editor Variables* on page 159
Custom System Properties

A variety of Java system properties can be set in the application to influence its behavior. For information about how to do this, see Setting a system property on page 168.

Table 4: Custom System Properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Allowed values</th>
<th>Default value</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>com.oxygenxml.disable.http.protocol.handlers</td>
<td>true or false</td>
<td>false</td>
<td>By default, Oxygen XML Editor uses the open source Apache HTTP Client software for HTTP(S) connections. If set to True, the default Java Sun HTTP(S) will be used instead. You will also lose WebDAV support and possibly other related features.</td>
</tr>
<tr>
<td>com.oxygenxml.default.options</td>
<td>A URL-type relative or absolute path.</td>
<td>N/A</td>
<td>Provides the path to an XML file containing default application options. For more details, see Customizing Default Options on page 152.</td>
</tr>
<tr>
<td>com.oxygenxml.customOptionsDir</td>
<td>A file system absolute path pointing to a folder.</td>
<td>N/A</td>
<td>Sets a folder to be used by the application to load and save preference files. The default location where the options are saved varies according to the operating system. See Importing/Exporting/Resetting Global Options on page 154.</td>
</tr>
<tr>
<td>com.oxygenxml.ApplicationDataFolder (Windows only)</td>
<td>A file system absolute path pointing to a folder.</td>
<td>%APPDATA%</td>
<td>When the application runs on Windows, you can set this property to change the location where the application considers that the APPDATA folder is located.</td>
</tr>
<tr>
<td>com.oxygenxml.editor/frameworks.url</td>
<td>A URL-type absolute path.</td>
<td>OXYGEN_DIR\frameworks</td>
<td>Changes the folder where the application considers that the main frameworks are installed. It has the same effect as changing the custom frameworks directory value in the Location preferences page.</td>
</tr>
<tr>
<td>com.oxygenxml.MultipleInstances</td>
<td>true or false</td>
<td>false</td>
<td>If set to true, multiple instances of the application are allowed to be started.</td>
</tr>
<tr>
<td>com.oxygenxml.xep.location</td>
<td>A file system absolute path pointing to a folder.</td>
<td>N/A</td>
<td>Points to a folder where RenderX XEP is installed. Has the same effect as configuring XEP in the FO Processors preferences page.</td>
</tr>
<tr>
<td>Property</td>
<td>Allowed values</td>
<td>Default value</td>
<td>Purpose</td>
</tr>
<tr>
<td>---------------------------------------------------</td>
<td>-------------------------------------------------------------------------------</td>
<td>---------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><code>com.oxygenxml.additional.classpath</code></td>
<td>A list of JAR-type resources separated by a classpath separator.</td>
<td>N/A</td>
<td>An additional list of libraries to be used in the application's internal class loader in addition to the libraries specified in the <code>lib</code> folder.</td>
</tr>
<tr>
<td><code>com.oxygenxml.user.home</code> (Windows only)</td>
<td>A file system absolute path pointing to a folder.</td>
<td><code>USERPROFILE</code></td>
<td>Overwrites the user home directory that was implicitly detected for the application.</td>
</tr>
<tr>
<td><code>com.oxygenxml.use.late.delegation.for.author.extensions</code></td>
<td>true or false</td>
<td>true</td>
<td>All Java extensions in a document type configuration are instantiated in a separate class loader. When true, the JAR libraries used in a certain document type configuration will have priority to resolve classes before delegating to the parent class loader. When false, the parent class loader will take precedence.</td>
</tr>
<tr>
<td><code>com.oxygenxml.stack.size.validation.threads</code></td>
<td>The number of bytes used for validation threads.</td>
<td>5<em>1024</em>1024</td>
<td>Some parts of the application (validation, content completion) that use the Relax NG parser sometimes require a larger Thread stack size to parse complex schemas. The default value should be more than enough.</td>
</tr>
<tr>
<td><code>com.oxygenxml.jing.skip.validation.xhtml.data.attrs</code></td>
<td>true or false</td>
<td>true</td>
<td>By default, the Relax NG validation was configured to skip validation for XHTML attributes that start with &quot;data-&quot;, which should be skipped from validation according to the XHTML 5 specification.</td>
</tr>
<tr>
<td><code>com.oxygenxml.report.problems.url</code></td>
<td>User defined URL</td>
<td>N/A</td>
<td>The URL where a problem reported through the Report Problem dialog box is sent. The report is sent in XML format using the report parameter with the POST HTTP method.</td>
</tr>
<tr>
<td><code>com.oxygenxml.parallel.title.computing.threads</code></td>
<td>Integers</td>
<td>4</td>
<td>The number of parallel threads that will be used to compute referenced topic titles. Increasing this value reduces the amount of time it takes to compute topic titles in the DITA Maps Manager view.</td>
</tr>
</tbody>
</table>

**Configuring Oxygen XML Editor** 166
Localizing the User Interface

You can select the language of the Oxygen XML Editor user interface. Oxygen XML Editor ships with the following languages: English, French, German, Japanese, and Dutch. To change the interface language, go to Options > Preferences > Global preferences page, then choose the appropriate language from the Language drop-down menu.

You can also localize the interface in another language by creating an interface localization file.

Creating an Interface Localization File

You can change the language of the Oxygen XML Editor user interface by creating an interface localization file. The example in this procedure is based on the Spanish language, and a standard Oxygen XML Editor Windows distribution.

1. Identify the code for the new language you want to translate the interface. It is composed from a language code (two or three lowercase letters that conform to the ISO 639 standard), followed by an underscore character, and a region code (two or three uppercase letters that conform to the ISO 3166 standard).
2. Write an email to the Oxygen XML Editor support team and ask them to send you the translation.xml sample file.
3. Open translation.xml in Oxygen XML Editor. The file contains all the interface messages that can be translated and is updated at every new release with the latest additions. Here is a sample of its content:

   ```xml
   <translation>
   <languageList>
   <language description="English" lang="en_US"/>
   </languageList>
   <key value="New">
      <comment>The File/New action. Creates a new document.</comment>
      <val lang="en_US">New</val>
   </key>
   <key value="New_folder">
      <comment>Creates a folder in the Project View.</comment>
      <val lang="en_US">New Folder</val>
   </key>
   ...
   </translation>
   
   4. Update the language element to reflect the new language. Set the description attribute to Spanish and the lang attribute to es_ES.

   5. For each key element translate the comment (optional) and val elements. Set the lang attribute to es_ES.

   | Note: After you are finished, the file should look like this: |
   |<translation>
   | <languageList>
   | <language description="Español" lang="es_ES"/>
   | </languageList>
   | <key value="New">
   | <comment>El Archivo / Nueva acción. Crea un nuevo documento.</comment>
   | <val lang="es_ES">Nuevo</val>
   | </key>
   | <key value="New_folder">
   | <comment>Crea una carpeta en la vista del proyecto.</comment>
   | <val lang="es_ES">Nueva carpeta</val>
   | </key>
   | ...
   | </translation>
   |

6. Open the Preferences dialog box (Options > Preferences), go to Global, and enable the Other language option. Browse for the translation.xml file.
7. Restart the application.

Setting a Java Virtual Machine Parameter when Launching Oxygen XML Editor

You can set Java Virtual Machine parameters (for example, if you want to increase the maximum amount of memory available) for the Oxygen XML Editor application launchers or command-line scripts. You can also create a custom startup parameters file.
Setting Parameters for the Application Launchers

Increasing the amount of memory that Oxygen XML Editor uses on Windows

To increase the memory available to Oxygen XML Editor on Windows:

- Browse to the installation directory of Oxygen XML Editor.
- Locate the -Xmx parameter in the oxygen18.1.vmoptions file.

**Note:** For 32-bit Windows modify the parameter to -Xmx1024m or larger, but not over -Xmx1200m. Make sure you do not exceed your physical RAM. For 64-bit Windows modify the parameter to a larger value (for example, -Xmx2048m). We recommended you to not use more than half of your existing physical RAM.

Restart Oxygen XML Editor. Go to Help > About and verify the amount of memory that is actually available (see the JVM Memory Used in the last row in the Copyright tab). If Oxygen XML Editor does not start and you receive and error message saying that it could not start the JVM, decrease the -Xmx parameter and try again.

For Windows Vista/7/8/10, copy the oxygen18.1.vmoptions to your desktop (or to any other folder with write access), modify it there, then copy it back to the Oxygen XML Editor installation folder.

**Note:** The parameters from the .vmoptions file are used when you start Oxygen XML Editor with the oxygen launcher (or with the desktop shortcut). In case you use the command line script oxygen.bat/oxygen.sh, modify the -Xmx parameter in the script file.

Increasing the amount of memory that Oxygen XML Editor uses on OS X

To increase the memory available to Oxygen XML Editor on OS X:

- **Ctrl + Single-Click (Command + Single-Click on OS X)** (or right-click) the Oxygen XML Editor icon in Finder.
- From the contextual menu, select Show Package Contents.
- Go to the contents directory and edit the Info.plist file.

**Note:** You can open this file either with the Property List Editor, or the TextEdit.

- Look for the VMOptions key and adjust the -Xmx parameter to a larger value (for example, -Xmx1500m)

**Note:** For a Mac kit bundled with Java 8, look for the VMOptionArray key and add the -Xmx parameter in a new string element from the array element. For example, for 1500 MB use the following:

\[
<string>-Xmx1500m</string>
\]

**Tip:** Try not to use more than half of your existing physical RAM if possible.

Setting a system property

To set a system property, edit the application launcher and add a parameter after the %OXYGEN_JAVA% token, using the following form:

```
-Dproperty.name=value
```

You can also set a system property through a parameter prefixed with -Doxy in the command line used to start the application:

```
oxygen18.1.exe "-Doxyproperty.name=value"
```

All system properties are displayed in the System properties tab of the About dialog box.

To view the list of Oxygen XML Editor system properties, go to Custom System Properties on page 165.
Disabling DPI Scaling

Some users may prefer the look of smaller icons in an HiDPI display. To achieve this, display scaling needs to be disabled for high DPI settings. To disable the DPI scaling, set the following property in .vmoptions (or in the .bat script):

```
sun.java2d.dpiaware=false
```

Setting Parameters in the Command Line Scripts

If you start Oxygen XML Editor with the oxygen.bat command line script, you have to add or modify the -Xmx parameter to the java command at the end of the script.

For example, to set the maximum amount of Java memory to 600 MB in Windows, modify the -Xmx parameter like this:

```
java -Xmx600m -Dsun.java2d.nodraw=true ...
```

On Mac OS X, the java command should look like this:

```
java "-Xdock:name=Oxygen" 
-Dcom.oxygenxml.editor.plugins.dir="$OXYGEN_HOME/plugins" 
-Xmx600m 
...
```

On Linux, the Java command should look like this:

```
java -Xmx600m 
*-Dcom.oxygenxml.editor.plugins.dir="$OXYGEN_HOME/plugins"
```

Creating Custom Startup Parameters File

The startup launchers for Oxygen XML Editor and its executable internal tools (Tree Editor, XML Schema Regular Expressions Builder, Large File Viewer, SVN Client, Compare Directories, and Compare Files) include a default .vmoptions file that contain some startup parameters (such the -Xmx parameter, which is used for allocating memory for that particular application). You can edit the parameters in these .vmoptions files so that the applications will launch with your desired values. However, if you re-install the application, install an update for the application, or deploy it to other users or machines, those parameters will be reset to their default values.

To avoid resetting user-defined startup parameters, you can create custom .vmoptions files and the application and the executable tools will automatically include your custom parameters at startup. The following custom files are recognized by the application and the executable tools:

- custom_commons.vmoptions - The parameters and their values of this file will be included in all the startup launchers.
- custom_<app name>.vmoptions - The <app name> is the name of the executable application or tool (for example, custom_diffFiles.vmoptions for the Compare Files tool). The parameters and their values of this file will be included in the startup launcher for this particular executable.

To be recognized and included, these custom startup parameter files must be saved in the installation directory of Oxygen XML Editor.
An Oxygen XML Editor perspective is an interface layout geared towards a specific use. The Oxygen XML Editor interface uses standard interface conventions and components to provide a familiar and intuitive editing environment across all operating systems. There are several perspectives that you can use to work with documents in Oxygen XML Editor. You can change the perspective by selecting the respective icons in the top-right corner of Oxygen XML Editor or by selecting the perspective from the **Window > Open Perspective** menu.
Editor Perspective

The Editor perspective is the most commonly used perspective and it is the default perspective when you start Oxygen XML Editor for the first time. It is the perspective that you will use to edit the content of your XML documents.

To switch the focus to this perspective, select the Editor button in the top-right corner of Oxygen XML Editor (or select Editor from the Window > Open perspective menu)

The layout of this perspective is composed of the following components:

Menus

Provides menu driven access to all the features and functions available in Oxygen XML Editor. Most of the menus are common for all types of documents. However, Oxygen XML Editor also includes some context-sensitive and framework-specific menus that are only available for a specific context or type of document.

Toolbars

Provides easy access to common and frequently used functions. Each icon is a button that acts as a shortcut to a related function. Most of the toolbars are common for all types of documents. However, Author mode also includes framework-specific toolbars, depending on the type of document that is being edited (for example, if you are editing a DITA document, a DITA Author Custom Actions toolbar is available that includes operations that are specific to DITA documents). The toolbars can be configured to suit your specific needs.

Editor Pane

The main editing pane where you spend most of your time reading, editing, applying markup, and validating your documents.

Views

Oxygen XML Editor includes a large variety of views to assist you with editing, viewing, searching, validating, transforming, and organizing your documents. The most commonly used views are displayed by default and you can choose to display others by selecting them from the Window > Show View menu. The layout of the views can also be configured according to your preferences.

When two or more views are displayed, the application provides divider bars. Divider bars can be dragged to a new position increasing the space occupied by one panel while decreasing it for the other.

As the majority of the work process centers around the Editor area, other views can be hidden using the controls located on the top-right corner of the view (.Options).

Some of the most helpful views in the Editor perspective include the following:

- **Project view** - Enables the definition of projects and logical management of the documents they contain.
- **DITA Maps Manager view** - For DITA frameworks, this view helps you organize, manage, and edit DITA topics and maps.
- **Open/Find Resource view** - Designed to offer advanced search capabilities in various scopes.
- **Outline view** - It provides an XML tag overview and offers a variety of functions, such as modifications follow-up, document structure change, document tag selection, and elements filtering.
- **Results view** - Displays the messages generated as a result of user actions such as validations, transformation scenarios, spell checking in multiple files, search operations, and others. Each message is a link to the location related to the event that triggered the message.
- **Attributes view** - Presents all possible attributes of the current element and allows you to edit attribute values. You can also use this view to insert attributes in Text mode. Author mode also includes an in-place attribute editor.
- **Model view** - Presents the current edited element structure model and additional documentation as defined in the schema.
- **Elements view** - Presents a list of all defined elements that you can insert at the current cursor position according to the document's schema. In Author mode this view includes tabs that present additional information relative to the cursor location.
- **Entities view** - Displays a list with all entities declared in the current document as well as built-in ones.
- **Transformation Scenarios view** - Displays a list with all currently configured transformation scenarios.
- **XPath/XQuery Builder view** - Displays the results from running an XPath expression.
- **WSDL SOAP Analyzer view** - Provides a tool that helps you test if the messages defined in a Web Service Descriptor (WSDL) are accepted by a Web Services server.
XSLT Debugger Perspective

The XSLT Debugger perspective allows you to detect problems in an XSLT transformation by executing the process step by step. To switch the focus to this perspective, select the XSLT Debugger button in the top-right corner of the interface or Window > Open perspective > XSLT Debugger.

The workspace in this perspective is organized as an editing area assisted by special helper views. The editing area contains editor panels that you can split horizontally or vertically in a stack of XML editor panels and a stack of XSLT editor panels. The XML files and XSL files can be edited in Text mode only.

The layout of this perspective is composed of the following components:

Menus
Provides menu driven access to all the features and functions available in the XSLT Debugger.

Toolbars
Contains all actions needed to configure and control the debugging process. The toolbars can be configured to suit your specific needs.

XML Source Pane
The editing pane where you can display and edit data or document-oriented XML documents.

XSL Source Pane
The editing pane where you can display and edit XSL stylesheets.

Output View
Displays the transformed output that results from the input of a selected document (XML) and selected stylesheet (XSL) to the transformer. The result of transformation is dynamically written as the transformation is processed. There are three types of views for the output: a text view (with XML syntax highlight), an XHTML view, and one text view for each xsl:result-document element used in the stylesheet (if it is an XSLT 2.0 / 3.0 stylesheet).

Debugging Information Views
Presented in two panes, they display various types of information that can be used to understand the transformation process. For each information type there is a corresponding tab. While running a transformation, relevant events are displayed in the various information views. This allows you to obtain a clear view of the transformation progress. See the Debugging Information Views topic for a list of all the information views (and links to more details on each view).

Note: You can add XPath expression automatically in the XWatch view using the Watch expression action from the contextual menu. In case you select an expression or a fragment of it and then click Watch expression in the contextual menu, the entire selection is presented in the XWatch view. Using Watch expression without selecting an expression displays the value of the attribute from the cursor position in the XWatch view. Variables detected at the cursor position are also displayed. Expressions displayed in the XWatch view are normalized (unnecessary white spaces are removed from the expression).

To watch our video demonstration about the XSLT debugging capabilities in Oxygen XML Editor, go to https://www.oxygenxml.com/demo/XSLT_Debugger.html.

XQuery Debugger Perspective

The XQuery Debugger perspective allows you to detect problems in an XQuery transformation process by executing the process step by step in a controlled environment and inspecting the information provided in the special views. To switch the focus to this perspective, select the XQuery Debugger button in the top-right corner of the interface or Window > Open perspective > XQuery Debugger.

The workspace in this perspective is organized as an editing area assisted by special helper views. The editing area contains editor panels that you can *split horizontally or vertically* in a stack of XML editor panels and a stack of XQuery editor panels. The XML files and XQuery files can be edited in *Text mode* only.

The layout of this perspective is composed of the following components:

**Menus**
- Provides menu driven access to all the features and functions available in the XQuery Debugger.

**Toolbars**
- Contains all actions needed to configure and control the debugging process. The toolbars can be configured to suit your specific needs.

**XML Source Pane**
- The editing pane where you can display and edit data or document-oriented XML documents.

**XQuery Source Pane**
- The editing pane where you can display and edit XQuery files.

**Output View**
- Displays the transformed output that results from the input of a selected document (XML) and selected XQuery document to the XQuery transformer. The result of transformation is dynamically written as the transformation is processed. There are two types of views for the output: a text view (with XML syntax highlight) and an XHTML view.

**Debugging Information Views**
- Presented in two panes, they display various types of information that can be used to understand the transformation process. For each information type there is a corresponding tab. While running a transformation, relevant events are displayed in the various information views. This allows you to obtain a clear view of the transformation progress. See the Debugging Information Views topic for a list of all the information views (and links to more details on each view).

**Note:** You can add XPath expression automatically in the XWatch view using the Watch expression action from the contextual menu. If you select an expression, or a fragment of it, and then click Watch expression in the contextual menu, the entire selection is presented in the XWatch view. Expressions displayed in the XWatch view are normalized (unnecessary white spaces are removed from the expression).

To watch our video demonstration about the XQuery debugging capabilities in Oxygen XML Editor, go to https://www.oxygenxml.com/demo/XQuery_Debugger.html.

- Database Perspective on page 173

Database Perspective

The Database perspective allows you to manage databases. To switch the focus to this perspective, select the Database Debugger button in the top-right corner of Oxygen XML Editor or select Database from the Window > Open perspective menu.

The Database perspective offers various helpful features, including:

- Support for browsing multiple connections at the same time.
- Support for both Relational and Native XML databases.
• Browsing the structure of databases.
• Viewing tables from databases.
• Inspecting or modifying data.
• Specifying XML Schemas for XML fields.
• SQL execution.
• XQuery execution.
• Data export to XML.

Supported Databases

Oxygen XML Editor supports numerous types of databases, including:
• Oracle Berkeley DB XML Database
• eXist XML Database
• IBM DB2 (Enterprise edition only)
• JDBC-ODBC Bridge
• MarkLogic (Enterprise edition only)
• Microsoft SQL Server 2005 and Microsoft SQL Server 2008 (Enterprise edition only)
• MySQL
• Oracle 11g (Enterprise edition only)
• PostgreSQL 8.3 (Enterprise edition only)
• Documentum xDB (X-Hive/DB) 10 XML Database (Enterprise edition only)
• Documentum (CMS) 6.5 (Enterprise edition only)
• SharePoint (CMS)

Note: For the databases marked with "Enterprise edition only", the XML capabilities are only available in the Enterprise edition of Oxygen XML Editor. For a detailed feature matrix that compares the Academic, Professional, and Enterprise editions of Oxygen XML Editor go to the Oxygen XML Editor website.

Supported Capabilities

The supported non-XML capabilities are as follows:
• Browsing the structure of the database instance.
• Opening a database table in the Table Explorer view.
• Handling the values from XML Type columns as String values.

Note: The non-XML capabilities are available in the Enterprise, Academic, and Professional editions of Oxygen XML Editor by registering the database driver as a Generic JDBC type driver when defining the data source for accessing the database. For more information, see Database Connection Support on page 1020.

The supported XML capabilities are as follows:
• Displaying an XML Schema node in the tree of the database structure (for databases with an XML-specific structure) with actions for opening, editing, and validating the schemas in an Oxygen XML Editor editor panel.
• Handling the values from XML Type columns as XML instance documents that can be opened and edited in an Oxygen XML Editor editor panel.
• Validating an XML instance document added to an XML Type (column of a table, etc.)

Tip: Connections configured on relational data sources can be used to import data to XML or to generate XML schemas.

Layout of the Database Perspective

The layout of this perspective is composed of the following components:

Menus
• Provides menu driven access to all the features and functions available in the XQuery Debugger.
**Toolbars**
Contains all actions needed to configure and control the debugging process. The *toolbars can be configured* to suit your specific needs.

**Editor Pane**
The main editing pane where you spend most of your time reading, editing, applying markup, and validating your documents.

**Data Source Explorer View**
Provides browsing support for the configured connections.

**Table Explorer View**
Provides table content editing support for inserting new rows, deleting table rows, editing cell values, exporting to an XML file, and more.

**Related information**

Chapter 6

Editing Modes

Topics:
- Text Editing Mode
- Grid Editing Mode
- Author Editing Mode
- Design Editing Mode (XML Schema Diagram Editor)

The main editing area in Oxygen XML Editor includes several editing modes to suit the type of editing that you want to perform. You can easily switch between modes by clicking on the desired mode at the bottom of the main editing pane. Oxygen XML Editor offers the following editing modes:

- **Text** - This mode presents the source of an XML document.
- **Grid** - This mode displays an XML document as a structured grid of nested tables.
- **Author** - This mode enables you to edit in a WYSIWYG-like editor.
- **Design** - This mode is found in the schema editor and represents the schema as a diagram.

The default editing mode that will be initially opened for each type of document can be set in two ways:

- If the *Allow Document Type specific edit mode setting to override the general mode setting* option is selected in the Edit Modes preferences page, then the edit mode specified in the Document Type configuration dialog box is used when that particular type of document is initially opened.
- If the *Allow Document Type specific edit mode setting to override the general mode setting* option is not selected, then the edit mode specified in the table in the Edit Modes preferences page is used when that particular type of document is initially opened.
Text Editing Mode

The **Text** mode editor in Oxygen XML Editor is designed to be a simple, yet powerful, XML source editor. It provides support to help you edit, transform, and debug XML-based documents. It is similar to other common text editors, but Oxygen XML Editor also includes specialized editing actions, a powerful **Content Completion Assistant**, a helpful **Outline View**, and many other unique features.

**Related information**

*Editing XML Documents in Text Mode* on page 275

**Navigating the Document Content in Text Mode**

Oxygen XML Editor includes some useful features to help you navigate XML documents in **Text** mode.

**Using the Keyboard**

Oxygen XML Editor allows you to quickly navigate through a document using the `Ctrl + CloseBracket` (Command + CloseBracket on OS X) key to go to the next XML node and `Ctrl + OpenBracket` (Command + OpenBracket on OS X) to go to the previous one.

To navigate one word forward or backwards, use `Ctrl + RightArrow` (Command + RightArrow on OS X), and `Ctrl + LeftArrow` (Command + LeftArrow on OS X), respectively. To position the cursor at the beginning or end of the document you can use `Ctrl + Home` (Command + Home on OS X), and `Ctrl + End` (Command + End on OS X), respectively.

**Navigation Buttons**

Oxygen XML Editor includes some actions that help you to quickly navigate to a particular modification. These navigation buttons are available in the main toolbar and the actions can also be accessed from the **Find** menu. The three actions include:

- **Last Modification** - Moves the cursor to the last modification in any opened document.
- **Back** - Moves the cursor to the previous position.
- **Forward** - Moves the cursor to the next position. Enabled after at least one press of the **Back** button.

**Navigating with the Outline View**

Oxygen XML Editor includes a very useful **Outline View** that displays a hierarchical tag overview of the currently edited XML Document.

You can use this view to quickly navigate through the current document by selecting nodes in the outline tree. It is synchronized with the editor area, so when you make a selection in the **Outline** view, the corresponding nodes are highlighted in the editor area.

![Figure 52: Outline View Navigation in Text Mode](image)

**Using the Breadcrumb to Navigate**

A **breadcrumb** on the top stripe indicates the path from the document root element to the current element. It can also be used as a helpful tool to navigate to specific elements throughout the structure of the document.

![Figure 53: Breadcrumb in Text Mode](image)
The last element listed in the breadcrumb is the element at the current cursor position. The current element is also highlighted by a thin light blue bar for easy identification. Clicking an element from the breadcrumb selects the entire element and navigates to it in the editor area.

Navigating with the Go To Dialog Box

In Text mode, you can navigate precisely to a location in the document you are editing by using the Go to dialog box. To open this dialog box, go to Find > Go to (Ctrl+L (Command+L on OS X)).

![Go to Dialog Box](image)

**Figure 54: Go to Dialog Box**

The dialog box includes the following fields for specifying a specific navigation location:

- **Line** - Destination line in the current document.
- **Column** - Destination column in the current document.
- **Offset** - Destination offset relative to the beginning of document.

Navigating with Bookmarks

By using bookmarks, you can mark positions in an edited document so that you can return to it later. This is especially helpful for navigating through large documents or while editing multiple documents. You can place up to nine distinct bookmarks in any document. Shortcut keys are available to place the bookmarks or to return to any of the marked positions. You can configure these shortcut keys in the Options > Menu Shortcut Keys menu.

![Editor Bookmarks](image)

**Figure 55: Editor Bookmarks**

A bookmark can be inserted in Text mode by doing one of the following:

- Click in the vertical stripe on the left side of the editor (to the left of the line number).
- Select the Create Bookmark (F9) action from the Edit > Bookmarks menu.

A bookmark can be removed by right-clicking its icon on the vertical stripe and selecting Remove or Remove all (Ctrl+F7 (Command+F7 on OS X)).

You can navigate the bookmarks by using one of the actions available on the Edit > Bookmarks > Go to menu or by using the shortcut keys that are listed in that menu.

Text Mode Views

There is a large selection of useful views available in the Window > Show View menu. This section presents some of the most helpful views for editing in Text mode.
Project View

The Project view is designed to assist you with organizing and managing related files grouped in the same XML project. The actions available on the contextual menu and toolbar associated to this panel enable the creation of XML projects and shortcuts to various operations on the project documents.

By default, the view is positioned on the left side of the Oxygen XML Editor window, above the Outline view. If the view has been closed, it can be reopened at any time from the Window > Show View menu (or using the Show Project View action from the Project menu).

The tree structure occupies most of the view area. In the upper left side of the view, there is a drop-down menu that contains all recently used projects and project management actions:

- **Open Project (Ctrl + F2 (Command + F2 on OS X))**
  - Opens an existing project. Alternatively, you can open a project by dropping an Oxygen XML Editor XPR project file from the file explorer into the Project panel.
  - **Notice:** When a project is opened for the first time, a confirmation dialog box will be displayed that asks you to confirm that the project came from a trusted source. This is meant to help prevent potential security issues.

- **New Project**
  - Creates a new, empty project.

The following actions are grouped in the upper right corner:

- **Collapse All**
  - Collapses all project tree folders. You can also collapse/expand a project tree folder if you select it and press the Enter key or Left Arrow to collapse and Right Arrow to expand.

- **Link with Editor**
  - When selected, the project tree highlights the currently edited file, if it is found in the project files.
  - **Note:** This button is disabled automatically when you move to the Debugger perspective.

- **Settings**
  - A submenu that contains the following actions:
    - **Filters**
      - Allows you to filter the information displayed in the Project view. Click the toolbar button to set filter patterns for the files you want to show or hide. Also, you can set filter patterns for the linked directories that are hidden.
    - **Show Full Path**
      - When selected, linked files and folders are presented with a full file path.
    - **Enable Master Files Support**
      - Select this option to enable the Master Files support.
Change Search and Refactor operations scope
Allows you to change the collection of documents that define the context of the search and refactor operations.

- **Use only Master Files, if enabled** - Restricts Oxygen XML Editor to perform the search and refactor operations starting from the master files that are defined for the current resource. This option is available when you select **Project** in the Select the scope for Search and Refactor operations dialog box and the **Master Files** support is enabled.

- **Working sets** - Allows you to specify the set of files that will be used for the scope of the search and refactor operations.

The files are usually organized in an XML project as a collection of folders. There are three types of resources displayed in the **Project** view:

- **Logical folders** - marked with a blue icon on Windows and Unix/Linux (Ubuntu) and a magenta icon on Mac OS X (Mac OS X). They help you group files within the project. This folder type has no correspondent on the physical disk, since they are used as containers for related items. Creating and deleting them does not affect the file system on disk. They are created on the project root or inside other logical folders by using the contextual action **New > Logical Folder**. The contextual menu action **Remove from Project** can be used to remove them from the project.

- **Physical folders and files** - marked with the operating system-specific icon for folders (usually a yellow icon on Windows and a blue icon on Mac OS X). These folders and files are mirrors of real folders or files that exist in the local file system. They are created or added to the project by using contextual menu actions (such as **New > File**, **New > Folder**, **Add Folder**, etc.) Also, the contextual menu action **Remove from Disk (Shift+Delete)** can be used to remove them from the project and local file system.

- **Shortcut folders and files** - the icons for file shortcuts include a shortcut symbol and names of folder shortcuts are displayed in bold text. All files and folders that appear as direct descendants of a logical folder are considered shortcuts. They are created and added with the contextual actions **Add Files** and **Add Folder** from the project root. Both contextual menu actions **Remove from Project** and **Remove from Disk (Shift+Delete)** are available for shortcuts. **Remove from Project** just removes the shortcut from the project, while **Remove from Disk (Shift+Delete)** removes the shortcut and the physical resource from the local file system.

![Figure 57: Project View with Examples of all Three Types of Resources](image)

Creating New Projects

The following action is available in the **Project** menu, the **New** menu in the contextual menu, or from the drop-down menu in the top-left of the **Project** view:

- **New Project**

  Creates a new, empty project.
Creating New Project Items

The following actions are available by selecting New from the contextual menu, when invoked from the Project view:

New > File

Opens a New file dialog box that helps you create a new file and adds it to the project structure.

New > Folder

Opens a New Folder dialog box that allows you to specify a name for a new folder and adds it to the structure of the project.

New > Logical Folder

Available when invoked from the project root, this action creates a logical folder in the tree structure (the icon is a magenta folder on Mac OS X - ).

New > Logical Folders from Web

Available when invoked from the project root, this action replicates the structure of a remote folder accessible over FTP/SFTP/WebDAV, as a structure of logical folders. The newly created logical folders contain the file structure of the folder it points to.

Add Content to a Logical Folder

The project itself is considered a logical folder. You can add content to a logical folder using one of the actions available in the contextual menu, when invoked from the project root:

Add Folder

Adds a link to a physical folder, whose name and content mirror a real folder that exists in the local file system (the icon of this action is different on Mac OS X ).

Add Files

Adds links to files on the local file system.

Add Edited File

Adds a link to the currently edited file in the project.

Managing Project Content

Creating/Adding Files and Folders

You can create linked folders (shortcuts) by dragging and dropping folders from a system explorer to the project tree (the Enable drag-and-drop in Project view option must be enabled in the Views preferences page), or by selecting Add Folder in the contextual menu from the project root. To create a file inside a linked folder, select the New > File action from the contextual menu.

Note: The linked files presented in the Project view are marked with a special icon. Linked folders are displayed in bold text.

You can create physical folders by selecting New > Folder from the contextual menu.

When adding files to a project, the default target is the project root. To change a target, select a new folder. Files may have multiple instances within the folder system, but cannot appear twice within the same folder.

Removing Files and Folders

To remove one or more linked files or folders, select them in the project tree and press the Delete key, or select the contextual menu action Remove from Project. To remove a linked file or folder from both project and local file system, select the contextual menu action Remove from Disk (Shift+Delete). The Remove from Disk (Shift+Delete) action is also used to remove physical files or folders.

CAUTION: In most cases this action is irreversible, deleting the file permanently. Under particular circumstances (if you are running a Windows installation of Oxygen XML Editor and the Recycle Bin is active) the file is moved to Recycle Bin.
You can move the resources of the project with drag and drop operations on the files and folders of the tree (the Enable oXygen consoles option must be enabled in the View preferences page).

You can also use the usual Cut, Copy, and Paste actions to move resources in the Project view.

Renaming Files and Folders
There are three ways you can rename an item in the Project view. Select the item in the Project view and do one of the following:

- Invoke the Rename action from the contextual menu.
- Press F2 and type the new name.
- Click the selected item and type the new name.

To finish editing the item name, press Enter.

Note: The Rename action is also available on logical files.

Locating and Opening Files
If a project folder contains a lot of documents, a certain document can be located quickly in the project tree by selecting the folder containing the desired document and typing the first few characters of the document name. The desired document is automatically selected as soon as the typed characters uniquely identify its name in the folder.

The selected document can be opened by pressing the Enter key, by double-clicking it, or with one of the Open actions from the contextual menu. The files with known document types are opened in the associated editor, while binary files are opened with the associated system application. To open a file with a known document type in an editor other than the default one, use the Open with action. Also, dragging and dropping files from the project tree to the editor area results in the files being opened.

Saving the Project
The project file is automatically saved every time the content of the Project view is saved or modified by actions such as adding or removing files and drag and drop.

Validate Files
The currently selected files in the Project view can be checked to be XML well-formed or validated against a schema (DTD, XML Schema, Relax NG, Schematron or NVDL) with one of the following contextual menu actions found in the Validate submenu:

- Check Well-Formedness
  Checks if the selected file or files are well-formed.
- Validate
  Validates the selected file or files against their associated schema. EPUB files make an exception, because this action triggers a Validate and Check for Completeness operation.

Validate with Schema
Validates the selected file of files against a specified schema.

- Configure Validation Scenario(s)
  Allows you to configure and run a validation scenario.

Applying Transformation Scenarios
The currently selected files in the Project view can be transformed in one step with one of the following actions available from contextual menu in the Transform submenu:

- Apply Transformation Scenario(s)
  Obtains the output with one of the built-in scenarios.
- Configure Transformation Scenario(s)
  Opens a dialog box that allows you to configure pre-defined transformation scenarios.
Transform with

Allows you to select a transformation scenario to be applied to the currently selected files. Along with the logical folder support, this allows you to group your files and transform them very easily.

Refactoring Actions (Available for certain document types (such as XML, XSD, and XSL)

Oxygen XML Editor includes some refactoring operations that help you manage the structure of your documents. The following actions are available from the contextual menu in the **Refactoring** submenu:

**Rename resource**
- Allows you to change the name of a resource.

**Move resource**
- Allows you to change the location on disk of a resource.

**XML Refactoring**
- Opens the XML Refactoring tool wizard that presents refactoring operations to assist you with managing the structure of your XML documents.

**Other XML Refactoring Actions**
- For your convenience, the last 5 XML Refactoring tool operations that are used will also appear in this submenu.

**Other Contextual Menu Actions**

Other actions that are available in the contextual menu from the project tree include:

**Open**
- Opens the selected files in the corresponding editor.

**Open with submenu**
- This submenu allows you to open the selected file with the internal editor, a system application, or other internal tools: DITA Maps Manager, Archive Browser, MathML Editor, Generate/Convert Schema, WSDL/SOAP Analyzer, Large File Viewer, Hex Viewer, SVG Viewer.

**Show in Explorer (or Show in Finder on OS X)**
- In Windows, the content of the selected folder or file is presented in a specific explorer window. On MAC OS X, the parent folder is opened and the selected folder is highlighted in a specific finder window.

**Copy Location**
- Copies an application-specific URL for the selected resource to the clipboard.

**Refresh**
- Refreshes the content and the dependencies between the resources in the **Master Files** directory.

**Find/Replace in Files**
- Allows you to find and replace text in multiple files.

**XPath in Files**
- Opens the XPath/XQuery Builder view that allows you to compose XPath and XQuery expressions and execute them over the currently edited XML document.

**Open/Find Resource**
- Opens the Open/Find Resource dialog box.

**Check Spelling in Files**
- Allows you to check the spelling of multiple files.

**Format and Indent Files**
- Opens the Format and Indent Files dialog box that allows you to configure the format and indent (pretty print) action that will be applied on the selected documents.
Open in SVN Client

Syncro SVN Client tool is opened and it highlights the selected resource in its corresponding working copy.

Compare

Allows you to compare multiple files or directories and the order of your selection determines where they are opened in the Compare Files or Compare Directories tool. If you select two files or folders, your first selection will be opened in the left panel and the other one in the right panel.

You can also select 3 files and the tool will automatically be opened in the three-way comparison mode. If you select three files, your first selection will be opened in the left panel, the second in the right panel, and the third selection will be the base (ancestor) file.

Generate Documentation > XML Schema Documentation

Opens the XML Schema Documentation Dialog Box.

Generate Documentation > XSLT Stylesheet Documentation

Opens the XSLT Stylesheet Documentation Dialog Box.

Generate Documentation > XQuery Documentation

Opens the XQuery Documentation Dialog Box.

Generate Documentation > WSDL Documentation

Opens the WSDL Documentation Dialog Box.

Properties

Displays the properties of the current file in a Properties dialog box.

Menu Level Actions

The following actions are available in the Project menu:

New Project

Creates a new, empty project.

Open Project (Ctrl + F2 (Command + F2 on OS X))

Opens an existing project. Alternatively, you can open a project by dropping an Oxygen XML Editor XPR project file from the file explorer into the Project panel.

Notice: When a project is opened for the first time, a confirmation dialog box will be displayed that asks you to confirm that the project came from a trusted source. This is meant to help prevent potential security issues.

Save Project As

Allows you to save the current project under a different name.

Validate all project files

Checks if the project files are well-formed and their mark-up conforms with the specified DTD, XML Schema, or Relax NG schema rules. It returns an error list in the message panel.

Filters

Opens the Project filters dialog box that allows you to decide which files and directories will be shown or hidden.

Enable Master Files Support

Allows you to enable the Master Files Support for each project you are working on.

Change Search and Refactor operations scope

Opens a dialog box that allows you to define the context of search and refactor operations.

Show Project View

Displays the Project view.

Reopen Project

Contains a list of links of previously used projects. This list can be emptied by invoking the Clear history action.
Open/Find Resource View

The Open/Find Resource view is designed to offer advanced search capabilities either by using a simple text search or by using the Apache Lucene - Query Parser Syntax. By default, the view is presented in the left side of the Oxygen XML Editor layout, next to the Project and DITA Maps Manager views. If the view is not displayed, it can be opened from the Window > Show View menu.

![Image of Open/Find Resource View]

Figure 58: Open/Find Resource View

You can use this view to find a file in the current Oxygen XML Editor project or in one of the DITA maps opened in the DITA Maps Manager view by typing only a few letters of the file name of a document or a fragment of the content you are searching for. The Open/Find Resource view also supports searching in document edits (comments, tracked change insertions/deletions, and highlighted content).

**Note:** Full support for searching in document edits is available only in the Enterprise edition of Oxygen XML Editor. The Professional edition offers support to search through a maximum of 10 edits.

Search Results

Search results are presented instantly, after you finish typing the content. The matching fragments of text are highlighted in the results list displayed in the dialog box. When you open one of the documents from the results list, the matching fragments of text are highlighted in the editing area. To remove the highlighting from your document, close the corresponding tab in the Results view at the bottom of the editor. To display the search history, position the cursor in the search field and press Ctrl + DownArrow (Command + DownArrow on OS X) or Ctrl + UpArrow (Command + UpArrow on OS X) on your keyboard. Pressing only the DownArrow key moves the selection to the list of results.

**Note:** Searches are not case sensitive. For example, if you search for car you get the same results as when you search for Car.

**Tip:** Suffix searches are also supported, both for searching in the content of your resources and in their name. For this, you can use wildcards. If you search for *ing with the in content option selected, you will find documents that contain the word presenting. If you search for */samples/*.gif with the in file paths option selected, you will find all the gif images from the samples directory.
Options Available in the View

The **Open/Find Resource** view offers the following options:

- **Settings** - Drop-down menu that includes the following settings for the view:
  - **Clear Index** - Clears the index.
  - **Show description** - Presents the search results in a more compact form, displaying only the title and the location of the resources.
  - **Options** - Opens the **Open/Find Resource preferences page** where you can configure various search options. For example, you can specify a **Content language** that differs from the default UI language in case your document contains multiple languages.

- **In file paths** - Select this option to search for resources by their name or by its path (or a fragment of its path).
- **In content** - Select this option to search through the content of your resources.
- **In reviews** - Select this option to search through the comments, tracked change insertions/deletions, or highlights in your resources.
- **Reindex** - Use this option to reindex your resources.

Contextual Menu Actions

A contextual menu is available on each search result and provides actions applicable to that particular document. These actions include:

- **Open** - Opens the document in one of Oxygen XML Editor internal editors.
- **Open with** - Allows you to choose to open the document in the **Internal editor** or an external **System application**.
- **Show in Explorer** - Identifies the document in the system file explorer.
- **Copy Location** - Copies the file path and places it in the clipboard.

Indexing Process

The content of the resources used to search in is parsed from an index. The indexing is performed both automatically and on request. Automatic indexing is performed when you modify, add, or remove resources in the currently indexed project. If the index was never initialized, the index is not updated on project changes.

To improve performance, the indexing process skips the following set of common English words (the so-called *stop words*): *a, an, and, are, as, at, be, but, by, for, if, in, into, is, it, no, not, of, on, or, such, that, the, their, then, there, these, they, this, to, was, will, with*. This means that if you are searching for any of these words, the indexing process will not be able to match any of them. However, you can configure the list of *stop words* in the **Open/Find Resource preferences page**.

Caching Mechanism

When you perform a search, a caching mechanism is used to gather the paths of all files linked in the current project. When the first search is performed, all project files are indexed and added to the cache. The next search operation uses the information extracted from the cache, thus improving the processing time. The cache is kept for the currently loaded project only, so when you perform a search in a new project, the cache is rewritten. Also, the cache is reset when you press the **Reindex** button.

⚠️ **Important:** Files larger than 2GB are not indexed.

If there is no file found that matches your file pattern or text search, a possible cause is that the file you are searching for was added to the Oxygen XML Editor project after the last caching operation. In this case, re-indexing the project files with the **Reindex** button enables the file to be found. The date and time of the last index operation are displayed below the file list.

Opening the Results

Once you find the files that you want to open, select them in the list and press the **Open** button (or double-click them). Each of the selected files is opened in *the editor associated with the type of the file*.

⚠️ **Note:** You can drag a resource from the **Open/Find Resource** view and drop it in a DocBook, DITA, TEI or XHTML document to create a link to that resource.
To watch our video demonstration about the **Open/Find Resource** feature and its search capabilities, go to https://www.oxygenxml.com/demo/Open_Find_Resource.html.

**Related information**

*Open/Find Resource Dialog Box* on page 256

**Outline View in Text Mode**

The **Outline** view in **Text** mode displays a general tag overview of the currently edited XML Document. When you edit a document, the **Outline** view dynamically follows the changes that you make, displaying the node that you modify. This functionality gives you great insight on the location of your modifications in the current document. It also shows the correct hierarchical dependencies between elements. This makes it easy for you to be aware of the document structure and the way element tags are nested.

**Outline View Features**

The **Outline** view allows you to:

- Quickly navigate through the document by selecting nodes in the **Outline** tree.
- Insert or delete nodes using contextual menu actions.
- Move elements by dragging them to a new position in the tree structure.
- Highlight elements in the editor area. It is synchronized with the editor area, so when you make a selection in the editor area, the corresponding nodes are highlighted in the **Outline** view, and vice versa.
- View document errors, as they are highlighted in the **Outline** view. A tooltip also provides more information about the nature of the error when you hover over the faulted element.

**Outline View Interface**

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (*, ?) and separate multiple patterns with commas.

It also includes a **Settings** menu in the top-right corner that presents a variety of options to help you filter the view even further.

**Drop and Drop Actions in the Outline View**

Entire XML elements can be moved or copied in the edited document using only the mouse in the **Outline** view with drag-and-drop operations. Several drag and drop actions are possible:

- If you drag an XML element in the **Outline** view and drop it on another node, then the dragged element will be moved after the drop target element.
- If you hold the mouse pointer over the drop target for a short time before the drop then the drop target element will be expanded first and the dragged element will be moved inside the drop target element after its opening tag.
- You can also drop an element before or after another element if you hold the mouse pointer towards the upper or lower part of the targeted element. A marker will indicate whether the drop will be performed before or after the target element.
- If you hold down the **(Ctrl (Command on OS X))** key after dragging, a copy operation will be performed instead of a move.

The drag and drop actions in the **Outline** view can be **disabled and enabled from a Preferences page**.
Outline View in Text Mode

Outline View in Author Mode on page 211

Outline View Filters in Text Mode

The upper part of the Outline view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (*, ?) and separate multiple patterns with commas.

The following actions are available in the Settings menu of the Outline view when editing in Text mode:

Filter returns exact matches
The text filter of the Outline view returns only exact matches.

Selection update on cursor move
Controls the synchronization between Outline view and source document. The selection in the Outline view can be synchronized with the cursor moves or the changes in the editor. Selecting one of the components from the Outline view also selects the corresponding item in the source document.

Flat presentation mode of the filtered results
When active, the application flattens the filtered result elements to a single level.

Show comments and processing instructions
Show/hide comments and processing instructions in the Outline view.

Show element name
Show/hide element name.

Show text
Show/hide additional text content for the displayed elements.

Show attributes
Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from the Outline preferences panel.

Configure displayed attributes
Displays the XML Structured Outline preferences page.

Outline View Contextual Menu Actions in Text Mode

The following actions are available from the contextual menu in the Outline view in Text mode:
Append Child
Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it as a child of the current element.

Insert Before
Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it immediately before the current element, as a sibling.

Insert After
Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it immediately after the current element, as a sibling.

Edit Attributes
Opens a dialog box that allows you to edit the attributes of the currently selected component.

Toggle Comment
Encloses the currently selected element in an XML comment, if the element is not already commented. If it is already commented, this action will remove the comment.

Cut
Cuts the currently selected component.

Copy
Copies the currently selected component.

Delete
Deletes the currently selected component.

Expand More
Expands the structure of a component in the Outline view.

Collapse All
Collapses the structure of all the component in the Outline view.

Attributes View in Text Mode
The Attributes view presents all the attributes of the current element determined by the schema of the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the Window > Show View menu.

You can use the Attributes view to insert attributes, edit their values, or add values to existing attributes.

The attributes are rendered differently depending on their state:

- The names of the attributes are rendered with a bold font, and their values with a plain font.
- Default values are rendered with a plain font, painted gray.
- Empty values display the text "[empty]", painted gray.
- Invalid attributes and values are painted red.

To edit the value of the corresponding attribute, double-click a cell in the Value column. If the possible values of the attribute are specified as list in the schema of the edited document, the Value column acts as a combo box that allows you to either select the value from a list or manually enter it.

You can sort the attributes table by clicking the Attribute column header. The table contents can be sorted as follows:

- By attribute name in ascending order.
- By attribute name in descending order.
- Custom order, where the used attributes are displayed at the beginning of the table sorted in ascending order, followed by the rest of the allowed elements sorted in ascending order.
Figure 60: Attributes View

Expand/Collapse Button

There is a Expand/ Collapse button at the top-right of the view. When expanded, this presents the following additional combo boxes:

Name Combo Box

Use this combo box to select an attribute. The drop-down list displays the list of possible attributes allowed by the schema of the document, as in the Attributes view. You can use the Remove button to delete an attribute and its value from the selected element.

Value Combo Box

Use this combo box to add, edit, or select the value of an attribute. If the selected attribute has predefined values in the schema, the drop-down list displays those possible values. You can use the Browse button to select a URL for the value of an attribute. After you have entered or selected a value, use the Update button (or press Enter) to add the value to the attribute.

Contextual Menu Actions in the Attributes View

The following actions are available in the contextual menu of the Attributes view when editing in Text mode:

Add

Allows you to insert a new attribute. Adding an attribute that is not in the list of all defined attributes is not possible when the Allow only insertion of valid elements and attributes schema aware option is enabled.

Set empty value

Specifies the current attribute value as empty.

Remove

Removes the attribute (action available only if the attribute is specified). You can invoke this action by pressing the (Delete) or (Backspace) keys.

Copy

Copies the attrName="attrValue" pair to the clipboard. The attrValue can be:

- The value of the attribute.
- The value of the default attribute, if the attribute does not appear in the edited document.
- Empty, if the attribute does not appear in the edited document and has no default value set.

Paste

Depending on the content of the clipboard, the following cases are possible:

- If the clipboard contains an attribute and its value, both of them are introduced in the Attributes view. The attribute is selected and its value is changed if they exist in the Attributes view.
- If the clipboard contains an attribute name with an empty value, the attribute is introduced in the Attributes view and you can start editing it. The attribute is selected and you can start editing it if it exists in the Attributes view.
• If the clipboard only contains text, the value of the selected attribute is modified.

Model View

The Model view presents the structure of the currently selected tag, and its documentation, defined as annotation in the schema of the current document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the Window > Show View menu.

Figure 61: Model View

The Model view is comprised of two sections, an element structure panel and an annotations panel.

Element Structure Panel

The element structure panel displays the structure of the currently edited or selected tag in a tree-like format. The information includes the name, model, and attributes of the current tag. The allowed attributes are shown along with imposed restrictions, if any.

Figure 62: Element Structure Panel
Annotation Panel

The Annotation panel displays the annotation information for the currently selected element. This information is collected from the XML schema.

Figure 63: Annotation panel

Elements View in Text Mode

The Elements view presents a list of all defined elements that are valid at the current cursor position according to the schema associated to the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the Window > Show View menu.

Double-clicking any of the listed elements inserts that element into the edited document, at the current cursor position.

Figure 64: Elements View in Text Mode

Entities View

Entities provide abbreviated entries that can be used in XML files when there is a need of repeatedly inserting certain characters or large blocks of information. An entity is defined using the ENTITY statement either in the DOCTYPE declaration or in a DTD file associated with the current XML file.

There are three types of entities:

- **Built-in or Predefined** - Entities that are part of the predefined XML markup (`<`, `&`, `apos`, `quot`).
- **Internal** - Defined in the DOCTYPE declaration header of the current XML.
- **External** - Defined in an external DTD module included in the DTD referenced in the XML DOCTYPE declaration.

Note: If you want to add internal entities, you would need to switch to the Text editing mode and manually modify the DOCTYPE declaration. If you want to add external entities, you need to open the DTD module file and modify it directly.

The Entities view displays a list with all entities declared in the current document, as well as built-in ones. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the Window > Show View menu.

Double-clicking one of the entities will insert it at the current cursor position in the XML document. You can also sort entities by name and value by clicking the column headers.
The view features a filtering capability that allows you to search an entity by name, value, or both. Also, you can choose to display the internal or external entities.

**Note:** When entering filters, you can use the ? and * wildcards. Also, you can enter multiple filters by separating them with a comma.

**Results View**

The Results view displays the messages generated as a result of user actions such as validations, transformations, search operations, and others. Each message is a link to the location related to the event that triggered the message. Double-clicking a message opens the file containing the location and positions the cursor at the location offset. The Results view is automatically opened when certain actions generate result messages. Those actions include the following:

- **Validation** actions
- **Transformation** actions
- **Check Spelling in Files** action
- **Find All** action from the *Find/Replace* dialog box
- **Find/Replace in Files** dialog box
- **Search References** action
- **XPath expression results**
- **SQL results**
**Results View Toolbar Actions**

The view includes a toolbar with the following actions:

- **Grouping options drop-down menu**
  A set of **Group by** toggle actions that allow you to group the messages according to a selected criteria so that they can be presented in a hierarchical layout. The criteria used for grouping can be the severity of the errors (error, warning, info message, etc.), the resource name, the description of the message, and so on.

  This drop-down menu also includes the following additional grouping actions:

  - **Ungroup all**
    Removes the grouping rules so that the messages are presented in a continuous list.

- **Show group columns**
  If any of the **Group by** options are selected, you can use this option to show or hide grouping columns.

  **Restore Defaults**
  Restores the column size for each column and the grouping rules that were saved in the user preferences the last time when this view was used. If it is the first time this view is used, the action sets an initial default column size for each column and a grouping rule that is appropriate for the type of messages. For example:

  - Group the messages by the path of the validated file if there are error messages from a validation action or spelling errors reported by the **Check Spelling in Files** action.
  - No grouping rule for the results of **applying an XPath expression**.

- **Highlight all results in editor**
  Oxygen XML Editor highlights all matches obtained after executing an XPath expression, or performing one of the following operations: **Find All**, **Find in Files**, **Search References**, and **Search Declarations**. Click **Highlight all results in editor** again to turn off highlighting.

  **Note:** To customize highlighting behavior, open the **Preferences** dialog box (**Options > Preferences**) and go to **Editor > Highlights category**. You can do the following customizations:

  - Set a specific color of the highlights depending on the type of action you make.
  - Set a maximum number of highlights that the application displays at any given time.

- **Remove selected**
  Removes the current selection from the view. This can be helpful if you want to reduce the number of messages or remove those that have already been addressed or not relevant to your task.

- **Remove all**
  Removes all messages from the view.

**Results View Contextual Menu Actions**

The following actions are available when the contextual menu is invoked in this view:

- **Show message**
  Displays a dialog box with the full error message, which is useful for a long message that does not have enough room to be displayed completely in the view.

- **Previous message**
  Navigates to the message above the current selection.

- **Next message**
  Navigates to the message below the current selection.

- **Remove selected**
  Removes selected messages from the view.

- **Remove all**
  Removes all messages from the view.
Copy
Copies the information associated with the selected messages:

• The file path of the document that triggered the output message.
• The path of the main file (in the case of a validation scenario, it is the path of the file from which the validation starts and can be different from the validated file).
• Error severity (error, warning, info message, etc.)
• Name of validating processor.
• Name of validation scenario.
• The line and column in the file that triggered the message.

Select All
Extends the selection to all the messages from the view.

Print Results
Sends the complete list of messages to a printer. For each message the included details are the same as the ones for the Copy action.

Save Results
Saves the complete list of messages in a file in text format. For each message the included details are the same as the ones for the Copy action.

Save Results as XML
Saves the complete list of messages in a file in XML format. For each message the included details are the same as the ones for the Copy action.

Group by
A set of Group by toggle actions that allow you to group the messages according to a selected criteria so that they can be presented in a hierarchical layout. The criteria used for grouping can be the severity of the errors (error, warning, info message, etc.), the resource name, the description of the message, and so on.

Ungroup all
Removes the grouping rules so that the messages are presented in a continuous list.

Show group columns
If any of the Group by options are selected, you can use this option to show or hide grouping columns.

Restore Defaults
Restores the column size for each column and the grouping rules that were saved in the user preferences the last time when this view was used. If it is the first time this view is used, the action sets an initial default column size for each column and a grouping rule that is appropriate for the type of messages. For example:

• Group the messages by the path of the validated file if there are error messages from a validation action or spelling errors reported by the Check Spelling in Files action.
• No grouping rule for the results of applying an XPath expression.

Expand All
Expands all the nodes of the tree, which is useful when the messages are presented in a hierarchical mode.

Collapse All
Collapses all the nodes of the tree, which is useful when the messages are presented in a hierarchical mode.

Syntax Highlight Depending on Namespace Prefix
The syntax highlight scheme of an XML file type allows the configuration of a color per each type of token that can appear in an XML file. Distinguishing between the XML tag tokens based on the namespace prefix brings additional visual help in editing some XML file types. For example, in XSLT stylesheets, elements from various namespaces (such as XSLT, XHTML, XSL:FO, or XForms) are inserted in the same document and the editor panel can become cluttered. Marking tags with different colors based on the namespace prefix allows easier identification of the tags.
Presenting Validation Errors in Text Mode

Oxygen XML Editor can be configured to automatically validate documents while editing in the Text mode, and actions are also available to manually validate documents on-request.

A line with a validation issue is marked in the editor panel by underlining the problem region with a colored line, according to the type of issue. The issues are also marked with a colored marker in the right vertical stripe. You can configure the color for each type in the Document Checking preferences page.

- **Validation Errors** - By default, underlined with a red squiggly line in the editing pane and a red marker in the right vertical stripe.
- **Validation Warnings** - By default, underlined with a yellow squiggly line in the editing pane and a yellow marker in the right vertical stripe.
- **Validation Info** - By default, underlined with a blue squiggly line in the editing pane and a blue marker in the right vertical stripe.

Hovering over a validation issue presents a tooltip message with more details about the problem and possible quick fixes (if available for that issue).

Also, the stripe on the right side of the editor panel is designed to display the issues found during the validation process and to help you locate them in the document. The stripe contains the following:

**Upper Part of the Stripe**

A success indicator square will turn green if the validation is successful or only info messages are found, red if validation errors are found, or yellow if only validation warnings are found. More details about the issues are displayed in a tool tip when you hover over indicator square. If there are numerous problems, only the first three are presented in the tool tip.

**Middle Part of the Stripe**

Errors are depicted with red markers, warnings with yellow markers, and info message with blue markers. If you want to limit the number of markers that are displayed, open the Preferences dialog box (Options > Preferences), go to Editor > Document checking, and specify the desired limit in the Maximum number of validation highlights option.
Clicking a marker will highlight the corresponding text area in the editor. The validation message is also displayed both in a tool tip (when hovering over the marker) and in the message area on the bottom of the editor panel (clicking the Document checking options button opens the Document Checking preferences page).

**Bottom Part of the Stripe**

Two navigation arrows ( ) allow you to jump to the next or previous issue. The same actions can be triggered from Document > Automatic validation > Next error (Ctrl + Period (Command + Period on OS X)) and Document > Automatic validation > Previous error (Ctrl + Comma (Command + Comma on OS X)). Also, the button can be used to clear all the validation markers.

Status messages from every validation action are logged in the Information view.

If you want to see all the validation messages grouped in the Results panel, you should use the Validate action from the toolbar or Document > Validate menu.

**Related information**

- Presenting Schematron Validation Issues

**Bidirectional Text Support in Text Mode**

Bidirectional documents contain text in both directions, usually involving characters from unique types of alphabets. If bidirectional text (such as Arabic or Hebrew languages), certain Asian languages (such as Devanagari, Bengali, Gurmukhi, Gujarati, Oriya, Tamil, Telugu, Kannada, Malayalam, Sinhala, Thai, Khmer), or other special characters (such as combining characters) are detected in a document, Oxygen XML Editor displays a Special Characters Detected dialog box that prompts you to Enable or Disable support for these special characters.

You can also configure the support for bidirectional text in the Open/Save preferences page. To enable or disable this support, open the Preferences dialog box (Options > Preferences), go to Editor > Open/Save, and choose the appropriate setting in the Support for Special Characters section.

**Note:** Disabling this support may affect text rendering, cursor positioning and navigation, as well as text selection and management operations. If you need to open very large documents, the bidirectional editing support can also be disabled to enhance performance while editing.

**Restriction:** Bidirectional content in the Text mode cannot be rendered using Bold or Italic.

**Related information**
- Bidirectional Text Support in Grid Mode on page 199
- Inserting Symbols on page 238

**Grid Editing Mode**

The Oxygen XML Editor Grid editing mode displays the XML document as a structured grid of nested tables where the text content can be modified without directly interacting with the XML markup. This is helpful for non-technical users who want to edit text content without modifying the XML markup. You can easily expand or collapse elements within the table and the document structure can be changed with simple drag/drop or copy/paste operations.

To switch to this mode, select Grid at the bottom of the editing area.
To watch our video demonstration about some of the features available in the Grid editor, go to https://www.oxygenxml.com/demo/Grid_Editor.html.

Related information

*Editing XML Documents in Grid Mode* on page 309

**Layouts: Grid and Tree**

The Grid editor offers two layout modes. The default one is the grid layout. This smart layout detects the recurring elements in the XML document and creates tables having the children (including the attributes) of these elements as columns. This way, it is possible to have tables nested in other tables, reflecting the structure of your document.

To switch between the two modes, go to Document > Grid Layout > Grid mode/Tree mode.

**Grid Mode Navigation**

At first, the content of a document opened in the Grid mode is collapsed. Only the root element and its attributes are displayed. The grid disposition of the node names and values is similar to a web form or dialog box. The same set of key shortcuts used to select dialog box components is also available in the Grid mode:
Table 5: Shortcuts in the Grid Mode

<table>
<thead>
<tr>
<th>Key</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tab</td>
<td>Moves the cursor to the next editable value in a table row.</td>
</tr>
<tr>
<td>Shift + Tab</td>
<td>Moves the cursor to the previous editable value in a table row.</td>
</tr>
<tr>
<td>Enter</td>
<td>Begins editing and lets you insert a new value. Also commits the changes after you finish editing.</td>
</tr>
<tr>
<td>UpArrow/PageUp</td>
<td>Navigates toward the beginning of the document.</td>
</tr>
<tr>
<td>DownArrow/PageDown</td>
<td>Navigates toward the end of the document.</td>
</tr>
<tr>
<td>Shift</td>
<td>Used in conjunction with the navigation keys to create a continuous selection area.</td>
</tr>
<tr>
<td>Ctrl (Command on OS X) key</td>
<td>Used in conjunction with the mouse cursor to create discontinuous selection areas.</td>
</tr>
</tbody>
</table>

The following key combinations can be used to scroll the grid:

- Ctrl + UpArrow (Command + UpArrow on OS X) - scrolls the grid upwards.
- Ctrl + DownArrow (Command + DownArrow on OS X) - scrolls the grid downwards.
- Ctrl + LeftArrow (Command + LeftArrow on OS X) scrolls the grid to the left.
- Ctrl + RightArrow (Command + RightArrow on OS X) scrolls the grid to the right.

An arrow sign displayed at the left of the node name indicates that this node has child nodes. To display the children, click this sign. The expand/collapse actions can be invoked either with the NumPad+ and NumPad- keys, or from the Expand/Collapse submenu of the contextual menu or from Document > Grid Expand/Collapse.

The following actions are available on the Expand/Collapse menu:

- **Expand All**
  - Expands the selection and all its children.
- **Collapse All**
  - Collapses the selection and all its children.

- **Expand Children**
  - Expands all the children of the selection but not the selection.

- **Collapse Children**
  - Collapses all the children of the selection but not the selection.

- **Collapse Others**
  - Collapses all the siblings of the current selection but not the selection.

**Bidirectional Text Support in Grid Mode**

If you are editing documents with a bidirectional text orientation, you can change the way the text is rendered and edited in the grid cells by using the Change Text Orientation (Ctrl + Shift + O (Command + Shift + O on OS X)) action that is available from the Edit menu in the Grid editing mode. Use this action to switch from the default left to right text orientation to the right to left orientation, and vice versa.

**Note:** This change applies only to the text from the cells, and not to the layout of the grid editor.
The **Author** editing mode in Oxygen XML Editor allows you to visually edit XML documents in a user-friendly interface that is similar to a WYSIWYG word processor. Oxygen XML Editor provides support for visually editing the most commonly used XML vocabularies in **Author** mode, including DITA, DocBook, TEI, and XHTML. Adding text content is as simple as doing so in a standard text editor but the content is rendered similar to how you will see it in the output. Tables, images, and media objects (such as videos) are also rendered comparable to the output.

To enter this mode, click the **Author** button at the bottom of the editing area.

To watch our video demonstration about some of the features available in the visual **Author** editing mode, go to [https://www.oxygenxml.com/demo/WYSIWYG_XML_Editing.html](https://www.oxygenxml.com/demo/WYSIWYG_XML_Editing.html).

**Related information**

* **Editing XML Documents in Author Mode** on page 313
a document and you do not press another key, pressing the Tab key will continue the navigation. However, if the cursor is positioned in a space preserved element and you press another key or you position the cursor inside such an element using the mouse, the Tab key can be used to arrange the text.

To navigate one word forward or backwards, use Ctrl + RightArrow (Command + RightArrow on OS X), and Ctrl + LeftArrow (Command + LeftArrow on OS X), respectively. Entities and hidden elements are skipped. To position the cursor at the beginning or at the end of the document you can use Ctrl + Home (Command + Home on OS X), and Ctrl + End (Command + End on OS X), respectively.

Navigation Buttons

Oxygen XML Editor includes some actions that help you to quickly navigate to a particular modification. These navigation buttons are available in the main toolbar and the actions can also be accessed from the Find menu. The three actions include:

- **Last Modification** - Moves the cursor to the last modification in any opened document.
- **Back** - Moves the cursor to the previous position.
- **Forward** - Moves the cursor to the next position. Enabled after at least one press of the Back button.

Navigating with the Outline View

Oxygen XML Editor includes a very useful outline view that displays a hierarchical tag overview of the currently edited XML Document.

You can use this view to quickly navigate through the current document by selecting nodes in the outline tree. It is synchronized with the editor area, so when you make a selection in the outline view, the corresponding nodes are highlighted in the editor area.

![Outline View Navigation in Author Mode](image)

**Figure 74: Outline View Navigation in Author Mode**

Using the Breadcrumb to Navigate

A breadcrumb on the top stripe indicates the path from document root to the current element. It can also be used as a helpful tool to navigate to specific elements throughout the structure of the document.

![Breadcrumb in Author Mode](image)

**Figure 75: Breadcrumb in Author Mode**

The last element listed in the breadcrumb is the element at the current cursor position. The last element is also highlighted by a thin light blue bar for easier identification. Clicking an element from the breadcrumb selects the entire element and navigates to it in the editor area.

Using the Linking Support

When working on multiple documents that reference each other (references, external entities, XInclude, DITA conref, etc), the linking support is useful for navigating between the documents. In the predefined customizations that are bundled with Oxygen XML Editor, links are marked with an icon representing a chain link (🔗). When hovering over the icon, the mouse pointer changes its shape to indicate that the link can be accessed and a tooltip presents the destination location. Click the link to open the referenced resource in the editor or system browser. The same effect can be obtained by using the Document > File > Open file at cursor (Ctrl + Enter (Command + Enter on OS X)) action when the cursor is inside a link element.

**Note:** Depending on the referenced file type, the target link will either be opened in the Oxygen XML Editor or in the default system application. If the target file does not exist, Oxygen XML Editor prompts you to create it.
Navigating with Bookmarks

A position in a document can be marked with a bookmark. You can then quickly go to the marked position with a keyboard shortcut or a menu action. This is useful when navigating large documents or working on multiple documents where the cursor needs to move between several marked positions. The bookmarks are displayed with a small icon on the vertical strip to the left of the editor. You can place up to nine distinct bookmarks in any document. Shortcut keys are available to place the bookmarks or to return to any of the marked positions. You can configure these shortcut keys in the Options > Menu Shortcut Keys menu.

![Figure 76: Editor Bookmarks](image)

A bookmark can be inserted in Author mode by doing one of the following:

- Click in the vertical stripe on the left side of the editor.
- Select the Create Bookmark (F9) action from the Edit > Bookmarks menu.

A bookmark can be removed by right-clicking its icon on the vertical stripe and select Remove or Remove all (Ctrl+F7 (Command+F7 on OS X)).

You can navigate the bookmarks by using one of the actions available on the Edit > Bookmarks > Go to menu or by using the shortcut keys that are listed in that menu.

Author Mode Views

The content author is supported by special views that are automatically synchronized with the current editing context of the editor panel. The views present additional information about this context thus helping the author to see quickly the current location in the overall document structure and the available editing options.

There is a large selection of useful views available in the Window > Show View menu. This section presents some of the most helpful views for editing in Author mode.

Project View

The Project view is designed to assist you with organizing and managing related files grouped in the same XML project. The actions available on the contextual menu and toolbar associated to this panel enable the creation of XML projects and shortcuts to various operations on the project documents.

![Figure 77: Project View](image)
By default, the view is positioned on the left side of the Oxygen XML Editor window, above the Outline view. If the view has been closed, it can be reopened at any time from the Window > Show View menu (or using the Show Project View action from the Project menu).

The tree structure occupies most of the view area. In the upper left side of the view, there is a drop-down menu that contains all recently used projects and project management actions:

1. **Open Project (Ctrl + F2 (Command + F2 on OS X))**
   
   Opens an existing project. Alternatively, you can open a project by dropping an Oxygen XML Editor XPR project file from the file explorer into the Project panel.

   **Notice:** When a project is opened for the first time, a confirmation dialog box will be displayed that asks you to confirm that the project came from a trusted source. This is meant to help prevent potential security issues.

2. **New Project**

   Creates a new, empty project.

The following actions are grouped in the upper right corner:

1. **Collapse All**

   Collapses all project tree folders. You can also collapse/expand a project tree folder if you select it and press the Enter key or Left Arrow to collapse and Right Arrow to expand.

2. **Link with Editor**

   When selected, the project tree highlights the currently edited file, if it is found in the project files.

   **Note:** This button is disabled automatically when you move to the Debugger perspective.

3. **Settings**

   A submenu that contains the following actions:

   * **Filters**

     Allows you to filter the information displayed in the Project view. Click the toolbar button to set filter patterns for the files you want to show or hide. Also, you can set filter patterns for the linked directories that are hidden.

   **Show Full Path**

   When selected, linked files and folders are presented with a full file path.

   **Enable Master Files Support**

   Select this option to enable the Master Files support.

   **Change Search and Refactor operations scope**

   Allows you to change the collection of documents that define the context of the search and refactor operations.

   * **Use only Master Files, if enabled** - Restricts Oxygen XML Editor to perform the search and refactor operations starting from the master files that are defined for the current resource. This option is available when you select Project in the Select the scope for Search and Refactor operations dialog box and the Master Files support is enabled.

   * **Working sets** - Allows you to specify the set of files that will be used for the scope of the search and refactor operations.

   The files are usually organized in an XML project as a collection of folders. There are three types of resources displayed in the Project view:

   * **Logical folders** - marked with a blue icon on Windows and Unix/Linux ( BehaviorSubject ) and a magenta icon on Mac OS X ( BehaviorSubject ). They help you group files within the project. This folder type has no correspondent on the physical disk, since they are used as containers for related items. Creating and deleting them does not affect the file system on disk. They are created on the project root or inside other logical folders by using the contextual action New > Logical Folder. The contextual menu action ✖ Remove from Project can be used to remove them from the project.

   * **Physical folders and files** - marked with the operating system-specific icon for folders (usually a yellow icon on Windows and a blue icon on Mac OS X). These folders and files are mirrors of real folders or files that exist in the local file system. They are created or added to the project by using contextual menu actions (such as New > File, New > Folder, Add Folder.
etc.) Also, the contextual menu action Remove from Disk (Shift+Delete) can be used to remove them from the project and local file system.

- **Shortcut folders and files** - the icons for file shortcuts include a shortcut symbol and names of folder shortcuts are displayed in bold text. All files and folders that appear as direct descendants of a logical folder are considered shortcuts. They are created and added with the contextual actions Add Files and Add Folder from the project root. Both contextual menu actions Remove from Project and Remove from Disk (Shift+Delete) are available for shortcuts. Remove from Project just removes the shortcut from the project, while Remove from Disk (Shift+Delete) removes the shortcut and the physical resource from the local file system.

![Figure 78: Project View with Examples of all Three Types of Resources](image)

**Creating New Projects**

The following action is available in the Project menu, the New menu in the contextual menu, or from the drop-down menu in the top-left of the Project view:

- **New Project**
  Creates a new, empty project.

**Creating New Project Items**

The following actions are available by selecting New from the contextual menu, when invoked from the Project view:

- **New > File**
  Opens a New file dialog box that helps you create a new file and adds it to the project structure.

- **New > Folder**
  Opens a New Folder dialog box that allows you to specify a name for a new folder and adds it to the structure of the project.

- **New > Logical Folder**
  Available when invoked from the project root, this action creates a logical folder in the tree structure (the icon is a magenta folder on Mac OS X).

- **New > Logical Folders from Web**
  Available when invoked from the project root, this action replicates the structure of a remote folder accessible over FTP/SFTP/WebDAV, as a structure of logical folders. The newly created logical folders contain the file structure of the folder it points to.
Add Content to a Logical Folder

The project itself is considered a logical folder. You can add content to a logical folder using one of the actions available in the contextual menu, when invoked from the project root:

- **Add Folder**
  Adds a link to a physical folder, whose name and content mirror a real folder that exists in the local file system (the icon of this action is different on Mac OS X).

- **Add Files**
  Adds links to files on the local file system.

- **Add Edited File**
  Adds a link to the currently edited file in the project.

Managing Project Content

Creating/Adding Files and Folders

You can create linked folders (shortcuts) by dragging and dropping folders from a system explorer to the project tree (the Enable drag-and-drop in Project view option must be enabled in the Views preferences page), or by selecting Add Folder in the contextual menu from the project root. To create a file inside a linked folder, select the New > File action from the contextual menu.

**Note:** The linked files presented in the Project view are marked with a special icon. Linked folders are displayed in bold text.

You can create physical folders by selecting New > Folder from the contextual menu.

When adding files to a project, the default target is the project root. To change a target, select a new folder. Files may have multiple instances within the folder system, but cannot appear twice within the same folder.

Removing Files and Folders

To remove one or more linked files or folders, select them in the project tree and press the Delete key, or select the contextual menu action Remove from Project. To remove a linked file or folder from both project and local file system, select the contextual menu action Remove from Disk (Shift+Delete). The Remove from Disk (Shift+Delete) action is also used to remove physical files or folders.

**CAUTION:** In most cases this action is irreversible, deleting the file permanently. Under particular circumstances (if you are running a Windows installation of Oxygen XML Editor and the Recycle Bin is active) the file is moved to Recycle Bin.

Moving Files and Folders

You can move the resources of the project with drag and drop operations on the files and folders of the tree (the Enable oXygen consoles option must be enabled in the View preferences page).

You can also use the usual Cut, Copy, and Paste actions to move resources in the Project view.

Renaming Files and Folders

There are three ways you can rename an item in the Project view. Select the item in the Project view and do one of the following:

- Invoke the Rename action from the contextual menu.
- Press F2 and type the new name.
- Click the selected item and type the new name.

To finish editing the item name, press Enter.

**Note:** The Rename action is also available on logical files.

Locating and Opening Files
If a project folder contains a lot of documents, a certain document can be located quickly in the project tree by selecting the folder containing the desired document and typing the first few characters of the document name. The desired document is automatically selected as soon as the typed characters uniquely identify its name in the folder.

The selected document can be opened by pressing the Enter key, by double-clicking it, or with one of the Open actions from the contextual menu. The files with known document types are opened in the associated editor, while binary files are opened with the associated system application. To open a file with a known document type in an editor other than the default one, use the Open with action. Also, dragging and dropping files from the project tree to the editor area results in the files being opened.

**Saving the Project**

The project file is automatically saved every time the content of the Project view is saved or modified by actions such as adding or removing files and drag and drop.

**Validate Files**

The currently selected files in the Project view can be checked to be XML well-formed or validated against a schema (DTD, XML Schema, Relax NG, Schematron or NVDL) with one of the following contextual menu actions found in the Validate submenu:

- **Check Well-Formedness**
  Checks if the selected file or files are well-formed.

- **Validate**
  Validates the selected file or files against their associated schema. EPUB files make an exception, because this action triggers a Validate and Check for Completeness operation.

- **Validate with Schema**
  Validates the selected file or files against a specified schema.

- **Configure Validation Scenario(s)**
  Allows you to configure and run a validation scenario.

**Applying Transformation Scenarios**

The currently selected files in the Project view can be transformed in one step with one of the following actions available from the contextual menu in the Transform submenu:

- **Apply Transformation Scenario(s)**
  Obtains the output with one of the built-in scenarios.

- **Configure Transformation Scenario(s)**
  Opens a dialog box that allows you to configure pre-defined transformation scenarios.

- **Transform with**
  Allows you to select a transformation scenario to be applied to the currently selected files.

Along with the logical folder support, this allows you to group your files and transform them very easily.

**Refactoring Actions (Available for certain document types (such as XML, XSD, and XSL)**

Oxygen XML Editor includes some refactoring operations that help you manage the structure of your documents. The following actions are available from the contextual menu in the Refactoring submenu:

- **Rename resource**
  Allows you to change the name of a resource.

- **Move resource**
  Allows you to change the location on disk of a resource.

- **XML Refactoring**
  Opens the XML Refactoring tool wizard that presents refactoring operations to assist you with managing the structure of your XML documents.
Other XML Refactoring Actions

For your convenience, the last 5 XML Refactoring tool operations that are used will also appear in this submenu.

Other Contextual Menu Actions

Other actions that are available in the contextual menu from the project tree include:

Open

Opens the selected files in the corresponding editor.

Open with submenu

This submenu allows you to open the selected file with the internal editor, a system application, or other internal tools: DITA Maps Manager, Archive Browser, MathML Editor, Generate/Convert Schema, WSDL/SOAP Analyzer, Large File Viewer, Hex Viewer, SVG Viewer.

Show in Explorer (or Show in Finder on OS X)

In Windows, the content of the selected folder or file is presented in a specific explorer window. On MAC OS X, the parent folder is opened and the selected folder is highlighted in a specific finder window.

Copy Location

Copies an application-specific URL for the selected resource to the clipboard.

📌 Refresh

Refreshes the content and the dependencies between the resources in the Master Files directory.

🔍 Find/Replace in Files

Allows you to find and replace text in multiple files.

รวด XPath in Files

Opens the XPath/XQuery Builder view that allows you to compose XPath and XQuery expressions and execute them over the currently edited XML document.

◮ Open/Find Resource

Opens the Open/Find Resource dialog box.

☑ Check Spelling in Files

Allows you to check the spelling of multiple files.

◮ Format and Indent Files

Opens the Format and Indent Files dialog box that allows you to configure the format and indent (pretty print) action that will be applied on the selected documents.

🌐 Open in SVN Client

Syncro SVN Client tool is opened and it highlights the selected resource in its corresponding working copy.

Compare

Allows you to compare multiple files or directories and the order of your selection determines where they are opened in the Compare Files or Compare Directories tool. If you select two files or folders, your first selection will be opened in the left panel and the other one in the right panel.

You can also select 3 files and the tool will automatically be opened in the three-way comparison mode. If you select three files, your first selection will be opened in the left panel, the second in the right panel, and the third selection will be the base (ancestor) file.

Generate Documentation > XML Schema Documentation

Opens the XML Schema Documentation Dialog Box.

Generate Documentation > XSLT Stylesheet Documentation

Opens the XSLT Stylesheet Documentation Dialog Box.

Generate Documentation > XQuery Documentation

Opens the XQuery Documentation Dialog Box.
Generate Documentation > WSDL Documentation

Opens the WSDL Documentation Dialog Box.

.getProperties

Displays the properties of the current file in a Properties dialog box.

Menu Level Actions

The following actions are available in the Project menu:

New Project

Creates a new, empty project.

Open Project (Ctrl + F2 (Command + F2 on OS X))

Opens an existing project. Alternatively, you can open a project by dropping an Oxygen XML Editor XPR project file from the file explorer into the Project panel.

*Notice:* When a project is opened for the first time, a confirmation dialog box will be displayed that asks you to confirm that the project came from a trusted source. This is meant to help prevent potential security issues.

Save Project As

Allows you to save the current project under a different name.

Validate all project files

Checks if the project files are well-formed and their mark-up conforms with the specified DTD, XML Schema, or Relax NG schema rules. It returns an error list in the message panel.

Filters

Opens the Project filters dialog box that allows you to decide which files and directories will be shown or hidden.

Enable Master Files Support

Allows you to enable the Master Files Support for each project you are working on.

Change Search and Refactor operations scope

Opens a dialog box that allows you to define the context of search and refactor operations.

Show Project View

Displays the Project view.

Reopen Project

Contains a list of links of previously used projects. This list can be emptied by invoking the Clear history action.

Working with EPUB on page 1014

Open/Find Resource View

The Open/Find Resource view is designed to offer advanced search capabilities either by using a simple text search or by using the Apache Lucene - Query Parser Syntax. By default, the view is presented in the left side of the Oxygen XML Editor layout, next to the Project and DITA Maps Manager views. If the view is not displayed, it can be opened from the Window > Show View menu.
You can use this view to find a file in the current Oxygen XML Editor project or in one of the DITA maps opened in the DITA Maps Manager view by typing only a few letters of the file name of a document or a fragment of the content you are searching for. The Open/Find Resource view also supports searching in document edits (comments, tracked change insertions/deletions, and highlighted content).

**Note:** Full support for searching in document edits is available only in the Enterprise edition of Oxygen XML Editor. The Professional edition offers support to search through a maximum of 10 edits.

**Search Results**

Search results are presented instantly, after you finish typing the content. The matching fragments of text are highlighted in the results list displayed in the dialog box. When you open one of the documents from the results list, the matching fragments of text are highlighted in the editing area. To remove the highlighting from your document, close the corresponding tab in the Results view at the bottom of the editor. To display the search history, position the cursor in the search field and press **Ctrl + DownArrow** (**Command + DownArrow on OS X**) or **Ctrl + UpArrow** (**Command + UpArrow on OS X**) on your keyboard. Pressing only the **DownArrow** key moves the selection to the list of results.

**Note:** Searches are not case sensitive. For example, if you search for *car* you get the same results as when you search for *Car*.

**Tip:** Suffix searches are also supported, both for searching in the content of your resources and in their name. For this, you can use wildcards. If you search for *ing* with the in content option selected, you will find documents that contain the word *presenting*. If you search for */samples/*.gif with the in file paths option selected, you will find all the gif images from the samples directory.

**Options Available in the View**

The Open/Find Resource view offers the following options:

- **Settings** - Drop-down menu that includes the following settings for the view:
  - **Clear Index** - Clears the index.
• **Show description** - Presents the search results in a more compact form, displaying only the title and the location of the resources.

• **Options** - Opens the *Open/Find Resource preferences page* where you can configure various search options. For example, you can specify a **Content language** that differs from the default UI language in case your document contains multiple languages.

• **In file paths** - Select this option to search for resources by their name or by its path (or a fragment of its path).

• **In content** - Select this option to search through the content of your resources.

• **In reviews** - Select this option to search through the comments, tracked change insertions/deletions, or highlights in your resources.

• **Reindex** - Use this option to reindex your resources.

**Contextual Menu Actions**

A contextual menu is available on each search result and provides actions applicable to that particular document. These actions include:

• **Open** - Opens the document in one of Oxygen XML Editor internal editors.

• **Open with** - Allows you to choose to open the document in the **Internal editor** or an external **System application**.

• **Show in Explorer** - Identifies the document in the system file explorer.

• **Copy Location** - Copies the file path and places it in the clipboard.

**Indexing Process**

The content of the resources used to search in is parsed from an index. The indexing is performed both automatically and on request. Automatic indexing is performed when you modify, add, or remove resources in the currently indexed project. If the index was never initialized, the index is not updated on project changes.

To improve performance, the indexing process skips the following set of common English words (the so-called **stop words**): a, an, and, are, as, at, be, but, by, for, if, in, into, is, it, no, not, of, on, or, such, that, the, their, then, there, these, they, this, to, was, will, with. This means that if you are searching for any of these words, the indexing process will not be able to match any of them. However, you can configure the list of **stop words** in the *Open/Find Resource preferences page*.

**Caching Mechanism**

When you perform a search, a caching mechanism is used to gather the paths of all files linked in the current project. When the first search is performed, all project files are indexed and added to the cache. The next search operation uses the information extracted from the cache, thus improving the processing time. The cache is kept for the currently loaded project only, so when you perform a search in a new project, the cache is rewritten. Also, the cache is reset when you press the **Reindex** button.

![Important:](image) Files larger than 2GB are not indexed.

If there is no file found that matches your file pattern or text search, a possible cause is that the file you are searching for was added to the Oxygen XML Editor project after the last caching operation. In this case, re-indexing the project files with the **Reindex** button enables the file to be found. The date and time of the last index operation are displayed below the file list.

**Opening the Results**

Once you find the files that you want to open, select them in the list and press the **Open** button (or double-click them). Each of the selected files is opened in the **editor associated with the type of the file**.

![Note:](image) You can drag a resource from the **Open/Find Resource** view and drop it in a DocBook, DITA, TEI or XHTML document to create a link to that resource.

To watch our video demonstration about the **Open/Find Resource** feature and its search capabilities, go to https://www.oxygenxml.com/demo/Open_Find_Resource.html.

*Open/Find Resource Dialog Box on page 256*
Outline View in Author Mode

The **Outline** view in **Author** mode displays a general tag overview of the currently edited XML Document. When you edit a document, the **Outline** view dynamically follows the changes that you make, displaying the node that you modify. This functionality gives you great insight on the location of your modifications in the current document. It also shows the correct hierarchical dependencies between elements. This makes it easy for you to be aware of the document structure and the way element tags are nested.

Outline View Features

The **Outline** view allows you to:

- Quickly navigate through the document by selecting nodes in the **Outline** tree.
- Insert or delete nodes using contextual menu actions.
- Move elements by dragging them to a new position in the tree structure.
- Highlight elements in the editor area. It is synchronized with the editor area, so when you make a selection in the editor area, the corresponding nodes are highlighted in the **Outline** view, and vice versa.
- View document errors, as they are highlighted in the **Outline** view. A tooltip also provides more information about the nature of the error when you hover over the faulted element.

Outline View Interface

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (*, ?) and separate multiple patterns with commas.

It also includes a ![Settings](image) menu in the top-right corner that presents a variety of options to help you filter the view even further.

Drop and Drop Actions in the Outline View

Entire XML elements can be moved or copied in the edited document using only the mouse in the **Outline** view with drag-and-drop operations. Several drag and drop actions are possible:

- If you drag an XML element in the **Outline** view and drop it on another node, then the dragged element will be moved after the drop target element.
- If you hold the mouse pointer over the drop target for a short time before the drop then the drop target element will be expanded first and the dragged element will be moved inside the drop target element after its opening tag.
- You can also drop an element before or after another element if you hold the mouse pointer towards the upper or lower part of the targeted element. A marker will indicate whether the drop will be performed before or after the target element.
- If you hold down the **(Ctrl (Command on OS X))** key after dragging, a copy operation will be performed instead of a move.

The drag and drop actions in the **Outline** view can be **disabled and enabled from a Preferences page**.

**Tip:** You can select and drag multiple nodes in the **Outline** view when editing in **Author** mode.
Outline View Filters in Author Mode

The upper part of the Outline view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (*, ?) and separate multiple patterns with commas.

The following actions are available in the Settings menu of the Outline view when editing in Author mode:

- **Filter returns exact matches**
  The text filter of the Outline view returns only exact matches.

- **Flat presentation mode of the filtered results**
  When active, the application flattens the filtered result elements to a single level.

- **Show comments and processing instructions**
  Show/hide comments and processing instructions in the Outline view.

- **Show element name**
  Show/hide element name.

- **Show text**
  Show/hide additional text content for the displayed elements.

- **Show attributes**
  Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from the Outline preferences panel.

- **Configure displayed attributes**
  Displays the XML Structured Outline preferences page.

Outline View Contextual Menu Actions in Author Mode

The contextual menu of the Outline view in Author mode contains the following actions:

- **Edit Attributes**
  Allows you to edit the attributes of a selected node. For more details about this action, see Attributes View in Author Mode on page 213.
Edit Profiling Attributes
Allows you to change the profiling attributes defined on all selected elements.

Append Child
Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection as a child of the current element.

Insert Before
Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection immediately before the current element, as a sibling.

Insert After
Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection immediately after the current element, as a sibling.

Cut, Copy, Paste, Delete editing actions
Executes the typical editing actions on the currently selected elements. The Cut and Copy operations preserve the styles of the copied content. The Paste before and Paste after actions allow you to insert a well-formed element before or after the currently selected element. The Paste as XML action pastes copied content that is considered to be valid XML, preserving its XML structure.

Toggle Comment
Encloses the currently selected element in an XML comment, if the element is not already commented. If it is already commented, this action will remove the comment.

Rename Element
Invokes a Rename dialog box that allows you to rename the currently selected element, siblings with the same name, or all elements with the same name.

Expand More
Expands the structure tree of the currently selected element.

Collapse All
Collapses all of the structure tree of the currently selected node.

Tip: You can copy, cut or delete multiple nodes in the Outline by using the contextual menu after selecting multiple nodes in the tree.

Related information
Attributes View in Author Mode on page 213

Attributes View in Author Mode
The Attributes view presents all the attributes of the current element determined by the schema of the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the Window > Show View menu.

You can use this view to edit or add attribute values. The attributes of an element are editable if any one of the following is true:

• The CSS stylesheet associated with the document does not specify a false value for the -oxy-editable property associated with the element.
• The element is entirely included in a deleted Track Changes marker.
• The element is part of a content fragment that is referenced in Author mode from another document.

The attributes are rendered differently depending on their state:

• The names of the attributes are rendered with a bold font, and their values with a plain font.
• Default values are rendered with a plain font, painted gray.
• Empty values display the text "[empty]", painted gray.
• Invalid attributes and values are painted red.
To edit the value of the corresponding attribute, double-click a cell in the **Value** column. If the possible values of the attribute are specified as a list in the schema of the edited document, the **Value** column acts as a combo box that allows you to either select the value from a list or manually enter it.

**Note:** If the cursor is located inside read-only content, the attribute names and values are faded and you cannot add, edit, or remove values.

You can sort the attributes table by clicking the **Attribute** column header. The table contents can be sorted as follows:

- By attribute name in ascending order.
- By attribute name in descending order.
- Custom order, where the used attributes are displayed at the beginning of the table sorted in ascending order, followed by the rest of the allowed elements sorted in ascending order.

![Attributes View](image)

**Figure 81: Attributes View**

A drop-down list located in the upper part of the view allows you to select the current element or its ancestors.

**Expand/Collapse Button**

There is an **Expand/Collapse** button at the top-right of the view. When expanded, this presents the following additional combo boxes:

**Name Combo Box**

Use this combo box to select an attribute. The drop-down list displays the list of possible attributes allowed by the schema of the document, as in the **Attributes** view. You can use the **Remove** button to delete an attribute and its value from the selected element.

**Value Combo Box**

Use this combo box to add, edit, or select the value of an attribute. If the selected attribute has predefined values in the schema, the drop-down list displays those possible values. You can use the **Browse** button to select a URL for the value of an attribute. After you have entered or selected a value, use the **Update** button (or press **Enter**) to add the value to the attribute.

**Contextual Menu Actions in the Attributes View**

The following actions are available in the contextual menu of the **Attributes** view when editing in **Author** mode:

**Set empty value**

Specifies the current attribute value as empty.
Remove

Removes the attribute (action available only if the attribute is specified). You can invoke this action by pressing the (Delete) or (Backspace) keys.

Copy

Copies the attrName="attrValue" pair to the clipboard. The attrValue can be:

- The value of the attribute.
- The value of the default attribute, if the attribute does not appear in the edited document.
- Empty, if the attribute does not appear in the edited document and has no default value set.

Paste

Depending on the content of the clipboard, the following cases are possible:

- If the clipboard contains an attribute and its value, both of them are introduced in the Attributes view. The attribute is selected and its value is changed if they exist in the Attributes view.
- If the clipboard contains an attribute name with an empty value, the attribute is introduced in the Attributes view and you can start editing it. The attribute is selected and you can start editing it if it exists in the Attributes view.
- If the clipboard only contains text, the value of the selected attribute is modified.

In-place Attributes Editor

Oxygen XML Editor includes an in-place attributes editor in Author mode. To edit the attributes of an XML element in-place, do one of the following:

- Select an element or place the cursor inside it and then press the Alt + Enter keyboard shortcut.
- Double-click any named start tag when the document is edited in one of the following display modes: Full Tags with Attributes, Full Tags, Block Tags, or Inline Tags.

This opens an in-place attributes editor that contains the same content as the Attributes view. By default, this editor presents the Name and Value fields, with the list of all the possible attributes collapsed.

![In-place Attributes Editor](image)

**Figure 82: In-place Attributes Editor**

Name Combo Box

Use this combo box to select an attribute. The drop-down list displays the list of possible attributes allowed by the schema of the document, as in the Attributes view.

Value Combo Box

Use this combo box to add, edit, or select the value of an attribute. If the selected attribute has predefined values in the schema, the drop-down list displays those possible values.

If you click More while in the collapsed version, it is expanded to the full version of the in-place attribute editor.
The full version includes a table grid, similar to the Attributes view, that presents all the attributes for the selected element.

**Model View**

The Model view presents the structure of the currently selected tag, and its documentation, defined as annotation in the schema of the current document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the Window > Show View menu.

**Figure 84: Model View**

The Model view is comprised of two sections, an element structure panel and an annotations panel.
Element Structure Panel

The element structure panel displays the structure of the currently edited or selected tag in a tree-like format. The information includes the name, model, and attributes of the current tag. The allowed attributes are shown along with imposed restrictions, if any.

Figure 85: Element Structure Panel

Annotation Panel

The Annotation panel displays the annotation information for the currently selected element. This information is collected from the XML schema.

Figure 86: Annotation panel

Elements View in Author Mode

The Elements view presents a list of all defined elements that are valid at the current cursor position according to the schema associated to the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the Window > Show View menu.

The upper part of the view features a combo box that contains the ordered ancestors of the current element. Selecting a new element in this combo box updates the list of the allowed elements. By default, only the elements that are allowed at the current cursor position are listed. However, if the Show only items allowed at cursor position option is disabled in the Views preferences page, two additional tabs (Before and After) will be displayed at the bottom of the view and they list elements that are allowed before or after the element at the current cursor position.

Double-clicking any of the listed elements inserts that element into the edited document and its position depends on the tab.

- **Cursor** tab - Double-clicking an element inserts it at the current cursor position.
- **Before** tab - Double-clicking an element inserts it before the element at the cursor position.
- **After** tab - Double-clicking an element inserts it after the element at the cursor position.
Entities View

Entities provide abbreviated entries that can be used in XML files when there is a need of repeatedly inserting certain characters or large blocks of information. An entity is defined using the ENTITY statement either in the DOCTYPE declaration or in a DTD file associated with the current XML file.

There are three types of entities:

- **Built-in or Predefined** - Entities that are part of the predefined XML markup (\&lt;\;\&gt;\;\&amp;\;\&apos;\;\&quot;).
- **Internal** - Defined in the DOCTYPE declaration header of the current XML.
- **External** - Defined in an external DTD module included in the DTD referenced in the XML DOCTYPE declaration.

**Note:** If you want to add internal entities, you would need to switch to the Text editing mode and manually modify the DOCTYPE declaration. If you want to add external entities, you need to open the DTD module file and modify it directly.

The Entities view displays a list with all entities declared in the current document, as well as built-in ones. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

Double-clicking one of the entities will insert it at the current cursor position in the XML document. You can also sort entities by name and value by clicking the column headers.

**Figure 88: Entities View**

The view features a filtering capability that allows you to search an entity by name, value, or both. Also, you can choose to display the internal or external entities.
Note: When entering filters, you can use the ? and * wildcards. Also, you can enter multiple filters by separating them with a comma.

Results View

The Results view displays the messages generated as a result of user actions such as validations, transformations, search operations, and others. Each message is a link to the location related to the event that triggered the message. Double-clicking a message opens the file containing the location and positions the cursor at the location offset. The Results view is automatically opened when certain actions generate result messages. Those actions include the following:

- Validation actions
- Transformation actions
- Check Spelling in Files action
- Find All action from the Find/Replace dialog box
- Find/Replace in Files dialog box
- Search References action
- XPath expression results
- SQL results

![Figure 89: Results View](image)

Results View Toolbar Actions

The view includes a toolbar with the following actions:

- Grouping options drop-down menu
  A set of Group by toggle actions that allow you to group the messages according to a selected criteria so that they can be presented in a hierarchical layout. The criteria used for grouping can be the severity of the errors (error, warning, info message, etc.), the resource name, the description of the message, and so on.

  This drop-down menu also includes the following additional grouping actions:

  - Ungroup all
    Removes the grouping rules so that the messages are presented in a continuous list.

  - Show group columns
    If any of the Group by options are selected, you can use this option to show or hide grouping columns.

  - Restore Defaults
    Restores the column size for each column and the grouping rules that were saved in the user preferences the last time when this view was used. If it is the first time this view is used, the action sets an initial default column size for each column and a grouping rule that is appropriate for the type of messages. For example:

    - Group the messages by the path of the validated file if there are error messages from a validation action or spelling errors reported by the Check Spelling in Files action.
    - No grouping rule for the results of applying an XPath expression.
Highlight all results in editor

Oxygen XML Editor highlights all matches obtained after executing an XPath expression, or performing one of the following operations: Find All, Find in Files, Search References, and Search Declarations. Click Highlight all results in editor again to turn off highlighting.

Note: To customize highlighting behavior, open the Preferences dialog box (Options > Preferences) and go to Editor > Highlights category. You can do the following customizations:

• Set a specific color of the highlights depending on the type of action you make.
• Set a maximum number of highlights that the application displays at any given time.

Remove selected
Removes the current selection from the view. This can be helpful if you want to reduce the number of messages or remove those that have already been addressed or not relevant to your task.

Remove all
Removes all messages from the view.

Results View Contextual Menu Actions

The following actions are available when the contextual menu is invoked in this view:

Show message
Displays a dialog box with the full error message, which is useful for a long message that does not have enough room to be displayed completely in the view.

Previous message
Navigates to the message above the current selection.

Next message
Navigates to the message below the current selection.

Remove selected
Removes selected messages from the view.

Remove all
Removes all messages from the view.

Copy
Copies the information associated with the selected messages:

• The file path of the document that triggered the output message.
• The path of the main file (in the case of a validation scenario, it is the path of the file from which the validation starts and can be different from the validated file).
• Error severity (error, warning, info message, etc.)
• Name of validating processor.
• Name of validation scenario.
• The line and column in the file that triggered the message.

Select All
Extends the selection to all the messages from the view.

Print Results
Sends the complete list of messages to a printer. For each message the included details are the same as the ones for the Copy action.

Save Results
Saves the complete list of messages in a file in text format. For each message the included details are the same as the ones for the Copy action.
Save Results as XML
Saves the complete list of messages in a file in XML format. For each message the included details are the same as the ones for the Copy action.

Group by
A set of Group by toggle actions that allow you to group the messages according to a selected criteria so that they can be presented in a hierarchical layout. The criteria used for grouping can be the severity of the errors (error, warning, info message, etc.), the resource name, the description of the message, and so on.

Ungroup all
Removes the grouping rules so that the messages are presented in a continuous list.

Show group columns
If any of the Group by options are selected, you can use this option to show or hide grouping columns.

Restore Defaults
Restores the column size for each column and the grouping rules that were saved in the user preferences the last time when this view was used. If it is the first time this view is used, the action sets an initial default column size for each column and a grouping rule that is appropriate for the type of messages. For example:

- Group the messages by the path of the validated file if there are error messages from a validation action or spelling errors reported by the Check Spelling in Files action.
- No grouping rule for the results of applying an XPath expression.

Expand All
Expands all the nodes of the tree, which is useful when the messages are presented in a hierarchical mode.

Collapse All
Collapses all the nodes of the tree, which is useful when the messages are presented in a hierarchical mode.

CSS Inspector View
The purpose of the CSS Inspector view is to display information about the styles applied to the currently selected element. You can use this view to examine the structure and layout of the CSS rules that match the element. The matching rules displayed in this view include a link to the line in the CSS file that defines the styles. With this tool you can see how the CSS rules were applied and the properties defined, and use the link to open the associated CSS for editing purposes.

![Figure 90: CSS Inspector View](image)
Displaying the CSS Inspector View

You can open this view by selecting the **Inspect Styles** action from the contextual menu in **Author** mode, or selecting the **CSS Inspector** view in the **Window > Show View** menu. This action makes the view visible and also initializes it for the currently selected element.

Displaying Rules

All rules that apply to the current element are displayed in sections, which are listed in order of importance (from most specific to least specific). Rules that are overridden by other rules are crossed out. If you click the link in the top-right corner of a rule Oxygen XML Editor opens the associated CSS file at the line number where the properties of the rule are defined.

![CSS Link](test.css:33)

![Override Rule](Override Rule)

**Figure 91: CSS Inspector View - Displaying Rules**

The **CSS Inspector** view contains five tabs:

- **Element** - Displays the CSS rules matching the currently selected element in the **Author** page (ordered from most-specific to least-specific).
- **:before** - Displays the rules matching the :before pseudo-element.
- **:after** - Displays the rules matching the :after pseudo-element.
- **Computed** - Displays all the styling properties that apply to the current element, as a result of all the CSS rules matching the element.
- **Path** - Displays the path for the current element, and its attributes, allowing you to quickly see the attributes on all parent elements, and allows you to copy fragments from this view and paste it into the associated CSS to easily create new rules.

The information displayed in each of the five tabs is updated when you click other elements in the **Author** editing view. The first three tabs include the link to the associated CSS source, while the other two tabs simply display the style properties that match the current element.

Each of the tabbed panes include a contextual menu with the following actions:

- **Copy** - copies the current selection
- **Select all** - selects all information listed in the pane
- **Show empty rules** - forces the view to show all the matching rules, even if they do not declare any CSS properties (by default, the empty rules are not displayed)

Displaying the XML Markup (Tags)

You can control the amount of markup that is displayed in the **Author** mode with various levels of tag modes for both **block** and **in-line** elements.

The following dedicated tag modes are available from the **Tags Display Mode** drop-down menu (available on the toolbar):

- **Full Tags with Attributes**
  Displays full tag names with attributes for both block and in-line elements.
- **Full Tags**
  Displays full tag names without attributes for both block and in-line elements.
- **Block Tags**
  Displays full tag names for block elements and simple tags without names for in-line elements.
- **Inline Tags**
  Displays full tag names for in-line elements, while block elements are not displayed.
**Partial Tags**

Displays simple tags without names for in-line elements, while block elements are not displayed.

**No Tags**

No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

**Configure Tags Display Mode**

Use this option to go to the *Author preferences page* where you can configure the *Tags* options, such as the default *Tags display mode*, *Tags background color*, *Tags foreground color*, *Tags font*, and if Oxygen XML Editor should use a *Compact tag layout* for displaying the tags by trying to group consecutive block tags on the same line.

*Note:* The associated CSS information is used to determine whether a tag should be considered inline or block. If the current document does not have an associated CSS stylesheet, then the *Full Tags* mode will be used.

**Displaying Referenced Content**

The references to entities, XInclude, and DITA conrefs are expanded by default in *Author* mode and the referenced content is displayed. You can control this behavior from the *Author preferences page*. The referenced resources are loaded and displayed inside the element or entity that refers them, however the displayed content cannot be modified directly.

```xml
<x:include href="included.xml">
  <!-- Edit referenced content -->
  included paragraph
</x:include>
```

*Figure 92: XInclude reference*

```css
/* Edit entity referenced content */
:First::before{
  color:block;
  background-color:inherit;
  font-family:monospace;
  font-style:normal;
}
```

*Figure 93: External entity reference*

When the referenced resource cannot be resolved, an error will be presented inside the element that refers them instead of the content.

If you want to make modifications to the referenced content, you must open the referenced resource in an editor. The referenced resource can be opened quickly by clicking the link (marked with the 🖼 icon) that is displayed before the referenced content or by using the *Edit Reference* action from the contextual menu (in this case the cursor is placed at the precise location where the action was invoked in the main file). The referenced resource is resolved through the XML Catalog set in *Preferences*.

The referenced content is refreshed:

- Automatically, when it is modified and saved from Oxygen XML Editor.
- On demand, by using the *Refresh references action*. Useful when the referenced content is modified outside the Oxygen XML Editor scope.

**Visual Hints for the Cursor Position**

When the cursor is positioned inside a new context, a tooltip will be shown for a couple of seconds displaying the position of the cursor relative to the context of the current element.

Here are some of the common situations that can be encountered:

- **Before first block** - The cursor is positioned before the first block child of the current node.
• **Between two block elements** - The cursor is positioned between two block elements.

• **After last block** - The cursor is positioned after the last block element child of the current node.

• **Inside a node** - The cursor is positioned inside a node.

• **Before an inline element** - The cursor is positioned inside an element, before an inline child element.

• **Between two inline elements** - The cursor is positioned between two inline elements.

• **After an inline element** - The cursor is positioned inside an element, after an inline child element.

The nodes in these cases are displayed in the tooltip window using the element names.

To deactivate this feature, open the **Preferences** dialog box (Options > Preferences), go to **Author > Cursor Navigation**, and disable the **Show cursor position tooltip option**. Even if this option is disabled, you can trigger the display of the position tooltip by pressing Shift+F2.

Note: The position information tooltip is not displayed if **Full Tags with Attributes** or **Full Tags** is selected in the **Tags display mode drop-down menu**.

**Location Tooltip**

When editing XML documents in a visual environment, you might find it difficult to position the cursor between certain tags that do not have a visual representation. To counterbalance this, Oxygen XML Editor displays a transparent preview of the position information, called the **Location Tooltip**:

![Figure 94: Location Tooltip](image-url)
Oxygen XML Editor displays a *Location Tooltip* when the following conditions are met:

- You are editing the document in one of the following *tags display modes*: Inline Tags, Partial Tags, No Tags.
- The mouse pointer is moved between block elements.

To activate or deactivate this feature, use the *Show location tooltip on mouse move option* in the *Cursor Navigation preferences page*.

**Presenting Validation Errors in Author Mode**

Oxygen XML Editor can be configured to *automatically validate documents* while editing in the *Author* mode, and actions are also available to *manually validate documents* on-request.

Validation issues are marked in *Author* mode with a colored underline in the editing pane and a colored marker in the right vertical stripe, according to the type of issue. You can configure the color for each type in the *Document Checking preferences page*.

- **Validation Errors** - By default, underlined with a red squiggly line in the editing pane and a red marker in the right vertical stripe.
- **Validation Warnings** - By default, underlined with a yellow squiggly line in the editing pane and a yellow marker in the right vertical stripe.
- **Validation Info** - By default, underlined with a blue squiggly line in the editing pane and a blue marker in the right vertical stripe.

Hovering over a validation issue presents a tooltip message with more details about the problem and *possible quick fixes* (if available for that issue).

Information about the issue is also displayed in the message area on the bottom of the editor panel (clicking the *Document checking options* button opens the *Document Checking preferences page* where you can configure some validation options (such as the colors used to present the validation issues). Some validation messages include an icon (‡) that provides a link to a style guide or specification.

![Figure 95: Presenting Validation Errors in Author Mode](image)

Also, the vertical stripe on the right side of the editor panel is designed to display the errors found during the validation process and to help you locate them in the document. The stripe contains the following:

**Upper Part of the Stripe**

By default, a success indicator square will turn green if the validation is successful or if only validation info messages are found, red if validation errors are found, or yellow if only validation warnings are found. More details about the issues are displayed in a tool tip when you hover over indicator square. If there are numerous issues, only the first three are presented in the tool tip.

**Middle Part of the Stripe**

By default, errors are depicted with red markers, warnings with yellow markers, and info messages with blue markers. If you want to limit the number of markers that are displayed, *open the Preferences dialog box (Options > Preferences)*, go to *Editor > Document checking*, and specify the desired limit in the *Maximum number of validation highlights* option.
Clicking a marker will highlight the corresponding text area in the editor. The validation message is also displayed both in a tool tip (when hovering over the marker) and in the message area on the bottom of the editor panel (clicking the Document checking options button opens the Document checking preferences page where you can configure some validation options.

**Bottom Part of the Stripe**

Two navigation arrows (.between) allow you to jump to the next or previous issue. The same actions can be triggered from Document > Automatic validation > Next error (Ctrl + Period (Command + Period on OS X)) and Document > Automatic validation > Previous error (Ctrl + Comma (Command + Comma on OS X)). Also, the button can be used to clear all the validation markers.

Status messages from every validation action are also logged in the Information view.

If you want to see all the validation messages grouped in the Results panel, you should use the Validate action from the toolbar or Document > Validate menu.

**Whitespace Handling in Author Mode**

When you edit a document in Author mode, Oxygen XML Editor must serialize the resulting document as XML. Oxygen XML Editor serializes the document when you save it or switch to another editing mode. When the document is serialized, Oxygen XML Editor formats and indents the XML document according to the current format and indent settings.

**Minimizing whitespace differences between versions**

When serializing a document to XML, Author mode will only format and indent those elements of the document that have been edited. Any element that has not been edited will be serialized exactly as it was loaded from disk. This is useful when your content is managed in a version control systems, as it avoids introducing insignificant whitespace differences between version, which in turn makes diff output easier to read.

**Entering whitespace in Author mode**

Oxygen XML Editor controls the entry of whitespace characters in Author mode according the XML whitespace rules, which means it will not let you insert insignificant whitespace. This means that it will not let you insert extra line-breaks or spaces inside a typical paragraph element, for instance. (Any such whitespace would be normalized away when the document was serialized to XML, so Oxygen XML Editor is saving you from any surprises when this happens.)

Of course, you will legitimately want to enter additional spaces and returns in some cases, such as code samples. Oxygen XML Editor will allow this in elements that are configured as preserve space elements according to the XML whitespace rules. For all of its predefined document types, Oxygen XML Editor is correctly configured to recognize preserve space elements and to allow you to enter additional spaces in them.

If you are using a predefined document type and you are unable to enter additional whitespace, make sure that you are using an element from that document type that is intended to be a preserve-space element.

If you are using a custom document type, make sure that it is configured correctly so that Oxygen XML Editor recognizes that the current element is a preserve-space element.

**Bidirectional Text Support in Author Mode**

Oxygen XML Editor offers support for languages that require right to left scripts. This means that authors editing documents in the Author mode can create and edit XML content in Arabic, Hebrew, Persian and others. To achieve this, Oxygen XML Editor implements the Unicode Bidirectional Algorithm, as specified by the Unicode consortium. The text arrangement is similar to what you get in a modern HTML browser. The final text layout is rendered according to the directional CSS properties matching the XML elements and the Unicode directional formatting codes.

By default, when navigating bidirectional text with the arrow keys in Author mode, pressing the right arrow key moves the cursor in the writing direction and the left arrow moves it in the opposite direction. However, if the Arrow keys move the cursor...
The writing direction option in the Cursor Navigation preferences page is disabled, pressing the right arrow will simply move the cursor to the right (and the left arrow moves it to the left), regardless of the text direction.

If bidirectional text (such as Arabic or Hebrew languages), certain Asian languages (such as Devanagari, Bengali, Gurmukhi, Gujarati, Oriya, Tamil, Telugu, Kannada, Malayalam, Sinhala, Thai, Khmer) or other special characters (such as combining characters), are detected in a document, Oxygen XML Editor displays a Special Characters Detected dialog box that prompts you to Enable or Disable support for these special characters.

To watch our video demonstration about the bidirectional text support in the Author mode, go to https://www.oxygenxml.com/demo/BIDI_Support.html.

Tip: If you experience performance issues when editing documents that contain bidirectional text, you could try one of the following solutions:

- The Eclipse plugin distribution of Oxygen XML Editor is faster than the standalone version when working with bidirectional text.
- Changing the font. For example, you could try using the David font in Hebrew content. If it is not already installed in your operating system, this font is available at: https://www.microsoft.com/typography/fonts/family.aspx?FID=234. To change the font in Oxygen XML Editor, open the Preferences dialog box (Options > Preferences), go to Appearance > Fonts, and change the font in the Author default font option.

Controlling the Text Direction Using XML Markup

Oxygen XML Editor Supports the following CSS properties:

**Table 6: CSS Properties Controlling Text Direction**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>direction</td>
<td>Specifies the writing direction of the text. The possible values are ltr (the text direction is left to right), rtl (the text direction is right to left), and inherit (the direction property is inherited from the parent element).</td>
</tr>
<tr>
<td>unicodeBidi</td>
<td>Used along with the direction property to create levels of embedded text with different text directions in the same document. The possible values of this property are bidi-override (creates an additional level of embedding and forces all strong characters to the direction specified in the direction), embed (creates an additional level of embedding), normal (does not use an additional level of embedding), and inherit (the value of the unicodeBidi property is inherited from parent element).</td>
</tr>
</tbody>
</table>

For instance, to declare an element as being Right to Left, you could use a stylesheet like the one below:

**XML File:**

```xml
<article>
  <myRTLpara>RIGHT TO LEFT TEXT</myRTLpara>
</article>
```

**Associated CSS File:**

```css
.myRTLpara{
  direction:rtl;
  unicode-bidi:embed;
}
```

Oxygen XML Editor recognizes the dir attribute on any XML document. The supported values are:

<table>
<thead>
<tr>
<th>value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ltr</td>
<td>The text from the current element is Left to Right, embedded.</td>
</tr>
</tbody>
</table>
The text from the current element is Right to Left, embedded.

The text from the current element is Left to Right, embedded.

The text from the current element is Right to Left, embedded.

The following XML document types make use of the `dir` attribute with the above values:

- DITA
- DocBook
- TEI
- XHTML

Note: When the inline element tags are visible, the text in the line is arranged according to the BIDI algorithm after replacing the tags symbols with Object Replacement Characters. This makes it possible to get a different text arrangement when viewing a document in the No Tags mode versus viewing it in the Full Tags mode.

Controlling the Text Direction Using the Unicode Direction Formatting Codes

These Unicode Direction Formatting Codes codes can be embedded in the edited text, specifying a text direction and embedding. However, it is not recommended to use them in XML as they are zero width characters, making it hard to debug the text arrangement.

Table 7: Directional Formatting Codes

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
<th>Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td>U+202A (LRE)</td>
<td>LEFT-TO-RIGHT EMBEDDING</td>
<td>Treats the following text as embedded left-to-right.</td>
</tr>
<tr>
<td>U+202B (RLE)</td>
<td>RIGHT-TO-LEFT EMBEDDING</td>
<td>Treats the following text as embedded right to left.</td>
</tr>
<tr>
<td>U+202D (LRO)</td>
<td>LEFT-TO-RIGHT OVERRIDE</td>
<td>Forces the following characters to be treated as strong left-to-right characters.</td>
</tr>
<tr>
<td>U+202E (RLO)</td>
<td>RIGHT-TO-LEFT OVERRIDE</td>
<td>Forces the following characters to be treated as strong right-to-left characters.</td>
</tr>
<tr>
<td>U+202C (PDF)</td>
<td>POP DIRECTIONAL FORMATTING CODE</td>
<td>Restores the bidirectional state to what it was before the last LRE, RLE, RLO, or LRO.</td>
</tr>
<tr>
<td>U+200E (LRM)</td>
<td>LEFT-TO-RIGHT MARK</td>
<td>Left-to-right strong zero-width character.</td>
</tr>
<tr>
<td>U+200F (RLM)</td>
<td>RIGHT-TO-LEFT MARK</td>
<td>Right-to-left strong zero-width character.</td>
</tr>
</tbody>
</table>

To insert Unicode Direction Formatting Codes, use the Character Map dialog box. To easily find such a code, you can either enter directly the hexadecimal value, or use the Details tab to enter the codes name.

Oxygen XML Editor offers the support for bi-directional text in all the side views (Outline view, Attributes view and so on) and text fields.

Design Editing Mode (XML Schema Diagram Editor)

XML Schemas enable document designers to specify the allowed structure and content of an XML document and to check if an XML document is valid.
Oxygen XML Editor provides a simple and expressive XML Schema diagram editor (Design mode) for editing XML Schemas. The schema diagram helps both the content authors who want to understand a schema and schema designers who develop complex schemas.

The diagram font can be increased using the usual Oxygen XML Editor shortcuts: (Ctrl (Meta on Mac OS) + "+") , (Ctrl (Meta on Mac OS)+"-") , (Ctrl (Meta on Mac OS) + 0) or (Ctrl (Meta on Mac OS) - mouse wheel). The whole diagram can also be zoomed with one of the predefined factors available in the Schema preferences panel. The same zoom factor is applied for the print and save actions.

Figure 96: XML Schema Diagram

To watch our video demonstration about the basic aspects of designing an XML Schema using the new Schema Editor, go to https://www.oxygenxml.com/demo/XML_Schema_Editing.html.

Navigation in the XML Schema Design Mode

The following editing and navigation features work for all types of schema components in the XML Schema Design mode:

• Select consecutive components on the diagram (components from the same level) using the Shift key. You can also make discontinuous selections in the schema diagram using the Ctrl (Meta on Mac OS) key. To deselect one of the components, use Ctrl + Single-Click (Command + Single-Click on OS X).

• Use the arrow keys to navigate the diagram vertically and horizontally.

• Use Home/End keys to jump to the first/last component from the same level. Use Ctrl + Home (Command + Home on OS X) key combination to go to the diagram root and Ctrl + End (Command + End on OS X) to go to the last child of the selected component.

• You can easily go back to a previously visited component while moving from left to right. The path will be preserved only if you use the left arrow key or right arrow key. For example, if the current selection is on the second attribute from an attribute group and you press the left arrow key to jump to the attribute group, when you press the right arrow key, then the selection will be moved to the second attribute.

• Go back and forward between components viewed or edited in the diagram by selecting them in the Outline view:
  - Back (go to previous schema component).
  - Forward (go to next schema component).
  - Go to Last Modification (go to last modified schema component).

• Copy, reference, or move global components, attributes, and identity constraints to another position and from one schema to another using the Cut/Copy and Paste/Paste as Reference actions.

• Go to the definition of an element or attribute with the Show Definition action.

• Search in the diagram using the Find/Replace dialog box or the Quick find toolbar. You can find/replace components only in the current file scope.

• You can expand and see the contents of the imports/includes/defines in the diagram. In order to edit components from other schemas the schema for each component will be opened as a separate file in Oxygen XML Editor.

  Tip: If an XML Schema referenced by the current opened schema was modified on disk, the change will be detected and you will be asked to refresh the current schema contents.

• Recursive references are marked with a recurse symbol (recurse symbol). Click this symbol to navigate between the element declaration and its reference.

Figure 97: Recursive Reference

XML Schema Outline View

The Outline view for XML Schemas presents all the global components grouped by their location, namespace, or type. By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened from the Window > Show View menu.
The **Outline** view provides the following options in the ▽ **Settings** menu on the **Outline** view toolbar:

### Filter returns exact matches

The text filter of the **Outline** view returns only exact matches;

### Selection update on cursor move

Allows a synchronization between **Outline** view and schema diagram. The selected view from the diagram is also selected in the **Outline** view.

### Sort

Allows you to sort alphabetically the schema components.

### Show all components

Displays all components that were collected starting from the main files. Components that are not referable from the current file are marked with an orange underline. To reference them, add an import directive with the `componentNS` namespace.

### Show referable components

Displays all components (collected starting from the main files) that can be referenced from the current file. This option is set by default.

### Show only local components

Displays the components defined in the current file only.

### Group by location/namespace/type

These three operations allow you to group the components by location, namespace, or type. When grouping by namespace, the main schema target namespace is the first presented in the **Outline** view.

The following contextual menu actions are available in the **Outline** view:

**Remove (Delete)**

Removes the selected item from the diagram.

**Search References (Ctrl (Meta on Mac OS)+Shift+R)**

Searches all references of the item found at current cursor position in the defined scope, if any.
**Search References in**
Searches all references of the item found at current cursor position in the specified scope.

**Component Dependencies (Ctrl (Meta on Mac OS)+Shift+F4)**
Allows you to see the dependencies for the current selected component.

**Resource Hierarchy (F4)**
Allows you to see the hierarchy for the current selected resource.

**Resource Dependencies (Shift + F4)**
Allows you to see the dependencies for the current selected resource.

**Rename Component in**
Renames the selected component.

**Generate Sample XML Files**
Generate XML files using the current opened schema. The selected component is the XML document root.

The upper part of the Outline view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (*, ?) and separate multiple patterns with commas.

**Tip:** The search filter is case insensitive. The following wildcards are accepted:
- * - any string
- ? - any character
- , - patterns separator

If no wildcards are specified, the string to search will be searched as a partial match.

The content of the Outline view and the editing area are synchronized. When you select a component in the Outline view, its definition is highlighted in the editing area.

- *Editing Relax NG Schema in the Master Files Context* on page 614

**XML Schema Attributes View**
The Attributes view for XML Schemas presents the properties for the selected component in the schema diagram. By default, it is displayed on the right side of the editor. If the view is not displayed, it can be opened from the Window > Show View menu.
The default value of a property is presented in the Attributes view with blue foreground. The properties that can not be edited are rendered with gray foreground. A non-editable category that contains at least one child is rendered with bold. Bold properties are properties with values set explicitly to them.

Properties for components that do not belong to the current edited schema are read-only but if you double-click them you can choose to open the corresponding schema and edit them.

You can edit a property by double-clicking by pressing Enter. For most properties you can choose valid values from a list or you can specify another value. If a property has an invalid value or a warning, it will be highlighted in the table with the corresponding foreground color. By default, properties with errors are highlighted with red and the properties with warnings are highlighted with yellow. You can customize these colors from the Document checking user preferences.

For imports, includes and redefines, the properties are not edited directly in the Attributes view. A dialog box will open that allows you to specify properties for them.

The schema namespace mappings are not presented in Attributes view. You can view/edit these by choosing Edit Schema Namespaces from the contextual menu on the schema root. See more in the Edit Schema Namespaces section.

The Attributes view has five actions available on the toolbar and also on the contextual menu:

- **Add**
  Allows you to add a new member type to an union's member types category.

- **Remove**
  Allows you to remove the value of a property.

- **Move Up**
  Allows you to move up the current member to an union's member types category.

- **Move Down**
  Allows you to move down the current member to an union's member types category.

- **Copy**
  Copy the attribute value.

- **Show Definition** <Ctrl (Meta on MAC OS) + Click>
  Shows the definition for the selected type.

- **Show Facets**
  Allows you to edit the facets for a simple type.
XML Schema Facets View

The **Facets** view for XML Schemas presents the facets for the selected component, if available. If the view is not displayed, it can be opened from the **Window > Show View** menu.

The default value of a facet is rendered in the **Facets** view with a blue color. The facets that cannot be edited are rendered with a gray color. The grouping categories (for example: **Enumerations** and **Patterns**) are not editable. If these categories contain at least one child they are rendered with bold. Bold facets are facets with values set explicitly to them.

**Important:** Usually inherited facets are presented as default in the **Facets** view but if patterns are inherited from a base type and also specified in the current simple type only the current specified patterns will be presented. You can see the effective pattern value obtained by combining the inherited and the specified patterns as a tooltip on the **Patterns** category.

Facets for components that do not belong to the current edited schema are read-only but if you double-click them you can choose to open the corresponding schema and edit them.

You can edit a facet by double-clicking it or by pressing Enter, when that facet is selected. For some facets you can choose valid values from a list or you can specify another value. If a facet has an invalid value or a warning, it will be highlighted in the table with the corresponding foreground color. By default, facets with errors are presented with red and the facets with warnings with yellow. You can customize the error colors from the **Document Checking user preferences**.

The **Facets** view provides the following actions in its toolbar and contextual menu:

- **Add**
  
  Allows you to add a new enumeration or a new pattern.

- **Remove**
  
  Allows you to remove the value of a facet.

**Edit Annotations**

- Allows you to edit an annotation for the selected facet.

- **Move Up**
  
  Allows you to move up the current enumeration/pattern in **Enumerations/Patterns** category.

- **Move Down**
  
  Allows you to move down the current enumeration/pattern in **Enumerations/Patterns** category.

- **Copy**
  
  Copy the attribute value.

**Open in Regular Expressions Builder**

- Rather than editing regular expressions manually, this action allows you to open the pattern in the **XML Schema Regular Expressions Builder** that guides you through the process of testing and constructing the pattern.

Facets can be fixed to prevent a derivation from modifying its value. To fix a facet value just press the **Pin** button.

---

**Editing Modes**
XML Schema Palette View

The Palette view is designed to offer quick access to XML Schema components and to improve the usability of the XML Schema diagram builder. You can use the Palette to drag and drop components in the Design mode. The components offered in the Palette view depend on the XML schema version set in the XML Schema preferences page. If the view is not displayed, it can be opened from the Window > Show View menu.

Components are organized functionally into 4 collapsible categories:

- Basic components: elements, group, attribute, attribute group, complex type, simple type, type alternative.
- Compositors and Wildcards: sequence, choice, all, any, any attribute, open content.
- Directives: import, include, redefine, override.
- Identity constraints: key, keyref, unique, selector, field, assert.

Note: The type alternative, open content, override, and assert components are available for XML Schema 1.1.

To add a component to the edited schema:

- Click and hold a graphic symbol from the Palette view, then drag the component into the Design view.
- A line dynamically connects the component with the XML schema structure.
- Release the component into a valid position.

Note: You cannot drop a component into an invalid position. When you hover the component into an invalid position, the mouse cursor changes its shape into . Also, the connector line changes its color from the usual dark gray to the color defined in the Validation error highlight color option (default color is red).

Chapter 7

Editing Documents

Topics:

- Working with Unicode
- Creating and Working with Documents
- Using Projects to Group Documents
- Editing XML Documents
- Editing XSLT Stylesheets
- Editing Ant Build Files
- Editing XML Schemas
- Editing XQuery Documents
- Editing WSDL Documents
- Editing CSS Stylesheets
- Editing LESS CSS Stylesheets
- Editing Relax NG Schemas
- Editing NVDL Schemas
- Editing JSON Documents
- Editing StratML Documents
- Editing XLIFF Documents
- Editing JavaScript Documents
- Editing XProc Scripts
- Editing Schematron Schemas
- Editing Schematron Quick Fixes
- Editing SVG Files
- Editing XHTML Documents
- Editing Markdown Documents
- Spell Checking
- AutoCorrect Misspelled Words
- Loading Large Documents
- Scratch Buffer
- Handling Read-Only Files
- Editing Documents with Long Lines
- XML Digital Signatures
- Compare Files or Directories

This chapter includes a large amount of information about editing numerous types of documents, how to create and work with documents, working with projects, and various editing features that are provided in Oxygen XML Editor. Each type of document has unique features and options when editing them in Oxygen XML Editor, while some editing features are available for all document types. This chapter also includes information about some of the special tools that are included in Oxygen XML Editor, such as the file and directory comparison tools.
Working with Unicode

Unicode provides a unique number for every character, independent of the platform and language. Unicode is an internationally recognized standard, adopted by industry leaders. The Unicode is required by modern standards (such as XML, Java, JavaScript, LDAP, CORBA 3.0, WML, etc.) and is the official way to implement ISO/IEC 10646.

It is supported in many operating systems, all modern browsers, and many other products. The emergence of the Unicode Standard, and the availability of tools supporting it, are among the most significant recent global software technology trends. Incorporating Unicode into client-server or multiple-tiered applications and websites offers significant cost savings over the use of legacy character sets.

As a modern XML Editor, Oxygen XML Editor provides support for the Unicode standard enabling your XML application to be targeted across multiple platforms, languages, and countries without re-engineering. Internally, the Oxygen XML Editor uses 16 bit characters covering the Unicode Character set.

As a Java application, Oxygen XML Editor includes a default Java input method for typing characters with Unicode codes. However, the default input method does not cover all the Unicode codes (for example, the codes for some accented characters or characters found in East Asian languages). Such characters can be inserted in the editor panel of Oxygen XML Editor either with the Character Map dialog box available from menu Edit > Insert from Character Map or by installing a Java input method that supports the insertion of the needed characters. The installation of a Java input method depends on the platform (Windows, Mac OS X, Linux, etc.) and is the same for any Java application.

Note: Oxygen XML Editor may not be able to display characters that are not supported by the operating system (either not installed or unavailable).

Tip: On windows, you can enable the support for CJK (Chinese, Japanese, Korean) languages from Control Panel / Regional and Language Options / Languages / Install files for East Asian languages.

Opening and Saving Documents with Unsupported Characters

When loading documents, Oxygen XML Editor reads the document prolog to determine the specified encoding type. This encoding is then used to instruct the Java Encoder to load support for and to save the document using the specified code chart. When the encoding type cannot be determined, Oxygen XML Editor prompts and display the Available Java Encodings dialog box that provides a list of all encodings supported by the Java platform.

If the opened document contains an unsupported character, Oxygen XML Editor applies the policy specified for handling such errors. If the policy is set to REPORT, Oxygen XML Editor displays an error dialog box with a message about the character not allowed by the encoding. If the policy is set to IGNORE, the character is removed from the document displayed in the editor panel. If the policy is set to REPLACE, the character is replaced with a standard replacement character for that encoding.

While in most cases you are using UTF-8, simply changing the encoding name causes the application to save the file using the new encoding.

When saving a document edited in the Text, Grid, or Design modes, if it contains characters not included in the encoding declared in the document prolog, Oxygen XML Editor detects the problem and signals it to the user. The user is responsible to resolve the conflict before saving the document.

When saving a document edited in the Author mode, all characters that fall outside the detected encoding will be automatically converted to hexadecimal character entities.

To edit documents written in Japanese or Chinese, change the font to one that supports the specific characters (a Unicode font). For the Windows platform, Arial Unicode MS or MS Gothic is recommended. Do not expect WordPad or Notepad to handle these encodings. Use applications such as Internet Explorer or Word to examine XML documents.

When a document with a UTF-16 encoding is edited and saved in Oxygen XML Editor, the saved document has a byte order mark (BOM) that specifies the byte order of the document content. The default byte order is platform-dependent. That means that a UTF-16 document created on a Windows platform (where the default byte order mark is UnicodeLittle) has a different BOM than a UTF-16 document created on a Mac OS platform (where the byte order mark is UnicodeBig). The byte order and the BOM of an existing document are preserved when the document is edited and saved. This behavior can be changed in Oxygen XML Editor from the Encoding preferences panel.
Inserting Symbols

You can insert symbols by using the **Character Map** dialog box that can be opened with the **Edit > Insert from Character Map** action. If you have enabled the **Symbols toolbar**, you can also use the **Symbols** drop-down menu to insert some of the most commonly used symbols and selecting **More symbols** from that menu will also open the **Character Map** dialog box.

![Character Map Dialog Box](image)

**Figure 102: Character Map Dialog Box**

The **Character Map** dialog box allows you to visualize all characters that are available in a particular font, pick the character you need, and insert it in the document you are editing. It includes the following fields and sections:

**Font**

Use this drop-down list to choose the font for which you want to display characters.

**Unicode Block**

Use this drop-down list to only see a certain range of characters. This will filter the number of characters displayed, showing only a contiguous range of characters corresponding to the selected block. Unassigned characters are displayed as empty squares.

**Search**

Use this filter to search for a character by one of the following attributes:

- hexadecimal
- decimal
- description

**Note:** Selecting description opens the Details tab. If you enter a character description in the Search field, description is selected automatically.

**Character Table Section**

The characters that are available to be inserted are listed in two tabs:

- **Compact** - Matrix-like table that displays a visual representation of the characters.
- **Details** - Displays the available characters in a tabular format, presenting their decimal and hexadecimal value along with their description.
Recently Used Characters Section
Displays the symbols that you have used recently and you can also select one from there to insert it in the current document.

Character Mode Section
The next section of the dialog box allows you to select how you want the character to appear in the Text editing mode. You can choose between the following:

- Character
- Character entity - decimal
- Character entity - hexadecimal

You can see the character or code that will be inserted in Text mode next to the selections in this section and a box on the right side of the dialog box allows you to see the character that will be inserted in Author mode. You can also see the name and range name of a character either at the bottom of the dialog box, or in a tooltip when hovering the cursor over the character.

Press the Insert button to insert the selected character in the current editor at cursor position. You will see the character in the editor if the editor font is able to render it. The Copy button copies it to the clipboard without inserting it in the editor.

Note: The Character Map dialog box cannot be used to insert Unicode characters in the Grid editor. Accordingly, the Insert button of the dialog box will be disabled if the current document is edited in Grid mode.

Unicode Fallback Font Support
Oxygen XML Editor provides fonts for most common Unicode ranges. However, if you use special symbols or characters that are not included in the default fonts, they will be rendered as small rectangles. A fallback font is a reserve typeface that contains symbols for as many Unicode characters as possible. When a display system encounters a character that is not part of the range of any of the available fonts, Oxygen XML Editor will try to find that symbol in a fallback font.

Example of a Scenario Where a Fallback Font is Needed
Suppose that you need to insert the wheelchair symbol ((UINT16)\U+267F) into your content in a Windows operating system. By default, Oxygen XML Editor does not render this symbol correctly since it is not included in any of the default fonts. It is included in Segoe UI Symbol, but this font is not part of the default fonts that come with Oxygen XML Editor. To allow Oxygen XML Editor to recognize and render the symbol correctly, you can add Segoe UI Symbol as a fallback font.

Add a Fallback Font in Windows (7 or Later)
To add a fallback font to the Oxygen XML Editor installation, use the following procedure:

1. Start Windows Explorer and browse to the [OXYGEN_INSTALL_DIR]/jre/lib/fonts directory.
2. Create a directory called fallback (if it is not already there).
3. Copy a font file (True Type Font - TTF) that includes the special characters into this directory.

   Tip: You could, for example, copy the Segoe UI Symbol Regular font from C:\Windows\Fonts.

4. Restart Oxygen XML Editor for the changes to take full effect.

Result: Whenever Oxygen XML Editor finds a character that cannot be rendered using its standard fonts, it will look for the glyph in the fonts stored in the fallback folder.

Alternate Solution for Other Platforms
For Mac OS X or other platforms, you could use the following approach:

1. Use a font editor (such as FontForge) to combine multiple true type fonts into a single custom font.
2. Install the font file into the dedicated font folder of your operating system.
3. In Oxygen XML Editor, open the Preferences dialog box (Options > Preferences) and go to Appearance > Fonts.
4. Click the Choose button in the Editor option and select your custom font from the drop-down list in the subsequent dialog box.
5. Restart Oxygen XML Editor for the font changes to take full effect.
Creating and Working with Documents

Oxygen XML Editor includes various features, actions, and wizards to assist you with creating new files and working with existing files. This section explains many of these features, including information on creating new documents, opening, saving, and closing existing files, searching documents, viewing file properties, and more.

Creating New Documents and Templates

Oxygen XML Editor includes a handy New Document wizard that allows you to customize and create new files from a large list of document types and predefined new file templates. You can also create your own templates and share them with others.

New Document Wizard

Oxygen XML Editor supports a wide range of document types. The New Document wizard presents the default associations between a file extension and the type of editor that opens the file. To customize these default associations, open the Preferences dialog box (Options > Preferences) and go to File Types.

The New Document wizard only creates a skeleton document. It may contain a root element, the document prolog, and possibly other child elements depending on options that are specific for each schema type.

New Document Wizard

The New Document wizard allows you to create various types of documents and provides some options that help you to configure the new document. To use this wizard to create a new document in Oxygen XML Editor, follow these steps:

1. Click the New button on the toolbar or select File > New.

   **Result:** The New Document wizard is displayed and it groups the supported document types in the following categories:
   - **Recently Used** - Contains the list of the most recently used file types.
   - **New Document** - Contains the list of all supported document types. This list includes XML, XSL, XML Schema, Document Type Definition, Relax NG Schema, XQuery, web Services Definition Language, Schematron Schema, CSS, Text, PHP, JavaScript, Java, C, C++, Batch, Shell, Properties, SQL, XML Catalog, PERL, and more.
   - **Global Templates** - Contains the list of predefined templates as well as user-defined custom templates. You can create your own custom file templates and add them to the templates folder of the Oxygen XML Editor installation directory. You can also specify an additional directory to use for the templates in the Document Templates preferences page.
   - **Framework Templates** - Contains the list of templates defined in the Document Type configuration dialog box (Templates tab) for each framework.

2. Select the type of document that you want to create.

3. If you want to use the default settings in the creation process, select Create at the bottom of the dialog box.

   **Result:** The document is created using the default settings and the new file is opened in the appropriate editor.

4. If you want to configure properties before creating the file, select Customize. This action is available for XML, XML Schema, Schematron, and XSL documents.

   **Result:** A new file configuration dialog box is opened that allows you to customize various options, depending on the document type you selected. After configuring the options in this wizard, click Create to create the file and open it in the appropriate editor.
If you selected XML Document for the type of file you want to create and selected the Customize option, the configuration dialog box will include the following options:

- **Schema URL** - Specifies the path to the schema file. When you select a file, Oxygen XML Editor analyzes its content and tries to fill in the rest of the dialog box.
- **Schema Type** - Allows you to select the schema type. The following options are available: XML Schema, DTD, RelaxNG XML syntax, RelaxNG compact syntax, and NVDL.
- **Public ID** - Specifies the PUBLIC identifier declared in the document prolog.
- **Namespace** - Specifies the document namespace.
- **Prefix** - Specifies the prefix for the namespace of the document root.
- **Root Element** - Populated with elements defined in the specified schema, enables selection of the element used as document root.
- **Description** - A small description of the selected document root.
- **Add Optional Content** - If you select this option, the elements and attributes defined in the XML Schema as optional are generated in the skeleton XML document.
- **Add First Choice Particle** - If you select this option, Oxygen XML Editor generates the first element of an xs:choice schema element in the skeleton XML document. Oxygen XML Editor creates this document in a new editor panel when you click OK.
XSLT Stylesheet File Type

Figure 104: New XSLT Stylesheet Configuration Dialog Box

If you selected XSLT Stylesheet for the type of file you want to create and selected the Customize option, the configuration dialog box will include the following options:

- Stylesheet version - Allows you to select the Stylesheet version number. You can select from: 1.0, 2.0, and 3.0.
- Add documentation annotations - Enable this option to generate the stylesheet annotation documentation.

XML Schema File Type

Figure 105: New XML Schema Configuration Dialog Box

If you selected XML Schema for the type of file you want to create and selected the Customize option, the configuration dialog box will include the following options:

• XML Schema 1.0 - Sets the minVersion attribute to 1.0 and the maxVersion attribute to 1.1.
• XML Schema 1.1 - Sets the minVersion attribute to 1.1.
• Target namespace - Allows you to specify the schema target namespace.
• Namespace prefix declaration table - This table contains namespace prefix declarations. Table information can be managed using the + New and × Delete buttons.

Tip: For further details on how you can set the version of an XML Schema, go to Setting the XML Schema Version.

Schematron File Type

Figure 106: New Schematron Configuration Dialog Box

If you selected Schematron for the type of file you want to create and selected the Customize option, the configuration dialog box will include the following option:

• Schematron version - Specifies the Schematron version. Possible options: 1.5 (deprecated) and ISO.

Note: Starting with version 16.0 of Oxygen XML Editor, the support for Schematron 1.5 is deprecated. It is recommended to use ISO Schematron instead.

Creating New Document Templates

Oxygen XML Editor allows you to create your own custom document templates and they will appear in the Global templates folder (or another specified folder) within the New document wizard.

Creating a New Document Template

To create your own custom document template and have it appear in the new file wizard, follow these steps:

1. Create a new file (whatever type of document you need) and customize it to become a starting point for creating new files of this type.

   Tip: You can use editor variables in the template file content and they will be expanded when the files are opened.

2. Save the new file template in one of the following locations:
   • The templates directory of the Oxygen XML Editor installation directory ([OXYGEN_INSTALL_DIR]/templates). File templates saved in this directory will appear in the Global templates category in the New document wizard.
   • You can also use any other directory of your choice, but you must add that directory to the list of templates in the Document Templates preferences page. This user-defined directory will appear in the New document wizard with the new file templates that you save in it.

Attention: The name that you use to save the template will be the name that appears in the new file wizard, including capitalization, space, and characters (for example, My Custom Template1.xml will appear in the new file wizard as My Custom Template1).
3. Open the new file wizard (New toolbar button or File > New) and you should see your custom template in the appropriate folder. For DITA templates, they will also appear in the dialog box for creating new DITA topics from the DITA Maps Manager, but if you create a corresponding properties file (see the procedure below), you need to set the type property to dita.

Related information
Customizing Document Templates on page 244

Customizing Document Templates

Oxygen XML Editor allows you to customize certain aspects of predefined or custom document templates. For example, you can customize the icons or specify a prefix/suffix that will be used for the proposed file name in the New document wizard.

Customizing the Icons for a Document Template

If you want to customize the icons to be used for document templates, use a properties file to specify the icons using the following procedure:

1. Create a new properties file or edit an existing one.
   
   • If you create a new properties file, use the same name as the template file except with a .properties extension (for example, MyTemplate.properties). This properties file will specify the paths to the icons that will be used in the new file wizard. You can find some examples in the templates directory of the Oxygen XML Editor installation directory to help you get started.

   When defining the icons, the properties file should look like this:

   ```
   type=general
   smallIcon=../icons/Article_16.png
   bigIcon=../icons/Article_48.png
   ```

   **Important:** For DITA files, the type property needs to be set to dita. Otherwise, the template will not appear in the dialog box for creating new DITA topics from the DITA Maps Manager. For all other types of files, set it to general. The icons specified in this properties file will only be used for the new file wizards and not in any other part of the interface.

   **Note:** If you created a new template and chose to use a custom directory for the new template (in step 2 of the new template procedure), make sure the path to the icons is relative to that directory.

   • If you edit an existing template, simply define the icon paths as specified above.

2. Save the properties file in the same directory as the document template.

3. Open the new file wizard (File > New) and you should see your custom icons next to the document template in the appropriate folder.

Add a Prefix or Suffix to File Names for a Document Template

You can use a properties file for each document template to add a prefix or suffix to the file name that is proposed in certain dialog boxes when you create a new file from that template. This applies to the following new document dialog boxes:

• The new document dialog box that appears when you select New > File from the contextual menu in the Project view. The prefix or suffix is added to the name of the file in the File name field.

• For DITA files, it also applies to the new document dialog box that appears when you select Append Child > New or Insert After > New from the DITA Maps Manager. The prefix or suffix is added to the name of the file in the Save as field.

To add a prefix or suffix to the file names for a document template, follow these steps:

1. Create a new properties file or edit an existing one.

   • If you create a new properties file, use the same name as the template file except with a .properties extension (for example, MyTemplate.properties). This properties file will specify the prefix/suffix that will be used to propose the file name in the new file wizards.
When defining the prefix/suffix, the properties file should look something like this:

```properties
type=general
filenamePrefix=prod_
filenameSuffix=_test
```

**Important:** For DITA files, the `type` property needs to be set to `dita`. For all other types of files, set it to `general`.

- If you edit an existing template, simply define the prefix/suffix as specified above.

2. Save the properties file in the same directory as the document template.
3. Open the new document wizard (using the methods described above) and when you select the appropriate template, you should see your prefix or suffix in the file name that is proposed in that dialog box.

*Creating New Document Templates* on page 243

### Opening Documents

To open a document in Oxygen XML Editor, do one of the following:

- Go to *File > Open (Ctrl + O (Command + O on OS X))* or click the [Open](#) toolbar button to display the Open File dialog box. The start folder of the *Open* dialog box can be either the last folder visited by this dialog box or the folder of the currently edited file. This can be configured in the user preferences.
- Go to *File > Open URL* or click the [Open URL](#) toolbar button to display a dialog box that allows you to access any resource identified through a URL (defined by a protocol, host, resource path, and an optional port). The following actions are available in the drop-down action list:
  - [Browse for local file](#) - Opens a local file browser dialog box, allowing you to select a local DITA map.
  - [Browse for remote file](#) - Displays the Open URL dialog box that allows you to open a remotely stored DITA map.
  - [Browse for archived file](#) - Displays the Archive Browser dialog box that allows you to browse the content of an archive and choose a DITA map.
  - [Browse Data Source Explorer](#) - Opens the Data Source Explorer that allows you to browse the data sources defined in the Data Sources preferences page.
    - **Tip:** You can open the Data Sources preferences page by using the Configure Database Sources shortcut from the Open URL dialog box.
  - [Search for file](#) - Displays the Open/Find Resource dialog box that allows you to search for a DITA map.
- Click the [Open/Find Resource](#) toolbar button to search for a file to open.
- Go to *File > Reload* to load the last saved file content. All unsaved modifications are lost.
- Go to *File > Reopen* to reopen one of the recently opened document files. The list containing recently opened files can be emptied by invoking the Clear history action.
- Select the Open or Open with action from the contextual menu of the Project view.

**Related information**

*Opening Local Files at Start-up* on page 246

### Opening the Current Document in System Application

To open the currently edited document in the associated system application, use the View in Browser/System Application action that is available in the *File* menu and on the *File* toolbar. If you want to open XML files in a specific internet browser, instead of the associated system application, you can specify the internet browser to be used. To do so, open the Preferences dialog box (Options > Preferences), go to Global, and set it in the Default Internet browser field. This will take precedence over the default system application settings.
Opening Local Files at Start-up

To open a local file at start-up when you open Oxygen XML Editor from the command line, add the paths for one or more local files as parameters in the command line:

- `scriptName [pathToXMLFile1] [pathToXMLFile2]`
  - `scriptIdName` is the name of the startup script for your platform (oxygen.bat on Windows, oxygen.sh on Unix/Linux, oxygenMac.sh on Mac OS).
  - `pathToXMLFileN` is the name of a local XML file.

An XML file and a schema file to be associated automatically to the file and used for validation and content completion:

```
scriptName -instance pathToXMLFile -schema pathToSchemaFile -schemaType XML_SCHEMA|DTD_SCHEMA|RNG_SCHEMA|RNC_SCHEMA -dtName documentTypeName
```

- `scriptIdName` is the name of the startup script for your platform (oxygen.bat on Windows, oxygen.sh on Unix/Linux, oxygenMac.sh on Mac OS).
  - `pathToXMLFile` is the name of a local XML file.
  - `pathToSchemaFile` is the name of the schema that you want to associate to the XML file, the four constants (XML_SCHEMA, DTD_SCHEMA, RNG_SCHEMA, RNC_SCHEMA) are the possible schema types (W3C XML Schema, DTD, Relax NG schema in full syntax, Relax NG schema in compact syntax).
  - `documentTypeName` specifies the name of the Document Type for which the schema is defined. If the Document Type is already set in preferences, its schema and type are updated.

The two possibilities of opening files at startup by specifying them in the command line are explained also if the startup script receives one of the `-h` or `--help` parameters.

Related information

- **Opening a File at a Specific Location Using the Command Line Interface** on page 246

Opening a File at a Specific Location Using the Command Line Interface

Oxygen XML Editor offers support for opening a file at a specific position using the command line interface, by transmitting parameters to the Oxygen XML Editor batch script file. The following methods are available, depending on how you identify the position that is needed:

1. **Specific position values (line and column number, or character offset)**

   Oxygen XML Editor supports the following position parameters:
   - `line` - The line number.
   - `column` - The column number (has meaning if the `line` parameter is also defined).
   - `char` - The character offset.

   **Examples for Windows:**

   ```
oxygen.bat file:samples/personal.xml#line=4
oxygen.bat file:samples/personal.xml#line=4column=5
oxygen.bat file:samples/personal.xml#line=4;column=5
oxygen.bat file:samples/personal.xml#char=334
```

2. **Simplified XPath index path**

   Oxygen XML Editor will open an XML file and select one of its elements identified by a simplified XPath index path. For example, an index path of the form 1/5/7 identifies the seventh child of the fifth child of the root element.

   **Restriction:** Oxygen XML Editor will display a selection that starts with the first character of the content of the identified element and spans until the end of the line.

   **Examples for Windows:**

   ```
oxygen.bat file:samples/personal.xml#1/5/7
```
The following example shows how you can open an XML document in Oxygen XML Editor and select the third child of the root element:

```
oxygen.bat  file:samples/personal.xml#element(1/3)
```

### 3. Anchors identified by ID attribute values

Oxygen XML Editor will open an XML file and select the element whose `id` attribute value is an exact match of the anchor attached to a command line instruction.

**Examples for Windows:**

The following example shows how you can open an XML document in Oxygen XML Editor and select the element that has the `id` element set to `titleID`:

```
oxygen.bat  file:samples/personal.xml#titleID
```

**Related information**

*Opening Local Files at Start-up* on page 246

### Saving Documents

You can save the document you are editing with one of the following actions:

- **File > Save.**
- **Save** toolbar button - If the document was not yet saved, it displays the **Save As** dialog box.
- **File > Save As** - Displays the **Save As** dialog box, used either to name and save an open document to a file or to save an existing file with a new name.
- **File > Save To URL** - Displays a **Save to URL** dialog box that can be used to save a file identified by its URL (defined by a protocol, host, resource path, and an optional port). Use the drop-down action list to choose one of the available save actions:
  - **Browse for local file** - Opens a local file browser dialog box allowing you to save the document locally.
  - **Browse for remote file** - Displays a **Save to URL** dialog box that allows you to save the document to a remote location (accessible through FTP, SFTP or WebDAV).
  - **Browse for archived file** - Displays the **Archive Browser** dialog box that allows you to save the document inside an archive.
  - **Browse Data Source Explorer** - Opens a **Data Source Explorer** that allows you to browse the data sources defined in the **Data Sources preferences page**.
    - **Tip:** You can get to the **Data Sources** preferences page, using the **Configure Database Sources** shortcut from the **Save to URL** dialog box.
  - **Search for file** - Displays the **Open/Find Resource** dialog box.
- **File > Save All** - Saves all open documents. If any document does not have a file, displays the **Save As** dialog box.

### Opening and Saving Remote Documents

Oxygen XML Editor supports editing remote files, using the FTP, SFTP, WebDAV, SharePoint, and SharePoint Online for Office 365 protocols. You can edit remote files in the same way you edit local files. For example, you can add remote files a project, or make them subject of XSL and FO transformations.

You can open one or more remote files in the **Open URL** dialog box.

A WebDAV resource can be locked when it is opened in Oxygen XML Editor by checking the **Lock WebDAV files on open option** to prevent other users to modify it concurrently on the server. If a user tries to edit a locked file, Oxygen XML Editor displays an error message that contains the lock owner's name. The lock is released automatically when the editor for that resource is closed in Oxygen XML Editor.
To avoid conflicts with other users when you edit a resource stored on a SharePoint server, you can Check Out the resource.

To improve the transfer speed, the content exchanged between Oxygen XML Editor and the HTTP/WebDAV server is compressed using the GZIP algorithm.

The current WebDAV Connection details can be saved using the Database Perspective button and then used in the Data Source Explorer view.

**Open URL**

To open this dialog box, go to File > Open URL (or click the Open URL toolbar button), then choose the Browse for remote file option from the drop-down action list.

![Open URL Dialog Box](image)

The displayed dialog box is composed of the following:

**Server URL**

Specifies the protocol (HTTP, HTTPS or FTP) and the host name or IP of the server.

**Tip:** When specifying a URL, follow these rules:

- To access an FTP server, write the protocol, host, and port (if using a non-standard one). For example, ftp://server.com or ftp://server.com:7800/.
- To access a WebDAV server, write the path to the directory of the WebDAV repository along with the protocol and the host name. For example, https://www.some-webdav-server.com:443/webdav-repository/.

**Important:** Make sure that the repository directory ends in a slash "/". For example, https://www.some-webdav-server.com:443/webdav-repository/

**Autoconnect**

If selected, the browse action is performed every time when you open the dialog box.
User and Password

To browse for a file on a server, you have to specify the user and password for the server. This information is bound to the selected URL displayed in the File URL combo box, and used further in opening/saving the file. If the Save option is selected, then the user and password are saved between editing sessions. The password is kept encrypted in the options file.

Note: Your password is well protected. If the options file is used on another machine by a user with a different username, the password will become unreadable since the encryption is dependent on the username. This is also true if you add URLs that contain a username and password to your project.

Connect

When you press this button, the directory listing will be shown in the main section of the dialog box. If the selected URL points to a SharePoint server, a dedicated SharePoint browsing component is presented.

Browser view

- If you are browsing a WebDAV or FTP repository, the items are presented in a tree-like fashion. You can browse the directories, and make multiple selections. Additionally, you may use the Rename, Delete, and New Folder actions to manage the file repository.

  Note: The file names are sorted in a case-insensitive way.

- When you browse a SharePoint repository, a specialized component renders the SharePoint site content.

Figure 108: Browsing a SharePoint Repository

The left side navigation area presents the SharePoint site structure in a tree-like fashion with various node types (such as sites, libraries, and folders).

Depending on the type of node, a contextual menu offers customized actions that can be performed on that node. The contextual menu of a folder allows you to create new folders and documents, import folders and files, and to rename and delete the folder.
Note: The rename and delete actions are not available for library root folders (folders located at first level in a SharePoint library).

Each library node displays a drop-down menu next to its name where you can select what you want to display for the current library node. This functionality is also available on the contextual menu of the node.

Figure 109: Drop-Down Menu to Select Which Items to Display

The content of a folder is displayed in a tabular form, where each row represents the properties of a folder or document. The list of columns and the way the documents and folders are organized depends on the currently selected view of the parent library.

You can filter and sort the displayed items. To display the available filters of a column, click the filter widget located on the column header. You can apply multiple filters at the same time.

Note: A column can be filtered or sorted only if it was configured this way on the server side.

Figure 110: Column Filter

File URL

You can use this combo box to directly specify the URL to be opened or saved. You can type a URL such as http://some.site/test.xml (if the file is accessible through normal HTTP protocol), or ftp://anonymous@some.site/home/test.xml (if the file is accessible through anonymous FTP).

This combo box also displays the current selection when the user changes selection by browsing the tree of folders and files on the server.

Changing File Permissions on a Remote FTP Server

Some FTP servers allow the modification of permissions of the files served over the FTP protocol. This protocol feature is accessible directly in the FTP/WebDAV file browser dialog box by right-clicking a tree node and selecting the Change permissions menu item.

In this dialog box, the usual Unix file permissions Read, Write, and Execute are granted or denied for the file owner, owner group, and the rest of the users. The aggregate number of permissions is updated in the Permissions text field when it is modified with one of the check boxes.

WebDAV over HTTPS

If you want to access a WebDAV repository across a non-secure network, Oxygen XML Editor allows you to load and save the documents over the HTTPS protocol (if the server understands this protocol) so that any data exchange with the WebDAV server is encrypted.

When a WebDAV repository is first accessed over HTTPS, the server hosting the repository will present a security certificate as part of the HTTPS protocol, without any user intervention. Oxygen XML Editor will use this certificate to decrypt any data stream received from the server. For the authentication to succeed you should make sure the security certificate of the server hosting the repository can be read by Oxygen XML Editor. This means that Oxygen XML Editor can find the certificate in the key store of the Java Runtime Environment in which it runs. You know the server certificate is not in the JRE key store if you get the error No trusted certificate found when trying to access the WebDAV repository.
Troubleshooting HTTPS

When Oxygen XML Editor cannot connect to an HTTPS-capable server, most likely there is no certificate set in the Java Runtime Environment (JRE) that Oxygen XML Editor runs into. The following procedure describes how to:

- Export a certificate to a local file using any HTTPS-capable Web browser (for example, Internet Explorer).
- Import the certificate file into the JRE using the keytool tool that comes bundled with Oxygen XML Editor.

Note: To make Oxygen XML Editor accept a certificate even if it is invalid, open the Preferences dialog box (Options > Preferences), go to Connection settings > HTTP(S)/WebDAV, and enable the Automatically accept a security certificate, even if invalid option.

1. Export the certificate into a local file
   a) Point your HTTPS-aware Web browser to the repository URL.
      If this is your first visit to the repository it will be displayed a security alert stating that the security certificate presented by the server is not trusted.

   ![Security alert - untrusted certificate](image)

   Figure 111: Security alert - untrusted certificate

   b) Go to menu Tools > Internet Options.
      Internet Options dialog box is opened.
   c) Select Security tab.
   d) Select Trusted sites icon.
   e) Press Sites button.
      This will open Trusted sites dialog box.
   f) Add repository URL to Websites list.
   g) Close the Trusted sites and Internet Options dialog boxes.
   h) Try again to connect to the same repository URL in Internet Explorer.
      The same error page as above will be displayed.
   i) Select Continue to this website option.
      A clickable area with a red icon and text Certificate Error is added to Internet Explorer address bar.
   j) Click the Certificate Error area.
      A dialog box containing a View certificates link is displayed.
   k) Click the View certificates link.
      Certificate dialog box is displayed.
   l) Select Details tab of Certificate dialog box.
m) Press **Copy to File** button. **Certificate Export Wizard** is started.

n) Follow indications of wizard for DER encoded binary X.509 certificate. Save certificate to local file `server.cer`.

2. Import the local file into the JRE running Oxygen XML Editor.
   a) Open a text-mode console with administrative rights.
      
      If Oxygen XML Editor has been installed in a user's home directory and includes a bundled JRE, administrative rights are not required. In all other cases administrative rights will be required.
   
   b) Go to the `lib/security` directory of the JRE running Oxygen XML Editor. You find the home directory of the JRE in the `java.home` property that is displayed in the About dialog box (**System properties** tab). On Mac OS X systems, the `lib/security` directory is usually located in `/System/Library/Java/JavaVirtualMachines/1.6.0.jdk/Contents/Home` directory.
      
      On OS X, if you have installed a distribution of Oxygen XML Editor that is not bundled with a JRE, a JRE from Apple is required. The Apple Java version 1.6 stores the certificates in `/System/Library/Java/Support/CoreDeploy.bundle/Contents/Home/lib/security/cacerts` with a symbolic link pointing to it from `/System/Library/Java/JavaVirtualMachines/1.6.0.jdk/Contents/Home/lib/security/cacerts`. On OS X, if you have installed a distribution of Oxygen XML Editor that bundles the JRE from Oracle, the JRE uses the `.install4j/jre.bundle/Contents/Home/jre/lib/security/cacerts` path within its installation directory.
   
   c) Run the following command:
      
      ```bash
      ..\..\bin\keytool -import -trustcacerts -file server.cer -keystore cacerts
      ```
      
      The `server.cer` file contains the server certificate, created during the previous step. keytool requires a password before adding the certificate to the JRE **keystore**. The default password is `changeit`. If someone changed the default password, then that person is the only one who can perform the import.

      **Tip:** If you need to import multiple certificates, you need to specify a different alias for each additional imported certificate with the `-alias` command line argument, as in the following example:
      
      ```bash
      ..\..\bin\keytool -import -alias myalias1 -trustcacerts -file server1.cer -keystore cacerts
      ..\..\bin\keytool -import -alias myalias2 -trustcacerts -file server2.cer -keystore cacerts
      ```

3. Restart Oxygen XML Editor.

*HTTP(S)/WebDAV Preferences* on page 148

**HTTP Authentication Schemes**

Oxygen XML Editor supports the following HTTP authentication schemes:

- **Basic** - The basic authentication scheme defined in the *RFC2617 specifications*.
- **Digest** - The digest authentication scheme defined in the *RFC2617 specifications*.
- **NTLM** - The NTLM scheme is a proprietary Microsoft Windows Authentication protocol (considered to be the most secure among currently supported authentication schemes).

  **Note:** For NTLM authentication, the user name must be preceded by the name of the domain it belongs to, as in the following example:

  ```text
  domain\username
  ```

- **Kerberos** - An authentication protocol that works on the basis of *tickets* to allow nodes communicating over a non-secure network to prove their identity to one another in a secure manner.
Single Sign-on

Oxygen XML Editor implements the *Single sign-on* property (meaning that you can log on once and gain access to multiple services without being prompted to log on for each of them), based on the *Kerberos* protocol and relies on a *ticket-granting ticket (TGT)* that Oxygen XML Editor obtains from the operating system.

To turn on the *Kerberos*-based authentication, you need to add the following system property in the `.vmoptions` configuration file or start-up script:

```
-Djavax.security.auth.useSubjectCredsOnly=false
```

Switching and Moving File Tabs

There are two keyboard shortcuts that can be used for cycling through the opened file tabs:

**Ctrl + Tab (Command + Tab on OS X)**

Switches between the tabs with opened files in the order most recent ones first.

**Ctrl + Shift + Tab (Command + Shift + Tab on OS X)**

Switches between the tabs with opened files in the reverse order.

There are also two shortcuts for moving the current tab:

**Ctrl + Alt + Comma**

Moves the current file tab one position to the left.

**Ctrl + Alt + Period**

Moves the current file tab one position to the right.

Searching Documents

Oxygen XML Editor includes advanced search capabilities to help you locate documents and resources.

**Open/Find Resource View**

The *Open/Find Resource* view is designed to offer advanced search capabilities either by using a simple text search or by using the *Apache Lucene - Query Parser Syntax*. By default, the view is presented in the left side of the Oxygen XML Editor layout, next to the *Project* and *DITA Maps Manager* views. If the view is not displayed, it can be opened from the *Window > Show View* menu.
You can use this view to find a file in the current Oxygen XML Editor project or in one of the DITA maps opened in the DITA Maps Manager view by typing only a few letters of the file name of a document or a fragment of the content you are searching for. The Open/Find Resource view also supports searching in document edits (comments, tracked change insertions/deletions, and highlighted content).

Note: Full support for searching in document edits is available only in the Enterprise edition of Oxygen XML Editor. The Professional edition offers support to search through a maximum of 10 edits.

Search Results

Search results are presented instantly, after you finish typing the content. The matching fragments of text are highlighted in the results list displayed in the dialog box. When you open one of the documents from the results list, the matching fragments of text are highlighted in the editing area. To remove the highlighting from your document, close the corresponding tab in the Results view at the bottom of the editor. To display the search history, position the cursor in the search field and press Ctrl + DownArrow (Command + DownArrow on OS X) or Ctrl + UpArrow (Command + UpArrow on OS X) on your keyboard. Pressing only the DownArrow key moves the selection to the list of results.

Note: Searches are not case sensitive. For example, if you search for car you get the same results as when you search for Car.

Tip: Suffix searches are also supported, both for searching in the content of your resources and in their name. For this, you can use wildcards. If you search for *ing with the in content option selected, you will find documents that contain the word presenting. If you search for */samples/*.gif with the in file paths option selected, you will find all the gif images from the samples directory.

Options Available in the View

The Open/Find Resource view offers the following options:

- Settings - Drop-down menu that includes the following settings for the view:
  - Clear Index - Clears the index.
• **Show description** - Presents the search results in a more compact form, displaying only the title and the location of the resources.

• **Options** - Opens the *Open/Find Resource preferences page* where you can configure various search options. For example, you can specify a **Content language** that differs from the default UI language in case your document contains multiple languages.

• **In file paths** - Select this option to search for resources by their name or by its path (or a fragment of its path).

• **In content** - Select this option to search through the content of your resources.

• **In reviews** - Select this option to search through the comments, tracked change insertions/deletions, or highlights in your resources.

• **Reindex** - Use this option to reindex your resources.

**Contextual Menu Actions**

A contextual menu is available on each search result and provides actions applicable to that particular document. These actions include:

• **Open** - Opens the document in one of Oxygen XML Editor internal editors.

• **Open with** - Allows you to choose to open the document in the **Internal editor** or an external **System application**.

• **Show in Explorer** - Identifies the document in the system file explorer.

• **Copy Location** - Copies the file path and places it in the clipboard.

**Indexing Process**

The content of the resources used to search in is parsed from an index. The indexing is performed both automatically and on request. Automatic indexing is performed when you modify, add, or remove resources in the currently indexed project. If the index was never initialized, the index in not updated on project changes.

To improve performance, the indexing process skips the following set of common English words (the so-called *stop words*): a, an, and, are, as, at, be, but, by, for, if, in, into, is, it, no, not, of, on, or, such, that, the, their, then, there, these, they, this, to, was, will, with. This means that if you are searching for any of these words, the indexing process will not be able to match any of them. However, you can configure the list of *stop words* in the *Open/Find Resource preferences page*.

**Caching Mechanism**

When you perform a search, a caching mechanism is used to gather the paths of all files linked in the current project. When the first search is performed, all project files are indexed and added to the cache. The next search operation uses the information extracted from the cache, thus improving the processing time. The cache is kept for the currently loaded project only, so when you perform a search in a new project, the cache is rewritten. Also, the cache is reset when you press the **Reindex** button.

**Important:** Files larger than 2GB are not indexed.

If there is no file found that matches your file pattern or text search, a possible cause is that the file you are searching for was added to the Oxygen XML Editor project after the last caching operation. In this case, re-indexing the project files with the **Reindex** button enables the file to be found. The date and time of the last index operation are displayed below the file list.

**Opening the Results**

Once you find the files that you want to open, select them in the list and press the **Open** button (or double-click them). Each of the selected files is opened in the editor associated with the type of the file.

**Note:** You can drag a resource from the *Open/Find Resource* view and drop it in a DocBook, DITA, TEI or XHTML document to create a link to that resource.

To watch our video demonstration about the *Open/Find Resource* feature and its search capabilities, go to [https://www.oxygenxml.com/demo/Open_Find_Resource.html](https://www.oxygenxml.com/demo/Open_Find_Resource.html).

Editing Documents 257
Searching in Content

To perform a search through the content of your resources, open the Open/Find Resource dialog box (from the Find menu or with Ctrl + Shift + R (Command + Shift + R on OS X)) or the Open/Find Resource view (by default, located on the left side of the editor), select the in content option, and in the search field enter the terms that you want to search for.

The Open/Find Resource feature is powered by Apache Lucene. Apache Lucene is a free open source information retrieval software library.

You can use the Open/Find Resource feature to either perform a simple text search or a more complex search using the Apache Lucene - Query Parser Syntax. Using the Apache Lucene - Query Parser Syntax means you can perform any of the following searches:

<table>
<thead>
<tr>
<th><strong>Term Searches</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Use the Open/Find Resource view or dialog box to search for plain text:</td>
</tr>
<tr>
<td>Garden Preparation</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Element-Specific Searches</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Use the Open/Find Resource view or dialog box to search for content that belongs to a specific element:</td>
</tr>
<tr>
<td>title:&quot;Garden Preparation&quot;</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Wildcard Searches</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Use wildcards to make your search more permissive:</td>
</tr>
<tr>
<td>Garden Prepar?tion</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Fuzzy Searches</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>If you are not sure of the exact form of a term that you are interested in, use the fuzzy search to find the terms that are similar to what you introduce in the Open/Find Resource view or dialog box. To perform a fuzzy search, use the ~ symbol after the word that you are not sure of:</td>
</tr>
<tr>
<td>Garden Preparing~</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Proximity Searches</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Use proximity searches to find words that are within a specific distance away. To perform a proximity search, use the ~ symbol at the end of your search. For example, to search for the word Garden and the word Preparation within 6 words of each other use:</td>
</tr>
<tr>
<td>&quot;Garden Preparation&quot;~6</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Range Searches</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Use range searches to match documents whose element values are between the lower and upper bound specified in the range query. For example, to find all documents whose titles are between Iris and Lilac, use:</td>
</tr>
<tr>
<td>title:(Iris TO Lilac)</td>
</tr>
</tbody>
</table>
The curly brackets denote an exclusive query. The results you get when using this query are all the documents whose titles are between *Iris* and *Lilac*, but not including *Iris* and *Lilac*. To create an inclusive query use square brackets:

```
title:[Iris to Lilac]
```

**Term Prioritising Searches**

Use term prioritising searches if the fragment of text that you are searching for contains certain words that are more important to your search than the rest of them. For example, if you are searching for *Autumn Flowers*, a good idea is to prioritise the word *Autumn* since the word *Flowers* occurs more often. To prioritise a word use the ^ symbol:

```
Autumn^6 Flowers
```

**Searches Using Boolean Operators**

You can use the **AND**, +, **OR**, -, and **NOT** operators.

To search for documents that contain both the words *Garden* and *Preparation*, use:

```
Garden AND Preparation
```

To search for documents that must contain the word *Garden* and may contain the word *Preparation*, use:

```
+Garden Preparation
```

To search for documents that contain either the word *Garden* or the word *Preparation*, use:

```
Garden OR Preparation
```

To search for documents that contain *Garden Preparation* but not *Preparation of the Flowers*, use:

```
"Garden Preparation" - "Preparation of the Flowers"
```

**Searches Using Grouping**

To search either for the word *Garden* or *Preparation*, and the word *Flowers*, use:

```
(Garden OR Preparation) AND Flowers
```

**Searches Using Element Grouping**

To search for a title that contains both the word *Flowers* and the phrase *Garden Preparation*, use:

```
title:(+Flowers +"Garden Preparation")
```

**Searching for Special Characters**

Sometimes you might need to search your content for special character, such as:

```
+ - && || () {} [ ] ^ ~ * ? : \n```

In this case, you should surround your search query with quotes. For example, to search for *(Hydrogen + Oxygen)=Water*, use:

```
"(Hydrogen + Oxygen)=Water"
```
Searching in File Paths

To perform a search in the file paths of your resources, open the **Open/Find Resource dialog box** (from the **Find** menu or with **Ctrl + Shift + R (Command + Shift + R on OS X)**) or the **Open/Find Resource view** (by default, located on the left side of the editor), select the **In file paths** option, and in the search field enter the terms that you want to search for.

The **Open/Find Resource** feature allows you to search for a resource either by its name or by its path (or by a fragment of its path).

You can use wildcards when you perform such searches:
- Use "*" to match any sequence of characters.
- Use "?" to match any single character.

For example, if you search for *-preferences-page you will find all the resources that contain the -preferences-page fragment in their name. If you search for */samples/*.gif, you will find all the .gif images from the samples directory.

Searching in Reviews

To perform a search in the edits of your resources, open the **Open/Find Resource dialog box** (from the **Find** menu or with **Ctrl + Shift + R (Command + Shift + R on OS X)**) or the **Open/Find Resource view** (by default, located on the left side of the editor), select the **In reviews** option, and in the search field enter the terms that you want to search for.

The following options are available:
- **Type** - Specifies whether you want to search for content in comments, tracked change insertions/deletions, or highlighted content.
- **Author** - Displays all the authors of the edits in your resources. The authors are collected when indexing. You can set a specific author for your search or search all of them.
- **Time** - Specifies the time when the edits that you are searching through were created.

Both the view and the dialog box display the edits that contain the search results and their parent topics along with a short description. To hide this description, go to **Settings** and disable the **Show Description** option.

Technical Aspects

When Oxygen XML Editor performs the indexing of your resources, the refereed content from your documents is not taken into account. For example, when DITA documents are indexed, the content from the `conref` elements is not parsed. The files that make up the index are stored on disk in the `[user_home_directory]\AppData\Roaming\com.oxygenxml\lucene` folder.

Closing Documents

To close open documents, use one of the following actions that are available in the contextual menu of the current editor tab (or from the **File** menu):

**Close (Ctrl + W (Command + W on OS X))**
- Closes the currently selected editor.

**Close Other Files**
- If multiple files are opened, this action is available to close all opened editors in the current group/stack of tabs except for the one you are currently viewing. If this action is selected from the **File** menu, it closes all opened editors in **all** groups/stacks of tabs except for the current one.

**Close Files to the Right**
- Available only from the contextual menu of the current editor tab and it closes all opened editors to the right of the currently selected editor.

**Close All**
- If multiple files are opened, this action is available to close all opened editors in the current group/stack of tabs. If this action is selected from the **File** menu, it closes all opened editors in **all** groups/stacks of tabs.

Contextual Menu of the Current Editor Tab

A contextual menu is available when you right-click the current editor tab label.
The actions that are available depend on the context and the number of files that are opened. The menu includes the following actions:

Close (Ctrl + W (Command + W on OS X))
Closes the currently selected editor.

Close Other Files
If multiple files are opened, this action is available to close all opened editors in the current group/stack of tabs except for the one you are currently viewing.

Close Files to the Right
Closes all opened editors to the right of the currently selected editor.

Close All
If multiple files are opened, this action is available to close all opened editors.

Move editor tab to the left (Ctrl + Alt + Comma)
Moves the current editor tab one position to the left.

Move editor tab to the right (Ctrl + Alt + Period)
Moves the current editor tab one position to the right.

Reopen last closed editor Ctrl + Alt + T (Command + Alt + T on OS X)
Reopens the last closed editor.

Maximize/Restore Editor Area
Collapses all the side views and spans the editing area to cover the entire width of the main window.

Add to project
Adds the file you are editing to the current project.

Add all to project
If multiple files are opened, this action is available to add all the opened files in the current group/stack of tabs to the current project.

Copy Location
Copies the disk location of the file.

Show in Explorer (Show in Finder on OS X)
Opens the Explorer to the file path of the file.

Viewing File Properties

The Properties view, you can quickly access information about the currently edited document. The information includes:

- Character encoding.
- Full path on the file system.
- Schema used for content completion and document validation.
- Document type name and path.
- Associated transformation scenario.
- Read-only state of a file.
- Bidirectional text (left to right and right to left) state.
- Total number of characters in the document.
- Line width.
- Indent with tabs state.
- Indent size.

The view can be accessed from Window > Show View > Properties.

To copy a value from the Properties view in the clipboard (for example, the full file path), use the Copy action available on the contextual menu of the view.
Using Projects to Group Documents

This section explains how to create and work with Projects.

Creating a New Project

Oxygen XML Editor allows you to organize your XML-related files into projects. This helps you manage and organize your files and also allows you to perform batch operations (such as validation and transformation) over multiple files. You can also share your project settings and transformation/validation scenarios with other users. Use the Project view to manage projects, and the files and folders contained within.

Creating a New Project

To create a new project, select New Project from the Project menu, the New menu in the contextual menu, or the drop-down menu at the top-left of the Project view. This opens a dialog box that allows you to assign a name to the new project and adds it to the structure of the project in the Project view.

Adding Items to the Project

To add items to the project, select any of the following actions that are available when invoking the contextual menu in the Project view:

- New > File
  Opens a New file dialog box that helps you create a new file and adds it to the project structure.

- New > Folder
  Opens a New Folder dialog box that allows you to specify a name for a new folder and adds it to the structure of the project.

The project itself is considered a logical folder. You can add a logical folder, or content to a logical folder, by using one of the following actions that are available in the contextual menu, when invoked from the project root:

- New > Logical Folder
  Creates a logical folder in the tree structure (the icon is a magenta folder on Mac OS X - ).

- New > Logical Folders from Web
  Replicates the structure of a remote folder accessible over FTP/SFTP/WebDAV, as a structure of logical folders. The newly created logical folders contain the file structure of the folder it points to.

- Add Folder
  Adds a link to a physical folder, whose name and content mirror a real folder that exists in the local file system (the icon of this action is different on Mac OS X ).

- Add Files
  Adds links to files on the local file system.

- Add Edited File
  Adds a link to the currently edited file in the project.

Using Linked Folders (Shortcuts)

Another easy way to organize your XML working files is to place them in a directory and then to create a corresponding linked folder in your project. If you add new files to that folder, you can simply use the Refresh (F5) action from the toolbar or contextual menu and the Project view will display the existing files and subdirectories. If your files are scattered amongst several folders, but represent the same class of files, you might find it useful to combine them in a logical folder.

You can create linked folders (shortcuts) by dragging and dropping folders from the Windows Explorer (Mac OS X Finder) to the project tree, or by selecting Add Folder in the contextual menu from the project root. Linked folders are displayed in
the Project view with bold text. To create a file inside a linked folder, select the New > File action from the contextual menu. The linked files presented in the Project view are marked with a special icon.

Note: Files may have multiple instances within the folder system, but cannot appear twice within the same folder.

For more information on managing projects and their content, see Project View on page 179.

For more details about how you can share projects with other users, see Sharing a Project - Team Collaboration on page 270.

Related information
Using Projects to Group Documents on page 262

Project View

The Project view is designed to assist you with organizing and managing related files grouped in the same XML project. The actions available on the contextual menu and toolbar associated to this panel enable the creation of XML projects and shortcuts to various operations on the project documents.

![Diagram of Project View]

By default, the view is positioned on the left side of the Oxygen XML Editor window, above the Outline view. If the view has been closed, it can be reopened at any time from the Window > Show View menu (or using the Show Project View action from the Project menu).

The tree structure occupies most of the view area. In the upper left side of the view, there is a drop-down menu that contains all recently used projects and project management actions:

- **Open Project (Ctrl + F2 (Command + F2 on OS X))**
  Opens an existing project. Alternatively, you can open a project by dropping an Oxygen XML Editor XPR project file from the file explorer into the Project panel.

  Notice: When a project is opened for the first time, a confirmation dialog box will be displayed that asks you to confirm that the project came from a trusted source. This is meant to help prevent potential security issues.

- **New Project**
  Creates a new, empty project.

The following actions are grouped in the upper right corner:

- **Collapse All**
  Collapses all project tree folders. You can also collapse/expand a project tree folder if you select it and press the Enter key or Left Arrow to collapse and Right Arrow to expand.

- **Link with Editor**
  When selected, the project tree highlights the currently edited file, if it is found in the project files.

  Note: This button is disabled automatically when you move to the Debugger perspective.
Settings

A submenu that contains the following actions:

Filters

Allows you to filter the information displayed in the Project view. Click the toolbar button to set filter patterns for the files you want to show or hide. Also, you can set filter patterns for the linked directories that are hidden.

Show Full Path

When selected, linked files and folders are presented with a full file path.

Enable Master Files Support

Select this option to enable the Master Files support.

Change Search and Refactor operations scope

Allows you to change the collection of documents that define the context of the search and refactor operations.

- Use only Master Files, if enabled - Restricts Oxygen XML Editor to perform the search and refactor operations starting from the master files that are defined for the current resource. This option is available when you select Project in the Select the scope for Search and Refactor operations dialog box and the Master Files support is enabled.

- Working sets - Allows you to specify the set of files that will be used for the scope of the search and refactor operations.

The files are usually organized in an XML project as a collection of folders. There are three types of resources displayed in the Project view:

- Logical folders - marked with a blue icon on Windows and Unix/Linux ( ) and a magenta icon on Mac OS X ( ). They help you group files within the project. This folder type has no correspondent on the physical disk, since they are used as containers for related items. Creating and deleting them does not affect the file system on disk. They are created on the project root or inside other logical folders by using the contextual action New > Logical Folder. The contextual menu action ✗ Remove from Project can be used to remove them from the project.

- Physical folders and files - marked with the operating system-specific icon for folders (usually a yellow icon on Windows and a blue icon on Mac OS X). These folders and files are mirrors of real folders or files that exist in the local file system. They are created or added to the project by using contextual menu actions (such as New > File, New > Folder, Add Folder, etc.) Also, the contextual menu action ⌘ Remove from Disk (Shift+Delete) can be used to remove them from the project and local file system.

- Shortcut folders and files - the icons for file shortcuts include a shortcut symbol and names of folder shortcuts are displayed in bold text. All files and folders that appear as direct descendants of a logical folder are considered shortcuts. They are created and added with the contextual actions Add Files and Add Folder from the project root. Both contextual menu actions ✗ Remove from Project and ⌘ Remove from Disk (Shift+Delete) are available for shortcuts. ✗ Remove from Project just removes the shortcut from the project, while ⌘ Remove from Disk (Shift+Delete) removes the shortcut and the physical resource from the local file system.
Figure 115: Project View with Examples of all Three Types of Resources

Creating New Projects

The following action is available in the Project menu, the New menu in the contextual menu, or from the drop-down menu in the top-left of the Project view:

- **New Project**
  Creates a new, empty project.

Creating New Project Items

The following actions are available by selecting New from the contextual menu, when invoked from the Project view:

- **New > File**
  Opens a New file dialog box that helps you create a new file and adds it to the project structure.

- **New > Folder**
  Opens a New Folder dialog box that allows you to specify a name for a new folder and adds it to the structure of the project.

- **New > Logical Folder**
  Available when invoked from the project root, this action creates a logical folder in the tree structure (the icon is a magenta folder on Mac OS X - ).

- **New > Logical Folders from Web**
  Available when invoked from the project root, this action replicates the structure of a remote folder accessible over FTP/SFTP/WebDAV, as a structure of logical folders. The newly created logical folders contain the file structure of the folder it points to.

Add Content to a Logical Folder

The project itself is considered a logical folder. You can add content to a logical folder using one of the actions available in the contextual menu, when invoked from the project root:

- **Add Folder**
  Adds a link to a physical folder, whose name and content mirror a real folder that exists in the local file system (the icon of this action is different on Mac OS X - ).

- **Add Files**
  Adds links to files on the local file system.
Add Edited File

Adds a link to the currently edited file in the project.

Managing Project Content
Creating/Adding Files and Folders

You can create linked folders (shortcuts) by dragging and dropping folders from a system explorer to the project tree (the Enable drag-and-drop in Project view option must be enabled in the Views preferences page), or by selecting Add Folder in the contextual menu from the project root. To create a file inside a linked folder, select the New > File action from the contextual menu.

Note: The linked files presented in the Project view are marked with a special icon. Linked folders are displayed in bold text.

You can create physical folders by selecting New > Folder from the contextual menu.

When adding files to a project, the default target is the project root. To change a target, select a new folder. Files may have multiple instances within the folder system, but cannot appear twice within the same folder.

Removing Files and Folders

To remove one or more linked files or folders, select them in the project tree and press the Delete key, or select the contextual menu action Remove from Project. To remove a linked file or folder from both project and local file system, select the contextual menu action Remove from Disk (Shift+Delete). The Remove from Disk (Shift+Delete) action is also used to remove physical files or folders.

CAUTION: In most cases this action is irreversible, deleting the file permanently. Under particular circumstances (if you are running a Windows installation of Oxygen XML Editor and the Recycle Bin is active) the file is moved to Recycle Bin.

Moving Files and Folders

You can move the resources of the project with drag and drop operations on the files and folders of the tree (the Enable oXygen consoles option must be enabled in the View preferences page).

You can also use the usual Cut, Copy, and Paste actions to move resources in the Project view.

Renaming Files and Folders

There are three ways you can rename an item in the Project view. Select the item in the Project view and do one of the following:

• Invoke the Rename action from the contextual menu.
• Press F2 and type the new name.
• Click the selected item and type the new name.

To finish editing the item name, press Enter.

Note: The Rename action is also available on logical files.

Locating and Opening Files

If a project folder contains a lot of documents, a certain document can be located quickly in the project tree by selecting the folder containing the desired document and typing the first few characters of the document name. The desired document is automatically selected as soon as the typed characters uniquely identify its name in the folder.

The selected document can be opened by pressing the Enter key, by double-clicking it, or with one of the Open actions from the contextual menu. The files with known document types are opened in the associated editor, while binary files are opened with the associated system application. To open a file with a known document type in an editor other than the default one, use the Open with action. Also, dragging and dropping files from the project tree to the editor area results in the files being opened.

Saving the Project

The project file is automatically saved every time the content of the Project view is saved or modified by actions such as adding or removing files and drag and drop.

Editing Documents 266
Validate Files
The currently selected files in the Project view can be checked to be XML well-formed or validated against a schema (DTD, XML Schema, Relax NG, Schematron or NVDL) with one of the following contextual menu actions found in the Validate submenu:

- **Check Well-Formedness**
  Checks if the selected file or files are well-formed.

- **Validate**
  Validates the selected file or files against their associated schema. EPUB files make an exception, because this action triggers a Validate and Check for Completeness operation.

Validate with Schema
Validates the selected file or files against a specified schema.

- **Configure Validation Scenario(s)**
  Allows you to configure and run a validation scenario.

Applying Transformation Scenarios
The currently selected files in the Project view can be transformed in one step with one of the following actions available from contextual menu in the Transform submenu:

- **Apply Transformation Scenario(s)**
  Obtains the output with one of the built-in scenarios.

- **Configure Transformation Scenario(s)**
  Opens a dialog box that allows you to configure pre-defined transformation scenarios.

- **Transform with**
  Allows you to select a transformation scenario to be applied to the currently selected files.

Along with the logical folder support, this allows you to group your files and transform them very easily.

Refactoring Actions (Available for certain document types (such as XML, XSD, and XSL)
Oxygen XML Editor includes some refactoring operations that help you manage the structure of your documents. The following actions are available from the contextual menu in the Refactoring submenu:

- **Rename resource**
  Allows you to change the name of a resource.

- **Move resource**
  Allows you to change the location on disk of a resource.

- **XML Refactoring**
  Opens the XML Refactoring tool wizard that presents refactoring operations to assist you with managing the structure of your XML documents.

Other XML Refactoring Actions
For your convenience, the last 5 XML Refactoring tool operations that are used will also appear in this submenu.

Other Contextual Menu Actions
Other actions that are available in the contextual menu from the project tree include:

- **Open**
  Opens the selected files in the corresponding editor.

- **Open with submenu**
  This submenu allows you to open the selected file with the internal editor, a system application, or other internal tools: DITA Maps Manager, Archive Browser, MathML Editor, Generate/Convert Schema, WSDL/SOAP Analyzer, Large File Viewer, Hex Viewer, SVG Viewer.

Editing Documents 267
Show in Explorer (or Show in Finder on OS X)

In Windows, the content of the selected folder or file is presented in a specific explorer window. On MAC OS X, the parent folder is opened and the selected folder is highlighted in a specific finder window.

Copy Location

Copies an application-specific URL for the selected resource to the clipboard.

Refresh

Refreshes the content and the dependencies between the resources in the Master Files directory.

Find/Replace in Files

Allows you to find and replace text in multiple files.

// XPath in Files

Opens the XPath/XQuery Builder view that allows you to compose XPath and XQuery expressions and execute them over the currently edited XML document.

Open/Find Resource

Opens the Open/Find Resource dialog box.

Check Spelling in Files

Allows you to check the spelling of multiple files.

Format and Indent Files

Opens the Format and Indent Files dialog box that allows you to configure the format and indent (pretty print) action that will be applied on the selected documents.

Open in SVN Client

Syncro SVN Client tool is opened and it highlights the selected resource in its corresponding working copy.

Compare

Allows you to compare multiple files or directories and the order of your selection determines where they are opened in the Compare Files or Compare Directories tool. If you select two files or folders, your first selection will be opened in the left panel and the other one in the right panel.

You can also select 3 files and the tool will automatically be opened in the three-way comparison mode. If you select three files, your first selection will be opened in the left panel, the second in the right panel, and the third selection will be the base (ancestor) file.

Generate Documentation > XML Schema Documentation

Opens the XML Schema Documentation Dialog Box.

Generate Documentation > XSLT Stylesheet Documentation

Opens the XSLT Stylesheet Documentation Dialog Box.

Generate Documentation > XQuery Documentation

Opens the XQuery Documentation Dialog Box.

Generate Documentation > WSDL Documentation

Opens the WSDL Documentation Dialog Box.

Properties

Displays the properties of the current file in a Properties dialog box.

Menu Level Actions

The following actions are available in the Project menu:

New Project

Creates a new, empty project.
Open Project (Ctrl + F2 (Command + F2 on OS X))

Opens an existing project. Alternatively, you can open a project by dropping an Oxygen XML Editor XPR project file from the file explorer into the Project panel.

⚠️ **Notice:** When a project is opened for the first time, a confirmation dialog box will be displayed that asks you to confirm that the project came from a trusted source. This is meant to help prevent potential security issues.

**Save Project As**

Allows you to save the current project under a different name.

**Validate all project files**

Checks if the project files are well-formed and their mark-up conforms with the specified DTD, XML Schema, or Relax NG schema rules. It returns an error list in the message panel.

**Filters**

Opens the Project filters dialog box that allows you to decide which files and directories will be shown or hidden.

**Enable Master Files Support**

Allows you to enable the Master Files Support for each project you are working on.

**Change Search and Refactor operations scope**

Opens a dialog box that allows you to define the context of search and refactor operations.

**Show Project View**

Displays the Project view.

**Reopen Project**

Contains a list of links of previously used projects. This list can be emptied by invoking the Clear history action.

**Related information**

*Working with EPUB* on page 1014

**Moving/Renaming Resources in the Project View**

The Project view allows you to move or rename files in the current project.

**Moving Resources**

To move a file or directory in the Project view, drag and drop it to the new location in the tree structure or use the ➥ Cut and ➤ Paste actions from the contextual menu or Edit menu (you can also use the ➦ Copy and ➤ Paste actions from the contextual menu or Edit menu to copy resources to a new location).

You can also move certain types of files (such as XML, XML Schema, Relax NG, WSDL, and XSLT) by using the Refactoring > Move resource action from the contextual menu. This action opens the Move resource dialog box that includes the following options:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - Enable this option to update the references to the resource you are moving, based upon the selected scope. You can select or configure the scope by using the ➖ button.

**Renaming Resources**

To quickly rename a file or a directory, use the in-place editing either by pressing F2 or by selecting Rename from the contextual menu.

You can also rename certain types of files (such as XML, XML Schema, Relax NG, WSDL, and XSLT) by using the Refactoring > Rename resource action from the contextual menu. This action opens the Rename resource dialog box that includes the following options:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
• **Update references of the renamed resource** - Enable this option to update the references to the resource you are renaming.

  You can *select or configure the scope* by using the ✦ button.

### Problems Updating References of Moved/Renamed Resources

In some cases, the references of a moved or a renamed resource can not be updated. For example, when a resource is resolved through an XML catalog or when the path to the moved or renamed resource contains entities. For these cases, Oxygen XML Editor displays a warning dialog box.

![Problems Dialog Box](image)

**Figure 116: Problems Dialog Box**

### Image Preview from the Project View

Images and SVG files from the **Project** view can be previewed in a separate panel.

To preview an image, either double-click the image name or click the **Preview** action from the contextual menu of the **Project** view. Supported image types are GIF, JPEG/JPG, PNG, BMP. Once the image is displayed in the **Preview** panel using the actions from the contextual menu, you can scale the image to its original size (1:1 action) or scale it down to fit in the view's available area (`Scale to fit` action).

To preview an **SVG file**, click the **Preview** action from the contextual menu of the **Project** view. Once the SVG is displayed in the **Preview** panel, the following actions are available on the contextual menu: **Zoom in, Zoom out, Rotate** and **Refresh**.

**Note:** You can drag an image from the **Image Preview** view and drop it in a DITA, DocBook, or TEI document.

### Sharing a Project - Team Collaboration

You can use XML projects to make team collaboration and synergy efficient and effective. Not only can you share the project files and folders, but Oxygen XML Editor also allows you to store preferences, transformation scenarios, and validation scenarios in a **project file** (`.xpr` file extension). It can be saved on a version control system (such as SVN, CVS, or Source Safe) or in a shared folder, so that your team will have access to the same resources stored in the project file.

---

---
Sharing Preferences (Creating a Project-Level Options File)

To share options that are configured in certain preferences pages, you can create a project-level options file by storing them in a project file (.xpr file extension). To do so, follow these steps:

1. You may want to use a fresh install for this procedure, to make sure that you do not copy personal or local preferences.
2. In the Project view, create a project or open an existing one.
3. Open the Preferences dialog box (Options > Preferences).
4. Configure the options in each preferences page that you want to be included in the project file and switch the storage preference to Project Options in each page.
   
   **Note:** Some pages do not have the Project Options switch, since the options they host might contain sensitive data (such as passwords, for example) that is unsuitable for sharing with other users.

5. Click OK and close the Preferences dialog box.

   All explicitly set values are now saved in the project file. You can then share the project file so that your team will have the same option configuration that you stored in the project file.

   **Note:** The project file extension (.xpr) must be preserved when the file is distributed to others.

   **Notice:** When a project is opened for the first time, a confirmation dialog box will be displayed that asks you to confirm that the project came from a trusted source. This is meant to help prevent potential security issues.

Sharing Transformation Scenarios

To share created and edited transformation scenarios, you can store them in a project file (.xpr file extension) by following these steps:

1. In the Project view, create a project or open an existing one.
2. When you create a new transformation scenario or edit an existing one, there is a Storage option. Switch the storage preference to Project Options in each transformation scenario you want to be included in the project file.
3. Click OK to store the scenario in the project file.

   You can then share the project file so that your team will have access to the same transformation scenarios that you stored in the project file. When you create a scenario at the project level, the URLs from the scenario become relative to the project URL.

   **Note:** The project file extension (.xpr) must be preserved when the file is distributed to others.

   **Notice:** When a project is opened for the first time, a confirmation dialog box will be displayed that asks you to confirm that the project came from a trusted source. This is meant to help prevent potential security issues.

Sharing Validation Scenarios

To share created and edited validation scenarios, you can store them in a project file (.xpr file extension) by following these steps:

1. In the Project view, create a project or open an existing one.
2. When you create a new validation scenario or edit an existing one, there is a Storage option. Switch the storage preference to Project Options in each validation scenario you want to be included in the project file.
3. Click OK to store the scenario in the project file.

   You can then share the project file so that your team will have access to the same validation scenarios that you stored in the project file. When you create a scenario at the project level, the URLs from the scenario become relative to the project URL.

   **Note:** The project file extension (.xpr) must be preserved when the file is distributed to others.

   **Notice:** When a project is opened for the first time, a confirmation dialog box will be displayed that asks you to confirm that the project came from a trusted source. This is meant to help prevent potential security issues.
Syncro SVN Client (Apache Subversion™)

To assist you with team collaboration and sharing projects, Oxygen XML Editor includes an embedded SVN (Subversion) Client. Even if you start developing a new project, or you want to migrate an existing one to Subversion, the Syncro SVN Client allows you to easily share it with the rest of your team.

It can be accessed from the Tools menu and can be used for synchronizing your working copy with a central repository.

It can also be started by selecting the Open in SVN Client action from the contextual menu of the Project view. This action opens the Syncro SVN Client and shows the selected project file in the Working Copy view.

Sharing Validation Scenarios on page 440

Minimize Differences Between Versions Saved on Multiple Computers

The number of differences between versions of the same file saved by multiple content authors on multiple computers can be minimized by imposing the same set of formatting options when saving the file, for all the content authors. An example, the following procedure can be used to minimize the differences:

1. Create an Oxygen XML Editor project file that will be shared by all content authors.
2. Configure your own formatting preferences. To do this, open the Preferences dialog box (Options > Preferences), go to Editor > Format, configure the appropriate options in this page, then go to Editor > Format > XML and configure the options there.
3. Save the configured options into your project file by selecting Project Options in both of the preferences pages.
4. Save the project and commit the project file to your versioning system so all the content authors can use it.
5. Make sure the project is opened in the Project view.
6. Open and save your XML files in the Author mode.
7. Commit the saved XML files to your versioning system.

When other content authors change the files, only the changed lines will be displayed in your diff tool instead of one big change that does not allow you to see the changes between two versions of the file.

Master Files Support

This chapter details the Master Files Support available in Oxygen XML Editor. A Master File typically refers to the root of an imported or included tree of modules and this support helps you simplify the configuration and development of XML projects.

Oxygen XML Editor allows you to define master files at project level. These master files are automatically used by Oxygen XML Editor to determine the context for operations such as validation, content completion, refactoring, or search for XML, XSD, XSL, WSDL, and RNG modules. Oxygen XML Editor maintains the hierarchy of the master files, helping you to determine the editing context.

To watch our video demonstration about the Master Files Support for XML documents, XSL documents, and WSDL documents, go to Working with Modular XML Files, Master Files Support, and Working with Modular WSDL Files, respectively.

Master Files Benefits

Using the Master Files support in Oxygen XML Editor includes the following benefits:

• When the module is validated, Oxygen XML Editor automatically identifies the master files that include the module and validates all of them.
• The Content Completion Assistant presents all the components that are collected from the master files for the modules they include.
• The Outline view displays all the components that are defined in the master files hierarchy.
• The master files that are defined for the current module determines the scope of the search and refactoring actions. Oxygen XML Editor performs the search and refactoring actions in the context that the master files determine, thus improving the speed of execution.
Enabling the Master Files Support

Oxygen XML Editor stores the *master files* in a folder located in the **Project** view, as the first child of the project root. The **Master Files Support** is disabled by default. To enable it, select **Enable Master Files Support** from the 🔄 Settings menu in the top-right corner of the **Project** view. You can also select **Enable Master Files Support** from the contextual menu of the **Master Files** directory, or from the contextual menu of the project itself. Oxygen XML Editor allows you to enable or disable the **Master Files Support** for each project you are working on.

When the **Master Files Support** is disabled, Oxygen XML Editor displays a window tip located at the bottom of the project view. This window contains an **Enable** button and a **Read more** link. Clicking the **read more** link takes you to the user guide. Clicking the **Enable** button opens the **Enable Master Files** dialog box. This dialog box contains general information about the **Master Files Support** and allows you to enable it. You can also use the **Detect and Enable** option to detect the **master files** from the current project.

⚠️ **Warning:** Once you close this window tip, Oxygen XML Editor hides it for all projects. You can make the window tip reappear by **resetting Oxygen XML Editor to its default settings**. However, doing so will result in you losing your customized options.

Detecting Master Files

Oxygen XML Editor allows you to detect the **master files** using the 🔄 Detect Master Files option. This action applies to the folders you select in the project. To detect **master files** over the entire project, do one of the following:

- Right-click the root of the project and select 🔄 Detect Master Files.
- Use the 🔄 Detect Master Files from Project option, available in the contextual menu of the Master Files folder.

Both of these options display the **Detect Master Files** wizard. In the first panel you can select the type of **master files** you want Oxygen XML Editor to detect. In the subsequent panel the detected **master files** are presented in a tree-like fashion. The resources are grouped into three categories:

- **Possible master files** - The files presented on the first level in this category are not imported or included from other files. These files are most likely to be set as **master files**.
- **Cycles** - The files that are presented on the first level have circular dependencies between them. Any of the files presented on the first level of a cycle is a possible **master file**.
- **Standalone** - Files that do not include or import other files and are also not included or imported themselves. It is not necessary to set them as **master files**.

To set them as **master files**, simply enable their check-boxes. Oxygen XML Editor marks all the children of a **master file** as modules. Modules are rendered in gray and their tool-tip presents a list of their **master files**. A module can be accessed from multiple **master files**.

The **master files** that are already defined in the project are automatically marked in the tree and cannot be removed. The only way to disable a **master file** is to delete it from the Master Files folder.

The next panel displays a list with the selected **master files**. Click the **Finish** button to add the **master files** in the Master Files folder.

You can use the **Select Master Files** option to automatically mark all **master files**. This action sets all the resources from the **Possible Master Files** category and the first resource of each **Cycle** as **master file**.

Tip: We recommend that you to only add top-level files (files that are at the root of the include/import graph) in the Master Files directory. Keep the file set to a minimum and only add files that import or include other files.

⚠️ **Attention:** If the **Master Files Support** is disabled, the Master Files directory is rendered only if it contains **master files**.

Adding Files to the Master File Directory

The Master Files directory only contains logical folders and linked files. To add files in the Master Files directory, use one of the following methods:

- Right-click a file from your project and select 🔄 Add to Master Files from the contextual menu.
• Select Add Files or Add Edited File from the contextual menu of the Master Files directory.
• Drag and drop files into the Master Files directory.
• From the contextual menu of the Resource Hierarchy Dependencies view, use the Add to Master Files action.

You can view the master files for the current resource in the Properties dialog of the Project view and the master files for the current editor in the Properties and Information views.

Project Validation and Transformation

The Master Files Support is also useful for project-level validation and transformation. When you hover the cursor over a file in the Master Files directory, Oxygen XML Editor displays the Validate and Transform buttons at the right of the file. Select one of these buttons to run a transformation or validation scenario. If the current node is selected, Oxygen XML Editor executes a batch transformation and validation. If the current node is not selected, Oxygen XML Editor executes the validation and transformation for the current node only. The behavior of these actions is the same as the behavior of the corresponding actions that are available in the contextual menu.

Note: The tooltip of the Validate and Transform buttons displays the associated scenarios that you can apply.

When you hover the cursor over the Master Files directory itself, Oxygen XML Editor also displays a Help button. Use this button (or press F1 on your keyboard) to open the Help section regarding the Master Files Support.

Contextual Menu of the Master Files

The contextual menu of the Master Files directory contains the following actions:

New
   Allows you to create a File, Logical Folder, or Project.

Add Files
   Allows you to add master files to the Master Files directory.

Add Edited File
   Use this option to add the currently edited file to the Master Files directory.

Open
   Opens all the files of the Master Files directory.

Paste
   Pastes the files you copy in the Master Files directory.

Rename
   Allows you to rename a file in the Master Files directory.

Refresh
   Refreshes the content of the Master Files directory.

Find/Replace in Files
   Opens the Find/Replace dialog box.

XPath in Files
   Opens the XPath/XQuery Builder view that allows you to compose XPath and XQuery expressions and execute them over the currently edited XML document.

Open/Find Resource
   Opens the Open/Find Resource dialog box.

Check Spelling in Files
   Opens the Check Spelling in Files dialog box.

Format and Indent Files
   Opens the Format and Indent Files dialog box that allows you to configure the format and indent (pretty print) action that will be applied on the selected documents.
Transform

Provides access to one of the following actions:

- **Apply Transformations Scenario(s)**
  Applies the transformation scenarios associated with the Master Files directory.

- **Configure Transformation Scenario(s)**
  Opens the Configure Transformation Scenario dialog box.

- **Transform with**
  Opens the Transform with dialog box that allows you to select the transformation scenario you want to execute.

Validate

Provides access to one of the following actions:

- **Check Well-Formedness**
  Allows you to check if a document is Namespace Well-Formed XML.

- **Validate**
  Oxygen XML Editor performs the validation of the master files.

- **Validate with Schema**
  Opens the Validate with dialog box. Oxygen XML Editor performs the validation of the master files using a schema.

- **Configure Validation Scenario(s)**
  Opens the Configure Validation Scenario dialog box.

- **Detect Master Files from Project**
  Enables automatic detection of master files.

Enable Master Files Support
Select this option to enable the Master Files Support.

Editing XML Documents

This section explains the various features in Oxygen XML Editor for editing XML documents. It includes information about the user interface components and actions that are available in the various editing modes and numerous features to help you edit XML documents in any mode.

Related information

- Text Editing Mode on page 177
- Author Editing Mode on page 200
- Grid Editing Mode on page 197

Editing XML Documents in Text Mode

The Oxygen XML Editor Text editing mode is designed to be a simple, yet powerful, XML source editor. You can use this mode to edit XML code, markup, and text and it provides support to help you transform, and debug XML-based documents. It is similar to other common text editors, but Oxygen XML Editor also includes specialized editing actions, a powerful Content Completion Assistant, a helpful Outline view, and many other unique features.

To enter this mode, click the Text button at the bottom of the editing area.

Navigating the Document Content in Text Mode

Oxygen XML Editor includes some useful features to help you navigate XML documents in Text mode.
Using the Keyboard

Oxygen XML Editor allows you to quickly navigate through a document using the Ctrl + CloseBracket (Command + CloseBracket on OS X) key to go to the next XML node and Ctrl + OpenBracket (Command + OpenBracket on OS X) to go to the previous one.

To navigate one word forward or backwards, use Ctrl + RightArrow (Command + RightArrow on OS X), and Ctrl + LeftArrow (Command + LeftArrow on OS X), respectively. To position the cursor at the beginning or end of the document you can use Ctrl + Home (Command + Home on OS X), and Ctrl + End (Command + End on OS X), respectively.

Navigation Buttons

Oxygen XML Editor includes some actions that help you to quickly navigate to a particular modification. These navigation buttons are available in the main toolbar and the actions can also be accessed from the Find menu. The three actions include:

- Last Modification - Moves the cursor to the last modification in any opened document.
- Back - Moves the cursor to the previous position.
- Forward - Moves the cursor to the next position. Enabled after at least one press of the Back button.

Navigating with the Outline View

Oxygen XML Editor includes a very useful Outline view that displays a hierarchical tag overview of the currently edited XML Document.

You can use this view to quickly navigate through the current document by selecting nodes in the outline tree. It is synchronized with the editor area, so when you make a selection in the Outline view, the corresponding nodes are highlighted in the editor area.

Figure 117: Outline View Navigation in Text Mode

Using the Breadcrumb to Navigate

A breadcrumb on the top stripe indicates the path from the document root element to the current element. It can also be used as a helpful tool to navigate to specific elements throughout the structure of the document.

Figure 118: Breadcrumb in Text Mode

The last element listed in the breadcrumb is the element at the current cursor position. The current element is also highlighted by a thin light blue bar for easy identification. Clicking an element from the breadcrumb selects the entire element and navigates to it in the editor area.

Navigating with the Go To Dialog Box

In Text mode, you can navigate precisely to a location in the document you are editing by using the Go to dialog box. To open this dialog box, go to Find > Go to (Ctrl+L (Command+L on OS X)).
The dialog box includes the following fields for specifying a specific navigation location:

- **Line** - Destination line in the current document.
- **Column** - Destination column in the current document.
- **Offset** - Destination offset relative to the beginning of document.

### Navigating with Bookmarks

By using bookmarks, you can mark positions in an edited document so that you can return to it later. This is especially helpful for navigating through large documents or while editing multiple documents. You can place up to nine distinct bookmarks in any document. shortcut keys are available to place the bookmarks or to return to any of the marked positions. You can configure these shortcut keys in the **Options > Menu Shortcut Keys** menu.

### Figure 120: Editor Bookmarks

A bookmark can be inserted in **Text** mode by doing one of the following:

- Click in the vertical stripe on the left side of the editor (to the left of the line number).
- Select the **Create Bookmark (F9)** action from the **Edit > Bookmarks** menu.

A bookmark can be removed by right-clicking its icon on the vertical stripe and selecting **Remove** or **Remove all (Ctrl+F7 (Command+F7 on OS X)).**

You can navigate the bookmarks by using one of the actions available on the **Edit > Bookmarks > Go to** menu or by using the shortcut keys that are listed in that menu.

### Smart Editing in Text Mode

Oxygen XML Editor includes **smart editing** features to help you edit XML documents in **Text** mode. The following smart editing features are included:

- **Closing tag auto-expansion** - This feature helps save some keystrokes by automatically inserting a closing tag when you insert a complete start tag and the cursor is automatically placed in between the start and end tags. For instance, after entering a start `<tag>`, the corresponding closing `</tag>` is automatically inserted and the cursor is placed between the two `<tag>`.</tag>.
- **Auto-rename matching tag** - When you edit the name of a start tag, Oxygen XML Editor will mirror-edit the name of the matching end tag. This feature can be controlled from the **Content Completion option page**.
- **Auto-breaking the edited line** - The **Hard line wrap option** automatically breaks the edited line when its length exceeds the maximum line length defined for the format and indent operation.
- **Indent on Enter** - The **Indent on Enter option** indents the new line inserted when you press **Enter**.
- **Smart Enter** - The **Smart Enter option** inserts an empty line between the start and end tags. If you press **Enter** between a start and end tag, the action places the cursor in an indented position on the empty line between the lines that contain the start and end tag.
- **Double-click** - A double-click selects certain text, depending on the position of the click in the document:
  - If the click position is on a start tag or end tag, then the element name is selected.
  - If the click position is immediately after the opening quote or immediately before the closing quote of an attribute value, then the entire attribute value is selected.
  - Otherwise, a double-click selects contiguous text.

- **Triple-click** - A triple-click selects entire regions of text, depending on the click position:
  - If the click position is on a start or end tag, then the entire tag is selected, including the start and end tags, and the content in between.
  - If the click position is after a start tag or before an end tag, then the entire content of the element without the start and end tags is selected.
  - If the click position is before a start tag or after an end tag, then the entire tag is selected, including the start and end tags, and the content in between.
  - If the click position is immediately before an attribute, then the entire attribute and its value is selected.
  - If the click position is in between the opening and closing quotes of an attribute value, then the entire attribute value is selected.
  - Otherwise, it selects the entire current line of text.

### Shortcut Actions in Text Mode

Oxygen XML Editor includes numerous shortcut actions to help you edit content in the **Text** editing mode.

#### Changing the Font Size (Zoom)

The font size of the editor panel can be changed with the following actions that are available with shortcuts or in the **Document > Font size** menu:

**Increase editor font** *(Ctrl + NumPad+ (Command + NumPad+ on OS X) or Ctrl + MouseWheelForward (Windows/Linux))*

Increases the font size (zooms in) with one point for each execution of the action.

**Note:** For Mac OS X, if you activate the **Enable mouse-wheel zooming option** in the **Editor** preferences page, you can use **Command + MouseWheelForward** to increase the font size (zoom in). It is disabled by default due to the way inertia affects the mouse wheel on Mac OS X.

**Decrease editor font** *(Ctrl + NumPad- (Command + NumPad- on OS X) or Ctrl + MouseWheelBackwards (Windows/Linux))*

Decreases the font size (zooms out) with one point for each execution of the action.

**Note:** For Mac OS X, if you activate the **Enable mouse-wheel zooming option** in the **Editor** preferences page, you can use **Command + MouseWheelBackwards** to decrease the font size (zoom out). It is disabled by default due to the way inertia affects the mouse wheel on Mac OS X.

**Normal editor font** *(Ctrl + 0 (Command + 0 on OS X))*

Resets the font size to the **value of the editor font set in the Fonts preferences page**.

#### Undo/Redo Actions

The typical undo and redo actions are available with shortcuts or in the **Edit** menu:

**Undo** *(Ctrl + Z (Command + Z on OS X))*

Reverses a maximum of 200 editing actions (configurable with the **Undo history size option** in the **Editor** preferences page) to return to the preceding state.

**Note:** Complex operations such as **Replace All** or **Indent selection** count as single undo events.

**Redo** *(Ctrl + Y (Command + Shift + Z on OS X, Ctrl + Shift + Z on Linux/Unix))*

Recreates a maximum of 100 editing actions that were undone by the **Undo** function.
Copy and Paste Actions
The typical copying and pasting actions are available with shortcuts or in the contextual menu (or the Edit menu):

- **Cut (Ctrl + X (Command + X on OS X))**
  Removes the current selected content from the document and places it in the clipboard.

- **Copy (Ctrl + C (Command + C on OS X))**
  Places a copy of the current selected content in the clipboard.

- **Paste (Ctrl + V (Command + V on OS X))**
  Inserts the current clipboard content into the document at the cursor position.

- **Select All (Ctrl + A (Command + A on OS X))**
  Selects the entire content of the current document.

Moving XML Nodes
You can use the following shortcuts to move XML elements or XSLT variables up or down in Text mode:

- **Ctrl + Alt + UpArrow (Command + Alt + UpArrow on OS X)**
  Moves the node up one line.

- **Ctrl + Alt + DownArrow (Command + Alt + DownArrow on OS X)**
  Moves the node down one line.

  **Note:** The requirements for these node moving actions to work are as follows:
  - The mechanism is designed to work without a selection. If you use these actions on a selection of content, it moves the entire selection. To make this mechanism work as intended, simply position the cursor somewhere on the line that you want to move.
  - A start tag must be the first text occurrence on the line where the cursor is positioned.
  - On the line where the element ends, only whitespaces are allowed after the end tag.

Miscellaneous Shortcut Actions in Text Mode
Oxygen XML Editor also includes the following other miscellaneous shortcut actions in Text mode:

- **Ctrl + Delete (Command + Delete on OS X)**
  Deletes the next word.

- **Ctrl + Backspace (Command + Backspace on OS X)**
  Deletes the previous word.

- **Ctrl + W (Command + W on OS X)**
  Cuts the previous word.

- **Ctrl + K (Command + K on OS X)**
  Cuts to end of line.

- **Ctrl + Single-Click (Command + Single-Click on OS X)**
  Use this shortcut to open any of the following:
  - Any absolute URL (URLs that have a protocol), regardless of their location in the document.
  - URI attributes such as: schemaLocation, noNamespaceSchemaLocation, href and others.
  - Processing instructions used for associating resources, xml-models, xml-stylesheets.

- **Ctrl + Shift + Y (Command + Shift + Y on OS X) (Document > Edit > Toggle Line Wrap)**
  Enables or disables line wrapping. When enabled, if text exceeds the width of the displayed editor, content is wrapped so that you do not have to scroll horizontally.

*Frequently Used Shortcut Keys* on page 17
Editing XML Markup in Text Mode

Oxygen XML Editor includes some useful actions that allow you to easily edit XML markup in Text mode. These actions are available in the Refactoring submenu of the contextual menu and in the Document > Markup menu, and many of the actions can also be done with simple keyboard shortcuts.

Using the Breadcrumb

A breadcrumb on the top stripe indicates the path from the document root element to the current element. It can also be used as a helpful tool to insert and edit specific elements in the document structure.

| book | chapter | sect1 | sect2 | sect3 | para | figure | title |

Figure 121: Breadcrumb in Text Mode

The last element listed in the breadcrumb is the element at the current cursor position. The current element is also highlighted by a thin light blue bar for easy identification. Clicking an element in the breadcrumb selects the entire element in the editor area. Also, each element provides a contextual menu with access to the following actions:

- **Append Child**
  - Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it as a child of the current element.

- **Insert Before**
  - Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it immediately before the current element, as a sibling.

- **Insert After**
  - Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it immediately after the current element, as a sibling.

- **Edit Attributes**
  - Opens an editing window that allows you to edit the attributes of the currently selected element.

- **Toggle Comment**
  - Encloses the currently selected element in an XML comment, if the element is not already commented. If it is already commented, this action will remove the comment.

- **Cut**
  - Removes the selected element and copies it to the clipboard.

- **Copy**
  - Copies the selected element to the clipboard.

- **Delete**
  - Deletes the currently selected element.

**Move Nodes**

You can easily move XML nodes in the current document by using the following shortcut keys:

- **Alt + UpArrow**
  - Moves the current node or selected nodes in front of the previous node.

- **Alt + DownArrow**
  - Moves the current node or selected nodes after the subsequent node.

**Rename Elements**

You can rename elements by using the following actions in the Refactoring submenu of the contextual menu (or from the Document > Markup menu):
**Rename Element**

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the Rename dialog box.

**Rename Prefix (Alt + Shift + P (Command + Shift + P on OS X))**

The prefix of the element from the cursor position, and any elements with the same prefix, can be renamed according with the options from the Rename dialog box.

- If you select the **Rename current element prefix** option, the application will recursively traverse the current element and all its children. For example, to change the xmlns:p1="ns1" association in the current element to xmlns:p5="ns1", if the xmlns:p1="ns1" association is applied on the parent element, then Oxygen XML Editor will introduce xmlns:p5="ns1" as a new declaration in the current element and will change the prefix from p1 to p5. If p5 is already associated with another namespace in the current element, then the conflict will be displayed in a dialog box. By pressing OK, the prefix is modified from p1 to p5 without inserting a new declaration.
- If you select the **Rename current prefix in all document** option, the application will apply the change on the entire document.
- To also apply the action inside attribute values, check the **Rename also attribute values that start with the same prefix** checkbox.

**Surround Content with Tags (Wrap)**

You can surround a selection of content with tags (wrap the content) by using the following action in the Refactoring submenu of the contextual menu (or from the Document > Markup menu):

- **Surround with submenu**
  Presents a drop-down menu that allows you to choose a tag to surround a selected portion of content.

- **Surround with Tags (Ctrl + E (Command + E on OS X))**
  Allows you to choose a tag that encloses a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.
  - If the **Position cursor between tags** option is enabled in the Content Completion preferences page, the cursor is placed between the start and end tag.
  - If the **Position cursor between tags** option is disabled in the Content Completion preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

- **Surround with '[tag]' (Ctrl + ForwardSlash (Command + ForwardSlash on OS X))**
  Surround the selected content with the last tag used.

**Unwrap the Content of Elements**

You can unwrap the content of an element by using the following action in the Refactoring submenu of the contextual menu (or from the Document > Markup menu):

- **Delete element tags (Alt + Shift + X (Command + Alt + X on OS X))**
  Deletes the start and end tag of the current element.

**Join or Split Elements**

You can join or split elements in the current document by using the following actions in the Refactoring submenu of the contextual menu (or from the Document > Markup menu):

- **Join elements (Alt + Shift + J (Command + Alt + J on OS X))**
  Joins the left and right elements relative to the current cursor position. The elements must have the same name, attributes, and attributes values.

- **Split element (Alt + Shift + D (Ctrl + Alt + D on OS X))**
  Split the element from the cursor position into two identical elements. The cursor must be inside the element.
**Other Refactoring Actions**

You can also manage the structure of the markup by using the other specific XML refactoring actions that are available in the **Refactoring** submenu of the contextual menu:

**Attributes submenu**
Contains predefined XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

- **Add/Change attribute**
  Allows you to change the value of an attribute or insert a new one.

- **Delete attribute**
  Allows you to remove one or more attributes.

- **Rename attribute**
  Allows you to rename an attribute.

- **Replace in attribute value**
  Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

**Comments submenu**
Contains predefined XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

- **Delete comments**
  Allows you to delete comments found inside one or more elements.

**DITA submenu**
Contains predefined XML refactoring operations that pertain to DITA documents with some of the information preconfigured based upon the current context.

- **Change topic ID to file name**
  Changes the ID of a topic to be the same as its file name.

- **Convert simple tables to CALS tables**
  Converts all DITA simple tables to CALS tables in the specified scope.

**Elements submenu**
Contains predefined XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

- **Delete element**
  Allows you to delete elements.

- **Delete element content**
  Allows you to delete the content of elements.

- **Insert element**
  Allows you to insert new elements.

- **Rename element**
  Allows you to rename elements.

- **Unwrap element**
  Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

- **Wrap element**
  Allows you to surround elements with element tags.

- **Wrap element content**
  Allows you to surround the content of elements with element tags.

**Fragments submenu**
Contains predefined XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.
Insert XML fragment
Allows you to insert an XML fragment.

Replace element content with XML fragment
Allows you to replace the content of elements with an XML fragment.

Replace element with XML fragment
Allows you to replace elements with an XML fragment.

JATSKit submenu
Contains predefined XML refactoring operations that pertain to JATS documents with some of the information preconfigured based upon the current context.

Add BITS DOCTYPE - NLM/NCBI Book Interchange 2.0
Adds an NLM ‘BITS’ 2.0 DOCTYPE declaration.

Add Blue DOCTYPE - NISO JATS Publishing 1.1
Adds a JATS ‘Blue’ 1.1 DOCTYPE declaration.

Normalize IDs
Assigned IDs are normalized and IDs are assigned to some elements that are missing them.

Folding XML Elements in Text Mode

When working with a large document, the folding support in Oxygen XML Editor can be used to collapse some element content leaving only those that you need to edit in focus. Expanding and collapsing works on individual elements. Expanding an element leaves the child elements unchanged.

By default, the folding feature is enabled in Oxygen XML Editor, but it can be disabled in the Text preferences page with the Enable folding option.

```
<xs:template match="articledescription"> ...[28 lines]
  <xs:apply-templates/>
</xs:template>

<xs:template match="code">
  <ul>
    <li class="textSmall">
      <xs:for-each select="coderow"> ...[2 lines]
        <p>
        </p>
      </xs:for-each>
    </li>
  </ul>
</xs:template>
```

Figure 122: Folding of XML Elements in Text Mode

The fact that the folds are persistent is a unique feature of Oxygen XML Editor. The next time you open the document the folds are restored to its last state.

Folding Actions in Text Mode

Element folds are marked with a small triangle ( ▼ ) in the left stripe. To toggle the fold, simply click the icon. Also, if you right-click the icon, the following actions are available:

- Collapse Other Folds (Ctrl + NumPad/ (Command + NumPad/ on OS X))
  Folds all the elements except the current element.

- Collapse Child Folds (Ctrl + NumPad. (Command + NumPad. on OS X))
  Folds the child elements that are indented one level inside the current element.
Expand Child Folds

Unfolds all child elements of the currently selected element.

Expand All (Ctrl + NumPad* (Command + NumPad* on OS X))

Unfolds all elements in the current document.

To watch our video demonstration about the folding support in Oxygen XML Editor, go to https://www.oxygenxml.com/demo/FoldingSupport.html.

Drag and Drop in Text Mode

To move a whole region of text to other location in the same edited document, just select the text, drag the selection by holding down the left mouse button and drop it to the target location.

You can also copy content from other applications and paste it into the document.

Selecting Content in Text Mode

Oxygen XML Editor includes a variety of keyboard shortcuts that allow you to select content in Text mode. These include numerous standard continuous selection possibilities that are common to many text editors, as well as a selection feature that allows you to select a rectangular area within a document in Text mode.

Standard Continuous Selection Shortcuts

Ctrl + A (Meta + A on Mac OS X)

Selects all content in the document.

Shift + Left/Right Arrow Keys

Begins a continuous selection at the cursor position and extends it one character at a time in the direction that you press the arrow keys.

Shift + Up/Down Arrow Keys

Begins a continuous selection at the cursor position and extends it one line at a time in the direction that you press the arrow keys.

Ctrl + Shift + Left/Right Arrow Keys (Meta + Shift + Left/Right Arrow Keys on Mac OS X)

Begins a continuous selection at the cursor position and extends it one word at a time in the direction that you press the arrow keys.

Shift + Home

Begins a continuous selection at the cursor position and extends it to the beginning of the current line (on Mac OS X, it extends to the beginning of the document).

Shift + End

Begins a continuous selection at the cursor position and extends it to the end of the current line (on Mac OS X, it extends to the end of the document).

Ctrl + Shift + Home

Begins a continuous selection at the cursor position and extends it to the beginning of the document.

Ctrl + Shift + End

Begins a continuous selection at the cursor position and extends it to the end of the document.

Shift + PageUp

Begins a continuous selection at the cursor position and extends it up one screen page.

Shift + PageDown

Begins a continuous selection at the cursor position and extends it down one screen page.

Double-Click

Selects certain text, depending on the position of the click in the document. See Smart Editing Double-Click for the specifics.

Triple-Click

Selects entire regions of text, depending on the position of the click in the document. See the Smart Editing Triple-Click for the specifics.
Right-Click > Select > Element
Selects the entire element at the current cursor position.

Right-Click > Select > Content
Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

Right-Click > Select > Attributes
Selects all the attributes of the element at the current cursor position.

Right-Click > Select > Parent
Selects the entire parent element at the current cursor position.

Rectangular Selection Shortcuts
Oxygen XML Editor also includes some keyboard shortcuts that allow you to select a rectangular block of content in Text mode and you can then copy, cut, paste, delete, or edit the selection.

Attention: The rectangular selection shortcuts will not work if the Line Wrap option is enabled in the Text preferences page.

The following shortcuts can be used to create a rectangular selection:

Alt + Mouse Click + Mouse Movement (Alt + Meta + Mouse Click + Mouse Movement on Mac OS X)
Begins a rectangular selection at the mouse click position and extends it in the direction that you move the mouse. Release Alt (Alt + Meta on Mac OS X) to enter the in-place editing mode.

Shift + Alt + Left/Right Arrow Keys (Shift + Alt + Meta + Left/Right Arrow Keys on Mac OS X)
Begins a rectangular selection at the cursor position and extends it one character at a time in the direction that you press the arrow keys (you can also use the mouse to extend the selection).

Shift + Alt + Up/Down Arrow Keys (Shift + Alt + Meta + Up/Down Arrow Keys on Mac OS X)
Begins a rectangular selection at the cursor position and extends it one line at a time in the direction that you press the arrow keys (you can also use the mouse to extend the selection).

Ctrl + Shift + Alt + Left/Right Arrow Keys (Ctrl + Shift + Alt + Meta + Left/Right Arrow Keys on Mac OS X)
Begins a rectangular selection at the cursor position and extends it one word at a time in the direction that you press the arrow keys.

Shift + Alt + Home (Shift + Alt + Meta + Home on Mac OS X)
Begins a rectangular selection at the cursor position and extends it to the beginning of the current line.

Shift + Alt + End (Shift + Alt + Meta + End on Mac OS X)
Begins a rectangular selection at the cursor position and extends it to the end of the current line.

Shift + Alt + PageUp (Shift + Alt + Meta + PageUp on Mac OS X)
Begins a rectangular selection at the cursor position and extends it up one screen page.

Shift + Alt + PageDown (Shift + Alt + Meta + PageDown on Mac OS X)
Begins a rectangular selection at the cursor position and extends it down one screen page.

You can then use standard editing actions to copy, cut, paste, or delete the entire selection.

In-Place Editing Mode
To edit the content of the rectangular selection, you can enter an in-place editing mode by releasing the Alt key (on Mac OS X, release both Alt & Meta). Once you are in the editing mode, you can simply use your keyboard to edit the entire selection of content, or click anywhere inside the selection to edit the content at the cursor position for all lines within the selection at once (as if the rectangular selection is a selection of columns). To exit the editing mode, press either Enter or Esc.

Content Completion Assistant in Text Mode
Oxygen XML Editor includes an intelligent Content Completion Assistant that offers rapid, in-line identification and insertion of structured language elements, attributes, and attribute values. Oxygen XML Editor shows the available entries that are valid in the current editing context.
The Content Completion Assistant feature is schema-driven (XML Schema, DTD, and RELAX NG) and status information about the detected schema is logged in the Information view.

The Content Completion Assistant is enabled by default. To disable it, open the Preferences dialog box (Options > Preferences), go to Editor > Content Completion, and disable the Enable content completion option.

Using the Content Completion Assistant in Text Mode

The feature is activated in Text mode in the following situations:

- After you press the `<` character when inserting an element, it is automatically activated after a short delay. You can adjust the activation delay with the Activation delay of the proposals window (ms) option from the Content Completion preferences page.
- After typing a partial element or attribute name, you can activate it by pressing Ctrl + Space (Command + Space on OS X) or Alt + ForwardSlash (Command + Alt + ForwardSlash on OS X). If there is only one valid proposal at the current location, it is inserted without displaying the list of proposals.

When active, the Content Completion Assistant displays a list of context-sensitive proposals valid at the current cursor position. You can navigate through the list of proposals by using the Up and Down keys on your keyboard. For each selected item in the list, the Content Completion Assistant displays a documentation window. You can customize the size of the documentation window by dragging its top, right, and bottom borders.

To insert the selected content in Text mode, do one of the following:

- Press Enter or Tab to insert both the start and end tags and position the cursor inside the start tag in a position suitable for inserting attributes.
- Press Ctrl + Enter (Command + Enter on OS X) to insert both the start and end tags and positions the cursor between the tags in a position where you can start typing content.

Note: When the DTD, XML Schema or RELAX NG schema specifies required child elements for the newly added element, they are inserted automatically only if the Add Element Content option (in the Content Completion preferences page) is enabled. The Content Completion Assistant can also add optional content and first choice particle, as specified in the DTD, XML Schema, or RELAX NG schema. To activate these features, select the Add optional content and Add first Choice particle options in the Content Completion preferences page.

After inserting an element, the cursor is positioned:

- Before the `>` character of the start tag, if the element allows attributes, to enable rapid insertion of any of the attributes supported by the element. Pressing the space bar displays the Content Completion list once again. This time it contains the list of allowed attribute names. If the attribute supports a fixed set of parameters, the assistant list displays the list of valid parameters. If the parameter setting is user-defined and therefore variable, the assistant is closed to enable manual insertion. The values of the attributes can be learned from the same elements in the current document.
- After the `>` character of the start tag if the element has no attributes.

Where the Content Completion Assistant is Displayed

The Content Completion Assistant is displayed:

- Anywhere within a tag name or at the beginning of a tag name in an XML document, XML Schema, DTD, or Relax NG (full or compact syntax) schema.
Anywhere within an attribute name or at the beginning of an attribute name in any XML document with an associated schema.

Within attribute values or at the beginning of attribute values in XML documents where lists of possible values have been defined for that element in the schema associated with the document.

Types of Proposals Listed in the Content Completion Assistant

The following things are considered for determining the proposals that are listed in the content completion window:

- The proposals that populate the **Content Completion Assistant** depend on the element structure specified in the DTD, XML Schema, Relax NG (full or compact syntax) schema, or NVDL schema associated with the edited document.

  Note: The **Content Completion Assistant** is able to offer elements defined both by XML Schemas version 1.0 and 1.1.

- The number and type of elements displayed by the **Content Completion Assistant** is dependent on the cursor's current position in the structured document. The child elements displayed within a given element are defined by the structure of the specified DTD, XML Schema, Relax NG (full or compact syntax) schema, or NVDL schema.

- A schema may declare certain attributes as *ID* or *IDREF/IDREFS*. When the document is validated, Oxygen XML Editor checks the uniqueness and correctness of the *ID* attributes. It also collects the attribute values declared in the document to prepare the list of proposals. This is available for documents that use DTD, XML Schema, and Relax NG schema.

- Values of all the `xml:id` attributes are handled as *ID* attributes. They are collected and displayed by the **Content Completion Assistant** as possible values for *anyURI* attributes defined in the schema of the edited document. This works only for XML Schema and Relax NG schemas.

- For documents that use an XML Schema or Relax NG schema, the content assistant offers proposals for attributes and elements values that have an enumeration of tokens as the type. Also, if a default value or fixed value is defined in the XML Schema used in validation for an attribute or element, then that value is offered in the **Content Completion Assistant** window.

Related information

*Customizing the Content Completion Assistant* on page 1182

Set Schema to be Used for Content Completion in Text Mode

The list of proposals in the **Content Completion Assistant** depend on the associated schemas. The DTD, XML Schema, Relax NG, or NVDL schema used to populate the **Content Completion Assistant** is specified in the following methods, in the order of their precedence:

- The *schema specified explicitly in the document*. In this case, Oxygen XML Editor reads the beginning of the document and resolves the location of the DTD, XML Schema, Relax NG schema, or NVDL schema.

- The *default schema declared in the Document Type configuration dialog box* that matches the edited document type.

- For XSLT stylesheets, the schema specified in the Oxygen XML Editor *XSL preferences page*. Oxygen XML Editor will read the content completion settings when the prolog fails to provide or resolve the location of a DTD, XML Schema, Relax NG, or NVDL schema.

- For XML Schemas, the schema specified in the Oxygen XML Editor *XSD preferences page*. Oxygen XML Editor will read the content completion settings and the specified schema will enhance the content completion inside the `xs:annotation/xs:appinfo` elements of the XML Schema.

Oxygen XML Editor creates the content completion lists by analysing the detected schema and the current context (the position in the editor). If you change the schema, then the list of tags to be inserted is also updated.
Figure 124: Example: Content Completion Driven by DocBook DTD

Schema Annotations in Text Mode

A schema annotation is a documentation snippet associated with the definition of an element or attribute in a schema. If such a schema is associated with an XML document, the annotations are displayed in:

- The Content Completion Assistant.
- A small tooltip window shown when the mouse hovers over an element or attribute. The tooltip window can be invoked at any time by using the F2 shortcut.

The schema annotations support is available if the schema type is one of the following:

- XML Schema
- Relax NG
- NVDL schema
- DTD

This feature is enabled by default, but you can disable it by deselecting the Show annotations in Content Completion Assistant option in the Annotations preferences page.

Styling Annotations with HTML

You can use HTML format in the annotations you add in an XML Schema or Relax NG schema. This improves the visual appearance and readability of the documentation window displayed when editing XML documents validated against such a schema. An annotation is recognized and displayed as HTML if it contains at least one HTML element (such as div, body, p, br, table, ul, or ol).

The HTML rendering is controlled by the Show annotations using HTML format, if possible option in the Annotations preferences page. When this options is disabled, the annotations are converted and displayed as plain text and if the annotation contains one or more HTML tags (p, br, ul, li), they are rendered as an HTML document loaded in a web browser. For example, p begins a new paragraph, br breaks the current line, ul encloses a list of items, and li encloses an item of the list.

Collecting Annotations from XML Schemas

In an XML Schema, the annotations are specified in an <xs:annotation> element like this:

```
<xs:annotation>
  <xs:documentation>
    Description of the element.
  </xs:documentation>
</xs:annotation>
```

If an element or attribute does not have a specific annotation, then Oxygen XML Editor looks for an annotation in the type definition of that element or attribute.

Collecting Annotations from Relax NG Schemas

For Relax NG schema, element and attribute annotations are made using the <documentation> element from the http://relaxng.org/ns/compatibility/annotations/1.0 namespace. However, any element outside the Relax NG namespace (http://relaxng.org/ns/structure/1.0) is handled as annotation and the text content is
displayed in the annotation window. To activate this behavior, enable the *Use all Relax NG annotations as documentation* option in the *Annotations* preferences page.

**Collecting Annotation from DTDs**

For DTD, Oxygen XML Editor defines a custom mechanism for annotations using comments enabled from the *Prefer DTD comments that start with "doc:" as annotations* option in the *Annotations* preferences page. The following is an example of a DTD annotation:

```
<!--doc:Description of the element. -->
```

**Content Completion Helper Views**

Information about the current element being edited is also available in various views, such as the *Model* view, *Attributes* view, *Elements* view, and *Entities* view. By default, they are located on the right-hand side of the main editor window. These views, along with the powerful *Outline* view, provide spatial and insight information about the edited document and the current element.

**Model View**

The *Model* view presents the structure of the currently selected tag, and its documentation, defined as annotation in the schema of the current document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the *Window > Show View* menu.

![Model View](image)

**Figure 125: Model View**

The *Model* view is comprised of two sections, an element structure panel and an annotations panel.

**Element Structure Panel**

The element structure panel displays the structure of the currently edited or selected tag in a tree-like format. The information includes the name, model, and attributes of the current tag. The allowed attributes are shown along with imposed restrictions, if any.
Annotation Panel

The Annotation panel displays the annotation information for the currently selected element. This information is collected from the XML schema.

Attributes View in Text Mode

The Attributes view presents all the attributes of the current element determined by the schema of the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the Window > Show View menu.

You can use the Attributes view to insert attributes, edit their values, or add values to existing attributes.

The attributes are rendered differently depending on their state:

- The names of the attributes are rendered with a bold font, and their values with a plain font.
- Default values are rendered with a plain font, painted gray.
- Empty values display the text "[empty]", painted gray.
- Invalid attributes and values are painted red.

To edit the value of the corresponding attribute, double-click a cell in the Value column. If the possible values of the attribute are specified as list in the schema of the edited document, the Value column acts as a combo box that allows you to either select the value from a list or manually enter it.

You can sort the attributes table by clicking the Attribute column header. The table contents can be sorted as follows:

- By attribute name in ascending order.
- By attribute name in descending order.
- Custom order, where the used attributes are displayed at the beginning of the table sorted in ascending order, followed by the rest of the allowed elements sorted in ascending order.
There is an Expand/Collapse button at the top-right of the view. When expanded, this presents the following additional combo boxes:

**Name Combo Box**
Use this combo box to select an attribute. The drop-down list displays the list of possible attributes allowed by the schema of the document, as in the Attributes view. You can use the Remove button to delete an attribute and its value from the selected element.

**Value Combo Box**
Use this combo box to add, edit, or select the value of an attribute. If the selected attribute has predefined values in the schema, the drop-down list displays those possible values. You can use the Browse button to select a URL for the value of an attribute. After you have entered or selected a value, use the Update button (or press Enter) to add the value to the attribute.

### Contextual Menu Actions in the Attributes View
The following actions are available in the contextual menu of the Attributes view when editing in Text mode:

**Add**
Allows you to insert a new attribute. Adding an attribute that is not in the list of all defined attributes is not possible when the Allow only insertion of valid elements and attributes schema aware option is enabled.

**Set empty value**
Specifies the current attribute value as empty.

**Remove**
Removes the attribute (action available only if the attribute is specified). You can invoke this action by pressing the (Delete) or (Backspace) keys.

**Copy**
Copies the attrName="attrValue" pair to the clipboard. The attrValue can be:
- The value of the attribute.
- The value of the default attribute, if the attribute does not appear in the edited document.
- Empty, if the attribute does not appear in the edited document and has no default value set.

**Paste**
Depending on the content of the clipboard, the following cases are possible:
- If the clipboard contains an attribute and its value, both of them are introduced in the Attributes view. The attribute is selected and its value is changed if they exist in the Attributes view.
- If the clipboard contains an attribute name with an empty value, the attribute is introduced in the Attributes view and you can start editing it. The attribute is selected and you can start editing it if it exists in the Attributes view.
• If the clipboard only contains text, the value of the selected attribute is modified.

**Elements View in Text Mode**

The **Elements** view presents a list of all defined elements that are valid at the current cursor position according to the schema associated to the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

Double-clicking any of the listed elements inserts that element into the edited document, at the current cursor position.

![Elements View](image)

**Figure 129: Elements View in Text Mode**

**Entities View**

**Entities** provide abbreviated entries that can be used in XML files when there is a need of repeatedly inserting certain characters or large blocks of information. An **entity** is defined using the **ENTITY** statement either in the DOCTYPE declaration or in a DTD file associated with the current XML file.

There are three types of entities:

• **Built-in or Predefined** - Entities that are part of the predefined XML markup (`<`, `&`, `;`).
• **Internal** - Defined in the DOCTYPE declaration header of the current XML.
• **External** - Defined in an external DTD module included in the DTD referenced in the XML DOCTYPE declaration.

**Note:** If you want to add internal entities, you would need to switch to the Text editing mode and manually modify the DOCTYPE declaration. If you want to add external entities, you need to open the DTD module file and modify it directly.

The **Entities** view displays a list with all entities declared in the current document, as well as built-in ones. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

Double-clicking one of the entities will insert it at the current cursor position in the XML document. You can also sort entities by name and value by clicking the column headers.
The view features a filtering capability that allows you to search an entity by name, value, or both. Also, you can choose to display the internal or external entities.

Note: When entering filters, you can use the ? and * wildcards. Also, you can enter multiple filters by separating them with a comma.

**Code Templates**

Code templates are code fragments that can be inserted quickly at the current editing position. Oxygen XML Editor includes a set of built-in code templates for CSS, LESS, Schematron, XSL, XQuery, and XML Schema document types. You can also define your own code templates and share them with others.

To get a complete list of available code templates, press Ctrl + Shift + Space in Text mode. To enter the code template, select it from the list or type its code and press Enter. If a shortcut key has been assigned to the code template, you can also use the shortcut key to enter it. Code templates are displayed with a . symbol in the content completion list.

When the Content Completion Assistant is invoked (Ctrl + Space (Command + Space on OS X) in Text mode or Enter in Author mode), it also presents a list of code templates specific to the type of the active editor.

To watch our video demonstration about code templates, go to https://www.oxygenxml.com/demo/Code_Templates.html.

**Outline View in Text Mode**

The Outline view in Text mode displays a general tag overview of the currently edited XML Document. When you edit a document, the Outline view dynamically follows the changes that you make, displaying the node that you modify. This functionality gives you great insight on the location of your modifications in the current document. It also shows the correct hierarchical dependencies between elements. This makes it easy for you to be aware of the document structure and the way element tags are nested.

**Outline View Features**

The Outline view allows you to:

- Quickly navigate through the document by selecting nodes in the Outline tree.
- Insert or delete nodes using contextual menu actions.
- Move elements by dragging them to a new position in the tree structure.
- Highlight elements in the editor area. It is synchronized with the editor area, so when you make a selection in the editor area, the corresponding nodes are highlighted in the Outline view, and vice versa.
View document errors, as they are highlighted in the Outline view. A tooltip also provides more information about the nature of the error when you hover over the faulted element.

Outline View Interface

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened from the Window > Show View menu.

The upper part of the Outline view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (*, ?) and separate multiple patterns with commas.

It also includes a Settings menu in the top-right corner that presents a variety of options to help you filter the view even further.

Drop and Drop Actions in the Outline View

Entire XML elements can be moved or copied in the edited document using only the mouse in the Outline view with drag-and-drop operations. Several drag and drop actions are possible:

• If you drag an XML element in the Outline view and drop it on another node, then the dragged element will be moved after the drop target element.
• If you hold the mouse pointer over the drop target for a short time before the drop then the drop target element will be expanded first and the dragged element will be moved inside the drop target element after its opening tag.
• You can also drop an element before or after another element if you hold the mouse pointer towards the upper or lower part of the targeted element. A marker will indicate whether the drop will be performed before or after the target element.
• If you hold down the (Ctrl (Command on OS X)) key after dragging, a copy operation will be performed instead of a move.

The drag and drop actions in the Outline view can be disabled and enabled from a Preferences page.

Figure 131: Outline View in Text Mode

Outline View in Author Mode on page 211

Outline View Filters in Text Mode

The upper part of the Outline view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (*, ?) and separate multiple patterns with commas.

The following actions are available in the Settings menu of the Outline view when editing in Text mode:
Filter returns exact matches

The text filter of the Outline view returns only exact matches.

Selection update on cursor move

Controls the synchronization between Outline view and source document. The selection in the Outline view can be synchronized with the cursor moves or the changes in the editor. Selecting one of the components from the Outline view also selects the corresponding item in the source document.

Flat presentation mode of the filtered results

When active, the application flattens the filtered result elements to a single level.

Show comments and processing instructions

Show/hide comments and processing instructions in the Outline view.

Show element name

Show/hide element name.

Show text

Show/hide additional text content for the displayed elements.

Show attributes

Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from the Outline preferences panel.

Configure displayed attributes

Displays the XML Structured Outline preferences page.

Outline View Contextual Menu Actions in Text Mode

The following actions are available from the contextual menu in the Outline view in Text mode:

Append Child

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it as a child of the current element.

Insert Before

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it immediately before the current element, as a sibling.

Insert After

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it immediately after the current element, as a sibling.

Edit Attributes

Opens a dialog box that allows you to edit the attributes of the currently selected component.

Toggle Comment

Encloses the currently selected element in an XML comment, if the element is not already commented. If it is already commented, this action will remove the comment.

Cut

Cuts the currently selected component.

Copy

Copies the currently selected component.

Delete

Deletes the currently selected component.

Expand More

Expands the structure of a component in the Outline view.
Quick Assist Support for IDs and IDREFS

The Quick Assist support is activated automatically when you place the cursor inside an ID or IDREF in Text mode. To access it, click the yellow bulb help marker placed on the current line, in the line number stripe of the editor. You can also invoke the quick assist menu from the contextual menu or by pressing Alt 1 (Meta Alt 1 on Mac OS X) on your keyboard.

The following actions are available:

- **Rename in**
  Renames the ID and all its occurrences. Selecting this action opens the Rename XML ID dialog box. This dialog box lets you insert the new ID value and choose the scope of the rename operation. For a preview of the changes you are about to make, click Preview. This opens the Preview dialog box, which presents a list with the files that contain changes and a preview zone of these changes.

- **Search Declarations**
  Searches for the declaration of the ID reference. By default, the scope of this action is the current project. If you configure a scope using the Select the scope for the Search and Refactor operations dialog box, this scope will be used instead.

- **Search References**
  Searches for the references of the ID. By default, the scope of this action is the current project. If you configure a scope using the Select the scope for the Search and Refactor operations dialog box, this scope will be used instead.

- **Change scope**
  Opens the Select the scope for the Search and Refactor operations dialog box.

- **Rename in File**
  Renames the ID you are editing and all its occurrences from the current file.

- **Search Occurrences**
  Searches for the declaration an references of the ID located at the cursor position in the current document.

Related information

Inserting or Opening a File at Cursor Location

When editing content in Text mode, the following actions (in regards to inserting, opening, or comparing files) are available in the Document > File menu:

- **Insert File**
  Inserts the content of the file with the specified file path into the current document, at the current position of the cursor.

- **Open File at Cursor**
  Opens the file at the cursor position in a new panel. If the file path represents a directory path, it will be opened in system file browser. If the file at the specified location does not exist, an error dialog box is displayed and it includes a Create new file button that starts the New document wizard. This allows you to choose the type or the template for the file. If the action succeeds, the file is created with the referenced location and name and is opened in a new editor panel.

- **Open File at Cursor in System Application**
  Opens the file (identified by its link) or web page (identified by a web link) found at cursor position. The target is opened in the default system application associated with that file type.

- **Compare**
  Opens the current file in the Compare Files tool.

Adjusting the Transparency of XML Markup

Most of the time you want the content of a document displayed on screen with zero transparency. However, if you want to focus your attention only on editing text content inside XML markup, Oxygen XML Editor offers the option of reducing the visibility of the markup by increasing their transparency when displayed in Text mode. To change the level of transparency,
use the [Tags Transparency Selector] drop-down menu that is available from the Source toolbar. By default, this drop-down menu is not visible. You can add it to the toolbar by using the Configure Toolbars action. There are several levels of transparency that can be adjusted to make the content more or less visible:

- **Normal Contrast** - Resets the transparency level back to normal.
- **Semi-transparent Text** - Slightly reduces the visibility of text to place greater emphasis on the visibility of the XML markup.
- **Transparent Text** - Greatly reduces the visibility of text to place even greater emphasis on the visibility of the XML markup.
- **Semi-transparent Markup** - Slightly reduces the visibility of the XML markup to place greater emphasis on the visibility of the text.
- **Transparent Markup** - Greatly reduces the visibility of the XML markup to place even greater emphasis on the visibility of the text.

![Figure 132: Tags Transparency Selector](https://example.com/f132.png)

**Locking and Unlocking XML Markup**

For documents with fixed markup, such as forms in which the XML tags are not allowed to be modified (only their text content), the possibility to edit the XML tag names can be disabled/enabled with the Lock / Unlock the XML tags action available in Text editing mode from:

- The Document > Source menu.
- The Source submenu from the contextual menu.

You can set the default lock state for all opened editors using the Lock the XML tags option in the Text preferences page.

**Formatting and Indenting XML Documents**

Oxygen XML Editor creates XML documents using several edit modes. In Text mode, you as the author decide how the XML file is formatted and indented. In the other modes, and when you switch between modes, Oxygen XML Editor must decide how to format and indent the XML. Oxygen XML Editor will also format and indent your XML for you in Text mode if you use one of the Format and Indent options:

- **Document > Source > Format and Indent** - Formats and indents the whole document.
- **Document > Source > Indent Selection** - Indents the current selection (but does not add line breaks). This action is also available in the Source submenu of the contextual menu.
- **Document > Source > Format and Indent Element** - Formats and indents the current element (the inmost nested element that currently contains the cursor) and its child-elements. This action is also available in the Source submenu of the contextual menu.

A number of settings affect how Oxygen XML Editor formats and indents XML. Many of these settings have to do with how whitespace is handled.
Significant and insignificant whitespace in XML

XML documents are text files that describe complex documents. Some of the white space (spaces, tabs, line feeds, etc.) in the XML document belongs to the document it describes (such as the space between words in a paragraph) and some of it belongs to the XML document (such as a line break between two XML elements). Whitespace belonging to the XML file is called insignificant whitespace. The meaning of the XML would be the same if the insignificant whitespace were removed. Whitespace belonging to the document being described is called significant whitespace.

Knowing when whitespace is significant or insignificant is not always easy. For instance, a paragraph in an XML document might be laid out like this:

<p>NO Free man shall be taken or imprisoned, or be stripped of his Freedom, or Liberties, or free Customs, or be outlawed, or exiled, or any otherwise destroyed; nor will we not pass upon him, nor condemn him, but by lawful judgment of his Peers, or by the <xref href="http://en.wikipedia.org/wiki/Law_of_the_land" format="html" scope="external">Law of the land</xref>. We will sell to no man, we will not deny to any man either Justice or Right.</p>

By default, XML considers a single whitespace between words to be significant, and all other whitespace to be insignificant. The paragraph above could have been written on one line because the XML parser would see it as exactly the same paragraph since all multiple consecutive whitespaces will be replaced with a single whitespace. Removing the insignificant space in markup like this is called normalizing space.

In some cases, all the spaces inside an element should be treated as significant. For example, in a code sample:

```xml
<codeblock>
class HelloWorld
{
    public static void main(String args[])
    {
        System.out.println("Hello World");
    }
}</codeblock>
```

Here every whitespace character between the codeblock tags should be treated as significant.

How Oxygen XML Editor determines when whitespace is significant

When Oxygen XML Editor formats and indents an XML document, it introduces or removes insignificant whitespace to produce a layout with reasonable line lengths and elements indented to show their place in the hierarchy of the document. To correctly format and indent the XML source, Oxygen XML Editor needs to know when to treat whitespace as significant and when to treat it as insignificant. However it is not always possible to tell this from the XML source file alone. To determine what whitespace is significant, Oxygen XML Editor assigns each element in the document to one of four categories:

Ignore space

In the ignore space category, all whitespace is considered insignificant. This generally applies to content that consists only of elements nested inside other elements, with no text content.

Normalize space

In the normalize space category, a single whitespace character between character strings is considered significant and all other spaces are considered insignificant. Therefore, all consecutive whitespaces will be replaced with a single space. This generally applies to elements that contain text content only.

Mixed content

In the mixed content category, a single whitespace between text characters is considered significant and all other spaces are considered insignificant. However,

- Whitespace between two child elements embedded in the text is normalized to a single space (rather than to zero spaces as would normally be the case for a text node with only whitespace characters, or the space between elements generally).
- The lack of whitespace between a child element embedded in the text and either adjacent text or another child element is considered significant. That is, no whitespace can be introduced here when formatting and indenting the file.
For example:

```xml
<p>The file is located in <i>HOME</i>/USER/hello.
   This is a <strong>big</strong> deal.</p>
```

In this example, whitespace should not be introduced around the i tags as it would introduce extra significant whitespace into the document. The space between the end </strong> tag and the beginning <emphasis> tag should be normalized to a single space, not zero spaces.

**Preserve space**

In the preserve space category, all whitespace in the element is regarded as significant. No changes are made to the spaces in elements in this category. However, child elements may be in another category, and may be treated differently.

Attribute values are always in the preserve space category. The spaces between attributes in an element tag are always in the default space category.

Oxygen XML Editor consults several pieces of information to assign an element to one of these categories. An element is always assigned to the most restrictive category (from Ignore to Preserve) that it is assigned to by any of the sources Oxygen XML Editor consults. For instance, if the element is named on the Default elements list (as described below) but it has an xml:space="preserve" attribute in the source file, it will be assigned to the preserve space category. If an element has the xml:space="default" attribute in the source, but is listed on the Mixed content elements list, it will be assigned to the mixed content category.

To assign elements to these categories, Oxygen XML Editor consults information from the following sources:

- **xml:space**
  - If the XML element contains the xml:space attribute, the element is promoted to the appropriate category based on the value of the attribute.

- **CSS whitespace property**
  - If the CSS stylesheet controlling the Author mode editor applies the whitespace: pre setting to an element, it is promoted to the preserve space category.

- **CSS display property**
  - If a text node contains only white-spaces:
    - If the node has a parent element with the CSS display property set to inline then the node is promoted to the mixed content category.
    - If the left or right sibling is an element with the CSS display property set to inline then the node is promoted to the mixed content category.
    - If one of its ancestors is an element with the CSS display property set to table then the node is assigned to the ignore space category.

- **Schema aware formatting**
  - If a schema is available for the XML document, Oxygen XML Editor can use information from the schema to promote the element to the appropriate category. For example:
    - If the schema declares an element to be of type xs:string, the element will be promoted to the preserve space category because the string built-in type has the whitespace facet with the value preserve.
    - If the schema declares an element to be mixed content, it will be promoted to the mixed content category.

Schema aware formatting can be turned on and off.

- To turn it on or off for Author mode, open the Preferences dialog box (Options > Preferences), go to Editor > Edit modes > Author > Schema aware, and enable/disable the Schema aware normalization, format and indent option.
- To turn it on or off for the Text editing mode, open the Preferences dialog box (Options > Preferences), go to Editor > Format > XML, and enable/disable the Schema aware format and indent option.
Preserve space elements list

If an element is listed in the Preserve space tab of the Element Spacing list in the XML formatting preferences, it is promoted to the preserve space category.

Default space elements list

If an element is listed in the Default space tab of the Element Spacing list in the XML formatting preferences, it is promoted to the default space category.

Mixed content elements list

If an element is listed in the Mixed content tab of the Element Spacing list in the XML formatting preferences, it is promoted to the mixed content category.

Element content

If an element contains mixed content, that is, a mix of text and other elements, it is promoted to the mixed content category. (Note that, in accordance with these rules, this happens even if the schema declares the element to have element only content.)

If an element contains text content, it is promoted to the default space category.

Text node content

If a text node contains any non-whitespace characters then the text node is promoted to the normalize space category.

Exception to the Rule

In general, an element can only be promoted to a more restrictive category (one that treats more whitespace as significant). However, there is one exception. In Author mode, if an element is marked as mixed content in the schema, but the actual element contains no text content, it can be demoted to the space ignore category if all of its child elements are displayed as blocks by the associated CSS (that is, they have a CSS property of display: block). For example, in some schemas, a section or a table entry can be defined as having mixed content but in many cases they contain only block elements. In these cases, any whitespace they contain cannot be significant and they can be treated as space ignore elements. This exception can be turned on or off using the Schema Aware Editing option in the Schema-Aware preferences page.

How Oxygen XML Editor formats and indents XML

You can control how Oxygen XML Editor formats and indents XML documents. This can be particularly important if you store your XML document in a version control system, as it allows you to limit the number of trivial changes in spacing between versions of an XML document. The following preference pages include options that control how XML documents are formatted:

- Format preferences page
- XML Formatting preferences page
- Whitespaces preferences page

When Oxygen XML Editor formats and indents XML

Oxygen XML Editor formats and indents a document, or part of it, on the following occasions:

- In Text mode when you select one of the format and indent actions (Document > Source > Format and Indent, Document > Source > Indent Selection, or Document > Source > Format and Indent Element).
- When saving documents in Author mode.
- When switching from Author mode to another mode.
- When saving documents in Design mode.
- When switching from Design mode to another mode.
- When saving or switching to Text mode from Grid mode, if the Format and indent when passing from grid to text or on save option is selected in the Grid preferences page.

Setting an Indent Size to Zero

Oxygen XML Editor will automatically format and indent documents at certain times. This includes indenting the content from the margin to reflect its structure. In some cases, you may not want your content indented. To avoid your content being indented, you can set an indent size of zero.
Note: Changing the indent size does not override the rules that Oxygen XML Editor uses for handling whitespace when formatting and indenting XML documents. Therefore, changing the indent size will have no effect on elements that require whitespaces to be maintained.

There are two cases to consider.

**Maintaining zero indent in documents with zero indent**

If you have existing documents with zero indent and you want Oxygen XML Editor to maintain a zero indent when editing or formatting those documents:

1. **Open the Preferences dialog box (Options > Preferences)** and go to Editor > Format.
2. Select Detect indent on open.
3. Select Use zero-indent if detected.

Oxygen XML Editor will examine the indent of each document as it is opened and if the indent is zero for all lines, or for nearly all lines, a zero indent will be used when formatting and indenting the document. Otherwise, Oxygen XML Editor will use the indent closest to what it detects in the document.

**Enforcing zero indent for all documents**

If you want all documents to be formatted with zero indent, regardless of their current indenting:

1. **Open the Preferences dialog box (Options > Preferences)** and go to Editor > Format.
2. Deselect Detect indent on open.
3. Set Indent size to 0.

All documents will be formatted and indented with an indent of zero.

⚠️ **Warning:** Setting the indent size to zero can change the meaning of some file types, such as Python source files.

### Format and Indent (Pretty Print) Multiple Files

Oxygen XML Editor provides support for formatting and indenting (pretty printing) multiple files at once. This action is available for any document in XML format, as well as for XQuery, CSS, JavaScript, and JSON documents.

To format and indent multiple files, use the **Format and Indent Files** action that is available in the contextual menu of the Project view or from the Tools menu. This opens the **Format and Indent Files** dialog box that allows you to configure options for the action.

![Format and Indent Files Dialog Box](image)

The **Scope** section allows you choose from the following scopes:

- **All opened files** - The pretty print is performed in all opened files.
• Directory of the current file - All the files in the folder of the current edited file.
• Project files - All files from the current project.
• Selected project files - The selected files from the current project.
• Specified path - Pretty prints the files located at a specified path.

The Options section includes the following options:
• File filter - Allow you to filter the files from the selected scope.
• Recurse subdirectories - When enabled, the pretty print is performed recursively for the specified scope. The one exception is that this option is ignored if the scope is set to All opened files.
• Include hidden files - When enabled, the pretty print is also performed in the hidden files.
• Make backup files with extension - When enabled, Oxygen XML Editor makes backup files of the modified files. The default extension is .bak, but you can change the extension as you prefer.

Managing Highlighted Content

While working with XML documents you often have frequent changes to the structure and content. You are often faced with a situation where you need to make a slight change in multiple places in the same document. Oxygen XML Editor includes a feature, Manage Highlighted Content, that is designed to help you achieve this.

When you are in Text mode and you perform a search operation or apply an XPath that highlights multiple results, you can select the Manage Highlighted Content action from the contextual menu of any highlight in the document, and the following options are available in its submenu:

• Modify All - Use this option to modify (in-place) all the occurrences of the selected content. When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

  Note: If you select a very large number of highlights that you want to modify using this feature, a dialog box informs you that you may experience performance issues. You have the option to either use the Find/Replace operation, or continue the operation.

• Surround All - Use this option to surround the highlighted content with a specific tag. This option opens the Tag dialog box. The Specify the tag drop-down menu presents all the available elements that you can choose from.
• Remove All - Removes all the highlighted content.

If you right-click content in another part of the document, other than a highlight, you have the option to select the following option:

• Modify All Matches - Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment in which the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Highlight ID Occurrences in Text Mode

To see the occurrences of an ID in an XML document in the Text mode, place the cursor inside the ID declaration or reference. The occurrences are marked in the vertical side bar at the right of the editor. Click a marker on the side bar to jump to the occurrence that it corresponds to. The occurrences are also highlighted in the editing area.

Note: Highlighted ID declarations are rendered with a different color than highlighted ID references. To customize these colors or disable this feature, open the Preferences dialog box (Options > Preferences) and go to Editor > Mark Occurrences.

Contextual Menu Actions in Text Mode

When editing XML documents in Text mode, Oxygen XML Editor provides the following actions in the contextual menu (many of them also appear in the submenus of the Document menu):
Cut, Copy, Paste
Executes the typical editing actions on the currently selected content.

Copy XPath
Copies the XPath expression of the current element or attribute from the current editor to the clipboard.

Toggle Comment (Ctrl + Shift + Comma (Command + Shift + M on OS X))
Comments the current selection of the current editor. If the selection already contains a comment the action removes the comment from around the selection. If there is no selection in the current editor and the cursor is not positioned inside a comment the current line is commented. If the cursor is positioned inside a comment then the commented text is uncommented.

Go to submenu
This submenu includes the following actions:

Go to Matching Tag (Ctrl + Shift + G)
Moves the cursor to the end tag that matches the start tag, or vice versa.

Go after Next Tag (Ctrl + CloseBracket (Command + CloseBracket on OS X))
Moves the cursor to the end of the next tag.

Go after Previous Tag (Ctrl + OpenBracket (Command + OpenBracket on OS X))
Moves the cursor to the end of the previous tag.

Select submenu
This submenu allows you to select the following:

Element
Selects the entire element at the current cursor position.

Content
Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

Attributes
Selects all the attributes of the element at the current cursor position.

Parent
Selects the parent element at the current cursor position.

Source submenu
This submenu includes the following actions:

Shift Right (Tab)
Shifts the currently selected block to the right.

Shift Left (Shift + Tab)
Shifts the currently selected block to the left.

Indent selection (Ctrl + I (Command + I on OS X))
Corrects the indentation of the selected block of lines if it does not follow the current indenting preferences.

Escape Selection
Escapes a range of characters by replacing them with the corresponding character entities.

Unescape Selection
Replaces the character entities with the corresponding characters.

Format and Indent Element (Ctrl + Shift + I (Command + Shift + I on OS X))
Pretty prints the element that surrounds the current cursor position.

To Upper Case
Converts the content selection to upper case characters.
To Lower Case
Converts the content selection to lower case characters.

Capitalize Lines
It capitalizes the first letter found on every new line that is selected. Only the first letter is affected, the rest of the line remains the same. If the first character on the new line is not a letter then no changes are made.

Convert Hexadecimal Sequence to Character (Ctrl + Shift + X (Command + Shift + X on OS X))
Converts a sequence of hexadecimal characters to the corresponding Unicode character. The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the 0x or 0X prefix. Examples of valid sequences: 0x0045, 0x0125, 1253, 265, 43.

Base64 Encode/Decode submenu
This submenu include the following actions for encoding or decoding base64 schemes:

Import File to Encode and Insert
Encodes a file and then inserts the encoded content into the current document at the cursor position.

Decode Selection and Export to File
Decodes a selection of text from the current document and then exports (saves) the result to another file.

Encode Selection
Replaces a selection of text with the result of encoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the Encoding for Base64, Base32, Hex conversions option in the Encoding preferences page will be used. Likewise, the same is true if the Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions option is disabled in the Messages preference page.

Decode Selection
Replaces a selection of text with the result of decoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the Encoding for Base64, Base32, Hex conversions option in the Encoding preferences page will be used. Likewise, the same is true if the Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions option is disabled in the Messages preference page.

Modify All Matches
Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Base32 Encode/Decode submenu
This submenu include the following actions for encoding or decoding base32 schemes:

Import File to Encode and Insert
Encodes a file and then inserts the encoded content into the current document at the cursor position.

Decode Selection and Export to File
Decodes a selection of text from the current document and then exports (saves) the result to another file.

Encode Selection
Replaces a selection of text with the result of encoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the Encoding for Base64, Base32, Hex conversions option in the Encoding preferences page will be used. Likewise, the same is true if the Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions option is disabled in the Messages preference page.
Decode Selection

Replaces a selection of text with the result of decoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the **Encoding for Base64, Base32, Hex conversions option in the Encoding preferences page** will be used. Likewise, the same is true if the **Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions option is disabled in the Messages preference page**.

Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Hex Encode/Decode submenu

This submenu include the following actions for encoding or decoding hex schemes:

**Import File to Encode and Insert**

Encodes a file and then inserts the encoded content into the current document at the cursor position.

**Decode Selection and Export to File**

Decodes a selection of text from the current document and then exports (saves) the result to another file.

**Encode Selection**

Replaces a selection of text with the result of encoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the **Encoding for Base64, Base32, Hex conversions option in the Encoding preferences page** will be used. Likewise, the same is true if the **Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions option is disabled in the Messages preference page**.

**Decode Selection**

Replaces a selection of text with the result of decoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the **Encoding for Base64, Base32, Hex conversions option in the Encoding preferences page** will be used. Likewise, the same is true if the **Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions option is disabled in the Messages preference page**.

**Modify All Matches**

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

**Join and Normalize Lines (Ctrl + J (Command + J on OS X))**

For the current selection, this action joins the lines by replacing the line separator with a single space character. It also normalizes the whitespaces by replacing a sequence of such characters with a single space.

**Insert new line after (Ctrl + Alt + Enter (Command + Alt + Enter on OS X))**

This action has the same result as moving the cursor to the end of the current line and pressing the ENTER key.

**Insert XInclude**

Displays a dialog box that allows you to browse and select the content to be included and automatically generates the corresponding XInclude instruction.

**Note:** In the **Author** mode, this dialog box presents a preview of the inserted document as an author page in the **preview** tab and as a text page in the **Source** tab. In the **Text** mode, the **Source** tab is presented.
Import entities list

Displays a dialog box that allows you to select a list of files as sources for external DTD entities. The internal subset of the DOCTYPE declaration of your document will be updated with the chosen entities. For instance, choosing the files chapter1.xml and chapter2.xml inserts the following section in the DOCTYPE:

```xml
<!ENTITY chapter1 SYSTEM "chapter1.xml">
<!ENTITY chapter2 SYSTEM "chapter2.xml">
```

Lock / Unlock the XML Tags

Disables or enables the ability to edit XML tags.

Canonicalize

Opens the Canonicalize dialog box that allows you to select a canonicalization algorithm to standardize the format of the document.

Sign

Opens the Sign dialog box that allows you to configure a digital signature for the document.

Verify Signature

Allows you to specify the location of a file to verify its digital signature.

Manage Highlighted Content submenu

This submenu is available from the contextual menu when it is invoked from a highlight after you perform a search operation or apply an XPath expression that highlights more than one result. The following options are available in this submenu:

Modify All

Allows you to modify (in-place) all the occurrences of the selected content. A thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Surround All

Surround the highlighted content with a specific tag. This option opens the Tag dialog box. The Specify the tag drop-down menu presents all the available elements that you can choose from.

Remove All

Removes all the highlighted content.

Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Show Definition (Ctrl + Shift + Enter)

Moves the cursor to the definition of the current element or attribute in the schema (DTD, XML Schema, Relax NG schema) associated with the edited XML document. If the current attribute is a “type” belonging to the “http://www.w3.org/2001/XMLSchema-instance” namespace, the cursor is moved in the XML schema to the definition of the type referenced in the value of the attribute.

Refactoring submenu

This submenu includes the following actions:

Rename Element

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the Rename dialog box.

Rename Prefix (Alt + Shift + P (Command + Shift + P on OS X))

The prefix of the element from the cursor position, and any elements with the same prefix, can be renamed according with the options from the Rename dialog box.

• If you select the Rename current element prefix option, the application will recursively traverse the current element and all its children. *For example*, to change the xmlns:p1="ns1" association in the current element to
xmlns:p5="ns1", if the xmlns:p1="ns1" association is applied on the parent element, then Oxygen XML Editor will introduce xmlns:p5="ns1" as a new declaration in the current element and will change the prefix from p1 to p5. If p5 is already associated with another namespace in the current element, then the conflict will be displayed in a dialog box. By pressing OK, the prefix is modified from p1 to p5 without inserting a new declaration.

- If you select the **Rename current prefix in all document** option, the application will apply the change on the entire document.
- To also apply the action inside attribute values, check the **Rename also attribute values that start with the same prefix** checkbox.

**Surround with submenu**

Presents a drop-down menu that allows you to choose a tag to surround a selected portion of content.

**Surround with Tags (Ctrl + E (Command + E on OS X))**

Allows you to choose a tag that encloses a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

- If the **Position cursor between tags option** is enabled in the **Content Completion** preferences page, the cursor is placed between the start and end tag.
- If the **Position cursor between tags option** is disabled in the **Content Completion** preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

**Surround with 'tag' (Ctrl + ForwardSlash (Command + ForwardSlash on OS X))**

Surround the selected content with the last tag used.

- **Delete element tags (Alt + Shift + X (Command + Alt + X on OS X))**
  Deletes the start and end tag of the current element.

- **Split element (Alt + Shift + D (Ctrl + Alt + D on OS X))**
  Split the element from the cursor position into two identical elements. The cursor must be inside the element.

- **Join elements (Alt + Shift + J (Command + Alt + J on OS X))**
  Joins the left and right elements relative to the current cursor position. The elements must have the same name, attributes, and attributes values.

**Attributes submenu**

Contains predefined XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

- **Add/Change attribute**
  Allows you to change the value of an attribute or insert a new one.

- **Delete attribute**
  Allows you to remove one or more attributes.

- **Rename attribute**
  Allows you to rename an attribute.

- **Replace in attribute value**
  Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

**Comments submenu**

Contains predefined XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

- **Delete comments**
  Allows you to delete comments found inside one or more elements.

**DITA submenu**

Contains predefined XML refactoring operations that pertain to DITA documents with some of the information preconfigured based upon the current context.
Change topic ID to file name
Changes the ID of a topic to be the same as its file name.

Convert simple tables to CALS tables
Converts all DITA simple tables to CALS tables in the specified scope.

Elements submenu
Contains predefined XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

Delete element
Allows you to delete elements.

Delete element content
Allows you to delete the content of elements.

Insert element
Allows you to insert new elements.

Rename element
Allows you to rename elements.

Unwrap element
Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

Wrap element
Allows you to surround elements with element tags.

Wrap element content
Allows you to surround the content of elements with element tags.

Fragments submenu
Contains predefined XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

Insert XML fragment
Allows you to insert an XML fragment.

Replace element content with XML fragment
Allows you to replace the content of elements with an XML fragment.

Replace element with XML fragment
Allows you to replace elements with an XML fragment.

JATSKit submenu
Contains predefined XML refactoring operations that pertain to JATS documents with some of the information preconfigured based upon the current context.

Add BITS DOCTYPE - NLM/NCBI Book Interchange 2.0
Adds an NLM 'BITS' 2.0 DOCTYPE declaration.

Add Blue DOCTYPE - NISO JATS Publishing 1.1
Adds a JATS 'Blue' 1.1 DOCTYPE declaration.

Normalize IDs
Assigned IDs are normalized and IDs are assigned to some elements that are missing them.

Manage IDs submenu
This submenu is available for XML documents that have an associated DTD, XML Schema, or Relax NG schema. It includes the following actions:

Rename in
Renames the ID and all its occurrences. Selecting this action opens the Rename XML ID dialog box. This dialog box lets you insert the new ID value and choose the scope of the rename operation. For a preview of the changes you are
about to make, click Preview. This opens the Preview dialog box, which presents a list with the files that contain changes and a preview zone of these changes.

**Rename in File**
Renames the ID you are editing and all its occurrences from the current file.

**Search References**
Searches for the references of the ID. By default, the scope of this action is the current project. If you configure a scope using the Select the scope for the Search and Refactor operations dialog box, this scope will be used instead.

**Search References in**
Searches for the references of the ID. Selecting this action opens the Select the scope for the Search and Refactor operations.

**Search Declarations**
Searches for the declaration of the ID reference. By default, the scope of this action is the current project. If you configure a scope using the Select the scope for the Search and Refactor operations dialog box, this scope will be used instead.

**Search Declarations in**
Searches for the declaration of the ID reference. Selecting this action opens the Select the scope for the Search and Refactor operations.

**Search Occurrences in file**
Searches for the declaration or references of the ID in the current document.

**Quick Assist (Alt + 1 (Command + Alt + 1 on OS X))**
Available when the cursor is inside an ID or IDREF; this action opens the Quick Assist window that allows you to select some search and refactoring actions for the selected ID or IDREF.

**Open submenu**
The following actions are available in this submenu:

**Open File at Cursor**
Opens the file at the cursor position in a new panel. If the file path represents a directory path, it will be opened in system file browser. If the file at the specified location does not exist, an error dialog box is displayed and it includes a Create new file button that starts the New document wizard. This allows you to choose the type or the template for the file. If the action succeeds, the file is created with the referenced location and name and is opened in a new editor panel.

**Open File at Cursor in System Application**
Opens the file (identified by its link) or web page (identified by a web link) found at cursor position. The target is opened in the default system application associated with that file type.

**Compare**
Opens the current file in the Compare Files tool.

**Resource Hierarchy**
Opens the Resource Hierarchy/Dependencies view that allows you to see the resource hierarchy for an XML document.

**Resource Dependencies**
Opens the Resource Hierarchy/Dependencies view that allows you to see the resource dependencies for an XML document.

**Editing XML Documents in Grid Mode**
The Grid mode in Oxygen XML Editor displays the XML document as a structured grid of nested tables where the text content can be modified without directly interacting with the XML markup. This is helpful for non-technical users who want to edit text content without modifying the XML markup. You can easily expand or collapse elements within the table and the document structure can be changed with simple drag/drop or copy/paste operations. A useful Content Completion Assistant is also available in Grid mode.

To enter this mode, click the Grid button at the bottom of the editing area.

To watch our video demonstration about some of the features available in the Grid editor, go to https://www.oxygenxml.com/demo/Grid_Editor.html.
Editing Actions in Grid Mode

A variety of editing actions are available in Grid mode from the contextual menu, the Document menu, the toolbar, and with shortcut keys. This section explains some of those useful editing actions.

Sorting a Table Column

You can sort certain table columns by using the Sort Ascending or Sort Descending actions that are available on the toolbar or from the contextual menu.

The sorting result depends on the data type of the column content. It could be a numerical sorting for numbers or an alphabetical sorting for text information. The editor automatically analyzes the content and decides what type of sorting to apply. When a mixed set of values is present in the sorted column, a dialog box is displayed that allows you to choose the desired type of sorting between numerical and alphabetical.

Inserting a Row in a Table

You can add a new row using the Copy/Paste actions, or by selecting Insert row from the contextual menu or the toolbar.

For a faster way to insert a new row, move the selection over the row header, and then press Enter. The row header is the zone in the left of the row that holds the row number. The new row is inserted below the selection.

Inserting a Column in a Table

You can insert a column after the selected column by using the Insert column action from the contextual menu or the toolbar.

Clearing the Content of a Column

You can clear all the cells from a column by using the Clear content action from the contextual menu.

Adding Nodes

You can add nodes before, after, or as a child of the currently selected node by using the various actions in the following submenus of the contextual menu:

- **Insert before** - Offers a list of valid nodes, depending on the context, and inserts your selection before the currently selected node, as a sibling.
- **Insert after** - Offers a list of valid nodes, depending on the context, and inserts your selection after the currently selected node, as a sibling.
- **Append child** - Offers a list of valid nodes, depending on the context, and appends your selection as a child of the currently selected node.

Duplicating Nodes

You can quickly create new nodes by duplicating existing ones. The Duplicate action is available in the contextual menu and in the Document > Grid Edit menu.

Refresh Layout

When using drag and drop to reorganize the document, the resulting layout can be different from the expected one. For instance, the layout can contain a set of sibling tables that can be joined together. To force the layout to be recomputed, you can use the Refresh selected action that is available in the contextual menu and in the Document > Grid Edit menu.

Editing a Cell Value

To edit the value of a cell, simply select the grid cell and press Enter or you can use the Start Editing action found in the Document > Grid Edit menu.

To stop editing a cell value, press Enter again or use the End Editing action found in the Document > Grid Edit menu.

To cancel the editing without saving the current changes in the document, press the Esc key.

Drag and Drop in the Grid Editing Mode

You can easily arrange sections in your XML document in the Grid mode by using drag and drop actions.

You can do the following with drag and drop:

- Copy or move a set of nodes.
• Change the order of columns in the tables.
• Move the rows from the tables.

These operations are available for both single and multiple selections. To deselect one of the selected fragments, use Ctrl + Single-Click (Command + Single-Click on OS X).

While dragging, the editor paints guide-lines showing the locations where you can drop the nodes. You can also drag nodes outside the Grid editor and text from other applications into the Grid. For more information, see Copy and Paste in the Grid Editor.

Copy and Paste in the Grid Editing Mode

The selection in the Grid mode is a bit complex compared to the selection in a text component. It consists of a currently selected cell and additional selected cells. These additional cells are either selected with the cursor, or implied by the currently selected cell. To be more specific, consider that you click the name of the column (this becomes the current selected cell), but the editor automatically extends the selection so that it contains all the cells from that column. The currently selected cell is painted with a color that is different from the rest of the selection.

You can also select discontinuous regions of nodes and place them in the clipboard with the copy action. To deselect one of the selected fragments, use Ctrl + Single-Click (Command + Single-Click on OS X).

Pasting Content Within Grid Mode

You can paste the copied nodes relative to the currently selected cell using one of the following actions (available in the contextual menu):

• Paste (Ctrl + V (Command + V on OS X)) - Pastes the content, as a sibling, just below (after) the current selection.
• Paste as Child - Pastes the content as the last child of the current selection.

Pasting Content from Grid Mode to Other Editors

Nodes that are copied from the Grid editor can also be pasted into the Text editor or other applications. When copying from the Grid into the Text editor or other text based applications, the inserted string represents the nodes serialization. The nodes from tables can be copied using HTML or RTF in table format. The resulting cells contain only the concatenated values of the text nodes.
Pasting Content from Other Editors into Grid Mode

You can also paste well-formed XML content or tab separated values from other editors into the Grid editor. If you paste XML content, the result will be the insertion of the nodes obtained by parsing this content.

If the pasted text contains multiple lines of tab-separated values, it can be considered as a matrix of values. By pasting this matrix of values into the Grid editor, the result will be a matrix of cells. If the operation is performed inside existing cells, the existing values will be overwritten and new cells will be created when needed. This is useful, for example, when trying to transfer data from spreadsheet-like editors to the Grid editor.
Content Completion Assistant in Grid Mode

If the edited document is associated with a schema (DTD, XML Schema, Relax NG, etc.), the Grid editing mode offers a **Content Completion Assistant** for the names and values of elements and attributes. If you choose to insert an element that has required content, the sub-tree of needed elements and attributes are automatically included.

To display the content completion pop-up menu, simply start editing a cell (for example, double-click a cell) or press **Ctrl + Space (Command + Space on OS X)** on your keyboard.

![Content Completion in Grid Editing Mode]

**Figure 137: Content Completion in Grid Editing Mode**

Editing XML Documents in Author Mode

The **Author** editing mode in Oxygen XML Editor allows you to visually edit XML documents in a user-friendly interface that is similar to a WYSIWYG word processor. This makes structured authoring easier for people who are not familiar with XML and it also provides easier access to the XML structure for XML experts. Oxygen XML Editor provides support for visually editing the most commonly used XML vocabularies in **Author** mode, including DITA, DocBook, TEI, and XHTML.

Adding text content in **Author** mode is as simple as doing so in a standard text editor but the content is rendered similar to how you will see it in the output. Tables, images, and media objects (such as videos) are also rendered comparable to the output. You can even play audio and video objects directly in **Author** mode and it includes an intuitive **Image Map Editor**. You can easily change the rendering by selecting one of the preset main styles from the **Styles drop-down menu** (available on the toolbar) and combine multiple alternate styles that behave like layers. You can also use the options in the Tags Display Mode drop-down menu to control how much XML markup is displayed in **Author** mode and there are various features and views that provide information about the XML structure based upon your current location within the document.

**Author** mode provides numerous helpful editing actions, many of which are specific to the type of document you are editing and it includes a variety of other powerful editing features, such as keyboard shortcuts, **drag and drop support**, a **Smart Paste mechanism**, and a **Content Completion Assistant**. **Author** mode also allows you to visualize and manage proficient content, you can collaborate with others with various review features (such as the ability to add comments, track changes, or highlight content), and includes many other unique features.

To enter this mode, click the **Author** button at the bottom of the editing area.

To watch our video demonstration about some of the features available in the visual **Author** editing mode, go to [https://www.oxygenxml.com/demo/WYSIWYG_XML_Editing.html](https://www.oxygenxml.com/demo/WYSIWYG_XML_Editing.html).

**Author Mode User Roles**

There are two main types of users for the **Author** mode: **framework developers** and **content authors**.

**Framework Developers**

A **framework developer** is a technical person with advanced XML knowledge who defines the framework for authoring XML documents in the visual editor. Once the framework is created or edited by the developer, it is distributed as a deliverable component ready to plug into the application for the content authors.

**Content Authors**

A **content author** does not need to have advanced knowledge about XML markup, operations such as validation of XML documents, or applying XPath expressions to an XML document. The content author just uses the framework set up by the developer in the application and starts editing the content of XML documents without editing the XML tags directly.
Document Type Association (Framework)

The framework that is set up by the developer is also called a document type association and defines a type of XML document by specifying all the details needed for editing the content of XML documents in Author mode.

The framework details that are created and customized by the developer include:

- The CSS stylesheet that drives the visual rendering of the document.
- The rules for associating an XML schema with the document, which is needed for the content completion assistance and validation of the document.
- Transformation scenarios for the document.
- XML catalogs.
- Custom actions available as buttons on the toolbar or in menus.

Oxygen XML Editor includes some ready-to-use predefined document types for XML frameworks, such as DocBook, DITA, TEI, JATS, and XHTML.

Rendering XML Documents in Author Mode

The structure of an XML document and the required restrictions on its elements and their attributes are defined with an XML schema. This makes it easier to edit XML documents in a visual editor. For more information about schema association, see Associating a Schema to XML Documents on page 450. The Author mode renders the content of the XML documents visually, based on a CSS stylesheet associated with the document.

Associating a Stylesheet with an XML Document

The rendering of an XML document in the Author mode is driven by a CSS stylesheet that conforms to the version 2.1 of the CSS specification from the W3C consortium. Some CSS 3 features, such as namespaces and custom extensions, of the CSS specification are also supported. Oxygen XML Editor also supports stylesheets coded with the LESS dynamic stylesheet language.

There are several methods for associating a stylesheet (CSS or LESS) with an XML document:

1. Insert the xml-stylesheet processing instruction with the type attribute at the beginning of the XML document. If you do not want to alter your XML documents, you should create a new document type (framework).

   CSS example:

   ```xml
   <?xml-stylesheet type="text/css" href="test.css"?>
   ```

   LESS example:

   ```xml
   <?xml-stylesheet type="text/css" href="test.less"?>
   ```

   Note: XHTML documents need a link element, with the href and type attributes in the head child element, as specified in the W3C CSS specification. XHTML example:

   ```xml
   <link href="/style/screen.css" rel="stylesheet" type="text/css"/>
   ```

   Tip: You can also insert the xml-stylesheet processing instruction by using the Associate XSLT/CSS Stylesheet action that is available on the toolbar or in the Document > XML Document menu.

2. Configure a Document Type Association by adding a new CSS or LESS file in the settings. To do so, open the Preferences dialog box (Options > Preferences) and go to Document Type Association. Edit the appropriate framework, open the Author tab, then the CSS tab. Press the New button to add a new CSS or LESS file.

   Note: The Document Type Associations are read-only, so you need to extend an existing one.

You can read more about associating a CSS to a document in the section about customizing the CSS of a document type. If a document has no CSS association or the referenced stylesheet files cannot be loaded, a default one is used. A warning message is also displayed at the beginning of the document, presenting the reason why the CSS cannot be loaded.
Selecting and Combining Multiple CSS Styles

Oxygen XML Editor provides a Styles drop-down menu on the toolbar that allows you to select one main (non-alternate) CSS style and multiple alternate CSS styles. This makes it easy to change the look of the document.

Tip: For information about configuring the Styles drop-down menu, see Selecting and Combining Multiple CSS Styles on page 1197.

You can select a main CSS stylesheet that styles the whole document and then apply alternate styles, as layers, to specific parts of the document. In the subsequent figure, a DITA document has the Century style selected for the main CSS and the alternate styles Full width, Show table column specification, Hints, and Inline actions are combined for additive styling to specific parts of the document.
Navigating the Document Content in Author Mode

Oxygen XML Editor includes some useful features to help you navigate XML documents.

Using the Keyboard

Oxygen XML Editor allows you to quickly navigate through a document using the Tab key to move the cursor to the next XML node and Shift + Tab to go to the previous one. If you encounter a space preserved element when you navigate through a document and you do not press another key, pressing the Tab key will continue the navigation. However, if the cursor is positioned in a space preserved element and you press another key or you position the cursor inside such an element using the mouse, the Tab key can be used to arrange the text.

To navigate one word forward or backwards, use Ctrl + RightArrow (Command + RightArrow on OS X), and Ctrl + LeftArrow (Command + LeftArrow on OS X), respectively. Entities and hidden elements are skipped. To position the cursor at the beginning or at the end of the document you can use Ctrl + Home (Command + Home on OS X), and Ctrl + End (Command + End on OS X), respectively.

Navigation Buttons

Oxygen XML Editor includes some actions that help you to quickly navigate to a particular modification. These navigation buttons are available in the main toolbar and the actions can also be accessed from the Find menu. The three actions include:
Navigating with the Outline View

Oxygen XML Editor includes a very useful Outline view that displays a hierarchical tag overview of the currently edited XML Document.

You can use this view to quickly navigate through the current document by selecting nodes in the outline tree. It is synchronized with the editor area, so when you make a selection in the Outline view, the corresponding nodes are highlighted in the editor area.

Using the Breadcrumb to Navigate

A breadcrumb on the top stripe indicates the path from document root to the current element. It can also be used as a helpful tool to navigate to specific elements throughout the structure of the document.

Using the Linking Support

When working on multiple documents that reference each other (references, external entities, XInclude, DITA conref, etc), the linking support is useful for navigating between the documents. In the predefined customizations that are bundled with Oxygen XML Editor, links are marked with an icon representing a chain link (🔗). When hovering over the icon, the mouse pointer changes its shape to indicate that the link can be accessed and a tooltip presents the destination location. Click the link to open the referenced resource in the editor or system browser. The same effect can be obtained by using the Document > File > Open file at cursor (Ctrl + Enter (Command + Enter on OS X)) action when the cursor is inside a link element.

Note: Depending on the referenced file type, the target link will either be opened in the Oxygen XML Editor or in the default system application. If the target file does not exist, Oxygen XML Editor prompts you to create it.

Navigating with Bookmarks

A position in a document can be marked with a bookmark. You can then quickly go to the marked position with a keyboard shortcut or a menu action. This is useful when navigating large documents or working on multiple documents where the cursor needs to move between several marked positions. The bookmarks are displayed with a small icon on the vertical strip to the left of the editor. You can place up to nine distinct bookmarks in any document. Shortcut keys are available to place the bookmarks or to return to any of the marked positions. You can configure these shortcut keys in the Options > Menu Shortcut Keys menu.
A bookmark can be inserted in Author mode by doing one of the following:

- Click in the vertical stripe on the left side of the editor.
- Select the Create Bookmark (F9) action from the Edit > Bookmarks menu.

A bookmark can be removed by right-clicking its icon on the vertical stripe and select Remove or Remove all (Ctrl+F7 (Command+F7 on OS X)).

You can navigate the bookmarks by using one of the actions available on the Edit > Bookmarks > Go to menu or by using the shortcut keys that are listed in that menu.

**Displaying the XML Markup (Tags)**

You can control the amount of markup that is displayed in the Author mode with various levels of tag modes for both block and in-line elements.

The following dedicated tag modes are available from the Tags Display Mode drop-down menu (available on the toolbar):

- **Full Tags with Attributes**
  Displays full tag names with attributes for both block and in-line elements.

- **Full Tags**
  Displays full tag names without attributes for both block and in-line elements.

- **Block Tags**
  Displays full tag names for block elements and simple tags without names for in-line elements.

- **Inline Tags**
  Displays full tag names for in-line elements, while block elements are not displayed.

- **Partial Tags**
  Displays simple tags without names for in-line elements, while block elements are not displayed.

- **No Tags**
  No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

**Configure Tags Display Mode**

Use this option to go to the Author preferences page where you can configure the Tags options, such as the default Tags display mode, Tags background color, Tags foreground color, Tags font, and if Oxygen XML Editor should use a Compact tag layout for displaying the tags by trying to group consecutive block tags on the same line.

**Note:** The associated CSS information is used to determine whether a tag should be considered inline or block. If the current document does not have an associated CSS stylesheet, then the Full Tags mode will be used.

**Editing Content in Author Mode**

The Author mode includes a large variety of user-friendly authoring features to help you work with XML content, including numerous toolbar, menu, and shortcut actions and some specialized content editing features.

**Undo/Redo Actions**

The typical undo and redo actions are available with shortcuts or in the Edit menu:
Undo (Ctrl + Z (Command + Z on OS X))
Reverses a maximum of 200 editing actions (configurable with the Undo history size option in the Editor preferences page) to return to the preceding state.

Note: Complex operations such as Replace All or Indent selection count as single undo events.

Redo (Ctrl + Y (Command + Shift + Z on OS X, Ctrl + Shift + Z on Linux/Unix))
Recreates a maximum of 100 editing actions that were undone by the Undo function.

Copy and Paste Actions
The typical copying and pasting actions are available with shortcuts or in the contextual menu (or the Edit menu):

Cut (Ctrl + X (Command + X on OS X))
Removes the current selected content from the document and places it in the clipboard.

Copy (Ctrl + C (Command + C on OS X))
Places a copy of the current selected content in the clipboard.

Paste (Ctrl + V (Command + V on OS X))
Inserts the current clipboard content into the document at the cursor position.

Select All (Ctrl + A (Command + A on OS X))
Selects the entire content of the current document.

Entering Text in Elements
By default, you can only enter text in elements that accept text content. If the element is declared as empty or element only in the associated schema, you are not allowed to insert text in it. Instead, a warning message is displayed.

Figure 143: Editing in empty element warning
To allow text to be inserted in these instances, go to the Schema-Aware preferences page and disable the Reject action when its result is invalid option in the Typing actions section.

Editing Text Content Without Modifying the XML Markup
You can use the options in the Tags Display Mode drop-down menu (available on the toolbar) to control how tags are displayed in Author mode. This can help you to clearly see where the current cursor position is within the tag structure so that you can avoid making unintended modifications to the XML markup. You can also switch to the Grid editing mode to modify text content without affecting the XML tags.

Changing the Font Size (Zoom)
The font size of the editor panel can be changed with the following actions that are available with shortcuts or in the Document > Font size menu:

Increase editor font (Ctrl + NumPad+ (Command + NumPad+ on OS X) or Ctrl + MouseWheelForward (Windows/Linux))
Increases the font size (zooms in) with one point for each execution of the action.

Note: For Mac OS X, if you activate the Enable mouse-wheel zooming option in the Editor preferences page, you can use Command + MouseWheelForward to increase the font size (zoom in). It is disabled by default due to the way inertia affects the mouse wheel on Mac OS X.
Decrease editor font (Ctrl + NumPad- (Command + NumPad- on OS X) or Ctrl + MouseWheelBackwards (Windows/Linux))

Decreases the font size (zooms out) with one point for each execution of the action.

Note: For Mac OS X, if you activate the Enable mouse-wheel zooming option in the Editor preferences page, you can use Command + MouseWheelBackwards to decrease the font size (zoom out). It is disabled by default due to the way inertia affects the mouse wheel on Mac OS X.

Normal editor font (Ctrl + 0 (Command + 0 on OS X))

Resets the font size to the value of the editor font set in the Fonts preferences page.

Editing XML Markup in Author Mode

Oxygen XML Editor includes some useful actions that allow you to easily edit XML markup in Author mode. Most of these actions are available in the contextual menu and some of them have simple keyboard shortcuts.

Selecting XML Markup in Author Mode

Selecting XML tags in Oxygen XML Editor is very simple with several methods for selecting entire elements:

• **Breadcrumb** - Click the element (XML tag) on the breadcrumb displayed at the top of the editing window.
• **Outline View** - Click the element name in the Outline view.
• **Full Tags Mode** - While editing in Full Tags mode, click the start or end tag of the element in the editor.
• **Mouse Selection** - While editing in Full Tags mode, click before the start tag of the element, drag the selection, and release the mouse button after the end tag.
• **Shift + Arrow Keys** - While editing in Full Tags mode, place the cursor before the start tag of the element, press and hold Shift, and use the arrow keys to make the selection (including the end tag).

Note: If the selection does not include the entire element (for example you do not include the end tag of the element), Oxygen XML Editor will automatically close the appropriate tags when pasting the copied selection. This ensures that the pasted content will always result in well-formed XML.

Using the Breadcrumb in Author Mode

A breadcrumb on the top stripe indicates the path from document root to the current element. It can also be used as a helpful tool to insert and edit specific elements in the document structure.

| book | chapter | sect1 | sect2 | sect3 | para | figure | title |

Figure 144: Breadcrumb in Author Mode

The last element listed in the breadcrumb is the element at the current cursor position. The last element is also highlighted by a thin light blue bar for easier identification. Clicking an element from the breadcrumb selects the entire element in the editor area and each element provides a contextual menu with access to the following actions:

a. **Edit Attributes**
   - Opens the in-place attributes editor that allows you to easily edit the attributes of an element.

Edit Profiling Attributes
   - Allows you to select the profiling attributes that apply to a certain element.

Append child
   - Opens a content completion list that allows you to select an element to be inserted as a child of the selected element.
Insert before
Opens a content completion list that allows you to select an element to be inserted (as a sibling) before the selected element.

Insert after
Opens a content completion list that allows you to select an element to be inserted (as a sibling) after the selected element.

Cut
Removes the selected element and copies it to the clipboard, while preserving the styles of the content.

Copy
Copies the selected element to the clipboard, while preserving the styles of the copied content.

Paste
Pastes a well-formed element from the clipboard at currently selected position in the breadcrumb.

Paste before
Insert a well-formed element (from the clipboard) before the currently selected element.

Paste after
Insert a well-formed element (from the clipboard) after the currently selected element.

Paste as XML
Inserts clipboard content that is considered to be well-formed XML content, preserving its XML structure.

Delete
Deletes the currently selected element.

Toggle Comment
Encloses the currently selected element in an XML comment, if the element is not commented, or removes the comment if it is commented.

Rename Element
Opens the Rename dialog box that allows you to rename the currently selected element and other elements with the same name.

Tip: The tag names displayed in the breadcrumb can be customized with an Author mode extension class that implements the AuthorBreadCrumbCustomizer API. See the Oxygen SDK for more details.

Move Nodes
You can move XML nodes in the current document by using the following actions in the Refactoring submenu of the contextual menu (or from the Document > Markup menu):

Move Up (Alt + UpArrow)
Moves the current node or selected nodes in front of the previous node.

Move Down (Alt + DownArrow)
Moves the current node or selected nodes after the subsequent node.

Tip: The easiest way to move nodes is to use the Alt + UpArrow and Alt + DownArrow shortcut keys.

Promote/Demote List Item Nodes
You can easily promote or demote selected list item nodes within ordered lists or unordered lists by using the following keyboard shortcuts:

Promote (Shift + Tab)
Promotes an entirely selected list item node to be a sibling of its parent node (the list item is moved to the left). It also works for selections of multiple list item nodes as long as all the selected nodes are siblings (on the same hierarchical level).

Demote (Tab)
Demotes an entirely selected list item node (the list item is moved to the right). It also works for selections of multiple list item nodes as long as all the selected nodes are siblings (on the same hierarchical level).
Join or Split Elements

You can join or split elements in the current document by using the following actions in the Refactoring submenu of the contextual menu (or from the Document > Markup menu):

- **Join Elements**
  Joins two adjacent block elements that have the same name. The action is available only when the cursor position is between the two adjacent block elements. Also, joining two block elements can be done by pressing the Delete or Backspace keys and the cursor is positioned between the boundaries of these two elements.

  **Tip:** Specifically, the Delete or Backspace keys can be used to join block elements in the following situations:
  1. The cursor is located before the end position of the first element and (Delete) key is pressed.
  2. The cursor is located after the end position of the first element and (Backspace) key is pressed.
  3. The cursor is located before the start position of the second element and (Delete) key is pressed.
  4. The cursor is located after the start position of the second element and (Backspace) key is pressed.

  If the element has no sibling or the sibling element has a different name, an Unwrap operation will be performed.

- **Split Element (Alt + Shift + D (Ctrl + Alt + D on OS X))**
  Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

Rename Elements

You can rename elements by using the following action in the Refactoring submenu of the contextual menu (or from the Document > Markup menu):

- **Rename Element**
  The element from the cursor position, and any elements with the same name, can be renamed according with the options from the Rename dialog box.

Surround Content with Tags (Wrap)

You can surround a selection of content with tags (wrap the content) by using the following action in the Refactoring submenu of the contextual menu (or from the Document > Markup menu):

- **Surround with Tags (Ctrl + E (Command + E on OS X))**
  Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

  - If the Position cursor between tags option is enabled in the Content Completion preferences page, the cursor is placed between the start and end tag.
  - If the Position cursor between tags option is disabled in the Content Completion preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

- **Surround with '[tag]' (Ctrl + ForwardSlash (Command + ForwardSlash on OS X))**
  Surround the selected content with the last tag used.

Unwrap the Content of Elements

You can unwrap the content of an element by using the following action in the Refactoring submenu of the contextual menu (or from the Document > Markup menu):

- **Delete Element Tags**
  Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the Delete or Backspace keys.
**Tip:** Specifically, the **Delete** or **Backspace** keys can be used to unwrap the content of an element in the following situations:

- The cursor is located before the start position of the element and **(Delete)** key is pressed.
- The cursor is located after the start position of the element and **(Backspace)** key is pressed.
- The cursor is located before the end position of the element and **(Delete)** key is pressed.
- The cursor is located after the end position of the element and **(Backspace)** key is pressed.

If the element has no sibling or the sibling element has a different name, an **Unwrap** operation will be performed.

**Remove Markup from Blocks of Content**

You can remove the markup from the current element by highlighting the appropriate block of content and using the following action in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

- **Remove All Markup**
  - Removes all the XML markup inside the selected block of content and keeps only the text content.

**Tip:** You can use the **(Delete)** or **(Backspace)** keys to remove markup, in which case the elements in the selected block will be unwrapped or joined with their sibling, or if the current element is empty, the element tags will be deleted.

**Remove Text from Selected Markup**

You can remove the text from elements by highlighting the appropriate block of content and using the following action in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

- **Remove Text**
  - Removes the text content of the selected block of content and keeps the markup in tact with empty elements.

**Other Refactoring Actions**

You can also manage the structure of the markup by using the other specific XML refactoring actions that are available in the **Refactoring** submenu of the contextual menu:

**Attributes submenu**

Contains predefined XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

- **Add/Change attribute**
  - Allows you to change the value of an attribute or insert a new one.

- **Delete attribute**
  - Allows you to remove one or more attributes.

- **Rename attribute**
  - Allows you to rename an attribute.

- **Replace in attribute value**
  - Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

**Comments submenu**

Contains predefined XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

- **Delete comments**
  - Allows you to delete comments found inside one or more elements.

**DITA submenu**

Contains predefined XML refactoring operations that pertain to DITA documents with some of the information preconfigured based upon the current context.
Change topic ID to file name
Changes the ID of a topic to be the same as its file name.

Convert simple tables to CALS tables
Converts all DITA simple tables to CALS tables in the specified scope.

Elements submenu
Contains predefined XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

Delete element
Allows you to delete elements.

Delete element content
Allows you to delete the content of elements.

Insert element
Allows you to insert new elements.

Rename element
Allows you to rename elements.

Unwrap element
Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

Wrap element
Allows you to surround elements with element tags.

Wrap element content
Allows you to surround the content of elements with element tags.

Fragments submenu
Contains predefined XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

Insert XML fragment
Allows you to insert an XML fragment.

Replace element content with XML fragment
Allows you to replace the content of elements with an XML fragment.

Replace element with XML fragment
Allows you to replace elements with an XML fragment.

JATSKit submenu
Contains predefined XML refactoring operations that pertain to JATS documents with some of the information preconfigured based upon the current context.

Add BITS DOCTYPE - NLM/NCBI Book Interchange 2.0
Adds an NLM 'BITS' 2.0 DOCTYPE declaration.

Add Blue DOCTYPE - NISO JATS Publishing 1.1
Adds a JATS 'Blue' 1.1 DOCTYPE declaration.

Normalize IDs
Assigned IDs are normalized and IDs are assigned to some elements that are missing them.

Editing Attributes in Author Mode

You can easily edit attributes in Author mode by using the Attributes View and Oxygen XML Editor also allows you to edit attribute and element values in-place, directly in the Author mode, using an in-place attribute editor.

In-place Attributes Editor

Oxygen XML Editor includes an in-place attributes editor in Author mode. To edit the attributes of an XML element in-place, do one of the following:

• Select an element or place the cursor inside it and then press the Alt + Enter keyboard shortcut.
• Double-click any named start tag when the document is edited in one of the following display modes: Full Tags with Attributes, Full Tags, Block Tags, or Inline Tags.

This opens an in-place attributes editor that contains the same content as the Attributes view. By default, this editor presents the Name and Value fields, with the list of all the possible attributes collapsed.

Figure 145: In-place Attributes Editor

Name Combo Box

Use this combo box to select an attribute. The drop-down list displays the list of possible attributes allowed by the schema of the document, as in the Attributes view.

Value Combo Box

Use this combo box to add, edit, or select the value of an attribute. If the selected attribute has predefined values in the schema, the drop-down list displays those possible values.

If you click More while in the collapsed version, it is expanded to the full version of the in-place attribute editor.

Figure 146: In-place Attributes Editor (Full Version)

The full version includes a table grid, similar to the Attributes view, that presents all the attributes for the selected element.
Note: If the cursor is located inside read-only content, the attribute names and values are faded and you cannot add, edit, or remove values.

Related information
Attributes View in Author Mode on page 213

Folding XML Elements in Author Mode

When working with a large document, the folding support in Oxygen XML Editor can be used to collapse some element content leaving only the parts that you need to edit in focus. Expanding and collapsing works on individual elements. Expanding an element leaves the child elements unchanged.

Figure 147: Folding of XML Elements in Author Mode

The fact that the folds are persistent is a unique feature of Oxygen XML Editor, meaning the next time you open the document the folds are restored to its last state.

Folding Actions in Author Mode

Foldable elements are marked with a small triangle (верхний) on the left side of the editor panel. If you hover over that arrow, the entire content of the element is highlighted by a dotted border for quick identification of the foldable area. To toggle the fold, simply click the icon. Also, the following actions are available in the Folding sub-menu of the contextual menu or from the Document > Folding menu:

- **Toggle Fold (or you can simply click on the ➦/➤ arrow)**
  Toggles the state of the current fold.

- **Collapse Other Folds (Ctrl + NumPad/) (Command + NumPad/ on OS X))**
  Folds all the elements except the current element.

- **Collapse Child Folds (Ctrl + NumPad. (Command + NumPad. on OS X))**
  Folds the child elements that are indented one level inside the current element.

- **Expand Child Folds**
  Unfolds all child elements of the currently selected element.

- **Expand All (Ctrl + NumPad* (Command + NumPad* on OS X))**
  Unfolds all elements in the current document.

To watch our video demonstration about the folding support in Oxygen XML Editor, go to https://www.oxygenxml.com/demo/FoldingSupport.html.

Drag and Drop in Author Mode

The Oxygen XML Editor Author mode includes support for dragging and dropping content in XML documents. When editing content in Author mode, entire sections or chunks of data can be moved or copied by using the drag and drop feature. The following situations can be encountered:

- When both of the drag and drop sources are from the Author mode editor, a well-formed XML fragment is transferred. The section is balanced before dropping it by adding matching tags when needed.
- When the drag source is from the Author mode editor but the drop target is a text-based editor, only the text inside the selection is transferred as it is.
- The text dropped from another text editor or another application into the Author mode editor is inserted without changes.
Smart Paste Support

The Author editing mode includes a Smart Paste feature that preserves certain style and structure information when copying content and pasting it into document types that support the feature. You can copy content from various sources, including web pages, external applications (such as Office-type applications), or other document types within Oxygen XML Editor, and then paste it into DITA, TEI, DocBook, JATS, and XHTML documents. Oxygen XML Editor preserves the original text styling (such as bold, italics, underline) and formatting (such as lists, tables, paragraphs) and considers various pasting solutions to keep the resulting document valid.

The styles and general layout of the pasted content are converted to the equivalent XML markup for the target document type while preserving certain style and structure information. For example, if you copy content that includes multiple paragraphs and then paste it in Author mode, the multiple paragraph structure is preserved. If you paste the content in a location where the resulting XML would not be valid, Oxygen XML Editor will attempt to place it in a valid location, and may prompt you with one or more choices for where to place it.

Smart Paste Options

By default, the Smart Paste features are enabled in Oxygen XML Editor. There are several options in the SchemaAware preferences page that control the Smart Paste feature:

- **Smart paste and drag and drop** - This option determines whether or not Oxygen XML Editor will try to find an appropriate insert position when the current location is not valid for the pasted content. This option is enabled by default.
- **Reject action when its result is invalid** - If you enable this option, Oxygen XML Editor will not let you paste content into a position where it would be invalid. This option is disabled by default.
- **Convert external content on paste** - This option determines whether or not Oxygen XML Editor will convert the styling and formatting of copied content from external sources when pasting it into a document type that supports the feature. This option is enabled by default.
- **Convert even when pasting inside space-preserve elements** - If you enable this option, the Smart Paste feature will also work when pasting external content into a space-preserve element (such as a codeblock). This option is disabled by default.

Smart Paste Supported Document Types

The Smart Paste feature is supported for the following document types (frameworks):

- DITA
- DocBook 4
- DocBook 5
- TEI P4
- TEI P5
- XHTML
- JATS

To watch our video demonstration about the Smart Paste support, go to https://www.oxygenxml.com/demo/Smart_Paste_Copy_Paste_from_Web_Office_Documents_to_DITA_DocBook_TEI_XHTML_Documents.html.

Customizing Smart Paste Support on page 1154

Selecting Content in Author Mode

Oxygen XML Editor includes a variety of keyboard shortcuts that allow you to easily select content in Author mode.

Selection Shortcuts in Author Mode

Ctrl + A (Meta + A on Mac OS X)

Selects all content in the document.
Shift + Left/Right Arrow Keys
Begins a continuous selection at the cursor position and extends it one character at a time in the direction that you press the arrow keys.

Shift + Up/Down Arrow Keys
Begins a continuous selection at the cursor position and extends it one line at a time in the direction that you press the arrow keys.

Ctrl + Shift + Left/Right Arrow Keys (Meta + Shift + Left/Right Arrow Keys on Mac OS X)
Begins a continuous selection at the cursor position and extends it one word at a time in the direction that you press the arrow keys.

Shift + Home
Begins a continuous selection at the cursor position and extends it to the beginning of the current line (on Mac OS X, it extends to the beginning of the document).

Shift + End
Begins a continuous selection at the cursor position and extends it to the end of the current line (on Mac OS X, it extends to the end of the document).

Ctrl + Shift + Home
Begins a continuous selection at the cursor position and extends it to the beginning of the document.

Ctrl + Shift + End
Begins a continuous selection at the cursor position and extends it to the end of the document.

Shift + PageUp
Begins a continuous selection at the cursor position and extends it up one screen page.

Shift + PageDown
Begins a continuous selection at the cursor position and extends it down one screen page.

Double-Click
Selects the word at the cursor position.

Triple-Click
Selects the node at the cursor position.

Right-Click > Select > Element
Selects the entire element at the current cursor position.

Right-Click > Select > Content
Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

Right-Click > Select > Parent
Selects the entire parent element at the current cursor position.

Content Completion Assistant in Author Mode
One of the most useful features in Author mode is the content completion support. It offers a list of elements, attributes, attribute values, and other options that are valid in the current editing context.

![Content Completion Assistant in Author Mode](image)

Figure 148: Content Completion Assistant in Author Mode
The Content Completion Assistant is enabled by default. To disable it, open the Preferences dialog box (Options > Preferences), go to Editor > Content Completion, and disable the Enable content completion option.

Using the Content Completion Assistant in Author Mode

To activate the feature in Author mode, use any of the following shortcut keys:

- **Enter**
- **Ctrl + Space (Command + Space on OS X)**
- **Alt + F (Forward Slash) (Command + Alt + Forward Slash on OS X)**

When active, the Content Completion Assistant displays a list of context-sensitive proposals valid at the current cursor position. You can navigate through the list of proposals by using the Up and Down keys on your keyboard. For each selected item in the list, the Content Completion Assistant displays a documentation window. You can customize the size of the documentation window by dragging its top, right, and bottom borders.

To insert the selected content in Author mode, simply press Enter.

Types of Proposals Listed in the Content Completion Assistant

The Content Completion Assistant offers the following types of proposed actions:

- Insert allowed elements for the current context schema and the list of proposals contains elements depending on the elements inserted both before and after the cursor position.
- Insert element values if such values are specified in the schema for the current context.
- Insert new undeclared elements by entering their name in the text field.
- Insert CDATA sections, comments, processing instructions.
- Insert code templates.
- If invoked on a selection that only contains an element start or end tag (remember that you can see all element tags while working in Full Tags mode), it will allow you to rename the element.
- If invoked on a selection of multiple elements or other content, it will allow you to surround the content with certain tags.
- If the Show all possible elements in the content completion list option from the Schema-Aware preferences page is enabled, the content completion pop-up window will present all the elements defined by the schema. When choosing an element from this section, the insertion will be performed using the schema-aware smart editing features.

Note: By default, you are not allowed to insert element names that are not defined by the schema. This can be changed by deselecting the Allow only insertion of valid elements and attributes check box from the Schema-Aware preferences page.

Examples of How the Content Completion Assistant Works

To illustrate how the feature works, consider the following examples of invoking the Content Completion Assistant in certain contexts:

- If the cursor is positioned at the beginning or at the end of the element, the first item offered in the Content Completion Assistant is a New <Element> item. Selecting this item will insert an empty element.

  Figure 149: Example (New [Element Name])

- If the cursor is positioned somewhere inside the element, the first entry in the Content Completion Assistant is a Split <Element> item. In most cases, you can only split the closest block element to the cursor position, but if it is inside a list
item, the list item will also be proposed for split. Selecting Split <Element> splits the content of the specified element around the cursor position.

Figure 150: Example (Split [Element Name])

- If the cursor is positioned inside a space preserved element (for example, a codeblock), the first choice in the Content Completion Assistant is Enter, which will insert a new line in the content of the element, followed by New <Element>.

Figure 151: Example ('ENTER' New Line)

- If invoked on a selection that only contains an element start or end tag (remember that you can see all element tags while working in Full Tags mode), it will allow you to rename the element.

Figure 152: Example (Rename)

- If invoked on a selection of multiple elements or other content, it will allow you to surround the content with certain tags.

Figure 153: Example (Surround)

Related information

Customizing the Content Completion Assistant on page 1182
Set the Schema to be Used for Content Completion

The proposals that are presented in the Content Completion Assistant depend on the associated schemas. The DTD, XML Schema, Relax NG, or NVDL schema used to populate the Content Completion Assistant is specified in the following methods, in the order of their precedence:

- The schema specified explicitly in the document. In this case, Oxygen XML Editor reads the beginning of the document and resolves the location of the DTD, XML Schema, Relax NG schema, or NVDL schema.
- The default schema declared in the Schema tab of the Document Type configuration dialog box for the particular document type.

Schema Annotations in Author Mode

A schema annotation is a documentation snippet associated with the definition of an element or attribute in a schema. If such a schema is associated with an XML document, the annotations are displayed in the Content Completion Assistant.

Figure 154: Schema Annotation in the Content Completion Assistant

The schema annotations support is available if the schema type is one of the following:

- XML Schema
- Relax NG
- NVDL schema
- DTD

This feature is enabled by default, but you can disable it by deselecting the Show annotations in Content Completion Assistant option in the Annotations preferences page.

Styling Annotations with HTML

You can use HTML format in the annotations you add in an XML Schema or Relax NG schema. This improves the visual appearance and readability of the documentation window displayed when editing XML documents validated against such a schema. An annotation is recognized and displayed as HTML if it contains at least one HTML element (such as div, body, p, br, table, ul, or ol).

The HTML rendering is controlled by the Show annotations using HTML format, if possible option in the Annotations preferences page. When this options is disabled, the annotations are converted and displayed as plain text and if the annotation contains one or more HTML tags (p, br, ul, li), they are rendered as an HTML document loaded in a web browser. For example, p begins a new paragraph, br breaks the current line, ul encloses a list of items, and li encloses an item of the list.

Collecting Annotations from XML Schemas

In an XML Schema, the annotations are specified in an <xs:annotation> element like this:

```xml
<xs:annotation>
  <xs:documentation>
    Description of the element.
  </xs:documentation>
</xs:annotation>
```

If an element or attribute does not have a specific annotation, then Oxygen XML Editor looks for an annotation in the type definition of that element or attribute.

Collecting Annotations from Relax NG Schemas

For Relax NG schema, element and attribute annotations are made using the <documentation> element from the http://relaxng.org/ns/compatibility/annotations/1.0 namespace. However, any element outside the
Relax NG namespace (http://relaxng.org/ns/structure/1.0) is handled as annotation and the text content is displayed in the annotation window. To activate this behavior, enable the *Use all Relax NG annotations as documentation* option in the Annotations preferences page.

**Collecting Annotation from DTDs**

For DTD, Oxygen XML Editor defines a custom mechanism for annotations using comments enabled from the *Prefer DTD comments that start with "doc:" as annotations* option in the Annotations preferences page. The following is an example of a DTD annotation:

```xml
<!--doc:Description of the element. -->
```

**Related tasks**

*Annotations for XML Elements and Attributes in Content Completion Assistant* on page 1191

**Related information**

*Customizing the Rendering of Elements* on page 1189

**Content Completion Helper Views**

Information about the current element being edited is also available in various views, such as the Model view, Attributes view, Elements view, and Entities view. By default, they are located on the right-hand side of the main editor window. These views, along with the powerful Outline view, provide spatial and insight information about the edited document and the current element.

**Model View**

The Model view presents the structure of the currently selected tag, and its documentation, defined as annotation in the schema of the current document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the Window > Show View menu.

![Figure 155: Model View](image)

The Model view is comprised of two sections, an element structure panel and an annotations panel.
Element Structure Panel

The element structure panel displays the structure of the currently edited or selected tag in a tree-like format. The information includes the name, model, and attributes of the current tag. The allowed attributes are shown along with imposed restrictions, if any.

![Element Structure Panel](image)

Figure 156: Element Structure Panel

Annotation Panel

The Annotation panel displays the annotation information for the currently selected element. This information is collected from the XML schema.

![Annotation panel](image)

Figure 157: Annotation panel

Attributes View in Author Mode

The Attributes view presents all the attributes of the current element determined by the schema of the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the Window > Show View menu.

You can use this view to edit or add attribute values. The attributes of an element are editable if any one of the following is true:

- The CSS stylesheet associated with the document does not specify a false value for the oxy-editable property associated with the element.
- The element is entirely included in a deleted Track Changes marker.
- The element is part of a content fragment that is referenced in Author mode from another document.

The attributes are rendered differently depending on their state:

- The names of the attributes are rendered with a bold font, and their values with a plain font.
- Default values are rendered with a plain font, painted gray.
- Empty values display the text "[empty]", painted gray.
- Invalid attributes and values are painted red.

To edit the value of the corresponding attribute, double-click a cell in the Value column. If the possible values of the attribute are specified as list in the schema of the edited document, the Value column acts as a combo box that allows you to either select the value from a list or manually enter it.
Note: If the cursor is located inside read-only content, the attribute names and values are faded and you cannot add, edit, or remove values.

You can sort the attributes table by clicking the Attribute column header. The table contents can be sorted as follows:

- By attribute name in ascending order.
- By attribute name in descending order.
- Custom order, where the used attributes are displayed at the beginning of the table sorted in ascending order, followed by the rest of the allowed elements sorted in ascending order.

**Figure 158: Attributes View**

A drop-down list located in the upper part of the view allows you to select the current element or its ancestors.

**Expand/Collapse Button**

There is an Expand/Collapse button at the top-right of the view. When expanded, this presents the following additional combo boxes:

**Name Combo Box**

Use this combo box to select an attribute. The drop-down list displays the list of possible attributes allowed by the schema of the document, as in the Attributes view. You can use the Remove button to delete an attribute and its value from the selected element.

**Value Combo Box**

Use this combo box to add, edit, or select the value of an attribute. If the selected attribute has predefined values in the schema, the drop-down list displays those possible values. You can use the Browse button to select a URL for the value of an attribute. After you have entered or selected a value, use the Update button (or press Enter) to add the value to the attribute.

**Contextual Menu Actions in the Attributes View**

The following actions are available in the contextual menu of the Attributes view when editing in Author mode:

**Set empty value**

Specifies the current attribute value as empty.

**Remove**

Removes the attribute (action available only if the attribute is specified). You can invoke this action by pressing the (Delete) or (Backspace) keys.
Copy

Copies the attrName="attrValue" pair to the clipboard. The attrValue can be:

- The value of the attribute.
- The value of the default attribute, if the attribute does not appear in the edited document.
- Empty, if the attribute does not appear in the edited document and has no default value set.

Paste

Depending on the content of the clipboard, the following cases are possible:

- If the clipboard contains an attribute and its value, both of them are introduced in the Attributes view. The attribute is selected and its value is changed if they exist in the Attributes view.
- If the clipboard contains an attribute name with an empty value, the attribute is introduced in the Attributes view and you can start editing it. The attribute is selected and you can start editing it if it exists in the Attributes view.
- If the clipboard only contains text, the value of the selected attribute is modified.

In-place Attributes Editor

Oxygen XML Editor includes an in-place attributes editor in Author mode. To edit the attributes of an XML element in-place, do one of the following:

- Select an element or place the cursor inside it and then press the Alt + Enter keyboard shortcut.
- Double-click any named start tag when the document is edited in one of the following display modes: Full Tags with Attributes, Full Tags, Block Tags, or Inline Tags.

This opens an in-place attributes editor that contains the same content as the Attributes view. By default, this editor presents the Name and Value fields, with the list of all the possible attributes collapsed.

![In-place Attributes Editor](image)

**Figure 159: In-place Attributes Editor**

Name Combo Box

Use this combo box to select an attribute. The drop-down list displays the list of possible attributes allowed by the schema of the document, as in the Attributes view.

Value Combo Box

Use this combo box to add, edit, or select the value of an attribute. If the selected attribute has predefined values in the schema, the drop-down list displays those possible values.

If you click More while in the collapsed version, it is expanded to the full version of the in-place attribute editor.
Figure 160: In-place Attributes Editor (Full Version)

The full version includes a table grid, similar to the Attributes view, that presents all the attributes for the selected element.

Elements View in Author Mode

The Elements view presents a list of all defined elements that are valid at the current cursor position according to the schema associated to the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the Window > Show View menu.

The upper part of the view features a combo box that contains the ordered ancestors of the current element. Selecting a new element in this combo box updates the list of the allowed elements. By default, only the elements that are allowed at the current cursor position are listed. However, if the Show only items allowed at cursor position option is disabled in the Views preferences page, two additional tabs (Before and After) will be displayed at the bottom of the view and they list elements that are allowed before or after the element at the current cursor position.

Double-clicking any of the listed elements inserts that element into the edited document and its position depends on the tab.

- **Cursor** tab - Double-clicking an element inserts it at the current cursor position.
- **Before** tab - Double-clicking an element inserts it before the element at the cursor position.
- **After** tab - Double-clicking an element inserts it after the element at the cursor position.

Figure 161: Elements View in Author Mode

Entities View

Entities provide abbreviated entries that can be used in XML files when there is a need of repeatedly inserting certain characters or large blocks of information. An entity is defined using the ENTITY statement either in the DOCTYPE declaration or in a DTD file associated with the current XML file.
There are three types of entities:

- **Built-in or Predefined** - Entities that are part of the predefined XML markup (`&lt;`, `&gt;`, `&amp;`, `&apos;`, `&quot;`).
- **Internal** - Defined in the DOCTYPE declaration header of the current XML.
- **External** - Defined in an external DTD module included in the DTD referenced in the XML DOCTYPE declaration.

**Note:** If you want to add internal entities, you would need to switch to the Text editing mode and manually modify the DOCTYPE declaration. If you want to add external entities, you need to open the DTD module file and modify it directly.

The **Entities** view displays a list with all entities declared in the current document, as well as built-in ones. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

Double-clicking one of the entities will insert it at the current cursor position in the XML document. You can also sort entities by name and value by clicking the column headers.

![Figure 162: Entities View](image)

The view features a filtering capability that allows you to search an entity by name, value, or both. Also, you can choose to display the internal or external entities.

**Note:** When entering filters, you can use the `?` and `*` wildcards. Also, you can enter multiple filters by separating them with a comma.

**Code Templates**

Code templates are code fragments that can be inserted quickly at the current editing position. Oxygen XML Editor includes a set of built-in code templates for CSS, LESS, Schematron, XSL, XQuery, and XML Schema document types. You can also define your own code templates and share them with others.

To get a complete list of available code templates, press `Ctrl + Shift + Space` in Text mode. To enter the code template, select it from the list or type its code and press **Enter**. If a shortcut key has been assigned to the code template, you can also use the shortcut key to enter it. Code templates are displayed with a `·` symbol in the content completion list.

When the **Content Completion Assistant** is invoked (`Ctrl + Space (Command + Space on OS X)` in Text mode or **Enter** in Author mode), it also presents a list of code templates specific to the type of the active editor.

To watch our video demonstration about code templates, go to [https://www.oxygenxml.com/demo/Code_Templates.html](https://www.oxygenxml.com/demo/Code_Templates.html).

**Outline View in Author Mode**

The **Outline** view in Author mode displays a general tag overview of the currently edited XML Document. When you edit a document, the **Outline** view dynamically follows the changes that you make, displaying the node that you modify. This
functionality gives you great insight on the location of your modifications in the current document. It also shows the correct hierarchical dependencies between elements. This makes it easy for you to be aware of the document structure and the way element tags are nested.

**Outline View Features**

The **Outline** view allows you to:

- Quickly navigate through the document by selecting nodes in the **Outline** tree.
- Insert or delete nodes using contextual menu actions.
- Move elements by dragging them to a new position in the tree structure.
- Highlight elements in the editor area. It is synchronized with the editor area, so when you make a selection in the editor area, the corresponding nodes are highlighted in the **Outline** view, and vice versa.
- View document errors, as they are highlighted in the **Outline** view. A tooltip also provides more information about the nature of the error when you hover over the faulted element.

**Outline View Interface**

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (*, ?) and separate multiple patterns with commas.

It also includes a **Settings** menu in the top-right corner that presents a variety of options to help you filter the view even further.

**Drop and Drop Actions in the Outline View**

Entire XML elements can be moved or copied in the edited document using only the mouse in the **Outline** view with drag-and-drop operations. Several drag and drop actions are possible:

- If you drag an XML element in the **Outline** view and drop it on another node, then the dragged element will be moved after the drop target element.
- If you hold the mouse pointer over the drop target for a short time before the drop then the drop target element will be expanded first and the dragged element will be moved inside the drop target element after its opening tag.
- You can also drop an element before or after another element if you hold the mouse pointer towards the upper or lower part of the targeted element. A marker will indicate whether the drop will be performed before or after the target element.
- If you hold down the **(Ctrl (Command on OS X))** key after dragging, a copy operation will be performed instead of a move.

The drag and drop actions in the **Outline** view can be **disabled and enabled from a Preferences page**.

**Tip:** You can select and drag multiple nodes in the **Outline** view when editing in **Author** mode.
Outline View Filters in Author Mode

The upper part of the Outline view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (*, ?) and separate multiple patterns with commas.

The following actions are available in the Settings menu of the Outline view when editing in Author mode:

- **Filter returns exact matches**
  - The text filter of the Outline view returns only exact matches.

- **Flat presentation mode of the filtered results**
  - When active, the application flattens the filtered result elements to a single level.

- **Show comments and processing instructions**
  - Show/hide comments and processing instructions in the Outline view.

- **Show element name**
  - Show/hide element name.

- **Show text**
  - Show/hide additional text content for the displayed elements.

- **Show attributes**
  - Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from the Outline preferences panel.

- **Configure displayed attributes**
  - Displays the XML Structured Outline preferences page.

Outline View Contextual Menu Actions in Author Mode

The contextual menu of the Outline view in Author mode contains the following actions:

- **Edit Attributes**
  - Allows you to edit the attributes of a selected node. For more details about this action, see Attributes View in Author Mode on page 213.
Edit Profiling Attributes
Allows you to change the *profiling attributes* defined on all selected elements.

Append Child
Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection as a child of the current element.

Insert Before
Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection immediately before the current element, as a sibling.

Insert After
Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection immediately after the current element, as a sibling.

Cut, Copy, Paste, Delete editing actions
Executes the typical editing actions on the currently selected elements. The Cut and Copy operations preserve the styles of the copied content. The Paste before and Paste after actions allow you to insert a well-formed element before or after the currently selected element. The Paste as XML action pastes copied content that is considered to be valid XML, preserving its XML structure.

Toggle Comment
Encloses the currently selected element in an XML comment, if the element is not already commented. If it is already commented, this action will remove the comment.

Rename Element
Invokes a Rename dialog box that allows you to rename the currently selected element, siblings with the same name, or all elements with the same name.

Expand More
Expands the structure tree of the currently selected element.

Collapse All
Collapses all of the structure tree of the currently selected node.

Tip: You can copy, cut or delete multiple nodes in the Outline by using the contextual menu after selecting multiple nodes in the tree.

Related information
*Attributes View in Author Mode* on page 213

Finding and Replacing Text
You can search for a specific word or string of characters using the following features:

- Find/Replace dialog box
- Find/Replace in Files dialog box
- Quick Find toolbar
- Find all Elements dialog box

Complex search operations may take some time to complete. If a search operation takes more than 5 seconds, you are prompted to decide whether you want to continue the operation or stop it.

Reviewing Documents
Oxygen XML Editor includes a variety of helpful review tools that improve your ability to collaborate with other members of your team, track changes, mark content for various reasons, add comments in your content, and to manage the review features.

Tracking Document Changes
The Track Changes feature is a way to keep track of the changes you make in a document. Track Changes highlights changes that you make to the content in a document, as well as changes to attributes. Changes can be tracked for insertions and deletions.
When the Track Changes feature is activated, insertions are rendered in Author mode with an underline while deletions are rendered with a strike through.

The tracked changes are also displayed in the Review view and you can also choose to present the changes in callouts by enabling Track Changes Deletions and Track Changes Insertions in the Callouts preferences page.

Adding Comments in Documents

You can associate a comment to a selected area of content. Comments can highlight virtually any content from your document, with the exception of read-only text. The difference between using comments and change tracking is that a comment can be associated to an area of text without modifying or deleting the text.

Comments are presented in callouts with persistent highlights and a colored background. The background color is assigned automatically by the application, but it can also be customized from the Review preferences page.

Highlighting Content

Oxygen XML Editor includes a highlighting feature that allows you to create digital markers to emphasise important fragments of your documents. This is especially useful when you want to mark content that needs additional work or the attention of others.

Using the Review View

Oxygen XML Editor includes a Review view that provides a simplified way of monitoring all the insertions, deletions, comments, and highlights in an XML document. This handy tool is especially useful for large teams that need to gather and manage all the edits from all team members who are working on the same project.

The Review view is also useful for managing tracked changes and comments in a single panel. In this view, the changes and comments are presented in a compact form, in the order they appear in the document, and they are synchronized with the changes and comments in the main editing area.

You can use this view to quickly navigate through changes, accept or reject them, or to view and manage comments or highlights. You can also search for specific changes or comments and it includes some filtering options (for example, you can filter it to only show certain types of edits or to only show edits for a particular author).

Printing Review Information

When you print a document from Author mode, whatever review information is shown in the main editing area will be included in the printed output. For example, tracked changes will be included and as long as the Comments option is enabled in the Callouts preferences page, comment callouts will also be included (same with tracked change callouts if their corresponding options are enabled in the Callouts preferences page.

Managing Tracked Changes

Oxygen XML Editor includes a Track Changes feature that allows you to review changes that you or other authors have made and then accept or reject them. You can also manage the visualization mode of the tracked changes, add comments to changes, and mark them as being done. These actions are easily accessible from contextual menus, the toolbar, or the Review view.

The Track Changes feature is also able to keep track of changes you make to attributes in a document and the changes are presented in the Review view and Attributes view.

To watch our video demonstration about the Track Changes support, go to https://www.oxygenxml.com/demo/Change_Tracking.html.

Types of Tracked Changes

The types of tracked changes include:

- Inserting, deleting content (text or elements)
- Drag and drop content (text or elements)
- Cutting or pasting content (text or elements)
- Inserting, deleting, and changing the structure of tables
- Inserting and editing lists and their content
- Inserting and deleting entities
• Inserting and deleting element tags
• Editing attributes
• Performing a Split operation
• Performing a Surround with operation
• Changes in referenced content (for example, XInclude fragments or DITA conrefs)

**Important:** If you copy content in Author mode that contains tracked changes, the changes will automatically be accepted prior to the content being copied to the clipboard. This filtering is performed only if the selection is not entirely inside a tracked change.

### Activating the Change Tracking Feature

To activate the Track Changes feature for the current document, use any of the following methods:

- Click the Track Changes button on the toolbar.
- Select Track Changes from the Review submenu of the contextual menu in the main editing area in Author mode.
- Select Track Changes from the Edit > Review menu.

When Track Changes is enabled, your modifications are highlighted using a distinctive color. The colors can be customized from the Review preferences page, along with the name of the author and the initial state of the feature when you open a document. Insertions are rendered with an underline while deletions are rendered with a strike through.

![Docbook 4 supports XHTML tables:](image)

```markdown
Sample XHTML Table with **fixed** width and proportional column widths

col{span:1, width:2.00ex}
col{span:1, width:0.46ex}

</tr>
</tbody>
</table>

They belong are all students of the computer science department.

This is a list of useful XML links:
```

![Figure 164: Change Tracking in Author Mode](image)

When hovering over a change a tooltip displays information about the author and modification time.

### Change Tracking Contextual Menu Actions

You can right-click any change in Author mode to access the following contextual menu actions:

- **Accept Change(s)**
  Accepts the tracked change located at the cursor position and moves to the next change. If you select a part of a deletion or insertion change, only the selected content is accepted. If you select multiple changes, all of them are accepted. For an insertion change, it keeps the inserted text and for a deletion change, it removes the content from the document.

- **Reject Change(s)**
  Rejects the tracked change located at the cursor position and moves to the next change. If you select a part of a deletion or insertion change, only the selected content is rejected. If you select multiple changes, all of them are rejected. For an insertion change, it removes the inserted text and for a deletion change, it preserves the original content.
Comment Change

Opens a dialog box that allows you to add a comment to an existing tracked change. The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

You can accept or reject multiple changes at once by selecting a block of content that contains the changes and then ✅ Accept Change(s) or ❌ Reject Change(s) from the contextual menu or toolbar.

Change Tracking Toolbar Actions

By default, the toolbar includes the following actions and options for reviewing or tracking changes (similar actions are also available in the Edit > Review menu and the Review submenu of the contextual menu):

✓ Track Changes

Enables or disables the track changes support for the current document.

✓ Accept Change(s)

Accepts the tracked change located at the cursor position and moves to the next change. If you select a part of a deletion or insertion change, only the selected content is accepted. If you select multiple changes, all of them are accepted. For an insertion change, it keeps the inserted text and for a deletion change, it removes the content from the document.

✗ Reject Change(s)

Rejects the tracked change located at the cursor position and moves to the next change. If you select a part of a deletion or insertion change, only the selected content is rejected. If you select multiple changes, all of them are rejected. For an insertion change, it removes the inserted text and for a deletion change, it preserves the original content.

✓ Comment Change

Opens a dialog box that allows you to add a comment to an existing tracked change. The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

• Track Changes Visualization Modes Drop-Down Menu

This drop-down menu includes specialized actions that allow you to switch between the following visualization modes:

- View All Changes/Comments - This mode is active by default. When you use this mode, all tracked changes are represented in the Author mode.
- View only Changes/Comments by - Only the tracked changes made by the author you select are presented.
- View Final - This mode offers a preview of the document as if all tracked changes (both inserted and deleted) were accepted.
- View Original - This mode offers a preview of the document as if all tracked changes (both inserted and deleted) were rejected. If you attempt to edit the document in this mode, the view mode will switch to View All Changes/Comments.

Note: If you use View Final mode and View Original mode, callouts are not displayed for comments or changes. To display callouts, use the View All Changes/Comments mode.

Highlight

Enables or disables the Highlight tool. Use the Highlight drop-down menu to select a new color.

Add Comment

Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).

Show/Edit Comment

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.
Remove Comment

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

Manage Reviews

Opens the Review view.

Tracked Change Callouts

You can also choose to display insertion and deletion changes in callouts in Author mode. By default, tracked changes are not displayed in callouts, but you can change this behavior by enabling Track Changes Deletions and Track Changes Insertions in the Callouts preferences page. You can also choose to display the actual content of the deletion or insertion.

By displaying the changes in callouts, you then have access to even more actions, such as the ability to reply or mark them as being done. For more information, see Author Callouts on page 350.

Tracked Changes in the Review View

The Review view is also useful for managing tracked changes and comments. In this view, the edits are presented in a compact form, in the order they appear in the document and each edit is marked with a type-specific icon. You can use this view to quickly navigate through changes, accept or reject them, or to add and manage comments for the changes. You can also search for specific changes and it includes some filtering options (for example, you can filter it to only show certain types of changes or to only show changes for a particular author).

For more information, see Review View on page 354.

Tracked Changes XML Source Code

The changes are stored in the document source code as processing instructions and they do not interfere with validations or transformations. For each change, the author name and the modification time are preserved.

Example - Insertion Change: The following processing instruction is an example of how an insertion change is stored in a document:

```xml
<?oxy_insert_start author="John Doe" timestamp="20090408T164459+0300"?>all<?oxy_insert_end?>
```

Example - Deletion Change: The following processing instruction is an example of how a deletion change is stored in a document:

```xml
<?oxy_delete author="John Doe" timestamp="20090508T164459+0300" content="belong"?>
```

Tracked Changes Behavior

The behavior of the Track Changes feature depends on the context, the type of change, and whether or not it is activated.

Inserting Content

If the Track Changes feature is disabled and you insert content, the following behavior is possible:

- Making an insertion in a Delete change results in the change being split in two and the content is inserted without being marked as change.
- Making an insertion in an Insert change results in the change being split in two and the content is inserted without being marked as change.
- Making an insertion in regular content results in a regular insertion.

If the Track Changes feature is enabled and you insert content, the following behavior is possible:

- Making an insertion in a Delete change results in the change being split in two and the current inserted content appears marked as an INSERT.
• Making an insertion in an Insert change results in the following:
  • If the original insertion was made by another user, the change is split in two and the current inserted content appears marked as an INSERT by the current author.
  • If the original Insert change was made by the same user, the change is just expanded to contain the inserted content. The creation time-stamp of the previous insert is preserved.

• If we insert in regular content, the current inserted content appears marked as an Insert change.

**Surrounding Content**

If the Track Changes feature is enabled and you surround content in a new XML element, the following behavior is possible:

• Making a surround in a Delete change results in nothing happening.
• Making a surround in an Insert change results in the following:
  • If the original insertion was made by another user, the change is split in two and the surround operation appears marked as being performed by the current author.
  • If the original Insert change was made by the same user, the existing change is just expanded to contain the surrounded content.

• Making a surround in regular content results in the operation being marked as a surround change.

**Deleting Characters**

If the Track Changes feature is disabled and you delete content character by character, the following behavior is possible:

• Deleting content in an existing Delete change results in nothing happening.
• Deleting content in an existing Insert change results in the content being deleted without being marked as a deletion and the INSERT change shrinks accordingly.
• Deleting in regular content results in a regular deletion.

If the Track Changes feature is enabled and you delete content character by character, the following behavior is possible:

• Deleting content in an existing Delete change results in the following:
  • If the same author created the Delete change, the previous change is marked as deleted by the current author.
  • If another author created the Delete change, nothing happens.
• Deleting content in an existing Insert change results in the following:
  • If the same author created the Insert change, the content is deleted and the Insert change shrinks accordingly.
  • If another author created the Insert change, the Insert change is split in two and the deleted content appears marked as a Delete change by the current author.

• Deleting in regular content results in the content being marked as a Delete change by the current author.

**Deleting Selections of Content**

If the Track Changes feature is disabled and you delete a selection of content, the following behavior is possible:

• If the selection contains an entire Delete change, the change disappears and the content is deleted.
• If the selection intersects with a Delete change (starts or ends in one), it results in nothing happening.
• If the selection contains an entire Insert change, the change disappears and the content is deleted.
• If the selection intersects with an Insert change (starts or ends in one), the Insert change is shrunk and the content is deleted.

If the Track Changes feature is enabled and you delete a selection of content, the following behavior is possible:

• If the selection contains an entire Delete change, the change is considered as rejected and then marked as deleted by the current author, along with the other selected content.
• If the selection intersects a Delete change (starts or ends in one), the change is considered as rejected and marked as deleted by the current author, along with the other selected content.
• If the selection contains an entire Insert change, the following is possible:
  • If the Insert is made by the same author, the change disappears and the content is deleted.
• If the **Insert** is made by another author, the change is considered as accepted and then marked as deleted by the current author, along with the other selected content.

• If the selection intersects an **Insert** change (starts or ends in one), the **Insert** change shrinks and the part of the **Insert** change that intersects with the selection is deleted.

**Deleting Tags**

Assuming you are using any of the **Tag Display Modes** other than ✗ **No Tags** and the **Track Changes** feature is disabled, the following behavior is possible:

• If you delete a start or end tag, both the start and end tag will be removed, while any content that was inside the element is preserved.

Assuming you are using any of the **Tag Display Modes** other than ✗ **No Tags** and the **Track Changes** feature is enabled, the following behavior is possible:

• If you delete a start tag of an **inline** element, both the start and end tag are marked as a **Delete** change by the current author, while any content that was inside the element is preserved.

**Copying Content**

If the **Track Changes** feature is disabled and you copy content, the following behavior is possible:

• If the copied area contains **Insert** or **Delete** changes (or attribute edits), these are also copied to the clipboard.

If the **Track Changes** feature is enabled and you copy content, the following behavior is possible:

• If the copied area contains **Insert** or **Delete** changes (or attribute edits), these are all accepted in the content of the clipboard (the changes will no longer be in the clipboard).

**Pasting Content**

If the **Track Changes** feature is disabled and you paste content, the following behavior is possible:

• If the clipboard content contains **Insert** or **Delete** changes (or attribute edits), they will be preserved on paste.

If the **Track Changes** feature is enabled and you paste content, the following behavior is possible:

• If the clipboard content contains **Insert** or **Delete** changes (or attribute edits), all the changes are accepted and then the paste operation proceeds according to the insertion rules.

**Tracked Changes Limitations**

There are some inherent limitations to the change tracking feature. These limitations include the following:

• **Limitations to rejected changes** - Recording changes has limitations and there is no guarantee that rejecting all changes will return the document exactly to its original state.

• **Limitations to hierarchical changes** - Recorded changes are not hierarchical, a change cannot contain other changes inside. For example, if you delete an insertion made by another user, then reject the deletion, the information about the author who made the previous insertion is not preserved.

• **Limitations to using certain actions** - Some actions cannot be implemented with the **Track Changes** feature enabled. For example, some of the table-related actions (>Delete Row(s), Delete Column(s), Join Cells, Split Cell) ignore the **Track Changes** feature when executing the action.

**Tracked Changes XML Markup**

Depending on the type of edits, the following track changes markup appears in the document source code when you activate the **Track Changes** feature:

<table>
<thead>
<tr>
<th>Edit Type</th>
<th>Processing Instruction Start Marker</th>
<th>Processing Instruction End Marker</th>
<th>Attributes</th>
</tr>
</thead>
</table>
If a comment intersects another, the mid attribute is used to correctly identify start and end processing instruction markers.

**Managing Comments**

You can add comments to any selected area of content within XML documents, with the exception of read-only content. The difference between using comments and tracked changes is that a comment is associated to a selection without modifying or deleting the content.

By default, when you annotate your XML documents, the comments are displayed in the Author mode as callouts (balloons) and they are rendered with a unique name and background for each user. If comments are not currently displayed in callouts, enable the Comments option in the Callouts preferences page. Comments are also displayed in the Review view.

![Figure 165: Comments in Author Mode](image)

**Managing Comments in the Main Editor**

You can insert and manage comments directly in the main editing area in Author mode.

**Add Comment**

To insert a comment at the cursor position or on a specific selection of content, select the Add Comment action from the toolbar (or in the Review submenu of the contextual menu).

**Show/Edit Comments**

To edit an existing comment that you have added in the main editing area in Author mode, select the Show/Edit Comments action from the toolbar (or in the Review submenu of the contextual menu). The action opens a dialog box that allows you to see and edit your comment at the cursor position. Note that you cannot edit a comment that was added by another user, so in that case, the dialog box just displays the comment without the possibility of editing it.

**Remove Comments**

To remove a comment at the cursor position or multiple comments in a selection, select Remove Comment(s) from the toolbar (or in the Review submenu of the contextual menu).

**Tip:** When adding or editing a comment, you can use Enter to insert line breaks and Oxygen XML Editor will take the line breaks into account when presenting the callout. You can also use Ctrl + Enter to accept your changes and close the dialog box.
Managing Comments in Callouts

As long as the Comments option is enabled in the Callouts preferences page, comments are also displayed in callouts. By displaying the comments in callouts, you then have access to even more actions, such as the ability to reply or mark them as being done. When you right-click a specific comment in its callout, the contextual menu includes the following actions.

Reply

Opens a dialog box that allows you to add a reply to a comment or tracked change. When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and Review view.

Mark as Done

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for tracked changes that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendents. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

Show/Edit Comment

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

Remove Comment

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

Callouts Options

Select this option to open the Callouts preference page where you can configure various callout options.

Tip: When adding, editing, or replying to a comment, you can use Enter to insert line breaks and Oxygen XML Editor will take the line breaks into account when presenting the callout. You can also use Ctrl + Enter to accept your changes and close the dialog box.

Managing Comments in the Review View

The Review view is also useful for managing comments. In this view, comments are presented in a compact form, in the order they appear in the document, along with tracked changes. You can also use this view to search for specific comments and it includes some filtering options (for example, you can filter it to only show comments for a particular author). When you right-click a specific comment in the Review view, the contextual menu includes the following actions.

Reply

Opens a dialog box that allows you to add a reply to a comment or tracked change. When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and Review view.

Mark as Done

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for tracked changes that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendents. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

Show/Edit Comment

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

Remove Comment

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

Show only reviews by '<author name>'

Filters the comments to only show comments for the particular author.
Remove all Comments

Removes all comments from the document.

Comments XML Source Code

The comments are stored in the document source code as processing instructions that contain information about the author name and the comment time:

```xml
<?oxy_comment_start author="John Doe" timestamp="20090508T164459+0300" comment="Do not change this content"?>
  Important content
<?oxy_comment_end?>
```

Replies to comments are stored in the document source code as a comment (with information about the author name and time), but with a `parentID` attribute and its value is the same as the `id` value of the parent comment.

```xml
<?oxy_comment_start author="Tom" timestamp="20160217T102630+0200" comment="We should not forget about recycling the oil and oil filter!" parentID="vws_x4l_1v" mid="4"?>
```

Managing Highlights

Use the Highlight tool to mark fragments in your document using various colors. This is especially useful when you want to mark sections that needs additional editing or to draw the attention of others to particular content.

To watch our video demonstration about using the Highlight tool, go to [https://www.oxygenxml.com/demo/Highlight_Tool.html](https://www.oxygenxml.com/demo/Highlight_Tool.html).

Using the Highlight Tool

You can find the Highlight action on the main toolbar, in the Edit > Review menu, or in the Review submenu of the contextual menu of a document. You can also choose the color to use for the highlight or choose to Stop highlighting from the same menus.

To highlight content, follow these steps:

1. Click the Highlight icon on the toolbar.

   **Step Result:** The highlighting mode is on and the cursor changes to a dedicated symbol.

2. Click the small arrow next to the Highlight icon and select the color that you want to use for the highlighting.

3. Select the content you want to highlight. To mark multiple parts of a document, press and hold Ctrl (Meta on Mac OS) and select the parts you want to highlight.

4. To exit the highlighting mode, press Esc, click the Highlight icon, or start editing the document.

To remove highlighting from a document, follow these steps:

1. Either select the text you want to remove highlighting from using your cursor, or press Ctrl + A (Command + A on OS X) if you want to select all of the text.

2. Click the small arrow next to the Highlight icon and select No color (erase), or right-click the highlighted content and select Remove highlight(s).

3. To exit the highlighting mode, press Esc, click the Highlight icon, or start editing the document.

   **Note:** Oxygen XML Editor preserves the highlighting of a document between working sessions.

Review View

The Review view is also useful for managing highlights. In this view, the highlights are presented in a compact form, in the order they appear in the document, along with tracked changes and comments. The following actions are available in the contextual menu of each highlight in the Review view:
Change Color
   Allows you to change the color of an existing highlight by selecting the new color from this menu.

Remove Highlight
   Removes the selected highlight.

Remove Highlights with the Same Color
   Removes the selected highlight and all others that have the same color.

Remove All Highlights
   Removes all highlights from the document.

Highlights XML Source Code
The highlights are stored in the document source code as processing instructions that contain information about the color:

```xml
<?oxy_custom_start type="oxy_content_highlight" color="0,128,255"?>
The highlights are stored</oxy_custom_end>?
```

Author Callouts

A callout is a string of text inside a graphic and is connected to a specific location in a document by a line. Oxygen XML Editor uses callouts to present comments and tracked change modifications that you or other members of your team have added to the document.

To watch our video demonstration about the Callouts support, go to https://www.oxygenxml.com/demo/CalloutsSupport.html.

Displaying Callouts in Author Mode

The callouts are displayed in the right side of the editing area in Author mode. They are decorated with a colored border and also have a colored background. The background color is assigned automatically by the application depending on the user who is editing the document and the type of change, but it can also be customized from the Review preferences page. This preferences page allows you to configure the colors for tracked change insertions or deletions, and for comments.

You can also choose to use the same color for all changes of that particular type of change, regardless of who makes the change. To do this, select the Fixed option for the particular type of change and choose a color from the color box. If the Automatic option is selected, Oxygen XML Editor automatically assigns a color based upon the Colors for automatic assignment list.

The horizontal line that connects the callouts to their corresponding text fragments has the same color as the border. If this horizontal line is not visible, enable the Show all connecting lines option in the Callouts preferences page. If you hover over a callout, it is highlighted and a tooltip is displayed that contains additional information.
Winter is the season of cold weather. The season occurs during December - February in the Northern hemisphere. In the Southern hemisphere winter occurs during June - August. Some of the flowers blooming in winter are: Acadia, Alstroemeria, Amaryllis, Carnation, Chrysanthemums, Cyclamen, Evergreens, Gerbera Daisy, Ginger, Helleborus, Holly berry, Lily, Asiatic Lily, Casa Blanca Lily, Narcissus, Orchid, Pansy, Pepperberry, Phlox, Protea, Queen Ann’s Lace, Roses, Star of Bethlehem, Statice.

Figure 166: Multiple Author Callouts

Note: Oxygen XML Editor displays callouts only if View All Changes/Comments or View Only Changes/Comments by is selected in the Track Changes Visualization Modes drop-down menu. Oxygen XML Editor does not display callouts in View Final and View Original modes.

In some cases, the text you are editing can span into the callouts area. For example, this situation can appear for callouts associated with wide images or space-preserve elements that contain long fragments (such as a DITA codeblock element or programlisting in DocBook). To help you view the text under the covered area, Oxygen XML Editor applies transparency to these callouts. When the cursor is located under a callout, the transparency is enhanced, allowing you to both edit the covered content and access the contextual menu of the editing area.

Figure 167: Transparent Callout

Adjusting Callout Width

To display more of the content in all the callouts in the current document, you can adjust the width by dragging the left side of any of the callouts. This will adjust the width for all comments in the current document. When you end the current editing session, the width of all callouts will revert back to the default value, which is the value of the Initial Width option in the Callouts preferences page.

You can also adjust the maximum number of lines to be shown in the callouts using the Text Lines Count Limit option. Note that this does not limit the number of lines in the actual comment. It only limits the number of lines shown without opening or editing it.

Type of Callouts in Oxygen XML Editor

Oxygen XML Editor uses callouts to display comments and tracked changes that you associate with fragments of the document you are editing. You can choose which types of edits will be shown in callouts by configuring the options in the Callouts preferences page. You can choose to enable the following types of review callouts:
• **Comment Callouts** - As long as the Comments option is enabled in the Callouts preferences page, comments are displayed in callouts. A comment callout contains the name of the author who inserts the callout and the comment itself. You can also enable the Show review time option to include timestamp information in the comment callouts.

![Figure 168: Comment Callouts](image)

There are several types of comments that can be added in Author mode:

- **Author Review Comments** - Comments that you associate with specific content. To insert this type of comment, select the content and use the Add Comment action that is available on the toolbar (or in the Review submenu of the contextual menu).
- **Comments Added to Tracked Changes** - Comments that you add to an already existing tracked change insertion or deletion. To insert this type of comment, right-click the change in the main editor or its callout and select Comment Change.
- **Replies to Comments** - You can use this type of comment to create discussion threads. To insert this type of comment, right-click the change in its callout and select Reply. A single callout is presented for a root comment or change and its replies. The replies are displayed with an indentation in the callouts and those that are on the same level are sorted depending on the timestamp.

![Figure 169: Callout for a Comment with Replies](image)

Tip: When adding, editing, or replying to a comment, you can use Enter to insert line breaks and Oxygen XML Editor will take the line breaks into account when presenting the callout. You can also use Ctrl + Enter to accept your changes and close the dialog box.

- **Tracked Change Deletion Callouts** - As long as the Track Changes Deletions option is enabled in the Callouts preferences page, deletions that are made while the Track Changes feature is enabled are displayed in callouts. A deletion callout contains the type of callout (Deleted) and the name of the author that made the deletion. You can also enable the Show deleted content in callout option to display the actual deleted content in the callout. Additionally, you can enable the Show review time option to include timestamp information in the deletion callouts.

![Figure 170: Deletion Callouts](image)

- **Tracked Change Insertion Callouts** - As long as the Track Changes Insertions option is enabled in the Callouts preferences page, insertions that are done while the Track Changes feature is enabled are displayed in callouts. An insertion callout contains the type of callout (Inserted) and the name of the author that inserted the content. You can also enable the Show
**inserted content in callout option** to display the actual deleted content in the callout. Additionally, you can enable the **Show review time option** to include timestamp information in the deletion callouts.

![Configure Transformation Scenario](docbook-configuration-icon.png)

**Figure 171: Insertion Callouts**

Callout Contextual Menu Actions

Some useful actions are available when the contextual menu is invoked on a callout. The actions depend on the type of callout.

**Insertion or Deletion Callout Actions**

The following actions are available in the contextual menu of an insertion or deletion callout:

- **Reply**
  - Opens a dialog box that allows you to add a reply to a comment or tracked change. When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and **Review** view.

- **Mark as Done**
  - A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for tracked changes that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendants. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

- **Accept Change**
  - Accepts the tracked change, removes the callout, and moves to the next change. For an *insertion* change, it keeps the inserted text and for a *deletion* change, it removes the content from the document.

- **Reject Change**
  - Rejects the tracked change, removes the callout, and moves to the next change. For an *insertion* change, it removes the inserted text and for a *deletion* change, it preserves the original content.

- **Comment Change**
  - Opens a dialog box that allows you to add a comment to an existing tracked change. The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

- **Edit Reference**
  - If the fragment that contains a callout is a reference, use this option to go to the reference and edit the callout.

- **Callouts Options**
  - Select this option to open the **Callouts preference page** where you can configure various callout options.

Comment Callout Actions

The following options are available in the contextual menu of a comment callout:

- **Reply**
  - Opens a dialog box that allows you to add a reply to a comment or tracked change. When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and **Review** view.

- **Mark as Done**
  - A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for tracked changes that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and...
all of its descendents. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

- Show/Edit Comment
  Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

- Remove Comment
  Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

- Edit Reference
  If the fragment that contains a callout is a reference, use this option to go to the reference and edit the callout.

- Callouts Options
  Select this option to open the Callouts preference page where you can configure various callout options.

**Printing Callouts**

When you print a document from Author mode, all callouts that you or other authors have added to the document are printed. For a preview of the document and its callouts, go to File > Print Preview.

**Review View**

The Review view is also useful for managing the information in callouts. In this view, changes and comments are presented in a compact form, in the order they appear in the document, and they are synchronized with the changes in the callouts. You can also search for specific changes or comments and it includes some filtering options (for example, you can filter it to only show certain types of edits or to only show edits for a particular author).

For more information, see Review View on page 354.

**Related information**

Managing Tracked Changes on page 341
Managing Comments on page 347
Review View on page 354

**Review View**

The Review view is a framework-independent panel, available both for built-in and custom XML document frameworks. It is designed to offer an enhanced way of monitoring all the changes that you make to a document. This means you can view and manage highlights, comments, and tracked changes using a single view.

The Review view is useful when you are working with documents that contain large number of edits. The edits are presented in a compact form, in the order they appear in the document. Each type of edit is marked with a specific icon. This view and the editing area are synchronized. When you select an edit listed in the Review view, its corresponding fragment of text is highlighted in the editing area and the reverse is also true. For example, when you place the cursor inside an area of text marked as inserted, its corresponding edit is selected in the list.

You can use this view to quickly navigate through changes and it includes some useful hover actions and contextual menu actions to help you manage changes, comments, and highlights. You can also search for specific changes or comments and it includes some filtering options (for example, you can filter it to only show certain types of edits or to only show edits for a particular author).
Activating the Review View

To activate the Review view, do one of the following:

- Click the Manage reviews button on the toolbar.
- Right-click anywhere in a document and select Review > Manage reviews.
- Open it from the Window > Show View menu.

Review View Settings

The upper part of the view contains a filtering area that allows you to search for specific edits. Use the small arrow symbol from the right side of the search field to display the search history.

The menu includes the following options:

- **Show highlights** - Controls whether or not the Review view displays the highlighting in your document.
- **Show comments** - Controls whether or not the Review view displays the comments in the document you are editing.
- **Show track changes** - Controls whether or not the Review view displays the inserted and deleted content in your document.
- **Show review time** - Displays the time when the edits from the Review view were made.
- **Configure review options** - Opens the Review preferences page where you can configure various options for review information.

Hover Actions in the Review View

You can use this view to easily manage changes, highlights, and comments that have been added by you or other users. The following actions are available when you hover over the changes in the Review view:

**Remove**

Available for highlights and comments presented in the Review view and it removes the particular highlight or comment from your document and moves to the next change.

**Accept**

Available for inserted and deleted content presented in the Review view and it accepts the particular change in your document and moves to the next change.

**Reject**

Available for inserted and deleted content presented in the Review view and it rejects the particular change in your document and moves to the next change.
Contextual Menu Actions in the Review View

Depending on the type of an edit, the following additional actions are available in the contextual menu of the Review view:

**Reply**
- Opens the Reply dialog box where you can add a reply to comment or change. The replies are displayed with an indentation in this view.

**Mark as Done**
- This toggles the comment or change as being done in the contextual menu and grays it out in the callout. You can mark a whole discussion thread as being done by selecting the action on the first (parent) comment in the thread.

- **Show Comment**
  - Available for comments added by other users and you can use this option to view it in a Show comment dialog box.

- **Edit Comment**
  - Available for comments you have added and you can use this action to edit a comment.

- **Remove Comment**
  - Use this action to remove the selected comment.

- **Show only Reviews by '<author name>'**
  - Use this action to filter the edits to only show them for a certain author.

- **Remove All Comments**
  - Use this action to remove all the comments that appear in the edited document.

**Change Color**
- Available for highlights and it opens a palette that allows you to choose a new color for the highlighted content.

**Remove Highlight**
- Use this action to remove the selected highlight.

**Remove Highlights with the Same Color**
- Use this action to remove all the highlights with the same color from the entire document.

**Remove All Highlights**
- Use this action to remove all the highlights in your document.

- **Accept Change**
  - Accepts the selected change and moves to the next change.

- **Reject change**
  - Rejects the selected change and moves to the next change.

- **Comment change**
  - Available for insertions or deletions and you can use this option to add a comment for the particular change.

**Accept all changes**
- Accepts all the changes made to a document.

**Reject all changes**
- Rejects all the changes made to a document.

- *Author Callouts* on page 350

**Profiling and Conditional Text**

Profiling text is a way to mark blocks of text meant to appear in some renditions of the document but not in others. Conditional text differs from one variant of the document to another, while unconditional text appear in all document versions. For example,
you can mark a section of a document that is to be included in a manual to be designated for expert users, while unmarked sections are included in all renditions.

**Profiling Attributes and Condition Sets**

Oxygen XML Editor allows you to define values for the profiling attributes and they can be easily managed to filter content in the published output. You can switch between profile sets to see how the edited content looks like before publishing. You can also conditionally profile parts of a document so that certain parts are displayed when certain profiling conditions are set. You can even customize the colors and styling of how the profiling is displayed in Author mode.

You can use profiling and conditional text to help you create documentation for multiple output scenarios, including:

- Multiple outputs for a series of similar products.
- Multiple outputs for various releases of a product.
- Multiple outputs for various audiences.

This feature helps to reduce the effort for updating and translating your content and provides an easy way to customize the output for various audiences.

![Figure 173: Example: Profiling Content](image)

Oxygen XML Editor includes a preconfigured set of profiling attribute values for some of the most popular document types. These attributes can be redefined to match your specific needs. You can also define your own profiling attributes for each document type (framework) and your profiling configuration can be shared amongst content authors through the project file.

**Apply Profiling to DITA Content**

To apply a profiling attribute to DITA content, highlight the content and select **Edit Profiling Attributes** from the contextual menu. To profile specific elements in a topic or map, right-click inside the element and select **Edit Profiling Attributes**. The **Edit Profiling Attributes** dialog box is displayed, allowing you to check each of the profiling tokens that apply for each attribute.
The profiling attributes and their potential values that appear in this dialog box depend on what has been configured in Oxygen XML Editor. If you have a large list of profiling attributes, you can use the text filter field to search for attributes or values, and you can expand or collapse attributes by using the Expand All/Collapse All buttons to the right of the text filter or the arrow button to the left of the profiling attribute name.

The attributes and values that appear in the dialog box are determined as follows:

• If your root DITA map references a DITA subject scheme map that defines values for the profiling attributes, those values are used. Oxygen XML Editor collects all the profiling values from the subject scheme map that is referenced in the map that is currently opened in the DITA Maps Manager (or set as the root map). In the image above (taken from the Oxygen XML Editor documentation project), you see values for eight products. They are the only values that are defined in the subject scheme map and thus, are the only ones that appear in the dialog box.

• If your project defines project-level configuration values for the profiling attributes, those values are used.

• If Oxygen XML Editor defines global-level configuration values for the profiling attributes, those values are used.

• Otherwise, a generic default set of profiling attributes and values are available.

Visualizing Profiled Content

You can visualize the effect of profiling content by using the profiling tools in the Profiling/Conditional Text drop-down menu that is located on the DITA Maps Manager toolbar. You can select which profiles to show, or apply colors to text that is profiled in various ways, as shown in the following image:
Managing Profiling Attributes

Oxygen XML Editor includes support for defining your own profiling attributes, or modifying existing ones, for each particular document type (framework). You can then apply the profiling attributes to content in Author mode to see how the profiling will affect the output.

Create Profiling Attributes

To create custom profiling attributes for a specific document type, follow these steps:

1. Make sure the attribute is already defined in the document DTD or schema before continuing with the procedure.
2. Open the Preferences dialog box (Options > Preferences) and go to Editor > Edit modes > Author > Profiling/Conditional Text.
3. In the Profiling Attributes section, press the New button.

   Step Result: The Profiling Attribute configuration dialog box is opened.
4. Configure your profiling attributes as desired. The following options are available in this dialog box:

**Document type**
Select the document type (framework) for which you have defined profiling attributes.

Tip: You can use the * or ? wildcards in this combo box. For example, DITA* would match any document type that starts with "DITA". You can also specify multiple document types by using commas to separate them.

**Attribute name**
The name of the new profiling attribute.

**Display name**
This optional field is used for descriptive rendering in profiling dialog boxes.

**Attribute Values Table**
This table displays the values for the profiling attribute and allows you to configure them by using the following buttons at the bottom of the table:

- **New** Opens a dialog box that allows you to insert a new value. The fields that can be configured in this dialog box correspond to the columns in the table and are as follows:
  - **Value** - The attribute value.
  - **Label** - You can specify a label for the attribute value that will be rendered as its name in various components in Author mode (Edit Profiling Attributes dialog box, Condition Set dialog box, Profiling tab in the Edit Properties dialog box, DITA Maps Manager). If the Label is not specified, the Value will be used as its rendered name.
  - **Description** - A description for the attribute value that will be displayed in the Attribute Values Table.

- **Edit** Use this button or double-click an attribute value to modify it.
Delete
Removes the selected attributed value.

Single value
Select this option if you want the attribute to only accept a single value.

Multiple values separated by
Select this option if you want the attribute to accept multiple values, and you can choose the type of delimiter to use. You can choose between space, comma, and semicolon, or you can enter a custom delimiter in the text field. A custom delimiter must be supported by the specified document type. For example, the DITA document type only accepts spaces as delimiters for attribute values.

5. Click OK to confirm your selections and close the Profiling Attributes configuration dialog box.
6. Click Apply to save the profiling attribute.

Editing Existing Profiling Attributes
To modify an existing profiling attribute or its values, follow these steps:

1. Open the Preferences dialog box (Options > Preferences) and go to Editor > Edit modes > Author > Profiling/Conditional Text.
2. In the Profiling Attributes section, press the Edit button to modify an existing condition set (you can also use Delete button to remove a profiling attribute or the Up and Down buttons to change their priority).

   Step Result: If you use the Edit button, the Profiling Attributes configuration dialog box is opened:
3. Modify your profiling attribute as desired.
4. To add or modify attribute values, use the New, Edit, or Delete buttons under the attribute values table.
5. Click OK to confirm your selections and close the Profiling Attributes configuration dialog box.
6. Click Apply to save your modifications.

Adding or Editing Profiling Attribute Values
There are several ways to add values to existing profiling attributes.

- Use the procedure in the Editing Existing Profiling Attributes section to edit an existing attribute and use the Profiling Attribute configuration dialog box to add, edit, or delete values for existing profiling attributes.
- You can add values directly to the existing profiling attributes in a document using the In-Place Attributes Editor in Author mode, the Attributes view, or in the source code in Text mode. However, this just adds them to the document and does not change the conditional text configuration. If you invoke the Edit Profiling Attributes action (from the contextual menu in Author mode) on the new value, the Profiling Values Conflict dialog box will appear and it includes an Add these values to the configuration action that will automatically add the new value to the particular profiling attribute. It also includes an Edit the configuration action that opens the Profiling / Conditional Text preferences page where you can edit the profiling configuration.

  Note: If the Allow contributing extra profiling attribute values option is disabled in the Profiling / Conditional Text preferences page, the Profiling Values Conflict dialog box will never appear, so this second method will not be possible.
Sharing Profiling Attribute Configurations

Your profiling configuration can be shared with other users through a project file. If you select **Project Options** at the bottom of the **Profiling/Conditional Text** preferences page, your configuration is stored in the project file and can be shared with others. For instance, if your project file is saved on a version control system (such as SVN, CVS, or Source Safe) or in a shared folder, your team will have the same option configuration that you stored in the project file.

For more information about sharing project files, see *Sharing a Project - Team Collaboration* on page 270.

Apply Profiling Attributes

Profiling attributes are applied on element nodes. You can apply profiling attributes on a text fragment (it will automatically be wrapped into a phrase-type element), on a single element, or on multiple elements in the same time. If there is no selection in your document, the profiling attributes are applied on the element at the cursor position.

To profile a fragment from your document, select the fragment in the **Author** editing mode and follow these steps:

1. Invoke the **Edit Profiling Attributes** action from the contextual menu in **Author** mode.

   **Step Result:** The **Edit Profiling Attributes** dialog box is displayed and shows all the profiling attributes and their values, as defined for the particular document type (framework). If you have a large list of profiling attributes, you can use the text filter field to search for attributes or values, and you can expand or collapse attributes by using the **Expand All/ Collapse All** buttons to the right of the text filter or the arrow button to the left of the profiling attribute name.

The attributes and values that appear in the dialog box are determined as follows:

- If you have *defined profiling attribute values* for the DITA document type in the **Profiling/Conditional Text preferences page** and you store them at **project-level**, those values are displayed in the dialog box.
- If you have *defined profiling attribute values* for the DITA document type in the **Profiling/Conditional Text preferences page** and you store them at **global-level**, those values are displayed in the dialog box.
- Otherwise, a generic default set of profiling attributes and values are available.
2. In the Edit Profiling Attributes dialog box, select the checkboxes that correspond to the attribute values you want to apply on the document fragment.

3. Click OK to finish the profiling configuration.

**Result:** The attribute names and values selected in the Edit Profiling Attributes dialog box are set on the elements contained in the profiled fragment. If you only select a fragment of content (rather than the entire element), this fragment is wrapped in phrase-type elements in which the profiling attributes are set.

If the Show Profiling Attributes option (available in the Profiling / Conditional Text toolbar menu) is enabled, a green border is painted around profiled text in the Author mode. Also, all profiling attributes set on the current element are listed at the end of the highlighted block and in its tooltip message. To edit the attributes of a profiled fragment, click one of the listed attribute values. A form control pops up and allows you to add or remove attribute values.

**Related information**

*Customize Profiling Conditions* on page 1157

**Managing Profiling Condition Sets**

Multiple profiling attributes can be aggregated into a profiling condition set that allows you to apply more complex filters on the document content. A Profiling Condition Set is a very powerful and convenient tool that can be used to preview the content that goes into the published output. For example, an installation manual available in both Windows and Linux variants can be profiled to highlight only the Linux procedures for more advanced users.
Create Profiling Condition Sets

To create a new profiling condition set, follow these steps:

1. *Open the Preferences dialog box (Options > Preferences)* and go to Editor > Edit modes > Author > Profiling/Conditional Text.
2. In the *Profiling Condition Sets section*, press the **New** button.

**Step Result:** The **Condition Set** configuration dialog box is opened.

![Figure 180: Condition Set Dialog Box](image)

3. Configure your condition set as desired. The following options are available in this dialog box:
   - **Name**
     The name of the new condition set.
   - **Document type**
     Select the document type (framework) for which you have defined profiling attributes.
   - **Use DITAVAL file**
     Select this option if you want the Profiling Condition Set to reference a DITAVAL file. You can specify the path by using the text field, its history drop-down, the ![Insert Editor Variables](image) button, or the browsing tools in the ![Browse](image) drop-down list.
   - **Include the content matching the following conditions**
     You can select this option to define the combination of attribute values for your condition set by selecting the appropriate checkboxes in this section. If you have defined a lot of profiling attributes, you can use the **filter** text field to search for specific conditions.

4. Click **OK** to confirm your selections and close the **Condition Set** configuration dialog box.
5. Click **Apply** to save the condition set. All saved profiling condition sets are available in the **Profiling / Conditional Text** toolbar drop-down menu.

Editing Existing Profiling Condition Sets

To modify an existing profiling condition set, follow these steps:

1. *Open the Preferences dialog box (Options > Preferences)* and go to Editor > Edit modes > Author > Profiling/Conditional Text.
2. In the *Profiling Condition Sets section*, press the **Edit** button to modify an existing condition set (you can also use **Delete** button to remove a condition set or the **Up** and **Down** buttons to change their priority).

**Step Result:** If you use the **Edit** button, the **Condition Set** configuration dialog box is opened:
3. Modify your condition set as desired.
4. Click **OK** to confirm your selections and close the **Condition Set** configuration dialog box.
5. Click **Apply** to save your modifications.

**Sharing Condition Set Configurations**

Your condition set configuration can be shared with other users through a project file. If you select **Project Options** at the bottom of the **Profiling/Conditional Text** preferences page, your configuration is stored in the project file and can be shared with others. For instance, if your project file is saved on a version control system (such as SVN, CVS, or Source Safe) or in a shared folder, your team will have the same option configuration that you stored in the project file.

For more information about sharing project files, see *Sharing a Project - Team Collaboration* on page 270.

**Apply Profiling Condition Sets**

All defined Profiling Condition Sets are available as shortcuts in the **Profiling / Conditional Text** toolbar menu. Select a menu entry to apply the condition set. The filtered content is then grayed-out in the **Author** mode, **Outline** view, and **DITA Maps Manager** view (for DITA documents). An element is filtered-out when one of its attributes is part of the condition set and its value does not match any of the value covered by the condition set.

**EXAMPLE:**

Suppose that you have the following document:

```
Spray painting

Short Description: When paint is applied using a spray nozzle, it is referred to as spray painting.

Context:

The garage is a good place to spray paint.

Step 1
Move the car out of the garage to avoid getting paint on it. Audience [novice]

Step 2
Place newspaper, cardboard, or a drop-cloth on the garage floor. Audience [expert]

Step 3
Place the object to be painted on the covered area. Audience [expert] Other [prop1]

Step 4
Follow the directions on the paint can to paint the object. Audience [expert] Other [prop1]

Step 5
Let the paint dry thoroughly before you move the object. Audience [novice] Other [prop1]
```

If you apply the following condition set, it means that you want to filter out the content to only include content written for an expert audience and content that has the *Other* attribute value of *prop1*.
This is how the document looks after you apply the condition set:

```
Spray painting

Short Description: When paint is applied using a spray nozzle, it is referred to as spray painting.

Context:

The garage is a good place to spray paint.

Step 1
Move the car out of the garage to avoid getting paint on it. Audience [novice]

Step 2
Place newspaper, cardboard, or a drop-cloth on the garage floor. Audience [expert]

Step 3
Place the object to be painted on the covered area. Audience [expert] Other [prop2]

Step 4
Follow the directions on the paint can to paint the object. Audience [expert] Other [prop1]

Step 5
Let the paint dry thoroughly before you move the object. Audience [novice] Other [prop1]
```

Profiling / Conditional Text Toolbar Menu

The Profiling / Conditional Text menu (available on the toolbar) allows you to select some settings for how profiled content is shown in the editor. It also displays a list of the profiling conditions sets that are defined in the current framework, and it includes an option that opens a preferences page where you can define and configure profiling attributes and condition sets.
The Profiling / Conditional Text menu includes the following:

**Show Profiling Colors and Styles**
Enable this option to turn on conditional colors and styling.

**Show Profiling Attributes**
Enable this option to turn on conditional text markers. They are displayed at the end of conditional text blocks, as a list of attribute name and their currently set values.

**Show Excluded Content**
Controls if the content filtered out by a particular condition set is hidden or grayed-out in the editor area and in the Outline and DITA Maps Manager views. When this option is enabled, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, disable this option.

*Note:* To remind you that document content is hidden, Oxygen XML Editor displays labels showing the currently applied condition set. These labels are displayed in the Author mode editing area, the Outline view and DITA Maps Manager view. Right-click any of the labels to quickly access the Show Excluded Content action.

**List of all profiling condition sets that match the current document type**
Click a condition set entry to activate it.

**Profiling Settings**
Opens the profiling options preferences page where you can manage profiling attributes and profiling conditions sets. You can also configure the profiling styles and colors options from the colors/styles preferences page and the attributes rendering preferences page.

All these settings are associated with the current project, being restored the next time you open it. For a new project all Profiling/Conditional Text menu actions states are reset to their default values.

**Customizing Colors and Styles for Rendering Profiling in Author Mode**
By applying profiling colors and styles, you can customize the Author mode editing area to mark profiled content so you can instantly spot differences between multiple variants of the output. This allows you to preview the content that will go into the published output. The excluded text is grayed-out or hidden in Author mode, allowing you to easily recognize the differences.

![Figure 181: Example: Profiling Colors and Styles](image-url)

Choosing the right style for a specific profiling attribute is a matter of personal taste, but be aware of the following:

- If the same block of text is profiled with two or more profiling attributes, their associated styles combine. Depending on the styling, this might result in an excessively styled content that may prove difficult to read or work with.
- It is recommended that you only profile the differences. There is no need to profile common content, since excessive profiling can visually pollute the document.
• A mnemonic associated with a style will help you instantly spot differences in the types of content.

**Styling Profiling Attribute Values**

To set colors and styles for profiling attribute values, follow these steps:

1. Enable the *Show Profiling Colors and Styles* option from the **Profiling / Conditional Text** toolbar drop-down menu.
2. Go to **Profiling Settings** from the **Profiling / Conditional Text** toolbar drop-down menu. This is a shortcut to the **Profiling/Conditional Text options page**. Select the **Colors and Styles options page**.
3. Configure the styling for your profiling attribute values.

**Result:** The styling is now applied in the **Author** editing mode, the **Outline** view, and in the **DITA Maps Manager** view (if you are working with DITA documents). Also, to help you more easily identify the profiling you want to apply in the current context, the styling is applied in the **Edit Profiling Attributes** dialog box and in the inline form control pop up that allows you to quickly set the profiling attributes.

![Figure 182: Profiling Attribute Value Form Control Pop Up](image)

**Alternate Method for DITA:** If you are using a DITAVAL filter file to control the filtering of profilled content in DITA topics, you can use a flag filter to define the colors and styles that will be used when rendering the profiling. For detailed information about this alternate method, see the procedure in the **Styling the Rendering of Profilled Content Using a DITAVAL File** on page 1613 topic.

**Adding Tables in Author Mode**

You can use the **Insert Table** action on the toolbar or from the contextual menu to add a table in various document types (DITA, DocBook, TEI, and XHTML). This opens the **Insert Table** dialog box. Each framework has a different set of options that are available in this dialog box for configuring the properties of the tables. In all cases, Oxygen XML Editor includes some general editing actions for configuring tables in **Author** mode.

This section explains those general actions and the various configuration options and layouts for tables that are inserted in the most commonly used frameworks.

**Editing Tables in Author Mode**

Oxygen XML Editor provides support for editing data in a tabular form. A variety of features and operations are available for editing tables in **Author** mode and they include the following:

**Adjusting Column Width**

To adjust the width of a column or table, drag the border of the column or table. The changes you make to a table are committed into the source document. You can also manage table width and column width specifications from the source document, and some types of tables include a **colspecs** section that appears above the table in **Author** mode that allows you to easily configure some column specifications (such as column width). These column width specifications are supported in fixed, dynamic, and proportional dimensions. The predefined DITA, DocBook, and XHTML frameworks support this feature. The layout of the tables for these document types takes into account the table width and the column width specifications particular to them.
Selecting Columns and Rows

To select a row or a column of a table, place the mouse cursor above the column or in front of the row you want to select, then click. When hovering the mouse cursor in front of rows or above column headers, the cursor changes to for row selection and to for column selection and that specific row or column is highlighted.

You can use the Ctrl and Shift keys to select multiple rows.

Selecting Cells

To select a cell in a table, press and hold the Ctrl key and click anywhere inside the cell. You can also use the Ctrl and Shift keys to select multiple cells or to deselect cells from a selection. Alternatively, you can click the left corner of a cell (right corner if you are editing a RTL document) to select it. The cursor changes to when you hover over the corner of the cell.

You can also select multiple rectangular blocks of cells by using your mouse to select a cell and drag it to expand the selection.

Drag and Drop

You can use the drag and drop action to edit the content of a table. You can select a column and drag it to another location in the table you are editing. When you drag a column and hover the cursor over a valid drop position, Oxygen XML Editor decorates the target location with bold rectangles. The same drag and drop action is also available for entire rows or columns by hovering the mouse cursor in front of rows or above column headers, then selecting the row or column and dragging them to the desired location.

Copy/Cut and Paste

In Oxygen XML Editor, you can copy/cut entire rows or columns of the table you are editing and paste the copied columns or rows inside the same table or inside other tables. You can also use the copy or cut actions for tables located in other documents. If you paste a row or column into non-table content, Oxygen XML Editor introduces a new table that contains the fragments of the copied row or column content.

For copied columns, the fragments are introduced starting with the header of the column. Also, if the copied column is from a CALS table, Oxygen XML Editor preserves column width information. This information is then used when you paste the column into another CALS table.

For copied cells, when pasting them into another cell without a selection (the cursor is just placed in the new cell), the copied cells are pasted while preserving their initial order and spacing. If pasting them into a selection of cells, first the content of the selected cells is deleted, then the copied cells are pasted with their initial order and spacing preserved and if there are more cells in the selection than in the copied content, the pasting will repeat the copied cells until the end of the selection.

Deleting Content

To delete the content of a cell, select the cell and press the Delete or Backspace key on your keyboard. If you press Delete or Backspace again, the selected table structure will also be removed.

To delete an entire row or column, place the cursor inside the row or column (or select it) and use the Delete Row(s) or Delete Column(s) actions from the toolbar or contextual menu. This will delete both the content and the table structure for the current row or column.
To delete a selection of multiple rows or columns, select them and use the Delete Row(s) or Delete Column(s) actions from the toolbar or contextual menu. This will delete both the content and the table structure for all rows or columns that exist in the current selection.

Navigating Cells

Along with the normal mouse navigation, you can also navigate between cells by using the arrow keys on your keyboard. By default, when using the arrow keys to navigate between table cells, the cursor jumps from one cell to another. However, if the Quick navigation in tables option is disabled in the Cursor Navigation preferences page, using the arrow keys to navigate between table cells will cause the cursor to navigate between XML nodes, rather than jumping from cell to cell.

Adding Tables in DocBook on page 370
Adding Tables in DITA Topics on page 377
Adding Tables in XHTML Documents on page 387

Adding Tables in DocBook

You can use the Insert Table action on the toolbar or from the contextual menu to add a table in a DocBook document. DocBook supports two types of tables:

- **CALS** table model - This is used for more advanced functionality.
- **HTML** table model - This is used for inserting a formal (captioned) HTML table.

Inserting a CALS Table Model in DocBook

To insert a CALS table model in DocBook documents, select the Insert Table action on the toolbar or from the contextual menu. The Insert Table dialog box appears. Select CALS for the table Model. This model allows you to configure a few more properties than the HTML model.

![Insert Table Dialog Box - CALS Model](image)

The dialog box allows you to configure the following options when you select the CALS table model:

**Title**

If this checkbox is enabled, you can specify a title for your table in the adjacent text box.

**Table Size**

Allows you to choose the number of Rows and Columns for the table.
Generate table header
If enabled, an extra row will be inserted at the top of the table to be used as the table header.

Generate table footer
If enabled, an extra row will be inserted at the bottom of the table to be used as the table footer.

Column widths
Allows you to specify the type of properties for column widths (colwidth attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a colwidth attribute with the values listed as the number of shares followed by an asterisk. The value of the shares are totaled and rendered as a percent. For example, colwidth="1* 2* 3*" causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in Author mode, the values of the colwidth attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the colwidth attribute is 1*.

- **dynamic** - If you choose this option, the columns are created without a specified width (colwidth attribute). Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in Author mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

- **fixed** - The width is specified in fixed units. By default, the pt unit is inserted, but you can change the units in the colspecs (column specifications) section above the table or in Text mode. The following units are allowed: pt (points), cm (centimeters), mm (millimeters), pi (picas), in (inches).

Frame
Allows you to specify a value for the frame attribute. It is used to specify where a border should appear in the table. There are a variety of allowed values, as specified in the DocBook CALS table specifications.

Row separator
Specifies whether or not to include row separators (rowsep attribute). The allowed values are: 0 (no separator) and 1 (include separators).

Column separator
Specifies whether or not to include column separators (colsep attribute). The allowed values are: 0 (no separator) and 1 (include separators).

Alignment
Specifies the alignment of the text within the table (align attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

Note: The justify value cannot be rendered in Author mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the char attribute for alignment.

Note: The options in the Insert Table dialog box for DocBook documents are persistent, so changes made in one session will carry over to another.

When you click Insert, a CALS table is inserted into your document at the current cursor position.

When you insert a CALS table, you see a link for setting the colspecs (column specifications) of your table. Click the link to open the controls that allow you to adjust various column properties. Although they appear as part of the Author mode, the colspecs link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.
Inserting an HTML Table Model

To insert an HTML table model in DocBook documents, select the Insert Table action on the toolbar or from the contextual menu. The Insert Table dialog box appears. Select HTML for the table Model.

The dialog box allows you to configure the following options when you select the HTML table model:

**Title**
- If this checkbox is enabled, you can specify a title for your table in the adjacent text box.

**Table Size**
- Allows you to choose the number of Rows and Columns for the table.

**Generate table header**
- If enabled, an extra row will be inserted at the top of the table to be used as the table header.

**Generate table footer**
- If enabled, an extra row will be inserted at the bottom of the table to be used as the table footer.

**Column widths**
- Allows you to specify the type of properties for column widths (width attribute). You can choose one of the following properties for the column width:
  - **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a width attribute (in a col element) with the values listed as the number of shares followed by an asterisk.
The value of the shares are totaled and rendered as a percent. For example, width="1* 2* 3*" causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in Author mode, the values of the width attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the width attribute is 1*.

- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in Author mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

- **fixed** - The width is specified in fixed units. By default, the pt unit is inserted, but you can change the units in the section above the table or in Text mode. In addition to the standard pixel, percentage, and relative values, this attribute also allows the special form “0*” (zero asterisk), which means that the width of the each column in the group should be the minimum width necessary to hold the contents.

**Frame**

Allows you to specify a value for the frame attribute. It is used to specify where a border should appear in the table. There are a variety of allowed values, as specified in the DocBook HTML table specifications.

**Alignment**

Specifies the alignment of the text within the table (align attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

**Note:** The justify value cannot be rendered in Author mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the char attribute for alignment.

**Note:** The options in the Insert Table dialog box for DocBook documents are persistent, so changes made in one session will carry over to another.

When you click Insert, an HTML style of table is inserted into your document at the current cursor position.

When you insert an HTML table, you see a section above the table that allows you to easily configure some properties without opening the Table Properties dialog box. Although this section appears as part of the Author mode, it will not appear in your output. It is just there to make it easier to adjust how the columns of your table are formatted.

**Editing an Existing Table**

You can edit the structure of an existing table using the table buttons on the toolbar (or in the contextual menu) to add or remove cells, rows, or columns, and to set basic table properties. Additional attributes can be used to fine-tune the formatting of your tables by using the Attributes view (Window > Show View > Attributes).

You can also use the Table Properties (Ctrl + T (Command + T on OS X)) action from the toolbar or contextual menu to modify many of the properties of the table.

Also, remember that underneath the visual representation, both table models are really just XML. If necessary, you can edit the XML directly by switching to Text mode.

**DocBook Table Layouts**

The DocBook framework supports the following two table model layouts:

- **CALS table model**
- **HTML table model**

**CALS Table Model Layout**

The CALS table model allows for more flexibility and table customization than other models. When choosing a CALS table model from the Insert Table dialog box, you have access to more configurable properties. The layout of a CALS table includes a colspecs section that allows you to easily configure some properties without opening the Table Properties dialog box. For example, you can change the value of column widths (colwidth attribute) or the text alignment (align attribute). Although
they appear as part of the **Author mode**, the colspecs link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

**Figure 187: CALS Table in DocBook**

**HTML Table Model Layout**

Choosing an *HTML* table model from the Insert Table dialog box in a DocBook document inserts a formal (captioned) HTML table. The layout of an *HTML* table includes a section above the table that allows you to easily configure some properties without opening the Table Properties dialog box. For example, you can change the value of column widths (*width* attribute) or the text alignment (*align* attribute). Although these properties appear as part of the **Author mode**, they will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

**Figure 188: HTML Table in DocBook**

**Pasting Tables in DocBook**

Tables that are pasted into a DocBook file are automatically converted to the CALS model. If you want to overwrite this behavior and instruct Oxygen XML Editor to convert them to *HTML* tables, set the `docbook.html.table` parameter to 1. You can find this parameter in the following stylesheet:

- `[/OXYGEN_INSTALL_DIR]/frameworks/docbook/resources/xhtml2db5Driver.xsl` for DocBook 5
- `[/OXYGEN_INSTALL_DIR]/frameworks/docbook/resources/xhtml2db4Driver.xsl` for DocBook 4

**Table Validation in DocBook**

Oxygen XML Editor reports table layout problems that are detected in manual or automatic validations. The types of errors that may be reported for DocBook table layout problems include:

**CALS Tables**

- A row has fewer cells than the number of columns detected from the table cols attribute.
- A row has more cells than the number of columns detected from the table cols attribute.
- A cell has a vertical span greater than the available rows count.
• The number of colspecs is different than the number of columns detected from the table cols attribute.
• The number of columns detected from the table cols attribute is different than the number of columns detected in the table structure.
• The value of the cols, rowsep, or colsep attributes are not numeric.
• The namest, nameend, or colname attributes point to an incorrect column name.

**HTML Tables**

• A row has fewer cells than the number of table columns.
• The value of the colspan, rowspan, or span attributes are not numeric.
• A cell has a vertical span greater than the available rows count.

**Editing Table Properties in DocBook**

You can edit the structure of an existing table using the table buttons on the toolbar (or from the contextual menu) to add or remove cells, rows, or columns, and to set basic table properties. Additional attributes can be used to fine-tune the formatting of your tables by using the *Attributes view* (Window > Show View > Attributes).

You can use the Table Properties (Ctrl + T (Command + T on OS X)) action to modify many of the properties of the table. You can also adjust some of the properties in the specification section above the table.

The Table properties dialog box allows you to set specific properties to the table elements. The options that are available depend on the context and location within the table in which the action was invoked.

**Note:** Some properties allow the following special values, depending on the context and the current properties or values:

- **<not set>** - Use this value if you want to remove a property.
- **<preserve>** - If you select multiple elements that have the same property set to different values, you can choose this value to keep the values that are already set. In some cases it can also be used to keep the current non-standard value for a particular property.

**Edit Table Properties for a CALS Table Model**

For a CALS table model, the Table properties dialog box includes four tabs of options:

• **Table** tab - The options in this tab apply to the entire table.
• **Row** tab - The options in this tab apply to the current row or selection of multiple rows. A message at the bottom of the tab tells you how many rows will be affected.
• **Column** tab - The options in this tab apply to the current column or selection of multiple columns. A message at the bottom of the tab tells you how many columns will be affected.
• **Cell** tab - The options in this tab apply to the current cell or selection of multiple cells. A message at the bottom of the tab tells you how many cells will be affected.

The options in four tabs include a *Preview* pane that shows a representation of the modification.
The options in the four tabs include the following:

**Horizontal alignment (Available in the Table, Column, and Cell tabs)**

Specifies the horizontal alignment of text within the current table/column/cell or selection of multiple columns/cells (align attribute). The allowed values are as follows:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

**Note:** The justify value cannot be rendered in Author mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the char attribute for alignment.

**Vertical alignment (Available in the Row and Cell tabs)**

Specifies the vertical alignment of text within the current row/cell or selection of multiple rows/cells (valign attribute). The allowed values are as follows:

- **top** - Aligns the text at the top of the cell.
- **middle** - Aligns the text in a vertically centered position.
- **bottom** - Aligns the text at the bottom of the cell.

**Column separator (Available in the Table, Column, and Cell tabs)**

Specifies whether or not to include column separators (borders/grid lines) in the form of the colsep attribute. The allowed values are: 0 (no separator) and 1 (include separators).

**Row separator (Available in all four tabs)**

Specifies whether or not to include row separators (borders/grid lines) in the form of the rowsep attribute. The allowed values are: 0 (no separator) and 1 (include separators).

**Frame**

Allows you to specify a value for the frame attribute. It is used to specify where a border should appear in the table. There are a variety of allowed values, as specified in the **DocBook CALS table specifications**.

**Row type (Available in the Row tab only)**

Allows you to change the row to a header, body, or footer type of row (within a thead, tbody, or tfoot attribute).
Edit Table Properties for an HTML Table Model

For an HTML table model, the Table properties dialog box includes four tabs of options (Table, Row, Column, and Cell) and the options include a Preview pane that shows a representation of the modification.

The options in the four tabs include the following:

Frame (Available only in the Table tab)

Allows you to specify a value for the frame attribute. It is used to specify where a border should appear in the table. There are a variety of allowed values, as specified in the DocBook HTML table specifications.

Row type (Available in the Row tab only)

Allows you change the row to a header, body, or footer type of row (within a thead, tbody, or tfoot attribute).

Horizontal alignment (Available in the Row, Column, and Cell tabs)

Specifies the horizontal alignment for the text in the current row/column/cell or selection of multiple rows/columns/cells (align attribute). The allowed values are:

- left - Aligns the text to a left position.
- right - Aligns the text to a right position.
- center - Aligns the text to a centered position.
- justify - Stretches the line of text so that it has equal width.

Note: The justify value cannot be rendered in Author mode, so you will only see it in the output.

- char - Aligns text to the leftmost occurrence of the value specified on the char attribute for alignment.

Vertical alignment (Available in the Row, Column, and Cell tabs)

Specifies the vertical alignment for the text in the current row/column/cell or selection of multiple rows/columns/cells (valign attribute). The allowed values are:

- top - Aligns the text at the top of the cell.
- middle - Aligns the text in a vertically centered position.
- bottom - Aligns the text at the bottom of the cell.
- baseline - Sets the row so that all the table data share the same baseline. This often has the same effect as the bottom value. However, if the fonts are different sizes, the baseline value often makes the table look better.

Related information

Editing Tables in Author Mode on page 368

Adding Tables in DITA Topics

You can use the Insert Table action on the toolbar or from the contextual menu to add a table in a DITA topic. By default, DITA supports four types of tables:

- DITA Simple table model - This is the most commonly used model for basic tables.
- CALS table model (OASIS Exchange Table Model) - This is used for more advanced functionality.
- DITA Choice table model - This is used within a step element in a DITA Task document to describe a series of optional choices that a user must make before proceeding.
- DITA Properties table model - This is used in DITA Reference documents to describe a property (for example, its type, value, and description).

If you are using a specialized DITA vocabulary, it may contain specialized versions of these table models.

Since DITA is a structured format, you can only insert a table in places in the structure of a topic where tables are allowed. The Oxygen XML Editor toolbar provides support for entering and editing tables. It also helps to indicate where you are allowed to insert a table or its components by disabling the appropriate buttons.

Inserting a Simple Table Model

To insert a Simple DITA table, select the Insert Table action on the toolbar or from the contextual menu (or the Table submenu from the DITA menu). The Insert Table dialog box appears. Select Simple for the table Model.
The dialog box allows you to configure the following options when you select the Simple table model:

**Title**

If this checkbox is enabled, you can specify a title for your table in the adjacent text box.

**Generate table header**

If enabled, an extra row will be inserted at the top of the table to be used as the table header.

**Column widths**

Allows you to specify the type of properties for column widths (colwidth attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a relcolwidth attribute with the values listed as the number of shares followed by an asterisk. The value of the shares are totaled and rendered as a percent. For example, relcolwidth="1* 2* 3*" causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in Author mode, the values of the relcolwidth attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the relcolwidth attribute is 1*.

- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in Author mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

**Frame**

Allows you to specify a value for the frame attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the conref target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

**Note:** The options in the **Insert Table** dialog box for DITA documents are persistent, so changes made in one session will carry over to another.
When you click **Insert**, a simple table is inserted into your document at the current cursor position.

### Inserting a CALS Table Model (OASIS Exchange Table)

To insert an OASIS Exchange Table (CALS), select the **Insert Table** action on the toolbar or from the contextual menu (or the **Table** submenu from the **DITA** menu). The **Insert Table** dialog box appears. Select **CALS** for the table **Model**. This model allows you to configure more properties than the **Simple** model.

![Insert Table Dialog Box - CALS Model](image)

**Figure 191: Insert Table Dialog Box - CALS Model**

The dialog box allows you to configure the following options when you select the **CALS** table model:

**Title**

If this checkbox is enabled, you can specify a title for your table in the adjacent text box.

**Table Size**

Allows you to choose the number of **Rows** and **Columns** for the table.

**Generate table header**

If enabled, an extra row will be inserted at the top of the table to be used as the table header.

**Column widths**

Allows you to specify the type of properties for column widths (**colwidth** attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a **colwidth** attribute with the values listed as the number of shares followed by an asterisk. The value of the shares are totaled and rendered as a percent. For example, `colwidth="1* 2* 3*"` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the **colwidth** attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the **colwidth** attribute is `1*`.

- **dynamic** - If you choose this option, the columns are created without a specified width (**colwidth** attribute). Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

- **fixed** - The width is specified in fixed units. By default, the **pt** unit is inserted, but you can change the units in the **colspecs** (column specifications) section above the table or in **Text** mode. The following units are allowed: **pt** (points), **cm** (centimeters), **mm** (millimeters), **pi** (picas), **in** (inches).

**Frame**

Allows you to specify a value for the **frame** attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:
• **none** - No border will be added.
• **all** - A border will be added to all frames.
• **top** - A border will be added to the top frame.
• **topbot** - A border will be added to the top and bottom frames.
• **bottom** - A border will be added to the bottom frame.
• **sides** - A border will be added to the side frames.
• **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

**Row separator**

Specifies whether or not to include row separators (`rowsep` attribute). The allowed values are: 0 (no separator) and 1 (include separators).

**Column separator**

Specifies whether or not to include column separators (`colsep` attribute). The allowed values are: 0 (no separator) and 1 (include separators).

**Alignment**

Specifies the alignment of the text within the table (`align` attribute). The allowed values are:

• **left** - Aligns the text to a left position.
• **right** - Aligns the text to a right position.
• **center** - Aligns the text to a centered position.
• **justify** - Stretches the line of text so that it has equal width.

  **Note:** The `justify` value cannot be rendered in **Author** mode, so you will only see it in the output.

• **char** - Aligns text to the leftmost occurrence of the value specified on the `char` attribute for alignment.
• **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

  **Note:** The options in the **Insert Table** dialog box for DITA documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, a CALS table is inserted into your document at the current cursor position.

When you insert a CALS table, you see a link for setting the `colspecs` (column specifications) of your table. Click the link to open the controls that allow you to adjust various column properties. Although they appear as part of the **Author mode**, the `colspecs` link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.
**Inserting a Choice Table Model**

To insert a *Choice* table within a *step* element in a DITA Task document, select the Insert Table action on the toolbar or in the Insert submenu from the contextual menu (or the Table submenu from the DITA menu), or select choicetable from the Content Completion Assistant. The Insert Table dialog box appears. Select Simple for the table Model.

![Insert Choice Table](image)

**Figure 193: Insert Table Dialog Box - Choice Model**

The dialog box allows you to configure the following options when you insert a *Choice* table model within a DITA Task:

**Table Size**
- Allows you to choose the number of Rows and Columns for the table.

**Generate table header**
- If enabled, an extra row will be inserted at the top of the table to be used as the table header.

**Column widths**
- Allows you to specify the type of properties for column widths (colwidth attribute). You can choose one of the following properties for the column width:
  - **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a relcolwidth attribute with the values listed as the number of shares followed by an asterisk. The value of the shares are totaled and rendered as a percent. For example, relcolwidth="1* 2* 3*" causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in Author mode, the values of the relcolwidth attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the relcolwidth attribute is 1*.
  - **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in Author mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

**Frame**
- Allows you to specify a value for the frame attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:
  - **none** - No border will be added.
  - **all** - A border will be added to all frames.
  - **top** - A border will be added to the top frame.
  - **topbot** - A border will be added to the top and bottom frames.
  - **bottom** - A border will be added to the bottom frame.
  - **sides** - A border will be added to the side frames.
  - **-dita-use-conref-target** - Normally, when using a conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the conref target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

When you click Insert, a *Choice* table is inserted into your DITA Task document at the current cursor position (within a *step* element).
Inserting a Properties Table Model

To insert a Properties table within a refbody element in a DITA Reference document, select the Insert Table action on the toolbar or in the Insert submenu from the contextual menu (or the Table submenu from the DITA menu), or select properties (wizard) from the Content Completion Assistant. The Insert Table dialog box appears. Select Properties for the table Model.

![Insert Table Dialog Box - Properties Model](https://example.com/insert-table-dialog-box-properties-model.png)

**Figure 194: Insert Table Dialog Box - Properties Model**

The dialog box allows you to configure the following options when you insert a Properties table model within a DITA Reference:

**Table Size**

Allows you to choose the number of Rows and Columns for the table.

**Generate table header**

If enabled, an extra row will be inserted at the top of the table to be used as the table header.

**Frame**

Allows you to specify a value for the frame attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the conref target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

When you click Insert, a Properties table is inserted into your DITA Reference document at the current cursor position (within a refbody element).

**Editing an Existing Table**

You can edit the structure of an existing table using the table buttons on the toolbar (or in the contextual menu) to add or remove cells, rows, or columns, and to set basic table properties. Additional attributes can be used to fine-tune the formatting of your tables by using the Attributes view (Window > Show View > Attributes). See the DITA documentation for a full explanation of these attributes.

Editing Documents
You can also use the `Table Properties (Ctrl + T (Command + T on OS X))` action from the toolbar or contextual menu (or DITA menu) to modify many of the properties of the table.

Also, remember that underneath the visual representation, both table models are really just XML. If necessary, you can edit the XML directly by switching to Text mode.

**Related information**

*Editing Tables in Author Mode* on page 368

**DITA Table Layouts**

Depending on the context, DITA accepts the following table layouts:

- **CALS table model**
- **Simple table model**
- **Choice table model**
- **Properties table model**

**CALS Table Model Layout**

The *CALS* table model allows for more flexibility and table customization than other models. When choosing a *CALS* table model from the *Insert Table* dialog box, you have access to more configurable properties. The layout of a *CALS* table includes a `colspecs` section that allows you to easily configure some properties without opening the *Table Properties* dialog box. For example, you can change the value of column widths (`colwidth` attribute) or the text alignment (`align` attribute). Although they appear as part of the *Author mode*, the `colspecs` link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

![Sample CALS Table with no specified width and proportional column widths](image)

**Figure 195: CALS Table in DITA**

**Simple Table Model Layout**

When choosing a *Simple* table model from the *Insert Table* dialog box, you only have access to configure a few properties. For example, you can choose the number of rows and columns, specify values for frames, and choose from a few types of properties for the column width. The layout of this type of table is very simple, as the name suggests.

![DITA Simple Table](image)

**Figure 196: DITA Simple Table**
Choice Table Model Layout

AChoice table model is used within a step element in a DITA Task document to describe a series of optional choices that a user must make before proceeding. The choicetable element is a useful device for documenting options within a single step of a task. You can insertChoice tables in DITA Task documents either by selecting choicetable from the Content Completion Assistant (within a step element) or by using theInsert Table action on the toolbar or from the contextual menu. The options and layout of a Choice table is similar to the Simple table model.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Opt A</td>
<td></td>
</tr>
<tr>
<td>Opt B</td>
<td></td>
</tr>
<tr>
<td>Opt C</td>
<td></td>
</tr>
</tbody>
</table>

Figure 197: DITA Choice Table

Properties Table Model Layout

AProperties table model is used within a refbody element in a DITA Reference document to describe a property (for example, its type, value, and description). You can insert Properties tables in DITA Reference documents either by selecting properties(wizard) from the Content Completion Assistant (within a refbody element) or by using theInsert Table action on the toolbar (or from the contextual menu) and selecting Properties for the Model. The layout of a Properties table is very simple. It allows for a maximum of 3 columns (typically for property type, value, and description) and the only options available are for whether or not you want a header row and for specifying frames (borders).

<table>
<thead>
<tr>
<th>Property Type</th>
<th>Property Value</th>
<th>Property Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>B</td>
<td>C</td>
</tr>
</tbody>
</table>

Figure 198: DITA Properties Table

Table Validation in DITA

Oxygen XML Editor reports table layout problems that are detected in manual or automatic validations. When you validate a DITA map with theValidate and Check for Completeness action, if the Report table layout problems option is enabled in the DITA Map Completeness Check dialog box, table layout problems will be reported in the validation results. The types of errors that may be reported for DITA table layout problems include:

CALS Tables

• A row has fewer cells than the number of columns detected from the table cols attribute.
• A row has more cells than the number of columns detected from the table cols attribute.
• A cell has a vertical span greater than the available rows count.
• The number of colspecs is different than the number of columns detected from the table cols attribute.
• The number of columns detected from the table cols attribute is different than the number of columns detected in the table structure.
• The value of the cols, rowsep, or colsep attributes are not numeric.
• The namest, nameend, or colname attributes point to an incorrect column name.

Simple or Choice Tables

• A row has fewer cells than the number of table columns.

Editing Table Properties in DITA

To customize the look of a table in DITA, place the cursor anywhere in a table and invoke the Table Properties (Ctrl + T (Command + T on OS X)) action from the toolbar or the Table submenu of the contextual menu (or DITA menu). This opens the Table properties dialog box.
The **Table properties** dialog box allows you to set specific properties to the table elements. The options that are available depend on the context and location within the table in which the action was invoked.

**Note:** Some properties allow the following special values, depending on the context and the current properties or values:

- `<not set>` - Use this value if you want to remove a property.
- `<preserve>` - If you select multiple elements that have the same property set to different values, you can choose this value to keep the values that are already set. In some cases it can also be used to keep the current non-standard value for a particular property.

### Edit Table Properties for a CALS Table Model

For a **CALS** table model, the **Table properties** dialog box includes four tabs of options:

- **Table** tab - The options in this tab apply to the entire table.
- **Row** tab - The options in this tab apply to the current row or selection of multiple rows. A message at the bottom of the tab tells you how many rows will be affected.
- **Column** tab - The options in this tab apply to the current column or selection of multiple columns. A message at the bottom of the tab tells you how many columns will be affected.
- **Cell** tab - The options in this tab apply to the current cell or selection of multiple cells. A message at the bottom of the tab tells you how many cells will be affected.

The options in four tabs include a **Preview** pane that shows a representation of the modification.

![Figure 199: Table Properties Dialog Box with Cell Tab Selected (DITA CALS Table Model)](image)

The options in the four tabs include the following:

**Horizontal alignment (Available in the Table, Column, and Cell tabs)**

Specifies the horizontal alignment of text within the current table/column.cell or selection of multiple columns/cells (align attribute). The allowed values are as follows:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

**Note:** The `justify` value cannot be rendered in **Author** mode, so you will only see it in the output.
• **char** - Aligns text to the leftmost occurrence of the value specified on the char attribute for alignment.

• **-dita-use-conref-target** - Normally, when using a conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the conref target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

**Vertical alignment (Available in the Row and Cell tabs)**

Specifies the vertical alignment of text within the current row/cell or selection of multiple rows/cells (valign attribute). The allowed values are as follows:

• **top** - Aligns the text at the top of the cell.

• **middle** - Aligns the text in a vertically centered position.

• **bottom** - Aligns the text at the bottom of the cell.

• **-dita-use-conref-target** - Normally, when using a conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the conref target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

**Column separator (Available in the Table, Column, and Cell tabs)**

Specifies whether or not to include column separators (borders/grid lines) in the form of the colsep attribute. The allowed values are: 0 (no separator) and 1 (include separators).

**Row separator (Available in all four tabs)**

Specifies whether or not to include row separators (borders/grid lines) in the form of the rowsep attribute. The allowed values are: 0 (no separator) and 1 (include separators).

**Frame (Available only in the Table tab)**

Allows you to specify a value for the frame attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

• **none** - No border will be added.

• **all** - A border will be added to all frames.

• **top** - A border will be added to the top frame.

• **topbot** - A border will be added to the top and bottom frames.

• **bottom** - A border will be added to the bottom frame.

• **sides** - A border will be added to the side frames.

• **-dita-use-conref-target** - Normally, when using a conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the conref target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

**Edit Table Properties for a Simple, Choice, or Properties Table Model**

For a Simple, Choice, Properties table model, the Table properties dialog box only allows you to edit a few options.

**Table tab**

**Frame**

Allows you to specify a value for the frame attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

• **none** - No border will be added.

• **all** - A border will be added to all frames.

• **top** - A border will be added to the top frame.

• **topbot** - A border will be added to the top and bottom frames.

• **bottom** - A border will be added to the bottom frame.

• **sides** - A border will be added to the side frames.

• **-dita-use-conref-target** - Normally, when using a conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the conref target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).
Row tab (not available for Properties tables)

Row type
- Allows you change the row to a body or header type of row.

Related information
- Adding Tables in DITA Topics on page 377
- Editing Tables in Author Mode on page 368

Adding Tables in XHTML Documents

You can use the Insert Table action on the toolbar or from the contextual menu to add a table in an XHTML document. This action opens the Insert Table dialog box.

![Insert Table Dialog Box in XHTML](image)

The dialog box allows you to configure the following options:

Caption
- If this checkbox is enabled, you can specify a title (caption) for your table in the adjacent text box.

Table Size
- Allows you to choose the number of Rows and Columns for the table.

Generate table header
- If enabled, an extra row will be inserted at the top of the table to be used as the table header.

Generate table footer
- If enabled, an extra row will be inserted at the bottom of the table to be used as the table footer.

Column widths
- Allows you to specify the type of properties for column widths (width attribute). You can choose one of the following properties for the column width:
  - **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a width attribute (in a col element) with the values listed as the number of shares followed by an asterisk. The value of the shares are totaled and rendered as a percent. For example, width="1* 2* 3*" causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in Author mode, the values of the width attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the width attribute is 1*.
  - **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in Author mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.
  - **fixed** - The width is specified in fixed units. By default, the pt unit is inserted, but you can change the units in the section above the table or in Text mode. In addition to the standard pixel, percentage, and relative values, this attribute
also allows the special form “0*” (zero asterisk), which means that the width of the each column in the group should be the minimum width necessary to hold the contents.

**Frame**

Allows you to specify a value for the frame attribute. It is used to specify where a border should appear in the table. There are a variety of allowed values, as specified in HTML specifications.

**Alignment**

Specifies the alignment of the text within the table (align attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

Note: The justify value cannot be rendered in Author mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the char attribute for alignment.

Note: The options in the Insert Table dialog box for XHTML documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, an HTML style of table is inserted into your XHTML document at the current cursor position.

When you insert an HTML table, you see a link for setting the colspecs (column specifications) of your table. Click the link to open the controls that allow you to adjust various column properties. Although they appear as part of the Author mode, the colspecs link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

**Editing an Existing Table**

You can edit the structure of an existing table using the table buttons on the toolbar (or in the contextual menu) to add or remove cells, rows, or columns, and to set basic table properties. Additional attributes can be used to fine-tune the formatting of your tables by using the Attributes view (Window > Show View > Attributes). Also, remember that underneath the visual representation, the table is really just XML. If necessary, you can edit the XML directly by switching to Text mode.

**XHTML Table Layout**

When you insert a table in an XHTML document, an HTML type of table is added. The layout of an XHTML table includes a colspecs section that allows you to easily configure some properties. For example, you can change the value of column widths (width attribute) or the text alignment (align attribute). Although they appear as part of the Author mode, the colspecs link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

Figure 201: Table Layout in XHTML Documents

**Table Validation in XHTML**

Oxygen XML Editor reports table layout problems that are detected in manual or automatic validations. The types of errors that may be reported for XHTML table layout problems include:

**HTML Tables**
• A row has fewer cells than the number of table columns.
• The value of the colspan, rowspan, or span attributes are not numeric.
• A cell has a vertical span greater than the available rows count.

Adding Tables in TEI Documents

You can use the Insert Table action on the toolbar or from the contextual menu to add a table in a TEI document. This action opens the Insert Table dialog box.

![Insert Table Dialog Box in TEI](image)

**Figure 202: Insert Table Dialog Box in TEI**

The dialog box allows you to configure the following options:

**Head**
If this checkbox is enabled, you can specify a title for your table in the adjacent text box.

**Table Size**
Allows you to choose the number of Rows and Columns for the table.

**Generate table header**
If enabled, an extra row will be inserted at the top of the table to be used as the table header.

**Note:** The options in the Insert Table dialog box for TEI documents are persistent, so changes made in one session will carry over to another.

When you click Insert, a simple table is inserted into your TEI document at the current cursor position.

Editing an Existing Table

You can edit the structure of an existing table using the table buttons on the toolbar (or in the contextual menu) to add or remove cells, rows, or columns. Additional attributes can be used to fine-tune the formatting of your tables by using the Attributes view (Window > Show View > Attributes). Also, remember that underneath the visual representation, the table is really just XML. If necessary, you can edit the XML directly by switching to Text mode.

Sorting Content in Tables and List Items

Oxygen XML Editor offers support for sorting the content of tables and list items of ordered and unordered lists.

What do you want to do?

• Sort an entire table.
• Sort a selection of rows in a table.
• Sort a table that contains cells merged over multiple rows.
• Sort list items.

**Sorting a Table**

To sort rows in a table, select the entire table (or specific rows) and use the Sort action from the main toolbar or the contextual menu. This opens the Sort dialog box.
This dialog box sets the range that is sorted and the sorting criteria. The range is automatically selected depending on whether you sort an entire table or only a selection of its rows.

**Note:** When you invoke the sorting operation over an entire table, the **Selected rows** option is disabled.

The **Criteria** section specifies the sorting criteria (a maximum of three sorting criteria are available), defined by the following:

- A name, which is collected from the column heading.
- The type of the information that is sorted. You can choose between the following:
  - Text - Alphanumeric characters.
  - Numeric - Regular integer or floating point numbers are accepted.
  - Date - Default date and time formats from the local OS are accepted (such as *short*, *medium*, *long*, *full*, *xs:date*, and *xs:dateTime*).
- The sorting direction (either ascending or descending).

The sort criteria is automatically set to the column where the cursor is located at the time when the sorting operation is invoked.

After you finish configuring the options in the **Sort** dialog box, click **OK** to complete the sorting operation. If you want to revert to the initial order of your content, press **Ctrl + Z (Command + Z on OS X)** on your keyboard.

**Note:** The sorting support takes the value of the `xml:lang` attribute into account and sorts the content in a natural order.

### Sorting a Selection of Rows

To sort a selection of rows in a table, select the rows that you want to sort and either right-click the selection and choose **Sort**, or click **Sort** on the main toolbar. This opens the **Sort** dialog box.
This dialog box sets the range that is sorted and the sorting criteria. The range is automatically selected depending on whether you sort an entire table or only a selection of its rows.

The **Sort** dialog box also allows you to apply the sorting operation to the entire table, using the **All rows** option.

The **Criteria** section specifies the sorting criteria (a maximum of three sorting criteria are available), defined by the following:

- A name, which is collected from the column heading.
- The type of the information that is sorted. You can choose between the following:
  - **Text** - Alphanumeric characters.
  - **Numeric** - Regular integer or floating point numbers are accepted.
  - **Date** - Default date and time formats from the local OS are accepted (such as *short*, *medium*, *long*, *full*, *xs:date*, and *xs:dateTime*).
- The sorting direction (either **ascending** or **descending**).

The sort criteria is automatically set to the column where the cursor is located at the time when the sorting operation is invoked.

After you finish configuring the options in the **Sort** dialog box, click **OK** to complete the sorting operation. If you want to revert to the initial order of your content, press **Ctrl + Z** (**Command + Z** on OS X) on your keyboard.

**Note:** The sorting support takes the value of the **xml:lang** attribute into account and sorts the content in a natural order.

**Sort Using Multiple Criteria**

You can also sort an entire table or a selection of its rows based on multiple sorting criteria. To do so, enable the rest of boxes in the **Criteria** section of the **Sort** dialog box, configure the applicable items, and click **OK** to complete the sorting operation.

![Sort dialog box]

**Figure 205: Sorting Based on Multiple Criteria**

**Sorting a Table that Contains Merged Cells**

If a table contains cells that span over multiple rows, you can not perform the sorting operation over the entire table. Still, the sorting mechanism works over a selection of rows that do not contain **rowspans**.

**Note:** For this type of table, the **Sort** dialog box keeps the **All rows** option disabled even if you perform the sorting operation over a selection of rows.

**Sorting List Items**

A sorting operation can be performed on various types of lists and list items. Oxygen XML Editor provides support for sorting the following types of lists:

- **Ordered list** (*ol*)
- **Unordered list** (*ul*)
- **Parameter list** (*parml*)
- **Simple list** (*sl*)
- **Required conditions** (*reqconds*)
The sorting mechanism works on an entire list or on a selection of list items. To sort items in a list, select the items or list and use the Sort action from the main toolbar or the contextual menu. This opens the Sort dialog box.

This dialog box sets the range that is sorted and the sorting criteria. The range is automatically selected depending on whether you sort an entire list or only a selection of its items.

**Note:** When you invoke the sorting operation over an entire list, the Selected rows option is disabled.

The Criteria section specifies the sorting criteria, defined by the following:

- The name of the type of item being sorted.
- The type of the information that is sorted. You can choose between the following:
  - **Text** - Alphanumeric characters.
  - **Numeric** - Regular integer or floating point numbers are accepted.
  - **Date** - Default date and time formats from the local OS are accepted (such as short, medium, long, full, xs:date, and xs:dateTime).
- The sorting direction (either ascending or descending).

After you finish configuring the options in the Sort dialog box, click OK to complete the sorting operation. If you want to revert to the initial order of your content, press Ctrl + Z (Command + Z on OS X) on your keyboard.

**Note:** The sorting support takes the value of the xml:lang attribute into account and sorts the content in a natural order.

### Inserting Images

To insert an image in a document while editing in Author mode, use one of the following methods:

- Click the Insert Image action from the toolbar and choose the image file you want to insert. Oxygen XML Editor tries to reference the image with a path that is relative to that of the document you are currently editing. For example, if you want to add the file:/C:/project/xml/dir/img1.jpg image into the file:/C:/project/xml/doc1.xml document, Oxygen XML Editor inserts a reference to dir/img1.jpg. This is useful when multiple users work on a common project and they have it stored in multiple locations.

**Note:** The Insert Image action is available for the following document types: DocBook 4, DocBook 5, DITA, TEI P4, TEI P5, XHTML.
• Drag an image from other application and drop it in the **Author** editing mode. If it is an image file, it is inserted as a reference to the image file. For example, in a DITA topic the path of the image file is inserted as the value of the `href` attribute in an image element:

```html
<image href="../images/image_file.png"/>
```

**Note:** To replace an image, just drag and drop a new image over the existing one. Oxygen XML Editor will automatically update the reference to the new image.

• Copy an image file from another document or another application (such as a system file browser or web browser) and paste it into your document. Oxygen XML Editor will insert it as a reference to the image file the same as the drag/drop method.

• Select an image (or part of an image) from another application (such as an image editor), copy it, and paste it into your document. Oxygen XML Editor will prompt you to save it. After saving the image, a reference to that file path is inserted at the paste position.

**Image Rendering in **Author** Mode**

The **Author** mode and the output transformation process might render the images referenced in an XML document differently, since they use different rendering engines.

**Table 8: Supported Image Formats**

<table>

</tr>
</tbody>
</table>

When an image cannot be rendered, Oxygen XML Editor **Author** mode displays a warning message that contains the reason why this is happening. Possible causes include the following:

• The image is too large. Enable the *Show very large images* option.

• The image format is not supported by default. It is recommended to [install the Java Advanced Imaging(JAI) Image I/O Tools plug-in](#).

**Scaling Images**

Image dimension and scaling attributes are taken into account when an image is rendered. The following rules apply:
• If you specify only the width attribute of an image, the height of the image is proportionally applied.
• If you specify only the height attribute of an image, the width of the image is proportionally applied.
• If you specify width and height attributes of an image, both of them control the rendered image.
• If you want to scale both the width and height of an image proportionally, use the `scale` attribute.

**Note:** As a Java application, Oxygen XML Editor uses the *Java Advanced Imaging* API that provides a pluggable support for new image types. If you have an *ImageIO* library that supports additional image formats, just copy this library to the `{OXYGEN_INSTALL_DIR}/lib` directory.

**Customize Oxygen XML Editor to Render CGM Images (Experimental Support)**

Oxygen XML Editor provides experimental support for CGM 1.0 images.

⚠️ **Attention:** Image hotspots are not supported.

Since this is an experimental support, some graphical elements might be missing from the rendered image.

The CGM rendering support is based on a third party library. In its free of charge variant it renders the images watermarked with the string Demo, painted across the panel. You can find more information about ordering the fully functioning version here: [http://www.bdaum.de/cgmpanel.htm](http://www.bdaum.de/cgmpanel.htm).

Follow this procedure to enable the rendering of CGM images in **Author** mode:

1. Download the `CGMPanel.ZIP` from [http://www.bdaum.de/CGMPanel.ZIP](http://www.bdaum.de/CGMPanel.ZIP).
2. Unpack the ZIP archive and copy the `cgmpanel.jar` into the `{OXYGEN_INSTALL_DIR}/lib` directory.
3. Restart the application.

**Customize Oxygen XML Editor to Render PDF Images (Experimental Support)**

Oxygen XML Editor provides experimental support for PDF images using the Apache PDFBox library.

To enable the rendering of PDF images in **Author** mode, follow this procedure:

1. Go to [http://pdfbox.apache.org/downloads.html](http://pdfbox.apache.org/downloads.html) and download the pre-built PDFBox standalone binary JAR files: `pdfbox-2.0.3.jar`, `fontbox-2.0.3.jar`, and `xmpbox-2.0.3.jar`. Alternatively, you can use the `1.8.12` version of these files, as they have been tested and work properly.

   **Note:** It is not recommended to use `pdfbox-app-2.0.3.jar` file instead of the three specified files because it contains additional classes that may cause conflicts elsewhere in Oxygen XML Editor.

2. Create a subfolder called `pdfImageJars` in the `{OXYGEN_INSTALL_DIR}/lib` directory.
3. Copy the downloaded JAR libraries to that newly created subfolder.
4. Restart the application.

**Customize Oxygen XML Editor to Render PSD Images**

Oxygen XML Editor provides support for rendering PSD (Adobe Photoshop) images.

To enable the rendering of PSD images in **Author** mode, follow this procedure:

1. Download the following JAR files:
   
   - [http://search.maven.org/remotecontent?filepath=com/twelvemonkeys/common/common-image/3.1.0/common-image-3.1.0.jar](http://search.maven.org/remotecontent?filepath=com/twelvemonkeys/common/common-image/3.1.0/common-image-3.1.0.jar)

2. Copy the downloaded JAR libraries to the `{OXYGEN_INSTALL_DIR}/lib` directory.
3. Restart the application.
Customize Oxygen XML Editor to Render EPS and AI Images

Most EPS and AI image files include a preview picture of the content. Oxygen XML Editor tries to render this preview picture. The following scenarios are possible:

- The EPS or AI image does not include the preview picture. Oxygen XML Editor cannot render the image.
- The EPS image includes a TIFF preview picture.

⚠️ Note: Some newer versions of the TIFF picture preview are rendered in gray-scale.

- The AI image contains a JPEG preview picture. Oxygen XML Editor renders the image correctly.

Installing Java Advanced Imaging (JAI) Image I/O Tools Plugin

Certain special image types can be rendered in Oxygen XML Editor by using a Java Advanced Imaging (JAI) Image I/O Tools plugin.

How to Install JAI Image I/O Tools Plugin

To install this plug, follow this procedure:

1. Start Oxygen XML Editor and open the Help > About dialog box. Go to the System properties tab and look for the java.runtime.name and java.home properties. Keep their values for later use.
2. Download the JAI Image I/O kit corresponding to your operating system and Java distribution (found in the java.runtime.name property). A list of archived JAI distributions can be found at: http://www.oracle.com/technetwork/java/javasebusiness/downloads/java-archive-downloads-java-client-419417.html.

⚠️ Note: The JAI API is not the same thing as JAI Image I/O. Make sure you have installed the latter.

3. Run the installer. When the installation wizard displays the Choose Destination Location page, fill-in the Destination Folder field with the value of the java.home property. Continue with the installation procedure and follow the on-screen instructions.

OS X Workaround

There is no native implementation of the JAI Image I/O Tools plugin for OS X 10.5 and later. However, it has a Java implementation fallback that also works on OS X. Some of the image formats are not fully supported in this fallback mode, but at least the TIFF image format is known to be supported.

Use the following procedure for this OS X workaround:

2. In the [OXYGEN_INSTALL_DIR]/lib directory, create a directory named endorsed

3. Unpack the tar.gz. Copy the clibwrapper_jiio.jar and jai_imageio.jar files from its lib directory and paste them in the [OXYGEN_INSTALL_DIR]/lib/endorsed directory.
4. Restart the application and the JAI Image I/O support will be up and running.

Using Retina/HiDPI Images in Author Mode

Oxygen XML Editor provides support for Retina and HiDPI images through simple naming conventions. The higher resolution images are stored in the same images folder as the normal resolution images and they are identified by a scaling factor that is included in the name of the image files. For instance, images with a Retina scaling factor of 2 will include @2x in the name (for example, myImage@2x.png).

You can reference an image to style an element in a CSS by using the url function in the content property, as in the following example:

```
listItem:before{
  content: url('../img/myImage.png');
}
```

This would place the image that is loaded from the myImage.png file just before the listItem element. However, if you are using a Retina display (on a Mac), the icon looks a bit blurry as it automatically gets scaled, or if you are using an HiDPI
Starting with version 17, Oxygen XML Editor interprets the argument of the `url` function as key rather than a fixed URL. Therefore, when running on a system with a Retina or HiDPI display, Oxygen XML Editor will first try to find the image file that corresponds to the retina scaling factor. For instance, using the previous example, Oxygen XML Editor would first try to find `myImage@2x.png`. If this file is not found, it defaults back to the normal resolution image file (`myImage.png`).

Oxygen XML Editor also supports dark color themes. This means that the background of the editor area can be of a dark color and the foreground a lighter color. On a dark background, you may find it useful to invert the colors of images. Again, this can be done with simple naming conventions. If an image designed for a dark background is not found, the normal image is used.

### Retina/HiDPI Naming Convention

Refer to the following table for examples of the Retina/HiDPI image naming convention that is used in Oxygen XML Editor:

<table>
<thead>
<tr>
<th>Color Theme</th>
<th>Referred Image File</th>
<th>Double Density Image File</th>
<th>Triple Density Image File</th>
</tr>
</thead>
<tbody>
<tr>
<td>normal</td>
<td>../img/myImage.png</td>
<td>../img/myImage@2x.png</td>
<td>../img/myImage@3x.png</td>
</tr>
<tr>
<td>dark</td>
<td>../img/myImage_dark.png</td>
<td>../img/myImage_dark@2x.png</td>
<td>../img/myImage_dark@3x.png</td>
</tr>
</tbody>
</table>

**Related information**

*Adding Retina/HiDPI Icons in a Framework* on page 1133

### Image Map Editor

Oxygen XML Editor includes an *Image Map Editor* that allows you to create hyperlinks in specific areas of an image that will link to various destinations. For example, an image that is a map of the seven continents may have a specific hyperlink for each continent that links to a resource that has information about the particular continent. The main purpose of an *image map* is to provide an easy way of linking various parts of an image without having to divide the image into separate image files.

The support for image maps in Oxygen XML Editor is available for images in DITA, DocBook, TEI, and XHTML document types (frameworks). To create an image map on an existing image and open the *Image Map Editor*, right-click the image and select *Image Map Editor*.

![Image Map Rendered in Author Mode](image.png)
**Image Maps in DITA**

Oxygen XML Editor includes support for *image maps* in DITA documents through the use of the `imagemap` element. This feature provides an easy way to create hyperlinks in various areas within an image without having to divide the image into separate image files. The visual *Author* editing mode includes an *Image Map Editor* that helps you to easily create and configure image maps.

![Image Map Editor in DITA](image)

**Figure 208: Image Map Editor in DITA**

**Image Map Editor Interface in DITA**

The interface of the *Image Map Editor* consists of the following sections and actions:

**Toolbar**

- **New Rectangle**
  
  Use this button to draw a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

- **New Circle**
  
  Use this button to draw a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

- **New Polygon**
  
  Use this button to draw a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

- **New Free Form Shape**
  
  Use this button to draw a free form shape over an area in the image. After selecting this button, left-click anywhere in the image to place the first point of your shape. Then move the cursor to the location of the next desired point and left-click to place the next point, and so on. To complete the shape (area), click the first point again and a line will
automatically be added from the last point that was added, or simply double-click the last point to automatically add the line from the last point back to the first.

**Duplicate**
Use this button to create a duplicate of the currently selected shape.

**Delete**
Use this button to delete the currently selected shape.

**Undo**
Use this button to undo the last action.

**Redo**
Use this button to redo the last action that was undone.

**Show/Hide Numbers**
Use this button to toggle between showing or hiding the numbers for the shapes.

**Bring Shape to Front**
Use this button to bring the currently selected shape forward to the top layer.

**Bring Shape Forward**
Use this button to bring the currently selected shape forward one layer.

**Send Shape Backward**
Use this button to send the currently selected shape back one layer.

**Send Shape to Back**
Use this button to send the currently selected shape back to the bottom layer.

**Color Chooser**
Use this drop-down menu to select a color scheme for the lines and numbers of the shapes.

**Zoom Slider**
Use this slider to zoom the image in or out in the main image pane.

**Image Pane**
This main image pane is where you work with shapes to add hyperlinks to multiple areas within an image. Use the mouse to move shapes around in the image pane. You can hold down the Ctrl key to select multiple shapes and then move them simultaneously. You can also drag the points of a selected shape to adjust its size and shape. It is easy to see which shape is selected in this image pane because the border of the selected shape changes from a solid line to a dotted one.

**Contextual Menu Actions Available in the Image Pane**
You can right-click the shapes, points, or anywhere in the Image Pane to invoke the contextual menu where the following actions are available:

**Add Point**
Adds a point to Polygon or Free Form shapes.

**Remove Point**
Removes the current point from Polygon or Free Form shapes.

**Duplicate**
Create a duplicate of the currently selected shape.

**Delete**
Delete the currently selected shape.
New Rectangle
Creates a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

New Circle
Creates a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

New Polygon
Creates a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

Undo
Use this action to undo the last action.

Redo
Use this action to redo the last action that was undone.

Shape Table
The table at the right of the Image Pane is a sequential list of all the areas (shapes) that have been added in the image. It shows their number, type, and description (if one has been added). If you select one of the entries in the table, the corresponding shape will be selected in the Image Pane.

Properties
Target
Allows you to choose the target resource that you want the selected area (shape) to be linked to. You can enter the path to the target in the text field but the easiest way to select a target is to use the Link drop-down menu to the right of the text field. You can choose between the following types of links: Cross Reference, File Reference, or Web Link. All three types will open a dialog box that allows you to define the target resource. This linking process is similar to the normal process of inserting links in DITA by using the identical Link drop-down menu from the main toolbar.

When you click OK to finalize your changes in the Image Map Editor, an xref element will be inserted with either an href attribute or a keyref attribute. Additional attributes may also be inserted and their values depend on the target and the type of link. For details about the three types of links and their dialog boxes, see Inserting a Link in Oxygen XML Editor on page 1581.

Description
You can enter an optional description for the selected area (shape) that will be displayed in the Image Map Details section in Author mode and as a tooltip message when the end user hovers over the hyperlink in the output.

How to Create an Image Map in DITA
To create an image map on an existing image in a DITA document, follow these steps:

1. Right-click the image and select Image Map Editor.
   Result: This action will apply an image map to the current image and open the Image Map Editor dialog box.

2. Add hyperlinks to the image by selecting one of the shape buttons (New Rectangle, New Circle, or New Polygon).

3. Move the shape to the desired area in the image and drag any of the points on the shape to adjust its size or form. You can use the other buttons on the toolbar to adjust its layer and color, or to perform other editing actions.

4. With the shape selected, use one of the linking options in the Link drop-down menu to select a target resource (or enter its path in the Target text field).

5. (Optional) Enter a Description for the selected area (shape).

6. If you want to add more hyperlinks to the image, select a shape button again and repeat the appropriate steps.

7. When you are finished creating hyperlinks, click OK to process your changes.
Result: The image map is applied on the image and the appropriate elements and attributes are automatically added. In Author mode, the image map is now rendered over the image. If the image includes an alt element, its value will be displayed under the image. The following two buttons will also now be available under the image in Author mode:

- **Image Map Editor** - Click this button to open the Image Map Editor.
- **Image Map Details** - Click this button to expand a section that displays the details of the image map and allows you to change the shape and coordinates of the hyperlinked areas. Keep in mind that if you change the shape in this section, you also need to add or remove coordinates to match the requirements of the new shape.

![Image Map Details](image)

**Figure 209: Image Map Details**

**How to Edit an Existing Image Map in DITA**

To edit an existing image map, use any of the following methods:

- Simply double-click the image.
- Right-click the image and select **Image Map Editor**.
- Click the **Image Map Editor** button below the image.

All three methods open the **Image Map Editor** where you can make changes to the image map with a visual editor. You can also make changes to the XML structure of the image map in the Text editing mode.

You can also click the **Image Map Details** button below the image to expand a section that displays the details of the image map and allows you to change the shape and coordinates of the hyperlinked areas. Keep in mind that if you change the shape in this section, you also need to add or remove coordinates to match the requirements of the new shape.

**Overlapping Areas**

If shapes overlap one another in the **Image Map Editor**, the one on the top layer takes precedence. The number shown inside each shape represent its layer (if the numbers are not displayed, click the **Show/Hide Numbers** button on the **Image Map Editor toolbar**). To change the layer order for a shape, use the layer buttons on the **Image Map Editor toolbar** (up, down, move up, move down).

If you insert a shape and all of its coordinates are completely inside another shape, the **Image Map Editor** will display a warning to let you know that the shape is entirely covered by a bigger shape. Keep in mind that if a shape is completely inside another shape, its hyperlink will only be accessible if its layer is on top of the bigger shape.

**Warning:** PDF output is limited to rectangular shaped image map objects. Therefore, if your image contains circles or polygons, those objects will be redrawn as rectangles in the PDF output. Keep in mind that this might affect overlaps in the output.

**Image Maps in DocBook**

Oxygen XML Editor includes support for image maps in DocBook documents through the use of the areaspect element. This feature provides an easy way to create hyperlinks in various parts of an image without having to divide the image into separate image files. The visual **Author** editing mode includes an **Image Map Editor** that helps you to easily create and configure image maps.
The interface of the Image Map Editor consists of the following sections and actions:

**Toolbar**

- **New Rectangle**
  Use this button to draw a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

- **Duplicate**
  Use this button to create a duplicate of the currently selected shape.

- **Delete**
  Use this button to delete the currently selected shape.

- **Undo**
  Use this button to undo the last action.

- **Redo**
  Use this button to redo the last action that was undone.

- **Show/Hide Numbers**
  Use this button to toggle between showing or hiding the numbers for the shapes.

- **Bring Shape to Front**
  Use this button to bring the currently selected shape forward to the top layer.

- **Bring Shape Forward**
  Use this button to bring the currently selected shape forward one layer.
Send Shape Backward
Use this button to send the currently selected shape back one layer.

Send Shape to Back
Use this button to send the currently selected shape back to the bottom layer.

Color Chooser
Use this drop-down menu to select a color scheme for the lines and numbers of the shapes.

Zoom Slider
Use this slider to zoom the image in or out in the main image pane.

Image Pane
This main image pane is where you work with shapes to add hyperlinks to multiple areas within an image. Use the mouse to move shapes around in the image pane. You can hold down the Ctrl key to select multiple shapes and then move them simultaneously. You can also drag the points of a selected shape to adjust its size and shape. It is easy to see which shape is selected in this image pane because the border of the selected shape changes from a solid line to a dotted one.

Contextual Menu Actions Available in the Image Pane
You can right-click the shapes, or anywhere in the Image Pane to invoke the contextual menu where the following actions are available:

Duplicate
Create a duplicate of the currently selected shape.

Delete
Delete the currently selected shape.

New Rectangle
Creates a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

Undo
Use this action to undo the last action.

Redo
Use this action to redo the last action that was undone.

Shape Table
The table at the right of the Image Pane is a sequential list of all the areas (shapes) that have been added in the image. It shows their number, type, and ID. If you select one of the entries in the table, the corresponding shape will be selected in the Image Pane.

Properties
ID
The identifier for the selected area. This will become the value of the xml:id attribute for the particular area element.

Target
Allows you to choose the target resource that you want the selected area to be linked to. You can enter the path to the target in the text field but the easiest way to select a target is to use the Link drop-down menu to the right of the text field. You can choose between the following types of links: Cross Reference or Web Link. Both types open a dialog box that allows you to select the target resource and it is inserted as the value of an xlink:href attribute.

Description
You can enter an optional description for the selected area that will be displayed in the Image Map Details section in Author mode and as a tooltip message when the end user hovers over the hyperlink in the output.
How to Create an Image Map in DocBook

To create an image map on an existing image in a DocBook document, follow these steps:

1. Right-click the image and select **Image Map Editor**.
   
   **Result:** This action will apply an *image map* to the current image and open the **Image Map Editor** dialog box.

2. Add hyperlinks to the image by selecting the [New Rectangle] button.
3. Move the shape to the desired area in the image and drag any of the points on the shape to adjust its size or form. You can use the *other buttons on the toolbar* to adjust its layer and color, or to perform other editing actions.
4. With the shape selected, enter an *ID* and use one of the *linking options* in the *Link* drop-down menu to select a target resource (or enter its path in the *Target* text field).
5. (Optional) Enter a *Description* for the selected area (shape).

6. If you want to add more hyperlinks to the image, select [New Rectangle] button again and repeat the appropriate steps.
7. When you are finished creating hyperlinks, click **OK** to process your changes.
   
   **Result:** The *image map* is applied on the image and the appropriate elements and attributes are automatically added. In **Author** mode, the image map is now rendered over the image. If the image includes an *alt* element, its value will be displayed above the image. The following two buttons will also now be available at the top of the image in **Author** mode:
   - **Image Map Editor** - Click this button to open the **Image Map Editor**.
   - **Image Map Details** - Click this button to expand a section that displays the details of the image map.

How to Edit an Existing Image Map in DocBook

To edit an existing image map, use any of the following methods:

- Simply double-click the image.
- Right-click the image and select **Image Map Editor**.
- Click the **Image Map Editor** button below the image.

All three methods open the **Image Map Editor** where you can make changes to the image map with a visual editor. You can also make changes to the XML structure of the image map in the **Text** editing mode.

You can also click the **Image Map Details** button above the image to expand a section that displays the details of the image map and allows you to change the coordinates and IDs of the hyperlinked areas.

Note: If you want to link a set of related *area* elements, you can use *areaset* elements. To add *areaset* elements, and *area* elements to the *areaset*, switch to **Text** mode and insert them manually.

Overlapping Areas

If shapes overlap one another in the **Image Map Editor**, the one on the top layer takes precedence. The number shown inside each shape represent its layer (if the numbers are not displayed, click the [Show/Hide Numbers] button on the **Image Map Editor toolbar**). To change the layer order for a shape, use the layer buttons on the **Image Map Editor toolbar** (`🔍`, `🔍`, `🔍`, `🔍`).

If you insert a shape and all of its coordinates are completely inside another shape, the **Image Map Editor** will display a warning to let you know that the shape is entirely covered by a bigger shape. Keep in mind that if a shape is completely inside another shape, its hyperlink will only be accessible if its layer is on top of the bigger shape.

**Image Maps in TEI**

Oxygen XML Editor includes support for *image maps* in TEI documents through the use of the *facsimile* element. In TEI documents, this feature provides an easy way to create areas (using *zone* elements) in an image where the end user can hover
or click to retrieve more information about that particular area of the image. The visual Author editing mode includes an Image Map Editor that helps you to easily create the areas in the image.

Figure 211: Image Map Editor in TEI

Image Map Editor Interface in TEI

The interface of the Image Map Editor consists of the following sections and actions:

**Toolbar**

- **New Rectangle**
  
  Use this button to draw a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

- **New Polygon**
  
  Use this button to draw a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

- **New Free Form Shape**
  
  Use this button to draw a free form shape over an area in the image. After selecting this button, left-click anywhere in the image to place the first point of your shape. Then move the cursor to the location of the next desired point and left-click to place the next point, and so on. To complete the shape (area), click the first point again and a line will automatically be added from the last point that was added, or simply double-click the last point to automatically add the line from the last point back to the first.

- **Duplicate**
  
  Use this button to create a duplicate of the currently selected shape.

- **Delete**
  
  Use this button to delete the currently selected shape.
Undo
Use this button to undo the last action.

Redo
Use this button to redo the last action that was undone.

Show/Hide Numbers
Use this button to toggle between showing or hiding the numbers for the shapes.

Bring Shape to Front
Use this button to bring the currently selected shape forward to the top layer.

Bring Shape Forward
Use this button to bring the currently selected shape forward one layer.

Send Shape Backward
Use this button to send the currently selected shape back one layer.

Send Shape to Back
Use this button to send the currently selected shape back to the bottom layer.

Color Chooser
Use this drop-down menu to select a color scheme for the lines and numbers of the shapes.

Zoom Slider
Use this slider to zoom the image in or out in the main image pane.

Image Pane
This main image pane is where you work with shapes to add areas (zones) within an image. Use the mouse to move shapes around in the image to the desired area and drag the points on a selected shape to adjust its size and shape. It is easy to see which shape is selected in this image pane because the border of the selected shape changes from a solid line to a dotted line.

Contextual Menu Actions Available in the Image Pane
You can right-click the shapes, points, or anywhere in the Image Pane to invoke the contextual menu where the following actions are available:

Add Point
Adds a point to Polygon or Free Form shapes.

Remove Point
Removes the current point from Polygon or Free Form shapes.

Duplicate
Create a duplicate of the currently selected shape.

Delete
Delete the currently selected shape.

New Rectangle
Creates a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

New Polygon
Creates a polygon shape over an area in the image. This actions opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.
Undo

Use this action to undo the last action.

Redo

Use this action to redo the last action that was undone.

Shape Table

The table at the right of the Image Pane is a sequential list of all the areas (shapes) that have been added in the image. It shows their number, type, and ID. If you select one of the entries in the table, the corresponding shape will be selected in the Image Pane.

Properties

ID

The identifier for the selected area. This will become the value of the xml:id attribute for the particular zone element. When you insert a new zone, a unique ID is automatically generated and displayed in this field. However, you can change this value if you want to.

How to Create an Image Map in TEI

To create an image map on an existing image in a TEI document, follow these steps:

1. The image (graphic) must be inside a facsimile element to support the Image Map Editor feature.
2. Right-click the image and select Image Map Editor.

   Result: This action will apply an image map to the current image and open the Image Map Editor dialog box.

3. Add areas (zones) in the image by selecting one of the shape buttons (☐ New Rectangle or ☐ New Polygon).
4. Move the shape to the desired area in the image and drag any of the points on the shape to adjust its size or form. You can use the other buttons on the toolbar to adjust its layer and color, or to perform other editing actions.
5. With the shape selected, enter an ID.
6. If you want to add more areas (zones) to the image, select a shape button again and repeat the appropriate steps.
7. When you are finished, click OK to process your changes.

   Result: The image map is applied on the image and the appropriate elements and attributes are automatically added. In Author mode, the image map is now rendered over the image and the following two buttons will now be available at the bottom of the image:

   • Image Map Editor - Click this button to open the Image Map Editor.
   • Image Map Details - Click this button to expand a section that displays the details of the image map.

How to Edit an Existing Image Map in TEI

To edit an existing image map, use any of the following methods:

• Simply double-click the image.
• Right-click the image and select Image Map Editor.
• Click the Image Map Editor button below the image.

All three methods open the Image Map Editor where you can make changes to the image map with a visual editor. You can also make changes to the XML structure of the image map in the Text editing mode.

You can also click the Image Map Details button below the image to expand a section that displays the details of the image map and allows you to change the coordinates and IDs of the hyperlinked areas.

Restriction: Currently, if zone elements contain additional content (such as text or comments) and you edit the image map, the Image Map Editor does not preserve the additional content. Therefore, if you do need to insert additional content inside the zone elements, you should do so after the image map has been created and finalized. Subsequent changes to the image map should then be done in Text mode.
Overlapping Areas

If shapes overlap one another in the **Image Map Editor**, the one on the top layer takes precedence. The number shown inside each shape represent its layer (if the numbers are not displayed, click the ![Show/Hide Numbers](image) button on the **Image Map Editor toolbar**). To change the layer order for a shape, use the layer buttons on the **Image Map Editor toolbar** ( ![1️⃣](image), ![2️⃣](image), ![3️⃣](image), ![4️⃣](image)).

If you insert a shape and all of its coordinates are completely inside another shape, the **Image Map Editor** will display a warning to let you know that the shape is entirely covered by a bigger shape. Keep in mind that if a shape is completely inside another shape, its hyperlink will only be accessible if its layer is on top of the bigger shape.

**Warning:** PDF output is limited to rectangular shaped image map objects. Therefore, if your image contains circles or polygons, those objects will be redrawn as rectangles in the PDF output. Keep in mind that this might affect overlaps in the output.

🌐 Send Shape Backward
Use this button to send the currently selected shape back one layer.

🌐 Send Shape to Back
Use this button to send the currently selected shape back to the bottom layer.

❖ Color Chooser
Use this drop-down menu to select a color scheme for the lines and numbers of the shapes.

🔍🔍🔍 Zoom Slider
Use this slider to zoom the image in or out in the main image pane.

Image Pane
This main image pane is where you work with shapes to add hyperlinks to multiple areas within an image. Use the mouse to move shapes around in the image pane. You can hold down the Ctrl key to select multiple shapes and then move them.
simultaneously. You can also drag the points of a selected shape to adjust its size and shape. It is easy to see which shape is selected in this image pane because the border of the selected shape changes from a solid line to a dotted one.

**Contextual Menu Actions Available in the Image Pane**

You can right-click the shapes, points, or anywhere in the Image Pane to invoke the contextual menu where the following actions are available:

- **Add Point**
  Adds a point to *Polygon* or *Free Form* shapes.

- **Remove Point**
  Removes the current point from *Polygon* or *Free Form* shapes.

- **Duplicate**
  Create a duplicate of the currently selected shape.

- **Delete**
  Delete the currently selected shape.

- **New Rectangle**
  Creates a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

- **New Circle**
  Creates a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

- **New Polygon**
  Creates a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

- **Undo**
  Use this action to undo the last action.

- **Redo**
  Use this action to redo the last action that was undone.

**Shape Table**

The table at the right of the *Image Pane* is a sequential list of all the areas (shapes) that have been added in the image. It shows their number, type, and description (value of the *Alternative* property). If you select one of the entries in the table, the corresponding shape will be selected in the *Image Pane*.

**Properties**

- **Href**
  Specifies the hyperlink target for the selected area. This will become the value of the `href` attribute for the particular `area` element. The possible values are:
    - **An Absolute URL** - A URL of another website (for example, `http://www.example.com/index.htm`).
    - **A Relative URL** - A link to a file within your website (for example, `index.htm`).
    - **An Element** - A link to the ID of an element within the page (for example, `#top`).
    - **Other Protocols** - A specified path using other protocols (such as `https://`, `ftp://`, `mailto:`).
    - **A Script** - A link to a script (for example, `javascript:alert('Hello');`)

- **Alternate**
  The description for the selected area. The value is inserted in an `alt` attribute in the particular `area` element. This is a required attribute to present a text alternative for browsers that do not display images.

- **Target**
  Specifies where to open the linked resource. The allowed values are:
    - **_blank** - Opens the linked resource in a new window or tab.
• _self - Opens the linked resource in the same frame as it was clicked.
• _parent - Opens the linked resource in the full body of the window.
• framename - Opens the linked resource in the named frame.

How to Create an Image Map in XHTML
To create an image map on an existing image in an XHTML document, follow these steps:

1. Right-click the image and select Image Map Editor.
   Result: This action will apply an image map to the current image and open the Image Map Editor dialog box.

2. Add hyperlinks to the image by selecting one of the shape buttons (☐ New Rectangle, ☐ New Circle, or ☐ New Polygon).
3. Move the shape to the desired area in the image and drag any of the points on the shape to adjust its size or form. You can use the other buttons on the toolbar to adjust its layer and color, or to perform other editing actions.
4. With the shape selected, specify the hyperlink target in the Href field and enter a description for the selected area in the Alternate field.
5. (Optional) Specify where the hyperlink resource will be opened in the Target field.
6. If you want to add more hyperlinks to the image, select a shape button again and repeat the appropriate steps.
7. When you are finished creating hyperlinks, click OK to process your changes.

   Result: The image map is applied on the image and the appropriate elements and attributes are automatically added. In Author mode, the image map is now rendered over the image and its properties are displayed in a section below the image.

How to Edit an Existing Image Map in XHTML
To edit an existing image map, use any of the following methods:

• Simply double-click the image.
• Right-click the image and select Image Map Editor.
• Click the Image Map Editor button below the image.

All three methods open the Image Map Editor where you can make changes to the image map with a visual editor. You can also make changes to the XML structure of the image map in the Text editing mode.

In Author mode, the details of the image map are also displayed below the image and you can edit the description, href, shape, and coordinates of the hyperlinked areas. Keep in mind that if you change the shape in this section, you also need to add or remove coordinates to match the requirements of the new shape.

Overlapping Areas
If shapes overlap one another in the Image Map Editor, the one on the top layer takes precedence. The number shown inside each shape represent its layer (if the numbers are not displayed, click the Show/Hide Numbers button on the Image Map Editor toolbar). To change the layer order for a shape, use the layer buttons on the Image Map Editor toolbar (agog, ), (agog, ), (agog, ), (agog, ).

If you insert a shape and all of its coordinates are completely inside another shape, the Image Map Editor will display a warning to let you know that the shape is entirely covered by a bigger shape. Keep in mind that if a shape is completely inside another shape, its hyperlink will only be accessible if its layer is on top of the bigger shape.

⚠️ Warning: PDF output is limited to rectangular shaped image map objects. Therefore, if your image contains circles or polygons, those objects will be redrawn as rectangles in the PDF output. Keep in mind that this might affect overlaps in the output.

HTML Image Map Specifications
Adding Video, Audio, and Embedded HTML Resources in DITA Topics

You can insert references to media resources (such as videos, audio clips, or embedded HTML frames) in your DITA topics. The media resources can be played directly in Author mode and in all HTML5-based outputs. There is a toolbar button that allows you to insert and configure a reference to the media resource.

Adding a Media Resource

To insert a media resource in a DITA document, use the following procedure:

1. Place the cursor at the location where you want the media resource.
2. Select the Insert Media Resource action from the toolbar. The Insert Media dialog box appears.

![Insert Media Dialog Box](image)

### Figure 213: Insert Media Dialog Box

3. Configure the options in this dialog box and click Insert.

   The Insert Media dialog box includes the following options:

   **URL**
   Use this option to specify a URL for a media resource. It will insert the URL as the value of a `data` attribute of an `object` element. You can type the URL of the resource you want to insert or use the Browse drop-down menu to select it.

   **Keyref**
   You can use the Choose Key Reference button to open the Choose Key dialog box that presents the list of keys available in the selected root map. Use this dialog box to insert the selected key as the value of the `datakeyref` attribute of an `object` element. All keys that are presented in the dialog box are gathered from the root map of the current DITA map.

   **Tip:** If your defined keys are not listed in this dialog box, it is most likely trying to gather keys from the wrong root map. You can change the root map by using the Change Root Map link.

   **Type**
   Oxygen XML Editor detects and automatically selects the media type based upon the specified resource in the URL field. You can manually change the type, but keep in mind that in the publishing stage the `object element is converted to an HTML5 element` based upon the type selected here. You can choose between: audio, video, or iframe.

   **Size**
   Use this section to configure the Width and Height of the frame for the media resource. Specifying a value in these options inserts a width and height attribute, respectively. For audio clips, only the Width can be adjusted.

   **Result in Author Mode:** A reference to the specified video, audio, or embedded HTML frame is inserted in an `object` element and it is rendered in Author mode so that it can be played directly from there.
**Result in Output:** In the publishing stage, the `object` element is converted to an HTML5 element so that it can be rendered properly and played in all HTML5-based outputs.

- **Videos** - The `object` element is converted to an HTML5 `video` element.
- **Audio Clips** - The `object` element is converted to an HTML5 `audio` element.
- **Embedded HTML Frames** - The `object` element is converted to an HTML5 `iframe` element.

**Tip:** There is an even faster way of inserting an embedded video (such as a YouTube or Vimeo). If you copy the embed code from the source (for example, you can right-click on a YouTube video and select *Copy embed code*), you can then paste the contents of the clipboard in the *URL field*, and the *Type* will automatically be set on `iframe`, while the *Width* and *Height* will be populated according to the detected size.

**Related information**

*Adding Images in DITA Topics* on page 1547

*Adding Video and Audio Objects in DITA WebHelp Output* on page 912

**Embedding HTML Content in DITA Topics**

The DITA Open Toolkit that comes bundled with Oxygen XML Editor includes a pre-installed plugin that allows you to embed well-formed HTML content directly in a DITA topic.

For example, suppose you wanted to embed a YouTube video directly in a DITA topic.

The DITA topic would look like this:

```
....
<foreign outputclass="html-embed"><![CDATA[
  <iframe width="420" height="315"
    src="https://www.youtube.com/embed/qepRkQxhTX"
    frameborder="0" allowfullscreen="true">
  </iframe>
]]>\]></foreign>
....
```

The converted HTML output would look like this:

```
...........
<iframe width="420" height="315" src="https://www.youtube.com/embed/qepRkQxhTX"
    frameborder="0" allowfullscreen="true">
  </iframe>
............
```

The plugin is also available on the oxygenxml GitHub projects page.

**Related information**

*Adding Video and Audio Objects in DITA WebHelp Output* on page 912

**Editing MathML Notations**

The Author editor includes a built-in editor for MathML notations. To start the MathML editor, either double-click a MathML notation, or select the *Edit Equation* action from its contextual menu. In the MathML editor you can edit the mathematical symbols of a MathML notation. You can open a MathML file of your current project directly in the MathML editor. To do this, select *Open with > MathML editor* from the contextual menu in the Project view.
The font size and font family that is used for the equations is based upon the context in which the MathML equation appears. To configure the minimum font size of the equation, open the Preferences dialog box (Options > Preferences) and go to Editor > Edit modes > Author > MathML.

Configure the MathFlow Editor

The MathFlow Components product can replace the default MathML editor with a specialized MathML editor. You have to purchase a MathFlow Component from Design Science and configure it in Oxygen XML Editor with the following procedure:

1. Install MathFlow by using the Universal installer (for versions prior to 2.1, use the MathFlow SDK).
2. Set the path to the MathFlow install folder in the MathML preferences page.
3. Set the path to the MathFlow license file in the MathML preferences page.
MathML Equations in HTML Output

Currently, only Firefox can render MathML equations embedded in the HTML code. MathJax is a solution to properly view MathML equations embedded in HTML content in a variety of browsers.

If you have DocBook or DITA content that has embedded MathML equations and you want to properly view the equations in published HTML output types (WebHelp, CHM, EPUB, etc.), you need to add a reference to the MathJax script in the head element of all HTML files that have the equation embedded.

For example:

```html
<script type="text/javascript" src="http://cdn.mathjax.org/mathjax/MathJax.js?config=TeX-AMS-MML_HTMLorMML"></script>
```

For DITA documents, you can also use the following procedure:

1. **Edit the DITA Map WebHelp transformation scenario** and open the Parameters tab.
2. Set the following parameter to point to an XML resource file that contains your script, depending on your type of WebHelp system.
   - **WebHelp Responsive Systems** - Set the webhelp.fragment.head parameter to point to your resource file.
   - **WebHelp Classic Systems** - Set the webhelp.head.script parameter to point to your resource file.
3. Run the transformation scenario.

**Result:** The equation should now be properly rendered in other browsers, such as Edge, IE, or Chrome.

**Refreshing the Content**

On occasion you may need to reload the content of the document from the disk or reapply the CSS. This can be performed by using the **Reload** action.

To refresh the content of the referenced resources you can use the **Refresh references** action. However, this action will not refresh the expanded external entities, for which you will need to use the **Reload** action.
Generating IDs for Elements in Author Mode

Oxygen XML Editor allows you to manually assign or edit values of `id` attributes in Author mode by using the Attributes View or an in-place attribute editor. Oxygen XML Editor also includes mechanisms to generate ID values for elements, either on-request or automatically, in DITA, DocBook, or TEI documents.

Generate IDs On-Request

You can generate ID values for specific elements on-request. To do so, select the element for which you want to generate an ID (or place the cursor inside the element) and select the Generate IDs action from the contextual menu or the framework-specific menu (DITA, DocBook, or TEI). This action generates a unique ID for the current element. If you invoke the action on a block of selected content, the action will generate IDs for all top-level elements and elements that are listed in the ID Options dialog box that are found in the current selection.

Note: The Generate IDs action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

Automatically Generate IDs

Oxygen XML Editor includes an option to automatically add unique ID values to certain elements when they are created in Author mode. The Auto generate IDs for elements option can be found in the ID Options dialog box that is displayed when you select the ID Options action from the framework-specific menu (DITA, DocBook, or TEI). If enabled, Oxygen XML Editor automatically generates unique ID values for elements that are listed in this dialog box. You can use this dialog box to customize the format of the ID values and choose which elements will have their ID values automatically generated (for example, you can customize the list of elements to include those that you most often need to identify).

ID Options Dialog Box

![ID Options Dialog Box](image)

The ID Options dialog box allows you to configure the following options in regards to generating ID values:

**ID Pattern**

The pattern for the ID values that will be generated. This text field can be customized using constant strings or any of the Oxygen XML Editor Editor Variables.

**Element name or class value to generate ID for**

The elements for which ID values will be generated, specified using class attribute values. To customize the list, use the Add, Edit, or Remove buttons.
Auto generate IDs for elements
If enabled, Oxygen XML Editor will automatically generate unique IDs for the elements listed in this dialog box when they are created in Author mode.

Remove IDs when copying content in the same document
When copying and pasting content in the same document, this option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs. To retain the element IDs, disable this option.

Note: This option does not have an effect on content that is cut and pasted.

Duplicating Elements with Existing IDs
If you duplicate elements with existing IDs (for example, through copy/paste or drag/drop actions), all IDs are removed at the resolution of the operation. However, you can use the options in the ID Options dialog box to change this behavior. The options in this dialog box affect duplicated elements with existing IDs in the following ways:

Note: Only the elements listed in this dialog box are affected by these options. Therefore, if you want to use these options to preserve IDs or generate new ones, you must first add the elements to be duplicated to the list in this dialog box.

- If the Auto generate IDs for elements option is enabled and you duplicate elements with existing IDs, Oxygen XML Editor assigns new, unique ID values to the duplicates.
- If the Auto generate IDs for elements option is disabled and you duplicate elements with existing IDs, the ID values are removed from the duplicates. However, when elements are duplicated in the same document, this option has no effect and IDs are preserved if the Remove IDs when copying content in the same document option is disabled.
- If the Remove IDs when copying content in the same document option is enabled, the ID values are removed from elements that are duplicated in the same document. However, enabling this option has no effect if the Auto generate IDs for elements option is enabled.
- If the Remove IDs when copying content in the same document option is disabled, the ID values are preserved when elements are duplicated in the same document. This option has no affect on elements that are duplicated in other documents.

Controlling the Default ID Generation Options
It is possible to configure the default ID generation options for DITA, DocBook, and TEI frameworks. In the frameworks folder for each of those document types, there is an XML configuration file called idGenerationDefaultOptions.xml that contains the default settings for generating IDs in each particular type of document. To configure the default settings, you can edit this file and save it back to the same directory.

The configuration file can be found in the resources folder within the particular framework. For example, the configuration file for the DITA framework is located in:

[OXYGEN_INSTALL_DIR]/frameworks/dita/resources/idGenerationDefaultOptions.xml.

Sharing Default ID Generation Options
If you want to share your configured default ID generation settings with other members of your team, follow these steps:

1. Configure the idGenerationDefaultOptions.xml file for your framework according to your needs.
2. Bundle a modified version of the entire framework folder (for example, [OXYGEN_INSTALL_DIR]/frameworks/dita/). To do this:
   a. Open the Preferences dialog box (Options > Preferences) and go to Document Type Association.
   b. Select your framework and click the Extend button.
   c. In the Document type configuration dialog box that is now displayed, select External for the Storage option. By default, this will save the extension in a new folder in the frameworks folder (for example, [OXYGEN_INSTALL_DIR]/frameworks/dita-extension (1)), but you can also use the Browse button to specify a specific name and folder.
   d. In this new extension folder, create a new folder called resources and add your modified idGenerationDefaultOptions.xml file to this new resources folder.
   e. Go back to the Document Type Association preferences page, select the extended framework, and click Edit.
f. Go to the Classpath tab, add a reference to your new resources folder, and move this reference up (using the Move Up button) so that it is the first one that appears in the list.

g. Click OK and exit out of the preferences page.

3. Distribute your newly extended folder to other team members by using one of the methods described in Sharing a Document Type (Framework) on page 1180.

Using Form Controls in Author Mode

You can use form controls in Author mode in a variety of ways to make it easier to capture, organize, and edit content. Oxygen XML Editor includes built-in form controls that can be used by content authors in Author mode. The types of built-in form controls that you can use include the following:

- **Audio** - A media object that plays audio clips.
- **Browser** - A media object that renders HTML frames or interact with SVG documents
- **Button** - A graphical user interface object that performs a specific action.
- **Button Group** - A graphical user interface group of buttons (such as radio buttons) that perform specific actions.
- **Checkbox** - A graphical user interface box that you can click to select or deselect a value.
- **Combo Box** - A graphical user interface object that can be a drop-down menu or a combination of a drop-down menu and a single-line text field.
- **Date Picker** - A form control object that allows you to select a date in a specified format.
- **HTML Content** - A graphical user interface box that is used for rendering HTML content.
- **Pop-up** - A contextual menu that provides quick access to various actions.
- **Text Area** - A box that allows you to enter multiple lines of text.
- **Text Field** - A graphical user interface box that allows you to enter a single line of text.
- **URL Chooser** - A dialog box that allows you to select the location of local or remote resources.
- **Video** - A media object that plays videos.

You can also implement custom form controls for more specific needs.

The following image is an example of how form controls can be used by content authors in Author mode. It includes several button form controls, a combo box, and a text field. The icon is a button form control that is assigned a specific action that changes the layout to an editing mode. The [ + ] and [ - ] icons are also button form controls that are assigned specific actions to add or delete records from the document. The Direct manager row includes a combo box form control that is both a drop-down menu and an editable text field, while the Homepage row includes a simple editable text field form control.

![Example of Form Controls in Author Mode](image)

Figure 217: Example of Form Controls in Author Mode

You can use your imagination to envision the multitude of ways that you can use form controls to make the editing experience for content authors easier and more efficient. As a working example, a bundled samples project (located in the samples folder inside the Oxygen XML Editor installation directory) contains a file called personal.xml that contains form controls. You can use this file, along with its corresponding personal.css file (form controls are defined in the CSS) to experiment with an example of how form controls can be implemented in Author mode.
Contextual Menu Actions in Author Mode

Oxygen XML Editor includes powerful support for editing XML documents through actions included in the contextual menu. When editing XML documents in Author mode, the contextual menu includes general actions that are available for all of the recognized document types and document type-specific actions that are configured for each document type.

General Contextual Menu Actions in Author Mode

The general actions that are available in the contextual menu (some of them are also available in the submenus of the Document menu) for all document types include the following:

Quick Fix (Alt + 1 (Command + Alt + 1 on OS X))

Available when the contextual menu is invoked on an error where Oxygen XML Editor can provide a quick fix.

Open Image

Available when the contextual menu is invoked on an image. This action allows you to open an image in the Oxygen XML Editor Image Viewer or in a default system application associated with the current image type.

Track Changes Actions

Available when the Track Changes feature is enabled and the contextual menu is invoked on a change. The following options are available:

✓ Accept Change(s)

Accepts the tracked change located at the cursor position and moves to the next change. If you select a part of a deletion or insertion change, only the selected content is accepted. If you select multiple changes, all of them are accepted. For an insertion change, it keeps the inserted text and for a deletion change, it removes the content from the document.

✗ Reject Change(s)

Rejects the tracked change located at the cursor position and moves to the next change. If you select a part of a deletion or insertion change, only the selected content is rejected. If you select multiple changes, all of them are rejected. For an insertion change, it removes the inserted text and for a deletion change, it preserves the original content.

✍ Comment Change

Opens a dialog box that allows you to add a comment to an existing tracked change. The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

Author Callout Actions

Available when the contextual menu is invoked on a callout. If enabled in the Callouts preferences page, the callouts are displayed in Author mode for comments, tracked insertion changes, or tracked deletion changes.

Insertion or Deletion Callout Actions

The following actions are available in the contextual menu when invoked on an insertion or deletion callout box:

Reply

Opens a dialog box that allows you to add a reply to a comment or tracked change. When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and Review view.

Mark as Done

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for tracked changes that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendents. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

✓ Accept Change(s)

Accepts the tracked change located at the cursor position and moves to the next change. If you select a part of a deletion or insertion change, only the selected content is accepted. If you select multiple changes, all of them are accepted. For an insertion change, it keeps the inserted text and for a deletion change, it removes the content from the document.
Reject Change(s)
Rejects the tracked change located at the cursor position and moves to the next change. If you select a part of a deletion or insertion change, only the selected content is rejected. If you select multiple changes, all of them are rejected. For an insertion change, it removes the inserted text and for a deletion change, it preserves the original content.

Comment Change
Opens a dialog box that allows you to add a comment to an existing tracked change. The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

Edit Reference
If the fragment that contains a callout is a reference, use this option to go to the reference and edit the callout.

Callouts Options
Select this option to open the **Callouts preference page** where you can configure various callout options.

Comment Callout Actions
The following actions are available in the contextual menu when invoked on a comment callout box:

Reply
Opens a dialog box that allows you to add a reply to a comment or tracked change. When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and **Review** view.

Mark as Done
A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for tracked changes that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendents. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

Show/Edit Comment
Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

Remove Comment
Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

Callouts Options
Select this option to open the **Callouts preference page** where you can configure various callout options.

Edit Attributes
Displays an **in-place attributes editor** that allows you to manage the attributes of an element.

Edit Profiling Attributes
Allows you to change the **profiling attributes** defined on all selected elements.

Insert submenu
This submenu includes insert actions that are specific to each framework, along with the following general action:

Insert Entity
Allows you to insert a predefined entity or character entity. Surrogate character entities (range #x10000 to #x10FFFF) are also accepted. Character entities can be entered in one of the following forms:

- `<decimal value>` - e. g. #65
- `&<decimal value>;` - e. g. &#65
- `<hexadecimal value>` - e. g. #x41
- `&<hexadecimal value>;` - e. g. &#x41
Cut (Ctrl + X (Command + X on OS X))
Removes the current selected content from the document and places it in the clipboard.

Copy (Ctrl + C (Command + C on OS X))
Places a copy of the current selected content in the clipboard.

Paste (Ctrl + V (Command + V on OS X))
Inserts the current clipboard content into the document at the cursor position.

Paste special submenu
This submenu includes special paste actions that are specific to each framework, as well as the following general paste actions:

Paste As XML
Pastes clipboard content that is considered to be XML, preserving its XML structure.

Paste As Text
Pastes clipboard content, ignoring any structure or styling markup.

Select submenu
This submenu allows you to select the following:

Element
Selects the entire element at the current cursor position.

Content
Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

Parent
Selects the entire parent element at the current cursor position.

Text submenu
This submenu contains the following actions:

To Lower Case
Converts the selected content to lower case characters.

To Upper Case
Converts the selected content to upper case characters.

Capitalize Sentences
Converts to upper case the first character of every selected sentence.

Capitalize Words
Converts to upper case the first character of every selected word.

Count Words
Counts the number of words and characters (no spaces) in the entire document or in the selection for regular content and read-only content.

Note: The content marked as deleted with change tracking is ignored when counting words.

Convert Hexadecimal Sequence to Character (Ctrl + Shift + X (Command + Shift + X on OS X))
Converts a sequence of hexadecimal characters to the corresponding Unicode character. The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the 0x or 0X prefix. Examples of valid sequences: 0x0045, 0x0125, 1253, 265, 43.

Refactoring submenu
Contains a series of actions designed to alter the XML structure of the document:
Toggle Comment
Encloses the currently selected text in an XML comment, or removes the comment if it is commented.

Move Up (Alt + UpArrow)
Moves the current node or selected nodes in front of the previous node.

Move Down (Alt + DownArrow)
Moves the current node or selected nodes after the subsequent node.

Split Element (Alt + Shift + D (Ctrl + Alt + D on OS X))
Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

Join Elements
Joins two adjacent block elements that have the same name. The action is available only when the cursor position is between the two adjacent block elements. Also, joining two block elements can be done by pressing the Delete or Backspace keys and the cursor is positioned between the boundaries of these two elements.

Surround with Tags (Ctrl + E (Command + E on OS X))
Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

• If the Position cursor between tags option is enabled in the Content Completion preferences page, the cursor is placed between the start and end tag.
• If the Position cursor between tags option is disabled in the Content Completion preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

Surround with '[tag]' (Ctrl + ForwardSlash (Command + ForwardSlash on OS X))
Surround the selected content with the last tag used.

Rename Element
The element from the cursor position, and any elements with the same name, can be renamed according with the options from the Rename dialog box.

Delete Element Tags
Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the Delete or Backspace keys.

Remove All Markup
Removes all the XML markup inside the selected block of content and keeps only the text content.

Remove Text
Removes the text content of the selected block of content and keeps the markup in tact with empty elements.

Attributes submenu
Contains predefined XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

Add/Change attribute
Allows you to change the value of an attribute or insert a new one.

Delete attribute
Allows you to remove one or more attributes.

Rename attribute
Allows you to rename an attribute.

Replace in attribute value
Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

Comments submenu
Contains predefined XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.
Delete comments
Allows you to delete comments found inside one or more elements.

DITA submenu
Contains predefined XML refactoring operations that pertain to DITA documents with some of the information preconfigured based upon the current context.

Change topic ID to file name
Changes the ID of a topic to be the same as its file name.

Convert simple tables to CALS tables
Converts all DITA simple tables to CALS tables in the specified scope.

Elements submenu
Contains predefined XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

Delete element
Allows you to delete elements.

Delete element content
Allows you to delete the content of elements.

Insert element
Allows you to insert new elements.

Rename element
Allows you to rename elements.

Unwrap element
Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

Wrap element
Allows you to surround elements with element tags.

Wrap element content
Allows you to surround the content of elements with element tags.

Fragments submenu
Contains predefined XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

Insert XML fragment
Allows you to insert an XML fragment.

Replace element content with XML fragment
Allows you to replace the content of elements with an XML fragment.

Replace element with XML fragment
Allows you to replace elements with an XML fragment.

JATSKit submenu
Contains predefined XML refactoring operations that pertain to JATS documents with some of the information preconfigured based upon the current context.

Add BITS DOCTYPE - NLM/NCBI Book Interchange 2.0
Adds an NLM 'BITS' 2.0 DOCTYPE declaration.

Add Blue DOCTYPE - NISO JATS Publishing 1.1
Adds a JATS 'Blue' 1.1 DOCTYPE declaration.

Normalize IDs
Assigned IDs are normalized and IDs are assigned to some elements that are missing them.

Review submenu
This submenu includes the following actions:
Track Changes
Enables or disables the track changes support for the current document.

Accept Change(s)
Accepts the tracked change located at the cursor position and moves to the next change. If you select a part of a deletion or insertion change, only the selected content is accepted. If you select multiple changes, all of them are accepted. For an insertion change, it keeps the inserted text and for a deletion change, it removes the content from the document.

Reject Change(s)
Rejects the tracked change located at the cursor position and moves to the next change. If you select a part of a deletion or insertion change, only the selected content is rejected. If you select multiple changes, all of them are rejected. For an insertion change, it removes the inserted text and for a deletion change, it preserves the original content.

Comment Change
Opens a dialog box that allows you to add a comment to an existing tracked change. The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

Highlight
Enables the highlighting tool that allows you to mark text in your document.

Colors
Allows you to select the color for highlighting text.

Stop highlighting
Use this action to disable the highlighting tool.

Remove highlight(s)
Use this action to remove highlighting from the document.

Add Comment
Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).

Show/Edit Comment
Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

Remove Comment
Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

Manage Reviews
Opens the Review view.

Manage IDs submenu
This submenu is available for XML documents that have an associated DTD, XML Schema, or Relax NG schema. It includes the following actions:

Rename in
Names the ID and all its occurrences. Selecting this action opens the Rename XML ID dialog box. This dialog box lets you insert the new ID value and choose the scope of the rename operation.

Search References
Searches for the references of the ID. By default, the scope of this action is the current project. If you configure a scope using the Select the scope for the Search and Refactor operations dialog box, this scope will be used instead.

Search References in
Searches for the references of the ID. Selecting this action opens the Select the scope for the Search and Refactor operations.
Search Occurrences in file

Searches for the occurrences of the ID in the current document.

Folding submenu

This submenu includes the following actions:

- **Toggle Fold**
  Toggles the state of the current fold.

- **Collapse Other Folds (Ctrl + NumPad/ (Command + NumPad/ on OS X))**
  Folds all the elements except the current element.

- **Collapse Child Folds (Ctrl + NumPad. (Command + NumPad. on OS X))**
  Folds the elements indented with one level inside the current element.

- **Expand Child Folds**
  Unfolds all child elements of the currently selected element.

- **Expand All (Ctrl + NumPad* (Command + NumPad* on OS X))**
  Unfolds all elements in the current document.

Inspect Styles

Opens the CSS Inspector view that allows you to examine the CSS rules that match the currently selected element.

Options

Opens the Author mode options page.

Document Type-Specific Contextual Menu Actions in Author Mode

Other document type-specific actions are available in the contextual menu of Author mode for the following document types (click the links to see the default actions that are available for each specific document types):

- **DocBook4 Author Actions**
- **DocBook5 Author Actions**
- **DITA Author Actions**
- **DITA Map Author Actions**
- **XHTML Author Actions**
- **TEI ODD Author Actions**
- **TEI P4 Author Actions**
- **TEI P5 Author Actions**
- **JATS Author Actions**

Validating XML Documents

The W3C XML specification states that a program should not continue to process an XML document if it finds a validation error. The reason is that XML software should be easy to write and all XML documents should be compatible. With HTML, for example, it is possible to create documents with lots of errors (for instance, when you forget an end tag). One of the main reasons that various HTML browsers have performance and compatibility problems is that they have different methods of figuring out how to render a document when an HTML error is encountered. Using XML helps to eliminate such problems.

Even when creating XML documents, errors are easily introduced. When working with large projects or a large number of files, the probability that errors will occur is even greater. Preventing and solving errors in your projects can be time consuming and frustrating. Fortunately, Oxygen XML Editor provides validation functions that enable you to easily identify errors and their location.

Checking XML Well-Formedness

A *Well-formed XML* document is a document that conforms to the XML syntax rules. A *Namespace Well-Formed XML* document is a document that is *Well-formed XML* and is also *Namespace-wellformed* and *Namespace-valid*.

**Well-Formedness Rules**

The XML Syntax rules for *Well-formed XML* are as follows:

- All XML elements must have a closing tag.
- XML tags are case-sensitive.
- All XML elements must be properly nested.
- All XML documents must have a root element.
- Attribute values must always be quoted.
- With XML, whitespace is preserved.

The *Namespace-wellformed* rules are as follows:

- All element and attribute names contain either zero or one colon.
- No entity names, processing instruction targets, or notation names contain any colons.

The *Namespace-valid* rules are as follows:

- The `xml` prefix is by definition bound to the namespace name: `http://www.w3.org/XML/1998/namespace`. It MAY be declared, but MUST NOT be undeclared or bound to any other namespace name. Other prefixes MUST NOT be bound to this namespace name.
- The `xmlns` prefix is used only to declare namespace bindings and is by definition bound to the namespace name: `http://www.w3.org/2000/xmlns/`. It MUST NOT be declared or undeclared. Other prefixes MUST NOT be bound to this namespace name.
- All other prefixes beginning with the three-letter sequence `x`, `m`, `l`, in any case combination, are reserved. This means that users SHOULDN'T use them except as defined by later specifications and processors MUST NOT treat them as fatal errors.
- The namespace prefix (unless it is `xml` or `xmlns`) MUST have been declared in a namespace declaration attribute in either the start tag of the element where the prefix is used or in an ancestor element (for example, an element in whose content the prefixed markup occurs). Furthermore, the attribute value in the innermost such declaration MUST NOT be an empty string.

**Check for Well-Formedness**

To check if a document is *Namespace Well-Formed XML*, select the *Check Well-Formedness* (Ctrl + Shift + W (Command + Shift + W on OS X)) action from the Document > Validate menu or from the Validation drop-down menu on the toolbar.

The selected files in the current project can also be checked for well-formedness with a single action by selecting the *Check Well-Formedness* action from the Validate submenu when invoking the contextual menu in the Project view.

If any errors are found, the result is displayed in the message panel at the bottom of the editor. Each error is displayed as one record in the result list and is accompanied by an error message. Clicking the record will open the document containing the error and highlight its approximate location.

### A non Well-formed XML Document

```xml
<root><tag></root>
```

When *Check Well-Formedness* is performed the following error is raised:

```
The element type "tag" must be terminated by the matching end-tag "</tag>"
```

To resolve the error, click the record in the result list and it will locate and highlight the approximate position of the error. In this case, identify the tag that is missing an end tag and insert `</tag>`.

---

Editing Documents 425
Validating XML Documents Against a Schema

A Valid XML document is a Well-Formed XML document that also conforms to the rules of a schema that defines the legal elements of an XML document. The schema type can be: XML Schema, Relax NG (full or compact syntax), Schematron, Document Type Definition (DTD), or Namespace-based Validation Dispatching Language (NVDL).

The purpose of the schema is to define the legal building blocks of an XML document. It defines the document structure with a list of legal elements.

The Validate function ensures that your document is compliant with the rules defined by an associated DTD, XML Schema, Relax NG, or Schematron schema. XML Schema or Relax NG schema also allows you to embed Schematron rules. For Schematron validations you can also select the validation phase.

Related information
Presenting Schematron Validation Issues
Associating a Schema to XML Documents on page 450

Automatic Validation

Oxygen XML Editor can be configured to automatically mark validation errors in the document as you are editing. The Enable automatic validation option in the Document Checking preferences page controls whether or not all validation errors and warnings will automatically be highlighted in the editor panel.

The automatic validation starts parsing the document and marking the errors after a configurable delay from the last key typed. Errors are highlighted with underline markers in the main editor panel and small rectangles on the right side ruler of the editor panel. Hovering over a validation error presents a tooltip message with more details about the error.

If the error message is long and it is not displayed completely in the error line at the bottom of the editing area, double-clicking the error icon at the left of the error line or on the error line displays an information dialog box with the full error message. The arrow buttons of the dialog box enable the navigation to other errors issued by the Automatic Validation feature.

Manual Validation Actions

You can choose to validate documents at any time by using the manual validation actions that are available in Oxygen XML Editor.

Manually Validate Current Document

To manually validate the currently edited document, use one of the following actions:
Validate (Ctrl + Shift + V (Command + Shift + V on OS X))

Available from the Validation drop-down menu on the toolbar, the Document > Validate menu, or from the Validate submenu when invoking the contextual menu in the Project view.

An error list is presented in the message panel at the bottom of the editor. Markup of the current document is checked to conform with the specified DTD, XML Schema, or Relax NG schema rules. This action also re-parses the XML catalogs and resets the schema used for content completion.

Validate (cached)

Available from the Validation drop-down menu on the toolbar or the Document > Validate menu.

This action caches the schema, allowing it to be reused for the next validation. Markup of the current document is checked to conform with the specified DTD, XML Schema, or Relax NG schema rules.

Note: Automatic validation also caches the associated schema.

Validate with

Available from the Validation drop-down menu on the toolbar, (or Document > Validate menu).

This action opens a dialog box that allows you to specify a schema for validating the current document.

You can use this action to validate the current document using a schema of your choice (XML Schema, DTD, Relax NG, NVDL, Schematron schema), other than the associated one. An error list is presented in the message panel at the bottom of the editor. Markup of current document is checked to conform with the specified schema rules.

Note: The Validate with action does not work for files loaded through an Oxygen XML Editor custom protocol plugin developed independently and added to Oxygen XML Editor after installation.

Validate with Schema

Available from the Validate submenu when invoking contextual menu in the Project view.

This action opens a dialog box that allows you to specify a schema for validating all selected files.

Other Validation Options

To quickly open the schema used for validating the current document, select the Open Associated Schema action from the toolbar (or Document > Schema menu).

The Validation options button, available in the Document > Validate menu, allows you to quickly access to the validation options for the built-in validator in the Oxygen XML Editor preferences page.

Tip: If a large number of validation errors are detected and the validation process takes too long, you can limit the maximum number of reported errors in the Document Checking preferences page.

Presenting Validation Errors in Text Mode

Oxygen XML Editor can be configured to automatically validate documents while editing in the Text mode, and actions are also available to manually validate documents on-request.

A line with a validation issue is marked in the editor panel by underlining the problem region with a colored line, according to the type of issue. The issues are also marked with a colored marker in the right vertical stripe. You can configure the color for each type in the Document Checking preferences page.

• Validation Errors - By default, underlined with a red squiggly line in the editing pane and a red marker in the right vertical stripe.
• Validation Warnings - By default, underlined with a yellow squiggly line in the editing pane and a yellow marker in the right vertical stripe.
• **Validation Info** - By default, underlined with a blue squiggly line in the editing pane and a blue marker in the right vertical stripe.

Hovering over a validation issue presents a tooltip message with more details about the problem and *possible quick fixes* (if available for that issue).

![Figure 218: Presenting Validation Errors in Text Mode](image)

Also, the stripe on the right side of the editor panel is designed to display the issues found during the validation process and to help you locate them in the document. The stripe contains the following:

**Upper Part of the Stripe**

A success indicator square will turn green if the validation is successful or only info messages are found, red if validation errors are found, or yellow if only validation warnings are found. More details about the issues are displayed in a tool tip when you hover over indicator square. If there are numerous problems, only the first three are presented in the tool tip.

**Middle Part of the Stripe**

Errors are depicted with red markers, warnings with yellow markers, and info message with blue markers. If you want to limit the number of markers that are displayed, *open the Preferences dialog box (Options > Preferences)*, go to *Editor > Document checking*, and specify the desired limit in the *Maximum number of validation highlights* option.

Clicking a marker will highlight the corresponding text area in the editor. The validation message is also displayed both in a tool tip (when hovering over the marker) and in the message area on the bottom of the editor panel (clicking the Document checking options button opens the *Document Checking preferences page*).

**Bottom Part of the Stripe**

Two navigation arrows (←) allow you to jump to the next or previous issue. The same actions can be triggered from *Document > Automatic validation > Next error* (*Ctrl + Period* (*Command + Period* on OS X)) and *Document > Automatic validation > Previous error* (*Ctrl + Comma* (*Command + Comma* on OS X)). Also, the ✗ button can be used to clear all the validation markers.

Status messages from every validation action are logged in the *Information view*.

If you want to see all the validation messages grouped in the Results panel, you should use the Validate action from the toolbar or *Document > Validate* menu.

**Presenting Validation Errors in Author Mode**

Oxygen XML Editor can be configured to *automatically validate documents* while editing in the Author mode, and actions are also available to manually validate documents on-request.

Validation issues are marked in Author mode with a colored underline in the editing pane and a colored marker in the right vertical stripe, according to the type of issue. You can configure the color for each type in the Document Checking preferences page.
- **Validation Errors** - By default, underlined with a red squiggly line in the editing pane and a red marker in the right vertical stripe.
- **Validation Warnings** - By default, underlined with a yellow squiggly line in the editing pane and a yellow marker in the right vertical stripe.
- **Validation Info** - By default, underlined with a blue squiggly line in the editing pane and a blue marker in the right vertical stripe.

Hovering over a validation issue presents a tooltip message with more details about the problem and possible quick fixes (if available for that issue).

Information about the issue is also displayed in the message area on the bottom of the editor panel (clicking the Document checking options button opens the Document Checking preferences page where you can configure some validation options (such as the colors used to present the validation issues). Some validation messages include an icon (🔗) that provides a link to a style guide or specification.

![Figure 219: Presenting Validation Errors in Author Mode](image)

Also, the vertical stripe on the right side of the editor panel is designed to display the errors found during the validation process and to help you locate them in the document. The stripe contains the following:

**Upper Part of the Stripe**

By default, a success indicator square will turn green if the validation is successful or if only validation info messages are found, red if validation errors are found, or yellow if only validation warnings are found. More details about the issues are displayed in a tool tip when you hover over indicator square. If there are numerous issues, only the first three are presented in the tool tip.

**Middle Part of the Stripe**

By default, errors are depicted with red markers, warnings with yellow markers, and info messages with blue markers. If you want to limit the number of markers that are displayed, open the Preferences dialog box (Options > Preferences), go to Editor > Document checking, and specify the desired limit in the Maximum number of validation highlights option.

Clicking a marker will highlight the corresponding text area in the editor. The validation message is also displayed both in a tool tip (when hovering over the marker) and in the message area on the bottom of the editor panel (clicking the Document checking options button opens the Document checking preferences page where you can configure some validation options.

**Bottom Part of the Stripe**

Two navigation arrows (akukan) allow you to jump to the next or previous issue. The same actions can be triggered from Document > Automatic validation > Next error (Ctrl + Period (Command + Period on OS X)) and Document > Automatic validation > Previous error (Ctrl + Comma (Command + Comma on OS X)). Also, the button can be used to clear all the validation markers.

Status messages from every validation action are also logged in the Information view.
If you want to see all the validation messages grouped in the **Results panel**, you should use the Validate action from the toolbar or **Document > Validate** menu.

**Related information**

*Validating XML Documents Against a Schema* on page 426  
*Presenting Schematron Validation Issues*

**Customizing Assert Error Messages**

To customize the error messages that the Xerces or Saxon validation engines display for the **assert** and **assertion** elements, set the **message** attribute on these elements.

- For Xerces, the **message** attribute has to belong to the `http://xerces.apache.org` namespace.
- For Saxon, the **message** attribute has to belong to the `http://saxon.sourceforge.net/` namespace.

The value of the **message** attribute is the error message displayed if the assertion fails.

**Custom Validators**

If you need to validate the edited document with a validation engine that is different from the built-in engine, you can configure external validators in the **Custom Validation Engines preferences page**. After a custom validation engine is **properly configured**, it can be applied on the current document by selecting it from the list of custom validation engines in the **Validation** toolbar drop-down menu. The document is validated against the schema declared in the document.

Some validators are configured by default but there are third-party processors that do not support the **output message format** of Oxygen XML Editor for linked messages:

- **LIBXML** - Included in Oxygen XML Editor (Windows edition only). It is associated to XML Editor. It is able to validate the edited document against XML Schema, Relax NG schema full syntax, internal DTD (included in the XML document) or a custom schema type. XML catalogs support (the `--catalogs` parameter) and XInclude processing (`--xinclude`) are enabled by default in the preconfigured LIBXML validator. The `--postvalid` parameter is also set by default and it allows LIBXML to validate correctly the main document even if the XInclude fragments contain IDREFS to ID's located in other fragments.

  For validation against an external DTD specified by URI in the XML document, add the `--dtdvalid ${ds}` parameter manually to the DTD validation command line. `$(ds)` represents the detected DTD declaration in the XML document.

  **CAUTION:** File paths containing spaces are not handled correctly in the LIBXML processor. For example, the built-in XML catalog files of the predefined document types (DocBook, TEI, DITA, etc.) are not handled by LIBXML if Oxygen XML Editor is installed in the default location on Windows (`C:\Program Files`) because the built-in XML catalog files are stored in the `frameworks` subfolder of the installation folder and in this case, the file path contains at least one space character.

  **Attention:** On OS X, if the full path to the LIBXML executable file is not specified in the **Executable path** text field, some errors may occur during validation against a W3C XML Schema, such as:

  ```
  Unimplemented block at ... xmlschema.c
  ```

  To avoid these errors, specify the full path to the LIBXML executable file.

- **Saxon-EE** - Included in Oxygen XML Editor. It is associated to XML Editor and XSD Editor. It is able to validate XML Schema schemas and XML documents against XML Schema schemas. The validation is done according to the W3C XML Schema 1.0 or 1.1. This can be **configured in Preferences**.

- **MSXML 4.0** - Included in Oxygen XML Editor (Windows edition only). It is associated to XML Editor, XSD Editor and XSL Editor. It is able to validate the edited document against XML Schema, internal DTD (included in the XML document), external DTD or a custom schema type.

- **MSXML.NET** - Included in Oxygen XML Editor (Windows edition only). It is associated to XML Editor, XSD Editor and XSL Editor. It is able to validate the edited document against XML Schema, internal DTD (included in the XML document), external DTD or a custom schema type.

- **XSV** - Not included in Oxygen XML Editor. Windows and Linux distributions of XSV can be downloaded from [http://www.cogsci.ed.ac.uk/~ht/xsv-status.html](http://www.cogsci.ed.ac.uk/~ht/xsv-status.html). The executable path is **already configured in Oxygen XML Editor** for the `[OXYGEN_INSTALL_DIR]/xsv` installation folder. If it is installed in a different folder, the predefined executable path must be **corrected in Preferences**. It is associated to XML Editor and XSD Editor. It is able to validate the edited document against XML Schema or a custom schema type.
• **SQC (Schema Quality Checker from IBM)** - Not included in Oxygen XML Editor. It can be downloaded [from here](#) (it comes as a zip file, at the time of this writing SQC2.2.1.zip is about 3 megabytes). The executable path and working directory are already configured for the SQC installation directory `OXYGEN_INSTALL_DIR/sqc`. If it is installed in a different folder, the predefined executable path and working directory must be corrected in the Preferences page. It is associated to XSD Editor.

A custom validator cannot be applied on files loaded through an *Oxygen XML Editor custom protocol plugin* developed independently and added to Oxygen XML Editor after installation.

**Linked Output Messages of an External Engine**

Validation engines display messages in an output view at the bottom of the Oxygen XML Editor window. If such an output message (warning, error, fatal error, etc) spans between three to six lines of text and has the format specified below, then the message is linked to a location in the validated document. Clicking the message in the output view highlights the location of the message in an editor panel containing the file referenced in the message. This behavior is similar to the linked messages generated by the default built-in validator.

Linked messages have the following format:

- **Type:** [F|E|W] (the string Type: followed by a letter for the type of the message: fatal error, error, warning) - this property is optional in a linked message.
- **SystemID:** a system ID of a file (the string SystemID: followed by the system ID of the file that will be opened for highlighting when the message is clicked in the output message - usually the validated file, the schema file or an included file).
- **Line:** a line number (the string Line: followed by the number of the line that will be highlighted).
- **Column:** a column number (the string Column: followed by the number of the column where the highlight will start on the highlighted line) - this property is optional in a linked message.
- **EndLine:** a line number (the string EndLine: followed by the number of the line where the highlight ends) - this property is optional in a linked message.
- **EndColumn:** a column number (the string EndColumn: followed by the number of the column where the highlight ends on the end line) - this property is optional in a linked message.
- **AdditionalInfoURL:** the URL string pointing to a remote location where additional information about the error can be found - this line is optional in a linked message.
- **Description:** message content (the string Description: followed by the content of the message that will be displayed in the output view).

Example of how a custom validation engine can report an error using the format specified above:

```
Type: E
SystemID: file:///c:/path/to/validatedFile.xml
Line: 10
Column: 20
EndLine: 10
EndColumn: 35
AdditionalInfoURL: http://www.host.com/path/to/errors.html#errorID
Description: custom validator message
```

**Validation Scenarios**

A complex XML document is split in smaller interrelated modules. These modules do not make much sense individually and cannot be validated in isolation due to interdependencies with other modules. Oxygen XML Editor validates the main module of the document when an imported module is checked for errors.

A typical example is the chunking of a DocBook XSL stylesheet that has chunk.xsl as the main module and param.xsl, chunk-common.xsl, and chunk-code.xsl as imported modules. param.xsl only defines XSLT parameters. The module chunk-common.xsl defines an XSLT template with the name chunk. Chunk-code.xsl calls this template. The parameters defined in param.xsl are used in the other modules without being redefined.
Validating chunk-code.xsl as an individual XSLT stylesheet generates misleading errors in regards to parameters and templates that are used but undefined. These errors are only caused by ignoring the context in which this module is used in real XSLT transformations and in which it is validated. To validate such a module, define a validation scenario to set the main module of the stylesheet and the validation engine used to find the errors. Usually this engine applies the transformation during the validation process to detect the errors that the transformation generates.

You can validate a stylesheet with several engines to make sure that you can use it in various environments and have the same results. For example, an XSLT stylesheet may be applied with Saxon 6.5, Xalan, and MSXML 4.0 engines in different production systems.

Other examples of documents that can benefit from a validation scenario include:

- A complex XQuery file with a main module that imports modules developed independently but validated in the context of the main module of the query. In an XQuery validation scenario, the default validator of Oxygen XML Editor (Saxon 9) or any connection to a database that supports validation (Berkeley DB XML Database, eXist XML Database, Documentum xDB (X-Hive/DB) 10 XML Database, MarkLogic version 5 or newer) can be set as a validation engine.
- An XML document in which the master file includes smaller fragment files using XML entity references.

Note: If a master file is associated with the current file, the validation scenarios defined in the master file are used and take precedence over the default scenarios defined for the particular framework. For more information on master files, see Master Files Support on page 272 or Working with Modular XML Files in the Master Files Context on page 457.

To watch our video demonstration about how to use a validation scenario in Oxygen XML Editor, go to https://www.oxygenxml.com/demo/Validation_Scenario.html.

Creating a New Validation Scenario

To create a validation scenario, follow these steps:

1. Select the Configure Validation Scenario(s) from the Validation toolbar drop-down menu, or from the Document > Validate menu (or the Validate submenu when invoking the contextual menu on a file in the Project view ). The Configure Validation Scenario(s) dialog box is displayed. It contains predefined and user-defined scenarios. The predefined scenarios are organized in categories depending on the type of file they apply to and you can identify them by a yellow key icon that marks them as read-only. The user-defined scenarios are organized under a single category. The default scenarios for the particular framework are rendered in bold.

Note: If a master file is associated with the current file, the validation scenarios defined in the master file are used and take precedence over the default scenarios defined for the particular framework. For more information on master files, see Master Files Support on page 272 or Working with Modular XML Files in the Master Files Context on page 457.
The top section of the dialog box contains a filter that allows you to search through the scenarios list and the **Settings** button allows you to configure the following options:

**Show all scenarios**
Select this option to display all the available scenarios, regardless of the document they are associated with.

**Show only the scenarios available for the editor**
Select this option to only display the scenarios that Oxygen XML Editor can apply for the current document type.

**Show associated scenarios**
Select this option to only display the scenarios associated with the document you are editing.

---

This option opens the **Import scenarios** dialog box that allows you to select the *scenarios* file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Editor ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

- Keep or replace the existing scenario.
- Keep both scenarios.

**Note:** When you keep both scenarios, Oxygen XML Editor adds *imported* to the name of the imported scenario.

---

This option opens the **Export selected scenarios** dialog box that allows you to select the *scenarios* file that contains the scenarios that you export. This is useful if you want to share scenarios with others or export them to another computer.

---

To add a scenario, click the **New** button.

The **New scenarios** dialog box is displayed and it lists all the validation units for the scenario.
This scenario configuration dialog box allows you to configure the following information and options:

**Name**
The name of the validation scenario.

**Storage**
You can choose between storing the scenario in the Project Options or Global Options.

**URL of the file to validate**
The URL of the main module that includes the current module. It is also the entry module of the validation process when the current one is validated. To edit the URL, double-click its cell and specify the URL of the main module by doing one of the following:

- Enter the URL in the text field or select it from the drop-down list.
- Use the • Browse drop-down button to browse for a local, remote, or archived file.
- Use the • Insert Editor Variable button to insert an editor variable or a custom editor variable.

```plaintext
$@desktop$ - My Desktop
$@start.dir$ - Start directory of custom validator
$@standard.params$ - List of standard params for command line
$@fn$ - The current file name without extension
$@currentFileURL$ - The path of the currently edited file (URL)
$@filePath$ - The path of current file directory (URL)
$@frameworks$ - Oxygen frameworks directory (URL)
$@nodir$ - Project directory (URL)
$@oxygenHome$ - Oxygen installation directory (URL)
$@home$ - The path to user home directory (URL)
$@dir$ - Project name
$@env(VAR_NAME)$ - Value of environment variable VAR_NAME
$@system(var.name)$ - Value of system variable var.name
```

**File type**
The type of the document that is validated in the current validation unit. Oxygen XML Editor automatically selects the file type depending on the value of the URL of the file to validate field.

**Validation engine**
You can select one of the engines available in Oxygen XML Editor for validation of the particular document type.
**Default engine** means that the default engine is used to run the validation for the current document type, as specified in the preferences page for that type of document (for example, *XSLT preferences page, XQuery preferences page, XML Schema preferences page*).

The DITA Validation engine performs DITA-specific checks in the context of the specifications (it is similar to the checks done with the DITA map Validate and Check for Completeness action, but for a local file rather than an entire DITA map).

The Table Layout Validation engine looks for table layout problems (for more information, see *Report table layout problems* on page 1540).

**Automatic validation**

If this option is checked, the validation operation defined by this row is also applied by the automatic validation feature. If the Automatic validation feature is disabled in the Document Checking preferences page, then this option is ignored, as the preference setting has a higher priority.

**Schema**

This option becomes active when you set the **File type** to XML Document and allows you to specify the schema used for the validation unit.

**Specify Schema**

Opens the Specify Schema dialog box that allows you to set a schema to be used for validating XML documents.

![Specify Schema Dialog Box](image)

**Figure 223: Specify Schema Dialog Box**

The Specify Schema dialog box contains the following options:

**Use detected schema**

Uses the schema detected for the particular document.

**Use custom schema**

Allows you to specify the schema using the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S) or a custom protocol. You can specify the URL by using the text field, the history drop-down, the Insert Editor Variables button, or the browsing tools in the Browse drop-down list.

- **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the URL field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.

- **Embedded schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, enable this option.

- **Extensions** - Opens a dialog box that allows you to specify Java extension JARs to be used during the validation.

- **Public ID** - Allows you to specify a public ID if you have selected a DTD.

- **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.
Move Up
Moves the selected scenario up one spot in the list.

Move Down
Moves the selected scenario down one spot in the list.

Add
Adds a new validation unit to the list.

Remove
Removes an existing validation unit from the list.

3. Configure any of the existing validation units according to the information above, and you can use the buttons at the bottom of the table to add, remove, or move validation units. Note that if you add a Schematron validation unit, you can also select the validation phase.

4. Press OK.
   The newly created validation scenario will now be included in the list of scenarios in the Configure Validation Scenario(s) dialog box. You can select the scenario in this dialog box to associate it with the current document and press the Apply associated button to run the validation scenario.

Editing a Validation Scenario
To edit an existing validation scenario, follow these steps:

1. Select the Configure Validation Scenario(s) from the Validation toolbar drop-down menu, or from the Document > Validate menu (or the Validate submenu when invoking the contextual menu on a file in the Project view).
   The Configure Validation Scenario(s) dialog box is displayed. It contains predefined and user-defined scenarios. The predefined scenarios are organized in categories depending on the type of file they apply to and you can identify them by a yellow key icon that marks them as read-only. The user-defined scenarios are organized under a single category. The default scenarios for the particular framework are rendered in bold.

   Note: If a master file is associated with the current file, the validation scenarios defined in the master file are used and take precedence over the default scenarios defined for the particular framework. For more information on master files, see Master Files Support on page 272 or Working with Modular XML Files in the Master Files Context on page 457.

![Configure Validation Scenario Dialog Box](image)

Figure 224: Configure Validation Scenario Dialog Box

The top section of the dialog box contains a filter that allows you to search through the scenarios list and the Settings button allows you to configure the following options:

Show all scenarios
Select this option to display all the available scenarios, regardless of the document they are associated with.
Show only the scenarios available for the editor
Select this option to only display the scenarios that Oxygen XML Editor can apply for the current document type.

Show associated scenarios
Select this option to only display the scenarios associated with the document you are editing.

Import scenarios
This option opens the Import scenarios dialog box that allows you to select the scenarios file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Editor ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

- Keep or replace the existing scenario.
- Keep both scenarios.

Note: When you keep both scenarios, Oxygen XML Editor adds imported to the name of the imported scenario.

Export selected scenarios
Use this option to export selected scenarios individually. Oxygen XML Editor creates a scenarios file that contains the scenarios that you export. This is useful if you want to share scenarios with others or export them to another computer.

2. Select the scenario and press the Edit button. If you try to edit one of the read-only predefined scenarios, you will receive a warning message that Oxygen XML Editor needs to creates customizable duplicate (you can also use the Duplicate button).

The Edit scenario dialog box is displayed and it lists all the validation units for the scenario.

![Edit Validation Scenario](image)

Figure 225: Edit Validation Scenario

This scenario configuration dialog box allows you to configure the following information and options:

Name
The name of the validation scenario.

Storage
You can choose between storing the scenario in the Project Options or Global Options.

URL of the file to validate
The URL of the main module that includes the current module. It is also the entry module of the validation process when the current one is validated. To edit the URL, double-click its cell and specify the URL of the main module by doing one of the following:

- Enter the URL in the text field or select it from the drop-down list.
- Use the · Browse drop-down button to browse for a local, remote, or archived file.
• Use the Insert Editor Variable button to insert an editor variable or a custom editor variable.

<table>

Figure 226: Insert an Editor Variable

File type
The type of the document that is validated in the current validation unit. Oxygen XML Editor automatically selects the file type depending on the value of the URL of the file to validate field.

Validation engine
You can select one of the engines available in Oxygen XML Editor for validation of the particular document type.

Default engine means that the default engine is used to run the validation for the current document type, as specified in the preferences page for that type of document (for example, XSLT preferences page, XQuery preferences page, XML Schema preferences page).

The DITA Validation engine performs DITA-specific checks in the context of the specifications (it is similar to the checks done with the DITA map Validate and Check for Completeness action, but for a local file rather than an entire DITA map).

The Table Layout Validation engine looks for table layout problems (for more information, see Report table layout problems on page 1540).

Automatic validation
If this option is checked, the validation operation defined by this row is also applied by the automatic validation feature. If the Automatic validation feature is disabled in the Document Checking preferences page, then this option is ignored, as the preference setting has a higher priority.

Schema
This option becomes active when you set the File type to XML Document and allows you to specify the schema used for the validation unit.

Specify Schema
Opens the Specify Schema dialog box that allows you to set a schema to be used for validating XML documents.
Figure 227: Specify Schema Dialog Box

The Specify Schema dialog box contains the following options:

Use detected schema
Uses the schema detected for the particular document.

Use custom schema
Allows you to specify the schema using the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S) or a custom protocol. You can specify the URL by using the text field, the history drop-down, the \[Insert Editor Variables\] button, or the browsing tools in the \[Browse\] drop-down list.
- **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the URL field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.
- **Embedded schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, enable this option.
- **Extensions** - Opens a dialog box that allows you to specify Java extension JARs to be used during the validation.
- **Public ID** - Allows you to specify a public ID if you have selected a DTD.
- **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.

[Tabs Move Up](#)
Moves the selected scenario up one spot in the list.

[Tabs Move Down](#)
Moves the selected scenario down one spot in the list.

Add
Adds a new validation unit to the list.

Remove
Removes an existing validation unit from the list.

3. Configure any of the existing validation units according to the information above, and you can use the buttons at the bottom of the table to add, remove, or move validation units. Note that if you add a Schematron validation unit, you can also select the validation phase.

4. When you are done configuring the scenario, press OK.
   The modified validation scenario will now be included in the list of scenarios in the Configure Validation Scenario(s) dialog box. If you chose to duplicate an existing one, the modified scenario will be listed with the word copy at the end of its name.
Sharing Validation Scenarios

The validation scenarios and their settings can be shared with other users by saving them at project level or by exporting them to a specialized scenarios file that can then be imported. When you create a new validation scenario or edit an existing one, there is a Storage option to control whether the scenarios are stored in Project Options or Global Options.

Selecting Project Options stores the scenario in the project file and can be shared with other users that have access to the project. If your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) then your team will have access to the scenarios that you define. When you create a scenario at the project level, the URLs from the scenario become relative to the project URL.

Selecting Global Options stores the scenario in the global options that are stored in the user home directory.

You can also change the storage options on existing validation scenarios by using the Change storage action from the contextual menu of the list of scenarios.

Related information
Sharing Application Settings on page 154

References to XML Schema Specification

If validation is done against XML Schema, Oxygen XML Editor indicates a specification reference relevant for each validation error. The error messages contain an Info field that, when clicked, will open the browser on the XML Schema Part 1: Structures specification at exactly the point where the error is described. This allows you to understand the reason for that error.

![Figure 228: Link to Specification for XML Schema Errors](image)

Resolving References to Remote Schemas with an XML Catalog

When a reference to a remote schema must be used in the validated XML document for interoperability purposes, but a local copy of the schema should actually be used for performance reasons, the reference can be resolved to the local copy of the schema with an XML catalog.

For example, if the XML document contains a reference to a remote schema docbook.rng like this:

```xml
<?xml-model href="http://www.oasis-open.org/docbook/xml/5.0/rng/docbook.rng" type="application/xml" schematypens="http://relaxng.org/ns/structure/1.0"?>
```

it can be resolved to a local copy with a catalog entry like this:

```xml
<url name="http://www.oasis-open.org/docbook/xml/5.0/rng/docbook.rng" url="rng/docbook.rng"/>
```

An XML catalog can also be used to map a W3C XML Schema specified with a URN in the xsi:schemaLocation attribute of an XML document to a local copy of the schema. For example, if the XML document specifies the schema with:

```xml
<topic xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"

- ...
the URN can be resolved to a local schema file with a catalog entry like this:

```xml
<url name="urn:oasis:names:tc:dita:xsd:topic.xsd:1.1"
     url="topic.xsd"/>
```

**Validation Example - A DocBook Validation Error**

In the following DocBook 4 document, the content of the `listitem` element does not match the rules of the DocBook 4 schema (`docbookx.dtd`).

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE article PUBLIC "-//OASIS//DTD DocBook XML V4.4//EN" "http://www.docbook.org/xml/4.4/docbookx.dtd">
<article>
  <title>Article Title</title>
  <sect1>
    <title>Section1 Title</title>
    <itemizedlist>
      <listitem>
        <link>a link here</link>
      </listitem>
    </itemizedlist>
  </sect1>
</article>
```

The ✔️ **Validate Document** action will return the following error:

`The expected element "link". The content of the parent element type must match 
("calloutlist|glosslist|bibliolist|itemizedlist|orderedlist|segmentedlist|simplelist
|variablelist|caution|important|note|tip|warning|literallayout|programlisting
|programlistingco|screen|screenco|screenshot|synopsis|cmdsynopsis|funcsynopsis
|classsynopsis|fieldsynopsis|constructorsynopsis|destructorsynopsis|methodsynopsis
|formalpara|para|simpara|address|blockquote|graphic|graphicco|mediaobject|mediaobjectco
|informalequation|informalexample|informalfigure|informaltab|equation|example|figure
table|msgset|procedure|sidebar|qandaset|task|anchor|bridgehead|remark|highlights
|abstract|authorblurb|epigraph|indexterm|beginpage")`.  

This error message is a little more difficult to understand, so understanding of the syntax or processing rules for the DocBook XML DTD `listitem` element is recommended. However, the error message does offer a clue as to the source of the problem, indicating that “The content of element type must match”.

Fortunately, most standards-based DTDs, XML Schemas, and Relax NG schemas are supplied with reference documentation. This enables you to lookup the element and read about it. In this case, you should learn about the child elements of `listitem` and their nesting rules. Once you have correctly inserted the required child element and nested it in accordance with the XML rules, the document will become valid.

**Finding and Replacing Text in the Current File**

This section walks you through the find and replace features available in Oxygen XML Editor.

You can use a number of advanced views depending on what you need to find in the document you are editing or in your entire project. The **Find/Replace dialog box** allows you to search through the current project or selected resources and offers a set of options to improve your search. The **Find All Elements/Attributes dialog box** allows you to search through the structure of the current document for elements and attributes.

As an alternative to the dedicated search operations, you can also use the **Quick Find toolbar**.

**Find/Replace Dialog Box**

To open the **Find/Replace** dialog box, use the **Find/Replace** action that is available in the **Find** menu, on the toolbar, or by pressing **Ctrl + F (Command + F on OS X)**. It is also invoked by the **Find/Replace** contextual menu action found in certain views.

You can use the **Find/Replace** dialog box to perform the following operations:

- Replace occurrences of target defined in the **Find** area with a new fragment of text defined in **Replace with** area.
- Find all the occurrences of a word or string of characters (that can span over multiple lines) in the document you are editing. This operation also takes into account all the white spaces contained in the fragment you are searching for.

**Note:** The **Find/Replace** dialog box counts the number of occurrences of the text you are searching for and displays it at the bottom of the dialog box, above the **Close** button. This number is also displayed in the **Results view**.
The find operation works on multiple lines, meaning that a find match can cover characters on multiple lines of text. To input multiple-line text in the Find and Replace with areas, do one of the following:

- Press Ctrl + Enter (Command + Enter on OS X) on your keyboard.
- Use the Insert newline contextual menu action.

You can use Perl-like regular expressions syntax to define patterns. A content completion assistance window is available in the Find and Replace with areas to help you edit regular expressions. It is activated every time you type \ (backslash key) or on-demand if you press Ctrl + Space (Command + Space on OS X) on your keyboard.

The replace operation can bind regular expression capturing groups ($1, $2, etc.) from the find pattern.

To replace the tag-name start tag and its attributes with the new-tag-name tag use as Find the expression <tag-name>(s+).*> and as Replace with the expression <new-tag-name>$1$2>.

The Find/Replace dialog box contains the following options:

- **Find** - The target character string to search for. You can search for Unicode characters specified in the \uNNNN format. Also, hexadecimal notation (\xNNNN) and octal notation (\0NNNN) can be used. In this case you have to select the Regular expression option. For example, to search for a space character you can use the \u0020 code.
- **Replace with** - The character string with which to replace the target. The string for replace can be on a line or on multiple lines. It can contain Perl notation capturing groups, only if the search expression is a regular expression and the Regular expression option is selected.

Note: Some regular expressions can indefinitely block the application. If the execution of the regular expression does not end in about 5 seconds, the application displays a dialog box that allows you to interrupt the operation.

Tip: Special characters such as newline and tab can be inserted in the Find and Replace with text boxes using dedicated actions in the contextual menu (Insert newline and Insert tab).

Unicode characters in the \uNNNN format can also be used in the Replace with area.

- The History button - Contain lists of the last find and replace expressions. Use the Clear history action from the bottom of the lists to remove these expressions.
- **XPath** - The XPath 2.0 expression you input in this combo is used for restricting the search scope.

Note: The Content Completion Assistant helps you input XPath expressions, valid in the current context.

- **Direction** - Specifies if the search direction is from current position to end of file (Forward) or to start of file (Backward).
- **Scope** - Specifies whether the Find/Replace operation is executed over the entire content of the edited document (All option), or over the selected lines of text (Only selected lines option). If the selection spans across multiple lines, when you open the Find/Replace dialog box, the scope is set to Only selected lines.
- **Case sensitive** - When checked, the search operation follows the exact letter case of the text entered in the Find field.
- **Whole words only** - Only entire occurrences of a word are included in the search operation.
- **Incremental** - The search operation is started every time you type or delete a letter in the Find text box.
- **Regular expression** - When this option is enabled, you can use regular expressions in Perl-like regular expressions syntax to look for specific pieces of text.
  - **Dot matches all** - A dot used in a regular expression also matches end of line characters.
  - **Canonical equivalence** - If enabled, two characters will be considered a match if, and only if, their full canonical decompositions match. For example, the å symbol can be inserted as a single character or as two characters (the a character, followed by the tilde character). This option is disabled by default.

- **Wrap around** - When the end of the document is reached, the search operation is continued from the start of the document, until its entire content is covered.
- **Enable XML search options** - This option is only available when editing in Text mode. It provides access to a set of options that allow you to search specific XML component types:
  - **Element names** - Only the element names are included in the search operation that ignores XML-tag notations ('<', '>', '), attributes or white-spaces.
  - **Element contents** - Search in the text content of XML elements.
• **Attribute names** - Only the attribute names are included in the search operation, without the leading or trailing white-spaces.
• **Attribute values** - Only the attribute values are included in the search operation, without single quotes(') or double quotes("").
• **Comments** - Only the content of comments is included in the search operation, excluding the XML comment delimiters ('<!-', '-->').
• **PIs (Processing Instructions)** - Only the content are searched, skipping '<?', '?>'. e.g.: <?processing instruction?>
• **CDATA** - Searches inside content of CDATA sections.
• **DOCTYPE** - Searches inside content of DOCTYPE sections.
• **Entities** - Only the entity names are searched.

The two buttons **Select All** and **Deselect All** allow a simple activation and deactivation of all types of XML components.

**Note:** Even if you enable all options of the **Enable XML search options** section, the search is still XML-aware. If you want to perform the search over the entire file content, disable **Enable XML search options**.

- **Find All Elements** - Available when editing in **Author** mode, you can use this link to extend the search scope to XML-specific markup (names and values of both attributes and elements).
- **Find** - Executes a find operation for the next occurrence of the target. It stops after highlighting the find match in the editor panel.
- **Replace** - Executes a replace operation for the target followed by a find operation for the next occurrence.
- **Find All** - Executes a find operation and displays all results in the **Results view**. The results are displayed in the **Results view**.
- **Replace All** - Executes a replace operation in the entire scope of the document.
- **Replace to End** - Executes a replace operation starting from current target until the end of the document, in the direction specified by the current selection of the **Direction** switch (**Forward** or **Backward**).

**Find All Elements Dialog Box**

To open the **Find All Elements** dialog box, go to **Find > Find All Elements**(Ctrl + Shift + E (Command + Shift + E on OS X)) or from the shortcut **Find All Elements** that is available in the **Find / Replace dialog box**. It assists you in defining XML element / attribute search operations in the current document.

![Find All Elements Dialog Box](image)

**Figure 229: Find All Elements Dialog Box**

The dialog box can perform the following actions:
- Find all the elements with a specified name
- Find all the elements that contain, or does not contain, a specified string in their text content
- Find all the elements that have a specified attribute
- Find all the elements that have an attribute with, or without, a specified value

You can combine all of these search criteria to filter your results.

The following fields are available in the dialog box:
• **Element name** - The qualified name of the target element to search for. You can use the drop-down menu to find an element or enter it manually. It is populated with valid element names collected from the associated schema. To specify any element name, leave the field empty.

  **Note:** Use the qualified name of the element (<namespace prefix>:<element name>) when the document uses this element notation.

• **Element text** - The target element text to search for. The drop-down menu beside this field allows you to specify whether you are looking for an exact or partial match of the element text. For any element text, select **contains** from the drop-down menu and leave the field empty. If you leave the field empty but select **equals** from the drop-down menu, only elements with no text will be found. Select **not contains** to find all elements that do not include the specified text.

• **Attribute name** - The name of the attribute that must be present in the element. You can use the drop-down menu to select an attribute or enter it manually. It is populated with valid attribute names collected from the associated schema. For any or no attribute name, leave the field empty.

  **Note:** Use the qualified name of the attribute (<namespace prefix>:<attribute name>) when the document uses this attribute notation.

• **Attribute value** - The drop-down menu beside this field allows you to specify that you are looking for an exact or partial match of the attribute value. For any or no attribute value, select **contains** from the drop-down menu and leave the field empty. If you leave the field empty but select **equals** from the drop-down menu, only elements with an empty attribute value will be found. Select **not contains** to find all elements that have attributes without a specified value.

• **Case sensitive** - When this option is checked, operations are case-sensitive

When you press **Find All**, Oxygen XML Editor tries to find the items that match all the search parameters. The results of the operation are presented as a list in the message panel.

**Quick Find Toolbar**

A reduced version of the Find / Replace dialog box is available as a dockable toolbar. To display it press the **Alt + Shift + F** (Command + Alt + F on OS X) key combination or invoke the Find > Find button or the Quick Find action. By default, the toolbar is displayed at the bottom of the Oxygen XML Editor window, above the status bar, but can be changed at any time by dragging (and docking) it to a different location. To hide the toolbar, use the Close button or ESC key.

All matches are highlighted in the current editor.

The toolbar offers the following controls:

• A search input box where you insert the text you want to search for. The input box keeps a history of the last used search text. The background color of the input box turns red when no match is found.

• **Next** and **Previous** buttons. They allow you to advance to the next or previous match.

• **All** button. Highlights in the current document all matches of the search string.

• **Incremental** checkbox. The search operation is started every time you type or delete a character in the search input box.

• **Case sensitive** checkbox. When selected, the search operation follows the exact letter case of the search text.

• Shortcuts to the Find/Replace and Find/Replace in Files dialog boxes.

**Keyboard Shortcuts for Finding the Next and Previous Match**

Navigating from one match to the next or previous one is very easy to perform using the **F3** and **Shift + F3** (Command + Shift + G on OS X) keyboard shortcuts. They are useful for quickly repeating the last find action performed in the Find / Replace dialog box, taking into account the same find options.

  **Restriction:** These shortcuts only take XPath expressions into account if the Find / Replace dialog box remains opened. Once you close it, the XPath expressions are no longer considered.

**Regular Expressions Syntax**

Oxygen XML Editor uses the *Java regular expression syntax*. It is **similar** to that used in Perl 5, with several exceptions. Thus, Oxygen XML Editor does not support the following constructs:

• The conditional constructs (?{X}) and (?{condition}X|Y).

• The embedded code constructs (?{code}) and (?{code}).
• The embedded comment syntax `(?#comment)`.
• The preprocessing operations `\l`, `\u`, `\L`, and `\U`.

When using regular expressions, note that some sets of characters from XPath/XML Schema/Schematron are slightly different than the ones used by Oxygen XML Editor/Java in the text searches from the Find/Replace dialog boxes. The most common example is with the \w and \W set of characters. To ensure consistent results between the two, it is recommended that you use the following constructs in the Find/Replace dialog boxes:

- `/w - \[#x0000-#x10FFFF]-\[\p{P}\p{Z}\p{C}\]` instead of `\w`
- `/W - \[\p{P}\p{Z}\p{C}\]` instead of `\W`

There are some other notable differences that may cause unexpected results, including the following:

- In Perl, `\1` through `\9` are always interpreted as back references. A backslash-escaped number greater than 9 is treated as a back reference if at least that many sub-expressions exist. Otherwise, it is interpreted, if possible, as an octal escape. In this class octal escapes must always begin with a zero. In Java, `\1` through `\9` are always interpreted as back references, and a larger number is accepted as a back reference if at least that many sub-expressions exist at that point in the regular expression. Otherwise, the parser will drop digits until the number is smaller or equal to the existing number of groups or it is one digit.
- Perl uses the `g` flag to request a match that resumes where the last match left off.
- In Perl, embedded flags at the top level of an expression affect the whole expression. In Java, embedded flags always take effect at the point where they appear, whether they are at the top level or within a group. In the latter case, flags are restored at the end of the group just as in Perl.
- Perl is forgiving about malformed matching constructs, as in the expression `*a`, as well as dangling brackets, as in the expression `abc]`, and treats them as literals. This class also accepts dangling brackets but is strict about dangling meta-characters such as `+`, `?` and `*`.

Comparison between the Java and Perl 5 regular expression syntax

Finding and Replacing Text in Multiple Files

To open the Find/Replace in Files dialog box, use the `Find/Replace in Files` action that is available in the following locations:

- The Find menu.
- The main toolbar.
- The contextual menu of the DITA Maps Manager view.
- The contextual menu of the Project view.
- The contextual menu of the Data Source Explorer view for most types of database connections.

The operation works on both local and remote files from an (S)FTP, WebDAV or CMS server.

It enables you to define Search for or Search and Replace operations across a number of files. You can use Perl-like regular expression syntax to match patterns in text content. The `replace` operation can bind regular expression capturing groups ($1, $2, etc.) from the find pattern.

To replace the `tag-name` start tag and its attributes with the `new-tag-name` tag use as **Text to find** the expression `<tag-name($+)(*>)` and as **Replace with** the expression `<new-tag-name$1$2>`.

The encoding used to read and write the files is detected from the XML header or from the BOM. If a file does not have an XML header or BOM Oxygen XML Editor uses by default the UTF-8 encoding for files of type XML, that is for files with one of the extensions: `.xml`, `.xsl`, `.fo`, `.xsd`, `.rng`, `.nvdl`, `.sch`, `.wsdl` or an extension associated with the XML editor type. For the other files it uses the encoding configured for non-XML files.

You can cancel a long operation at any time by pressing the **Cancel** button of the progress dialog box displayed when the operation is executed.

Since the content of read-only files cannot be modified, the Replace operation is not processing those files. For every such file, a warning message is displayed in the message panel.
The dialog box contains the following options:

- **Text to find** - The target character string to search for. You can search for Unicode characters specified in the \uNNNN format. Also, hexadecimal notation (\xNNNN) and octal notation (\0NNNN) can be used. In this case you have to select the Regular expression option. For example, to search for a space character you can use the \u0020 code.

- **Case sensitive** - When checked, the search operation follows the exact letter case of the value entered in the Text to find field.

- **Whole words only** - Only entire occurrences of a word are included in the search operation.

- **Ignore extra whitespaces** - If enabled, the application normalizes the content (collapses any sequence of whitespace characters into a single space) and trims its leading and trailing whitespaces when performing the search operation.

- **Regular expression** - When this option is enabled, you can use regular expressions in Perl-like regular expressions syntax to look for specific pieces of text.

  - **Dot matches all** - A dot used in a regular expression also matches end of line characters.

  - **Canonical equivalence** - If enabled, two characters will be considered a match if, and only if, their full canonical decompositions match. For example, the á symbol can be inserted as a single character or as two characters (the a character, followed by the tilde character). This option is disabled by default.

- **XPath** - The XPath 2.0 expression you input in this combo is used for restricting the search scope.

  **Note:** The Content Completion Assistant helps you input XPath expressions, valid in the current context.

- **Enable XML search options** - This option is only available when editing in Text mode. It provides access to a set of options that allow you to search specific XML component types:
• **Element names** - Only the element names are included in the search operation that ignores XML-tag notations ('<', '/', '>'), attributes or white-spaces.

• **Element contents** - Search in the text content of XML elements.

• **Attribute names** - Only the attribute names are included in the search operation, without the leading or trailing white-spaces.

• **Attribute values** - Only the attribute values are included in the search operation, without single quotes(') or double quotes(').

• **Comments** - Only the content of comments is included in the search operation, excluding the XML comment delimiters ('<!--', '-->').

• **PIs (Processing Instructions)** - Only the content are searched, skipping '<?, '?>. e. g.: <?processing instruction?>

• **CDATA** - Searches inside content of CDATA sections.

• **DOCTYPE** - Searches inside content of DOCTYPE sections.

• **Entities** - Only the entity names are searched.

The two buttons Select All and Deselect All allow a simple activation and deactivation of all types of XML components.

**Note:** Even if you enable all options of the Enable XML search options section, the search is still XML-aware. If you want to perform the search over the entire XML content, disable Enable XML search options.

• **Replace with** - The character string with which to replace the target. It may contain regular expression group markers if the search expression is a regular expression and the Regular expression checkbox is checked.

• **Make backup files with extension** - In the replace process Oxygen XML Editor makes backup files of the modified files. The default extension is .bak, but you can change the extension as you prefer.

• **Selected project resources** - Searches only in the selected files of the currently opened project. This option is not displayed when this dialog box is opened from the contextual menu of the DITA Maps Manager view and Archive Browser view.

• **Project files** - Searches in all files from the current project. This option is not displayed when this dialog box is opened from the contextual menu of the DITA Maps Manager view and Archive Browser view.

• **All opened files** - Searches in all files opened in Oxygen XML Editor (regular files or DITA maps). You are prompted to save all modified files before any operation is performed. This option is not displayed when this dialog box is started from the contextual menu of the DITA Maps Manager view and Archive Browser view.

• **Current file directory** - The search is done in the directory of the file opened in the current editor panel. If there is no opened file, this option is disabled. This option is not displayed when this dialog box is opened from the contextual menu of the DITA Maps Manager view and Archive Browser view.

• **Current DITA Map hierarchy** - The search is done in all maps and topics referenced by the currently selected DITA map, opened in the DITA Maps Manager view.

• **Opened archive** - The search is done in an archive opened in the Archive Browser view. Displayed only when this dialog box is opened from the Archive Browser view.

• **Specified path** - Chooses the search path.

• **Include files** - Narrows the scope of the operation only to the files that match the given filters.

• **Recurse subdirectories** - When enabled, the pretty print is performed recursively for the specified scope. The one exception is that this option is ignored if the scope is set to All opened files.

• **Include hidden files** - When enabled, the search is also performed in the hidden files.

• **Include archives** - When enabled, the search is also done in all individual file entries from all supported ZIP-type archives.

• **Show separate results for each search expression** - When enabled, the application opens a new tab to display the result of each new search expression. When the option is unchecked, the search results are displayed in the Find in Files tab, replacing any previous search results.

• **Find All** - Executes a find operation and returns the result list to the message panel. The results are displayed in a view that allows grouping the results as a tree with two levels.

• **Replace All** - Replaces all occurrences of the target contained in the specified files.

When you replace a fragment of text, Oxygen XML Editor provides a preview of the changes you make. The **Preview** dialog box is divided in two sections. The first section presents a list of all the documents containing the fragment of text you want to modify. The second section offers a view of the original file and a view of the final result. It also allows you to highlight all changes using the vertical bar from the right side of the view. The Next change and Previous change buttons allow you to navigate through the changes displayed in the Preview dialog box.
CAUTION: Use this option with caution. Global search and replace across all project files does not open the files containing the targets, nor does it prompt on a per occurrence basis, to confirm that a replace operation must be performed. As the operation simply matches the string defined in the find field, this may result in replacement of matching strings that were not originally intended to be replaced.

Regular Expressions Syntax
 Oxygen XML Editor uses the Java regular expression syntax. It is similar to that used in Perl 5, with several exceptions. Thus, Oxygen XML Editor does not support the following constructs:

- The conditional constructs (?!{X}) and (?!{condition}X|Y).
- The embedded code constructs (!${code}) and ($?{code}).
- The embedded comment syntax (!$#comment).
- The preprocessing operations \l, \u, \L, and \U.

When using regular expressions, note that some sets of characters from XPath/XML Schema/Schematron are slightly different than the ones used by Oxygen XML Editor/Java in the text searches from the Find/Replace dialog boxes. The most common example is with the \w and \W set of characters. To ensure consistent results between the two, it is recommended that you use the following constructs in the Find/Replace dialog boxes:

- /w - [\w0000-\w10FFFF]-[\p{P}|\p{Z}|\p{C}] instead of \w
- /W - [\p{P}|\p{Z}|\p{C}]] instead of \W

There are some other notable differences that may cause unexpected results, including the following:

- In Perl, \1 through \9 are always interpreted as back references. A backslash-escaped number greater than 9 is treated as a back reference if at least that many sub-expressions exist. Otherwise, it is interpreted, if possible, as an octal escape. In this class octal escapes must always begin with a zero. In Java, \1 through \9 are always interpreted as back references, and a larger number is accepted as a back reference if at least that many sub-expressions exist at that point in the regular expression. Otherwise, the parser will drop digits until the number is smaller or equal to the existing number of groups or it is one digit.
- Perl uses the g flag to request a match that resumes where the last match left off.
- In Perl, embedded flags at the top level of an expression affect the whole expression. In Java, embedded flags always take effect at the point where they appear, whether they are at the top level or within a group. In the latter case, flags are restored at the end of the group just as in Perl.
- Perl is forgiving about malformed matching constructs, as in the expression *a, as well as dangling brackets, as in the expression abc], and treats them as literals. This class also accepts dangling brackets but is strict about dangling meta-characters such as +, ? and *.

Search and Refactor Actions for IDs and IDREFS
 Oxygen XML Editor allows you to search for ID declarations and references (IDREFS) and to define the scope of the search and refactor operations. These operations are available for XML documents that have an associated DTD, XML Schema, or Relax NG schema. These operations are available through the search and refactor actions in the contextual menu. In Text mode, these actions are also available in the Quick Assist menu.

The search and refactor actions from the contextual menu are grouped in the Manage IDs section:

Rename in
 Renames the ID and all its occurrences. Selecting this action opens the Rename XML ID dialog box. This dialog box lets you insert the new ID value and choose the scope of the rename operation. For a preview of the changes you are about to make, click Preview. This opens the Preview dialog box, which presents a list with the files that contain changes and a preview zone of these changes.

Rename in File
 Renames the ID you are editing and all its occurrences from the current file.

Note: Available in the Text mode only.
Search References

Searches for the references of the ID. By default, the scope of this action is the current project. If you configure a scope using the *Select the scope for the Search and Refactor operations* dialog box, this scope will be used instead.

**Search References in**

Searches for the references of the ID. Selecting this action opens the *Select the scope for the Search and Refactor operations.*

Search Declarations

Searches for the declaration of the ID reference. By default, the scope of this action is the current project. If you configure a scope using the *Select the scope for the Search and Refactor operations* dialog box, this scope will be used instead.

*Note:* Available in the Text mode only.

**Search Declarations in**

Searches for the declaration of the ID reference. Selecting this action opens the *Select the scope for the Search and Refactor operations.*

*Note:* Available in the Text mode only.

Search Occurrences in file

Searches for the declaration and references of the ID in the current document.

Tip: A quick way to go to the declaration of an ID in Text mode is to move the cursor over an ID reference and use the *Ctrl + Single-Click (Command + Single-Click on OS X)* navigation.

Selecting an ID that you use for search or refactor operations differs between the Text and Author modes. In the Text mode, you position the cursor inside the declaration or reference of an ID. In the Author mode, Oxygen XML Editor collects all the IDs by analyzing each element from the path to the root. If more IDs are available, you are prompted to choose one of them.

![Figure 231: Selecting an ID in the Author Mode](image)

**Related information**

*Working with Modular XML Files in the Master Files Context* on page 457

**Search and Refactor Operations Scope**

The *scope* is a collection of documents that define the context of a search and refactor operation. To control it you can use the *Change scope* operation, available in the Quick Assist action set or on the Resource Hierarchy/Dependency View toolbar. You can restrict the scope to the current project or to one or multiple working sets. The *Use only Master Files, if enabled* checkbox allows you to restrict the scope of the search and refactor operations to the resources from the Master Files directory. Click *read more* for details about the *Master Files support.*
The scope you define is applied to all future search and refactor operations until you modify it. Contextual menu actions allow you to add or delete files, folders, and other resources to the working set structure.

**Associating a Schema to XML Documents**

Oxygen XML Editor relies on schemas to validate XML documents and to compute valid proposals for the Content Completion Assistant.

**Supported Types of Schema**

The following schema types are supported:

- W3C XML Schema 1.0 and 1.1 (with and without embedded Schematron rules)
- DTD
- Relax NG - XML syntax (with and without embedded Schematron rules)
- Relax NG - compact syntax
- NVDL
- Schematron (both ISO Schematron and Schematron 1.5)

**Detecting a Schema**

For the purposes of using validation and content completion mechanisms, Oxygen XML Editor tries to detect a schema by searching multiple locations, in the following order:

- The *schema defined in a validation scenario*.
- The *schema defined in the validation scenarios associated with the particular document type* (if defined).
- The *schema that is associated directly in the XML document*.

**Note:** If a DTD schema is specified in the document, the content completion for **Author** mode is based on this schema (even if there is already one detected from the validation scenario).

- The *schema defined in the Document Type Association*.

In addition, the locations of the schema can be mapped through the use of an *XML Catalog*. For more information, see *Resolving Schema Locations Through XML Catalogs* on page 457.
Tip: To quickly open the schema used for validating the current document, select the Open Associated Schema action from the toolbar (or Document > Schema menu).

Associating a Schema Through a Validation Scenario

Oxygen XML Editor uses the rules defined in the detected schema to report errors and warnings during automatic and manual validations that help maintain the structural integrity of your XML documents. You can specify the schema to be used for validation directly in validation scenarios and there are several methods that can be used to do so.

Configure a Validation Scenario and Specify the Schema

To associate a schema to a validation scenario to be used whenever the scenario is invoked, follow these steps:

1. Select the Configure Validation Scenario(s) from the Validation toolbar drop-down menu, or from the Document > Validate menu (or the Validate submenu when invoking the contextual menu on a file in the Project view).
2. Press the New button to create a new validation scenario or the Edit button to modify an existing one.
3. Add or configure validation units according to your needs and click the Specify Schema button.

Step Result: The Specify Schema dialog box is displayed:

![Specify Schema Dialog Box](image)

The Specify Schema dialog box contains the following options:

Use detected schema
Uses the schema detected for the particular document.

Use custom schema
Allows you to specify the schema using the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S) or a custom protocol. You can specify the URL by using the text field, the history drop-down, the Insert Editor Variables button, or the browsing tools in the Browse drop-down list.
- **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the URL field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.
- **Embedded schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, enable this option.
- **Public ID** - Allows you to specify a public ID if you have selected a DTD.
- **Extensions** - Opens a dialog box that allows you to specify Java extension JARs to be used during the validation.
• **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.

4. Select the schema to be associated with the validation unit and configure the rest of the options according to your preferences.
5. Click **OK** on both dialog boxes.

**Result:** The schema is now associated with that validation scenario whenever it is invoked.

**Use the Validate with Action to Specify a Schema for Validating the Current Document**

To validate the current document using a specified schema, follow these steps:

1. Select the **Validation with** action from the **- Validation** drop-down menu on the toolbar (or **Document > Validate** menu).

   **Step Result:** The **Validate with** dialog box is displayed:

   ![Validate with Dialog Box](image)

   **Figure 234: Validate with Dialog Box**

   This dialog box contains the following options:

   • **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S) or a custom protocol. You can specify the URL by using the text field, the history drop-down, the **Insert Editor Variables** button, or the browsing tools in the **Browse** drop-down list.

   • **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the **URL** field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.

   • **Embedded schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, enable this option.

   • **Public ID** - Allows you to specify a public ID if you have selected a DTD.

   • **Extensions** - Opens a dialog box that allows you to specify Java extension JARs to be used during the validation.

   • **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.

2. Select the schema to be associated with the manual validation and configure the rest of the options according to your preferences.
3. Click **OK**.

   **Result:** The current document is validated using the schema you specified.

   **Tip:** To quickly open the schema used for validating the current document, select the **Open Associated Schema** action from the toolbar (or **Document > Schema** menu).

**Use the Validate with Schema Action to Specify a Schema for Validating all Selected Documents**

To validate multiple documents using a specified schema, follow these steps:

1. Select all the documents you want to validate in the **Project view**.
2. Invoke the contextual menu (right-click) and select the **Validate with Schema** action from the **Validate** submenu.
Step Result: The Validate with dialog box is displayed:

![Validate with dialog box](image)

**Figure 235: Validate with Dialog Box**

This dialog box contains the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S) or a custom protocol. You can specify the URL by using the text field, the history drop-down, the **Insert Editor Variables** button, or the browsing tools in the **Browse** drop-down list.
- **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the **URL** field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.
- **Embedded schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, enable this option.
- **Public ID** - Allows you to specify a public ID if you have selected a DTD.
- **Extensions** - Opens a dialog box that allows you to specify Java extension JARs to be used during the validation.
- **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.

3. Select the schema that you want to use to validate all selected documents and configure the rest of the options according to your preferences.
4. Click **OK**.

**Result:** The selected documents are validated using the schema you specified.

**Associating a Schema in Validation Scenarios Defined in the Document Type**

To report errors and warnings during automatic and manual validations that help maintain the structural integrity of particular XML document types, Oxygen XML Editor uses rules defined in the schema that is detected in the validation scenarios that are associated to each particular document type.

To associate a schema in validation scenarios defined in the **Document Type Association**, follow these steps:

1. **Open the Preferences dialog box (Options > Preferences)** and go to **Document Type Association**.
2. Select your particular document type and click the **Edit** or **Duplicate** button to modify an existing framework (or use the **New** button to create a new one).

   **Step Result:** This opens a **Document type configuration dialog box**.

3. Go to the **Validation tab**.
4. Create or edit a validation scenario:
   
   a. To **create a new validation scenario**, click the **New** button.
   
   b. To **edit the properties of an existing validation scenario**, select it and click the **Edit** button (you can also use the **Duplicate** button to copy an existing scenario and edit its properties).

5. **Add or configure validation units** according to your needs and click the **Specify Schema** button.

   **Step Result:** The **Specify Schema** dialog box is displayed:
Figure 236: Specify Schema Dialog Box

The Specify Schema dialog box contains the following options:

**Use detected schema**

Uses the *schema detected for the particular document*.

**Use custom schema**

Allows you to specify the schema using the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S) or a *custom protocol*. You can specify the URL by using the text field, the history drop-down, the ![Insert Editor Variables](image) button, or the browsing tools in the ![Browse](image) drop-down list.

- **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the **URL** field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.

- **Embedded schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, enable this option.

- **Public ID** - Allows you to specify a public ID if you have selected a DTD.

- **Extensions** - Opens a dialog box that allows you to specify Java extension JARs to be used during the validation.

- **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.

6. Select the schema to be associated with the validation unit and configure the rest of the options according to your preferences.
7. Click **OK** on both dialog boxes.

**Result:** The schema is now associated with the validation scenario you just configured for that particular document type.

**Associating a Schema Directly in XML Documents**

**Associate Schema Action**

The schema used by the Content Completion Assistant and document validation engine can be associated with the current document by using the ![Associate Schema](image) action. For most of the schema types, it uses the *xml-model processing instruction*, with the exceptions of:

- **W3C XML Schema** - The xsi:schemaLocation attribute is used.
- **DTD** - The DOCTYPE declaration is used.

The association can specify a relative file path or a URL of the schema. The advantage of relative file path is that you can configure the schema at file level instead of document type level.

To associate a schema to the current document, follow these steps:

1. Select the ![Associate Schema](image) action from the toolbar (or **Document > Schema** menu).
Step Result: The **Associate Schema** dialog box is displayed:

![Associate Schema Dialog Box](image)

**Figure 237: Associate Schema Dialog Box**

This dialog box contains the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S) or a custom protocol.

- **Use path relative to file location** - Enable this option if the XML instance document and the associated schema contain relative paths. The location of the schema file is inserted in the XML instance document as a relative file path. This practice allows you, for example, to share these documents with other users without running into problems caused by multiple project locations on physical disk.

- **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the URL field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.

- **Add additional association for embedded schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, enable this option.

- **Public ID** - Allows you to specify a public ID if you have selected a DTD.

- **Keep existing schema associations** - Enable this option to use the existing schema associations of the currently edited document.

2. Select the schema that will be associated with the XML document and configure the rest of the options according to your preferences.
3. Click **OK**.

Result: The schema association is created based upon the specified type.

- **XML Schema** - The association with an XML Schema is added as an attribute of the root element with one of the following:
  - `xsi:schemaLocation` attribute, if the root element of the document sets a default namespace with an `xmlns` attribute.
  - `xsi:noNamespaceSchemaLocation` attribute, if the root element does not set a default namespace.

- **DTD** - The association with a DTD is added as a DOCTYPE declaration.

- **Other** - The association with a Relax NG, Schematron, or NVDL schema is added as `xml-model processing instruction`.

Tip: To quickly open the schema used for validating the current document, select the **Open Associated Schema** action from the toolbar (or **Document > Schema** menu).
Associate Schema with the `xml-model` Processing Instruction

The `xml-model` processing instruction associates a schema with the XML document that contains the processing instruction. It must be added at the beginning of the document, just after the XML prolog. The following code snippet contains an `xml-model` processing instruction declaration:

```xml
<?xml-model href="../schema.sch" type="application/xml" schematypens="http://purl.oclc.org/dsdl/schematron" phase="ALL" title="Main schema"?>
```

It is available in the **Content Completion Assistant**, before XML document root element, and includes the following attributes:

- `href` (required) - The schema file location.
- `type` - The content type of the schema. This is an optional attribute with the following possible values for each specified type:
  - DTD - The recommended value is `application/xml-dtd`.
  - W3C XML Schema - The recommended value is `application/xml`, or can be left unspecified.
  - RELAX NG XML Syntax - The recommended value is `application/xml`, or can be left unspecified.
  - RELAX NG Compact Syntax - The recommended value is `application/relax-ng-compact-syntax`.
  - Schematron - The recommended value is `application/xml`, or can be left unspecified.
  - NVDL - The recommended value is `application/xml`, or can be left unspecified.
- `schematypens` - The namespace for the schema language of the referenced schema with the following possible values:
  - DTD - Not specified.
  - RELAX NG XML Syntax - The recommended value is `http://relaxng.org/ns/structure/1.0`.
  - RELAX NG Compact Syntax - Not specified.
  - Schematron - The recommended value is `http://purl.oclc.org/dsdl/schematron`.
  - NVDL - The recommended value is `http://purl.oclc.org/dsdl/nvdl/ns/structure/1.0`.
- `phase` - The phase name for the validation function in Schematron schema. This is an optional attribute. To run all phases from the Schematron, use the special `#ALL` value. If the phase is not specified, the default phase that is configured in the Schematron will be applied.
- `title` - The title for the associated schema. This is an optional attribute.

Older versions of Oxygen XML Editor used the `oxygen` processing instruction with the following attributes:

- `RNGSchema` - Specifies the path to the Relax NG schema that is associated with the current document.
- `type` - Specifies the type of Relax NG schema. It is used along with the `RNGSchema` attribute and can have the value `xml` or `compact`.
- `NVDLSchema` - Specifies the path to the NVDL schema that is associated with the current document.
- `SCHSchema` - Specifies the path to the SCH schema that is associated with the current document.

**Note:** Documents that use the `oxygen` processing instruction are compatible with newer versions of Oxygen XML Editor.

[Content Completion Assistant in Author Mode](#) on page 328

**Associating a Schema in the Document Type Association**

The schema used to compute valid proposals in the Content Completion Assistant and by the document validation engine to report errors and warnings can be defined in each particular document type (framework). This schema will be used only if one is not detected in the current XML file.

To associate a schema in a particular *Document Type Association*, follow these steps:

1. **Open the Preferences dialog box** (**Options > Preferences**) and go to **Document Type Association**.
2. Select your particular document type and click the Edit or Duplicate button to modify an existing framework (or use the New button to create a new one).

**Step Result:** This opens a Document type configuration dialog box.

3. Go to the Schema tab.
4. Select the schema type and its URI.
5. Click OK.

**Result:** The schema is now associated with the particular document type and will be used by the Content Completion Assistant and validation engine if a schema is not detected in the current XML document.

Resolving Schema Locations Through XML Catalogs

Schema locations can be mapped using an XML Catalog. Oxygen XML Editor resolves the location of a schema in the following order:

- First, it attempts to resolve the schema location as a URI (uri, uriSuffix, rewriteUri, delegateUri mappings from the XML Catalog). If this succeeds, the process ends here.
- If the Resolve schema locations also through system mappings option is selected, it attempts to resolve the schema location as a system ID (system, systemSuffix, rewriteSuffix, rewriteSystem from the XML Catalog). If this succeeds, the process ends here.
- If the Process "schemaLocation" namespaces through URI mappings for XML Schema option is selected, the target namespace of the imported XML Schema is resolved through URI mappings. If the schema specified in the schemaLocation attribute is not resolved successfully, the namespace of the root element is taken into account. If this succeeds, the process ends here.
- If none of these succeeds, the actual schema location is used.

Learn Document Structure when Schema is not Detected

When working with documents that do not specify a schema, or for which the schema is not known or does not exist, Oxygen XML Editor is able to learn and translate the document structure to a DTD. You can choose to save the learned structure to a file to provide a DTD as an initialization source for content completion and document validation. This feature is also useful for producing DTDs for documents that contain personal or custom element types.

When you open a document that is not associated with a schema, Oxygen XML Editor automatically learns the document structure and uses it for content completion. To disable this feature, disable the Learn on open document option in the user preferences.

Related information

Detecting a Schema on page 450

Create a DTD from Learn Document Structure Option

When there is no schema associated with an XML document, Oxygen XML Editor can learn the document structure by parsing the document internally. This feature is enabled with the Learn on open document option that is available in the user preferences.

To create a DTD from the learned structure, follow these steps:

1. Open the XML document for which a DTD will be created.
2. Go to Document > XML Document > Learn Structure (Ctrl + Shift + L (Command + Shift + L on OS X)). The Learn Structure action reads the mark-up structure of the current document. The Learn completed message is displayed in the application status bar when the action is finished.
3. Go to Document > XML Document > Save Structure (Ctrl + Shift + S (Command + Shift + S on OS X)) and enter the DTD file path.
4. Press the Save button.

Working with Modular XML Files in the Master Files Context

Smaller interrelated modules that define a complex XML modular structure cannot be correctly edited or validated individually, due to their interdependency with other modules. Oxygen XML Editor provides the support for defining the main module (or modules), allowing you to edit any file from the hierarchy in the context of the master XML files.

You can set a main XML document either using the master files support from the Project view, or using a validation scenario.
To set a main file using a validation scenario, add validation units that point to the main modules. Oxygen XML Editor warns you if the current module is not part of the dependencies graph computed for the main XML document. In this case, it considers the current module as the main XML document.

The advantages of working with modular XML files in the context of a master file include:

- Correct validation of a module in the context of a larger XML structure.
- **Content Completion Assistant** displays all collected entities and IDs starting from the master files.
- Oxygen XML Editor uses the schema defined in the master file when you edit a module that is included in the hierarchy through the *External Entity* mechanism.
- The master files defined for the current module determines the *scope of the search and refactoring actions* for ID/IDREFS values and for updating references when renaming/moving a resource. Oxygen XML Editor performs the search and refactoring actions in the context that the master files determine, improving the speed of execution.

To watch our video demonstration about editing modular XML files in the master files context, go to [https://www.oxygenxml.com/demo/Working_With_XML_Modules.html](https://www.oxygenxml.com/demo/Working_With_XML_Modules.html).

### XML Resource Hierarchy/Dependencies View

The Resource Hierarchy/Dependencies view allows you to easily see the hierarchy / dependencies for an XML document. The tree structure presented in this view is built based on the *XInclude* and *External Entity* mechanisms. To define the scope for calculating the dependencies of a resource, click *Configure dependencies search scope* on the Resource Hierarchy/Dependencies toolbar.

To open this view, go to Window > Show View > Resource Hierarchy/Dependencies. As an alternative, right-click the current document and either select Resource Hierarchy or Resource Dependencies.

![Figure 238: Resource Hierarchy/Dependencies View - Hierarchy for Syncro phone v1.xml](#)

The build process for the dependencies view is started with the Resource Dependencies action available on the contextual menu.
The following actions are available in the Resource Hierarchy/Dependencies view:

- **Refresh**
  Refreshes the Hierarchy/Dependencies structure.

- **Stop**
  Stops the hierarchy/dependencies computing.

- **Show Hierarchy**
  Allows you to choose a resource to compute the hierarchy structure.

- **Show Dependencies**
  Allows you to choose a resource to compute the dependencies structure.

- **Configure**
  Allows you to configure a scope to compute the dependencies structure. There is also an option for automatically using the defined scope for future operations.

- **History**
  Provides access to the list of previously computed dependencies. Use the Clear history button to remove all items from this list.

The contextual menu contains the following actions:

- **Open**
  Opens the resource. You can also double-click a resource in the Hierarchy/Dependencies structure to open it.

- **Copy location**
  Copies the location of the resource.

- **Move resource**
  Moves the selected resource.

- **Rename resource**
  Renames the selected resource.

- **Show Resource Hierarchy**
  Shows the hierarchy for the selected resource.

- **Show Resource Dependencies**
  Shows the dependencies for the selected resource.

- **Add to Master Files**
  Adds the currently selected resource in the Master Files directory.

- **Expand All**
  Expands all the children of the selected resource from the Hierarchy/Dependencies structure.
Collapse All
Collapses all children of the selected resource from the Hierarchy/Dependencies structure.

Tip: When a recursive reference is encountered in the Hierarchy view, the reference is marked with a special icon 🚸.

Note: The Move resource or Rename resource actions give you the option to update the references to the resource. Only the references made through the XInclude and External Entity mechanisms are handled.

- Search and Refactor Operations Scope on page 449

Moving/Renaming XML Resources
When you select the Rename action in the contextual menu of the Resource/Hierarchy Dependencies view, the Rename resource dialog box is displayed. The following fields are available:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references** - Enable this option to update the references to the resource you are renaming.

When you select the Move action from the contextual menu of the Resource/Hierarchy Dependencies view, the Move resource dialog box is displayed. The following fields are available:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - Enable this option to update the references to the resource you are moving, in accordance with the new location and name.

If the Update references of the moved resource(s) option is enabled, a Preview option (which opens the Preview dialog box) is available for both actions. The Preview dialog box presents a list with the resources that are updated.

Working with XML Catalogs
An XML Catalog maps a system ID or a URI reference pointing to a resource (stored either remotely or locally) to a local copy of the same resource. If XML processing relies on external resources (such as referenced schemas and stylesheets), the use of an XML Catalog becomes a necessity when Internet access is not available or the Internet connection is slow.

Oxygen XML Editor supports any XML Catalog file that conforms to one of the following:

1. **OASIS XML Catalogs Committee Specification v1.1**.
2. **OASIS Technical Resolution 9401:1997**, including the plain-text flavor described in that resolution.

The version 1.1 of the OASIS XML Catalog specification introduces the possibility to map a system ID, public ID, or a URI to a local copy using only a suffix of the ID or URI used in the actual document. This is done using the catalog elements `systemSuffix` and `uriSuffix`.

Depending on the resource type, Oxygen XML Editor uses different catalog mappings.
Creating an XML Catalog with a Template

An XML Catalog file can be created quickly in Oxygen XML Editor starting from the two XML Catalog document templates called OASIS XML Catalog 1.0 and OASIS XML Catalog 1.1 and available when creating new document templates.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE catalog PUBLIC "-//OASIS//DTD XML Catalogs V1.1//EN" "http://www.oasis-open.org/committees/entity/release/1.1/catalog.dtd">
<catalog xmlns="urn:oasis:names:tc:entity:xmlns:xml:catalog">
<!-- Use "system" and "public" mappings when resolving DTDs -->
<system systemId="http://www.docbook.org/xml/4.4/docbookx.dtd" uri="frameworks/docbook/4.4/dtd/docbookx.dtd"/>
<!-- "systemSuffix" matches any system ID ending in a specified string -->
<systemSuffix systemIdSuffix="docbookx.dtd" uri="frameworks/docbook/4.4/dtd/docbookx.dtd"/>
<!-- Use "uri" for resolving XML Schema and XSLT stylesheets -->
<uri name="http://www.oasis-open.org/docbook/xml/5.0/rng/docbook.rng" uri="frameworks/docbook/xsl/fo/docbook.rng"/>
<!-- The "uriSuffix" matches any URI ending in a specified string -->
<uriSuffix uriSuffix="docbook.xsl" uri="frameworks/docbook/xsl/fo/docbook.xsl"/>
</catalog>
```
How Oxygen XML Editor Determines which Catalog to Use

An XML catalog is used to resolve references for document validation and transformations and it maps such references to the built-in local copies of the schemas of the Oxygen XML Editor frameworks (DocBook, DITA, TEI, XHTML, SVG, etc.).

Oxygen XML Editor includes a built-in catalog set as default, but you can also create your own and Oxygen XML Editor looks for catalogs in the following order:

- Global user-defined catalogs that are set in the XML Catalog preferences page.
- User-defined catalogs that are set at document type level, in the Catalog tab from the Document Type configuration dialog box.
- Default built-in catalogs.

An XML catalog can be used to map a W3C XML Schema specified with an URN in the xsi:noNamespaceSchemaLocation attribute of an XML document to a local copy of the schema.

Considering the following XML document code snippet:

```xml
<topic xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"

The URN can be resolved to a local schema file with a catalog entry like this:

```xml
<uri name="urn:oasis:names:tc:dita:xsd:topic.xsd:1.1" uri="topic.xsd"/>
```

Related information
XML Catalog Preferences on page 106

Resolving Schema Locations Through XML Catalogs

Schema locations can be mapped using an XML Catalog. Oxygen XML Editor resolves the location of a schema in the following order:

- First, it attempts to resolve the schema location as a URI (uri, uriSuffix, rewriteUri, delegateUri mappings from the XML Catalog). If this succeeds, the process end here.
- If the Resolve schema locations also through system mappings option is selected, it attempts to resolve the schema location as a system ID (system, systemSuffix, rewriteSuffix, rewriteSystem from the XML Catalog). If this succeeds, the process ends here.
- If the Process 'schemaLocation' namespaces through URI mappings for XML Schema option is selected, the target namespace of the imported XML Schema is resolved through URI mappings. If the schema specified in the schemaLocation attribute is not resolved successfully, the namespace of the root element is taken into account. If this succeeds, the process ends here.
- If none of these succeeds, the actual schema location is used.

Editing Large XML Documents with DTD Entities or XInclude

Consider the case of documenting a large project. It is likely that there will be several people involved. The resulting document can be few megabytes in size. The question becomes how to deal with this amount of data in such a way that work parallelism will not be affected.

Fortunately, XML provides two solutions for this: DTD Entities and XInclude. A master document can be created, with references to the other document parts, containing the document sections. The users can edit the documents individually, then apply an XSLT stylesheet over the master and obtain the output files in various formats (for example, PDF or HTML).

Including Document Parts with DTD Entities

There are two conditions for including a part using DTD entities:

- The master document should declare the DTD to be used, while the external entities should declare the XML sections to be referenced.
- The document containing the section must not define again the DTD.
A master document looks like this:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE book SYSTEM "../xml/docbookx.dtd" [
<!ENTITY testing SYSTEM "testing.xml" > ]
> 
<book>
  <chapter> ...
</chapter></book>
```

The referenced document looks like this:

```xml
<section> ... here comes the section content ... </section>
```

Note:

The indicated DTD and the element names (section, chapter) are used here only for illustrating the inclusion mechanism. You can use any DTD and element names you need.

At a certain point in the master document there can be inserted the section testing.xml entity:

```xml
... &testing; ...
```

When splitting a large document and including the separate parts in the master file using external entities, only the master file will contain the Document Type Definition (the DTD) or other type of schema. The included sections can not define the schema again because the main document will not be valid. If you want to validate the parts separately you have to use XInclude for assembling the parts together with the master file.

**Including Document Parts with XInclude**

XInclude is a standard for assembling XML instances into another XML document through inclusion. It enables larger documents to be dynamically created from smaller XML documents without having to physically duplicate the content of the smaller files in the main file. XInclude is targeted as the replacement for External Entities. The advantage of using XInclude is that, unlike the entities method, each of the assembled documents is permitted to contain a Document Type Declaration (DOCTYPE). This means that each file is a valid XML instance and can be independently validated. It also means that the main document, which includes smaller instances, can be validated without having to remove or comment out the DOCTYPE. as is the case with External Entities. This makes XInclude a more convenient and effective method for managing XML instances that need to be stand-alone documents and part of a much larger project.

The main application for XInclude is in the document-oriented content frameworks such as manuals and Web pages. Employing XInclude enables you to manage content in a modular fashion that is akin to Object Oriented methods used in languages such as Java, C++ or C#.

The advantages of modular documentation include: reusable content units, smaller file units that are easier to be edited, better version control and distributed authoring.

### Include a chapter in an article using XInclude

Create a chapter file and an article file in the samples folder of the Oxygen XML Editor install folder.

**Chapter file (introduction.xml) looks like this:**

```xml
<?xml version="1.0"?>
<!DOCTYPE chapter PUBLIC "-//OASIS//DTD DocBook XML V4.3//EN" 
"http://www.oasis-open.org/docbook/xml/4.3/docbookx.dtd">
<chapter>
  <title>Getting started</title>
  <section>
    <title>Section title</title>
    <para>Para text</para>
  </section>
</chapter>
```

**Main article file looks like this:**

```xml
<?xml version="1.0"?>
<!DOCTYPE article PUBLIC "-//OASIS//DTD DocBook XML V4.3//EN" 
"http://www.docbook.org/xml/4.3/docbookx.dtd">
```

**Editing Documents** 463
In this example, note the following:

- The DOCTYPE declaration defines an entity that references a file containing the information to add the `xi` namespace to certain elements defined by the DocBook DTD.
- The `href` attribute of the `xi:include` element specifies that the `introduction.xml` file will replace the `xi:include` element when the document is parsed.
- If the `introduction.xml` file cannot be found, the parser will use the value of the `xi:fallback` element - aFIXME message.

If you want to include only a fragment of a file in the master file, the fragment must be contained in a tag having an `xml:id` attribute and you must use an XPointer expression pointing to the `xml:id` value.

**Notice:** Oxygen XML Editor supports the XPointer Framework and the XPointer element() Scheme, but it does NOT support the XPointer xpointer() Scheme.

For example, if the master file is:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<test>
  <xi:include href="a.xml" xpointer="a1"
    xmlns:xi="http://www.w3.org/2001/XInclude"/>
</test>
```

and the `a.xml` file is:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<test>
  <a xml:id="a1">test</a>
</test>
```

after resolving the XPointer reference the document is:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<test>
  <a xml:id="a1" xml:base="a.xml">test</a>
</test>
```

The XInclude support in Oxygen XML Editor is enabled by default. To configure it, open the Preferences dialog box (Options > Preferences) and go to XML > XML Parser > Enable XInclude processing. When enabled, Oxygen XML Editor will be able to validate and transform documents comprised of parts added using XInclude.

**Viewing Status Information**

Status information generated by operations such as schema detection, manual validation, automatic validation, and transformations are fed into the Information view, allowing you to monitor how the operation is being executed.
Messages contain a timestamp, the name of the thread that generated it and the actual status information. The number of displayed messages can be controlled with the *Maximum number of lines* option in the *Views* preference page.

To make the view visible, select **Window > Show View > Information**.

### Making a Persistent Copy of Results

The **Results** view displays the results from the following operations:

- document validation
- checking the form of documents
- XSLT or FO transformation
- find all occurrences of a string in a file
- find all occurrences of a string in multiple files
- applying an XPath expression to the current document

To make a persistent copy of the **Results** view, use one of these actions:

**File > Save Results**

Displays the **Save Results** dialog box, used to save the result list of the current message tab. The action is also available on the right-click menu of the **Results** panel.

**File > Print Results**

Displays the **Page Setup** dialog box used to define the page size and orientation properties for printing the result list of the current **Results panel**. The action is also available on the right-click menu of the **Results** panel.

**Save Results as XML from the contextual menu**

Saves the content of the **Results** panel in an XML file with the format:

```xml
<Report>
  <Incident>
    <engine>The engine who provide the error.</engine>
    <severity>The severity level</severity>
    <Description>Description of output message.</Description>
    <SystemID>The location of the file linked to the message.</SystemID>
    <Location>
      <start>
        <line>Start line number in file.</line>
        <column>Start column number in file</column>
      </start>
      <end>
        <line>End line number in file.</line>
        <column>End column number in file</column>
      </end>
    </Location>
  </Incident>
</Report>
```
Related information

Results View on page 193

Editor Highlights

An editor highlight is a text fragment emphasized by a colored background. Highlights are generated in both Text and Author mode when the following actions generate results:

- Find/Replace in Files
- Open/Find Resource
- Find All
- Find All Elements
- XPath in Files
- Search References
- Search Declarations

By default, Oxygen XML Editor uses a different color for each type of highlight (XPath in Files, Find/Replace, Search References, Search Declarations, etc.) You can customize these colors and the maximum number of highlights displayed in a document on the Editor preferences page. The default maximum number of highlights is 10000.

You can navigate the highlights in the current document by using the following methods:

- Clicking the markers from the range ruler, located at the right side of the document.
- Clicking the Next and Previous buttons ( ) from the bottom of the range ruler.

  Note: When there are multiple types of highlights in the document, the Next and Previous buttons ( ) navigate through highlights of the same type.

- Clicking the messages displayed in the Results view at the bottom of the editor.

To remove the highlights, you can do the following:

- Click the Remove all button from bottom of the range ruler.
- Close the results tab at the bottom of the editor that contains the output of the action that generated the highlights.
- Click the Remove all button from the results panel at the bottom of the editor.

  Note: Use the Highlight all results in editor button to either display all the highlights or hide them.

Printing a File

Printing is supported in Text, Author, and Grid modes. The Print (Ctrl + P (Command + P on OS X)) action that is available from File menu displays the Page Setup dialog box, used for defining the page size and orientation properties for printing.

A Print Preview action is also available in the File menu. It allows you to manage the format of the printed document.
The main window is split in three sections:

- **Preview area** - Displays the formatted document page as it will appear on printed paper.
- **Left stripe** - The left-side stripe that displays a list of thumbnail pages. Clicking any of them displays the page content in the main preview area.
- **Toolbar** - The toolbar area at the top that contains controls for printing, page settings, page navigation, print scaling, and zoom.

**Other Printing Features**

- If you are printing a document that is opened in the **Author** visual editing mode, you can use the **CSS print media type** to change the styling in the printed output.
- If you are printing a document that is opened in **Author** mode and it contains **Tracked Changes**, you can print (or print preview) a copy of the document as if all changes have been accepted by switching the **Track Changes Visualization Mode** to **View Final**.
- If you are printing a document that is opened in **Text** mode and line numbers are displayed (the **Show line numbers option** is enabled), the printed output will include the line numbers.
- If you are printing an XML document that is opened in **Text** mode and the **folding support** is activated (the **Enable folding option** is enabled), the printed output will include the current folded state. Note that this applies to printing an entire document and not selections within the document.
- If you are printing an XML document that is opened in **Text** mode and a block of content is selected, you have the ability to print only the selection of text rather than the entire document. When you invoke the print action with a block of content selected in **Text** mode, a dialog box will be presented that offers you the choice to print the selection or the entire document.
XML Quick Fixes

The Oxygen XML Editor Quick Fix support helps you resolve errors that appear in an XML document by offering quick fixes to problems such as missing required attributes or invalid elements. Quick fixes are available in Text mode and Author mode.

To activate this feature, hover over or place the cursor in the highlighted area of text where a validation error or warning occurs. If a Quick Fix is available for that particular error or warning, you can access the Quick Fix proposals with any of the following methods:

- When hovering over the error or warning, the proposals are presented in a tooltip pop-up window and the available quick fixes include a link that can be used to perform the fix.

  ![Figure 242: Quick Fix Presented in a Tooltip in Text Mode](image)

- When hovering over the error or warning in Author mode, a small quick fix drop-down menu is presented. You can use the drop-down menu to display a list of available quick fixes to select from for the particular error or warning.

  ![Figure 243: Quick Fix Presented in a Tooltip in Author Mode](image)

- If you place the cursor in the highlighted area where a validation error or warning occurs, a quick fix icon is displayed in the stripe on the left side of the editor. If you click this icon, Oxygen XML Editor displays the list of available fixes.

  ![Figure 244: Quick Fix Drop-Down Menu in Author Mode](image)

- With the cursor placed in the highlighted area of the error or warning, you can also invoke the quick fix menu by pressing \textbf{Alt + 1} (\textbf{Command + Alt + 1} on \textbf{OS X}) on your keyboard.

Whenever you make a modification in the XML document or you apply a fix, the list of quick fixes is recomputed to ensure that you always have valid proposals.

\textbf{Note:} A quick fix that adds an element inserts it along with required and optional elements, and required and fixed attributes, depending on how the Content Completion Assistant options are configured.
Quick Fixes for DTD, XSD, and Relax NG Errors

Oxygen XML Editor offers quick fixes for common errors that appear in XML documents that are validated against DTD, XSD, or Relax NG schemas.

**Note:** For XML documents validated against XSD schemas, the quick fixes are only available if you use the default Xerces validation engine.

Quick fixes are available in **Text** mode and **Author** mode.

Oxygen XML Editor provides quick fixes for numerous types of problems, including the following:

<table>
<thead>
<tr>
<th>Problem type</th>
<th>Available quick fixes</th>
</tr>
</thead>
<tbody>
<tr>
<td>A specific element is required in the current context</td>
<td>Insert the required element</td>
</tr>
<tr>
<td>An element is invalid in the current context</td>
<td>Remove the invalid element</td>
</tr>
<tr>
<td>The content of the element should be empty</td>
<td>Remove the element content</td>
</tr>
<tr>
<td>An element is not allowed to have child elements</td>
<td>Remove all child elements</td>
</tr>
<tr>
<td>Text is not allowed in the current element</td>
<td>Remove the text content</td>
</tr>
<tr>
<td>A required attribute is missing</td>
<td>Insert the required attribute</td>
</tr>
<tr>
<td>An attribute is not allowed to be set for the current element</td>
<td>Remove the attribute</td>
</tr>
<tr>
<td>The attribute value is invalid</td>
<td>Propose the correct attribute values</td>
</tr>
<tr>
<td>ID value is already defined</td>
<td>Generate a unique ID value</td>
</tr>
<tr>
<td>References to an invalid ID</td>
<td>Change the reference to an already defined ID</td>
</tr>
</tbody>
</table>

*Schematron Quick Fixes (SQF)* on page 469

**Schematron Quick Fixes (SQF)**

Oxygen XML Editor provides support for Schematron Quick Fixes (SQF). They help you resolve issues that appear in XML documents that are validated against Schematron schemas by offering you solution proposals. The Schematron Quick Fixes are an extension of the Schematron language and they allow you to define fixes for Schematron validation messages. Specifically, they are associated with *assert* or *report* messages.

A typical use case is using Schematron Quick Fixes to assist content authors with common editing tasks. For example, you can use Schematron rules to automatically report certain validation warnings (or errors) when performing regular editing tasks, such as inserting specific elements or changing IDs to match specific naming conventions. For more details and examples, please see the following blog post: [http://blog.oxygenxml.com/2015/05/schematron-checks-to-help-technical.html](http://blog.oxygenxml.com/2015/05/schematron-checks-to-help-technical.html).

**Displaying the Schematron Quick Fix Proposals**

The defined Schematron Quick Fixes are displayed on validation errors in **Text** mode and **Author** mode.

Refactoring XML Documents

In the life cycle of XML documents there are instances when the XML structure needs to be changed to accommodate various needs. For example, when an associated schema is updated, an attribute may have been removed, or a new element added to the structure.

These types of situations cannot be resolved with a traditional Find/Replace tool, even if the tool accepts regular expressions. The problem becomes even more complicated if an XML document is computed or referenced from multiple modules, since multiple resources need to be changed.

To assist you with these types of refactoring tasks, Oxygen XML Editor includes a specialized XML Refactoring tool that helps you manage the structure of your XML documents.

XML Refactoring Tool

The XML Refactoring tool is presented in the form of an easy to use wizard that is designed to reduce the time and effort required to perform various structure management tasks. For example, you can insert, delete, or rename an attribute in all instances of a particular element that is found in all documents within your project.

To access the tool, select the XML Refactoring action from one of the following locations:

- The Tools menu.
- The Refactoring submenu from the contextual menu in the Project view.
- The Refactoring submenu from the contextual menu in the DITA Maps Manager view.

Note: The predefined refactoring operations are also available from the Refactoring submenu in the contextual menu of Author or Text mode. This is useful because by selecting the operations from the contextual menu, Oxygen XML Editor considers the editing context to skip directly to the wizard page of the appropriate operation and to help you by preconfiguring some of the parameter values. For your convenience, the last 5 operations that are used also appear in the Refactoring submenu of the contextual menu in the Project view and the DITA Maps Manager.

XML Refactoring Wizard

The XML Refactoring tool includes the following wizard pages:

Refactoring operations

The first wizard page presents the available operations, grouped by category. To search for an operation, you can use the filter text box at the top of the page.
Configure Operation Parameters

The next wizard page allows you to specify the parameters for the refactoring operation. The parameters are specific to the type of refactoring operation that is being performed. For example, to delete an attribute you need to specify the parent element and the qualified name of the attribute to be removed.
Scope and Filters

The last wizard page allows you to select the set of files that represent the input of the operation. You can select from predefined resource sets (such as the current file, your whole project, the current DITA map hierarchy, etc.) or you can define your own set of resources by creating a working set.

The Filters section includes the following options:

- **Include files** - Allows you to filter the selected resources by using a file pattern. For example, to restrict the operation to only analyze build files you could use `build*.*xml` for the file pattern.
- **Restrict only to known XML file types** - When enabled, only resources with a known XML file type will be affected by the operation.
- **Look inside archives** - When enabled, the resources inside archives will also be affected.

![Figure 249: XML Refactoring - Scope and Filters Wizard Page](image)

If an operation takes longer than expected you can use the **Stop** button in the progress bar to cancel the operation.

**Note:** It is recommended that you use the **Preview** button to review all the changes that will be made by the refactoring operation before applying the changes.

**Warning:** After clicking the **Finish** button, the operation will be processed and Oxygen XML Editor provides no automatic means for reverting the operations. Any **Undo** action will only revert changes on the current document.

Predefined Refactoring Operations

The XML Refactoring tool includes a variety of predefined operations that can be used for common refactoring tasks. They are grouped by category in the **Refactoring operations** wizard page. You can also access the operations from the **Refactoring** submenu in the contextual menu of **Author** or **Text** mode. The operations are also grouped by category in this submenu. When selecting the operations from the contextual menu, Oxygen XML Editor considers the editing context to get the names and namespaces of the current element or attribute, and uses this information to preconfigure some of the parameter values for the selected refactoring operation.

**Tip:** Each operation includes a link in the lower part of the wizard that opens the **XML / XSLT-FO-XQuery / XPath** preferences page where you can configure XPath options and declare namespace prefixes.

The following predefined operations are available:
Refactoring Operations for **Attributes**

Add/Change attribute

Use this operation to change the value of an attribute or insert a new one. This operation allows you to specify the following parameters:

- **Parent element** section
  - **Element** - The parent element of the attribute to be changed, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

- **Attribute** section
  - **Local name** - The local name of the affected attribute.
  - **Namespace** - The namespace of the affected attribute.
  - **Value** - The value for the affected attribute.

- **Options** section
  - You can choose between one of the following options for the **Operation mode**:
    - Add the attribute in the parent elements where it is missing
    - Change the value in the parent elements where the attribute already exists
    - Both

Delete attribute

Use this operation to remove one or more attributes. This operation requires you to specify the following parameters:

- **Element** - The parent element of the attribute to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.
- **Attribute** - The name of the attribute to be deleted.

Rename attribute

Use this operation to rename an attribute. This operation requires you to specify the following parameters:

- **Element** - The parent element of the attribute to be renamed, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.
- **Attribute** - The name of the attribute to be renamed.
- **New local name** - The new local name of the attribute.

Replace in attribute value

Use this operation to search for a text fragment inside an attribute value and change the fragment to a new value. This operation allows you to specify the following parameters:

- **Target attribute** section
  - **Element** - The parent element of the attribute to be modified, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.
  - **Attribute** - The name of the attribute to be modified.

- **Find / Replace** section
  - **Find** - The text fragments to find. You can use Perl-like regular expressions.
  - **Replace with** - The text fragment to replace the target with. This parameter can bind regular expression capturing groups ($1, $2, etc.) from the find pattern.

Refactoring Operations for **Comments**

Delete comments

Use this operation to delete comments from one or more elements. This operation requires you specify the following parameter:
- **Element** - The target element (or elements) for which comments will be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

  **Note:** Comments that are outside the root element will not be deleted because the serializer preserves the content before and after the root.

**Refactoring Operations for DITA**

**Change topic ID to file name**

Use this operation to change the ID of a topic to be the same as its file name. This operation allows you to choose a scope for the operation and some filters:

- **Scope** - Select from a variety of options to define the scope for which resources will be affected by the operation. For example, you can choose to affect all resources in the **Project**, **All opened files**, or just the **Current file**.
- **Filters** section
  - **Include files** - Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as * or ?).
  - **Restrict to known XML file types only** - Excludes non-XML file types from the operation.
  - **Look inside archives** - If this option is enabled, the scope of the operation will include files inside archives.

**Convert simple tables to CALS tables**

Use this operation to convert DITA simple tables to CALS tables. This operation allows you to choose a scope for the operation and some filters:

- **Scope** - Select from a variety of options to define the scope for which resources will be affected by the operation. For example, you can choose to affect all resources in the **Project**, **All opened files**, or just the **Current file**.
- **Filters** section
  - **Include files** - Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as * or ?).
  - **Restrict to known XML file types only** - Excludes non-XML file types from the operation.
  - **Look inside archives** - If this option is enabled, the scope of the operation will include files inside archives.

**Refactoring Operations for Elements**

**Delete element**

Use this operation to delete elements. This operation requires you to specify the following parameter:

- **Element** - The target element to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

**Delete element content**

Use this operation to delete the content of elements. This operation requires you to specify the following parameter:

- **Element** - The target element whose content is to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

**Insert element**

Use this operation to insert new elements. This operation allows you to specify the following parameters:

- **Element** section
  - **Local name** - The local name of the element to be inserted.
  - **Namespace** - The namespace of the element to be inserted.
- **Location** section
  - **XPath** - An XPath expression that identifies an existing element to which the new element is relative, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.
  - **Position** - The position where the new element will be inserted, in relation to the specified existing element. The possible selections in the drop-down menu are: **After**, **Before**, **First child**, or **Last child**.
Rename element
Use this operation to rename elements. This operation requires you to specify the following parameters:

- **Target elements (XPath)** - The target elements to be renamed, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.
- **New local name** - The new local name of the element.

Unwrap element
Use this operation to remove the surrounding tags of elements, while keeping the content unchanged. This operation requires you to specify the following parameter:

- **Target elements (XPath)** - The target elements whose surrounding tags will be removed, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

Wrap element
Use this operation to surround elements with element tags. This operation allows you to specify the following parameters:

- **Target elements (XPath)** - The target elements to be surrounded with tags, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

  - **Wrapper element** section
    - **Local name** - The local name of the *Wrapper element*.
    - **Namespace** - The namespace of the *Wrapper element*.

Wrap element content
Use this operation to surround the content of elements with element tags. This operation allows you to specify the following parameters:

- **Target elements (XPath)** - The target elements whose content will be surrounded with tags, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

  - **Wrapper element** section
    - **Local name** - The local name of the *Wrapper element* that will surround the content of the target.
    - **Namespace** - The namespace of the *Wrapper element* that will surround the content of the target.

Refactoring Operations for Fragments

Insert XML fragment
Use this operation to insert an XML fragment. This operation allows you to specify the following:

- **XML Fragment** - The XML fragment to be inserted.
  - **Location** section
    - **XPath** - An XPath expression that identifies an existing element to which the inserted fragment is relative, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.
    - **Position** - The position where the fragment will be inserted, in relation to the specified existing element. The possible selections in the drop-down menu are: After, Before, First child, or Last child.

Replace element content with XML fragment
Use this operation to replace the content of elements with an XML fragment. This operation allows you to specify the following parameters:

- **Target elements (XPath)** - The target elements whose content will be replaced, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.
- **XML Fragment** - The XML fragment with which to replace the content of the target element.

Replace element with XML fragment
Use this operation to replace elements with an XML fragment. This operation allows you to specify the following parameters:

- **Target elements (XPath)** - The target elements to be replaced, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.
- **XML Fragment** - The XML fragment with which to replace the target element.
Refactoring Operations for JATSKit

Add BITS DOCTYPE - NLM/NCBI Book Interchange 2.0

Use this operation to add an NLM 'BITS' 2.0 DOCTYPE declaration. This operation allows you to choose a scope for the operation and some filters:

- **Scope** - Select from a variety of options to define the scope for which resources will be affected by the operation. For example, you can choose to affect all resources in the **Project**, **All opened files**, or just the **Current file**.
- **Filters section**
  - **Include files** - Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as * or ?).
  - **Restrict to known XML file types only** - Excludes non-XML file types from the operation.
  - **Look inside archives** - If this option is enabled, the scope of the operation will include files inside archives.

Add Blue DOCTYPE - NISO JATS Publishing 1.1

Use this operation to add a JATS 'Blue' 1.1 DOCTYPE declaration. This operation allows you to choose a scope for the operation and some filters:

- **Scope** - Select from a variety of options to define the scope for which resources will be affected by the operation. For example, you can choose to affect all resources in the **Project**, **All opened files**, or just the **Current file**.
- **Filters section**
  - **Include files** - Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as * or ?).
  - **Restrict to known XML file types only** - Excludes non-XML file types from the operation.
  - **Look inside archives** - If this option is enabled, the scope of the operation will include files inside archives.

Normalize IDs

Use this operation to normalize assigned IDs and assigned IDs to elements that are missing them. This operation allows you to choose a scope for the operation and some filters:

- **Scope** - Select from a variety of options to define the scope for which resources will be affected by the operation. For example, you can choose to affect all resources in the **Project**, **All opened files**, or just the **Current file**.
- **Filters section**
  - **Include files** - Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as * or ?).
  - **Restrict to known XML file types only** - Excludes non-XML file types from the operation.
  - **Look inside archives** - If this option is enabled, the scope of the operation will include files inside archives.

Additional Notes

- **Note**: There are some operations that allow `<ANY>` for the **local name** and **namespace** parameters. This value can be used to select an element or attribute regardless of its local name or namespace. Also, the `<NO_NAMESPACE>` value can be used to select nodes that do not belong to a namespace.

- **Note**: Some operations have parameters that accept XPath expressions to match elements or attributes. In these XPath expressions you can only use the prefixes declared in the **Options > Preferences > XML > XSLT-FO-XQUERY > XPath** page. This preferences page can be easily opened by clicking the link in the note (Each prefix used in an XPath expression must be declared in the Default prefix-namespace mappings section) at the bottom of the **Configure Operation Parameters** wizard page.

Custom Refactoring Operations

While Oxygen XML Editor includes a variety of predefined XML refactoring operations to help you accomplish particular tasks, you can also create custom operations according to your specific needs. For example, you could create a custom refactoring operation to convert an attribute to an element and insert the element as the first child of the parent element.

An XML Refactoring operation is defined as a pair of resources:
• An *XQuery Update script* or *XSLT stylesheet* that Oxygen XML Editor will run to refactor the XML files.

• An *XML Operation Descriptor* file that contains information about the operation (such as the name, description, and parameters).

![Diagram of an XML Refactoring Operation]

Figure 250: Diagram of an XML Refactoring Operation

All the defined custom operations are loaded by the *XML Refactoring Tool* and presented in the *Refactoring Operations wizard page*, along with the predefined built-in operations.

After the user chooses an operation and specifies its parameters, Oxygen XML Editor processes an XQuery Update or XSLT transformation over the input file. This transformation is executed in a *safe mode*, which implies the following:

• When loading the document:
  • The *XInclude* mechanism is disabled. This means that the resources included by using XInclude will not be visible in the transformation.
  • The DTD entities will be processed without being expanded.
  • The associated DTD will be not loaded, so the default attributes declared in the DTD will not be visible in the transformation.

• When saving the updated XML document:
  • The *DOCTYPE* will be preserved.
  • The DTD entities will be preserved as they are in the original document when the document is saved.
  • The attribute values will be kept in their original form without being normalized.
  • The spaces between attributes are preserved. Basically, the spaces are lost by a regular XML serialization since they are not considered important.

The result of this transformation overrides the initial input file.

**Note:** To achieve some of the previous goals, the XML Refactoring mechanism adds several attributes that are interpreted internally. The attributes belong to the

http://www.oxygenxml.com/ns/xmlRefactoring/additional_attributes namespace. These attributes should not be taken into account when processing the input XML document since they are discarded when the transformed document is serialized.
Restriction: *Comments* or *processing instructions* that are in any node before or after the root element cannot be modified by an XML Refactoring operation. In other words, XML Refactoring operations can only be performed on *comments* or *processing instructions* that are inside the root element.

## Creating a Custom Refactoring Operation

To create a custom refactoring operation, follow these steps:

1. *Create an* XQuery *Update script* or *XSLT file*.
2. *Create an XML Refactoring Operation Descriptor file*.
3. Store both files in *one of the locations that Oxygen XML Editor* scans when loading the custom operations.

**Result:** Once you run the XML Refactoring tool again, the custom operation appears in the *Refactoring Operations* wizard page.

### Related information

*Storing and Sharing Refactoring Operations* on page 484

### Custom Refactoring Script

The first step in creating a custom refactoring operation is to create an *XQuery Update script* or *XSLT stylesheet* that is needed to process the refactoring operations. The easiest way to create this script file is to use the *New* document wizard to create a new *XQuery* or *XSLT* file and you can use *our examples* to help you with the content.

There are cases when it is necessary to add parameters in the *XQuery script* or *XSLT stylesheet*. For instance, if you want to rename an element, you may want to declare an external parameter associated with the name of the element to be renamed. To allow you to specify the value for these parameters, they need to be declared in the *refactoring operation descriptor file* that is associated with this operation.

**Note:** The XQuery Update processing is disabled by default in Oxygen XML Editor. Thus, if you want to create or edit an XQuery Update script you have to enable this facility by creating an XQuery transformation scenario and choose *Saxon EE* as the transformation engine. Also, you need to make sure the *Enable XQuery update option is enabled in the Saxon processor advanced options*.

**Note:** If you are using an XSLT file, XPath expressions that are passed as parameters will automatically be rewritten to conform with the mapping of the namespace prefixes declared in the *XML /XSLT-FO-XQuery / XPath preferences* page.

The next step in creating a custom refactoring operation is to *create a custom operation descriptor file*.

### Related information

*Example of an XML Refactoring Operation* on page 481

### Custom Refactoring Operation Descriptor File

The second step in creating a custom refactoring operation is to create an operation descriptor file. The easiest way to do this is to use the *New* document wizard and choose the *XML Refactoring Operation Descriptor* template.

### Introduction to the Descriptor File

This file contains information (such as name, description, and id) that is necessarily when loading an XML Refactoring operation. It also contains the path to the XQuery Update script or XSLT stylesheet that is associated with the particular operation through the *script* element.

You can specify a category for your custom operations to logically group certain operations. The *category* element is optional and if it is not included in the descriptor file, the default name of the category for the custom operations is *Other operations*.

The descriptor file is edited and validated against the following schema: *frameworks/xml_refactoring/operation_descriptor.xsd*.
Declaring Parameters in the Descriptor File

If the XQuery Update script or XSLT stylesheet includes parameters, they should be declared in the parameters section of the descriptor file. All the parameters specified in this section of the descriptor file will be displayed in the XML Refactoring tool within the Configure Operation Parameters wizard page for that particular operation.

The value of the first description element in the parameters section will be displayed at the top of the Configure Operation Parameters wizard page.

To declare a parameter, specify the following information:

- **label** - This value is displayed in the user interface for the parameter.
- **name** - The parameter name used in the XQuery Update script or XSLT stylesheet and it should be the same as the one declared in the script.
- **type** - Defines the type of the parameter and how it will be rendered. There are several types available:
  - TEXT - Generic type used to specify a simple text fragment.
  - XPATH - Type of parameter whose value is an XPATH expression. For this type of parameter, Oxygen XML Editor will use a text input with corresponding content completion and syntax highlighting.
    - **Note**: The value of this parameter is transferred as plain text to the XQuery Update or XSLT transformation without being evaluated. You should evaluate the XPath expression inside the XQuery Update script or XSLT stylesheet. For example, you could use the `saxon:evaluate` Saxon extension function.
    - **Note**: A relative XPath expression is converted to an absolute XPath expression by adding `//` before it (`//XPathExp`). This conversion is done before transferring the XPath expression to the XML refactoring engine.
    - **Note**: When writing XPath expressions, you can only use prefixes declared in the Options > Preferences > XML > XSLT-FO-XQUERY > XPath options page.
  - NAMESPACE - Used for editing namespace values.
  - REG_EXP_FIND - Used when you want to match a certain text by using Perl-like regular expressions.
  - REG_EXP_REPLACE - Used along with REG_EXP_FIND to specify the replacement string.
  - XML_FRAGMENT - This type is used when you want to specify an XML fragment. For this type, Oxygen XML Editor will display a text area specialized for inserting XML documents.
  - NC_NAME - The parameter for NC_NAME values. It is useful when you want to specify the local part of a QName for an element or attribute.
  - BOOLEAN - Used to edit boolean parameters.
  - TEXT_CHOICE - It is useful for parameters whose value should be from a list of possible values. Oxygen XML Editor renders each possible value as a radio button option.
- **description** - The description of the parameter. It is used by the application to display a tooltip when you hover over the parameter.
- **possibleValues** - Contains the list with possible values for the parameter and you can specify the default value, as in the following example:

```xml
<possibleValues onlyPossibleValuesAllowed="true">
  <value name="before">Before</value>
  <value name="after" default="true">After</value>
  <value name="firstChild">FirstChild</value>
  <value name="lastChild">Last Child</value>
</possibleValues>
```

Specialized Parameters to Match Elements or Attributes

If you want to match elements or attributes, you can use some specialized parameters, in which case Oxygen XML Editor will propose all declared elements or attributes based on the schema associated with the currently edited file. The following specialized parameters are supported:

- **elementLocation**
  
  This parameter is used to match elements. For this type of parameter, the application displays a text field where you can enter the element name or an XPath expression. The text from the label attribute is displayed in the application as the
label of the text field. The name attribute is used to specify the name of the parameter from the XQuery Update script or XSLT stylesheet. If the value of the useCurrentContext attribute is set to true, the element name from the cursor position is used as proposed values for this parameter.

Example of an elementLocation:

```xml
<elementLocation name="elem_loc" useCurrentContext="false">
  <element label="Element location">
    <description>Element location description.</description>
  </element>
</elementLocation>
```

attributeLocation

This parameter is used to match attributes. For this type of parameter, the application displays two text fields where you can enter the parent element name and the attribute name (both text fields accept XPath expressions for a finer match). The text from the label attributes is displayed in the application as the label of the associated text fields. The name attribute is used to specify the name of the parameter from the XQuery Update script or XSLT stylesheet. The value of this parameter is an XPath expression that is computed by using the values of the expression from the element and attribute text fields. For example, if section is entered for the element and a title is entered for the attribute, the XPath expression would be computed as //section/@title. If the value of the useCurrentContext attribute is set to true, the element and attribute name from the cursor position is used as proposed values for the operation parameters.

Example of an attributeLocation:

```xml
<attributeLocation name="attr_xpath" useCurrentContext="true">
  <element label="Element path">
    <description>Element path description.</description>
  </element>
  <attribute label="Attribute">
    <description>Attribute path description.</description>
  </attribute>
</attributeLocation>
```

elementParameter

This parameter is used to specify elements by local name and namespace. For this type of parameter, the application displays two combo boxes with elements and namespaces collected from the associated schema of the currently edited file. The text from the label attribute is displayed in the application as label of the associated combo. The name attribute is used to specify the name of the parameter from the XQuery Update script or XSLT stylesheet. If you specify the allowsAny attribute, the application will propose <ANY> as a possible value for the Name and Namespace combo boxes. You can also use the useCurrentContext attribute and if its value is set to true, the element name and namespace from the cursor position is used as proposed values for the operation parameters.

Example of an elementParameter:

```xml
<elementParameter id="elemID">
  <localName label="Name" name="element_localName" allowsAny="true" useCurrentContext="true">
    <description>Local name of the parent element.</description>
  </localName>
  <namespace label="Namespace" name="element_namespace" allowsAny="true">
    <description>Local name of the parent element.</description>
  </namespace>
</elementParameter>
```

attributeParameter

This parameter is used to specify attributes by local name and namespace. For this type of parameter, the application displays two combo boxes with attributes and their namespaces collected from the associated schema of the currently edited file. The text from the label attribute is displayed in the application as label of the associated combo box. If you specify the allowsAny attribute, the application will propose <ANY> as a possible value for the Name and Namespace combo boxes. You can also use the useCurrentContext attribute and if its value is set to true, the attribute name and namespace from the cursor position is used as proposed values for the operation parameters.

Example of an attributeParameter:

```xml
<attributeParameter dependsOn="elemID">
  <localName label="Name" name="attribute_localName" useCurrentContext="true">
    <description>The name of the attribute to be converted.</description>
  </localName>
</attributeParameter>
```
Note: All predefined operations are loaded from the [OXYGEN_INSTALL_DIR]/refactoring folder.

Example of an XML Refactoring Operation on page 481

Example of an XML Refactoring Operation

To demonstrate creating a custom operation, consider that we have a task where we need to convert an attribute into an element and insert it inside another element. A specific example would be if you have a project with a variety of image elements where a deprecated alt attribute was used for the description and you want to convert all instances of that attribute into an element with the same name and insert it as the first child of the image element.

Thus, our task is to convert this attribute into an element with the same name and insert it as the first child of the image element.

Figure 251: Example: Custom XML Refactoring Operation

A new custom XML refactoring operation requires:

- An XQuery Update script or XSLT stylesheet.
- An XML Refactoring operation descriptor file that contains the path to the XQuery Update script or XSLT stylesheet.

Example of an XQuery Update Script for Creating a Custom Operation to Convert an Attribute to an Element

The XQuery Update script does the following:

- Iterates over all elements from the document that have the specified local name and namespace.
- Finds the attribute that will be converted to an element.
- Computes the QName of the new element to be inserted and inserts it as the first child of the parent element.

```xquery
{::
  XQuery document used to implement 'Convert attribute to element'
  operation from XML Refactoring tool.
  ::
}
declare namespace output = "http://www.w3.org/2010/xslt-xquery-serialization";
declare option output:method   "xml";
declare option output:indent   "no";
{: Local name of the attribute's parent element. :}
declare variable $element_localName as xs:string external;
```
Example of an XSLT Script for Creating a Custom Operation to **Convert an Attribute to an Element**

The XSLT stylesheet does the following:

- Iterates over all elements from the document that have the specified local name and namespace.
- Finds the attribute that will be converted to an element.
- Adds the new element as the first child of the parent element.

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
 xmlns:xs="http://www.w3.org/2001/XMLSchema"
 exclude-result-prefixes="xs"
 xmlns:xr="http://www.oxygenxml.com/ns/xmlRefactoring"
 version="2.0">

 <xsl:param name="element_localName" as="xs:string" required="yes"/>
 <xsl:param name="element_namespace" as="xs:string" required="yes"/>
 <xsl:param name="attribute_localName" as="xs:string" required="yes"/>
 <xsl:param name="attribute_namespace" as="xs:string" required="yes"/>
 <xsl:param name="new_element_localName" as="xs:string" required="yes"/>
 <xsl:param name="new_element_namespace" as="xs:string" required="yes"/>

 <xsl:template match="node() | @*">
   <xsl:copy>
     <xsl:apply-templates select="node() | @*"/>
   </xsl:copy>
 </xsl:template>

 <xsl:template match="//*[xr:check-local-name($element_localName, ., true())
 and
 xr:check-namespace-uri($element_namespace, .)]">
   <xsl:variable name="attributeToConvert" select="@*[xr:check-local-name($attribute_localName, ., true())
 and
 xr:check-namespace-uri($attribute_namespace, .)]"/>
   <xsl:choose>
     <xsl:when test="empty($attributeToConvert)">
       <xsl:copy>
         <xsl:apply-templates select="node() | @*"/>
       </xsl:copy>
     </xsl:when>
     <xsl:otherwise>
       <xsl:copy>
         <xsl:apply-templates select="node() | @*"/>
         <xsl:apply-templates select="{QName($new_element_namespace, $new_element_localName)}">{string($attributeToConvert)} as first into $node,
           delete node $attributeToConvert
         </xsl:apply-templates>
       </xsl:copy>
     </xsl:otherwise>
   </xsl:choose>
 </xsl:template>
</xsl:stylesheet>
```
Note: The XSLT stylesheet imports a module library that contains utility functions and variables. The location of this module is resolved via an XML catalog set in the XML Refactoring framework.

Example of an Operation Descriptor File for Creating a Custom Operation to Convert an Attribute to an Element

After you have developed the XQuery script or XSLT stylesheet, you have to create an XML Refactoring operation descriptor. This descriptor is used by the application to load the operation details such as name, description, or parameters.

```xml
<refactoringOperationDescriptor
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xmlns="http://www.oxygenxml.com/ns/xmlRefactoring"
  id="convert-attribute-to-element"
  name="Convert attribute to element">
  <description>Converts the specified attribute to an element. The new element will be inserted as first child of the attribute's parent element.</description>
  <script type="XSLT" href="convert-attribute-to-element.xsl"/>
  <parameters>
    <elementParameter id="elemID">
      <localName label="Name" name="element_localName" allowsAny="true">
        <description>Local name of the parent element.</description>
      </localName>
      <namespace label="Namespace" name="element_namespace" allowsAny="true">
        <description>Local name of the parent element</description>
      </namespace>
    </elementParameter>
    <attributeParameter dependsOn="elemID">
      <localName label="Name" name="attribute_localName">
        <description>Name of the attribute to be converted.</description>
      </localName>
      <namespace label="Namespace" name="attribute_namespace" allowsAny="true">
        <description>Namespace of the attribute to be converted.</description>
      </namespace>
    </attributeParameter>
    <elementParameter>
      <localName label="Name" name="new_element_localName">
        <description>The name of the new element.</description>
      </localName>
      <namespace label="Namespace" name="new_element_namespace">
        <description>The namespace of the new element.</description>
      </namespace>
    </elementParameter>
  </parameters>
</refactoringOperationDescriptor>
```
Note: If you are using an XSLT file, the line with the `script` element would look like this:

```xml
<script type="XSLT" href="convert-attribute-to-element.xsl"/>
```

**Results**

After you have created these files, copy them into a folder *scanned by Oxygen XML Editor when it loads the custom operation.* When the XML Refactoring tool is started again, you will see the created operation.

Since various parameters can be specified, this custom operation can also be used for other similar tasks. The following image shows the parameters that can be specified in our example of the custom operation to convert an attribute to an element:

![XML Refactoring Wizard for a Custom Operation](image)

**Figure 252: Example: XML Refactoring Wizard for a Custom Operation**

**Storing and Sharing Refactoring Operations**

Oxygen XML Editor scans the following locations when looking for XML Refactoring operations to provide flexibility:

- A **refactoring** folder, created inside a directory that is associated to a **framework** you are customizing.
- Any folder. In this case, you need to **open the Preferences dialog box** *(Options > Preferences)*, go to **XML > XML Refactoring**, and specify the same folder in the **Load additional refactoring operations from** text box.

Note: If you share a project with your team, you can also share the custom operation by doing the following: Then by doing the following:

1. Save the custom operation in a folder that is part of your project.
2. Switch the **XML Refactoring** option page to project level:
   a. **Open the Preferences dialog box** *(Options > Preferences)* and go to **XML > XML Refactoring**.
   b. Select **Project Options** at the bottom of the dialog box.
3. In the **Load additional refactoring operations from** text box, use the `$pd` editor variable so that the folder path is declared relative to the project.

- A folder specified by the **XML Refactoring Operations Plugin Extension**.
- The **refactoring** folder from the Oxygen XML Editor installation directory *(\OXYGEN_INSTALL_DIR\refactoring/)*.

**Sharing Custom Refactoring Operations**

The purpose of Oxygen XML Editor scanning multiple locations for the XML Refactoring operations is to provide more flexibility for developers who want to share the refactoring operations with the other team members. Depending on your particular use case, you can attach the custom refactoring operations to other resources, such as frameworks or projects.
After storing custom operations, you can share them with other users by sharing the resources.

**Localizing XML Refactoring Operations**

Oxygen XML Editor includes localization support for the XML refactoring operations.

The translation keys for the built-in refactoring operations are located in 

\[OXYGEN_INSTALL_DIR]/refactoring/i18n/translation.xml.

The localization support is also available for custom refactoring operations. The following information can be translated:

- The operation name, description, and category.
- The description of the parameters element.
- The label, description, and possibleValues for each parameter.

Translated refactoring information uses the following form:

\`${i18n(translation_key)}`

Oxygen XML Editor scans the following locations to find the translation.xml files that are used to load the translation keys:

- A refactoring/i18n folder, created inside a directory that is associated to a customized framework.
- A i18n folder, created inside a directory that is associated to a customized framework.
- An i18n folder inside any specified folder. In this case, you need to open the Preferences dialog box (Options > Preferences), go to XML > XML Refactoring, and specify the folder in the Load additional refactoring operations from text box.
- An i18n folder located in directories specified through the XML Refactoring Operations Plugin Extension.
- The refactoring/i18n folder from the Oxygen XML Editor installation directory (\[OXYGEN_INSTALL_DIR]/refactoring/i18n).

**Example of a Refactoring Operation Descriptor File with i18n Support**

```xml
<refactoringOperationDescriptor
    xmlns="http://www.oxygenxml.com/ns/xmlRefactoring" id="remove_text_content"
    name="${i18n(Remove_text_content)}">
  <description>${i18n(Remove_text_content_description)}</description>
  <script type="XQUERY_UPDATE" href="remove_text_content.xq"/>
  <parameters>
    <description>${i18n(parameters_description)}</description>
    <parameter label="${i18n(Element_name)}" name="element_localName" type="NC_NAME">
      <description>${i18n(Element_name_descriptor)}</description>
      <possibleValues>
        <value default="true" name="value1">${i18n(value_1)}</value>
        <value name="value2">${i18n(value_2)}</value>
      </possibleValues>
    </parameter>
  </parameters>
</refactoringOperationDescriptor>
```

**Editing XSLT Stylesheets**

Oxygen XML Editor includes a built-in editor for XSLT stylesheets. This section presents the features of the XSLT editor and how these features can be used. The features of the XSLT editor include:

- **Create new XSLT files and templates** - You can use the built-in new file wizards to create new XSLT documents or templates.
- **Open and Edit XSLT files** - XSLT files can be opened and edited in the source editor (Text mode).
- **Visual Editing** - XSLT stylesheets are rendered, and can be edited, in the visual Author editing mode.
- **Validation** - Presents validation errors in XSLT files.
- **Content completion** - Offers proposals for properties and the values that are available for each property.
- **Syntax highlighting** - The syntax highlighting in Oxygen XML Editor makes XSLT files more readable.
To watch our video demonstration about basic XSLT editing and transformation scenarios in Oxygen XML Editor, go to [https://www.oxygenxml.com/demo/XSL_Editing.html](https://www.oxygenxml.com/demo/XSL_Editing.html).

## Editing XSLT Stylesheets in the Master Files Context

Smaller interrelated modules that define a complex stylesheet cannot be correctly edited or validated individually, due to their interdependency with other modules. For example, a function defined in a main stylesheet is not visible when you edit an included or imported module. Oxygen XML Editor provides the support for defining the main module (or modules), allowing you to edit any of the imported/included files in the context of the larger stylesheet structure.

You can set a main XSLT stylesheet either using the master files support from the Project view, or using a validation scenario.

To set a main file using a validation scenario, add validation units that point to the main modules. Oxygen XML Editor warns you if the current module is not part of the dependencies graph computed for the main stylesheet. In this case, it considers the current module as the main stylesheet.

The advantages of editing in the context of main file include:

- Correct validation of a module in the context of a larger stylesheet structure.
- **Content Completion Assistant** displays all components valid in the current context.
- The **Outline** displays the components collected from the entire stylesheet structure.

To watch our video demonstration about editing XSLT stylesheets in the master files context, go to [https://www.oxygenxml.com/demo/MasterFilesSupport.html](https://www.oxygenxml.com/demo/MasterFilesSupport.html).

## Validating XSLT Stylesheets

Oxygen XML Editor performs the validation of XSLT documents with the help of an XSLT processor that you can configure in the preferences pages according to the XSLT version. For XSLT 1.0, the options are: Xalan, Saxon 6.5.5, Saxon 9.6.0.7 and a JAXP transformer specified by the main Java class. For XSLT 2.0, the options are: Saxon 9.6.0.7 and a JAXP transformer specified by the main Java class. For XSLT 3.0, the options are Saxon 9.6.0.7 and a JAXP transformer specified by the main Java class.

To access the XSLT preferences quickly, use the Validation options action from the Document > Validate menu.

### Creating a Validation Scenario for XSLT Stylesheets

You can validate an XSLT document using the engine defined in the transformation scenario, or a custom validation scenario. If you choose to validate using the engine from transformation scenario, and a transformation scenario is not associated with the current document or the engine has no validation support, the default engine is used. To set the default engine, open the Preferences dialog box (Options > Preferences) and go to XML > XSLT/FO/XQuery > XSLT.

You can also create new validation scenarios or edit existing ones, and you can add jars and classes that contain extension functions. To create or edit a validation scenario for an XSLT stylesheet, follow these steps:

1. With the XSLT file opened in Oxygen XML Editor, select the Configure Validation Scenario(s) from the Document > Validate menu, or the Validation toolbar drop-down menu, or from the Validate submenu when invoking the contextual menu on the XSLT file in the Project view .
   The Configure Validation Scenario(s) dialog box is displayed. It contains the existing scenarios, organized in categories depending on the type of file they apply to. You can use the options in the Settings drop-down menu to filter which scenarios are shown.

2. To edit an existing scenario, select the scenario and press the Edit button. If you try to edit one of the read-only predefined scenarios, Oxygen XML Editor creates a customizable duplicate (you can also use the Duplicate button).

3. To add a new scenario, press the New button.
   The New scenarios dialog box is displayed. It lists all validation units of the scenario.
4. Configure the following information in this dialog box:
   a) **Name** - The name of the validation scenario.
   b) **Storage** - You can choose between storing the scenario in the **Project Options** or **Global Options**.
   c) **URL of the file to validate** - In most cases, leave this field as the default selection (the URL of the current file). If you want to specify a different URL, double-click its cell and enter the URL in the text field, select it from the drop-down list, or use the **Browse** drop-down menu or **Insert Editor Variable** button.
   d) **File type** - The file type should be **XSLT Document**.
   e) **Validation engine** - Click the cell to select a validation engine. You must select an engine to be able to add or edit extensions.
   f) **Automatic validation** - If this option is checked, the validation operation defined by this row is also used by the **automatic validation feature**.

5. To add or edit extensions, click the **Edit extensions** button. This button is only available if the **File type** is set as **XSLT Document** and a **Validation engine** is chosen. The **Libraries** dialog box is opened. It is used to specify the jars and classes that contain extension functions called from the XSLT file of the current validation scenario. They will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item and press the **Move up** or **Move down** buttons.

6. Press **OK** to close the **New scenario** dialog box. The newly created validation scenario is now included in the list of scenarios in the **Configure Validation Scenario(s)** dialog box. You can select the scenario in this dialog box to associate it with the current XSLT document and press the **Apply associated** button to run the validation scenario.

**Validating XSLT Stylesheets with Custom Engines**

If you need to validate an XSLT stylesheet with a validation engine that is different from the built-in engine, you can configure external engines as custom XSLT validation engines in the Oxygen XML Editor preferences. After a custom validation engine is **properly configured**, it can be applied on the current document by selecting it from the list of custom validation engines in the **Validation** toolbar drop-down menu. The document is validated against the schema declared in the document.

By default, there are two validators that are configured for XSLT stylesheets:

- **MSXML 4.0** - included in Oxygen XML Editor (Windows edition). It is associated to the XSL Editor type in **Preferences page**.
- **MSXML.NET** - included in Oxygen XML Editor (Windows edition). It is associated to the XSL Editor type in **Preferences page**.

**Content Completion in XSLT Stylesheets**

The list of proposals offered by the **Content Completion Assistant** are context-sensitive and includes proposals that are valid at the current cursor position. You can enhance the list of proposals by specifying an additional schema. This schema is **defined**...
by the user in the Content Completion / XSL preferences page and can be: XML Schema, DTD, RELAX NG schema, or NVDL schema.

<xml:element name="table">
<xml:attribute name="border">1</xml:attribute>
<xml:attribute name="align">left</xml:attribute>
<xml:apply-imports>
<xml:apply-templates>
<xml:attribute>
<xml:call-template>
<font name="verdana" size="3">
<box>Email</box>
</font>
</td>
</table>
</xml:element>

**Figure 254: XSLT Content Completion Assistant**

The feature is activated in **Text** mode in the following situations:

- After you press the `<` character when inserting an element, it is automatically activated after a short delay. You can adjust the activation delay with the *Activation delay of the proposals window (ms)* option from the **Content Completion** preferences page.
- After typing a partial element or attribute name, you can activate it by pressing **Ctrl + Space (Command + Space on OS X)** or **Alt + ForwardSlash (Command + Alt + ForwardSlash on OS X)**. If there is only one valid proposal at the current location, it is inserted without displaying the list of proposals.

The **Content Completion Assistant** proposes numerous item types (such as templates, variables, parameters, keys, etc.) that are defined in the current stylesheet, and in the imported and included XSLT stylesheets. The **Content Completion Assistant** also includes **code templates that can be used to quickly insert code fragments** into stylesheets.

**Note:** For XSL and XSD resources, the **Content Completion Assistant** collects its components starting from the master files. The master files can be defined in the project or in the associated validation scenario. For further details about the **Master Files** support go to **Defining Master Files at Project Level**.

The extension functions included in the Saxon 6.5.5 and 9.6.0.7 transformation engines are presented in the content completion list only if the Saxon namespace (*http://saxon.sf.net* for XSLT version 2.0 / 3.0 or *http://icl.com/saxon* for XSLT version 1.0) is declared and one of the following conditions is true:

- The edited file has a transformation scenario that uses as transformation engine Saxon 6.5.5 (for XSLT version 1.0), Saxon 9.6.0.7 PE or Saxon 9.6.0.7 EE (for XSLT version 2.0 / 3.0).
- The edited file has a validation scenario that uses as validation engine Saxon 6.5.5 (for version 1.0), Saxon 9.6.0.7 PE or Saxon 9.6.0.7 EE (for version 2 / 3.0).
- The validation engine specified in **Options** page is Saxon 6.5.5 (for version 1.0), Saxon 9.6.0.7 PE or Saxon 9.6.0.7 EE (for version 2 / 3.0).

Additionally, the Saxon-CE-specific extension functions and instructions are presented in the list of content completion assistance proposals only if the *http://saxonica.com/ns/interactiveXSLT* namespace is declared.

Namespace prefixes in the scope of the current context are presented at the top of the content completion assistance window to speed up the insertion into the document of prefixed elements.
For the common namespaces such as XSL namespace (http://www.w3.org/1999/XSL/Transform), XML Schema namespace (http://www.w3.org/2001/XMLSchema), or Saxon namespace (http://icl.com/saxon for version 1.0, http://saxon.sf.net/ for version 2.0 / 3.0), Oxygen XML Editor provides an easy mode to declare them by proposing a prefix for these namespaces.

**Content Completion in XPath Expressions**

In XSLT stylesheets, the **Content Completion Assistant** provides *all the features available in the XML editor* and also adds some enhancements. In XPath expressions used in attributes of XSLT stylesheets (elements such as match, select, and test), the **Content Completion Assistant** offers the names of XPath and XSLT functions, XSLT axes, and user-defined functions (the name of the function and its parameters). If a transformation scenario was defined and associated to the edited stylesheet, the **Content Completion Assistant** computes and presents elements and attributes based on:

- The input XML document selected in the scenario.
- The current context in the stylesheet.

The associated document is displayed in the **XSLT/XQuery Input view**.

Content completion for XPath expressions is started:

- On XPath operators detected in one of the `match`, `select`, and `test` attributes of XSLT elements: `:`, `/`, `//`, `[,]`, `|`, `::`, `$`
- For attribute value templates of non-XSLT elements, that is the `{` character when detected as the first character of the attribute value.
- On request, if the combination **Ctrl + Space (Command + Space on OS X)** is pressed inside an edited XPath expression.

The proposals presented in the **Content Completion Assistant** are dependent on:

- The context of the current XSLT element.
- The XML document associated with the edited stylesheet in the stylesheet transformation scenario.
- The XSLT version of the stylesheet (1.0, 2.0, or 3.0).

**Note:** The XSLT 3.0 content completion list of proposals includes specific elements and attributes for the 3.0 version.

For example, if the document associated with the edited stylesheet is:

```xml
<personnel>
  <person id="Big.Boss">
    <name>
      <family>Boss</family>
      <given>Big</given>
    </name>
    <email>chief@oxygenxml.com</email>
    <link subordinates="one.worker"/>
  </person>
  <person id="one.worker">
    <name>
      <family>Worker</family>
      <given>One</given>
    </name>
    <email>one@oxygenxml.com</email>
    <link manager="Big.Boss"/>
  </person>
</personnel>
```

If you enter an `xsl:template` element using the **Content Completion Assistant**, the following actions are triggered:
• The `match` attribute is inserted automatically.
• The cursor is placed between the quotes.
• The XPath **Content Completion Assistant** automatically displays a pop-up window with all the XSLT axes, XPath functions and elements and attributes from the XML input document that can be inserted in the current context.

The set of XPath functions depends on the XSLT version declared in the root element `xsl:stylesheet: 1.0, 2.0, or 3.0.

![Figure 256: Content Completion in the match Attribute](image)

If the cursor is inside the `select` attribute of an `xsl:for-each`, `xsl:apply-templates`, `xsl:value-of` or `xsl:copy-of` element the content completion proposals depend on the path obtained by concatenating the XPath expressions of the parent XSLT elements `xsl:template` and `xsl:for-each` as shown in the following figure:

![Figure 257: Content Completion in the select Attribute](image)

Also XPath expressions typed in the `test` attribute of an `xsl:if` or `xsl:when` element benefit of the assistance of the content completion.

![Figure 258: Content Completion in the test Attribute](image)

XSLT variable references are easier to insert in XPath expressions with the help of the content completion pop-up triggered by the `$` character, which signals the start of such a reference in an XPath expression.
If the `{` character is the first one in the value of the attribute, the same Content Completion Assistant is available also in attribute value templates of non-XSLT elements.

The name function returns a string containing a QName representing the expanded-name of the node in the argument node-set that is first in document order. The QName must represent the expanded-name with respect to the namespace declarations in effect on the node whose expanded-name is being represented. Typically, the function takes also other arguments, having the same type, and returns a xs:string.
Moving the cursor on the first variable $v1$, the editor identifies the `abs` as context function and shows its signature:

```xml
<name>"v1"</name>
<match><![CDATA[
 abs($arg as numeric?) as numeric?
]]></match>
<block><![CDATA[
concat(abs($v1), abs($v2))]]></block>
</template>
</stylesheet>
```

**Figure 262: XPath Tooltip Helper - Identify the abs Function's Argument**

Further, clicking the second `abs` function name, the editor detects that it represents the second argument of the `concat` function. The tooltip is repainted to display the second argument in bold font.

```xml
<name>"concat($arg1 as xs:atomicType?, $arg2 as xs:atomicType?, ...) as xs:string"</name>
<match><![CDATA[
 concat(abs($v1), abs($v2))]]></match>
<block><![CDATA[
concat(abs($v1), abs($v2))]]></block>
</template>
</stylesheet>
```

**Figure 263: XPath Tooltip Helper - Identify the concat Function's Second Argument**

The tooltip helper is also available in the **XPath Builder** view and **XPath toolbar**.

**Syntax Highlighting in XSLT**

Oxygen XML Editor supports syntax highlighting in XSLT documents to improve the readability of the content and reduce the time it takes to internalize the semantics of the structured content.

To customize the colors or styles used for the syntax highlighting colors for XSLT files, follow these steps:

1. Open the Preferences dialog box (Options > Preferences).
2. Go to **Editor > Syntax Highlight**.
3. Select and expand the **XML** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.
5. Select the **XSL** tab in the Preview pane to see the effects of your changes.

**Related information**

*Customize Syntax Highlight colors* on page 97

**XSLT Outline View**

The Outline view for XSLT stylesheets displays the list of all the components (templates, attribute-sets, character-maps, variables, functions, keys, outputs) from both the edited stylesheet and its imports or includes. For XSL and XSD resources, the Outline view collects its components starting from the master files. The master files can be defined in the project or in the associated validation scenario. For further details about the **Master Files** support go to *Defining Master Files at Project Level*.

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.
The following actions are available in the Settings menu on the Outline view toolbar:

**Filter returns exact matches**

The text filter of the Outline view returns only exact matches;

**Selection update on cursor move**

Controls the synchronization between Outline view and source document. The selection in the Outline view can be synchronized with the cursor moves or the changes in the XSLT editor. Selecting one of the components from the Outline view also selects the corresponding item in the source document.

When the **Show components** option is selected, the following actions are available:

**Show XML structure**

Displays the XML document structure in a tree-like structure.

**Show all components**

Displays all components that were collected starting from the main file. This option is set by default.

**Show only local components**

Displays the components defined in the current file only.

**Group by location/type**

The stylesheet components can be grouped by location and type.

When the **Show XML structure** option is selected, the following actions are available:

**Show components**

Switches the Outline view to the components display mode.

**Flat presentation mode of the filtered results**

When active, the application flattens the filtered result elements to a single level.

**Show comments and processing instructions**

Show/hide comments and processing instructions in the Outline view.

**Show element name**

Show/hide element name.
Show text
Show/hide additional text content for the displayed elements.

Show attributes
Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from the Outline preferences panel.

Configure displayed attributes
Displays the XML Structured Outline preferences page.

The following contextual menu actions are also available when the Show components option is selected in the Settings menu:

Edit Attributes
Opens a small in-place editor that allow you to edit the attributes of the selected node.

Cut
Cuts the currently selected node.

Copy
Copies the currently selected node.

Delete
Deletes the currently selected node.

Search References Ctrl + Shift + R (Command + Shift + R on OS X)
Searches all references of the item found at current cursor position in the defined scope, if any. See Finding XSLT References and Declarations for more details.

Search References in
Searches all references of the item found at current cursor position in the specified scope. See Finding XSLT References and Declarations for more details.

Component Dependencies
Allows you to see the dependencies for the current selected component. See Component Dependencies View for more details.

Resource Hierarchy
Displays the hierarchy for the currently selected resource.

Resource Dependencies
Displays the dependencies of the currently selected resource.

Rename Component in
Renames the selected component. See XSLT Refactoring Actions for more details.

The following contextual menu actions are available in the Outline view when the Show XML structure option is selected in the Settings menu:

Append Child
Displays a list of elements that you can insert as children of the current element.

Insert Before
Displays a list of elements that you can insert as siblings of the current element, before the current element.

Insert After
Displays a list of elements that you can insert as siblings of the current element, after the current element.

Edit Attributes
Opens a small in-place editor that allow you to edit the attributes of the selected node.

Toggle Comment
Comments/uncomments the currently selected element.
Search references
Searches for the references of the currently selected component.

Search references in
Searches for the references of the currently selected component in the context of a scope that you define.

Component dependencies
Displays the dependencies of the currently selected component.

Rename Component in
Renames the currently selected component in the context of a scope that you define.

Cut
Cuts the currently selected component.

Copy
Copies the currently selected component.

Delete
Deletes the currently selected component.

Expand More
Expands the structure of a component in the Outline view.

Collapse All
Collapses the structure of all the component in the Outline view.

The stylesheet components information is presented on two columns: the first column presents the name and match attributes, the second column the mode attribute. If you know the component name, match or mode, you can search it in the Outline view by typing one of these pieces of information in the filter text field from the top of the view or directly on the tree structure. When you type de component name, match or mode in the text field, you can switch to the tree structure using:

- Keyboard arrow keys
- Enter key
- Tab key
- Shift-Tab key combination

To switch from tree structure to the filter text field, you can use Tab and Shift-Tab.

Tip: The search filter is case insensitive. The following wildcards are accepted:

- * - any string
- ? - any character
- , - patterns separator

If no wildcards are specified, the string to search is used as a partial match.

The content of the Outline view and the editing area are synchronized. When you select a component in the Outline view, its definition is highlighted in the editing area.

Oxygen XML Editor allows you to sort the components of the tree in the Outline view.

Note: Sorting groups in the Outline view is not supported.

Oxygen XML Editor has a predefined order of the groups in the Outline view:

- For location, the names of the files are sorted alphabetically. The main file is the one you are editing and it is located at the top of the list.
- For type, the order is: parameters, variables, templates, functions, set attributes, character-map.

Note: When no grouping is available and the table is not sorted, Oxygen XML Editor sorts the components depending on their order in the document. Oxygen XML Editor also takes into account the name of the file that the components are part of.
XSLT/XQuery Input View

The structure of the XML document associated to the edited XSLT stylesheet, or the structure of the source documents of the edited XQuery is displayed in a tree form in a view called the XSLT/XQuery Input view. If the view is not displayed, it can be opened from the Window > Show View menu. The tree nodes represent the elements of the documents.

XSLT

If you click a node in the XSLT/XQuery Input view, the corresponding template from the stylesheet is highlighted. A node can be dragged from this view and dropped in the editor area for quickly inserting xsl:template, xsl:for-each, or other XSLT elements that have the match/select/test attribute already completed. The value of the attribute is the correct XPath expression that refers to the dragged tree node. This value is based on the current editing context of the drop spot.

Figure 265: XSLT Input View

XSLT Example:

For the following XML document:

```xml
<personnel>
  <person id="Big.Boss">
    <name>
      <family>Boss</family>
      <given>Big</given>
    </name>
    <email>chief@oxygenxml.com</email>
    <link subordinates="one.worker"/>
  </person>
  <person id="one.worker">
    <name>
      <family>Worker</family>
      <given>One</given>
    </name>
    <email>one@oxygenxml.com</email>
    <link manager="Big.Boss"/>
  </person>
</personnel>
```

and the following XSLT stylesheet:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  version="2.0">
  <xsl:template match="personnel">
    <xsl:for-each select="*">
    </xsl:for-each>
  </xsl:template>
</xsl:stylesheet>
```

if you drag the given element and drop it inside the xsl:for-each element, the following pop-up menu is displayed:
If you select `Insert xsl:copy-of` (for example), the resulting document will look like this:

```xml
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform" version="2.0">
  <xsl:template match="personnel">
    <xsl:for-each select="*">
      <xsl:copy-of select="name/given"/>
    </xsl:for-each>
  </xsl:template>
</xsl:stylesheet>
```

You can also use the XSLT/XQuery Input view to drag and drop a node into the editing area to quickly insert XQuery expressions.

For the following XML documents:

```xml
<movies>
  <movie id="1">
    <title>The Green Mile</title>
    <year>1999</year>
  </movie>
  <movie id="2">
    <title>Taxi Driver</title>
    <year>1976</year>
  </movie>
</movies>
```
and the following XQuery:

```xml
let $review := doc("reviews.xml")
for $movie in doc("movies.xml")/movies/movie
let $movie-id := $movie/@id
return
<rave id="{$movie/@id}">
{$movie/title}
{$movie/year}
<maxRating>
{...}
</maxRating>
</movie>
```

If you drag the `review` element and drop it between the braces, the following pop-up menu is displayed:

![Figure 269: XQuery Input Drag and Drop Pop-up Menu](image)

Select **FLWOR review**, the resulting document will look like this:

```xml
{ where ( … ) return $rave }
```

![Figure 270: XQuery Input Drag and Drop Result](image)

**XSLT Resource Hierarchy/Dependencies View**

The **Resource Hierarchy/Dependencies** view allows you to see the hierarchy/dependencies for a stylesheet. If the view is not displayed, it can be opened from the **Window > Show View** menu.

If you want to see the hierarchy of a stylesheet, select the desired stylesheet in the **Project** view and choose **Resource Hierarchy** from the contextual menu.
If you want to see the dependencies of a stylesheet, select the desired stylesheet in the Project view and choose Resource Dependencies from the contextual menu.

The following actions are available in the Resource Hierarchy/Dependencies view:
Refresh
Refreshes the Hierarchy/Dependencies structure.

Stop
Stops the hierarchy/dependencies computing.

Show Hierarchy
Allows you to choose a resource to compute the hierarchy structure.

Show Dependencies
Allows you to choose a resource to compute the dependencies structure.

Configure
Allows you to configure a scope to compute the dependencies structure. There is also an option for automatically using the defined scope for future operations.

History
Provides access to the list of previously computed dependencies. Use the *Clear history* button to remove all items from this list.

The contextual menu contains the following actions:

Open
Opens the resource. You can also double-click a resource in the Hierarchy/Dependencies structure to open it.

Copy location
Copies the location of the resource.

Move resource
Moves the selected resource.

Rename resource
Renames the selected resource.

Show Resource Hierarchy
Shows the hierarchy for the selected resource.

Show Resource Dependencies
Shows the dependencies for the selected resource.

Add to Master Files
Adds the currently selected resource in the *Master Files* directory.

Expand All
Expands all the children of the selected resource from the Hierarchy/Dependencies structure.

Collapse All
Collapses all children of the selected resource from the Hierarchy/Dependencies structure.

Tip: When a recursive reference is encountered in the Hierarchy view, the reference is marked with a special icon ☹.

Related information
*Working with Modular XML Files in the Master Files Context* on page 457
*Search and Refactor Operations Scope* on page 449

Moving/Renaming XSLT Resources
You can move and rename a resource presented in the Resource/Hierarchy Dependencies view, using the Rename resource and Move resource refactoring actions from the contextual menu.

When you select the Rename action in the contextual menu of the Resource/Hierarchy Dependencies view, the Rename resource dialog box is displayed. The following fields are available:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references** - Enable this option to update the references to the resource you are renaming.
When you select the **Move** action from the contextual menu of the **Resource/Hierarchy Dependencies** view, the **Move resource** dialog box is displayed. The following fields are available:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - Enable this option to update the references to the resource you are moving, in accordance with the new location and name.

If the **Update references of the moved resource(s)** option is enabled, a **Preview** option (which opens the **Preview** dialog box) is available for both actions. The **Preview** dialog box presents a list with the resources that are updated.

**XSLT Component Dependencies View**

The Component Dependencies view allows you to see the dependencies for a selected XSLT component. If the view is not displayed, it can be opened from the **Window > Show View** menu.

If you want to see the dependencies of an XSLT component, select the desired component in the editor and choose the **Component Dependencies** action from the contextual menu. The action is available for all named components (templates, variables, parameters, attribute sets, keys, functions, outputs).

![Component Dependencies View - Hierarchy for table.xsl](image)

**Figure 273: Component Dependencies View - Hierarchy for table.xsl**

In the Component Dependencies view you have several actions in the toolbar:

- **Refresh**
  
  Refreshes the dependencies structure.

- **Stop**
  
  Stops the dependencies computing.
Configure

Allows you to configure a search scope to compute the dependencies structure. You can decide to use automatically the defined scope for future operations by checking the corresponding checkbox.

History

Allows you to repeat a previous dependencies computation.

The following actions are available on the contextual menu:

Go to First Reference

Selects the first reference of the referenced component from the current selected component in the dependencies tree.

Go to Component

Shows the definition of the current selected component in the dependencies tree.

Tip: If a component contains multiple references to another, a small table is displayed that contains all references. When a recursive reference is encountered, it is marked with a special icon 🟥.

Related information

Search and Refactor Operations Scope on page 449

Highlight Component Occurrences

When a component (for example variable or named template) is found at current cursor position, Oxygen XML Editor performs a search over the entire document to find the component declaration and all its references. When found, they are highlighted both in the document and in the stripe bar, at the right side of the document.

Note: Oxygen XML Editor also supports occurrences highlight for template modes.

Customizable colors are used: one for the component definition and another one for component references. Occurrences are displayed until another component is selected and a new search is performed. All occurrences are removed when you start to edit the document.

This feature is enabled by default. To configure it, open the Preferences dialog box (Options > Preferences) and go to Editor > Mark Occurrences. A search can also be triggered with the Search > Search Occurrences in File (Ctrl + Shift + U (Command + Shift + U on OS X)) contextual menu action. Matches are displayed in separate tabs of the Results view.

Finding XSLT References and Declarations

The following search actions related with XSLT references and declarations are available from the Search submenu of the contextual menu and from the Document > References menu:

• 📖 Search References - Searches all references of the item found at current cursor position in the defined scope, if any. If a scope is defined but the currently edited resource is not part of the range of determined resources, a warning dialog box is displayed that allows you to define another search scope.

• 📖 Search References in - Searches all references of the item found at current cursor position in the file or files that you specify when a scope is defined.

• 📖 Search Declarations - Searches all declarations of the item found at current cursor position in the defined scope, if any. If a scope is defined but the current edited resource is not part of the range of resources determined by this scope, a warning dialog box is displayed that allows you to define another search scope.

• 📖 Search Declarations in - Searches all declarations of the item found at current cursor position in the file or files that you specify when a scope is defined.

• 📖 Search Occurrences in File - Searches all occurrences of the item at the cursor position in the currently edited file.

The following action is available from the contextual menu and the Document > Schema menu:

• 📖 Show Definition - Moves the cursor to the location of the definition of the current item.

Note: You can also use the Ctrl + Single-Click (Command + Single-Click on OS X) shortcut on a reference to display its definition.
XSLT Stylesheet Component Documentation Support

Oxygen XML Editor offers built-in support for documenting XSLT stylesheets. If the expanded QName of the element has a non-null namespace URI, the xsl:stylesheet element may contain any element not from the XSLT namespace. Such elements are referenced as user-defined data elements. Such elements can contain the documentation for the stylesheet and its elements (top-level elements whose names are in the XSLT namespace). Oxygen XML Editor offers its own XML schema that defines such documentation elements. The schema is named stylesheet_documentation.xsd and can be found in [OXYGEN_INSTALL_DIR]/frameworks/stylesheet_documentation. The user can also specify a custom schema in XSL Content Completion options.

When content completion is invoked inside an XSLT editor by pressing Ctrl + Space (Command + Space on OS X), it offers elements from the XSLT documentation schema (either the built-in one or one specified by user).

In Text mode, to add documentation blocks while editing use the Add component documentation action available in the contextual menu.

In Author mode, the following stylesheet documentation actions are available in the contextual menu, Component Documentation submenu:

- **Add component documentation** - Adds documentation blocks for the component at cursor position.
- **Paragraph** - Inserts a new documentation paragraph.
- **Bold** - Makes the selected documentation text bold.
- **Italic** - Makes the selected documentation text italic.
- **List** - Inserts a new list.
- **List Item** - Inserts a list item.

If the cursor is positioned inside the xsl:stylesheet element context, documentation blocks are generated for all XSLT elements. If the cursor is positioned inside a specific XSLT element (such as a template or function), a documentation block is generated for that element only.

Example of a documentation block using Oxygen XML Editor built-in schema

```xml
<xd:doc>
  <xd:desc>
    <xd:p>Search inside parameter <xd:i>string</xd:i> for the last occurrence of parameter <xd:i>searched</xd:i>. The substring starting from the 0 position to the identified last occurrence will be returned. <xd:ref name="f:substring-after-last" type="function" xmlns:f="http://www.oxygenxml.com/doc/xsl/functions">See also</xd:ref></xd:p>
  </xd:desc>
  </xd:doc>
```

Generating Documentation for an XSLT Stylesheet

You can use Oxygen XML Editor to generate detailed documentation in HTML format for the elements (top-level elements whose names are in the XSLT namespace) of an XSLT stylesheet. You can select what XSLT elements to include in the generated documentation and also the level of details to present for each of them. The elements are hyperlinked. To generate
documentation in a *custom output format*, you can edit the XSLT stylesheet used to generate the documentation, or create your own stylesheet.

To open the **XSLT Stylesheet Documentation** dialog box, select **XSLT Stylesheet Documentation** from the **Tools > Generate Documentation** menu or from the **Generate Documentation** submenu in the contextual menu of the **Project** view.

![Figure 274: XSLT Stylesheet Documentation Dialog Box](image)

The **XSL URL** field of the dialog box must contain the full path to the XSL Stylesheet file you want to generate documentation for. The stylesheet may be a local or a remote file. You can specify the path to the stylesheet by entering it in the text field, or by using the **Insert Editor Variables** button or the options in the **Browse** drop-down menu.

### Output Tab

The following options are available in the **Output** tab:

- **Format** - Allows you to choose between the following formats:
  - **HTML** - The documentation is generated in *HTML output format*.
  - **Custom** - The documentation is generated in a *custom output format*, allowing you to control the output. Click the **Options** button to open a **Custom format options** dialog box where you can specify a custom stylesheet for creating the output. There is also an option to **Copy additional resources to the output folder** and you can select the path to the additional **Resources** that you want to copy. You can also choose to keep the intermediate XML files created during the documentation process by deselecting the **Delete intermediate XML file** option.

- **Output file** - You can specify the path of the output file by entering it in the text field, or by using the **Insert Editor Variables** button or the options in the **Browse** drop-down menu.

- **Split output into multiple files** - Instructs the application to split the output into multiple files. For large XSLT stylesheets, choosing another split criterion may generate smaller output files, providing faster documentation browsing. You can choose to split them by namespace, location, or component name.

- **Open in Browser/System Application** - Opens the result in the system application associated with the output file type.

  **Note:** To set the browser or system application that will be used, *open the Preferences dialog box (Options > Preferences)*, go to **Global**, and set it in the **Default Internet browser** field. This will take precedence over the default system application settings.
**Settings Tab**

When you generate documentation for an XSLT stylesheet you can choose what XSLT elements to include in the output (templates, functions, global parameters, global variables, attribute sets, character maps, keys, decimal formats, output formats, XSLT elements from referenced stylesheets) and the details to include in the documentation.

![Settings Tab of the XSLT Stylesheet Documentation Dialog Box](image)

The **Settings** tab allows you to choose whether or not to include the following components: **Templates, Functions, Global parameters, Global variables, Attribute sets, Character maps, Keys, Decimal formats, Output formats, Referenced stylesheets**.

You can choose whether or not to include the following other details:

- **Documentation** - Shows the documentation for each XSLT element. For HTML format, the user-defined data elements that are recognized and transformed in documentation blocks of the XSLT elements they precede, are the ones from the following schemas:
  - Oxygen XML Editor built-in XSLT documentation schema.
  - A subset of DocBook 5 elements. The recognized elements are: `section`, `sect1` to `sect5`, `emphasis`, `title`, `ulink`, `programlisting`, `para`, `orderedlist`, `itemizedlist`.
  - A subset of DITA elements. The recognized elements are: `concept`, `topic`, `task`, `codeblock`, `p`, `b`, `i`, `ul`, `ol`, `pre`, `sli`, `sli`, `step`, `steps`, `li`, `title`, `xref`.
  - Full XHTML 1.0 support.
  - XSLStyle documentation environment. XSLStyle uses DocBook or DITA languages inside its own user-defined data elements. The supported DocBook and DITA elements are the ones mentioned above.
  - Doxsl documentation framework. Supported elements are: `codefrag`, `description`, `para`, `docContent`, `documentation`, `parameter`, `function`, `docSchema`, `link`, `list`, `listitem`, `module`, `parameter`, `template`, `attribute-set`;

  Other XSLT documentation blocks that are not recognized will just be serialized inside an HTML `pre` element. You can change this behavior by using a *custom format* instead of the built-in *HTML format* and providing your own XSLT stylesheets.

- **Use comments** - Controls whether or not the comments that precede an XSLT element is treated as documentation for the element they precede. Comments that precede or succeed the `xsl:stylesheet` element, are treated as documentation for the whole stylesheet. Note that comments that precede an import or include directive are not collected as documentation for the imported/included module. Also, comments from within the body of the XSLT elements are not collected at all.
- **Namespace** - Shows the namespace for named XSLT elements.
- **Location** - Shows the stylesheet location for each XSLT element.
- **Parameters** - Shows parameters of templates and functions.
- **References** - Shows the named XSLT elements that are referenced from within an element.
- **Used by** - Shows the list of all the XSLT elements that reference the current named element.
- **Supersedes** - Shows the list of all the XSLT elements that are superseded the current element.
- **Overriding** - Shows the list of all the XSLT elements that override the current element.
- **Return type** - Shows the return type of the function.
- **Source** - Shows the text stylesheet source for each XSLT element.
- **Import precedence** - Shows the computed import precedence as declared in the XSL transformation specifications.
- **Generate index** - Creates an index with all the XSLT elements included in the documentation.

**Export settings** - Save the current settings in a settings file for further use (for example, with the exported settings file you can generate the same documentation from the command-line interface.)

**Load settings** - Reloads the settings from the exported file.

**Generate** - Use this button to generate the XSLT documentation.

**Related information**

*XSLT Stylesheet Component Documentation Support* on page 503

### Generate XSLT Documentation in HTML Format

The XSLT documentation generated in HTML format is presented in a visual diagram style with various sections, hyperlinks, and options.

![Figure 276: XSLT Stylesheet Documentation Example](image)

The generated documentation includes the following:

- **Table of Contents** - You can group the contents by namespace, location, or component type. The XSLT elements from each group are sorted alphabetically (named templates are presented first and the match ones second).
• Information about main, imported, and included stylesheets. This information consists of:
  • XSLT modules included or imported by the current stylesheet.
  • The XSLT stylesheets where the current stylesheet is imported or included.
  • The stylesheet location.

### Figure 277: Information About an XSLT Stylesheet

If you choose to split the output into multiple files, the table of contents is displayed in the left frame. The contents are grouped using the same criteria as the split.

After the documentation is generated, you can collapse or expand details for some stylesheet XSLT elements by using the Showing options or the Collapse or Expand buttons.

### Figure 278: Showing Options

For each element included in the documentation, the section presents the element type followed by the element name (value of the name or match attribute for match templates).
Generate XSLT Documentation in a Custom Format

XSLT stylesheet documentation can be also generated in a custom format. You can choose the format from the XSLT Stylesheet Documentation dialog box. Specify your own stylesheet to transform the intermediary XML generated in the documentation process. You must write your stylesheet based on the schema xslDocSchema.xsd from \[OXYGEN_INSTALL_DIR\]/frameworks/stylesheet_documentation. You can create a custom format starting from one of the stylesheets used in the predefined HTML, PDF, and DocBook formats. These stylesheets are available in \[OXYGEN_INSTALL_DIR\]/frameworks/stylesheet_documentation/xsl.
When using a custom format, you can also copy additional resources into the output folder or choose to keep the intermediate XML files created during the documentation process.

### Generating XSLT Documentation From the Command-Line Interface

You can export the settings of the **XSLT Stylesheet Documentation** dialog box to an XML file by pressing the **Export settings** button. With the exported settings file, you can generate the same documentation from the command line by running the script `stylesheetDocumentation.bat` (on Windows) / `stylesheetDocumentation.sh` (on OS X / Unix / Linux) located in the Oxygen XML Editor installation folder. The script can be integrated in an external batch process launched from the command-line interface.

The command-line parameter of the script is the relative path to the exported XML settings file. The files that are specified with relative paths in the exported XML settings are resolved relative to the script directory.

#### Example of an XML Configuration File

```xml
<serialized>
  <map>
    <entry>
      <String xml:space="preserve">xsd.documentation.options</String>
      <xsdDocumentationOptions>
        <field name="outputFile">
          <String xml:space="preserve">${cfn}.html</String>
        </field>
        <field name="splitMethod">
          <Integer xml:space="preserve">1</Integer>
        </field>
        <field name="openOutputInBrowser">
          <Boolean xml:space="preserve">true</Boolean>
        </field>
        <field name="format">
          <Integer xml:space="preserve">1</Integer>
        </field>
        <field name="customXSL">
          <null/>
        </field>
        <field name="deleteXMLFiles">
          <Boolean xml:space="preserve">true</Boolean>
        </field>
        <field name="includeIndex">
          <Boolean xml:space="preserve">true</Boolean>
        </field>
        <field name="includeGlobalElements">
          <Boolean xml:space="preserve">true</Boolean>
        </field>
        <field name="includeGlobalAttributes">
          <Boolean xml:space="preserve">true</Boolean>
        </field>
        <field name="includeLocalElements">
          <Boolean xml:space="preserve">true</Boolean>
        </field>
        <field name="includeLocalAttributes">
          <Boolean xml:space="preserve">true</Boolean>
        </field>
        <field name="includeSimpleTypes">
          <Boolean xml:space="preserve">true</Boolean>
        </field>
        <field name="includeComplexTypes">
          <Boolean xml:space="preserve">true</Boolean>
        </field>
        <field name="includeGroups">
          <Boolean xml:space="preserve">true</Boolean>
        </field>
        <field name="includeAttributesGroups">
          <Boolean xml:space="preserve">true</Boolean>
        </field>
        <field name="includeRedefines">
          <Boolean xml:space="preserve">true</Boolean>
        </field>
        <field name="includeReferencedSchemas">
          <Boolean xml:space="preserve">true</Boolean>
        </field>
        <field name="detailsDiagram">
          <Boolean xml:space="preserve">true</Boolean>
        </field>
        <field name="detailsNamespace">
          <Boolean xml:space="preserve">true</Boolean>
        </field>
        <field name="detailsLocation">
          <Boolean xml:space="preserve">true</Boolean>
        </field>
        <field name="detailsType">
          <Boolean xml:space="preserve">true</Boolean>
        </field>
      </xsdDocumentationOptions>
    </entry>
  </map>
</serialized>

Editing Documents 509
XSLT Quick Assist Support

The Quick Assist support helps you to rapidly access search and refactoring actions. If one or more actions are available in the current context, they are accessible via a yellow bulb help ( Nuevo ) placed at the current line in the stripe on the left side of the editor. Also, you can invoke the quick assist menu by using the Alt + 1 ( Meta + Alt + 1 on Mac OS X ) keyboard shortcuts.

Two categories of actions are available in the Quick Assist menu:

• Actions available on a selection made inside an attribute that contains an XPath expression:

  📑 Extract template

  Extracts the selected XSLT instructions sequence into a new template.

  🔄 Move to another stylesheet

  Allows you to move one or more XSLT global components (templates, functions, or parameters) to another stylesheet.

  🎨 Extract local variable

  Allows you to create a new local variable by extracting the selected XPath expression.

  🎨 Extract global variable

  Allows you to create a new global variable by extracting the selected XPath expression.

  ◇ Extract template parameter

  Allows you to create a new template parameter by extracting the selected XPath expression.

  ◇ Extract global parameter

  Allows you to create a new global parameter by extracting the selected XPath expression.
Figure 281: XSLT Quick Assist Support - Refactoring Actions

- Actions available when the cursor is positioned over the name of a component:

  - **Rename Component in**
    Renames the component and all its dependencies.
  
  - **Search Declarations**
    Searches the declaration of the component in a predefined scope. It is available only when the context represents a component name reference.
  
  - **Search References**
    Searches all references of the component in a predefined scope.
  
  - **Component Dependencies**
    Searches the component dependencies in a predefined scope.
  
  - **Change Scope**
    Configures the scope that will be used for future search or refactor operations.
  
  - **Rename Component**
    Allows you to rename the current component in-place.
  
  - **Search Occurrences**
    Searches all occurrences of the component within the current file.

XSLT Quick Fix Support

The Oxygen XML Editor Quick Fix support helps you resolve various errors that appear in a stylesheet by proposing quick fixes to problems such as missing templates, misspelled template names, missing functions, or references to an undeclared variable or parameter.

To activate this feature, hover over or place the cursor in the highlighted area of text where a validation error or warning occurs. If a Quick Fix is available for that particular error or warning, you can access the Quick Fix proposals with any of the following methods:

- When hovering over the error or warning, the proposals are presented in a tooltip pop-up window.
- If you place the cursor in the highlighted area where a validation error or warning occurs, a quick fix icon (ockeye) is displayed in the stripe on the left side of the editor. If you click this icon, Oxygen XML Editor displays the list of available fixes.
- With the cursor placed in the highlighted area of the error or warning, you can also invoke the quick fix menu by pressing Alt + 1 (Command + Alt + 1 on OS X) on your keyboard.

**Note:** The quick fixes are available only when validating an XSLT file with Saxon HE/PE/EE.

Figure 283: Example of an Undefined XSLT Functions Quick Fix

Figure 284: Example of an Undeclared XSLT Variables/Parameters Quick Fix

Oxygen XML Editor provides XSLT quick fixes for the following types of instances:

- **Template does not exist**, when the template name referenced in a `call-template` element does not exist. The following fixes are available:
  - Create template "TemplateName" - creates a template and generates its corresponding parameters. The template name and parameter names and types are collected from the `call-template` element.
  - Change reference to "newTemplateName" - changes the name of the missing template referenced in the `call-template` element. The proposed new names are the existing templates with names similar with the missing one.

- **Variable/Parameter not declared**, when a parameter or variable reference cannot be found. The following fixes are available:
  - Create global variable "varName" - creates a global variable with the specified name in the current stylesheet. The new variable is added at the beginning of the stylesheet after the last global variable or parameter declaration.
  - Create global parameter "paramName" - creates a global parameter with the specified name in the current stylesheet. The new parameter is added at the beginning of the stylesheet after the last global parameter or variable declaration.
  - Create local variable "varName" - creates a local variable with the specified name before the current element.
  - Create template parameter "paramName" - creates a new parameter with the specified name in the current template. This fix is available if the error is located inside a template.
• **Create function parameter "paramName"** - creates a new parameter with the specified name in the current function. This fix is available if the error is located inside a function.

• **Change reference to "varName"** - changes the name of the referenced variable/parameter to an existing local or global variable/parameter, that has a similar name with the current one.

**Parameter from a called template is not declared**, when a parameter referenced from a call-template element is not declared. The following fixes are available:

• **Create parameter "paramName" in the template "templateName"** - creates a new parameter with the specified name in the referenced template.

• **Change "paramName" parameter reference to "newParamName"** - changes the parameter reference from the call-template element to a parameter that is declared in the called template.

• **Remove parameter "paramName" from call-template** - removes the parameter with the specified name from the call-template element.

• **No value supplied for required parameter**, when a required parameter from a template is not referenced in a call-template element. The following quick-fix is available::

• **Add parameter "paramName" in call-template** - creates a new parameter with the specified name in call-template element.

• **Function "prefix:functionName()" has not been defined**, when a function declaration is not found. The following quick fixes are available:

• **Create function "prefix:functionName(param1, param2)"** - creates a new function with the specified signature, after the current top level element from stylesheet.

• **Change function to "newFunctionName(\ldots)"** - changes the referenced function name to an already defined function. The proposed names are collected from functions with similar names and the same number of parameters.

• **Attribute-set "attrSetName" does not exist**, when the referenced attribute set does not exist. The following quick fixes are available:

• **Create attribute-set "attrSetName"** - creates a new attribute set with the specified name, after the current top level element from stylesheet.

• **Change reference to "attrSetName"** - changes the referenced attribute set to an already defined one.

• **Character-map "characterMap" has not been defined**, when the referenced character map declaration is not found. The following quick fixes are available:

• **Create character-map "characterMapName"** - creates a new character map with the specified name, after the current top level element from stylesheet.

• **Change reference to "characterMapName"** - changes the referenced character map to an already defined one.

**XSLT Refactoring Actions**

Oxygen XML Editor offers a set of actions that allow you to change the structure of an XSLT stylesheet without changing the results of running it in an XSLT transformation. Depending on the selected text, the following XSLT refactoring actions are available from the **Refactoring** submenu of the contextual menu (or from the Document > Refactoring menu):

• **Extract template** (Active only when the selection contains well-formed elements) - Extracts the selected XSLT instructions sequence into a new template. It opens a dialog box that allows you to specify the name of the new template to be created. The possible changes to perform on the document can be previewed before altering the document. After pressing OK, the template is created and the selection is replaced with a `<xsl:call-template>` instruction referencing the newly created template.

  **Note:** The newly created template is indented and its name is highlighted in the `<xsl:call-template>` element.

• **Extract function** - Extracts the selected XSLT instructions sequence into a new function. It opens a dialog box that allows you to specify the name of the new function. It then moves the selected lines to a newly created XSLT function and inserts a function call in the place of the selected lines.
• **Create local variable** - Creates an XSLT variable, wrapped around the selection. It opens a dialog box that allows you to specify the name of the new variable. It then wraps the selection in the variable and you can reference it at anytime in the code.

• **Move to another stylesheet** (Active only when entire components are selected) - Allows you to move one or more XSLT global components (templates, functions, or parameters) to another stylesheet. It opens a dialog box that allows you to specify where the selected components will be moved to. Follow these steps when using the dialog box:

  1. Choose whether you want to move the selected components to a new stylesheet or an existing one.
  2. If you choose to move the components to an existing one, select the destination stylesheet. Press the **Choose** button to select the destination stylesheet file. Oxygen XML Editor will automatically check if the destination stylesheet is already contained by the hierarchy of the current stylesheet. If it is not contained, choose whether or not the destination stylesheet will be referenced (imported or included) from the current stylesheet. The following options are available:

     - **Include** - The current stylesheet will use an `xsl:include` instruction to reference the destination stylesheet.
     - **Import** - The current stylesheet will use an `xsl:import` instruction to reference the destination stylesheet.
     - **None** - There will be created no relation between the current and destination stylesheets.

  3. Press the **Move** button to move the components to the destination. The moved components are highlighted in the destination stylesheet.

• **Convert attributes to xsl:attributes** - Converts the attributes from the selected element and represents each of them with an `<xsl:attribute>` instruction. For example, the following element:

  ```xml
  <person id="$x{test}Boss"/>
  ```

  is converted to:

  ```xml
  <person>
    <xsl:attribute name="id">
      <xsl:value-of select="x{test}"/>
      <xsl:text>Boss</xsl:text>
    </xsl:attribute>
  </person>
  ```

• **Convert xsl:if into xsl:choose/xsl:when** - Converts an `xsl:if` block to an `xsl:when` block surrounded by an `xsl:choose` element. For example, the following block:

  ```xml
  <xsl:if test="a">
    <!-- XSLT code -->
  </xsl:if>
  ```

  is converted to:

  ```xml
  <xsl:choose>
    <xsl:when test="a">
      <!-- XSLT code -->
    </xsl:when>
    <xsl:otherwise>
      <!-- XSLT code -->
    </xsl:otherwise>
  </xsl:choose>
  (where the | character is the current cursor position)

• **Extract local variable** (Active on a selection made inside an attribute that contains an XPath expression) - Allows you to create a new local variable by extracting the selected XPath expression. After creating the new local variable before the current element, Oxygen XML Editor allows you to edit the name of the variable.

• **Extract global variable** (Active on a selection made inside an attribute that contains an XPath expression) - Allows you to create a new global variable by extracting the selected XPath expression. After creating the new global variable, Oxygen XML Editor allows you to edit the name of the variable.

  **Note:** Oxygen XML Editor checks if the selected expression depends on local variables or parameters that are not available in the global context where the new variable is created.
• **Extract template parameter** (Active on a selection made inside an attribute that contains an XPath expression) - Allows you to create a new template parameter by extracting the selected XPath expression. After creating the new parameter, Oxygen XML Editor allows you to edit the name of the parameter.

• **Extract global parameter** (Active on a selection made inside an attribute that contains an XPath expression) - Allows you to create a new global parameter by extracting the selected XPath expression. After creating the new parameter, Oxygen XML Editor allows you to edit the name of the parameter.

  **Note:** Oxygen XML Editor checks if the selected expression depends on local variables or parameters that are not available in the global context where the new parameter is created.

• **Rename Component** - Allows you to rename the current component (in-place). The component and all its references in the document are highlighted with a thin border and the changes you make to the component at the cursor position are updated in real time to all occurrences of the component. To exit the in-place editing, press the Esc or Enter key on your keyboard.

• **Rename Component in** - Opens a dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the Preview button, you can view the files to be affected by the action.

![Figure 285: Rename Identity Constraint Dialog Box](image)

**Figure 285: Rename Identity Constraint Dialog Box**

  **Note:** Many of these refactoring actions are also proposed by the Quick Assist support.

To watch our video demonstration about XSLT refactoring, go to [https://www.oxygenxml.com/demo/XSL_Refactoring.html](https://www.oxygenxml.com/demo/XSL_Refactoring.html).

**XSLT Unit Test (XSpec)**

XSpec is a behavior driven development (BDD) framework for XSLT and XQuery. XSpec consists of a syntax for describing the behavior of your XSLT or XQuery code, and some code that enables you to test your code against those descriptions.

To create an XSLT Unit Test, go to File > New > XSLT Unit Test. You can also create an XSLT Unit Test from the contextual menu of an XSL file in the Project view. Oxygen XML Editor allows you to customize the XSpec document when you create it. In the customization dialog box, you can enter the path to an XSL document or to a master XSL document.
To run an XSLT Unit Test, open the XSPEC file in an editor and click **Apply Transformation Scenario(s)** on the main toolbar.

**Note:** The transformation scenario is defined in the XSPEC document type.

When you create an XSpec document based on an XSL document, Oxygen XML Editor uses information from the validation and transformation scenarios associated with the XSL file. From the transformation scenario Oxygen XML Editor uses extensions and properties of Saxon 9.6.0.7, improving the Ant scenario associated with the XSpec document.

**Figure 286: New XSLT Unit Test Wizard**

An XSpec file contains one, or more test scenarios. You can test a stylesheet in one of the following ways:

- Test an entire stylesheet.

  Testing is performed in a certain context. You can define a context as follows:

  - Inline context, building the test based on a string.

    ```xml
    <x:scenario label="when processing a para element">
      <x:context>
        <para>...</para>
      </x:context>
    </x:scenario>
    ```

  - Based on an external file, or on a part of an external file extracted with an XPath expression.

    ```xml
    <x:scenario label="when processing a para element">
      <x:context href="source/test.xml" select="/doc/body/p[1]" />
      ...</x:scenario>
    ```
• Test a function.

```xml
<x:scenario label="when capitalising a string">
  <x:call function="eg:capital-case">
    <x:param select=""an example string"" />
    <x:param select="true()" />
  </x:call>
</x:scenario>
```

• Test a template with a name.

```xml
<x:call template="createTable">
  <x:param name="nodes">
    <value>A</value>
    <value>B</value>
  </x:param>
  <x:param name="cols" select="2" />
</x:call>
```

You can reference test files between each other, which allows you to define a suite of tests. For further details about test scenarios, go to [https://github.com/expath/xspec/wiki/Writing-Scenarios](https://github.com/expath/xspec/wiki/Writing-Scenarios).

### Editing Ant Build Files

Oxygen XML Editor includes an Ant editor that provides a variety of specialized features to assist you with creating and editing Ant build files. The editor includes some specialized views, content completion assistance, automatic validation, syntax highlighting, *Quick Assist* and *Quick Fix* support, as well as numerous common editing and search features.

**Related information**

*Editing XML Documents in Text Mode* on page 275

### Editing Ant Build Files in the Context of Master Files

Smaller interrelated modules that define a complex Ant build file cannot be correctly edited or validated individually due to their interdependency with other modules. For example, a *target* defined in a main build file is not visible when you edit an included or imported module. Oxygen XML Editor provides support for defining the main module (or modules), allowing you to edit any of the imported/included files in the context of the larger Ant build structure.

You can set a main Ant build file either by using the *master files support from the Project view*, or a validation scenario.

To set a main file using a validation scenario, add validation units that point to the main modules. Oxygen XML Editor warns you if the current module is not part of the dependencies graph computed for the main build file. In this case, it considers the current module as the main build file.

The advantages of editing in the context of main file include:

- Correct validation of a module in the context of a larger build structure.
- **Content Completion Assistant** displays all components valid in the current context.
- The *Outline* view displays the components collected from the entire build file structure.

### Validate Ant Build Files

Oxygen XML Editor performs the validation of Ant build files with the help of a built-in processor, which is largely based on the Apache Ant libraries. The path to these libraries can be configured in the *Ant preferences page*. The validation processor accesses the *parameters set in the associated Ant transformation scenario* and uses them as Ant properties when validating the current build script.

Oxygen XML Editor automatically validates Ant build files as you type. You can also validate the currently edited file by selecting the ✅ Validate action from the ✅ Validation toolbar drop-down menu or the Document > Validate menu.

**Tip:** To make a custom task available in the Ant validation engine, add a JAR file that contains the task implementation to the library directory of the built-in Ant distribution that comes bundled with Oxygen XML Editor (for example, `${OXYGEN_INSTALL_DIR}/tools/ant/lib` folder).
Create a Validation Scenario for Ant Build Files

If you want to customize the validation process for Ant build files, you can create a new validation scenario (or configure an existing one). For example, if you want to validate interrelated modules that define a complex Ant build file, you can specify the main Ant file by configuring a validation scenario. To create or configure a validation scenario, select Configure Validation Scenario(s) from the Validate toolbar drop-down menu or the Document > Validate menu.

Passing parameters to the Ant validation engine

Ant validation scenarios cannot be configured to accept custom Ant parameters. However, you can specify values for the parameters in your Ant document using an Ant transformation scenario:

1. Create a new Ant transformation scenario.
2. Edit the transformation scenario and set all parameters you need to pass to your Ant document.
3. Associate the new scenario with your Ant document (in the Configure Transformation Scenarios(s) dialog box). You do not need to run the transformation scenario. Every time a validation operation is triggered, the built-in validation engine uses the parameters set in the transformation scenario.

   Note: This behavior is available only for the validation scenarios that use the built-in validation engine. The custom defined validation engines do not benefit from this functionality.

Content Completion in Ant Build Files

The proposals offered by the Content Completion Assistant are context-sensitive.

The Content Completion Assistant proposes various item types that are defined in the current Ant build and in the imported and included builds. The proposals include:

- Element names
- Attribute names
- Property names

   Note: In addition to the user-defined properties, the Content Completion Assistant offers the following values:

   - The system properties set in the Java Virtual Machine.
   - The built-in properties that Ant provides.

- Target names
- Task and type reference IDs

   Tip: To make a custom task available in the Content Completion Assistant, add a JAR file that contains the task implementation to the library directory of the built-in Ant distribution that comes bundled with Oxygen XML Editor (for example, \[OXYGEN_INSTALL_DIR\]/tools/ant/lib folder).

   Note: For Ant resources, the proposals are collected starting from the master files. The master files can be defined in the project or in the associated validation scenario. For further details about the Master Files support go to Defining Master Files at Project Level.

Related information

http://ant.apache.org/manual/properties.html

Syntax Highlighting in Ant Files

Oxygen XML Editor supports syntax highlighting in Ant files to improve the readability of the content and reduce the time it takes to internalize the semantics of the structured content.

To customize the colors or styles used for the syntax highlighting colors for Ant build files, follow these steps:

1. Open the Preferences dialog box (Options > Preferences).
2. Go to Editor > Syntax Highlight.
3. Select and expand the Ant Property section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.

You can see the effects of your changes in the Preview pane.

**Related information**

*Syntax Highlight Preferences* on page 97

**Ant Outline View**

The **Outline** view for Ant files displays the list of all the components (properties, targets, extension points, task/type definitions and references) from both the edited Ant build file and its imported and included modules. For Ant resources, the **Outline** view collects its components starting from the master files. The master files can be defined in the project and the main build file can be specified in a validation scenario. For more details, see *Defining Master Files at Project Level*.

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

![Ant Outline View](image)

**Figure 287: Ant Outline View**

The following actions are available in the **Settings** menu on the Outline view toolbar:

**Filter returns exact matches**

The text filter of the **Outline** view returns only exact matches. By default, this filter is not selected.

**Selection update on cursor move**

Controls the synchronization between **Outline** view and source document. The selection in the **Outline** view can be synchronized with the cursor moves or the changes in the Ant editor. Selecting one of the components from the outline view also selects the corresponding item in the source document.

When the **Show components** option is selected, the following actions are available:

**Show XML structure**

Displays the XML document structure in a tree-like manner.

**Sort**

Sorts the components in the **Outline** view alphabetically.

**Show all components**

Displays all components that were collected starting from the main file. This option is set by default.

**Show only local components**

Displays the components defined in the current file only.

**Group by location/type**

The build file components can be grouped by location and type.
When the Show XML structure option is selected, the following actions are available:

Show components
Switches the Outline view to the components display mode.

Flat presentation mode of the filtered results
When active, the application flattens the filtered result elements to a single level.

Show comments and processing instructions
Show/hide comments and processing instructions in the Outline view.

Show element name
Show/hide element name.

Show text
Show/hide additional text content for the displayed elements.

Show attributes
Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from the Outline preferences panel.

Configure displayed attributes
Displays the XML Structured Outline preferences page.

The following actions are available in the contextual menu of the Outline view (when the Show XML structure option is selected in the Settings menu:

Append Child
Displays a list of elements that can be inserted as children of the current element.

Insert Before
Displays a list of elements that can be inserted as siblings of the current element, before the current element.

Insert After
Displays a list of elements that can be inserted as siblings of the current element, after the current element.

Edit Attributes
Displays an in-place attribute editing window.

Toggle Comment
Comments/uncomments the currently selected element.

Search References Ctrl + Shift + R (Command + Shift + R on OS X)
Searches all references of the item found at current cursor position in the defined scope. See Find References and Declarations of Ant Components for more details.

Search References in
Searches all references of the item found at current cursor position in the specified scope. See Find References and Declarations of Ant Components for more details.

Component Dependencies
Allows you to see the dependencies for the current selected component. See Ant Component Dependencies View for more details.

Rename Component in
 Renames the selected component. See Ant Refactoring Actions for more details.

Cut, Copy, Delete
Executes the typical editing actions on the currently selected component.

Expand More
Expands recursively all sub-components of the selected component.
Collapse All

Collapses recursively all sub-components of the selected component.

You can search a component in the Outline view by typing its name in the filter text field at the top of the view or directly on the tree structure. When you type the component name in the text field, you can switch to the tree structure using the following:

- Down arrow key
- Tab key
- Shift-Tab key combination

To switch from tree structure to the filter text field, you can use Tab and Shift-Tab.

Tip: The search filter is case insensitive. The following wildcards are accepted:

- * - any string
- ? - any character
- , - patterns separator

If no wildcards are specified, the string to search is used as a partial match (such as *textToFind*).

The content of the Outline view and the editing area are synchronized. When you select a component in the Outline view, its definition is highlighted in the editing area.

Oxygen XML Editor has a predefined order for the groups in the Outline view:

- For location, the names of the files are sorted alphabetically. The main file is the one you are editing and it is located at the top of the list.
- For type, the order is: properties, targets, references.

Note: When no grouping is available Oxygen XML Editor sorts the components depending on their order in the document. Oxygen XML Editor also takes into account the name of the file that the components are part of.

### Ant Resource Hierarchy/Dependencies View

The Resource Hierarchy/Dependencies view allows you to see the hierarchy/dependencies for an Ant build file by analyzing imported or included build files. If the view is not displayed, it can be opened from the Window > Show View menu.

If you want to see the hierarchy of a build file, select it in the Project view and choose Resource Hierarchy from the contextual menu.

If you want to see the dependencies of a build file, select it in the Project view and choose Resource Dependencies from the contextual menu.

The following actions are available in the Resource Hierarchy/Dependencies view:

- **Refresh**
  Refreshes the Hierarchy/Dependencies structure.

- **Stop**
  Stops the hierarchy/dependencies computing.

- **Show Hierarchy**
  Allows you to choose a resource to compute the hierarchy structure.

- **Show Dependencies**
  Allows you to choose a resource to compute the dependencies structure.

- **Configure**
  Allows you to configure a scope to compute the dependencies structure. There is also an option for automatically using the defined scope for future operations.

- **History**
  Provides access to the list of previously computed dependencies. Use the Clear history button to remove all items from this list.

Editing Documents 521
The contextual menu contains the following actions:

**Open**
- Opens the resource. You can also double-click a resource in the Hierarchy/Dependencies structure to open it.

**Copy location**
- Copies the location of the resource.

**Move resource**
- Moves the selected resource.

**Rename resource**
- Renames the selected resource.

**Show Resource Hierarchy**
- Shows the hierarchy for the selected resource.

**Show Resource Dependencies**
- Shows the dependencies for the selected resource.

**Add to Master Files**
- Adds the currently selected resource in the Master Files directory.

**Expand All**
- Expands all the children of the selected resource from the Hierarchy/Dependencies structure.

**Collapse All**
- Collapses all children of the selected resource from the Hierarchy/Dependencies structure.

Tip: When a recursive reference is encountered in the Hierarchy view, the reference is marked with a special icon 🚨.

### Ant Component Dependencies View

The Component Dependencies view allows you to see the dependencies for a selected Ant component. If the view is not displayed, it can be opened from the Window > Show View menu.

If you want to see the dependencies of an Ant component, select the desired component in the editor or Outline view and choose the Component Dependencies action from the contextual menu. The action is available for the following components: properties, targets, extension-points, and references (those that have an id set).

The following toolbar actions are available in the Component Dependencies view:

- **Refresh**
  - Refreshes the dependencies structure.

- **Stop**
  - Stops the dependencies computing.

- **Configure**
  - Allows you to configure a search scope to compute the dependencies structure. You can decide to use automatically the defined scope for future operations by checking the corresponding checkbox.

- **History**
  - Allows you to repeat a previous dependencies computation.

The following actions are available from the contextual menu:

**Go to First Reference**
- Selects the first reference of the referenced component from the current selected component in the dependencies tree.

**Go to Component**
- Shows the definition of the current selected component in the dependencies tree.

Tip: If a component contains multiple references to another, these references are listed in a table displayed at the bottom of Component Dependencies view. When a recursive reference is encountered, it is marked with a special icon 🚨.
Highlight Component Occurrences

When a component (for example property or target) is found at the current cursor position, they are highlighted in both the document and in the stripe bar at the right side of the document. Oxygen XML Editor also supports occurrences highlight for type and task references.

Customizable colors are used (one for the component definition and another one for component references). Occurrences are displayed until another component is selected and a new search is performed. All highlights are removed when you start to edit the document.

This feature is enabled by default. To configured it, open the Preferences dialog box (Options > Preferences) and go to Editor > Mark Occurrences. If the automatic feature is disabled for a particular type of file, you can perform this search by going to Search > Search Occurrences in File Ctrl + Shift + U (Command + Shift + U on OS X) in the contextual menu. Matches are displayed in separate tabs of the Results view.

Find References and Declarations of Ant Components

The following search actions related to references and declarations of Ant components are available from the Search submenu of the contextual menu and from the Document > References menu:

- Search References - Searches all references of the item found at current cursor position in the defined scope.
- Search References in - Searches all references of the item found at current cursor position in the file or files that you specify after selecting a scope for the search operation.
- Search Declaratons - Searches all declarations of the item found at current cursor position in the defined scope.
- Search Declarartions in - Searches all declarations of the item found at current cursor position in the file or files that you specify when defining a new scope.
- Search Occurrences in File - Searches all occurrences of the item at the cursor position in the currently edited file.

The following action is available from the contextual menu and the Document > Schema menu:

- Show Definition - Moves the cursor to the location of the definition of the current item.

Note: You can also use the Ctrl + Single-Click (Command + Single-Click on OS X) shortcut on a reference to display its definition.

Ant Quick Assist Support

The Quick Assist support helps you to rapidly access search and refactoring actions. If one or more actions are available in the current context, they are accessible via a yellow bulb icon (💡) placed at the current line in the stripe on the left side of the editor. Also, you can invoke the quick assist menu by using the Alt + 1 (Meta + Alt + 1 on Mac OS X) keyboard shortcuts.

The quick assist support offers direct access to the following actions:

- Rename Component in
  Renames the component and all its dependencies.
- Search Declarations
  Searches the declaration of the component in a predefined scope. It is available only when the context represents a component name reference.
- Search References
  Searches all references of the component in a predefined scope.
Component Dependencies

Searches the component dependencies in a predefined scope.

Change Scope

Configures the scope that will be used for future search or refactor operations.

Rename Component

Allows you to rename the current component in-place.

Search Occurrences

Searches all occurrences of the component within the current file.

Ant Quick Fix Support

The Oxygen XML Editor Quick Fix support helps you resolve missing target reference errors that may occur when developing Ant build documents.

To activate this feature, hover over or place the cursor in the highlighted area of text where a validation error or warning occurs. If a Quick Fix is available for that particular error or warning, you can access the Quick Fix proposals with any of the following methods:

- When hovering over the error or warning, the proposals are presented in a tooltip pop-up window.
- If you place the cursor in the highlighted area where a validation error or warning occurs, a quick fix icon (🛠️) is displayed in the stripe on the left side of the editor. If you click this icon, Oxygen XML Editor displays the list of available fixes.
- With the cursor placed in the highlighted area of the error or warning, you can also invoke the quick fix menu by pressing Alt + 1 (Command + Alt + 1 on OS X) on your keyboard.

Oxygen XML Editor provides the following types of quick fixes for Ant build files:

- **Create new target** - Creates a new target with the specified name.
- **Change reference to "targetName"** - Corrects the reference to point to an already defined target.
- **Remove target reference** - Removes the erroneous reference.

Ant Refactoring Actions

The following refactoring actions can be applied on targets, extension-points, properties, and references and allow you to consistently rename a component in the entire Ant build file structure. They are available from the Refactoring submenu in the contextual menu of the current editor or from the Document > Refactoring menu:

- **Rename Component** - Allows you to rename the current component (in-place). The component and all its references in the document are highlighted with a thin border and the changes you make to the component at the cursor position are updated in real time to all occurrences of the component. To exit the in-place editing, press the Esc or Enter key on your keyboard.

- **Rename Component in** - Opens a dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the Preview button, you can view the files to be affected by the action.
Editing XML Schemas

An XML Schema describes the structure of an XML document and is used to validate XML document instances against it, to check that the XML instances conform to the specified requirements. If an XML instance conforms to the schema then it is said to be valid. Otherwise, it is invalid.

Oxygen XML Editor offers support for both XML Schema 1.0 and 1.1 and you can edit XML Schema files in the following editing modes:

- **Text editing mode** - Allows you to edit XML Schema files in a source editing mode.
- **Grid editing mode** - Displays XML Schema files in a structured spreadsheet-like grid.
- **Design editing mode** - Visual schema designer that helps you understand the structure and develop complex schemas.
- **Author editing mode** - The visual Author mode is also available for XML Schema, allowing you to visually edit the schema annotations. It presents a polished and compact view of the XML Schema, with support for links on imported/included schemas.

For information about applying and detecting schemas, see *Associating a Schema to XML Documents* on page 450.

**Related information**

*Associating a Schema to XML Documents* on page 450

**Design Editing Mode (XML Schema Diagram Editor)**

XML Schemas enable document designers to specify the allowed structure and content of an XML document and to check if an XML document is valid.

Oxygen XML Editor provides a simple and expressive XML Schema diagram editor (Design mode) for editing XML Schemas. The schema diagram helps both the content authors who want to understand a schema and schema designers who develop complex schemas.

The diagram font can be increased using the usual Oxygen XML Editor shortcuts: *Ctrl* (Meta on Mac OS) + "+"), *Ctrl* (Meta on Mac OS)+"-"), *Ctrl* (Meta on Mac OS) + 0 or *Ctrl* (Meta on Mac OS) - mouse wheel. The whole diagram...
can also be zoomed with one of the predefined factors *available in the Schema preferences panel*. The same zoom factor is applied for the print and save actions.

**Figure 289: XML Schema Diagram**

To watch our video demonstration about the basic aspects of designing an XML Schema using the new Schema Editor, go to [https://www.oxygenxml.com/demo/XML_Schema_Editing.html](https://www.oxygenxml.com/demo/XML_Schema_Editing.html).

**Navigation in the XML Schema Design Mode**

The following editing and navigation features work for all types of schema components in the XML Schema **Design** mode:

- Select consecutive components on the diagram (components from the same level) using the *Shift* key. You can also make discontinuous selections in the schema diagram using the *Ctrl* (*Meta* on Mac OS) key. To deselect one of the components, use *Ctrl* + Single-Click (*Command* + Single-Click on OS X).
- Use the arrow keys to navigate the diagram vertically and horizontally.
- Use *Home/End* keys to jump to the first/last component from the same level. Use *Ctrl* + *Home* (*Command* + *Home on OS X*) key combination to go to the diagram root and *Ctrl* + *End* (*Command* + *End on OS X*) to go to the last child of the selected component.
You can easily go back to a previously visited component while moving from left to right. The path will be preserved only if you use the left arrow key or right arrow key. For example, if the current selection is on the second attribute from an attribute group and you press the left arrow key to jump to the attribute group, when you press the right arrow key, then the selection will be moved to the second attribute.

Go back and forward between components viewed or edited in the diagram by selecting them in the Outline view:

- **Back** (go to previous schema component).
- **Forward** (go to next schema component).
- **Go to Last Modification** (go to last modified schema component).

Copy, reference, or move global components, attributes, and identity constraints to another position and from one schema to another using the Cut/Copy and Paste/Paste as Reference actions.

Go to the definition of an element or attribute with the Show Definition action.

Search in the diagram using the Find/Replace dialog box or the Quick find toolbar. You can find/replace components only in the current file scope.

You can expand and see the contents of the imports/includes/redefines in the diagram. In order to edit components from other schemas the schema for each component will be opened as a separate file in Oxygen XML Editor.

**Tip:** If an XML Schema referenced by the current opened schema was modified on disk, the change will be detected and you will be asked to refresh the current schema contents.

Recursive references are marked with a *recurse symbol* (○). Click this symbol to navigate between the element declaration and its reference.

![Recursive Reference](image)

**Figure 290: Recursive Reference**

**Schema Editing Actions**

You can edit an XML schema using drag and drop operations or contextual menu actions.

Drag and drop is the easiest way to move the existing components to other locations in an XML schema. For example, you can quickly insert an element reference in the diagram with a drag and drop from the Outline view to a compositor in the diagram. Also, the components order in an xs:sequence can be easily changed using drag and drop.

If this property has not been set, you can easily set the attribute/element type by dragging over it a simple type or complex type from the diagram. If the type property for a simple type or complex type is not already set, you can set it by dragging over it a simple or complex type.

Depending on the drop area, various actions are available:

- **move** - Context dependent, the selected component is moved to the destination.
- **reference** - Context dependent, the selected component is referenced from the parent.
- **copy** - If (Ctrl (Meta on Mac OS)) key is pressed, a copy of the selected component is inserted to the destination.

Visual clues about the operation type are indicated by the mouse pointer shape:

- ▼ - When moving a component.
- ▼ - When referencing a component.
- ▼ - When copying a component.
You can edit some schema components directly in the diagram. For these components, you can edit the name and the additional properties presented in the diagram by double clicking the value you want to edit. If you want to edit the name of a selected component, you can also press (Enter). The list of properties that can be displayed for each component can be customized in the Preferences.

When editing references, you can choose from a list of available components. Components from an imported schema for which the target namespace does not have an associated prefix is displayed in the list as componentName#targetNamespace. If the reference is from a target namespace that was not yet mapped, you are prompted to add prefix mappings for the inserted component namespace in the current edited schema.

You can also change the compositor by double-clicking it and choose the compositor you want from the proposals list.

There are some components that cannot be edited directly in the diagram: imports, includes, redefines. The editing action can be performed if you double-click or press (Enter) on an import/include/redefine component. An edit dialog box is displayed, allowing you to customize the directives.

Contextual Menu Actions in the Design Mode

The contextual menu of the Design mode includes the following actions:

- **Show Definition (Ctrl + Shift + Enter)**
  Shows the definition for the current selected component. For references, this action is available by clicking the arrow displayed in its bottom right corner.

- **Open Schema (Ctrl + Shift + Enter)**
  Opens the selected schema. This action is available for xsd:import, xsd:include and xsd:redefine elements. If the file you try to open does not exist, a warning message is displayed and you have the possibility to create the file.

- **Edit Attributes ()**
  Allows you to edit the attributes of the selected component in a small in-place editor that presents the same attributes as in the Attributes View and the Facets View. The actions that can be performed on attributes in this dialog box are the same actions presented in the two views.

- **Append child**
  Offers a list of valid components, depending on the context, and appends your selection as a child of the currently selected component. You can set a name for a named component after it has been added in the diagram.

- **Insert before**
  Offers a list of valid components, depending on the context, and inserts your selection before the selected component, as a sibling. You can set a name for a named component after it has been added in the diagram.

- **Insert after**
  Offers a list of valid components, depending on the context, and inserts your selection after the selected component, as a sibling. You can set a name for a named component after it has been added in the diagram.

- **New global**
  Inserts a global component in the schema diagram. This action does not depend on the current context. If you choose to insert an import you have to specify the URL of the imported file, the target namespace and the import ID. The same information, excluding the target namespace, is requested for an xsd:include or xsd:redefine element.

  **Note:** If the imported file has declared a target namespace, the field Namespace is completed automatically.

- **Edit Schema Namespaces**
  When performed on the schema root, it allows you to edit the schema target namespace and namespace mappings. You can also invoke the action by double-clicking the target namespace property from Attributes view for the schema or by double-clicking the schema component.
Edit Annotations

Allows you to edit the annotation for the selected schema component in the **Edit Annotations** dialog box. You can perform the following operations in the dialog box:

- **Edit all appinfo/documentation items for a specific annotation** - All appinfo/documentation items for a specific annotation are presented in a table and can be easily edited. Information about an annotation item includes: type (documentation/appinfo), content, source (optional, specify the source of the documentation/appinfo element) and xml:lang. The content of a documentation/appinfo item can be edited in the **Content** area below the table.

- **Insert/Insert before/Remove documentation/appinfo**. The **Add** button allows you to insert a new annotation item (documentation/appinfo). You can add a new item before the item selected in the table by pressing the **Insert Before** button. Also, you can delete the selected item using the **Remove** button.

- **Move items up/down** - to do this use the **Move up** and **Move down** buttons.

- **Insert/Insert before/Remove annotation** - Available for components that allow multiple annotations such as schemas or redefines.

- **Specify an ID for the component annotation**. An optional identifier for the annotation.

Annotations are rendered by default under the graphical representation of the component. When you have a reference to a component with annotations, these annotations are presented in the diagram also below the reference component. The **Edit Annotations** action invoked from the contextual menu edit the annotations for the reference. If the reference component does not have annotations, you can edit the annotations of the referenced component by double-clicking the annotations area. Otherwise, you can edit the referenced component annotations only if you go to the definition of the component.

**Note:** For imported/included components that do not belong to the currently edited schema, the **Edit Annotations** dialog box presents the annotation as read-only. To edit its annotation, open the schema where the component is defined.

Extract Global Element

Action that is available for local elements. A local element is made global and is replaced with a reference to the global element. The local element properties that are also valid for the global element declaration are kept.

![Figure 291: Extracting a Global Element](image)

If you use the **Extract Global Element** action on a `name` element, the result is:

![Figure 292: Extracting a Global Element on a `name` Element](image)
Extract Global Attribute

Action available for local attributes. A local attribute is made global and replaced with a reference to the global attribute. The properties of local attribute that are also valid in the global attribute declaration are kept.

Figure 293: Extracting a Global Attribute

If you use the Extract Global Attribute action on a note attribute, the result is:

Figure 294: Extracting a Global Attribute on a note Attribute

Extract Global Group

Action available for compositors (sequence, choice, all). This action extracts a global group and makes a reference to it. The action is enabled only if the parent of the compositor is not a group.
If you use the **Extract Global Group** action on the sequence element, the **Extract Global Component** dialog box is displayed and you can choose a name for the group. If you type `personGroup`, the result is:

**Figure 295: Extracting a Global Group**

If you use the action on the union component and choose `numericST` for the new global simple type name, the result is:

**Figure 298: Extracting a Global Simple Type on a union Component**
Figure 299: Extracting a Global Complex Type

If you use the action on a `person` element and choose `person_type` for the new complex type name, the result is:

Figure 300: Extracting a Global Complex Type on a `person` Element

- **Rename Component in**
  Rename the selected component.

- **Cut Ctrl + X (Command + X on OS X)**
  Cut the selected component(s).

- **Copy Ctrl + C (Command + C on OS X)**
  Copy the selected component(s).

- **Copy XPath**
  This action copies an XPath expression that identifies the selected element or attribute in an instance XML document of the edited schema and places it in the clipboard.

- **Paste Ctrl + V (Command + V on OS X)**
  Paste the component(s) from the clipboard as children of the selected component.

- **Paste as Reference**
  Create references to the copied component(s). If not possible a warning message is displayed.

- **Remove (Delete)**
  Remove the selected component(s).

- **Override component**
  Copies the overridden component in the current XML Schema. This option is available for `xs:override` components.

- **Redefine component**
  The referenced component is added in the current XML Schema. This option is available for `xs:redefine` components.
Optional
Can be performed on element/attribute/group references, local attributes, elements, compositors, and element wildcards. The minOccurs property is set to 0 and the use property for attributes is set to optional.

Unbounded
Can be performed on element/attribute/group references, local attributes, elements, compositors, and element wildcards. The maxOccurs property is set to unbounded and the use property for attributes is set to required.

Search
Can be performed on local elements or attributes. This action makes a reference to a global element or attribute.

Search References
Searches all references of the item found at current cursor position in the defined scope if any.

Search References in
Searches all references of the item found at current cursor position in the specified scope.

Search Occurrences in File
Searches all occurrences of the item found at current cursor position in the current file.

Component Dependencies
Allows you to see the dependencies for the current selected component.

Resource Hierarchy
Allows you to see the hierarchy for the current selected resource.

Flatten Schema
Recursively adds the components of included Schema files to the main one. It also flattens every imported XML Schema from the hierarchy.

Resource Dependencies
Allows you to see the dependencies for the current selected resource.

Expand All
Recursively expands all sub-components of the selected component.

Collapse All
Recursively collapses all sub-components of the selected component.

Save as Image
Save the diagram as image, in JPEG, BMP, SVG or PNG format.

Generate Sample XML Files
Generate XML files using the current opened schema. The selected component is the XML document root. See more in the Generate Sample XML Files section.

Options
Show the Schema preferences panel.

XML Schema Components
A schema diagram contains a series of interconnected components. To quickly identify the relation between two connected components, the connection is represented as:

- A thick line to identify a connection with a required component (in the following image, family is a required element).

![Figure 301: Example: Required Component](image)

- A thin line to identify a connection with an optional component (in the following image, email is an optional element).
The following topics explain in detail all available components and their symbols as they appear in an XML schema diagram.

**xs:schema**

```
  <xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema">
    <targetNamespace>http://www.oxygenxml.com/supported-grammars</targetNamespace>
  </xs:schema>
```

**Figure 303: The xs:schema Component**

Defines the root element of a schema. A schema document contains representations for a collection of schema components, such as type definitions and element declarations, that have a common target namespace. See more info at [http://www.w3.org/TR/xmlschema11-1/#element-schema](http://www.w3.org/TR/xmlschema11-1/#element-schema).

By default, it displays the targetNamespace property when rendered.

**Table 10: xs:schema Properties**

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Description</th>
<th>Possible Values</th>

<td><strong>SystemID</strong></td>
<td>The schema system id</td>
<td>Not editable property.</td>
</tr>
</tbody>
</table>
Figure 304: The \texttt{xs:element} Component

Defines an element. An element declaration is an association of a name with a type definition, either simple or complex, an (optional) default value and a (possibly empty) set of identity-constraint definitions. See more info at http://www.w3.org/TR/xmlschema11-1/#element-element.

An element by default displays the following properties when rendered in the diagram: \textit{default}, \textit{fixed}, \textit{abstract} and \textit{type}. When referenced or declared locally, the element graphical representation also contains the value for the \textit{minOccurs} and \textit{maxOccurs} properties (for 0..1 and 1..1 occurs the values are implied by the connector style) and the connectors to the element are drawn using dotted lines if the element is optional.

\textbf{Table 11: \texttt{xs:element} Properties}

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Description</th>
<th>Possible Values</th>
<th>Mentions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The element name. Always required.</td>
<td>Any NCName for global or local elements, any QName for element references.</td>
<td>If missing, will be displayed as \textquote{[element]} in diagram.</td>
</tr>
<tr>
<td>Is Reference</td>
<td>When set, the local element is a reference to a global element.</td>
<td>true/false</td>
<td>Appears only for local elements.</td>
</tr>
<tr>
<td>Type</td>
<td>The element type.</td>
<td>All declared or built-in types. In addition, the following anonymous types are available: [ST-restriction], [ST-union], [ST-list], [CT-anonymous], [CT-extension SC], [CT-restriction SC], [CT-restriction CC], [CT-extension CC].</td>
<td>For all elements. For references, the value is set in the referenced element.</td>
</tr>
<tr>
<td>Base Type</td>
<td>The extended/restricted base type.</td>
<td>All declared or built-in types</td>
<td>For elements with complex type, with simple or complex content.</td>
</tr>
<tr>
<td>Mixed</td>
<td>Defines if the complex type content model will be mixed.</td>
<td>true/false</td>
<td>For elements with complex type.</td>
</tr>
<tr>
<td>Content</td>
<td>The content of the complex type.</td>
<td>simple/complex</td>
<td>For elements with complex type that extends/restricts a base type. It is automatically detected.</td>
</tr>
<tr>
<td>Content Mixed</td>
<td>Defines if the complex content model will be mixed.</td>
<td>true/false</td>
<td>For elements with complex type that has a complex content.</td>
</tr>
<tr>
<td>Default</td>
<td>Default value of the element. A default value is automatically assigned to the element when no other value is specified.</td>
<td>Any string</td>
<td>The fixed and default attributes are mutually exclusive.</td>
</tr>
<tr>
<td>Property Name</td>
<td>Description</td>
<td>Possible Values</td>
<td>Mentions</td>
</tr>
<tr>
<td>---------------</td>
<td>-------------</td>
<td>----------------</td>
<td>---------</td>
</tr>
<tr>
<td>Fixed</td>
<td>A simple content element may be fixed to a specific value using this attribute. A fixed value is also automatically assigned to the element and you cannot specify another value.</td>
<td>Any string</td>
<td>The fixed and default attributes are mutually exclusive.</td>
</tr>
<tr>
<td>Min Occurs</td>
<td>Minimum number of occurrences of the element.</td>
<td>A numeric positive value. Default value is 1</td>
<td>Only for references/local elements</td>
</tr>
<tr>
<td>Max Occurs</td>
<td>Maximum number of occurrences of the element.</td>
<td>A numeric positive value. Default value is 1</td>
<td>Only for references/local elements</td>
</tr>
<tr>
<td>Substitution Group</td>
<td>Qualified name of the head of the substitution group that this element belongs to.</td>
<td>All declared elements. For XML Schema 1.1 this property supports multiple values.</td>
<td>For global and reference elements</td>
</tr>
<tr>
<td>Abstract</td>
<td>Controls whether or not the element may be used directly in instance XML documents. When set to true, the element may still be used to define content models, but it must be substituted through a substitution group in the instance document.</td>
<td>true/false</td>
<td>For global elements and element references</td>
</tr>
<tr>
<td>Form</td>
<td>Defines if the element is &quot;qualified&quot; (belongs to the target namespace) or &quot;unqualified&quot; (doesn't belong to any namespace).</td>
<td>unqualified/qualified</td>
<td>Only for local elements</td>
</tr>
<tr>
<td>Nillable</td>
<td>When this attribute is set to true, the element can be declared as nil using an xsi:nil attribute in the instance documents.</td>
<td>true/false</td>
<td>For global elements and element references</td>

</table>

**xs:attribute**

![manager](type xsID)

**Figure 305: The xs:attribute Component**

Defines an attribute. See more info at [http://www.w3.org/TR/xmlschema11-1/#element-attribute](http://www.w3.org/TR/xmlschema11-1/#element-attribute).

An attribute by default displays the following properties when rendered in the diagram: default, fixed, use and type. Connectors to the attribute are drawn using dotted lines if the attribute use is optional. The attribute name is stroked out if prohibited.

**Table 12: xs:attribute Properties**

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Description</th>
<th>Possible Value</th>
<th>Mentions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Attribute name. Always required.</td>
<td>Any NCName for global/local attributes, all declared attributes' QName for references.</td>
<td>For all local or global attributes. If missing, will be displayed as '[attribute]' in the diagram.</td>
</tr>
<tr>
<td>Property Name</td>
<td>Description</td>
<td>Possible Value</td>
<td>Mentions</td>
</tr>
<tr>
<td>----------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>-----------------------</td>
<td>--------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Is Reference</td>
<td>When set, the local attribute is a reference.</td>
<td>true/false</td>
<td>For local attributes.</td>
</tr>
<tr>
<td>Type</td>
<td>Qualified name of a simple type.</td>
<td>All global simple types and built-in simple types. In addition another 3 proposals are present: [anonymous restriction], [anonymous list], [anonymous union] for creating anonymous simple types more easily.</td>
<td>For all attributes. For references, the type is set to the referenced attribute.</td>
</tr>
<tr>
<td>Default</td>
<td>Default value. When specified, an attribute is added by the schema processor (if it is missing from the instance XML document) and it is given this value. The default and fixed attributes are mutually exclusive.</td>
<td>Any string</td>
<td>For all local or global attributes. For references the value is from the referenced attribute.</td>
</tr>
<tr>
<td>Fixed</td>
<td>When specified, the value of the attribute is fixed and must be equal to this value. The default and fixed attributes are mutually exclusive.</td>
<td>Any string</td>
<td>For all local or global attributes. For references the value is from the referenced attribute.</td>
</tr>
<tr>
<td>Use</td>
<td>Possible usage of the attribute. Marking an attribute &quot;prohibited&quot; is useful to exclude attributes during derivations by restriction.</td>
<td>optional, required, prohibited</td>
<td>For local attributes</td>
</tr>
<tr>
<td>Form</td>
<td>Specifies whether or not the attribute is qualified (must have a namespace prefix in the instance XML document). The default value for this attribute is specified by the attributeFormDefault attribute of the xs:schema document element.</td>
<td>unqualified/qualified</td>
<td>For local attributes</td>
</tr>
<tr>
<td>Inheritable</td>
<td>Specifies if the attribute is inheritable. Inheritable attributes can be used by &lt;alternative&gt; element on descendant elements.</td>
<td>true/false</td>
<td>For all local or global attributes. The default value is false. This property is available for XML Schema 1.1.</td>
</tr>
</tbody>
</table>
Setting a target namespace for local attribute is useful only when restricts attributes of a complex type that is declared in other schema with a different target namespace. This property is available for XML Schema 1.1.

### xs:attributeGroup

Table 13: xs:attributeGroup Properties

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Description</th>
<th>Possible Values</th>
<th>Mentions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Attribute group name. Always required.</td>
<td>Any NCName for global attribute groups, all declared attribute groups for reference.</td>
<td>For all global or referenced attribute groups. If missing, will be displayed as [attributeGroup] in diagram.</td>
</tr>
<tr>
<td>ID</td>
<td>The component id.</td>
<td>Any id</td>

</tr>
<tr>
<td>System ID</td>
<td>The component system id.</td>
<td>Not editable property.</td>
<td>For all attribute groups.</td>
</tr>
</tbody>
</table>

### xs:complexType

Figure 307: The xs:complexType Component

Defines a top level complex type. Complex Type Definitions provide for: See more data at http://www.w3.org/TR/xmlschema11-1/#element-complexType.

- Constraining element information items by providing Attribute Declarations governing the appearance and content of attributes.
- Constraining element information item children to be empty, or to conform to a specified element-only or mixed content model, or else constraining the character information item children to conform to a specified simple type definition.
- Using the mechanisms of Type Definition Hierarchy to derive a complex type from another simple or complex type.
- Specifying post-schema-validation infoset contributions for elements.
- Limiting the ability to derive additional types from a given complex type.
• Controlling the permission to substitute, in an instance, elements of a derived type for elements declared in a content model to be of a given complex type.

Tip: A complex type that is a base type to another type will be rendered with yellow background.

### Table 14: `xs:complexType` Properties

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Description</th>
<th>Possible Values</th>
<th>Mentions</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
<td>The name of the complex type. Always required.</td>
<td>Any NCName</td>
<td>Only for global complex types. If missing, will be displayed as <code>[complexType]</code> in diagram.</td>
</tr>
<tr>
<td><strong>Base Type Definition</strong></td>
<td>The name of the extended/restricted types.</td>
<td>Any from the declared simple or complex types.</td>
<td>For complex types with simple or complex content.</td>
</tr>
<tr>
<td><strong>Derivation Method</strong></td>
<td>The derivation method.</td>
<td>restriction/extension</td>
<td>Only when base type is set. If the base type is a simple type, the derivation method is always extension.</td>
</tr>
<tr>
<td><strong>Content</strong></td>
<td>The content of the complex type.</td>
<td>simple/complex</td>
<td>For complex types that extend/restrict a base type. It is automatically detected.</td>
</tr>
<tr>
<td><strong>Content Mixed</strong></td>
<td>Specifies if the complex content model will be mixed.</td>
<td>true/false</td>
<td>For complex contents.</td>
</tr>
<tr>
<td><strong>Mixed</strong></td>
<td>Specifies if the complex type content model will be mixed.</td>
<td>true/false</td>
<td>For global and anonymous complex types.</td>
</tr>
<tr>
<td><strong>Abstract</strong></td>
<td>When set to true, this complex type cannot be used directly in the instance documents and needs to be substituted using an <code>xsi:type</code> attribute.</td>
<td>true/false</td>
<td>For global and anonymous complex types.</td>
</tr>
<tr>
<td><strong>Block</strong></td>
<td>Controls if a substitution (either through a <code>xsi:type</code> or substitution groups) can be performed for a complex type, which is an extension or a restriction of the current complex type. This attribute can only block such substitutions (it cannot &quot;unblock&quot; them), which can also be blocked in the element definition. The default value is defined by the <code>blockDefault</code> attribute of <code>xs:schema</code>.</td>
<td>all, extension, restriction, extension restriction, [Empty]</td>
<td>For global complex types.</td>
</tr>
<tr>
<td><strong>Final</strong></td>
<td>Controls whether the complex type can be further derived by extension or restriction to create new complex types.</td>
<td>all, extension, restriction, extension restriction, [Empty]</td>
<td>For global complex types.</td>
</tr>
</tbody>
</table>

</table>

xs:openContent

Figure 327: The xs:openContent Component

The openContent element enables instance documents to contain extension elements to be inserted amongst the elements declared by the schema. You can declare open content for your elements at one place (within the complexType definition) or at the schema level.

For further details about the openContent component, go to http://www.w3.org/TR/xmlschema11-1/#element-openContent.
Table 32: `xs:openContent` Properties

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Description</th>
<th>Possible Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mode</td>
<td>Specifies where the extension elements can be inserted.</td>
<td>The value can be: &quot;interleave&quot;, &quot;suffix&quot; or &quot;none&quot;. The default value is &quot;interleave&quot;.</td>
</tr>
<tr>

<td>The component system id.</td>
<td>Not editable property.</td>
</tr>
</tbody>
</table>

Note: This component is available for XML Schema 1.1 only. To change the version of the XML Schema, open the Preferences dialog box (Options > Preferences) and go to XML > XML Parser > XML Schema.

Constructs Used to Group Schema Components

This section explains the components that can be used for grouping other schema components:

- Attributes
- Constraints
- Substitutions

Attributes

![Attributes Construct](image)

Figure 328: Attributes Construct

Groups all attributes and attribute groups belonging to a complex type.

Table 33: `attributes` Properties

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Description</th>
<th>Possible Values</th>

<td>The element for which the substitutions are displayed.</td>
<td>Not editable property.</td>
</tr>
<tr>
<td>System ID</td>
<td>The component system id.</td>
<td>Not editable property.</td>
</tr>
</tbody>
</table>

**Schema Validation**

Validation for the **Design** mode is seamlessly integrated in the Oxygen XML Editor *XML documents validation* capability.
Figure 331: XML Schema Validation

A schema validation error is presented by highlighting the invalid component:

- In the Attributes View.
- In the diagram by surrounding the component that has the error with a red border.
- A marker on the errors stripe at the right of the diagram view.
- A status label with a red icon (��) below the diagram view.

Invalid facets for a component are highlighted in the Facets View.

Components with invalid properties are rendered with a red border. This is a default color, but you can customize it in the Document checking user preferences. When hovering an invalid component, the tooltip will present the validation errors associated with that component.

When editing a value that is supposed to be a qualified or unqualified XML name, the application provides automatic validation of the entered value. This proves to be very useful in avoiding setting invalid XML names for the given property.

If you validate the entire schema using the Validate action from the Document > Validate menu or from the Validation toolbar drop-down menu, all validation errors will be presented in the Errors tab. To resolve an error, just click it (or double-click for errors located in other schemas) and the corresponding schema component will be displayed as the diagram root so that you can easily correct the error.

Important: If the schema imports only the namespace of other schema without specifying the schema location and a catalog is set-up that maps the namespace to a certain location both the validation and the diagram will correctly identify the imported schema.

Tip: If the validation action finds that the schema contains unresolved references, the application will suggest the use of validation scenarios, but only if the current edited schema is an XML Schema module.

Edit Schema Namespaces

You can use the XML Schema Namespaces dialog box to easily set a target namespace and define namespace mappings for a newly created XML Schema. In the Design mode these namespaces can be modified anytime by choosing Edit Schema Namespaces from the contextual menu. You can also do this by double-clicking the schema root in the diagram.

The XML Schema Namespaces dialog box allows you to edit the following information:

- Target namespace - The target namespace of the schema.
• **Prefixes** - The dialog box displays a table with namespaces and the mapped prefixes. You can add a new prefix mapping or remove an already existing one.

**XML Schema Palette View**

The Palette view is designed to offer quick access to XML Schema components and to improve the usability of the XML Schema diagram builder. You can use the Palette to drag and drop components in the Design mode. The components offered in the Palette view depend on the XML schema version set in the XML Schema preferences page. If the view is not displayed, it can be opened from the Window > Show View menu.

![Image of the Palette View](https://www.oxygenxml.com/demo/Schema_Palette.html)

**Figure 332: Palette View**

Components are organized functionally into 4 collapsible categories:

- Basic components: elements, group, attribute, attribute group, complex type, simple type, type alternative.
- Compositors and Wildcards: sequence, choice, all, any, any attribute, open content.
- Directives: import, include, redefine, override.
- Identity constraints: key, keyref, unique, selector, field, assert.

**Note:** The type alternative, open content, override, and assert components are available for XML Schema 1.1.

To add a component to the edited schema:

- Click and hold a graphic symbol from the Palette view, then drag the component into the Design view.
- A line dynamically connects the component with the XML schema structure.
- Release the component into a valid position.

**Note:** You cannot drop a component into an invalid position. When you hover the component into an invalid position, the mouse cursor changes its shape into ![Invalid Position](https://www.oxygenxml.com/demo/Validation_error_highlight_color_option.png). Also, the connector line changes its color from the usual dark gray to the color defined in the Validation error highlight color option (default color is red).

**XML Schema Facets View**

The Facets view for XML Schemas presents the facets for the selected component, if available. If the view is not displayed, it can be opened from the Window > Show View menu.
Figure 333: Facets View

The default value of a facet is rendered in the Facets view with a blue color. The facets that can not be edited are rendered with a gray color. The grouping categories (for example: Enumerations and Patterns) are not editable. If these categories contain at least one child they are rendered with bold. Bold facets are facets with values set explicitly to them.

⚠️ Important: Usually inherited facets are presented as default in the Facets view but if patterns are inherited from a base type and also specified in the current simple type only the current specified patterns will be presented. You can see the effective pattern value obtained by combining the inherited and the specified patterns as a tooltip on the Patterns category.

Facets for components that do not belong to the current edited schema are read-only but if you double-click them you can choose to open the corresponding schema and edit them.

You can edit a facet by double-clicking it or by pressing Enter, when that facet is selected. For some facets you can choose valid values from a list or you can specify another value. If a facet has an invalid value or a warning, it will be highlighted in the table with the corresponding foreground color. By default, facets with errors are presented with red and the facets with warnings with yellow. You can customize the error colors from the Document Checking user preferences.

The Facets view provides the following actions in its toolbar and contextual menu:

- **Add**
  Allows you to add a new enumeration or a new pattern.

- **Remove**
  Allows you to remove the value of a facet.

- **Edit Annotations**
  Allows you to edit an annotation for the selected facet.

- **Move Up**
  Allows you to move up the current enumeration/pattern in Enumerations/Patterns category.

- **Move Down**
  Allows you to move down the current enumeration/pattern in Enumerations/Patterns category.

- **Copy**
  Copy the attribute value.

**Open in Regular Expressions Builder**
Rather than editing regular expressions manually, this action allows you to open the pattern in the XML Schema Regular Expressions Builder that guides you through the process of testing and constructing the pattern.

Facets can be fixed to prevent a derivation from modifying its value. To fix a facet value just press the Pin button.
Editing XML Schema in Text Editing Mode

The Oxygen XML Editor Text editing mode can be used for editing XML Schema in a source editing mode. It offers powerful content completion support, a synchronized Outline view, and multiple refactoring actions. The Outline view has two display modes: the standard outline mode and the components mode.

A diagram of the XML Schema can be presented side by side with the text. To activate the diagram presentation, enable the Show Full Model XML Schema diagram checkbox from the Diagram preferences page.

Editing XML Schema in the Master Files Context

Smaller interrelated modules that define a complex XML Schema cannot be correctly edited or validated individually, due to their interdependency with other modules. For example, an element defined in a main schema document is not visible when you edit an included module. Oxygen XML Editor provides the support for defining the main module (or modules), thus allowing you to edit any of the imported/included schema files in the context of the larger schema structure.

You can set a main XML document either using the master files support from the Project view, or using a validation scenario.

To set a main file using a validation scenario, add validation units that point to the main schemas. Oxygen XML Editor warns you if the current module is not part of the dependencies graph computed for the main schema. In this case, it considers the current module as the main schema.

The advantages of editing in the context of main file include:

- Correct validation of a module in the context of a larger schema structure.
- Content Completion Assistant displays all the referable components valid in the current context. This include components defined in modules other than the currently edited one.
- The Outline displays the components collected from the entire schema structure.

Validating XML Schema Documents

By default, XML Schema files are validated as you type. To change this, open the Preferences dialog box (Options > Preferences), go to Editor > Document Checking, and disable the Enable automatic validation option.

To validate an XML Schema document manually, select the Validate action from the Validation toolbar drop-down menu or the Document > Validate menu. When Oxygen XML Editor validates an XML Schema file, it expands all the included modules so the entire schema hierarchy is validated. The validation problems are highlighted directly in the editor, making it easy to locate and fix any issues.

References to XML Schema Specification

The same as in editing XML documents, the message of an error obtained by validation of an XML Schema document includes a reference to the W3C specification for XML Schema. An error message contains an Info field that will open the browser on the "XML Schema Part 1: Structures" specification at exactly the point where the error is described, thus allowing you to understand the reason for that error.
Validation of an XML Schema containing a type definition with a minOccurs or maxOccurs attribute having a value larger than 256 limits the value to 256 and issues a warning about this restriction in the Message panel at the bottom of the Oxygen XML Editor window. Otherwise, for large values of the minOccurs and maxOccurs attributes, the validator fails with an OutOfMemory error that might make Oxygen XML Editor unusable without restarting the entire application.

**Important:** If the schema imports only a namespace without specifying the schema location and a catalog is set up to map the namespace to a certain location, both validation and the schema components will correctly identify the imported schema.

### Content Completion in XML Schema

The intelligent **Content Completion Assistant** available in Oxygen XML Editor enables rapid, in-line identification and insertion of elements, attributes and attribute values valid in the editing context. All available proposals are listed in a pop-up menu displayed at the current cursor position.

The **Content Completion Assistant** is enabled by default. To disable it, open the Preferences dialog box (Options > Preferences), go to Editor > Content Completion, and disable the Enable content completion option.

When active, the **Content Completion Assistant** displays a list of context-sensitive proposals valid at the current cursor position. You can navigate through the list of proposals by using the Up and Down keys on your keyboard. For each selected item in the list, the **Content Completion Assistant** displays a documentation window. You can customize the size of the documentation window by dragging its top, right, and bottom borders.

To insert the selected content in Text mode, do one of the following:

- Press **Enter** or **Tab** to insert both the start and end tags and position the cursor inside the start tag in a position suitable for inserting attributes.
- Press **Ctrl + Enter** (**Command + Enter on OS X**) to insert both the start and end tags and positions the cursor between the tags in a position where you can start typing content.

Depending on the selected schema version, Oxygen XML Editor populates the proposals list with information taken either from XML Schema 1.0 or 1.1.

Oxygen XML Editor helps you to easily reference a component by providing the list of proposals (complex types, simple types, elements, attributes, groups, attribute groups, or notations) valid in the current context. The components are collected from the current file or from the imported/included schemas.

When editing `xs:annotation/xs:appinfo` elements of an XML Schema, the Content Completion Assistant proposes elements and attributes from a custom schema (by default ISO Schematron). This feature can be configured from the **XSD Content Completion** preferences page.

### XML Schema Outline View

The Outline view for XML Schemas presents all the global components grouped by their location, namespace, or type. By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened from the Window > Show View menu.
The **Outline** view provides the following options in the **Settings** menu on the **Outline** view toolbar:

**Filter returns exact matches**

The text filter of the **Outline** view returns only exact matches;

**Selection update on cursor move**

Allows a synchronization between **Outline** view and schema diagram. The selected view from the diagram is also selected in the **Outline** view.

**Sort**

Allows you to sort alphabetically the schema components.

**Show all components**

Displays all components that were collected starting from the main files. Components that are not referable from the current file are marked with an orange underline. To reference them, add an import directive with the `component:ns` namespace.

**Show referable components**

Displays all components (collected starting from the main files) that can be referenced from the current file. This option is set by default.

**Show only local components**

Displays the components defined in the current file only.

**Group by location/namespace/type**

These three operations allow you to group the components by location, namespace, or type. When grouping by namespace, the main schema target namespace is the first presented in the **Outline** view.

The following contextual menu actions are available in the **Outline** view:

**Remove (Delete)**

Removes the selected item from the diagram.

**Search References (Ctrl (Meta on Mac OS)+Shift+R)**

Searches all references of the item found at current cursor position in the defined scope, if any.
Search References in
Searches all references of the item found at current cursor position in the specified scope.

Component Dependencies (Ctrl (Meta on Mac OS)+Shift+F4)
Allows you to see the dependencies for the current selected component.

Resource Hierarchy (F4)
Allows you to see the hierarchy for the current selected resource.

Resource Dependencies (Shift + F4)
Allows you to see the dependencies for the current selected resource.

Rename Component in
Renames the selected component.

Generate Sample XML Files
Generate XML files using the current opened schema. The selected component is the XML document root.

The upper part of the Outline view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (*, ?) and separate multiple patterns with commas.

Tip: The search filter is case insensitive. The following wildcards are accepted:
- * - any string
- ? - any character
- , - patterns separator

If no wildcards are specified, the string to search will be searched as a partial match.

The content of the Outline view and the editing area are synchronized. When you select a component in the Outline view, its definition is highlighted in the editing area.

Generating Sample XML Files on page 568
Editing Relax NG Schema in the Master Files Context on page 614

XML Schema Attributes View
The Attributes view for XML Schemas presents the properties for the selected component in the schema diagram. By default, it is displayed on the right side of the editor. If the view is not displayed, it can be opened from the Window > Show View menu.
The default value of a property is presented in the Attributes view with blue foreground. The properties that can not be edited are rendered with gray foreground. A non-editable category that contains at least one child is rendered with bold. Bold properties are properties with values set explicitly to them.

Properties for components that do not belong to the current edited schema are read-only but if you double-click them you can choose to open the corresponding schema and edit them.

You can edit a property by double-clicking by pressing Enter. For most properties you can choose valid values from a list or you can specify another value. If a property has an invalid value or a warning, it will be highlighted in the table with the corresponding foreground color. By default, properties with errors are highlighted with red and the properties with warnings are highlighted with yellow. You can customize these colors from the Document checking user preferences.

For imports, includes and redefines, the properties are not edited directly in the Attributes view. A dialog box will open that allows you to specify properties for them.

The schema namespace mappings are not presented in Attributes view. You can view/edit these by choosing Edit Schema Namespaces from the contextual menu on the schema root. See more in the Edit Schema Namespaces section.

The Attributes view has five actions available on the toolbar and also on the contextual menu:

- **Add**
  - Allows you to add a new member type to an union's member types category.

- **Remove**
  - Allows you to remove the value of a property.

- **Move Up**
  - Allows you to move up the current member to an union's member types category.

- **Move Down**
  - Allows you to move down the current member to an union's member types category.

- **Copy**
  - Copy the attribute value.

- **Show Definition**
  - Shows the definition for the selected type.

- **Show Facets**
  - Allows you to edit the facets for a simple type.
XML Schema Resource Hierarchy / Dependencies View

The Resource Hierarchy / Dependencies view allows you to easily see the hierarchy / dependencies for an XML Schema, a Relax NG schema or an XSLT stylesheet. If the view is not displayed, it can be opened from the Window > Show View menu.

The Resource Hierarchy / Dependencies is useful when you want to start from an XML Schema (XSD) file and build and review the hierarchy of all the other XSD files that are imported, included or redefined in the given XSD file. The view is also able to build the tree structure, that is the structure of all other XSD files that import, include or redefine the given XSD file. The scope of the search is configurable (the current project, a set of local folders, etc.)

The build process for the hierarchy view is started with the Resource Hierarchy action available on the contextual menu of the editor panel.

Figure 337: Resource Hierarchy/Dependencies View - Hierarchy for xhtml11.xsd

The build process for the dependencies view is started with the Resource Dependencies action available on the contextual menu.
The following actions are available in the Resource Hierarchy/Dependencies view:

- **Refresh**
  
  Refreshes the Hierarchy/Dependencies structure.

- **Stop**
  
  Stops the hierarchy/dependencies computing.

- **Show Hierarchy**
  
  Allows you to choose a resource to compute the hierarchy structure.

- **Show Dependencies**
  
  Allows you to choose a resource to compute the dependencies structure.

- **Configure**
  
  Allows you to configure a scope to compute the dependencies structure. There is also an option for automatically using the defined scope for future operations.

- **History**
  
  Provides access to the list of previously computed dependencies. Use the **Clear history** button to remove all items from this list.

The contextual menu contains the following actions:

- **Open**
  
  Opens the resource. You can also double-click a resource in the Hierarchy/Dependencies structure to open it.

- **Copy location**
  
  Copies the location of the resource.

- **Move resource**
  
  Moves the selected resource.

- **Rename resource**
  
  Renames the selected resource.

- **Show Resource Hierarchy**
  
  Shows the hierarchy for the selected resource.
Show Resource Dependencies

- Shows the dependencies for the selected resource.

Add to Master Files

- Adds the currently selected resource in the Master Files directory.

Expand All

- Expands all the children of the selected resource from the Hierarchy/Dependencies structure.

Collapse All

- Collapses all children of the selected resource from the Hierarchy/Dependencies structure.

Tip: When a recursive reference is encountered in the Hierarchy view, the reference is marked with a special icon ☢.

Note: The Move resource or Rename resource actions give you the option to update the references to the resource.

Related information

- Working with Modular XML Files in the Master Files Context on page 457
- Search and Refactor Operations Scope on page 449

Moving/Renaming XML Schema Resources

You can move and rename a resource presented in the Resource/Hierarchy Dependencies view, using the Rename resource and Move resource refactoring actions from the contextual menu.

When you select the Rename action in the contextual menu of the Resource/Hierarchy Dependencies view, the Rename resource dialog box is displayed. The following fields are available:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references** - Enable this option to update the references to the resource you are renaming.

When you select the Move action from the contextual menu of the Resource/Hierarchy Dependencies view, the Move resource dialog box is displayed. The following fields are available:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - Enable this option to update the references to the resource you are moving, in accordance with the new location and name.

If the Update references of the moved resource(s) option is enabled, a Preview option (which opens the Preview dialog box) is available for both actions. The Preview dialog box presents a list with the resources that are updated.

Component Dependencies View for XML Schema

The Component Dependencies view allows you to spot the dependencies for the selected component of an XML Schema, a Relax NG schema, a NVDL schema or an XSLT stylesheet. If the view is not displayed, it can be opened from the Window > Show View menu.

If you want to see the dependencies of a schema component:

- Select the desired schema component in the editor.
- Choose the Component Dependencies action from the contextual menu.

The action is available for all named components (for example, elements or attributes).
In the **Component Dependencies** view the following actions are available in the toolbar:

- **Refresh**
  Refreshes the dependencies structure.

- **Stop**
  Stop the dependencies computing.

- **Configure**
  Allows you to configure a search scope to compute the dependencies structure.

- **History**
  Contains a list of previously executed dependencies computations.

The contextual menu contains the following actions:

- **Go to First Reference**
  Selects the first reference of the referenced component from the current selected component in the dependencies tree.

- **Go to Component**
  Shows the definition of the currently selected component in the dependencies tree.

**Tip:** If a component contains multiple references to another components, a small table is displayed that contains all these references. When a recursive reference is encountered, it is marked with a special icon 🧘‍♂️.
Highlight Component Occurrences

When a component (for example types, elements, attributes) is found at current cursor position, Oxygen XML Editor performs a search over the entire document to find the component declaration and all its references. When found, they are highlighted both in the document and in the stripe bar, at the right side of the document. Customizable colors are used: one for the component definition and another one for component references. Occurrences are displayed until another component is selected and a new search is performed. All occurrences are removed when you start to edit the document.

This feature is on by default. To configured it, open the Preferences dialog box (Options > Preferences) and go to Editor > Mark Occurrences. A search can also be triggered with the Search > Search Occurrences in File () contextual menu action. All matches are displayed in a separate tab of the Results view.

Searching and Refactoring Actions in XML Schemas

Search Actions

The following search actions can be applied on attribute, attributeGroup, element, group, key, unique, keyref, notation, simple, or complex types and are available from the Search submenu in the contextual menu of the current editor or from the Document > References menu:

- **Search References** - Searches all references of the item found at current cursor position in the defined scope, if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box is displayed and you have the possibility to define another search scope.

- **Search References in** - Searches all references of the item found at current cursor position in the file or files that you specify when define a scope in the Search References dialog box.

- **Search Declarations** - Searches all declarations of the item found at current cursor position in the defined scope if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box will be displayed and you have the possibility to define another search scope.

- **Search Declarations in** - Searches all declarations of the item found at current cursor position in the file or files that you specify when you define a scope for the search operation.

- **Search Occurrences in File** - Searches all occurrences of the item at the cursor position in the currently edited file.

The following action is available from the contextual menu and the Document > Schema menu:

- **Show Definition** - Moves the cursor to the definition of the referenced XML Schema item.

  Note: You can also use the Ctrl + Single-Click (Command + Single-Click on OS X) shortcut on a reference to display its definition.

Refactoring Actions

The following refactoring actions can be applied on attribute, attributeGroup, element, group, key, unique, keyref, notation, simple, or complex types and are available from the Refactoring submenu in the contextual menu of the current editor or from the Document > Refactoring menu:

- **Rename Component** - Allows you to rename the current component (in-place). The component and all its references in the document are highlighted with a thin border and the changes you make to the component at the cursor position are updated in real time to all occurrences of the component. To exit the in-place editing, press the Esc or Enter key on your keyboard.

- **Rename Component in** - Opens a dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the Preview button, you can view the files to be affected by the action.
Quick Fixes for DTD, XSD, and Relax NG Errors

Oxygen XML Editor offers quick fixes for common errors that appear in XML documents that are validated against DTD, XSD, or Relax NG schemas.

Note: For XML documents validated against XSD schemas, the quick fixes are only available if you use the default Xerces validation engine.

Quick fixes are available in Text mode and Author mode.

Oxygen XML Editor provides quick fixes for numerous types of problems, including the following:

<table>
<thead>
<tr>
<th>Problem type</th>
<th>Available quick fixes</th>
</tr>
</thead>
<tbody>
<tr>
<td>A specific element is required in the current context</td>
<td>Insert the required element</td>
</tr>
<tr>
<td>An element is invalid in the current context</td>
<td>Remove the invalid element</td>
</tr>
<tr>
<td>The content of the element should be empty</td>
<td>Remove the element content</td>
</tr>
<tr>
<td>An element is not allowed to have child elements</td>
<td>Remove all child elements</td>
</tr>
<tr>
<td>Text is not allowed in the current element</td>
<td>Remove the text content</td>
</tr>
<tr>
<td>A required attribute is missing</td>
<td>Insert the required attribute</td>
</tr>
<tr>
<td>An attribute is not allowed to be set for the current element</td>
<td>Remove the attribute</td>
</tr>
<tr>
<td>The attribute value is invalid</td>
<td>Propose the correct attribute values</td>
</tr>
<tr>
<td>ID value is already defined</td>
<td>Generate a unique ID value</td>
</tr>
<tr>
<td>References to an invalid ID</td>
<td>Change the reference to an already defined ID</td>
</tr>
</tbody>
</table>
XML Schema Quick Assist Support

The Quick Assist support improves the development workflow, offering fast access to the most commonly used actions when you edit schema documents.

The Quick Assist feature is activated automatically when the cursor is positioned over the name of a component. It is accessible via a yellow bulb icon (_outline) placed at the current line in the stripe on the left side of the editor. Also, you can invoke the quick assist menu by using the $\text{Alt} + 1$ ($\text{Meta} + \text{Alt} + 1$ on Mac OS X) keyboard shortcuts.

The quick assist support offers direct access to the following actions:

- **Rename Component in**
  Renames the component and all its dependencies.

- **Search Declarations**
  Searches the declaration of the component in a predefined scope. It is available only when the context represents a component name reference.

- **Search References**
  Searches all references of the component in a predefined scope.

- **Component Dependencies**
  Searches the component dependencies in a predefined scope.

- **Change Scope**
  Configures the scope that will be used for future search or refactor operations.

- **Rename Component**
  Allows you to rename the current component in-place.

- **Search Occurrences**
  Searches all occurrences of the component within the current file.

To watch our video demonstration about improving schema development using the Quick Assist action set, go to [https://www.oxygenxml.com/demo/Quick_Assist.html](https://www.oxygenxml.com/demo/Quick_Assist.html).

Generating Sample XML Files

Oxygen XML Editor offers support to generate sample XML files both from XML schema 1.0 and XML schema 1.1, depending on the XML schema version set in XML Schema preferences page.

To generate sample XML files from an XML Schema, use the Generate Sample XML Files action from the Tools menu. This action is also available in the contextual menu of the schema Design mode. The action opens the Generate Sample XML Files dialog box that allows you to configure a variety of options for generating the files.

For more information about this tool, watch our video demonstration about generating sample XML files at https://www.oxygenxml.com/demo/Generate_Sample_XML_Files.html.

The Generate Sample XML Files dialog box contains three tabs with various configurable options. Default values for these options can be set in the Sample XML Files Generator preferences page. You can also run the tool from the command line using exported options.

Schema Tab (Generate Sample XML Files Tool)

The Generate Sample XML Files tool includes a dialog box that allows you to configure a variety of options for generating the XML files. The first set of options are found in the Schema tab.

![Figure 342: Generate Sample XML Files Dialog Box (Schema Tab)](image)

This tab includes the following options:

**URL**
- Specifies the URL of the Schema location. You can specify the path by using the text field, the history drop-down menu, or the browsing tools in the Browse drop-down list.

**Namespace**
- Displays the namespace of the selected schema.

**Root Element**
- After the schema is selected, this drop-down menu is populated with all root candidates gathered from the schema. Choose the root of the output XML documents.

**Output folder**
- Path to the folder where the generated XML instances will be saved.
Filename prefix and Extension
You can specify the prefix and extension for the file name that will be generated. Generated file names have the following format: prefixN.extension, where N represents an incremental number from 0 up to the specified Number of instances.

Number of instances
The number of XML files to be generated.

Open first instance in editor
When checked, the first generated XML file is opened in the editor.

Namespaces section
You can specify the Default Namespace, as well as the prefixes for the namespaces.

Load settings
Use this button to load previously exported settings.

Export settings
Use this button to save the current settings for future use.

You can click OK at any point to generate the sample XML files.

Options Tab (Generate Sample XML Files Tool)
The Generate Sample XML Files tool includes a dialog box that allows you to configure a variety of options for generating the XML files. The Options tab allows you to set specific options for namespaces and elements.

This tab includes the following options:

Namespace / Element table
Allows you to set a namespace for each element name that appears in an XML document instance. The following prefix-to-namespace associations are available:
• All elements from all namespaces (<ANY> - <ANY>). This is the default setting.
• All elements from a specific namespace.
• A specific element from a specific namespace.

Settings subtab

Namespace
Displays the namespace specified in the table at the top of the dialog box.

Element
Displays the element specified in the table at the top of the dialog box.

Generate optional elements
When checked, all elements are generated, including the optional ones (having the minOccurs attribute set to 0 in the schema).

Generate optional attributes
When checked, all attributes are generated, including the optional ones (having the use attribute set to optional in the schema).

Values of elements and attributes
Controls the content of generated attribute and element values. The following choices are available:

• None - No content is inserted.
• Default - Inserts a default value depending of data type descriptor of the particular element or attribute. The default value can be either the data type name or an incremental name of the attribute or element (according to the global option from the XML Instances Generator preferences page). Note that type restrictions are ignored when this option is enabled. For example, if an element is of a type that restricts an xs:string with the xs:maxLength facet to allow strings with a maximum length of 3, the XML instance generator tool may generate string element values longer than 3 characters.
• Random - Inserts a random value depending of data type descriptor of the particular element or attribute.

Important: If all of the following are true, the XML Instances Generator outputs invalid values:

• At least one of the restrictions is a regexp.
• The value generated after applying the regexp does not match the restrictions imposed by one of the facets.

Preferred number of repetitions
Allows you to set the preferred number of repeating elements related to minOccurs and maxOccurs facets defined in the XML Schema.

• If the value set here is between minOccurs and maxOccurs, then that value is used.
• If the value set here is less than minOccurs, then the minOccurs value is used.
• If the value set here is greater than maxOccurs, then maxOccurs is used.

Maximum recursion level
If a recursion is found, this option controls the maximum allowed depth of the same element.

Type alternative strategy
Used for the xs:alternative element from XML Schema 1.1. The possible strategies are:

• First - The first valid alternative type is always used.
• Random - A random alternative type is used.

Choice strategy
Used for xs:choice or substitutionGroup elements. The possible strategies are:

• First - The first branch of xs:choice or the head element of substitutionGroup is always used.
• Random - A random branch of xs:choice or a substitute element or the head element of a substitutionGroup is used.
Generate the other options as comments

If enabled, generates the other possible choices or substitutions (for xs:choice and substitutionGroup). These alternatives are generated inside comments groups so you can uncomment and use them later. Use this option with care (for example, on a restricted namespace and element) as it may generate large result files.

Element values subtab

Allows you to add values that are used to generate the content of elements. If there are multiple values, then the values are used in a random order.

Attribute values subtab

Allows you to add values that are used to generate the content of attributes. If there are multiple values, then the values are used in a random order.

Load settings

Use this button to load previously exported settings.

Export settings

Use this button to save the current settings for future use.

You can click OK at any point to generate the sample XML files.

Advanced Tab (Generate Sample XML Files Tool)

The Generate Sample XML Files tool includes a dialog box that allows you to configure a variety of options for generating the XML files. The Advanced tab allows you to set some options in regards to output values and performance.

Use incremental attribute / element names as default

If checked, the value of an element or attribute starts with the name of that element or attribute. For example, for an element the generated values are: a1, a2, a3, and so on. If not checked, the value is the name of the type of that element / attribute (for example: string, decimal, etc.)

Maximum length

The maximum length of string values generated for elements and attributes.

Discard optional elements after nested level

The optional elements that exceed the specified nested level are discarded. This option is useful for limiting deeply nested element definitions that can quickly result in very large XML documents.

Running the Generate Sample XML Files Tool from the Command Line

The Generate Sample XML Files tool can be also used from command line by running the script called xmlGenerator.bat (on Windows) / xmlGenerator.sh (on Mac OS X / Unix / Linux) located in the Oxygen XML Editor installation folder. The parameters can be set in the dialog box, exported to an XML file on disk with the Export settings button, and then reused from command line. With the exported settings file, you can generate the same XML instances from the command line as from the dialog box. For example:

xmlGenerator.bat path_of_CFG_file
The script can be integrated in an external batch process launched from the command line. The command line parameter of the script is the relative path to the exported XML settings file. The files specified with relative paths in the exported XML settings will be made absolute relative to the folder where the script is run.

The following example shows such an XML configuration file:

---

**XML Configuration File**

```xml
<settings>
  <schemaSystemId>http://www.w3.org/2001/XMLSchema.xsd</schemaSystemId>
  <documentRoot>schema</documentRoot>
  <outputFolder>D:\projects\output</outputFolder>
  <filenamePrefix>instance</filenamePrefix>
  <filenameExtension>xml</filenameExtension>
  <noOfInstances>1</noOfInstances>
  <openFirstInstance>true</openFirstInstance>
  <defaultNamespace>&lt;NO_NAMESPACE&gt;</defaultNamespace>
  <element namespace="&lt;ANY>"
    name="&lt;ANY>">
    <generateOptionalElements>false</generateOptionalElements>
    <generateOptionalAttributes>false</generateOptionalAttributes>
    <valuesForContentType>DEFAULT</valuesForContentType>
    <preferredNumberOfRepetitions>2</preferredNumberOfRepetitions>
    <maximumRecursivityLevel>1</maximumRecursivityLevel>
    <choicesAndSubstitutions strategy="RANDOM">
      generateOthersAsComments="true"/>
      <attribute namespace="&lt;ANY>"
        name="&lt;ANY>">
        <attributeValue>attrValue1</attributeValue>
        <attributeValue>attrValue2</attributeValue>
      </attribute>
    </element>
  </settings>
```

---

**Generating Documentation for an XML Schema**

Oxygen XML Editor can generate detailed documentation for the components of an XML Schema in HTML, PDF, DocBook, or other custom formats. You can select the components and the level of detail. The components are hyperlinked in both HTML and DocBook documents.

**Note:** You can generate documentation for both XML Schema version 1.0 and 1.1.

To generate documentation for an XML Schema document, select XML Schema Documentation from the Tools > Generate Documentation menu or from the Generate Documentation submenu in the contextual menu of the Project view.
The Schema URL field of the dialog box must contain the full path to the XML Schema (XSD) file for which you want to generate documentation. The schema may be a local or a remote file. You can specify the path to the schema by entering it in the text field, or by using the Insert Editor Variables button or the options in the Browse drop-down menu.

Output Tab

The following options are available in the Output tab:

- **Format** - Allows you to choose between the following formats:
  - HTML - The documentation is generated in HTML output format.
  - PDF - The documentation is generated in PDF output format.
  - DocBook - The documentation is generated in DocBook output format.
  - Custom - The documentation is generated in a custom output format, allowing you to control the output. Click the Options button to open a Custom format options dialog box where you can specify a custom stylesheet for creating the output. There is also an option to Copy additional resources to the output folder and you can select the path to the additional Resources that you want to copy. You can also choose to keep the intermediate XML files created during the documentation process by deseleting the Delete intermediate XML file option.

- **Output file** - You can specify the path of the output file by entering it in the text field, or by using the Insert Editor Variables button or the options in the Browse drop-down menu.

- **Split output into multiple files** - Instructs the application to split the output into multiple files. You can choose to split them by namespace, location, or component name.

- **Open in Browser/System Application** - Opens the result in the system application associated with the output file type.

  **Note:** To set the browser or system application that will be used, open the Preferences dialog box (Options > Preferences), go to Global, and set it in the Default Internet browser field. This will take precedence over the default system application settings.
• **Keep only the annotations with xml:lang set to** - The generated output will contain only the annotations with the `xml:lang` attribute set to the selected language. If you choose a primary language code (for example, `en` for English), this includes all its possible variations (`en-us, en-uk`, etc.).

**Settings Tab**

When you generate documentation for an XML schema you can choose what components to include in the output and the details to be included in the documentation.

![Figure 346: Settings Tab of the XML Schema Documentation Dialog Box](image)

The **Settings** tab allows you to choose whether or not to include the following components: **Global elements**, **Global attributes**, **Local elements**, **Local attributes**, **Simple Types**, **Complex Types**, **Groups**, **Attribute Groups**, **Redefines**, **Referenced schemas**, **Include notations**.

You can choose whether or not to include the following other details:

- **Diagram** - Displays the diagram for each component. You can choose the image format (JPEG, PNG, GIF, SVG) to use for the diagram section. The generated diagrams are dependent on the options from the **Schema Design Properties** page.

- **Diagram annotations** - This option controls whether or not the annotations of the components presented in the diagram sections are included.

- **Namespace** - Displays the namespace for each component.
- **Location** - Displays the schema location for each component.
- **Type** - Displays the component type if it is not an anonymous one.
- **Type hierarchy** - Displays the types hierarchy.
- **Model** - Displays the model (sequence, choice, all) presented in BNF form. The separator characters that are used depend upon the information item used:
  - **xs:all** - Its children will be separated by space characters.
  - **xs:sequence** - Its children will be separated by comma characters.
  - **xs:choice** - Its children will be separated by `|` characters.
• **Children** - Displays the list of component's children.
• **Instance** - Displays an XML instance generated based on each schema element.
• **Used by** - Displays the list of all the components that reference the current one. The list is sorted by component type and name.
• **Properties** - Displays some of the component's properties.
• **Facets** - Displays the facets for each simple type
• **Identity constraints** - Displays the identity constraints for each element. For each constraint there are presented the name, type (unique, key, keyref), reference attribute, selector and field(s).
• **Attributes** - Displays the attributes for the component. For each attribute there are presented the name, type, fixed or default value, usage and annotation.
• **Asserts** - Displays the *assert* elements defined in a complex type. The test, XPath default namespace, and annotation are presented for each assert.
• **Annotations** - Displays the annotations for the component. If you choose *Escape XML Content*, the XML tags are present in the annotations.
• **Source** - Displays the text schema source for each component.
• **Generate index** - Displays an index with the components included in the documentation.
  - **Include local elements and attributes** - If checked, local elements and attributes are included in the documentation index.
  - **Include resource hierarchy** - Specifies whether or not the resource hierarchy for an XML Schema documentation is generated. It is disabled by default.

**Export settings** - Save the current settings in a settings file for further use (for example, with the exported settings file you can generate the same documentation from the command line interface.)

**Load settings** - Reloads the settings from the exported file.

**Generate** - Use this button to generate the XML Schema documentation.

**Related information**

*Customizing the PDF Output of Generated XML Schema Documentation* on page 578

**Output Formats for Generating XML Schema Documentation**

XML Schema documentation can be generated in HTML, PDF, DocBook, or a custom format. You can choose the format from the *Schema Documentation* dialog box. For the PDF and DocBook formats, the option to split the output in multiple files is not available.

**HTML Output Format**

The XML Schema documentation generated in HTML format contains images corresponding to the same schema definitions as the ones displayed by the schema diagram editor. These images are divided in clickable areas that are linked to the definitions of the names of types or elements. The documentation of a definition includes a *Used By* section with links to the other definitions that reference it. If the *Escape XML Content* option is unchecked, the HTML or XHTML tags used inside the `xs:documentation` elements of the input XML Schema for formatting the documentation text (for example, `<b>`, `<i>`, `<u>`, `<ul>`, `<li>`, etc.) are rendered in the generated HTML documentation.

The generated images format is PNG. The image of an XML Schema component contains the graphical representation of that component as it is rendered in the *schema diagram panel of the Oxygen XML Editor XSD editor panel.*
The generated documentation includes a table of contents. You can group the contents by namespace, location, or component type. After the table of contents there is some information about the main, imported, included, and redefined schemas. This information contains the schema target namespace, schema properties (attribute form default, element form default, version), and schema location.

If you choose to split the output into multiple files, the table of contents is displayed in the left frame. The contents are grouped in the same mode. If you split the output by location, each file contains a schema description and the components that you have chosen to include. If you split the output by namespace, each file contains information about schemas from that namespace and the list with all included components. If you choose to split the output by component, each file contains information about a schema component. After the documentation is generated, you can collapse or expand details for some schema components by using the Showing options or the Collapse or Expand buttons.
Figure 349: Showing Options

For each component included in the documentation, the section presents the component type follow by the component name. For local elements and attributes, the name of the component is specified as parent name/component name. You can easily go to the parent documentation by clicking the parent name.

Figure 350: Documentation for a Schema Component

If the schema contains imported or included modules, their dependencies tree is generated in the documentation.
PDF Output Format

For the PDF output format, the documentation is generated in DocBook format and a transformation using the FOP processor is applied to obtain the PDF file. To configure the FOP processor, see the FO Processors preferences page.

For information about customizing the PDF output, see Customizing the PDF Output of Generated XML Schema Documentation on page 578.

DocBook Output Format

If you generate the documentation in DocBook output format, the documentation is generated as a DocBook XML file. You can then apply a predefined transformation scenario (such as, DocBook PDF or DocBook HTML) on the output file, or configure your own transformation scenario for it to convert it into whatever format you desire.

Custom Output Format

For the custom format, you can specify a stylesheet to transform the intermediary XML file generated in the documentation process. You have to edit your stylesheet based on the schema xsdDocSchema.xsd from [OXYGEN_INSTALL_DIR]/frameworks/schema_documentation. You can create a custom format starting from one of the stylesheets used in the predefined HTML, PDF, and DocBook formats. These stylesheets are available in [OXYGEN_INSTALL_DIR]/frameworks/schema_documentation/xsl.

When using a custom format you can also copy additional resources into the output folder and choose to keep the intermediate XML files created during the documentation process.

Customizing the PDF Output of Generated XML Schema Documentation

To customize the PDF output of the generated XML Schema documentation, use the following procedure:

1. Customize the [OXYGEN_INSTALL_DIR]/frameworks/schema_documentation/xsl/xsdDocDocbook.xsl stylesheet to include the content that you want to add in the PDF output. Add the content in the XSLT template with the match="schemaDoc" attribute between the info and xsl:apply-templates elements, as commented in the following example:

```xml
<info>
  <pubdate><xsl:value-of select="format-date(current-date(), [Mn] [D], [Y], 'en', (), ())"/> </pubdate>
</info>
<!-- Add the XSLT template content with match="schemaDoc" attribute here -->
<xsl:apply-templates select="schemaHierarchy"/>
```

Note: The content that you insert here has to be wrapped in DocBook markup. For details about working with DocBook see the following video demonstration: https://www.oxygenxml.com/demo/DocBook_Editing_in_Author.html.
2. Create an intermediary file that holds the content of your XML Schema documentation.
   a. Go to Tools > Generate Documentation > XML Schema Documentation.
   b. Select Custom for the output format and click the Options button.
   c. In the Custom format options dialog box, do the following:
      a. Enter the customized stylesheet in the Custom XSL field
         ([OXYGEN_INSTALL_DIR]/frameworks/schema_documentation/xsl/xsdDocDocbook.xsl).
      b. Enable the Copy additional resources to the output folder option, and leave the default selection in the Resources field.
      c. Click OK.
   d. When you return to the XML Schema Documentation dialog box, just press the Generate button to generate a DocBook XML file with an intermediary form of the Schema documentation.

3. Create the final PDF document.
   a. Use the Configure Transformation Scenario(s) action from the toolbar or the Document > Transformation menu, click New, and select XML transformation with XSLT.
   b. In the New Scenario dialog box, go to the XSL URL field and choose the [OXYGEN_INSTALL_DIR]/frameworks/docbook/oxygen/xsdDocDocbookCustomizationFO.xsl file.
   c. Go to the FO Processor tab and enable the Perform FO Processing and XSLT result as input options.
   d. Go to the Output tab and select the directory where you want to store the XML Schema documentation output and click OK.
   e. Click Apply Associated.

Tip: If you want your modifications to be permanent so that you can simply select the PDF output format in the XML Schema Documentation dialog box, rather than configuring a custom format each time you generate this documentation, follow this procedure:

1. Create a JAR or ZIP file that includes the modified stylesheet (customized in step 1 above), placed in the following directory structure: builtin/documentation/schema_documentation/xsdDocDocbook.xsl.
2. Create a new directory named endorsed inside the [OXYGEN_INSTALL_DIR]/lib directory and place the created JAR or ZIP file inside it.
3. Restart Oxygen XML Editor and the PDF output format will now use your customized stylesheet.

Generating XML Schema Documentation From the Command-Line Interface
You can export the settings of the XML Schema Documentation dialog box to an XML file by pressing the Export settings button. With the exported configuration file, you can generate the same documentation from the command-line interface by running the following script:

- schemaDocumentation.bat on Windows.
- schemaDocumentation.sh on OS X / Unix / Linux.

The script is located in the Oxygen XML Editor installation folder. The script can be integrated in an external batch process launched from the command-line interface. The script accepts a variety command line arguments that allow you to configure the documentation.

The accepted syntax and arguments are as follows:

```
```

**schemaFile**

The XML Schema file.

**-cfg:configfile**

The exported configuration file. It contains the output file, output format options, split method, and some advanced options regarding the included components and components details. If an external configuration file is specified, all other supplied arguments except for the XML Schema file will be ignored.
The file where the generated documentation will be saved. By default, it is the name of the schema file with an *html* extension.

**-format:<value>**

The output format type used when generating the documentation. Possible values are as follows:

- *html* - To generate documentation in HTML format.
- *pdf* - To generate documentation in PDF format.
- *docbook* - To generate documentation in DocBook format.
- *custom* - To generate documentation in a custom format.

**-xsl:<xslFile>**

The XSL file to be applied on the intermediate XML format. If there is no XSL file provided, the result will be in the HTML format.

**-split:<value>**

The split method used when generating the documentation. Splitting is recommended for large schemas. Possible values are as follows:

- *none* (default value) - To generate one single output file.
- *namespace* - To generate an output file for every namespace in the schema.
- *component* - To generate an output file for every component in the schema.
- *location* - To generate an output file for every schema location.

**-openInBrowser:<value>**

Opens the result of the transformation in a browser or system application. Possible values are *true* or *false* (default value).

**--help | -help | --h | -h**

Displays the available options.

Example of the script in a Windows command line:

```
schemaDocumentation example.xsd -out:schemaDocumentation.html
   -format:custom -xsl:example.xsl -split:namespace
```

**Converting Schema to Another Schema Language**

The *Generate/Convert Schema* tool allows you to convert a DTD or Relax NG (full or compact syntax) schema or a set of XML files to an equivalent XML Schema, DTD or Relax NG (full or compact syntax) schema. Where perfect equivalence is not possible due to limitations of the target language, Oxygen XML Editor generates an approximation of the source schema. Oxygen XML Editor uses *Trang multiple format converter* to perform the actual schema conversions.

To use this tool, select the *Generate/Convert Schema* (Alt + Shift + C (Command + Alt + C on OS X)) action from the *Tools* menu or from the *Open with* submenu when invoking the contextual menu in the *Project* view. This action opens the *Generate/Convert Schema* dialog box that allows you to configure various options for conversion.
Figure 352: Generate/Convert Schema Dialog Box

The Generate/Convert Schema dialog box includes the following options:

**Input section**
Allows you to select the language of the source schema. If the conversion is based on a set of XML files, rather than just a single XML file, select the XML Documents option and use the file selector to add the XML files involved in the conversion.

**Output section**
Allows you to select the language of the target schema.

**Options**
You can choose the **Encoding**, the maximum **Line width**, and the **Indent size** (in number of spaces) for one level of indentation.

**Output file**
Specifies the path for the output file that will be generated.

**Close dialog when finished**
If you deselect this option, the dialog box will remain opened after the conversion so that you can easily continue to convert more files.

**Advanced options**
If you select XML 1.0 DTD for the input, you can click this button to access more advance options to further fine-tune the conversion. The following advanced options are available:

**XML 1.0 DTD Input section**
These options apply to the source DTD:

- **xmlns** - Specifies the default namespace, that is the namespace used for unqualified element names.
- **attlist-define** - Specifies how to construct the name of the definition representing an attribute list declaration from the name of the element. The specified value must contain exactly one percent character. This percent character is replaced by the name of element (after colon replacement) and the result is used as the name of the definition.
- **colon-replacement** - Replaces colons in element names with the specified chars when constructing the names of definitions used to represent the element declarations and attribute list declarations in the DTD.
- **any-name** - Specifies the name of the definition generated for the content of elements declared in the DTD as having a content model of ANY.
• **element-de**fine - Specifies how to construct the name of the definition representing an element declaration from the name of the element. The specified value must contain exactly one percent character. This percent character is replaced by the name of element (after colon replacement) and the result is used as the name of the definition.

• **annotation-prefix** - Default values are represented using an annotation attribute prefix:defaultValue where prefix is the specified value and is bound to http://relaxng.org/ns/compatibility/annotations/1.0 as defined by the RELAX NG DTD Compatibility Committee Specification. By default, the conversion engine will use a for prefix unless that conflicts with a prefix used in the DTD.

• **inline-attlist** - Instructs the application not to generate definitions for attribute list declarations, but instead move attributes declared in attribute list declarations into the definitions generated for element declarations. This is the default behavior when the output language is XSD.

• **strict-any** - Preserves the exact semantics of ANY content models by using an explicit choice of references to all declared elements. By default, the conversion engine uses a wildcard that allows any element

• **generate-start** - Specifies whether or not the conversion engine should generate a start element. DTD's do not indicate what elements are allowed as document elements. The conversion engine assumes that all elements that are defined but never referenced are allowed as document elements.

• **xmlns mappings** table - Each row specifies the prefix used for a namespace in the input schema.

**W3C XML Schema Output section**

This section is available if you select **W3C XML Schema** for the output.

• **disable-abstract-elements** - Disables the use of abstract elements and substitution groups in the generated XML Schema. This can also be controlled using an annotation attribute.

• **any-process-contents** - One of the values: strict, lax, skip. Specifies the value for the processContents attribute of any elements. The default is skip (corresponding to RELAX NG semantics) unless the input format is DTD, in which case the default is strict (corresponding to DTD semantics).

• **any-attribute-process-contents** - Specifies the value for the processContents attribute of anyAttribute elements. The default is skip (corresponding to RELAX NG semantics).

---

**Converting Database to XML Schema**

Oxygen XML Editor includes a tool that allows you to create an XML Schema from the structure of a database.

To convert a database structure to an XML Schema, use the following procedure:

1. Select the **Convert DB Structure to XML Schema** action from the **Tools** menu.

   **Result:** The Convert DB Structure to XML Schema dialog box is opened and your current database connections are displayed in the **Connections** section.

2. If the database source is not listed, click the **Configure Database Sources** button to open the **Data Sources preferences page** where you can configure data sources and connections.

3. In the **Format for generated schema** section, select one of the following formats:

   • **Flat schema** - A flat structure that resembles a tree-like view of the database without references to elements.
   • **Hierarchical schema** - Display the table dependencies visually, in a type of tree view where dependent tables are shown as indented child elements in the content model. Select this option if you want to configure the database columns of the tables to be converted.

4. Click **Connect**.

   **Result:** The database structure is listed in the **Select database tables** section according to the format you chose.

5. Select the database tables that you want to be included in the XML Schema.

6. If you selected **Hierarchical schema** for the format, you can configure the database columns.

   a. Select the database column you want to configure.
   b. In the **Criterion** section you can choose to convert the selected database column as an **Element**, **Attribute**, or to be **Skipped** in the resulting XML Schema.
   c. You can also change the name of the selected database column by changing it in the **Name** text field.

7. Click **Generate XML Schema**.
Result: The database structure is converted to an XML Schema and it is opened for viewing and editing.

**Flatten an XML Schema**

You can organize an XML schema linked by `xs:include` and `xs:import` statements on several levels. In some cases, working on such a schema as if it were a single file is more convenient than working on multiple files separately. The **Flatten Schema** operation allows you to flatten an entire hierarchy of XML schemas. Starting with the main XML schema, Oxygen XML Editor calculates its hierarchy by processing the `xs:include` and `xs:import` statements.

The **Flatten Schema** action is available from the **Tools** menu or the contextual menu in **Text** mode. The action opens the **Flatten Schema** dialog box that allows you to configure the operation.

![Flatten Schema Dialog Box](image)

**Figure 353: Flatten Schema Dialog Box**

For the main schema file and for each imported schema, a new flattened schema is generated in the specified output folder. These schemas have the same name as the original ones.

**Note:** If necessary, the operation renames the resulted schemas to avoid duplicated file names.

A flattened XML schema is obtained by recursively adding the components of the included schemas into the main one. This means Oxygen XML Editor replaces the `xs:include`, `xs:redefine`, and `xs:override` elements with the ones coming from the included files.

**Options in the Flatten Schema Dialog Box**

The following options are available in the **Flatten Schema** dialog box:

**File name**

The name of the output file.

**Output directory**

The path of the output directory where the flattened schema file will be saved.

**Open the flattened XML Schema file in editor**

Opens the main flattened schema in the editing area after the operation completes.
Use the XML Catalogs when collecting the referenced XML Schemas
   Enables the imported and included schemas to be resolved through the available XML Catalogs.
   
   **Note:** Changing this option triggers the recalculation of the dependencies graph for the main schema.

Process the imported XML Schemas resolved through the XML Catalogs
   Specifies whether or not the imported schemas that were resolved through an XML Catalog are also processed.

Flatten the imported XML Schema(s)
   Specifies whether or not the imported schemas are flattened.
   
   **Note:** For the schemas skipped by the flatten operation, no files are created in the output folder and the corresponding import statements remain unchanged.

Flatten Schema from the Command Line
The **Flatten Schema** tool can be also run from command line by using the following command:

- `flattenSchema.bat` on Windows
- `sh flattenSchemaMac.sh` on OS X
- `sh flattenSchema.sh` on Unix/Linux

The command line accepts the following parameters:

- `-in:inputSchemaURL` - The input schema URL.
- `-outDir:outputDirectory` - The directory where the flattened schemas should be saved.
- `-flattenImports:<boolean_value>` - Controls whether or not the imported XML Schemas should be flattened. The default value `true`.
- `-useCatalogs:<boolean_value>` - Controls if the references to other XML Schemas should be resolved through the available XML Catalogs. The default value `false`.
- `-flattenCatalogResolvedImports:<boolean_value>` - Controls whether or not the imported schemas that were resolved through the XML Catalogs should be flattened. The default value is `true`.
   
   **Note:** This option is used only when `-useCatalogs` is set to `true`.

- `-verbose` - Provides information about the current flatten XML Schema operation.
- `--help | -help | --h | -h` - Prints the available parameters for the operation.

**Command Line Example for Windows**
```
flattenSchema.bat -in:http://www.w3.org/MarkUp/SCHEMA/xhtml11.xsd
   -outDir:mySchemas/flattened/xhtml -flattenImports:true -useCatalogs:true
   -flattenCatalogResolvedImports:true -verbose
```

**Command Line Example for OS X**
```
sh flattenSchemaMac.sh -in:http://www.w3.org/MarkUp/SCHEMA/xhtml11.xsd
   -outDir:mySchemas/flattened/xhtml -flattenImports:true -useCatalogs:true
   -flattenCatalogResolvedImports:true -verbose
```

**Command Line Example for Unix/Linux**
```
sh flattenSchema.sh -in:http://www.w3.org/MarkUp/SCHEMA/xhtml11.xsd
   -outDir:mySchemas/flattened/xhtml -flattenImports:true -useCatalogs:true
   -flattenCatalogResolvedImports:true -verbose
```

**XML Schema Regular Expressions Builder**
The XML Schema regular expressions builder allows you to test regular expressions on a fragment of text as they are applied to an XML instance document. Start the tool by selecting **XML Schema Regular Expressions Builder** from the **Tools** menu.
Figure 354: XML Schema Regular Expressions Builder Dialog Box

The dialog box contains the following:

**Regular expressions editor**

Allows you to edit the regular expression to be tested and used. Content completion is available and presents a list with all the predefined expressions. It is triggered by pressing Ctrl + Space (Command + Space on OS X).

**Error display area**

If the edited regular expression is incorrect, an error message will be displayed here. The message contains the description and the exact location of the error. Also, clicking the quick navigation button (←) highlights the error inside the regular expression.

**Category**

You can choose from several categories of predefined expressions. The selected category influences the displayed expressions in the Available expressions table.

**Available expressions**

This table includes the available regular expressions and a short description for each of them. The set of expressions depends on the category selected in the previous Category combo box. You can add an expression in the Regular expressions editor by double-clicking the expression row in the table. You will notice that in the case of Character categories and Block names, the expressions are also listed in complementary format.

**Evaluate expression on**

You can choose between two options:

- **Evaluate expression on each line** - The edited expression will be applied on each line in the Test area.
- **Evaluate expression on all text** - The edited expression will be applied on the whole text.

**Test**

A text editor that allows you to enter a text sample for which the regular expression will be applied. All matches of the edited regular expression will be highlighted.

After editing and testing your regular expression you can insert it in the current editor. The Insert button will become active when an editor is opened in the background and there is an expression in the Regular expressions editor.
The regular expression builder cannot be used to insert regular expressions in the Grid mode or schema Design mode. Accordingly, the Insert button will be disabled if the current document is edited in these modes.

Note: Some regular expressions may indefinitely block the Java Regular Expressions engine. If the execution of the regular expression does not end in about five seconds, the application displays a dialog box that allows you to interrupt the operation.

XML Schema 1.1

Oxygen XML Editor offers full support for XML Schema 1.1, including:

- XML Documents Validation and Content Completion Based on XML Schema 1.1.
- XML Schema 1.1 Validation and Content Completion.
- Editing XML Schema 1.1 files in the Schema Design mode.
- The Flatten Schema action.
- Resource Hierarchy/Dependencies and Refactoring Actions.
- Master Files.
- Support for generating XML instances based on XML Schema.
- Support for validating XML documents with an NVDL schema that contains an XML Schema 1.1 validation step.

Note: To enable XML Schema 1.1 validation in NVDL, you need to pass the following option to the validation engine to specify the schema version: http://www.thaiopensource.com/validate/xsd-version (the possible values are 1.0 or 1.1.

Tip: To enable the full XPath expression in assertions and type alternatives, you need to set the http://www.thaiopensource.com/validate/full-xpath option.

XML Schema 1.1 is a superset of XML Schema 1.0, that offers lots of new powerful capabilities.

Figure 355: XML Schema 1.1

The significant new features in XSD 1.1 are:

- Assertions - Support to define assertions against the document content using XPath 2.0 expressions (an idea borrowed from Schematron).
- Conditional type assignment - The ability to select the type of schema an element is validated against, based on the values of the attribute of the element.
- Open content - Content models can use the openContent element to specify content models with open content. These content models allow elements not explicitly mentioned in the content model to appear in the document instance. It is as if wildcards were automatically inserted at appropriate points within the content model. A default may be set that causes all content models to be open unless specified otherwise.

To see the complete list with changes since version 1.0, go to http://www.w3.org/TR/xmlschema11-1/#ch_specs.
XML Schema 1.1 is intended to be mostly compatible with XML Schema 1.0 and to have approximately the same scope. It also addresses bug fixes and brings improvements that are consistent with the constraints on scope and compatibility.

**Note:** An XML document conforming to a 1.0 schema can be validated using a 1.1 validator, but an XML document conforming to a 1.1 schema may not validate using a 1.0 validator.

If you are constrained to use XML Schema 1.0 (for example, if you develop schemas for a server that uses an XML Schema 1.0 validator that cannot be updated), change the default XML Schema version to 1.0. If you keep the default XML Schema version set to 1.1, the **Content Completion Assistant** presents XML Schema 1.1 elements that you can insert accidentally in an 1.0 XML Schema. So even if you make a document invalid conforming with XML Schema 1.0, the validation process does not signal any issues.

To change the default XML Schema version, open the **Preferences** dialog box (Options > Preferences) and go to XML > XML Parser > XML Schema.

To watch our video demonstration about the XML Schema 1.1 support, go to [https://www.oxygenxml.com/demo/XML_Schema_11.html](https://www.oxygenxml.com/demo/XML_Schema_11.html).

**Related information**

Setting the XML Schema Version on page 587

### Setting the XML Schema Version

Oxygen XML Editor lets you set the version of the XML Schema you are editing either in the **XML Schema** preferences page, or through the versioning attributes. If you want to use the versioning attributes, set the `minVersion` and `maxVersion` attributes, from the `http://www.w3.org/2007/XMLSchema-versioning` namespace, on the `schema` root element.

**Note:** The versioning attributes take priority over the XML Schema version defined in the preferences page.

<table>
<thead>
<tr>
<th>Versioning Attributes</th>
<th>XML Schema Version</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>minVersion = &quot;1.0&quot; maxVersion = &quot;1.1&quot;</code></td>
<td>1.0</td>
</tr>
<tr>
<td><code>minVersion = &quot;1.1&quot;</code></td>
<td>1.1</td>
</tr>
<tr>
<td><code>minVersion = &quot;1.0&quot; maxVersion = greater than &quot;1.1&quot;</code></td>
<td>The XML Schema version defined in the XML Schema preferences page</td>
</tr>
<tr>
<td>Not set in the XML Schema document</td>
<td>The XML Schema version defined in the XML Schema preferences page</td>
</tr>
</tbody>
</table>

To change the XML Schema version of the current document, use the **Change XML Schema version** action from the contextual menu. This is available both in the Text mode, and in the Design mode and opens the **Change XML Schema version** dialog box. The following options are available:

- **XML Schema 1.0** - Inserts the `minVersion` and `maxVersion` attributes on the `schema` element and gives them the values "1.0" and "1.1" respectively. Also, the namespace declaration
  
  (xmlns:vc=http://www.w3.org/2007/XMLSchema-versioning) is inserted automatically if it does not exist.

- **XML Schema 1.1** - Inserts the `minVersion` attribute on the `schema` element and gives it the value "1.1". Also, removes the `maxVersion` attribute if it exists and adds the versioning namespace
  
  (xmlns:vc=http://www.w3.org/2007/XMLSchema-versioning) if it is not declared.

- **Default XML Schema version** - Removes the `minVersion` and `maxVersion` attributes from the `schema` element. The default schema version, defined in the XML Schema preferences page, is used.

**Note:** The **Change XML Schema version** action is also available in the informative panel presented at the top of the edited XML Schema. If you close this panel, it will no longer appear until you restore Oxygen XML Editor to its default options.

Oxygen XML Editor automatically uses the version set through the versioning attributes, or the default version if the versioning attributes are not declared, when proposing content completion elements and validating an XML Schema. Also, the XML instance validation against an XML Schema is aware of the versioning attributes defined in the XML Schema.
When you generate sample XML files from an XML Schema, Oxygen XML Editor takes into account the minVersion and maxVersion attributes defined in the XML Schema.

Editing XQuery Documents

This section explains the features of the XQuery editor and how to use them.

XQuery Outline View

The XQuery document structure is presented in the Outline view. The outline tree presents the list of all the components (namespaces, imports, variables, and functions) from both the edited XQuery file and its imports and it allows quick access to components. By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened from the Window > Show View menu.

Figure 356: XQuery Outline View

The following actions are available in the Settings menu on the Outline view toolbar:

Selection update on cursor move

Controls the synchronization between Outline view and source document. The selection in the Outline view can be synchronized with the cursor moves or the changes performed in the XQuery editor. Selecting one of the components from the Outline view also selects the corresponding item in the source document.

Sort

Allows you to alphabetically sort the XQuery components.

Show all components

Displays all collected components starting from the current file. This option is set by default.

Show only local components

Displays the components defined in the current file only.
Group by location/namespace/type

Allows you to group the components by location, namespace, and type. When grouping by namespace, the main XQuery module namespace is presented first in the Outline view.

If you know the component name, you can search it in the Outline view by typing its name in the filter text field from the top of the view or directly on the tree structure. When you type the component name in the filter text field you can switch to the tree structure using the arrow keys of the keyboard, (Enter), (Tab), (Shift-Tab). To switch from tree structure to the filter text field, you can use (Tab), (Shift-Tab).

Tip: The search filter is case insensitive. The following wildcards are accepted:
- * - any string
- ? - any character
- , - patterns separator

If no wildcards are specified, the string to search is used as a partial match.

The upper part of the Outline view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (*, ?) and separate multiple patterns with commas.

Folding in XQuery Documents

In a large XQuery document, the instructions enclosed in the '{' and '}' characters can be collapsed so that only the needed instructions remain in focus. The same folding features available for XML documents are also available in XQuery documents.

```
let $minRating := min(Review/reviews/review[@movie-id = $movie-id]/@rating)
return
</movie>
</avgRating>
</value>
]@2 lines
]@5 lines
]@2 lines
]@5 lines
]@2 lines
]@5 lines
</movie>
Figure 357: Folding in XQuery Documents
```

There is available the action Go to Matching Bracket Ctrl + Shift + G on contextual menu of XQuery editor for going to matching character when cursor is located at '{' character or '}' character. It helps for finding quickly matching character of current folding element.

Formatting and Indenting XQuery Documents

Editing XQuery documents may lead to large chunks of content that are not easily readable by human audience. Also, each developer may have a particular way of writing XQuery code. Oxygen XML Editor assists you in maintaining a consistent code writing style with the Format and Indent action that is available in the Document > Source menu and also on the toolbar.

The Format and Indent action achieves this by performing the following steps:
- Manages whitespaces, by collapsing or inserting space characters where needed.
Formats complex expressions on multiple, more readable lines by properly indenting each of them. The amount of whitespaces that form an indent unit is controlled through one of the Indent with tabs and Indent size options from the Format Preferences page.

Note: These operations can be performed only if your XQuery document conforms with W3C XQuery 1.0, XQuery Update Facility 1.0, and XQuery 3.0 specifications. If the Format and Indent operation fails, the document is left unaltered and an error message is presented in the Results view.

Generating HTML Documentation for an XQuery Document

To generate HTML documentation for an XQuery document, use the XQuery Documentation dialog box. It is opened with the XQuery Documentation action that is available from the Tools > Generate Documentation menu or from the Generate Documentation submenu in the contextual menu of the Project view.

The dialog box allows you to configure a set of parameters for the process of generating the HTML documentation.

The following options are available:

- **Input** - The full path to the XQuery file must be specified in one of the two fields in this section:
  - **URLFile** - The URL of the file in which you want to generate the documentation.
  - **Folder** - The directory that contains the files for which you want to generate the documentation. You can also specify the XQuery file extensions to be searched for in the specified directory.

- **Default function namespace** - Optional URI for the default namespace for the submitted XQuery.

- **Predefined function namespaces** - Optional, engine-dependent, predefined namespaces that the submitted XQuery refers to. They allow the conversion to generate annotation information to support the presentation component hypertext linking (only if the predefined modules have been loaded into the local xqDoc XML repository).

- **Open in Browser/System Application** - Select this option if you want the result to be opened in the system application associated with that file type.

  Note: To set the browser or system application that will be used, open the Preferences dialog box (Options > Preferences), go to Global, and set it in the Default Internet browser field. This will take precedence over the default system application settings.

- **Output** - Allows you to specify where the generated documentation is saved on disk.
Editing WSDL Documents

WSDL is an XML format for describing network services as a set of endpoints operating on messages containing either document-oriented or procedure-oriented information. The operations and messages are described abstractly, and then bound to a concrete network protocol and message format to define an endpoint. Related concrete endpoints are combined into abstract endpoints (services).

Oxygen XML Editor provides a special type of editor dedicated to WSDL documents. The WSDL editor offers support for validation, a specialized Content Completion Assistant, a component oriented Outline view, searching and refactoring operations, and support to generate documentation.

Both WSDL version 1.1 and 2.0 are supported and SOAP versions 1.1 and 1.2. That means that in the location where a SOAP extension can be inserted the Content Completion Assistant offers elements from both SOAP 1.1 and SOAP 1.2. Validation of SOAP requests is executed first against a SOAP 1.1 schema and then against a SOAP 1.2 schema. In addition to validation against the XSD schemas, Oxygen XML Editor also checks if the WSDL file conforms with the WSDL specification (available only for WSDL 1.1 and SOAP 1.1).

In the following example you can see how the errors are reported.

```
<output name="getVersionOut">
   <soap.body use="encoded" namespace="http://arcweb.esri.com/services/sr/">
      <output>
         <soap.address location="http://arcweb.esri.com/services/sr/">
            <operation>
               <binding>
```

**Figure 359: Validating a WSDL file**

To watch our video demonstration about the WSDL editing support in Oxygen XML Editor, go to [https://www.oxygenxml.com/demo/Create_New_WSDL.html](https://www.oxygenxml.com/demo/Create_New_WSDL.html).

Related information

* Editing XML Documents in Text Mode on page 275

Editing WSDL Documents in the Master Files Context

Smaller interrelated modules that define a complex WSDL structure cannot be correctly edited or validated individually, due to their interdependency with other modules. Oxygen XML Editor provides the support for defining the main module (or modules), allowing you to edit any of the imported/included files in the context of the larger WSDL structure.

You can set a main WSDL document either using the master files support from the Project view, or using a validation scenario.

To set a main file using a validation scenario, add validation units that point to the main modules. Oxygen XML Editor warns you if the current module is not part of the dependencies graph computed for the main WSDL document. In this case, it considers the current module as the main WSDL document.

The advantages of editing in the context of a master file include:

- Correct validation of a module in the context of a larger WSDL structure.
- Content Completion Assistant displays all components valid in the current context.
- The Outline displays the components collected from the entire WSDL structure.

**Note:** When you edit an XML schema document that has a WSDL document set as master, the validation operation is performed over the master WSDL document.

To watch our video demonstration about editing WSDL documents in the master files context, go to [https://www.oxygenxml.com/demo/WSDL_Working_Modules.html](https://www.oxygenxml.com/demo/WSDL_Working_Modules.html).
Validating WSDL Documents

By default, WSDL files are validated as you type. To change this, open the Preferences dialog box (Options > Preferences), go to Editor > Document Checking, and disable the Enable automatic validation option.

To validate a WSDL document manually, select the Validate action from the Validation toolbar drop-down menu or the Document > Validate menu. The validation problems are highlighted directly in the editor, making it easy to locate and fix any issues.

Content Completion Assistance in WSDL Documents

The Content Completion Assistant is a powerful feature that enhances the editing of WSDL documents. It helps you define WSDL components by proposing context-sensitive element names. Another important capability of the Content Completion Assistant is to propose references to the defined components when you edit attribute values. For example, when you edit the type attribute of a binding element, the Content Completion Assistant proposes all the defined port types. Each proposal that the Content Completion Assistant offers is accompanied by a documentation hint.

Note: XML schema specific elements and attributes are offered when the current editing context is the internal XML schema of a WSDL document.

![Figure 360: WSDL Content Completion Assistant](image)

Note: The Content Completion Assistant collects its components starting from the master files. The master files can be defined in the project or in the associated validation scenario. For further details about the Master Files support go to Defining Master Files at Project Level.

Namespace prefixes in the scope of the current context are presented at the top of the content completion assistance window to speed up the insertion into the document of prefixed elements.

![Figure 361: Namespace Prefixes in the Content Completion Assistant](image)

For the common namespaces, such as XML Schema namespace (http://www.w3.org/2001/XMLSchema) or SOAP namespace (http://schemas.xmlsoap.org/wsdl/soap/), Oxygen XML Editor provides an easy mode to declare them by proposing a prefix for these namespaces.
WSDL Outline View

The **Outline** view for WSDL documents displays the list of all the components (services, bindings, port types and so on) of the currently open WSDL document along with the components of its imports.

If you use the **Master Files support**, the **Outline** view collects the components of a WSDL document starting from the master files of the current document.

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

![WSDL Outline View](image)

**Figure 362: WSDL Outline View**

The **Outline** view can display both the components of the current document and its XML structure, organized in a tree-like fashion. You can switch between the display modes by using the **Show XML structure** and **Show components** actions in the **Settings** menu on the **Outline** view toolbar. The following actions are available:

**Filter returns exact matches**

The text filter of the **Outline** view returns only exact matches.

**Selection update on cursor move**

Controls the synchronization between the **Outline** view and the current document. The selection in the **Outline** view can be synchronized with the cursor moves or the changes in the WSDL editor. Selecting one of the components from the **Outline** view also selects the corresponding item in the current document.

When the **Show components** option is selected, the following actions are available:

**Show XML structure**

Displays the XML structure of the current document in a tree-like manner.

**Sort**

Sorts the components in the **Outline** view alphabetically.

**Show all components**

Displays all the components that were collected starting from current document or from the main document, if it is defined.

**Show referable components**

Displays all the components that you can reference from the current document.

**Show only local components**

Displays the components defined in the current file only.
Group by location
Groups the WSDL components by their location.

Group by type
Groups the WSDL components by their type.

Group by namespace
Groups the WSDL components by their namespace.

Note: By default, all the three grouping criteria are active.

When the Show XML structure option is selected, the following actions are available:

Show components
Switches the Outline view to the components display mode.

Flat presentation mode of the filtered results
When active, the application flattens the filtered result elements to a single level.

Show comments and processing instructions
Show/hide comments and processing instructions in the Outline view.

Show element name
Show/hide element name.

Show text
Show/hide additional text content for the displayed elements.

Show attributes
Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from the Outline preferences panel.

Configure displayed attributes
Displays the XML Structured Outline preferences page.

The following contextual menu actions are available in the Outline view when the Show components option is selected in the Settings menu:

Edit Attributes
Opens a dialog box that allows you to edit the attributes of the currently selected component.

Cut
Cuts the currently selected component.

Copy
Copies the currently selected component.

Delete
Deletes the currently selected component.

Search references
Searches for the references of the currently selected component.

Search references in
Searches for the references of the currently selected component in the context of a scope that you define.

Component dependencies
Displays the dependencies of the currently selected component.

Resource Hierarchy
Displays the hierarchy for the currently selected resource.
Resource Dependencies
Displays the dependencies of the currently selected resource.

 Rename Component in
Renames the currently selected component in the context of a scope that you define.

The following contextual menu actions are available in the Outline view when the Show XML structure option is selected in the Settings menu:

Append Child
Displays a list of elements that you can insert as children of the current element.

Insert Before
Displays a list of elements that you can insert as siblings of the current element, before the current element.

Insert After
Displays a list of elements that you can insert as siblings of the current element, after the current element.

Edit Attributes
Opens a dialog box that allows you to edit the attributes of the currently selected component.

 Toggle Comment
Comments/uncomments the currently selected element.

Search references
Searches for the references of the currently selected component.

Search references in
Searches for the references of the currently selected component in the context of a scope that you define.

Component dependencies
Displays the dependencies of the currently selected component.

 Rename Component in
Renames the currently selected component in the context of a scope that you define.

Cut
Cuts the currently selected component.

Copy
Copies the currently selected component.

Delete
Deletes the currently selected component.

Expand More
Expands the structure of a component in the Outline view.

Collapse All
Collapses the structure of all the component in the Outline view.

To switch from the tree structure to the text filter, use Tab and Shift-Tab.

Tip: The search filter is case insensitive. The following wildcards are accepted:

• * - any string
• ? - any character
• , - patterns separator

If no wildcards are specified, the string to search is used as a partial match.

The content of the Outline view and the editing area are synchronized. When you select a component in the Outline view, its definition is highlighted in the editing area.
The **Resource Hierarchy/Dependencies** view allows you to see the hierarchy/dependencies for a WSDL resource. If the view is not displayed, it can be opened from the **Window > Show View** menu.

**Note:** The hierarchy of a WSDL resource includes the hierarchy of imported XML Schema resources. The dependencies of an XML Schema resource present the WSDL documents that import the schema.

To view the hierarchy of a WSDL document, select the document in the **Project** view and choose **Resource Hierarchy** from the contextual menu.

![Resource Hierarchy/Dependencies View](image)

**Figure 363: Resource Hierarchy/Dependencies View**

If you want to see the dependencies of a WSDL document, select the document in the **Project** view and choose **Resource Dependencies** from the contextual menu.
The following actions are available in the Resource Hierarchy/Dependencies view:

- **Refresh**
  Refreshes the Hierarchy/Dependencies structure.

- **Stop**
  Stops the hierarchy/dependencies computing.

- **Show Hierarchy**
  Allows you to choose a resource to compute the hierarchy structure.

- **Show Dependencies**
  Allows you to choose a resource to compute the dependencies structure.

- **Configure**
  Allows you to configure a scope to compute the dependencies structure. There is also an option for automatically using the defined scope for future operations.

- **History**
  Provides access to the list of previously computed dependencies. Use the ✪ Clear history button to remove all items from this list.

The contextual menu contains the following actions:

- **Open**
  Opens the resource. You can also double-click a resource in the Hierarchy/Dependencies structure to open it.

- **Copy location**
  Copies the location of the resource.

- **Move resource**
  Moves the selected resource.

- **Rename resource**
  Renames the selected resource.
Show Resource Hierarchy

Shows the hierarchy for the selected resource.

Show Resource Dependencies

Shows the dependencies for the selected resource.

Add to Master Files

Adds the currently selected resource in the Master Files directory.

Expand All

Expands all the children of the selected resource from the Hierarchy/Dependencies structure.

Collapse All

Collapses all children of the selected resource from the Hierarchy/Dependencies structure.

Tip: When a recursive reference is encountered in the Hierarchy view, the reference is marked with a special icon ☰.

Note: The Move resource or Rename resource actions give you the option to update the references to the resource.

Related information

Working with Modular XML Files in the Master Files Context on page 457
Search and Refactor Operations Scope on page 449

Moving/Renaming WSDL Resources

You can move and rename a resource presented in the Resource/Hierarchy Dependencies view, using the Rename resource and Move resource refactoring actions from the contextual menu.

When you select the Rename action in the contextual menu of the Resource/Hierarchy Dependencies view, the Rename resource dialog box is displayed. The following fields are available:

• New name - Presents the current name of the edited resource and allows you to modify it.
• Update references - Enable this option to update the references to the resource you are renaming.

When you select the Move action from the contextual menu of the Resource/Hierarchy Dependencies view, the Move resource dialog box is displayed. The following fields are available:

• Destination - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
• New name - Presents the current name of the moved resource and gives you the option to change it.
• Update references of the moved resource(s) - Enable this option to update the references to the resource you are moving, in accordance with the new location and name.

If the Update references of the moved resource(s) option is enabled, a Preview option (which opens the Preview dialog box) is available for both actions. The Preview dialog box presents a list with the resources that are updated.

Component Dependencies View in WSDL Documents

The Component Dependencies view allows you to view the dependencies for a selected WSDL component. If the view is not displayed, it can be opened from the Window > Show View menu.

To view the dependencies of an WSDL component, select the desired component in the editor and choose the Component Dependencies action from the contextual menu. This action is available for all WSDL components (messages, port types, operations, bindings and so on).

Note: If you search for dependencies of XML Schema elements, the Component Dependencies view presents the references from WSDL documents.
Figure 365: Component Dependencies View

The following actions are available in the toolbar of the Component Dependencies view:

- **Refresh**
  Refreshes the dependencies structure.

- **Stop**
  Stops the dependencies computing.

- **Configure**
  Allows you to configure a search scope to compute the dependencies structure. You can decide to use the defined scope for future operations automatically, by checking the corresponding check box.

- **History**
  Allows you to repeat a previous dependencies computation.

The following actions are available in the contextual menu of the Component Dependencies view:

- **Go to First Reference**
  Selects the first reference of the referenced component from the current selected component in the dependencies tree.

- **Go to Component**
  Displays the definition of the current selected component in the dependencies tree.

**Tip:** If a component contains multiple references to another, a small table is displayed that contains all references. When a recursive reference is encountered, it is marked with a special icon 🔄.

### Highlight Component Occurrences in WSDL Documents

When you position your mouse cursor over a component in a WSDL document, Oxygen XML Editor searches for the component declaration and all its references and highlights them automatically.

Customizable colors are used: one for the component definition and another one for component references. Occurrences are displayed until another component is selected.

To change the default behavior of Highlight Component Occurrences, open the Preferences dialog box (Options > Preferences) and go to Editor > Mark Occurrences. You can also trigger a search using the Search > Search Occurrences in File () action from contextual menu. Matches are displayed in separate tabs of the Results view.

### Searching and Refactoring Operations in WSDL Documents

#### Search Actions

The following search actions are available from the Search submenu in the contextual menu of the current editor or from the Document > References menu:
- **Search References** - Searches all references of the item found at current cursor position in the defined scope, if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box is displayed and you have the possibility to define another search scope.

- **Search References in** - Searches all references of the item found at current cursor position in the file or files that you specify when define a scope in the Search References dialog box.

- **Search Declarations** - Searches all declarations of the item found at current cursor position in the defined scope if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box will be displayed and you have the possibility to define another search scope.

- **Search Declarations in** - Searches all declarations of the item found at current cursor position in the file or files that you specify when you define a scope for the search operation.

- **Search Occurrences in File** - Searches all occurrences of the item at the cursor position in the currently edited file.

The following action is available from the Document > Schema menu:

- **Show Definition** - Takes you to the location of the definition of the current item.

  *Note:* You can also use the Ctrl + Single-Click (Command + Single-Click on OS X) shortcut on a reference to display its definition.

**Refactoring Actions**

The following refactoring actions are available from the Refactoring submenu from the Document > Refactoring menu or in the contextual menu of the current editor:

- **Rename Component** - Allows you to rename the current component (in-place). The component and all its references in the document are highlighted with a thin border and the changes you make to the component at the cursor position are updated in real time to all occurrences of the component. To exit the in-place editing, press the Esc or Enter key on your keyboard.

- **Rename Component in** - Opens a dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the Preview button, you can view the files to be affected by the action.

![Figure 366: Rename Identity Constraint Dialog Box](image-url)
Searching and Refactoring Operations Scope in WSDL Documents

The scope is a collection of documents that define the context of a search and refactor operation. To control it you can use the Change scope operation, available in the Quick Assist action set or on the Resource Hierarchy/Dependency View toolbar. You can restrict the scope to the current project or to one or multiple working sets. The Use only Master Files, if enabled checkbox allows you to restrict the scope of the search and refactor operations to the resources from the Master Files directory. Click read more for details about the Master Files support.

![Change Scope Dialog Box](image)

Figure 367: Change Scope Dialog Box

The scope you define is applied to all future search and refactor operations until you modify it. Contextual menu actions allow you to add or delete files, folders, and other resources to the working set structure.

Quick Assist Support in WSDL Documents

The Quick Assist feature is activated automatically when the cursor is positioned over the name of a component. It is accessible via a yellow bulb icon ( ) placed at the current line in the stripe on the left side of the editor. Also, you can invoke the quick assist menu by using the Alt + 1 (Meta + Alt + 1 on Mac OS X) keyboard shortcuts.

![WSDL Quick Assist Support](image)

Figure 368: WSDL Quick Assist Support

The quick assist support offers direct access to the following actions:

- Rename Component in
  
  Renames the component and all its dependencies.
Search Declarations
Searches the declaration of the component in a predefined scope. It is available only when the context represents a component name reference.

Search References
Searches all references of the component in a predefined scope.

Component Dependencies
Searches the component dependencies in a predefined scope.

Change Scope
Configures the scope that will be used for future search or refactor operations.

Rename Component
Allows you to rename the current component in-place.

Search Occurrences
Searches all occurrences of the component within the current file.

Generating Documentation for WSDL Documents
You can use Oxygen XML Editor to generate detailed documentation for the components of a WSDL document in HTML format. You can select the WSDL components to include in your output and the level of details to present for each of them. Also, the components are hyperlinked. You can also generate the documentation in a custom output format by using a custom stylesheet.

Note: The WSDL documentation includes the XML Schema components that belong to the internal or imported XML schemas.

To generate documentation for a WSDL document, select WSDL Documentation from the Tools > Generate Documentation menu or from the Generate Documentation submenu in the contextual menu of the Project view.

Figure 369: WSDL Documentation Dialog Box
The Input URL field of the dialog box must contain the full path to the WSDL document that you want to generate documentation for. The WSDL document may be a local or a remote file. You can specify the path to the WSDL file by entering it in the text field, or by using the Insert Editor Variables button or the options in the Browse drop-down menu.
Output Tab

The following options are available in the Output tab:

- **Format** - Allows you to choose between the following formats:
  - **HTML** - The documentation is generated in *HTML output format*.
  - **Custom** - The documentation is generated in a *custom output format*, allowing you to control the output. Click the Options button to open a Custom format options dialog box where you can specify a custom stylesheet for creating the output. There is also an option to **Copy additional resources to the output folder** and you can select the path to the additional **Resources** that you want to copy. You can also choose to keep the intermediate XML files created during the documentation process by deselecting the **Delete intermediate XML file** option.

- **Output file** - You can specify the path of the output file by entering it in the text field, or by using the **Insert Editor Variables** button or the options in the **Browse** drop-down menu.

- **Split output into multiple files** - Instructs the application to split the output into multiple files. For large WSDL documents, choosing a different split criterion may generate smaller output files providing a faster documentation browsing. You can choose to split them by namespace, location, or component name.

- **Open in Browser/System Application** - Opens the result in the system application associated with the output file type.

  **Note:** To set the browser or system application that will be used, *open the Preferences dialog box* (Options > Preferences), go to **Global**, and set it in the **Default Internet browser** field. This will take precedence over the default system application settings.

- **Keep only the annotations with xml:lang set to** - The generated output will contain only the annotations with the `xml:lang` attribute set to the selected language. If you choose a primary language code (for example, `en` for English), this includes all its possible variations (en-us, en-uk, etc.).

Setting Tab

When you generate documentation for a WSDL document, you can choose what components to include in the output and the details to be included in the documentation.

![WSDL Documentation Dialog Box](image)

**Figure 370: Settings Tab of the WSDL Documentation Dialog Box**

The **Settings** tab allows you to choose whether or not to include the following:

- **Components**
  - **Services** - Specifies whether or not the generated documentation includes the WSDL services.
• **Bindings** - Specifies whether or not the generated documentation includes the WSDL bindings.
• **Port Types** - Specifies whether or not the generated documentation includes the WSDL port types.
• **Messages** - Specifies whether or not the generated documentation includes the WSDL messages.
• **XML Schema Components** - Specifies whether or not the generated documentation includes the XML Schema components.
  • **Only global elements and types** - Specifies whether or not the generated documentation includes only global elements and types.

• **Component Details**
  • **Namespace** - Presents the namespace information for WSDL or XML Schema components.
  • **Location** - Presents the location information for each WSDL or XML Schema component.
  • **Used by** - Presents the list of components that reference the current one.
  • **Documentation** - Presents the component documentation. If you choose **Escape XML Content**, the XML tags are presented in the documentation.
  • **Source** - Presents the XML fragment that defines the current component.
  • **Instance** - Generates a sample XML instance for the current component.

  **Note:** This option applies to the XML Schema components only.

• **XML Schema Diagram** - Displays the diagram for each XML Schema component. You can choose the image format (JPEG, PNG, GIF, SVG) to use for the diagram section.
  • **Diagram annotations** - Specifies whether or not the annotations of the components presented in the diagram sections are included.

• **Generate index** - Displays an index with the components included in the documentation.
  • **Include local elements and attributes** - If checked, local elements and attributes are included in the documentation index.
  • **Include resource hierarchy** - Specifies whether or not the resource hierarchy for an XML Schema documentation is generated. It is disabled by default.

**Export settings** - Save the current settings in a settings file for further use (for example, with the exported settings file you can generate the same documentation from the command-line interface.)

**Load settings** - Reloads the settings from the exported file.

**Generate** - Use this button to generate the WSDL documentation.

**Generating WSDL Documentation in HTML Format**

The WSDL documentation generated in HTML format is presented in a visual diagram style with various sections, hyperlinks, and options.
The documentation of each component is presented in a separate section. The title of the section is composed of the component type and the component name. The component information (namespace, documentation, etc.) is presented in a tabular form.

If you choose to split the output into multiple files, the table of contents is displayed in the left frame and is divided in two tabs: **Components** and **Resource Hierarchy**.

The **Components** tab allows you to group the contents by namespace, location, or component type. The WSDL components from each group are sorted alphabetically. The **Resource Hierarchy** tab displays the dependencies between WSDL and XML Schema modules in a tree-like fashion. The root of the tree is the WSDL document that you generate documentation for.

After the documentation is generated, you can collapse or expand details for some WSDL components by using the **Showing** options or the  

**Figure 372: Showing Options**

**Generating WSDL Documentation in a Custom Format**

To obtain the default HTML documentation output from a WSDL document, Oxygen XML Editor uses an intermediary XML document to which it applies an XSLT stylesheet. To create a custom output from your WSDL document, edit the **wsdlDocHtml.xsl** XSLT stylesheet or create your own.

**Note:** The **wsdlDocHtml.xsl** stylesheets that are used to obtain the HTML documentation is located in the

[OXYGEN_INSTALL_DIR]/frameworks/wsdl_documentation/xsl folder.

**Note:** The intermediary XML document complies with the **wsdlDocSchema.xsd** XML Schema. This schema is located in the [OXYGEN_INSTALL_DIR]/frameworks/wsdl_documentation folder.
When using a custom format, you can also copy additional resources into the output folder or choose to keep the intermediate XML files created during the documentation process.

Generating WSDL Documentation from the Command-Line Interface

To generate documentation for a WSDL document from the command line, open the WSDL Documentation dialog box and click Export settings. Using the exported settings file you can generate the same documentation from the command line by running the following scripts:

- `wsdlDocumentation.bat` on Windows.
- `wsdlDocumentation.sh` on Unix / Linux.
- `wsdlDocumentationMac.sh` on Mac OS X.

The scripts are located in the installation folder of Oxygen XML Editor. You can integrate the scripts in an external batch process launched from the command-line interface.

WSDL SOAP Analyzer

After you edit and validate your Web service descriptor against a mix of the XML Schemas for WSDL and SOAP, it is easy to check if the defined SOAP messages are accepted by the remote Web Services server by using the integrated WSDL SOAP Analyzer tool (available from the toolbar or Tools menu).

Composing a SOAP Request

WSDL SOAP Analyzer is a tool that helps you test if the messages defined in a Web Service Descriptor (WSDL) are accepted by a Web Services server.

Oxygen XML Editor provides two ways of testing, one for the currently edited WSDL document and another for the remote WSDL documents that are published on a web server. To open the WSDL SOAP Analyzer tool for the currently edited WSDL document do one of the following:

- Click the WSDL SOAP Analyzer toolbar button.
- Use the WSDL SOAP Analyzer action from the Tools menu.
- Go to Open with > WSDL SOAP Analyzer in the contextual menu of the Project view.
This tool contains a SOAP analyzer and sender for Web Services Description Language file types. The analyzer fields are as follows:

- **Services** - The list of services defined by the WSDL file.
- **Ports** - The ports for the selected service.
- **Operations** - The list of available operations for the selected service.
- **Action URL** - The script that serves the operation.
- **SOAP Action** - Identifies the action performed by the script.
- **Version** - Choose between 1.1 and 1.2. The SOAP version is selected automatically depending on the selected port.
- **Request Editor** - It allows you to compose the web service request. When an action is selected, Oxygen XML Editor tries to generate as much content as possible for the SOAP request. The envelope of the SOAP request has the correct namespace for the selected SOAP version, that is `http://schemas.xmlsoap.org/soap/envelope/` for SOAP 1.1 or `http://www.w3.org/2003/05/soap-envelope` for SOAP 1.2. Usually you just have to change a few values for the request to be valid. The **Content Completion Assistant** is available for this editor and is driven by the schema that defines the type of the current message. While selecting various operations, Oxygen XML Editor remembers the modified request for each one. You can press the **Regenerate** button to overwrite your modifications for the current request with the initial generated content.
- **Attachments List** - You can define a list of file URLs to be attached to the request.
- **Response Area** - Initially it displays an auto generated server sample response so you can have an idea about how the response looks like. After pressing the **Send** button, it presents the message received from the server in response to the Web request.
Service request. It may show also error messages. If the response message contains attachments, Oxygen XML Editor prompts you to save them, then tries to open them with the associated system application.

- **Errors List** - There may be situations where the WSDL file is respecting the WSDL XML Schema, but it fails to be valid (for example, in the case of a message that is defined by means of an element that is not found in the types section of the WSDL). In such a case, the errors are listed here. This list is presented only when there are errors.

- **Send Button** - Executes the request. A status dialog box is displayed when Oxygen XML Editor is connecting to the server.

The testing of a WSDL file is straightforward: click the WSDL analysis button, then select the service, the port, and the operation. The editor generates the skeleton for the SOAP request. You can edit the request, eventually attach files to it and send it to the server. Watch the server response in the response area. You can find more details in the *Testing Remote WSDL Files* section.

**Note:** SOAP requests and responses are automatically validated in the **WSDL SOAP Analyzer** using the XML Schemas specified in the WSDL file.

Once defined, a request derived from a Web Service descriptor can be saved with the **Save** button to a Web Service SOAP Call (WSSC) file for later reuse. In this way, you save time in configuring the URLs and parameters.

You can open the result of a Web Service call in an editor panel using the **Open** button.

### Testing Remote WSDL Files

To open and test a remote WSDL file the steps are the following:

1. Go to **Tools > WSDL SOAP Analyzer**.
2. On the **WSDL File** tab enter the URL of the remote WSDL file.
   
   You enter the URL:
   
   - by typing
   - by browsing the local file system
   - by browsing a remote file system
   - by browsing a **UDDI Registry**

3. Press the **OK** button.
   
   This will open the **WSDL SOAP Analyzer** tool. In the **Saved SOAP Request** tab you can open directly a previously saved Web Service SOAP Call (WSSC) file, thus skipping the analysis phase.

### UDDI Registry Browser

Pressing the **UDDI Registry** button in the **WSDL File Opener** dialog box (menu **Tools > WSDL SOAP Analyzer**) opens the **UDDI Registry Browser** dialog box.
The fields of the dialog box are as follows:

- **URL** - Type the URL of an UDDI registry or choose one from the default list.
- **Keywords** - Enter the string you want to be used when searching the selected UDDI registry for available Web services.
- **Rows to fetch** - The maximum number of rows to be displayed in the result list.
- **Search by** - You can choose to search either by company or by provided service.
- **Case sensitive** - When checked, the search takes into account the keyword case.
- **Search** - The WSDL files that matched the search criteria are added in the result list.

When you select a WSDL from the list and click the **OK** button, the UDDI Registry Browser dialog box is closed and you are returned to the WSDL File Opener dialog box.

### Editing CSS Stylesheets

Oxygen XML Editor includes a built-in editor for CSS stylesheets. This section presents the features of the CSS editor and how these features should be used. The features of the CSS editor include:

- **Create new CSS files and templates** - You can use the built-in new file wizards to create new CSS documents or templates.
- **Open and Edit CSS files** - CSS files can be opened and edited in a source editing mode.
- **Validation** - Presents validation errors in CSS files.
- **Content completion** - Offers proposals for properties and the values that are available for each property.
- **Syntax highlighting** - The syntax highlighting in Oxygen XML Editor makes CSS files more readable.
- **Shortcut to open resources** - You can use **Ctrl + Single-Click (Command + Single-Click on OS X)** to open imported stylesheets or other resources (such as images) in the default system application for the particular type of resource.

### Validating CSS Stylesheets

Oxygen XML Editor includes a built-in CSS Validator, integrated with general validation support. This makes the usual validation features for presenting errors also available for CSS stylesheets.
When you edit a CSS document, you can access the CSS validator options by selecting Validation options from the Document > Validate menu.

The CSS properties accepted by the validator are those included in the current CSS profile that is selected in the CSS validation preferences. The CSS 3 with Oxygen extensions profile includes all the CSS 3 standard properties plus the CSS extensions specific for Oxygen that can be used in Author mode. That means all Oxygen specific extensions are accepted in a CSS stylesheets by the built-in CSS validator when this profile is selected.

Specify Custom CSS Properties

To specify custom CSS properties, follow these steps:

1. Create a file named CustomProperties.xml that has the following structure:

   ```xml
   <css_keywords
     xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
     xsi:schemaLocation="http://www.oxygenxml.com/ns/css
     http://www.oxygenxml.com/ns/css/CssProperties.xsd"
     xmlns="http://www.oxygenxml.com/ns/css">
     <property name="custom">
       <summary>Description for custom property.</summary>
       <value name="customValue"/>
       <value name="anotherCustomValue"/>
     </property>
   </css_keywords>
   ```

2. Go to your desktop and create the builtin/css-validator/ folder structure.

3. Press and hold Shift and right-click anywhere on your desktop. From the contextual menu, select Open Command Window Here.

4. In the command line, run the jar cvf custom_props.jar builtin/ command. The custom_props.jar file is created.

5. Go to [OXYGEN_INSTALL_DIR]/lib and create the endorsed folder. Copy the custom_props.jar file to [OXYGEN_INSTALL_DIR]/lib/endorsed.

Content Completion in CSS Stylesheets

A Content Completion Assistant, similar to the one available for XML documents offers the CSS properties and the values available for each property. It is activated with the Ctrl + Space (Command + Space on OS X) shortcut and is context-sensitive when invoked for the value of a property. The Content Completion Assistant also includes code templates that can be used to quickly insert code fragments into CSS stylesheets. The code templates that are proposed include form controls, actions, and Author mode operations.

```
  &persn[before { display:block;]
```

Figure 376: Content Completion in CSS Stylesheets

The properties and values available are dependent on the CSS Profile selected in the CSS preferences. The CSS 2.1 set of properties and property values is used for most of the profiles. However, with CSS 1 and CSS 3 specific proposal sets are used.

The profile CSS 3 with Oxygen extensions includes all the CSS 3 standard properties plus the CSS extensions specific for Oxygen XML Editor that can be used in Author mode.

Proposals for CSS Selectors - After inserting a CSS selector, the content completion assistance will propose a list of pseudo-elements and pseudo-classes that are available for the selected CSS profile.

Proposals for @media and @import Rules - After inserting @media or @import <url> rules, the content completion assistance will propose a list of supported media types.
CSS Outline View

The Outline view for CSS stylesheets presents the import declarations for other CSS stylesheet files and all the selectors defined in the current CSS document. The selector entries can be presented as follows:

- In the order they appear in the document.
- Sorted by the element name used in the selector.
- Sorted by the entire selector string representation.

You can synchronize the selection in the Outline view with the cursor moves or changes you make in the stylesheet document. When you select an entry from the Outline view, Oxygen XML Editor highlights the corresponding import or selector in the CSS editor.

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened from the Window > Show View menu.

![CSS Outline View](image)

The selectors presented in this view can be found quickly using the key search field. When you press a sequence of character keys while the focus is in the view, the first selector that starts with that sequence is selected automatically.

Folding in CSS Stylesheets

In a large CSS stylesheet document, some styles can be collapsed so that only the styles that are needed remain in focus. The same folding features available for XML documents are also available in CSS stylesheets.

**Note:** To enhance your editing experience, you can select entire blocks (parts of text delimited by brackets) by double-clicking somewhere inside the brackets.

Formatting and Indenting CSS Stylesheets (Pretty Print)

If the edited CSS stylesheet becomes unreadable because of the bad alignment of the text lines, the format and indent operation available for XML documents is also available for CSS stylesheets. It works in the same way as for XML documents and is available as the same menu and toolbar action.

Minifying CSS Stylesheets

*Minification* (or compression) of a CSS document is the practice of removing unnecessary code without affecting the functionality of the stylesheet.
To minify a CSS, invoke the contextual menu anywhere in the edited document and choose the **Minify CSS** action. Oxygen XML Editor opens a dialog box that allows you to:

- Set the location of the resulting CSS.
- Place each style rule on a new line.

After pressing **OK**, Oxygen XML Editor performs the following actions:

- All spaces are normalized (all leading and trailing spaces are removed, while sequences of white spaces are replaced with single space characters).
- All comments are removed.

**Note:** The CSS minifier relies heavily upon the W3C CSS specification. If the content of the CSS file you are trying to minify does not conform with the specifications, an error dialog box will be displayed, listing all errors encountered during the processing.

The resulting CSS stylesheet gains a lot in terms of execution performance, but loses in terms of readability. The source CSS document is left unaffected.

**Note:** To restore the readability of a minified CSS, invoke the **Format and Indent** action from the **Document > Source** menu, the **Source** submenu from the contextual menu, or **Source** toolbar. However, this action will not recover any of the deleted comments.

### Editing LESS CSS Stylesheets

Oxygen XML Editor provides support for stylesheets coded with the LESS dynamic stylesheet language. LESS extends the CSS language by adding features that allow mechanisms such as *variables, nesting, mixins, operators, and functions*. Oxygen XML Editor offers additional LESS features that include:

- **Create new LESS files and templates** - You can use the built-in new file wizards to *create new LESS documents or templates*.
- **Open and Edit LESS files** - LESS files can be opened and edited in a source editing mode.
- **Validation** - Presents validation errors in LESS files.
- **Content completion** - Offers proposals for properties and the values that are available for each property.
- **Compile to CSS** - Options are available to compile LESS files to CSS.
- **Syntax highlighting** - Oxygen XML Editor supports syntax highlighting in LESS files, although there may be some limitations in supporting all the LESS constructs.

**Shortcut to open resources** - While editing LESS files, you can use **Ctrl + Single-Click (Command + Single-Click on OS X)** to open imported stylesheets or other resources (such as images) in the default system application for the particular type of resource.

For more information about LESS go to [http://lesscss.org/](http://lesscss.org/).

### Validating LESS Stylesheets

Oxygen XML Editor includes a built-in **LESS CSS Validator**, integrated with general validation support. The **usual validation features** for presenting errors also available for LESS stylesheets.

Oxygen XML Editor provides three validation methods:

- **Automatic validation as you type** - marks validation errors in the document as you are editing.

- **Validation upon request**, by pressing the **Validate** button from the **Validation** toolbar drop-down menu. An error list is presented in the message panel at the bottom of the editor.

- **Validation scenarios**, by selecting **Configure Validation Scenario(s)** from the **Validation** toolbar drop-down menu. Errors are presented in the message panel at the bottom of the editor. This is useful when you need to validate the current file as part of a larger LESS import hierarchy (for instance, you may change the URL of the file to validate to the root of the hierarchy).
Content Completion in LESS Stylesheets

A Content Completion Assistant offers the LESS properties and the values available for each property. It is activated with the Ctrl + Space (Command + Space on OS X) shortcut and is context-sensitive when invoked for the value of a property in a LESS file. The Content Completion Assistant also includes code templates that can be used to quickly insert code fragments into LESS stylesheets. The code templates that are proposed include form controls, actions, and Author mode operations.

Figure 378: Content Completion in LESS Stylesheets

The properties and values available are dependent on the CSS Profile selected in the CSS preferences.

Compiling LESS Stylesheets to CSS

When editing LESS files, you can compile the files into CSS. Oxygen XML Editor provides both manual and automatic options to compile LESS stylesheets into CSS.

Important: The LESS processor works well only with files having the UTF-8 encoding. Thus, it is highly recommended that you always use the utf-8 encoding when working with LESS files or the files they import (other LESS or CSS files). You can use the following directive at the beginning of your files:

```xml
@charset "utf-8;"
```

You have two options for compiling LESS files to CSS:

1. Use the contextual menu in a LESS file and select Compile to CSS (Ctrl + Shift + C (Command + Shift + C on OS X)).
2. Enable the Automatically compile LESS to CSS when saving option in the settings (open the Preferences dialog box (Options > Preferences) and go to Editor > Open/Save > Save Hooks). If enabled, when you save a LESS file it will automatically be compiled to CSS (this option is disabled by default).

Important: If this option is enabled, when you save a LESS file, the CSS file that has the same name as the LESS file is overwritten without warning. Make sure all your changes are made in the LESS file. Do not edit the CSS file directly, as your changes might be lost.

Editing Relax NG Schemas

An XML Schema describes the structure of an XML document and is used to validate XML document instances against it, to check that the XML instances conform to the specified requirements. If an XML instance conforms to the schema then it is said to be valid. Otherwise, it is invalid.

Oxygen XML Editor offers support for editing Relax NG schema files in the following editing modes:

- **Text editing mode** - Allows you to edit Relax NG schema files in a source editing mode, along with a schema design pane with two tabs that offer a Full Model View and Logical Model View.
- **Grid editing mode** - Displays Relax NG schema files in a structured spreadsheet-like grid.
- **Author editing mode** - The visual Author mode is also available for Relax NG schema files, presenting the schema similar to the Relax NG compact syntax. It links to imported schemas and external references. Embedded Schematron is also supported in Relax NG schemas with XML syntax.

For information about applying and detecting schemas, see Associating a Schema to XML Documents on page 450.

Related information

Associating a Schema to XML Documents on page 450
**Editing Relax NG Schema in the Master Files Context**

Smaller interrelated modules that define a complex Relax NG Schema cannot be correctly edited or validated individually, due to their interdependency with other modules. For example, an element defined in a main schema document is not visible when you edit an included module. Oxygen XML Editor provides the support for defining the main module (or modules), thus allowing you to edit any of the imported/included schema files in the context of the larger schema structure.

You can set a main Relax NG document either using the master files support from the Project view, or using a validation scenario.

To set a main file using a validation scenario, add validation units that point to the main schemas. Oxygen XML Editor warns you if the current module is not part of the dependencies graph computed for the main schema. In this case, it considers the current module as the main schema.

The advantages of editing in the context of main file include:

- Correct validation of a module in the context of a larger schema structure.
- **Content Completion Assistant** displays all the referable components valid in the current context. This include components defined in modules other than the currently edited one.
- The **Outline** displays the components collected from the entire schema structure.

---

**Relax NG Schema Diagram Editor**

This section explains how to use the graphical diagram editor for Relax NG schemas.

**Introduction to Relax NG Schema Diagram Editor**

Oxygen XML Editor provides a simple, expressive, and easy-to-read schema diagram editor for Relax NG schemas.

With this new feature you can easily develop complex schemas, print them on multiple pages or save them as JPEG, PNG, or BMP images. It helps both schema authors in developing the schema and content authors who are using the schema to understand it.

Oxygen XML Editor is the only XML editor to provide a side by side source and diagram presentation and have them real-time synchronized:

- The changes you make in the Editor are immediately visible in the Diagram (no background parsing).
- Changing the selected element in the diagram selects the underlying code in the source editor.

**Full Model View**

When you create a new schema document or open an existing one, the editor panel is divided in two sections: one containing the schema diagram and the second the source code. The schema diagram editor has two tabs that offer a **Full Model View** and **Logical Model View**.
Figure 379: Relax NG Schema Editor - Full Model View

The following references can be expanded in place: patterns, includes, and external references. This expansion mechanism, coupled with the synchronization support, makes the schema navigation easy.

All the element and attribute names are editable by double-clicking the names.

Logical Model View

The Logical Model View presents the compiled schema in the form of a single pattern. The patterns that form the element content are defined as top level patterns with generated names. These names are generated depending of the elements name class.
Symbols Used in the Schema Diagram

The views in the schema diagram editor renders all the Relax NG schema patterns with the following intuitive symbols:

- `define` pattern with the `name` attribute set to the value shown inside the rectangle (in this example `name`).
- `define` pattern with the `combine` attribute set to `interleave` and the `name` attribute set to the value shown inside the rectangle (in this example `attlist.person`).
- `define` pattern with the `combine` attribute set to `choice` and the `name` attribute set to the value shown inside the rectangle (in this example `attlist.person`).
- `element` pattern with the `name` attribute set to the value shown inside the rectangle (in this example `name`).
- `attribute` pattern with the `name` attribute set to the value shown inside the rectangle (in this case `note`).
- `ref` pattern with the `name` attribute set to the value shown inside the rectangle (in this case `family`).
- `oneOrMore` pattern.
- `zeroOrMore` pattern.
- `optional` pattern.
- **choice pattern**.

- **value pattern** (for example, used inside a choice pattern).

- **group pattern**.

- **Doc** - A pattern from the Relax NG Annotations namespace (http://relaxng.org/ns/compatibility/annotations/1.0) that is treated as a documentation element in a Relax NG schema.

- **text pattern**.

- **empty pattern**.

**Actions Available in the Schema Diagram Editor**

When editing Relax NG schemas in **Full Model View**, the contextual menu offers the following actions:

**Append child**

- Appends a child to the selected component.

**Insert Before**

- Inserts a component before the selected component.

**Insert After**

- Inserts a component after the selected component.

**Edit attributes**

- Edits the attributes of the selected component.

**Remove**

- Removes the selected component.

**Show only the selected component**

- Depending on its state (selected/not selected), either the selected component or all the diagram components are shown.

**Show Annotations**

- Depending on its state (selected/not selected), the documentation nodes are shown or hidden.

**Auto expand to references**

- This option controls how the schema diagram is automatically expanded. If you select it and then edit a top-level element or you make a refresh, the diagram is expanded until it reaches referenced components. If this option is left unchecked, only the first level of the diagram is expanded, showing the top-level elements. For large schemas, the editor disables this option automatically.

**Collapse Children**

- Collapses the children of the selected view.

**Expand Children**

- Expands the children of the selected view.

**Print Selection**

- Prints the selected view.

**Save as Image**

- Saves the current selection as JPEG, BMP, SVG or PNG image.

**Refresh**

- Refreshes the schema diagram according to the changes in your code. They represent changes in your imported documents or changes that are not reflected automatically in the compiled schema).

If the schema is not valid, you see only an error message in the **Logical Model View** instead of the diagram.
Validating Relax NG Schema Documents

By default, Relax NG schema files are validated as you type. To change this, open the Preferences dialog box (Options > Preferences), go to Editor > Document Checking, and disable the Enable automatic validation option.

To validate a Relax NG schema document manually, select the Validate action from the Validation toolbar drop-down menu or the Document > Validate menu. When Oxygen XML Editor validates a Relax NG schema file, it expands all the included modules so the entire schema hierarchy is validated. The validation problems are highlighted directly in the editor, making it easy to locate and fix any issues.

Relax NG Outline View

The Outline view for Relax NG schemas presents a list with the patterns that appear in the diagram in both the Full Model View and Logical Model View cases and it allows for quick access to a component by name. By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened from the Window > Show View menu.

Figure 381: Relax NG Outline View

This view has two modes, with the tree showing either the XML structure or the defined pattern (components) collected from the current document. By default, the Outline view presents the components.

When the Show components option is selected in the Settings menu on the Outline view toolbar, the following option is available:

Show XML structure
Shows the XML structure of the current document in a tree-like manner.
The following actions are available in the ☰ Settings menu on the Outline view toolbar when the ☰ Show XML structure option is selected:

**Filter returns exact matches**
The text filter of the Outline view returns only exact matches.

**Selection update on cursor move**
Allows a synchronization between Outline view and schema diagram. The selected view from the diagram will be also selected in the Outline view.

**Show components**
Shows the defined pattern collected from the current document.

**Flat presentation mode of the filtered results**
When active, the application flattens the filtered result elements to a single level.

**Show comments and processing instructions**
Show/hide comments and processing instructions in the Outline view.

**Show element name**
Show/hide element name.

**Show text**
Show/hide additional text content for the displayed elements.

**Show attributes**
Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from the Outline preferences panel.

**Configure displayed attributes**
Displays the XML Structured Outline preferences page.

The following contextual menu actions are also available in the Outline view when the ☰ Show XML structure option is selected in the ☰ Settings menu:

**Append Child**
Displays a list of elements that you can insert as children of the current element.

**Insert Before**
Displays a list of elements that you can insert as siblings of the current element, before the current element.

**Insert After**
Displays a list of elements that you can insert as siblings of the current element, after the current element.

**Edit Attributes**
Opens a dialog box that allows you to edit the attributes of the currently selected component.

**Toggle Comment**
Comments/uncomments the currently selected element.

**Search references**
Searches for the references of the currently selected component.

**Search references in**
Searches for the references of the currently selected component in the context of a scope that you define.

**Component dependencies**
Displays the dependencies of the currently selected component.

**Rename Component in**
Renames the currently selected component in the context of a scope that you define.
Cut
Cuts the currently selected component.

Copy
Copies the currently selected component.

Delete
Deletes the currently selected component.

Expand More
Expands the structure of a component in the Outline view.

Collapse All
Collapses the structure of all the component in the Outline view.

The upper part of the Outline view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (*, ?) and separate multiple patterns with commas.

RNG Resource Hierarchy/Dependencies View

The Resource Hierarchy/Dependencies view allows you to see the hierarchy/dependencies for a schema. If the view is not displayed, it can be opened from the Window > Show View menu.

If you want to see the hierarchy of a schema, select the desired schema in the Project view and choose Resource Hierarchy from the contextual menu.

![Resource Hierarchy/Dependencies View](image)

Figure 382: Resource Hierarchy/Dependencies View - hierarchy for map.rng

If you want to see the dependencies of a schema, select the desired schema in the Project view and choose Resource Dependencies from the contextual menu.
The following actions are available in the Resource Hierarchy/Dependencies view:

- **Refresh**
  Refreshes the Hierarchy/Dependencies structure.

- **Stop**
  Stops the hierarchy/dependencies computing.

- **Show Hierarchy**
  Allows you to choose a resource to compute the hierarchy structure.

- **Show Dependencies**
  Allows you to choose a resource to compute the dependencies structure.

- **Configure**
  Allows you to configure a scope to compute the dependencies structure. There is also an option for automatically using the defined scope for future operations.

- **History**
  Provides access to the list of previously computed dependencies. Use the **Clear history** button to remove all items from this list.

The contextual menu contains the following actions:

- **Open**
  Opens the resource. You can also double-click a resource in the Hierarchy/Dependencies structure to open it.

- **Copy location**
  Copies the location of the resource.

- **Move resource**
  Moves the selected resource.

- **Rename resource**
  Renames the selected resource.

- **Show Resource Hierarchy**
  Shows the hierarchy for the selected resource.
Show Resource Dependencies

Shows the dependencies for the selected resource.

Add to Master Files

Adds the currently selected resource in the *Master Files* directory.

Expand All

Expands all the children of the selected resource from the Hierarchy/Dependencies structure.

Collapse All

Collapses all children of the selected resource from the Hierarchy/Dependencies structure.

Tip: When a recursive reference is encountered in the Hierarchy view, the reference is marked with a special icon 🔄.

Note: The *Move resource* or *Rename resource* actions give you the option to update the references to the resource.

Related information

- [Search and Refactor Operations Scope](#) on page 449

Moving/Renaming RNG Resources

You can move and rename a resource presented in the Resource/Hierarchy Dependencies view, using the Rename resource and Move resource refactoring actions from the contextual menu.

When you select the Rename action in the contextual menu of the Resource/Hierarchy Dependencies view, the Rename resource dialog box is displayed. The following fields are available:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references** - Enable this option to update the references to the resource you are renaming.

When you select the Move action from the contextual menu of the Resource/Hierarchy Dependencies view, the Move resource dialog box is displayed. The following fields are available:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - Enable this option to update the references to the resource you are moving, in accordance with the new location and name.

If the Update references of the moved resource(s) option is enabled, a Preview option (which opens the Preview dialog box) is available for both actions. The Preview dialog box presents a list with the resources that are updated.

Note: Updating the references of a resource that is resolved through a catalog is not supported. Also, the update references operation is not supported if the path to the renamed or moved resource contains entities.

Component Dependencies View for RelaxNG Schemas

The Component Dependencies view allows you to see the dependencies for a selected Relax NG component. If the view is not displayed, it can be opened from the Window > Show View menu.

If you want to see the dependencies of a RelaxNG component, select the desired component in the editor and choose the Component Dependencies action from the contextual menu. The action is available for all named defines.
In the Component Dependencies view you have several actions in the toolbar:

- **Refresh**
  Refreshes the dependencies structure.

- **Stop**
  Stops the dependencies computing.

- **Configure**
  Allows you to configure a search scope to compute the dependencies structure. You can decide to use automatically the defined scope for future operations by checking the corresponding checkbox.

- **History**
  Allows you to repeat a previous dependencies computation.

The following actions are available on the contextual menu:

- **Go to First Reference**
  Selects the first reference of the referenced component from the current selected component in the dependencies tree.

- **Go to Component**
  Shows the definition of the current selected component in the dependencies tree.

**Tip:** If a component contains multiple references to another components, a small table is displayed that contains all references. When a recursive reference is encountered, it is marked with a special icon.

### Searching and Refactoring Actions in RNG Schemas

#### Search Actions

The following search actions can be applied on named *defines* and are available from the **Search** submenu in the contextual menu of the current editor or from the **Document > References** menu:

- **Search References** - Searches all references of the item found at current cursor position in the defined scope, if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box is displayed and you have the possibility to define another search scope.

- **Search References in** - Searches all references of the item found at current cursor position in the file or files that you specify when define a scope in the **Search References** dialog box.

- **Search Declarations** - Searches all declarations of the item found at current cursor position in the defined scope if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box will be displayed and you have the possibility to define another search scope.

- **Search Declarations in** - Searches all declarations of the item found at current cursor position in the file or files that you specify when you define a scope for the search operation.
• **Search Occurrences in File** - Searches all occurrences of the item at the cursor position in the currently edited file.

The following action is available from the contextual menu and the **Document > Schema** menu:

• **Show Definition** - Moves the cursor to the definition of the current element in the Relax NG (full syntax) schema.

  **Note:** You can also use the `Ctrl + Single-Click (Command + Single-Click on OS X)` shortcut on a reference to display its definition.

**Refactoring Actions**

The following refactoring actions can be applied on named *defines* and are available from the **Refactoring** submenu in the contextual menu of the current editor or from the **Document > Refactoring** menu:

• **Rename Component** - Allows you to rename the current component (in-place). The component and all its references in the document are highlighted with a thin border and the changes you make to the component at the cursor position are updated in real time to all occurrences of the component. To exit the in-place editing, press the **Esc** or **Enter** key on your keyboard.

• **Rename Component in** - Opens a dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the **Preview** button, you can view the files to be affected by the action.

![Rename Identity Constraint Dialog Box](image)

**Quick Fixes for DTD, XSD, and Relax NG Errors**

Oxygen XML Editor offers quick fixes for common errors that appear in XML documents that are validated against DTD, XSD, or Relax NG schemas.

**Note:** For XML documents validated against XSD schemas, the quick fixes are only available if you use the default Xerces validation engine.

Quick fixes are available in **Text** mode and **Author** mode.

Oxygen XML Editor provides quick fixes for numerous types of problems, including the following:
<table>
<thead>
<tr>
<th>Problem type</th>
<th>Available quick fixes</th>
</tr>
</thead>
<tbody>
<tr>
<td>A specific element is required in the current context</td>
<td>Insert the required element</td>
</tr>
<tr>
<td>An element is invalid in the current context</td>
<td>Remove the invalid element</td>
</tr>
<tr>
<td>The content of the element should be empty</td>
<td>Remove the element content</td>
</tr>
<tr>
<td>An element is not allowed to have child elements</td>
<td>Remove all child elements</td>
</tr>
<tr>
<td>Text is not allowed in the current element</td>
<td>Remove the text content</td>
</tr>
<tr>
<td>A required attribute is missing</td>
<td>Insert the required attribute</td>
</tr>
<tr>
<td>An attribute is not allowed to be set for the current element</td>
<td>Remove the attribute</td>
</tr>
<tr>
<td>The attribute value is invalid</td>
<td>Propose the correct attribute values</td>
</tr>
<tr>
<td>ID value is already defined</td>
<td>Generate a unique ID value</td>
</tr>
<tr>
<td>References to an invalid ID</td>
<td>Change the reference to an already defined ID</td>
</tr>
</tbody>
</table>

**RNG Quick Assist Support**

The Quick Assist support improves the development workflow, offering fast access to the most commonly used actions when you edit schema documents.

The Quick Assist feature is activated automatically when the cursor is positioned over the name of a component. It is accessible via a yellow bulb icon (💡) placed at the current line in the stripe on the left side of the editor. Also, you can invoke the quick assist menu by using the **Alt + 1** (Meta + Alt + 1 on Mac OS X) keyboard shortcuts.

![RNG Quick Assist Support](image)

**Figure 386: RNG Quick Assist Support**

The quick assist support offers direct access to the following actions:

- **Rename Component in**
  - Renames the component and all its dependencies.

- **Search Declarations**
  - Searches the declaration of the component in a predefined scope. It is available only when the context represents a component name reference.

- **Search References**
  - Searches all references of the component in a predefined scope.

- **Component Dependencies**
  - Searches the component dependencies in a predefined scope.
Change Scope
Configures the scope that will be used for future search or refactor operations.

Rename Component
Allows you to rename the current component in-place.

Search Occurrences
Searches all occurrences of the component within the current file.

Configuring a Custom Datatype Library for a RELAX NG Schema
A RELAX NG schema can declare a custom datatype library for the values of elements found in XML document instances. The datatype library must be developed in Java and it must implement the interface specified on the www.thaiopensource.com website.

The jar file containing the custom library and any other dependent jar file must be added to the classpath of the application, that is the jar files must be added to the folder \OXYGEN_INSTALL_DIR\lib.

To load the custom library, restart Oxygen XML Editor.

Editing NVDL Schemas
Some complex XML documents are composed by combining elements and attributes from namespaces. Furthermore, the schemas that define these namespaces are not even developed in the same schema language. In such cases, it is difficult to specify in the document all the schemas that must be taken into account for validation of the XML document or for content completion. An NVDL (Namespace Validation Definition Language) schema can be used. This schema allows the application to combine and interleave multiple schemas of different types (W3C XML Schema, RELAX NG schema, Schematron schema) in the same XML document.

Oxygen XML Editor offers support for editing NVDL schema files in the following editing modes:

- **Text editing mode** - Allows you to edit NVDL schema files in a source editing mode, along with a schema design pane with two tabs that offer a Full Model View and Logical Model View.
- **Grid editing mode** - Displays NVDL schema files in a structured spreadsheet-like grid.
- **Author editing mode** - The visual Author mode is also available for Relax NG schema files, presenting them in a compact and easy to understand representation.

For information about applying and detecting schemas, see Associating a Schema to XML Documents on page 450.

Associating a Schema to XML Documents on page 450

NVDL Schema Diagram
This section explains how to use the graphical diagram of a NVDL schema.

Introduction to NVDL Schema Diagram Editor
Oxygen XML Editor provides a simple, expressive, and easy-to-read schema diagram editor for NVDL schemas.

With this new feature you can easily develop complex schemas, print them on multiple pages or save them as JPEG, PNG, and BMP images. It helps both schema authors in developing the schema and content authors that are using the schema to understand it.

Oxygen XML Editor is the only XML Editor to provide a side by side source and diagram presentation and have them real-time synchronized:
The changes you make in the Editor are immediately visible in the Diagram (no background parsing).
Changing the selected element in the diagram, selects the underlying code in the source editor.

**Full Model View**

When you create a schema document or open an existing one, the editor panel is divided in two sections: one containing the schema diagram and the second the source code. The diagram view has two tabbed panes offering a Full Model View and a Logical Model View.

**Figure 387: NVDL Schema Editor - Full Model View**

The Full Model View renders all the NVDL elements with intuitive icons. This representation coupled with the synchronization support makes the schema navigation easy.

Double-click any diagram component to edit its properties.

**Logical Model View**

The Logical Model View presents the compiled schema in the form of a single pattern. The patterns that form the element content are defined as top level patterns with generated names. These names are generated depending of the elements name class.
Actions Available in the Diagram Editor

The contextual menu offers the following actions:

**Show only the selected component**
Depending on its state (selected/not selected), either the selected component or all the diagram components are shown.

**Show Annotations**
Depending on its state (selected/not selected), the documentation nodes are shown or hidden.

**Auto expand to references**
This option controls how the schema diagram is automatically expanded. For instance, if you select it and then edit a top-level element or you trigger a diagram refresh, the diagram will be expanded until it reaches the referenced components. If this option is left unchecked, only the first level of the diagram is expanded, showing the top-level elements. For large schemas, the editor disables this option automatically.

**Collapse Children**
Collapses the children of the selected view.

**Expand Children**
Expands the children of the selected view.

**Print Selection**
Prints the selected view.

**Save as Image**
Saves the current selection as image, in JPEG, BMP, SVG or PNG format.

**Refresh**
Refreshes the schema diagram according to the changes in your code (changes in your imported documents or those that are not reflected automatically in the compiled schema).

If the schema is not valid, you see only an error message in the **Logical Model View** instead of the diagram.

**NVDL Outline View**
The Outline view for NVDL schemas presents a list with the named or anonymous rules that appear in the diagram and it allows for quick access to a rule by name. By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened from the Window > Show View menu.

**Validating NVDL Schema Documents**
By default, NVDL schema files are validated as you type. To change this, open the Preferences dialog box (Options > Preferences), go to Editor > Document Checking, and disable the Enable automatic validation option.
To validate an NVDL schema document manually, select the **Validate** action from the **Validation** toolbar drop-down menu or the **Document > Validate** menu. When Oxygen XML Editor validates an NVDL schema file, it expands all the included modules so the entire schema hierarchy is validated. The validation problems are highlighted directly in the editor, making it easy to locate and fix any issues.

**Related information**

*Validating XML Documents Against a Schema* on page 426

### Component Dependencies View for NVDL Schemas

The **Component Dependencies** view allows you to see the dependencies for a selected NVDL named mode. If the view is not displayed, it can be opened from the **Window > Show View** menu.

If you want to see the dependencies of an NVDL mode, select the desired component in the editor and choose the **Component Dependencies** action from the contextual menu. The action is available for all named modes.

![Component Dependencies View](image)

#### Figure 389: Component Dependencies View - Hierarchy for test.nvdl

In the **Component Dependencies** the following actions are available on the toolbar:

- **Refresh**
  
  Refreshes the dependencies structure.

- **Stop**
  
  Allows you to stop the dependencies computing.

- **Configure**
  
  Allows you to configure a search scope to compute the dependencies structure. If you decide to set the application to use automatically the defined scope for future operations, select the corresponding checkbox.

- **History**
  
  Repeats a previous dependencies computation.

The following actions are available in the contextual menu:

- **Go to First Reference**
  
  Selects the first reference of the referenced component from the current selected component in the dependencies tree.

- **Go to Component**
  
  Shows the definition of the current selected component in the dependencies tree.

- **Tip:** If a component contains multiple references to another component, a small table containing all references is displayed. When a recursive reference is encountered it is marked with a special icon ☰.

### Searching and Refactoring Actions in NVDL Schemas

#### Search Actions

The following search actions can be applied on `name`, `useMode`, and `startMode` attributes and are available from the **Search** submenu in the contextual menu of the current editor or from the **Document > References** menu:
- **Search References** - Searches all references of the item found at current cursor position in the defined scope, if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box is displayed and you have the possibility to define another search scope.

- **Search References in** - Searches all references of the item found at current cursor position in the file or files that you specify when you define a scope in the Search References dialog box.

- **Search Declarations** - Searches all declarations of the item found at current cursor position in the defined scope if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box will be displayed and you have the possibility to define another search scope.

- **Search Declarations in** - Searches all declarations of the item found at current cursor position in the file or files that you specify when you define a scope for the search operation.

- **Search Occurrences in File** - Searches all occurrences of the item at the cursor position in the currently edited file.

The following action is available from the contextual menu and the Document > Schema menu:

- **Show Definition** - Moves the cursor to its definition in the schema used by the NVDL to validate it.

  **Note:** You can also use the **Ctrl + Single-Click (Command + Single-Click on OS X)** shortcut on a reference to display its definition.

### Refactoring Actions

The following refactoring actions can be applied on name, useMode, and startMode attributes and are available from the Refactoring submenu in the contextual menu of the current editor or from the Document > Refactoring menu:

- **Rename Component** - Allows you to rename the current component (in-place). The component and all its references in the document are highlighted with a thin border and the changes you make to the component at the cursor position are updated in real time to all occurrences of the component. To exit the in-place editing, press the **Esc** or **Enter** key on your keyboard.

- **Rename Component in** - Opens a dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the **Preview** button, you can view the files to be affected by the action.

![Figure 390: Rename Identity Constraint Dialog Box](image-url)
Editing JSON Documents

This section explains the features of the Oxygen XML Editor JSON Editor and how to use them.

Editing JSON Documents in Text Mode

When editing JSON documents in the Text editing mode, the usual text editing actions are available, along with other editor specific actions, including:

- Find / Replace
- Drag and Drop
- Validation
- Format and Indent (Pretty Print)

Note: You can run XPath expressions on opened JSON documents, but in Text mode the XPath results cannot be mapped in the document. However, they can be mapped in the Grid editing mode. You can use the Grid button at the bottom of the editor panel to switch to that editing mode.

![Figure 391: JSON Editor Text Mode](image)

Related information

Text Preferences on page 72

Editing JSON Documents in Grid Mode on page 632
Syntax Highlighting in JSON Documents

Oxygen XML Editor supports syntax highlighting in JSON files to improve the readability of the content and reduce the time it takes to internalize the semantics of the structured content.

To customize the colors or styles used for the syntax highlighting colors for JSON files, follow these steps:

1. *Open the Preferences dialog box (Options > Preferences).*
2. Go to *Editor > Syntax Highlight.*
3. Select and expand the *JSON* section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.

You can see the effects of your changes in the *Preview* pane.

Related information

*Syntax Highlight Preferences* on page 97

Folding in JSON

In a large JSON document, the data enclosed in the '{' and '}' characters can be collapsed so that only the needed data remain in focus. The *folding features available for XML documents* are available in JSON documents.

Editing JSON Documents in Grid Mode

![Figure 392: JSON Editor Grid Mode](image)
Oxygen XML Editor allows you to view and edit the JSON documents in the **Grid mode**. The JSON is represented in Grid mode as a compound layout of nested tables in which the JSON data and structure can be easily manipulated with table-specific operations or drag and drop operations on the grid components. You can also use the following JSON-specific contextual actions:

**Array**
- Useful when you want to convert a JSON value to array.

**Insert value before**
- Inserts a value before the currently selected one.

**Insert value after**
- Inserts a value after the currently selected one.

**Append value as child**
- Appends a value as a child of the currently selected value.

You can **customize the JSON grid appearance** according to your needs. For instance, you can change the font, the cell background, foreground, or even the colors from the table header gradients. The default width of the columns can also be changed.

**Related information**
- **Grid Editing Mode** on page 197
- **Grid Preferences** on page 73

### Validating JSON Documents

Oxygen XML Editor includes a built-in JSON validator (based on the free JAVA source code available on www.json.org), integrated with the general validation support.

**Related information**
- **Presenting Validation Errors in Text Mode** on page 196
- **Document Checking Preferences** on page 88

### JSON Outline View

The **Outline** view for JSON documents displays the list of all the components of the JSON document you are editing. By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

![Figure 393: JSON Outline View](image)

The following actions are available in the contextual menu of the JSON Outline view:
The 🛠️ Settings menu on the JSON Outline view toolbar allows you to enable 🟢 Selection update on cursor move. This option controls the synchronization between the Outline view and source the document. Oxygen XML Editor synchronizes the selection in the Outline view with the cursor moves or the changes you make in the JSON editor. Selecting one of the components from the Outline view also selects the corresponding item in the source document.

**XML to JSON Converter**

Oxygen XML Editor includes a useful and simple tool for converting XML files to JSON. It can be found in the Tools menu.

To convert an XML document to JSON, follow these steps:

1. Select the **XML to JSON** action from the **Tools** menu.

The **XML to JSON** dialog box is displayed:

![XML to JSON Dialog Box](image)

**Figure 394: XML to JSON Dialog Box**

2. Choose or enter the **Input URL** of the XML document.
3. Choose the path of the **Output file** that will contain the conversion JSON result.
4. Check the **Open in Editor** option to open the JSON result of the conversion in the Oxygen XML Editor JSON Editor.
5. Click the **Convert** button.

The original XML document is now converted to a JSON document.
Editing StratML Documents

Strategy Markup Language (StratML) is an XML vocabulary and schema for strategic plans. Oxygen XML Editor supports StratML Part 1 (Strategic Plan) and StratML Part 2 (Performance Plans and Reports) and provides templates for the following documents:

- **Strategic Plan** (StratML Part 1)
- **Performance Plan** (StratML Part 2)
- **Performance Report** - (StratML Part 2)
- **Strategic Plan** - (StratML Part 2)

You can view the components of a StratML document in the **Outline** view. Oxygen XML Editor implements a default XML with XSLT transformation scenario for this document type, called StratML to HTML.

Editing XLIFF Documents

XLIFF (XML Localization Interchange File Format) is an XML-based format that was designed to standardize the way multilingual data is passed between tools during a localization process. Oxygen XML Editor provides the following support for editing XLIFF documents:

XLIFF Version 1.2 and 2.0 Support:

- New file templates for XLIFF documents.
- A default CSS file (xliff.css) used for rendering XLIFF content in Author mode is stored in `OXYGEN_INSTALL_DIR/frameworks/xliff/css`. 
Validation and content completion support using local catalogs. The default catalog (catalog.xml) for version 1.2 is stored in [OXYGEN_INSTALL_DIR]/frameworks/xliff/xsd/1.2, and for version 2.0 in [OXYGEN_INSTALL_DIR]/frameworks/xliff/xsd/2.0.

XLIFF Version 2.0 Enhanced Support:

Support for validating XLIFF 2.0 documents using modules. The default modules are stored in [OXYGEN_INSTALL_DIR]/frameworks/xliff/xsd/2.0/modules.

Editing JavaScript Documents

This section explains the features of the Oxygen XML Editor JavaScript Editor and how you can use them.

JavaScript Editing Actions

Oxygen XML Editor allows you to create and edit JavaScript files and assists you with useful features such as syntax highlight, content completion, and outline view. To enhance your editing experience, you can select entire blocks (parts of text delimited by brackets) by double-clicking somewhere inside the brackets.

```javascript
function newPage(filename, overlay) {
    var divs = document.getElementsByTagName("div");
    if (divs) {
        var xdiv = divs[0];
        if (xdiv) {
            var xid = xdiv.getAttribute("id");
            var mytoc = window.top.frames[0];
            if (mytoc.lastUnderlined) {
                mytoc.lastUnderlined.style.textDecoration = "none";
            }
            var tdiv = xGetElementById(xid, mytoc);
            if (tdiv) {
                var ta = tdiv.getElementsByTagName("a").item(0);
                ta.style.textDecoration = "underline";
                mytoc.lastUnderlined = ta;
            }
        }
    }
}
```

Figure 396: JavaScript Editor Text Mode

The contextual menu of the JavaScript editor offers the following actions:

- **Cut**
  Allows you to cut fragments of text from the editing area.

- **Copy**
  Allows you to copy fragments of text from the editing area.

- **Paste**
  Allows you to paste fragments of text in the editing area.

- **Toggle Comment**
  Allows you to comment a line or a fragment of the JavaScript document you are editing. This option inserts a single comment for the entire fragment you want to comment.
**Toggle Line Comment**

Allows you to comment a line or a fragment of the JavaScript document you are editing. This option inserts a comment for each line of the fragment you want to comment.

**Go to Matching Bracket**

Use this option to find the closing, or opening bracket, matching the bracket at the cursor position. When you select this option, Oxygen XML Editor moves the cursor to the matching bracket, highlights its row, and decorates the initial bracket with a rectangle.

**Note:** A rectangle decorates the opening or closing bracket that matches the current one, at all times.

**Source**

Allows you to select one of the following actions:

- **To Lower Case**
  
  Converts the selection content to lower case characters.

- **To Upper Case**
  
  Converts the selection content to upper case characters.

- **Capitalize Lines**
  
  Converts to upper case the first character of every selected line.

- **Join and Normalize Lines**
  
  Joins all the rows you select to one row and normalizes the content.

- **Insert new line after**
  
  Inserts a new line after the line at the cursor position.

**Modify all matches**

Use this option to modify (in-place) all the occurrences of the selected content. When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

**Open**

Allows you to select one of the following actions:

- **Open File at Cursor** - select this action to open the source of the file located at the cursor position

- **Open File at Cursor in System Application** - select this action to open the source of the file located at the cursor position with the application that the system associates with the file

**Compare**

Select this option to open the Compare Files tool to compare the file you are editing with a file you choose in the dialog box.

**Folding**

When you invoke the contextual menu from the folding stripe on the left side of the editor, the following actions are available:

- **Collapse Other Folds** *(Ctrl + NumPad/ (Command + NumPad/ on OS X)*
  
  Folds all the elements except the current element.

- **Collapse Child Folds** *(Ctrl + NumPad. (Command + NumPad. on OS X))*
  
  Folds the elements indented with one level inside the current element.

- **Expand Child Folds**
  
  Unfolds all child elements of the currently selected element.

- **Expand All** *(Ctrl + NumPad® (Command + NumPad® on OS X))*
  
  Unfolds all elements in the current document.
Validating JavaScript Files

You have the possibility to validate the JavaScript document you are editing. Oxygen XML Editor uses the Mozilla Rhino library for validation. For more information about this library, go to [http://www.mozilla.org/rhino/doc.html](http://www.mozilla.org/rhino/doc.html). The JavaScript validation process checks for errors in the syntax. Calling a function that is not defined is not treated as an error by the validation process. The interpreter discovers this error when executing the faulted line. Oxygen XML Editor can validate a JavaScript document both on-request and automatically.

Content Completion in JavaScript Documents

When you edit a JavaScript document, the **Content Completion Assistant** presents you a list of the elements you can insert at the cursor position. For an enhanced assistance, JQuery methods are also presented. The following icons decorate the elements in the content completion list of proposals depending on their type:

- f - function
- V - variable
- o - object
- p - property
- m - method

**Note:** These icons decorate both the elements from the content completion list of proposals and from the **Outline** view.

![Figure 397: JavaScript Content Completion Assistant](image)

The **Content Completion Assistant** collects:

- Method names from the current file and from the library files.
- Functions and variables defined in the current file.

If you edit the content of a function, the content completion list of proposals contains all the local variables defined in the current function, or in the functions that contain the current one.

JavaScript Outline View

Oxygen XML Editor present a list of all the components of the JavaScript document you are editing in the **Outline** view. By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.
The following icons decorate the elements in the Outline view depending on their type:

- ![function](function.jpg) - function
- ![variable](variable.jpg) - variable
- ![object](object.jpg) - object
- ![property](property.jpg) - property
- ![method](method.jpg) - method

The contextual menu of the JavaScript Outline view contains the usual Cut, Copy, Paste, and Delete actions. From the Settings menu, you can enable the Update selection on cursor move option to synchronize the Outline view with the editing area.

## Editing XProc Scripts

An XProc script is edited as an XML document that is validated against a RELAX NG schema. If the script has an associated transformation scenario, then the XProc engine from the scenario is invoked as validating engine. The default engine for XProc scenarios is the Calabash engine that comes bundled with Oxygen XML Editor version 18.1.

The content completion inside the element `input/inline` from the XProc namespace `http://www.w3.org/ns/xproc` offers elements from the following schemas depending both on the port attribute and the parent of the input element. When invoking the content completion inside the XProc element `inline`, the list of content completion proposals is populated as follows:

- If the value of the port attribute is stylesheet and the xslt element is the parent of the input elements, the [Content Completion Assistant](https://www.oxygenxml.com) offers XSLT elements.
- If the value of the port attribute is schema and the validate-with-relax-ng element is the parent of the input element, the [Content Completion Assistant](https://www.oxygenxml.com) offers RELAX NG schema elements.
- If the value of the port attribute is schema and the validate-with-xml-schema element is the parent of the input element, the [Content Completion Assistant](https://www.oxygenxml.com) offers XML Schema schema elements.
- If the value of the port attribute is schema and the validate-with-schematron element is the parent of the input element, the [Content Completion Assistant](https://www.oxygenxml.com) offers either ISO Schematron elements or Schematron 1.5 schema elements.
- If the above cases do not apply, then the [Content Completion Assistant](https://www.oxygenxml.com) offers elements from all the schemas from the above cases.
The XProc editor assists you in writing XPath expressions by offering a **Content Completion Assistant** and dedicated coloring schemes. To customize the coloring schemes, open the **Preferences dialog box (Options > Preferences)** and go to **Editor > Syntax Highlight**.

![Figure 399: XProc Content Completion](image)

### Editing Schematron Schemas

Schematron is a simple and powerful Structural Schema Language for making assertions about patterns found in XML documents. It relies almost entirely on XPath query patterns for defining rules and checks. Schematron validation rules allow you to specify a meaningful error message. This error message is provided to you if an error is encountered during the validation stage.

Oxygen XML Editor assists you in editing Schematron documents with schema-based content completion, syntax highlight, search and refactor actions, and dedicated icons for the **Outline** view. You can create a new Schematron schema using one of the Schematron templates available in the **New document wizard**.

For information about applying and detecting Schematron schemas, see **Associating a Schema to XML Documents** on page 450.

### Validating XML Documents Against Schematron

The Skeleton XSLT processor is used for validation and conforms with ISO Schematron or Schematron 1.5. It allows you to **validate XML documents against Schematron schemas** or against combined RELAX NG/W3C XML Schema and Schematron.

### How to Specify the Query Language Binding

You can specify the query language binding to be used in the Schematron schema by doing the following:

- For embedded ISO schematron, open the **Preferences dialog box (Options > Preferences)**, go to **XML > XML Parser > Schematron**, and select it in the **Embedded rules query language binding option**.
- For standalone ISO Schematron, specify the version by setting the query language to be used in a **queryBinding** attribute on the schema root element. For more information see the **Query Language Binding section of the Schematron specifications**.
- For Schematron 1.5 (standalone and embedded), open the **Preferences dialog box (Options > Preferences)**, go to **XML > XML Parser > Schematron**, and select the version in the **XPath Version** option.

### Multi-Lingual Support in Schematron Messages

You can specify the desired language for the validation messages in the **Schematron Preferences page**. The Schematron validation messages can be presented in multiple languages by defining the language for each message using the Schematron diagnostics. For more information, see the **Use of Schematron for Multi-Lingual Schemas** specification.
How to Customize Color Schemes in Schematron

The Schematron editor renders the XPath expressions with dedicated coloring schemes. To customize the coloring schemes, open the Preferences dialog box (Options > Preferences) and go to Editor > Syntax Highlight.

Schematron Transformation Scenario

When you create a Schematron document, Oxygen XML Editor provides a built-in transformation scenario. You can use this scenario to obtain the XSLT style-sheet corresponding to the Schematron schema. You can apply this XSLT stylesheet to XML documents to obtain the Schematron validation results.

To watch our video demonstration about the Schematron support in Oxygen XML Editor, go to https://www.oxygenxml.com/demo/Schematron_Validation.html, and to https://www.oxygenxml.com/demo/Editing_Schematron_Schemas/Editing_Schematron_Schemas.html.

 Associating a Schema to XML Documents on page 450

Editing Schematron Schema in the Master Files Context

Smaller interrelated modules that define a complex Schematron cannot be correctly edited or validated individually, due to their interdependency with other modules. For example, a diagnostic defined in a main schema document is not visible when you edit an included module. Oxygen XML Editor provides the support for defining the main module (or modules), thus allowing you to edit any of the imported/included schema files in the context of the larger schema structure.

You can set a main Schematron document either using the master files support from the Project view, or using a validation scenario.

To set a main file using a validation scenario, add validation units that point to the main schemas. Oxygen XML Editor warns you if the current module is not part of the dependencies graph computed for the main schema. In this case, it considers the current module as the main schema.

The advantages of editing in the context of main file include:

- Correct validation of a module in the context of a larger schema structure.
- Content Completion Assistant displays all the referable components valid in the current context. This include components defined in modules other than the currently edited one.

Validating Schematron Documents

By default, a Schematron schema is validated as you type. To change this, open the Preferences dialog box (Options > Preferences), go to Editor > Document Checking, and disable the Enable automatic validation option.

To validate a Schematron document manually, select the Validate action from the Validation toolbar drop-down menu or the Document > Validate menu. When Oxygen XML Editor validates a Schematron schema, it expands all the included modules so the entire schema hierarchy is validated. The validation problems are highlighted directly in the editor, making it easy to locate and fix any issues.

Oxygen XML Editor offers an error management mechanism capable of pinpointing errors in XPath expressions and in the included schema modules.

Related information
 Presenting Schematron Validation Issues

Presenting Schematron Validation Issues

The possible issues that might occur during the validation process when validating XML documents against Schematron are presented with colored underlines in the editing pane, colored markers in the right vertical stripe, and details about the issues are presented in the Errors panel at the bottom area of the Oxygen XML Editor window. Each error is flagged with a severity level that can be: warning, error, fatal or info.

To set a severity level, Oxygen XML Editor looks for the following information:

- The role attribute, which can have one of the following values:
• **warn** or **warning** - Sets the severity level to **warning**. By default, underlined with a yellow squiggly line in the editing pane and a yellow marker in the right vertical stripe.

• **error** - Sets the severity level to **error**. By default, underlined with a red squiggly line in the editing pane and a red marker in the right vertical stripe.

• **fatal** - Sets the severity level to **fatal**. By default, underlined with a red squiggly line in the editing pane and a red marker in the right vertical stripe.

• **info** or **information** - Sets the severity level to **info**. By default, underlined with a blue squiggly line in the editing pane and a blue marker in the right vertical stripe.

• The start of the message, after trimming leading white-spaces. Oxygen XML Editor looks to match the following exact string of characters (case sensitive):

  • **Warning:** - Sets the severity level to **warning**. By default, underlined with a yellow squiggly line in the editing pane and a yellow marker in the right vertical stripe.

  • **Error:** - Sets the severity level to **error**. By default, underlined with a red squiggly line in the editing pane and a red marker in the right vertical stripe.

  • **Fatal:** - Sets the severity level to **fatal**. By default, underlined with a red squiggly line in the editing pane and a red marker in the right vertical stripe.

  • **Info:** - Sets the severity level to **info**. By default, underlined with a blue squiggly line in the editing pane and a blue marker in the right vertical stripe.

• If none of the previous rules match, Oxygen XML Editor sets the severity level to **error**. By default, underlined with a red squiggly line in the editing pane and a red marker in the right vertical stripe.

**Tip:** You can configure the color for each type in the [Document Checking preferences page](#).

### Content Completion in Schematron Documents

Oxygen XML Editor helps you edit a Schematron schema through the **Content Completion Assistant**, offering proposals that are valid at the cursor position. When you edit the value of an attribute that refers a component, the proposed components are collected from the entire schema hierarchy. For example, if the editing context is `phase/active/@pattern`, the **Content Completion Assistant** proposes all the defined patterns.

**Note:** For Schematron resources, the **Content Completion Assistant** collects its components starting from the master files. The master files can be defined in the project or in the associated validation scenario. For further details about the **Master Files** support go to [Defining Master Files at Project Level](#).

If the editing context is an attribute value that is an XPath expression (such as `assert/@test` or `report/@test`), the Content Completion Assistant offers the names of XPath functions, the XPath axes, and user-defined variables.

The **Content Completion Assistant** displays XSLT 1.0 functions and optionally XSLT 2.0 / 3.0 functions in the attributes `path`, `select`, `context`, `subject`, `test` depending on the [Schematron options](#) that are set in Preferences pages. If the Saxon 6.5.5 namespace `xmlns:saxon="http://icl.com/saxon"` or the Saxon 9.6.0.7 namespace is declared in the Schematron schema `xmlns:saxon="http://saxon.sf.net/"`) the content completion also displays the XSLT Saxon extension functions as in the following figure:
The Content Completion Assistant also includes code templates that can be used to quickly insert code fragments into Schematron documents.

XML Schema or RELAX NG with Embedded Schematron Rules

Schematron rules can be embedded into an XML Schema through annotations (using the appinfo element), or in any element on any level of a RELAX NG Schema (taking into account that the RELAX NG validator ignores all elements that are not in the RELAX NG namespace).

Oxygen XML Editor accepts such documents as Schematron validation schemas and it is able to extract and use the embedded rules.

Validating XML Documents with Relax NG and Embedded Schematron

To validate an XML document with both RELAX NG schema and its embedded Schematron rules, you need to associate the document with both schemas. For example:

```xml
<?xml-model href="percent.rng" type="application/xml" schematypens="http://relaxng.org/ns/structure/1.0"/>
<?xml-model href="percent.rng" type="application/xml" schematypens="http://purl.oclc.org/dsdl/schematron"/>
```

The second association validates your document with Schematron rules extracted from the RELAX NG Schema.

Validating XML Documents with XML Schema and Embedded Schematron

Similarly, you can specify an XML Schema having the embedded Schematron rules.

```xml
<?xml-model href="percent.xsd" type="application/xml"
schematypens="http://purl.oclc.org/dsdl/schematron"/>
```

Note: When you work with XML Schema or Relax NG documents that have embedded Schematron rules Oxygen XML Editor provides two built-in validation scenarios: Validate XML Schema with embedded Schematron for XML schema, and Validate Relax NG with embedded Schematron for Relax NG. You can use one of these scenarios to validate the embedded Schematron rules.

Example: Embedded Schematron in Relax NG Schema

```xml
<sch:pattern>
  <sch:rule context="...">
    <sch:assert test="...">Message.</sch:assert>
  </sch:rule>
</sch:pattern>
```
Example: Embedded Schematron in XML Schema

```xml
<xsd:appinfo>
  <sch:pattern>
    <sch:rule context="...">
      <sch:assert test="...">Message.</sch:assert>
    </sch:rule>
  </sch:pattern>
</xsd:appinfo>
```

*Embed Schematron Quick Fixes in Relax NG or XML Schema* on page 657

Schematron Outline View

The **Outline** view for Schematron schemas presents a list of components in a tree-like structure and it allows for quick access to a component by name. By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

![Figure 401: Schematron Outline View](image)

The following actions are available in the **Settings** menu on the **Outline** view toolbar:

- **Filter returns exact matches**
  
The text filter of the **Outline** view returns only exact matches.

- **Selection update on cursor move**
  
  Controls the synchronization between **Outline** view and source document. The selection in the **Outline** view can be synchronized with the cursor moves or the changes in the editor. Selecting one of the components from the **Outline** view also selects the corresponding item in the source document.

- **Flat presentation mode of the filtered results**
  
  When active, the application flattens the filtered result elements to a single level.

- **Show comments and processing instructions**
  
  Show/hide comments and processing instructions in the **Outline** view.

- **Show element name**
  
  Show/hide element name.

- **Show text**
  
  Show/hide additional text content for the displayed elements.
Show attributes
Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from the Outline preferences panel.

Configure displayed attributes
Displays the XML Structured Outline preferences page.

The following contextual menu actions are also available in the Outline view:

Append Child
Displays a list of elements that you can insert as children of the current element.

Insert Before
Displays a list of elements that you can insert as siblings of the current element, before the current element.

Insert After
Displays a list of elements that you can insert as siblings of the current element, after the current element.

Edit Attributes
Opens a dialog box that allows you to edit the attributes of the currently selected component.

Toggle Comment
Comments/uncomments the currently selected element.

Cut
Cuts the currently selected component.

Copy
Copies the currently selected component.

Delete
Deletes the currently selected component.

Expand More
Expands the structure of a component in the Outline view.

Collapse All
Collapses the structure of all the component in the Outline view.

The upper part of the Outline view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (*, ?) and separate multiple patterns with commas.

Schematron Resource Hierarchy/Dependencies View

The Resource Hierarchy/Dependencies view allows you to see the hierarchy/dependencies for a Schematron schema. If the view is not displayed, it can be opened from the Window > Show View menu.

If you want to see the hierarchy of a schema, select the desired schema in the Project view and choose Resource Hierarchy from the contextual menu.
If you want to see the dependencies of a schema, select the desired schema in the Project view and choose Resource Dependencies from the contextual menu.

The following actions are available in the Resource Hierarchy/Dependencies view:

- **Refresh**
  Refreshes the Hierarchy/Dependencies structure.

- **Stop**
  Stops the hierarchy/dependencies computing.

- **Show Hierarchy**
  Allows you to choose a resource to compute the hierarchy structure.

- **Show Dependencies**
  Allows you to choose a resource to compute the dependencies structure.

- **Configure**
  Allows you to configure a scope to compute the dependencies structure. There is also an option for automatically using the defined scope for future operations.

- **History**
  Provides access to the list of previously computed dependencies. Use the Clear history button to remove all items from this list.

The contextual menu contains the following actions:

- **Open**
  Opens the resource. You can also double-click a resource in the Hierarchy/Dependencies structure to open it.

- **Copy location**
  Copies the location of the resource.

- **Move resource**
  Moves the selected resource.
Rename resource

   Renames the selected resource.

Show Resource Hierarchy

   Shows the hierarchy for the selected resource.

Show Resource Dependencies

   Shows the dependencies for the selected resource.

Add to Master Files

   Adds the currently selected resource in the Master Files directory.

Expand All

   Expands all the children of the selected resource from the Hierarchy/Dependencies structure.

Collapse All

   Collapses all children of the selected resource from the Hierarchy/Dependencies structure.

Tip: When a recursive reference is encountered in the Hierarchy view, the reference is marked with a special icon.

Note: The Move resource or Rename resource actions give you the option to update the references to the resource.

Moving/Renaming Schematron Resources

You can move and rename a resource presented in the Resource/Hierarchy Dependencies view, using the Rename resource and Move resource refactoring actions from the contextual menu.

When you select the Rename action in the contextual menu of the Resource/Hierarchy Dependencies view, the Rename resource dialog box is displayed. The following fields are available:

• New name - Presents the current name of the edited resource and allows you to modify it.
• Update references - Enable this option to update the references to the resource you are renaming.

When you select the Move action from the contextual menu of the Resource/Hierarchy Dependencies view, the Move resource dialog box is displayed. The following fields are available:

• Destination - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
• New name - Presents the current name of the moved resource and gives you the option to change it.
• Update references of the moved resource(s) - Enable this option to update the references to the resource you are moving, in accordance with the new location and name.

If the Update references of the moved resource(s) option is enabled, a Preview option (which opens the Preview dialog box) is available for both actions. The Preview dialog box presents a list with the resources that are updated.

Highlight Component Occurrences in Schematron Documents

When you position your mouse cursor over a component in a Schematron document, Oxygen XML Editor searches for the component declaration and all its references and highlights them automatically.

Customizable colors are used: one for the component definition and another one for component references. Occurrences are displayed until another component is selected.

To change the default behavior of Highlight Component Occurrences, open the Preferences dialog box (Options > Preferences) and go to Editor > Mark Occurrences. You can also trigger a search using the Search > Search Occurrences in File Ctrl + Shift + U (Command + Shift + U on OS X) action from contextual menu. Matches are displayed in separate tabs of the Results view.

Searching and Refactoring Operations in Schematron Documents

Search Actions

The following search actions can be applied on pattern, phase, or diagnostic types and are available from the Search submenu in the contextual menu of the current editor or from the Document > References menu:
- **Search References** - Searches all references of the item found at current cursor position in the defined scope, if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box is displayed and you have the possibility to define another search scope.

- **Search References in** - Searches all references of the item found at current cursor position in the file or files that you specify when define a scope in the **Search References** dialog box.

- **Search Declarations** - Searches all declarations of the item found at current cursor position in the defined scope if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box will be displayed and you have the possibility to define another search scope.

- **Search Declarations in** - Searches all declarations of the item found at current cursor position in the file or files that you specify when you define a scope for the search operation.

- **Search Occurrences in File** - Searches all occurrences of the item at the cursor position in the currently edited file.

**Refactoring Actions**

The following refactoring actions can be applied on pattern, phase, or diagnostic types and are available from the Refactoring submenu in the contextual menu of the current editor or from the Document > Refactoring menu:

- **Rename Component** - Allows you to rename the current component (in-place). The component and all its references in the document are highlighted with a thin border and the changes you make to the component at the cursor position are updated in real time to all occurrences of the component. To exit the in-place editing, press the **Esc** or **Enter** key on your keyboard.

- **Rename Component in** - Opens a dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the **Preview** button, you can view the files to be affected by the action.

![Figure 404: Rename Identity Constraint Dialog Box](image)

**Searching and Refactoring Operations Scope in Schematron Documents**

The *scope* is a collection of documents that define the context of a search and refactor operation. To control it you can use the **Change scope** operation, available in the Quick Assist action set or on the Resource Hierarchy/Dependency View toolbar. You can restrict the scope to the current project or to one or multiple working sets. The **Use only Master Files, if enabled**
The checkbox allows you to restrict the scope of the search and refactor operations to the resources from the Master Files directory. Click read more for details about the Master Files support.

Figure 405: Change Scope Dialog Box

The scope you define is applied to all future search and refactor operations until you modify it. Contextual menu actions allow you to add or delete files, folders, and other resources to the working set structure.

Quick Assist Support in Schematron Documents

The Quick Assist support improves the development workflow, offering fast access to the most commonly used actions when you edit schema documents.

The Quick Assist feature is activated automatically when the cursor is positioned over the name of a component. It is accessible via a yellow bulb icon ((Adapter) placed at the current line in the stripe on the left side of the editor. Also, you can invoke the quick assist menu by using the Alt + 1 (Meta + Alt + 1 on Mac OS X) keyboard shortcuts.

Figure 406: Schematron Quick Assist Support

The quick assist support offers direct access to the following actions:

- Rename Component in
  Renames the component and all its dependencies.

- Search Declarations
  Searches the declaration of the component in a predefined scope. It is available only when the context represents a component name reference.

- Search References
  Searches all references of the component in a predefined scope.
Component Dependencies
Searches the component dependencies in a predefined scope.

Change Scope
Configures the scope that will be used for future search or refactor operations.

Rename Component
Allows you to rename the current component in-place.

Search Occurrences
Searches all occurrences of the component within the current file.

Editing Schematron Quick Fixes
Oxygen XML Editor provides support for editing the Schematron Quick Fixes. You can define a library of quick fixes by editing them directly in the current Schematron file or in a separate file. Oxygen XML Editor assists you in editing Schematron Quick Fixes with schema-based content completion, syntax highlighting, and validation as you type.

For information about applying and detecting the Schematron schemas that include SQF, see Associating a Schema to XML Documents on page 450.

Related information
Oxygen XML Blog: Schematron Checks to Help Technical Writing

Schematron Quick Fixes (SQF)
Oxygen XML Editor provides support for Schematron Quick Fixes (SQF). They help you resolve issues that appear in XML documents that are validated against Schematron schemas by offering you solution proposals. The Schematron Quick Fixes are an extension of the Schematron language and they allow you to define fixes for Schematron validation messages. Specifically, they are associated with assert or report messages.

A typical use case is using Schematron Quick Fixes to assist content authors with common editing tasks. For example, you can use Schematron rules to automatically report certain validation warnings (or errors) when performing regular editing tasks, such as inserting specific elements or changing IDs to match specific naming conventions. For more details and examples, please see the following blog post: http://blog.oxygenxml.com/2015/05/schematron-checks-to-help-technical.html.

Displaying the Schematron Quick Fix Proposals
The defined Schematron Quick Fixes are displayed on validation errors in Text mode and Author mode.

Figure 407: Example of a Schematron Quick Fix

Related information
Editing Schematron Quick Fixes on page 650
Schematron Quick Fix Specifications
Presenting Schematron Validation Issues

Defining Schematron Quick Fixes
You can define and customize Schematron Quick Fixes directly in the current Schematron file or in a separate Schematron file. The Schematron Quick Fixes are an extension of the Schematron language and they allow you to define fixes for Schematron error messages. You can refer the quick fixes from the assert or report elements in the values of the sqf:fix attributes.
Defining a Schematron Quick Fix

The basics of a Schematron Quick Fix is defined by an ID, name, description, and the operations to be executed.

- **ID** - Defined by the `id` attribute from the `fix` element and must be unique in the current context. It is used to refer the quick fix from a `report` or `assert` element.
- **Name** - The name of the quick fix is defined by the `title` element.
- **Description** - Defined by the text in the paragraphs (p) of the `description` element.
- **Operations** - The following basic types of `operations (elements)` are supported:
  - `<sqf:add>` Element - To add a new node or fragment in the document.
  - `<sqf:delete>` Element - To remove a node from the document.
  - `<sqf:replace>` Element - To replace a node with another node or fragment.
  - `<sqf:stringReplace>` Element - To replace text content with other text or a fragment.

![Schematron Quick Fix Components](image)

Figure 408: Schematron Quick Fix Components

The assertion message that generates the quick fix is added as the `description` of the problem to be fixed. The `title` is presented as the name of the quick fix. The content of the paragraphs (p) within the `description` element are presented in the tooltip message when the quick fix is selected.

Additional Elements Supported in the Schematron Quick Fixes

- `<sqf:user-entry>`
  This element defines a value that must be set manually by the user. For more information, see **User Entry SQF Operation** on page 654.

- `<sqf:call-fix>`
  This element calls another quick fix within a quick fix. The called quick fix must be defined globally or in the same Schematron rule as the calling quick fix. A calling quick fix adopts the activity elements of the called quick fix and should not include other activity elements. You can also specify which parameters are sent by using the `<sqf:with-param>` child element.

- `<sqf:group>`
  Allows you to group multiple quick fixes and refer them from an `assert` or `report` element.

- `<sqf:fixes>`
  Is defined globally and contains global fixes and groups of fixes.

- `<sqf:keep>`
  Used to copy the selected nodes that are specified by the `select` attribute.

  **Note:** In Oxygen XML Editor the copied nodes cannot be manipulated by the current or other activity elements.
<sqf:param>
Defines a parameter for a quick fix. If the parameter is defined as abstract then the type and default value should not be specified and the fix can be called from an abstract pattern that defines this parameter.

Other SQF Notes

Note: The sqf:default-fix attribute is ignored in Oxygen XML Editor.

For more details on editing Schematron Quick Fixes, go to: Schematron Quick Fix Specifications

Basic Schematron Quick Fix Operations

There are four basic operations that can be executed in a Schematron Quick Fix: Add, Delete, Replace, and String Replace.

Add

The <sqf:add> element allows you to add a node to the instance. An anchor node is required to select the position for the new node. The anchor node can be selected by the match attribute. Otherwise, it is selected by the context attribute of the rule.

The target attribute defines the name of the node to be added. It is required if the value of the node-type attribute is set to anything other than "comment".

The <sqf:add> element has a position attribute and it determines the position relative to the anchor node. The new node could be specified as the first child of the anchor node, the last child of the anchor node, before the anchor node, or after the anchor node (first-child is the default value). If you want to add an attribute to the anchor node, do not use the position attribute.

Note: If you insert an element and its content is empty, Oxygen XML Editor will insert the required element content.

An Example of the <sqf:add> Element:

```xml
<schema xmlns="http://purl.oclc.org/dsdl/schematron"
  xmlns:sqf="http://www.schematron-quickfix.com/validator/process"
  queryBinding="xslt2">
  <pattern>
    <rule context="head">
      <assert test="title" sqf:fix="addTitle">title element missing.</assert>
      <sqf:fix id="addTitle">
        <sqf:description>
          <sqf:title>Insert title element.</sqf:title>
        </sqf:description>
        <sqf:add target="title" node-type="element">Title text</sqf:add>
      </sqf:fix>
    </rule>
  </pattern>
</schema>
```

Specific Add Operations:

- **Insert Element** - To insert an element, use the <sqf:add> element, set the value of the node-type to "element", and specify the element QName with the target attribute. If the element has a prefix, it must be defined in the Schematron using a namespace declaration (<ns uri="namespace" prefix="prefix"/>).

- **Insert Attribute** - To insert an attribute, use the <sqf:add> element, set the value of the node-type to "attribute", and specify the attribute QName with the target attribute. If the attribute has a prefix, it must be defined in the Schematron using a namespace declaration (<ns uri="namespace" prefix="prefix"/>).

- **Insert Fragment** - If the node-type is not specified, the <sqf:add> element will insert an XML fragment. The XML fragment must be well formed. You can specify the fragment in the add element or by using the select attribute.

- **Insert Comment** - To insert a comment, use the <sqf:add> element and set the value of the node-type to "comment".

- **Insert Processing Instruction** - To insert a processing instruction, use the <sqf:add> element, set the value of the node-type to "pi" or "processing-instruction", and specify the name of the processing instruction in the target attribute.
Delete

The `<sqf:delete>` element allows you to remove any type of node (such as elements, attributes, text, comments, or processing instructions). To specify nodes for deletion the `<sqf:delete>` element can include a `match` attribute that is an XPath expression (the default value is `. ). If the `match` attribute is not included, it deletes the context node of the Schematron rule.

An Example of the `<sqf:delete>` Element:

```xml
<schema xmlns="http://purl.oclc.org/dsdl/schematron" queryBinding="xslt2"
    xmlns:sql="http://www.schematron-quickfix.com/validator/process">
  <pattern>
    <rule context="*[@xml:lang]">
      <report test="@xml:lang" sqf:fix="#remove_lang">
        The attribute "xml:lang" is forbidden.
      </report>
      <sqf:fix id="#remove_lang">
        <sqf:description>
          <sqf:title>Remove "xml:lang" attribute</sqf:title>
        </sqf:description>
        <sqf:delete match="@xml:lang"/>
      </sqf:fix>
    </rule>
  </pattern>
</schema>
```

Replace

The `<sqf:replace>` element allows you to replace nodes. Similar to the `<sqf:delete>` element, it can include a `match` attribute. Otherwise, it replaces the context node of the rule. The `<sqf:replace>` element has three tasks. It identifies the nodes to be replaced, defines the replacing nodes, and defines their content.

An Example of the `<sqf:replace>` Element:

```xml
<schema xmlns="http://purl.oclc.org/dsdl/schematron"
    xmlns:sql="http://www.schematron-quickfix.com/validator/process" queryBinding="xslt2">
  <pattern>
    <rule context="title">
      <report test="exists(ph)" sqf:fix="#resolvePh" role="warn">
        ph element is not allowed in title.</report>
      <sqf:fix id="#resolvePh">
        <sqf:description>
          <sqf:title>Change the ph element into text</sqf:title>
        </sqf:description>
        <sqf:replace match="ph">
          <value-of select="."/>
        </sqf:replace>
      </sqf:fix>
    </rule>
  </pattern>
</schema>
```

Other Attributes for Replace Operations:

- **node-type** - Determines the type of the replacing node. The permitted values include:
  - `keep` - Keeps the node type of the node to be replaced.
  - `element` - Replaces the node with an element.
  - `attribute` - Replaces the node with an attribute.
  - `pi` - Replaces the node with a processing instruction.
  - `comment` - Replaces the node with a comment.
  - `target` - By using a QName it gives the replacing node a name. This is necessary when the value of the `node-type` attribute is anything other than "comment".
  - `select` - Allows you to choose the content of the replacing nodes. You can use XPath expressions with the `select` attribute. If the `select` attribute is not specified then the content of the `<sqf:replace>` element is used instead.

String Replace

The `<sqf:stringReplace>` element is different from the others. It can be used to find a sub-string of text content and replace it with nodes or other strings.

Attributes for the String Replace Operation:

- **match** - Allows you to select text nodes that contain the sub-strings you want to replace.
• **select** - Allows you to select the replacing fragment, in case you do not want to set it in the content of the stringReplace element.
• **regex** - Matches the sub-strings using a regular expression.

**Note:** Consider the following information about using regular expressions in the stringReplace element:

- The regular expressions from this operation are compiled as Java regular expressions. For more information, see [https://docs.oracle.com/javase/7/docs/api/java/util/regex/Pattern.html](https://docs.oracle.com/javase/7/docs/api/java/util/regex/Pattern.html).
- The *j* flag allows you to use the standard Java regular expression engine, which allows native Java regular expression syntax. This allows, for example, the use of \b in a regular expression to match word boundaries. For more information, see [http://www.saxonica.com/html/documentation/functions/fn/matches.html](http://www.saxonica.com/html/documentation/functions/fn/matches.html).
- Regular expressions in the `<sqf:stringReplace>` element always have the *dot matches all* flag set to "true". Therefore, the line terminator will also be matched by the regular expression.

**Attention:** The context of the content within the `<sqf:stringReplace>` element is set to the whole text node, rather than the current sub-string.

**An Example of the `<sqf:stringReplace>` Element:**

```xml
<?xml version="1.0" encoding="UTF-8"?>
<sch:schema xmlns:sch="http://purl.oclc.org/dsdl/schematron"
    xmlns:sqf="http://www.schematron-quickfix.com/validator/process"
    queryBinding="xslt2">
    <sch:pattern>
        <sch:rule context="text()">
            <sch:report test="matches(., \[oO\][xX]\[ygen\])" sqf:fix="changeWord">The oXygen word is not allowed</sch:report>
            <sqf:fix id="changeWord">
                <sqf:description>
                    <sqf:title>Replace word with product</sqf:title>
                </sqf:description>
                <sqf:stringReplace regex="\[oO\][xX]\[ygen\]"><ph keyref="product"/>
            </sqf:stringReplace>
        </sch:rule>
    </sch:pattern>
</sch:schema>
```

**Related information**

- [User Entry SQF Operation](#) on page 654
- [Restricting Quick Fix Operations](#) on page 654

**User Entry SQF Operation**

The `<sqf:user-entry>` element defines a value that must be set manually by the user. If multiple `user-entry` elements are defined, Oxygen XML Editor will display a dialog box for each one, in which the user can specify values. Also, the `<user-entry>` element can be used as an XPath variable where the XPath variable is the name of the `user-entry`.

**An Example of the `<sqf:user-entry>` Element:**

```xml
<sqf:fix id="duplicate">
    <sqf:description>
        <sqf:title>Change the name of the element</sqf:title>
    </sqf:description>
    <sqf:user-entry name="newName" default="product">
        <sqf:description>
            <sqf:title>Enter the new name of the element</sqf:title>
        </sqf:description>
    </sqf:user-entry>
    <sqf:replace node-type="element" target="{$newName}" select="child::node()"/>
</sqf:fix>
```

**Related information**

- [Basic Schematron Quick Fix Operations](#) on page 652

**Restricting Quick Fix Operations**

To restrict a quick fix or a specific operation to only be available if certain conditions are met, the *use-when* attribute can be included in the `<sqf:fix>` element or any of the SQF operation elements. The condition of the *use-when* attribute is an
XPath expression and the fix or operation will be performed only if the condition is satisfied. In the following example, the use-when condition is applied to the <sqf:fix> element:

```xml
<sqf:fix id="last" use-when="$colWidthSummarized - 100 lt $lastWidth"
role="replace">
  <sqf:title>Subtract excessive width from the last element.</sqf:title>
  <sqf:description>
    <let name="delta" value="$colWidthSummarized - 100"/>
    <sqf:add match="html:col[last()]" target="width" node-type="attribute">
      <let name="newWidth" value="number(substring-before(@width,'%')) - $delta"/>
      <value-of select="concat($newWidth,'%')"/>
    </sqf:add>
  </sqf:description>
</sqf:fix>
```

**Basic Schematron Quick Fix Operations** on page 652

Formatting/Indenting ContentInserted by SQF Operations

Content that is inserted by the Add, Replace, or String Replace Schematron Quick Fix operations is automatically indented unless you set the value of the xml:space attribute to preserve on the operation element. There are several methods available to format the content that is inserted:

- **xsl:text** - You can use an xsl:text element to format the inserted content and keep the automatic indentation, as in the following example:

```xml
<sqf:add position="last-child">
  <row><xsl:text>
    <entry>First column</entry><xsl:text>
    <entry>Second column</entry><xsl:text>
  </row><xsl:text>
</sqf:add>
```

- **xml:space** - Use the xml:space attribute and set its value to preserve to format the content and specify the spacing between elements, as in the following example:

```xml
<sqf:add node-type="element" target="codeblock" xml:space="preserve">
  /* a long sample program */
  Do forever
  Say "Hello, World"
  End</sqf:add>
```

Related information

**Basic Schematron Quick Fix Operations** on page 652

Executing Schematron Quick Fixes in Other Documents

You can apply Schematron Quick Fixes over nodes from referenced documents (using XInclude or external entities), and you can access them as nodes in your current document.

Also, you can apply the quick fixes over other documents using the doc() function in the value of the match attribute. For example, you can add a new key in the keylist.xml file using the following operation:

```xml
<sqf:add match="doc('keylist.xml')/KeyList" target="Key"
node-type="element" select="Key2">
```

Validating Schematron Quick Fixes

By default, Schematron Quick Fixes are validated as you edit them within the Schematron file or while editing them in a separate file. To change this, open the Preferences dialog box (Options > Preferences), go to Editor > Document Checking, and disable the Enable automatic validation option.

To validate Schematron Quick Fixes manually, select the Validate action from the *Validation toolbar drop-down menu or the Document > Validate menu. The validation problems are highlighted directly in the editor, making it easy to locate and fix any issues.
Content Completion in SQF

Oxygen XML Editor helps you edit Schematron Quick Fixes embedded in a Schematron document by offering proposals that are valid at the cursor position in a Content Completion Assistant. When you edit the value of an attribute that references a quick fix id, the ids are collected from the entire definition scope. For example, if the editing context is `assert/@sqf:fix`, the Content Completion Assistant proposes all fixes defined locally and globally.

If the editing context is an attribute value that is an XPath expression (such as `sqf:add/@match` or `replace/@select`), the Content Completion Assistant offers the names of XPath functions, the XPath axes, and user-defined variables and parameters.

The Content Completion Assistant displays XSLT 1.0 functions (and optionally XSLT 2.0 / 3.0 functions) in the attributes `path`, `select`, `context`, `subject`, and `test`, depending on the Schematron options that are set in Preferences pages. If the Saxon 6.5.5 namespace (`xmlns:saxon="http://icl.com/saxon"`) or the Saxon 9.6.0.7 namespace is declared in the Schematron schema (`xmlns:saxon="http://saxon.sf.net/"`) the content completion also displays the XSLT Saxon extension functions.

Highlight Quick Fix Occurrences in SQF

When you position your mouse cursor over a quick fix id in a Schematron document, Oxygen XML Editor searches for the quick fix declaration and all its references and highlights them automatically.

Customizable colors are used: one for the quick fix definition and another one for its references. Occurrences are displayed until another quick fix is selected.

To change the default behavior of Highlight Component Occurrences, open the Preferences dialog box (Options > Preferences) and go to Editor > Mark Occurrences. You can also trigger a search using the Search > Search Occurrences in File (Ctrl + Shift + U (Command + Shift + U on OS X)) action from contextual menu. Matches are displayed in separate tabs of the Results view.

Searching and Refactoring Operations in SQF

Search Actions

The following search actions can be applied on quick fix ids and are available from the Search submenu in the contextual menu of the current editor or from the Document > References menu:

- [Search References](#) - Searches all references of the item found at current cursor position in the defined scope, if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box is displayed and you have the possibility to define another search scope.
- [Search References in](#) - Searches all references of the item found at current cursor position in the file or files that you specify when define a scope in the Search References dialog box.
- [Search Declarations](#) - Searches all declarations of the item found at current cursor position in the defined scope if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box will be displayed and you have the possibility to define another search scope.
- [Search Declarations in](#) - Searches all declarations of the item found at current cursor position in the file or files that you specify when define a scope for the search operation.
- [Search Occurrences in File](#) - Searches all occurrences of the item at the cursor position in the currently edited file.

Refactoring Actions

The following refactoring actions can be applied on quick fix ids and are available from the Refactoring submenu in the contextual menu of the current editor or from the Document > Refactoring menu:
• **Rename Component** - Allows you to rename the current component (in-place). The component and all its references in the document are highlighted with a thin border and the changes you make to the component at the cursor position are updated in real time to all occurrences of the component. To exit the in-place editing, press the **Esc** or **Enter** key on your keyboard.

• **Rename Component in** - Opens a dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the **Preview** button, you can view the files to be affected by the action.

![Rename Identity Constraint Dialog Box](image)

**Figure 409: Rename Identity Constraint Dialog Box**

**Embed Schematron Quick Fixes in Relax NG or XML Schema**

Schematron Quick Fixes can be embedded into an XML Schema through annotations (using the `appinfo` element), or in a schematron rule embedded in the RELAX NG Schema. For more information about embedding schematron in XML Schema or Relax NG, see [XML Schema or RELAX NG with Embedded Schematron Rules](#) on page 643.

Oxygen XML Editor is able to extract and use the embedded Schematron Quick Fixes. To make the embedded Schematron Quick Fixes available, follow these steps:

1. Define a validation against a schema.
2. For the **Schema type**, choose XML Schema or Relax NG.
3. Enable the **Embedded schematron rules** option.

**Example: Embedded Schematron Quick Fix in XML Schema**

```xml
<xsd:appinfo>
  <sch:pattern>
    <sch:rule context="...">
      <sch:assert test="..." sqf:fix="fixId">Message.</sch:assert>
    </sch:rule>
    ......
  </sch:pattern>
</xsd:appinfo>
```
Example: Embedded Schematron Quick Fix in Relax NG

```
<sch:pattern>
  <sch:rule context="...">
    <sch:assert test="..." sqf:fix="fixId">Message.</sch:assert>
    .......
  </sch:rule>
</sch:pattern>
```

Tip: For more extensive examples, see our samples in the [OXYGEN_INSTALL_DIR]/samples/schematron folder.

XML Schema or RELAX NG with Embedded Schematron Rules on page 643

Defining Schematron Quick Fixes on page 650

Integrating SQF in a Framework

You can use Schematron Quick Fixes to assist your content authors by imposing rules for an entire framework (document type) and offering fixes when a rule violation is detected.

For example, if you are using DITA, you may want your contributors to avoid inserting a figure (fig element) inside a paragraph (p element) that contains other content since it may result in undesirable placement or spacing in the output. The Schematron rule and its Quick Fix for this particular use-case could look like this:

```
<schema xmlns="http://purl.oclc.org/dsdl/schematron"
  xmlns:sqf="http://www.schematron-quickfix.com/validator/process"
  queryBinding="xslt2">
  <pattern id="check.figure.location">
    <rule context="p/fig">
      <report test="true()" role="warn" sqf:fix="moveAfter">
        A figure inside a paragraph doesn't transform well into PDF. </report>
      <sqf:fix id="moveAfter">
        <sqf:title>Move after the paragraph.</sqf:title>
        <sqf:description></sqf:description>
        <let name="figToMove" value="."/>
        <sqf:add match="parent::p" select="$figToMove" position="after"/>
        <sqf:delete match="."/>
      </sqf:fix>
    </rule>
  </pattern>
</schema>
```

The result of this example would be that the user will see a warning if they insert a fig element inside a p element and they are presented with the option of selecting the Quick Fix that would move the figure outside the paragraph.

How to Integrate SQF in a Framework

To integrate a Schematron Quick Fix in a framework, follow these steps:

1. Define a Schematron Quick Fix for a rule in an existing or new Schematron file.
2. Save it somewhere in your framework directory. For example, the default framework directory for DITA is located in: [OXYGEN_INSTALL_DIR]/frameworks/dita/.
3. Add a reference to the Schematron file that includes the SQF in your framework by following the procedure in Associating a Schema in Validation Scenarios Defined in the Document Type on page 453.
4. Open a document in your framework and test the new rule and quick fix.
5. You can continue to refine the rule and develop additional rules as needed.

Editing SVG Files

SVG (Scalable Vector Graphics) is a platform for two-dimensional graphics. It has two parts: an XML-based file format and a programming API for graphical applications. Some of the key features include support for shapes, text, and embedded raster graphics with many painting styles, scripting through languages such as ECMAScript, and support for animation.

SVG is a vendor-neutral, open standard that has important industry support. Companies such as Adobe, Apple, and IBM have contributed to its W3C specifications. Many documentation frameworks (including DocBook) have support for SVG by defining the graphics directly in the document.

Oxygen XML Editor adds SVG support by using the Batik distribution package (an open source project developed by the Apache Software Foundation) and the default XML catalog resolves the SVG DTD.

Note: Batik partially supports SVG 1.1. For a detailed list of supported elements, attributes, and properties, see the Batik Implementation Status page.

How to Render SVG Images that Use Java Scripting

1. Copy the js.jar library from the Batik distribution into the Oxygen XML Editor lib folder.
2. Restart the application.

Standalone SVG Viewer

Oxygen XML Editor includes a simple SVG Viewer that allows you to work with SVG images.

To open the viewer, select SVG Viewer from the Tools menu.

Figure 410: SVG Viewer

You can browse for and open any SVG file that has the .svg or .svgz extension.

If the file is included in the current project, you can open it in the viewer by right-clicking the image file in the Project view and selecting Open with > SVG Viewer.

Actions Available in the SVG Viewer

The following actions are available in the SVG Viewer:

Zoom in

To zoom in on an image, use any of the following methods:

• Scroll forward with the mouse wheel.
• Select Zoom in from the contextual menu.
• Use the Ctrl + I (Command + I on OS X) keyboard shortcut.
Zoom out
To zoom in on an image, use any of the following methods:

- Scroll **backward** with the mouse wheel.
- Use the **Ctrl + O (Command + O on OS X)** keyboard shortcut.
- Select **Zoom out** from the contextual menu.

Rotate
To rotate an image, use either of the following methods:

- Use the **Ctrl + Right-Click + Drag (Command + Right-Click + Drag on OS X)** shortcut.
- Select **Rotate** from the contextual menu. This rotates the image exactly 90 degrees clockwise.

Refresh
To refresh (or reset) an image, use either of the following methods:

- Use the **Ctrl + T (Command + T on OS X)** keyboard shortcut.
- Select **Refresh** from the contextual menu.

Move
To move an image, use either of the following methods:

- Use the **Arrow Keys** on your keyboard.
- Use the **Shift + Left-Click + Drag** shortcut.

Pan
To pan an image, **click and drag** the image with your mouse.

*SVG 1.2 Rendering Issues* on page 1508

**Integrated SVG Viewer in the Results Panel**

Oxygen XML Editor includes an integrated SVG Viewer that can render the results of an XSLT transformation scenario that generates SVG images in the results panel at the bottom of the editor. This is useful for developing XSL stylesheets with the capability of producing SVG graphics.

To enable this feature, select **Show in results view as > SVG** in the Output tab of the XSLT transformation scenario configuration dialog box. When you run the transformation, the SVG result is then rendered in an integrated SVG viewer in the results panel.

**Example of a Use-Case**

Suppose you have an XML document that describes the evolution of your sales over a time period and you want to create a graphic for it. You could use the following steps to accomplish this task:

1. Start with a static SVG image, written directly in Oxygen XML Editor or exported from a external graphics tool.
2. Extract the parts that are dependent upon the data from the XML document and create an XSL template to produce the image.
3. Create an **XML transformation with XSLT scenario**.
4. While configuring the transformation scenario, select **Show in results view as > SVG in the Output tab** of the configuration dialog box.
5. Run the transformation.

The SVG image is rendered in an integrated SVG viewer in the results panel at the bottom of the editor.
Editing XHTML Documents

Oxygen XML Editor provides support for editing XHTML files. Oxygen XML Editor includes XHTML catalogs and document templates to help you get started. You can also find a sample file in the [OXYGEN_INSTALL_DIR]/samples/xhtml folder.

The XHTML editing features include:

- **Source Editing** - You can edit XHTML files in the Text editing mode (XML source editor) using all of its useful features.
- **Visual Editing** - You can edit XHTML files in the visual Author editing mode using all of its authoring features.
- **Validation** - Easily identify errors and their location with the Oxygen XML Editor XML validation features.
- **Content Completion** - The Content Completion Assistant displays a list of context-sensitive proposals that are valid at the current cursor position.
- **Import HTML as XHTML** - Oxygen XML Editor includes support for importing HTML files as an XML document.
- **Remote Editing** - Oxygen XML Editor has built-in support for editing documents that are stored on remote servers through FTP, SFTP, and WebDAV protocols, allowing you to edit XHTML pages from your web server.
- **Syntax Highlighting** - XHTML documents with embedded CSS, JS, PHP, and JSP scripts are rendered with dedicated coloring schemes. To customize them, open the Preferences dialog box (Options > Preferences) and go to Editor > Syntax Highlight.

XHTML Document Type on page 778

Editing Markdown Documents

*Markdown* was created as a lightweight markup language with plain text formatting syntax designed to provide a syntax that is very easy to read and write, and to convert it to HTML and other formats. It is often used by content contributors who want a quick and easy way to write content without having to take their fingers off the keyboard and without having to learn numerous codes or shortcuts, and it can easily be shared interchangeably between virtually any types of contributor and system.

Oxygen XML Editor provides a built-in Markdown editor that allows you to convert Markdown syntax to HTML or DITA and it includes a preview panel to help you visualize the final output. Aside from the plain text syntax that is common amongst most Markdown applications, the editor in Oxygen XML Editor also integrates many other powerful features that content authors are accustomed to using for other types of documents. Some of these additional unique features include:

- Additional toolbar and contextual menu actions.
- Automatic validation to help keep the syntax valid.
- Dedicated syntax highlighting to make Markdown documents even easier to read and write.
- Unique features for creating Markdown documents directly in DITA maps and converting Markdown documents to DITA topics.
- Specialized syntax rules to combine popular syntax features from several specifications.
Markdown Editor

Oxygen XML Editor provides an intuitive, dynamic, and easy-to-use Markdown editor for writing and converting Markdown documents. It is a splitscreen editor with two panels that are synchronized in real-time. The left side is a simple text editor that is specially designed for writing Markdown syntax. The right side is a WYSIWYG style preview of how changes will look in the output.

Left-Side Markdown Text Editor

The left pane is a simple text editor that is refined to accept Markdown syntax. At the same time, you still have many of the actions, options, and features that you are used to when editing any other type of document in Oxygen XML Editor.

The features of this special editor that are unique for Markdown documents include:

- **Unique Markdown Syntax Rules** - The Markdown editor in Oxygen XML Editor uses an integration of rules that combine rules from common default Markdown syntax along with many of the rules used in the GitHub Flavored Markdown syntax.
- **Syntax Highlighting** - The Oxygen XML Editor syntax highlighting feature is integrated into the Markdown text editor to make it easier to read and write Markdown syntax. You can even customize the colors and styles for the syntax highlighting.
- **Automatic Spell Checking** - The Markdown editor supports the Oxygen XML Editor automatic spell checking feature that reports possible misspelled words as you type. You simply need to enable the Automatic spell check option in the Spell Check preferences page, then click the Select editors button and select Markdown Editor.
- **Helpful Toolbar and Contextual Menu Actions** - A variety of unique actions are available from the toolbar to help you insert proper Markdown syntax. The contextual menu also includes some common editing actions, as well as unique actions to export (convert) Markdown documents to HTML or DITA.
- **Shortcut Keys** - Many of the shortcut keys that are most commonly used in Oxygen XML Editor also work in the Markdown editor.

Right-Side WYSIWYG Preview Pane

The right pane is a WYSIWYG Preview pane that shows a visual representation of how changes made in the left-side text editor will be converted to HTML or DITA output. The changes you make in the text editor are parsed continually and they are immediately visible in the Preview pane. There are two tabs available in the Preview pane, one for visualizing DITA output and one for visualizing HTML output. You can switch between the two tabs at the bottom of the pane.

The Preview pane includes the following unique features:

- **WYSIWYG Visualization** - This pane presents the Markdown syntax from the left-side text editor in a visual WYSIWYG style interface that is automatically synchronized as you type.
- **Export Options** - The DITA tab includes a contextual menu action to export (convert) the current Markdown document to a DITA topic. Similarly, the HTML tab includes a contextual menu action to export (convert) the Markdown document to HTML.
- **Automatic Validation** - As you edit Markdown documents, they are validated automatically. The conversion engine constantly tries to parse your changes and if a change results in an error that prevents the parser from converting the syntax, an error message will be displayed in the Preview pane or Results view at the bottom of the editor.
- **Print Feature** - The Markdown editor includes a Print action that is available in the contextual menu and it allows you to configure options for printing the current document as you see it in the Preview pane.
- **Specialized DITA Features** - The Markdown editor includes some unique, specialized features to integrate it with the powerful DITA support in Oxygen XML Editor.
Creating New Markdown Documents

To create a new Markdown document in Oxygen XML Editor, follow these steps:

1. Click the **New** button on the toolbar or select **File > New**.
2. Select the **Markdown** file template (in the **New Document** folder).
3. Click the **Create** button.

**Result:** A new Markdown document is created and it is opened in the specialized **Markdown Editor**.

**Actions Available in the Markdown Editor**

Aside from the actions that are available in Oxygen XML Editor for any type of document (such as the actions in the various menus and the common sections of the toolbar), a variety of unique actions are also available in the Markdown editor, from the toolbar and contextual menu.

**Toolbar Actions**

The following default actions are readily available on the toolbar when editing Markdown documents:
Header (1st Level)
Inserts an *atx-style first level header* at the cursor position.

Header (2st Level)
Inserts an *atx-style second level header* at the cursor position.

Header (3rd Level)
Inserts an *atx-style third level header* at the cursor position.

---

Horizontal Rule
Inserts a horizontal rule at the cursor position.

Bold (Strong)
Marks the selected text with *bold*.

Italic (Emphasis)
Marks the selected text with *italics*.

Strikethrough
Marks the selected text with a *strikethrough*.

Code Block
Inserts (or surrounds selected text in) a *codeblock*.

Blockquote
Inserts a *blockquote* at the cursor position.

Insert Link
Opens the Insert Link dialog box that allows you to define a *link* to insert at the cursor position.

![Insert Link Dialog Box](image1)

Insert Image
Opens the Insert Image dialog box that allows you to define an *image* to insert at the cursor position. You can type the URL of the image you want to insert or use browsing tools in the *Browse* drop-down menu.

![Insert Image Dialog Box](image2)
Insert Ordered List
Inserts an ordered list at the cursor position. Three child list items are also automatically inserted by default.

Insert Unordered List
Inserts an unordered list at the cursor position. Three child list items are also automatically inserted by default.

Insert Task List
Inserts a task list at the cursor position. Three child list items are also automatically inserted by default.

Insert Table
Inserts a table at the cursor position.

Contextual Menu Actions
The following default actions are available in the contextual menu when editing Markdown documents:

Cut, Copy, Paste
Use these actions to execute the typical editing actions on the currently selected content.

Source submenu
This submenu includes the following actions:

To Upper Case
Converts the content selection to upper case characters.

To Lower Case
Converts the content selection to lower case characters.

Capitalize Lines
It capitalizes the first letter found on every new line that is selected. Only the first letter is affected, the rest of the line remains the same. If the first character on the new line is not a letter then no changes are made.

Convert Hexadecimal Sequence to Character (Ctrl + Shift + X (Command + Shift + X on OS X))
Converts a sequence of hexadecimal characters to the corresponding Unicode character. The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the 0x or 0X prefix. Examples of valid sequences: 0x0045, 0X0125, 1253, 265, 43.

Base64 Encode/Decode submenu
This submenu includes the following actions for encoding or decoding base64 schemes:

Import File to Encode and Insert
Encodes a file and then inserts the encoded content into the current document at the cursor position.

Decode Selection and Export to File
Decodes a selection of text from the current document and then exports (saves) the result to another file.

Encode Selection
Replaces a selection of text with the result of encoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the Encoding for Base64, Base32, Hex conversions option in the Encoding preferences page will be used. Likewise, the same is true if the Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions option is disabled in the Messages preference page.

Decode Selection
Replaces a selection of text with the result of decoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the Encoding for Base64, Base32, Hex conversions option in the Encoding preferences page will be used. Likewise, the same is true if the Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions option is disabled in the Messages preference page.
Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Base32 Encode/Decode submenu

This submenu includes the following actions for encoding or decoding base32 schemes:

Import File to Encode and Insert

Encodes a file and then inserts the encoded content into the current document at the cursor position.

Decode Selection and Export to File

Decodes a selection of text from the current document and then exports (saves) the result to another file.

Encode Selection

Replaces a selection of text with the result of encoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the Encoding for Base64, Base32, Hex conversions option in the Encoding preferences page will be used. Likewise, the same is true if the Show the dialog box for choosing the encoding for Base64, Base32, Hex conversions option is disabled in the Messages preference page.

Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Hex Encode/Decode submenu

This submenu includes the following actions for encoding or decoding hex schemes:

Import File to Encode and Insert

Encodes a file and then inserts the encoded content into the current document at the cursor position.

Decode Selection and Export to File

Decodes a selection of text from the current document and then exports (saves) the result to another file.

Encode Selection

Replaces a selection of text with the result of encoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the Encoding for Base64, Base32, Hex conversions option in the Encoding preferences page will be used. Likewise, the same is true if the Show the dialog box for choosing the encoding for Base64, Base32, Hex conversions option is disabled in the Messages preference page.

Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.
Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Join and Normalize Lines (Ctrl + J (Command + J on OS X))

For the current selection, this action joins the lines by replacing the line separator with a single space character. It also normalizes the whitespaces by replacing a sequence of such characters with a single space.

Insert new line after (Ctrl + Alt + Enter (Command + Alt + Enter on OS X))

This action has the same result as moving the cursor to the end of the current line and pressing the ENTER key.

Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Open submenu

The following actions are available in this submenu:

Open File at Cursor

Opens the file at the cursor position in a new panel. If the file path represents a directory path, it will be opened in system file browser. If the file at the specified location does not exist, an error dialog box is displayed and it includes a Create new file button that starts the New document wizard. This allows you to choose the type or the template for the file. If the action succeeds, the file is created with the referenced location and name and is opened in a new editor panel.

Open File at Cursor in System Application

Opens the file (identified by its link) or web page (identified by a web link) found at cursor position. The target is opened in the default system application associated with that file type.

Compare

Opens the current file in the Compare Files tool.

Show/Hide Preview

A toggle action that shows or hides the Preview pane.

Export as DITA Topic

Converts the current Markdown document into a DITA topic.

Export as HTML

Converts the current Markdown document into an HTML document.

Print (Available in the Preview pane)

Opens a page setup dialog box that allows you to configure printing options for the current document.

Syntax Highlighting in the Markdown Editor

Oxygen XML Editor supports syntax highlighting in the Markdown editor to improve the readability of the content and make it easier to internalize the semantics of the content.

To customize the colors or styles used for the syntax highlighting colors for Markdown documents, follow these steps:

1. Open the Preferences dialog box (Options > Preferences).
2. Go to Editor > Syntax Highlight.
3. Select and expand the Markdown section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.

You can see the effects of your changes in the Preview pane.

**Related information**

- *Syntax Highlight Preferences* on page 97
- *Markdown Editor* on page 662

**Automatic Validation in Markdown Documents**

Markdown documents are validated automatically as you type. The conversion engine constantly tries to parse your changes to display the results in the Preview pane. If a change results in an error that prevents the parser from converting the syntax, an error message will be displayed in the DITA tab or in the Results view at the bottom of the editor.

The types of errors that will be reported include the following:

- Improper order of headers.
- The syntax in a documents begins with something other than a 1st level header.
- Tags are not closed properly if XHTML markup is used in the document.
- Invalid tag names if XHTML markup is used in the document.
- Markup is not well formed if XHTML markup is used in the document.

**Related information**

*Markdown Editor* on page 662

**Working with Markdown Documents in DITA**

Oxygen XML Editor includes some unique features that allow you to easily integrate Markdown documents in a DITA project. This is especially helpful for teams that have contributors who are familiar with the Markdown syntax, but they want their output to be generated from DITA projects. The integration between the Markdown editor and DITA includes actions to export or convert Markdown documents to DITA topics and the DITA tab in the Preview pane provides a visualization of how the topic will look after conversion.

**Export Markdown as a DITA Topic**

The Markdown editor includes an option to quickly convert the current Markdown document into a DITA topic. The Export as DITA Topic action is available in the contextual menu of the left-side text editor and the right-side Preview pane when the DITA tab selected.

The conversion creates a new XML file that is defined as a DITA topic and opens it in the Text editing mode. You can then work with the document as you would with any other DITA topic, although you may need to manually correct some issues where the parser could not properly map Markdown syntax to DITA markup.

**Working with Markdown Documents in the DITA Maps Manager**

Oxygen XML Editor has some specialized features that allow you to integrate Markdown documents directly into your DITA project using the DITA Maps Manager. The following features are available for Markdown documents in the DITA Maps Manager view:

- **Insert Reference to Markdown Document** - You can use the New, Reference, and Reference to the currently edited file actions from the Append Child or Insert After submenus when invoking the contextual menu in the DITA Maps Manager to insert a reference to a Markdown document at the selected location in the map. Markdown documents will be inserted as a topic reference (\texttt{topicref} element) with the format attribute set to \texttt{markdown}.

- **Validate Markdown Documents in DITA Maps** - When you use the Validate and Check for Completeness action from the DITA Maps Manager toolbar to check the integrity of the structure of a DITA map, Markdown documents that are referenced in the DITA map will be converted to DITA topics in the background and validated the same as any other DITA topic.

- **Transforming DITA Maps with Markdown Documents** - When transforming DITA maps that have Markdown documents referenced, the transformation will convert the Markdown documents to normal DITA output without you needing to manually convert the Markdown documents to DITA topics.
• **Manually Convert Markdown Documents to DITA Topics** - If you need to use DITA semantics that are not possible in Markdown syntax (such as content references, related links, and other DITA-specific syntax), you can manually convert the Markdown document into a DITA topic. To do so, right-click the Markdown document in the DITA Maps Manager and select **Refactoring > Convert Markdown to DITA Topic**. This will open a dialog box that allows you to configure options for converting the document to an XML file that is defined as a DITA topic.

![Convert Markdown to DITA Topic Dialog Box](image)

**Figure 415: Convert Markdown to DITA Topic Dialog Box**

This dialog box includes the following options:

**Destination**
The destination path for the new DITA topic.

**File Name**
Presents the current name and allows you to change it.

**Update references**
Select this option to update all references of the file in the DITA map and in the files referenced from the DITA map.

**Delete Markdown file**
If enabled, the Markdown version of the file is deleted when the document is converted into a DITA file. If disabled (default value), when the document is converted into a DITA file, the original Markdown file is also preserved in its current location.

**Preview**
Select this button to display a preview of the changes Oxygen XML Editor is about to make.

**Convert**
Select this button to perform the conversion.

**Tip:** Oxygen XML Editor comes with a sample ditamap project for converting Markdown to DITA. Go to the **Project view**, open the `sample.xpr` project, and navigate to the `dita/markdown-dita` folder.

*Automatic Validation in Markdown Documents* on page 668

**Markdown Editor Syntax Rules and Specifications**

The Markdown editor in Oxygen XML Editor uses rules that were integrated from the most common set of *default Markdown syntax rules* along with many of the *GitHub Flavored Markdown rules*.

The Oxygen XML Editor implementation of the most commonly used syntax rules are as follows:

**Headers**
The Markdown editor supports two styles of headers, *Setext* and *Atx*.

* Setext Style
Setext-style headers are underlined using equal signs (for first-level headers) and dashes (for second-level headers). Any number of equal signs or dashes will result in the same output.

**Example: Setext Style Headers**

<table>
<thead>
<tr>
<th>Level</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>First-Level Header (H1)</td>
<td>=======</td>
</tr>
<tr>
<td>Second-Level Header (H2)</td>
<td>----------</td>
</tr>
</tbody>
</table>

- **Atx Style**

Atx-style headers use 1-6 hash characters at the start of the line, corresponding to header levels 1-6. Optionally, you may close atx-style headers. This is purely cosmetic and the closing hashes do not need to match the number of hashes used to open the header. It is the number of opening hashes that determines the header level.

**Example: Atx Style Headers**

```
# H1 text #
## H2 text
### H3 text ######
#### H4 text
##### H5 text ###
###### H6 text
```

**Horizontal Rules (for HTML output only)**

You can produce a horizontal rule tag (`<hr />`) by placing three or more hyphens, asterisks, or underscores on a line by themselves. Optionally, they can be separated by spaces.

- **Example: Horizontal Rules**

```
* * *
*****
---------------------------------------
_ _ _ _
```

**Paragraphs and Line Breaks**

A paragraph is simply one or more consecutive lines of text, separated by one or more blank lines. The text at the beginning of a paragraph should not be indented with spaces or tabs. To create a new paragraph, simply insert a blank line in between them.

**Important:** When converting to HTML, if you break a paragraph on multiple lines (without a blank line in between them), it will create a break tag (`<br />`). When converting to DITA, the text is kept in a single paragraph in this case and a blank line is required to break a paragraph. This behavior differs slightly from the default Markdown rules.

- **Example: Paragraphs**

```
This is a paragraph that contains
two lines of text. (In HTML, a break tag is created in between the two lines)

This is a new paragraph.
```

**Styling Text**

The Markdown editor supports some syntax rules for styling text (such as bold, italic, or strikethrough).

- **Italic (Emphasis)** - Text wrapped with one asterisk or underscore produces an italic (emphasis) tag.
• **Bold (Strong)** - Text wrapped with two asterisks or underscores produces a bold (strong) tag.

• **Strikethrough** - In HTML only, text wrapped with two tildes (~~) produces a strikethrough tag.

Tip: You can also combine these styling rules. For example, **BoldText _ItalicText_ BoldText** would produce italicized text within bold text. Also, if you surround an asterisk or underscore with spaces, it will be treated as a literal asterisk or underscore. To produce a literal asterisk or underscore at a position where it would otherwise be used as an styling delimiter, you can escape it with a backslash (for example, \*literal asterisks\*).

## Links

The Markdown editor supports two types of links, *inline* and *reference*. In both cases, it begins with link text that is delimited by [square brackets].

• **Inline Links**

  To create an inline link, use a set of regular parentheses immediately after the closing square bracket for the link text. Inside the parentheses, put the URL where you want the link to point, and optionally a title surrounded in quotes. Also, if you referencing a local resource on the same server, you can use relative paths.

  **Examples: Inline Link**

  With a title:

  Text with [example link text](http://www.example.com/path "Title") an inline link with a title.

  Without a title:

  Text with [example link text](http://www.example.com/path) an inline link without a title.

  Relative path:

  Text with [example link text](/relative_path/) an inline link with relative path.

• **Reference Links**

  Reference-type links use a second set of square brackets that include a label (link identifier) to identify the link (it may consist of letters, numbers, spaces, and punctuation and it is not case sensitive). You can optionally use a space to separate the sets of brackets. The labels (link identifiers) are only used for creating the links and do not appear in the output.

  Text with [link text1][id 1] a reference-type link and [link text2][id_2] another one.

  Then, somewhere in the document, you need to define your link label on a line by itself. The link identifier must be within square brackets followed by a colon, then after one or more spaces the URL for the link. Optionally this can be followed by a title enclosed in single quotes, double quotes, or parentheses. Also, the link may optionally be enclosed in angle brackets (< >).

  [id 1]: http://example1.com/ "Optional Title"
  [id_2]: <http://example2.com/> "Optional Title2"

Other notes about Reference Links:

• You can put the title on a second line and use extra spaces or tabs for padding. This is useful for aesthetics when the URL is long.
Automatic Links
The Markdown editor supports a shortcut style for creating automatic links for URLs and email addresses. You simply surround the URL or email address with angle brackets.

![Note: These automatic links only work properly in HTML conversions. The Preview pane may display them properly in the DITA tab, but the DITA output will not properly recognize the format.

• URLs
By surrounding a URL with angle brackets, you can show the actual text of the URL while also making it clickable in the output.

`<http://example.com/>`

For example, in HTML it is converted to:

`<a href="http://example.com/">http://example.com/</a>`

• Email Addresses
Automatic links for email addresses work similarly, except that Markdown will also perform a bit of randomized decimal and hex entity-encoding to help obscure your address from address-harvesting spambots.

`<address@example.com>`

In HTML, it is converted to something like:

`<a href="&#x6D;&#x61;i&#x6C;&#x74;&#x6F;:&#x61;&#x64;&#x64;&#x72;&#x65; &#115;&#115;&#64;&#101;&#120;&#x61;&#109;&#x70;&#x6C;ea&#x2E;&#99;&#111;&#109;">address@example.com</a>`

Images
The Markdown editor uses an image syntax that is intended to resemble the syntax for links, allowing for the same two types: inline and reference. In both cases, the syntax for images begin with an exclamation mark, followed by `alt` attribute text surrounded by square brackets, and then followed by a set of parentheses that contain the URL or path to the image.

• Inline Images
For inline images, use a set of regular parentheses immediately after the closing square bracket for the `alt` attribute text. Inside the parentheses, put the URL or path of the image, and optionally a title surrounded in quotes.

Examples: Inline Images
With a title:

Text with ![Alt text](/path/to/img.jpg "Optional title") an inline image with a title.

Without a title:
**Reference Images**

For reference-type images, use a second set of square brackets that include a label (image identifier) to identify the image (it may consist of letters, numbers, spaces, and punctuation and it is not case sensitive). You can optionally use a space to separate the sets of brackets. The labels (image identifiers) do not appear in the output.

Text with ![Alt text](/path/to/img.jpg) an inline link without a title.

Text with ![Alt text1][id] a reference-type image.

Then, somewhere in the document, you need to define your image label on a line by itself. The image identifier must be within square brackets followed by a colon, then after one or more spaces the URL or path of the image. Optionally this can be followed by a title enclosed in single quotes, double quotes, or parentheses.

[id]: url/to/image "Optional Title"

**Blockquotes**

The Markdown editor uses email-style greater than characters (>) for blockquotes. You only need to put the > before the first line of a hard-wrapped paragraph, but it looks better (and is more clear) if you put a > before every line.

**Example: Blockquotes**

> This is a blockquote with two paragraphs. Lorem ipsum dolor sit amet, consectetur adipiscing elit. Aliquam hendrerit mi posuere lectus. Vestibulum enim wisi, viverra nec, fringilla in, laoreet vitae, risus.  
> Donec sit amet nisl. Aliquam semper ipsum sit amet velit. Suspendisse id sem consectetur libero luctus adipiscing.

Blockquotes can be nested by adding additional levels of > characters.

**Example: Nested Blockquotes**

> This is the first level of quoting.  
> > This is nested blockquote.  
> > Back to the first level.

Blockquotes can also contain other Markdown elements (such as headers, lists, and code blocks).

**Example: Blockquotes with Other Markdown Elements**

> ## This is a header.  
> 1. This is the first list item.  
> 2. This is the second list item.  
> Here's some example code:  
> ```
> return shell_exec("echo $input | $markdown_script")
> ```

**Quoting Code (Inline and Code Blocks)**

The Markdown editor supports quoting code or commands inline within a sentence or in distinct blocks.

**Inline**

You can quote or emphasize code within a sentence (inline) with single backticks (`'). The text within the backticks will not be formatted.

**Example: Inline Code Emphasis**

This is a normal sentence with a `code` in the middle.
• **Code Blocks**

You can format code or text into its own distinct block by inserting a blank line before and after the content and using at least 4 spaces (or 1 tab), or by using opening and closing triple backticks (```) on separate lines.

**Example: Code Block**

This is a normal paragraph:

    This is a code block

This is a normal paragraph:

    ...
    This is a code block
```

One level of indentation is removed from each line of a codeblock and it continues until it reaches a line that is not indented (or until the closing backticks).

**Example: Code Block with Indentation**

```plaintext
    tell application "something"
    beep
    end tell
```

For example, in HTML the result would look like this:

```
<pre><code>
tell application "Foo"
    beep
end tell
</code></pre>
```

You can also add an optional language identifier to enable syntax highlighting in your code blocks. The Oxygen XML Editor Markdown editor supports the following languages: *Java, JavaScript, CSS, and Python*.

**Example: Syntax Highlighting in Code Block**

```css
input[type="submit"] {
    color: white;
    font-weight: bold;
}
```

**Inline XHTML (for HMTL output only)**

The Markdown editor supports writing inline XHTML. Since Markdown is just a writing format, it requires a conversion for publishing purposes. If you are using the HTML conversion, for any markup that is not covered by Markdown syntax, you can simply use XHTML syntax.

**Example: Inline XHTML**

This is a regular paragraph.

```
<table>
    <tr>
        <td>Col 1</td>
        <td>Col 2</td>
    </tr>
</table>
```

This is another regular paragraph.
Lists

The Markdown editor supports ordered and unordered lists. You can also insert blockquotes and code blocks inside list items. List markers typically start at the left margin, but may be indented by up to three spaces.

- **Unordered Lists**
  
  For unordered lists, you can use asterisks (*), plus signs (+), and hyphens (–) interchangeably.

<table>
<thead>
<tr>
<th>List item 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>+ List item 2</td>
</tr>
<tr>
<td>- List item 3</td>
</tr>
</tbody>
</table>

- **Ordered Lists**
  
  For ordered lists, use numbers followed by periods. The actual numbers you use have no effect on the output. It simply converts them to list items within an ordered list and the actual number of list items will determine the numbers in the output.

<table>
<thead>
<tr>
<th>1. List item 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>8. List item 2</td>
</tr>
<tr>
<td>5. List item 3</td>
</tr>
</tbody>
</table>

- **Nested Lists**
  
  You can create nested lists by indenting lines by two spaces.

<table>
<thead>
<tr>
<th>1. Ordered list item 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Nested ordered list item 1</td>
</tr>
<tr>
<td>2. Nested ordered list item 2</td>
</tr>
<tr>
<td>* 2nd level nested unordered list item 1</td>
</tr>
<tr>
<td>* 2nd level nested unordered list item 2</td>
</tr>
<tr>
<td>* 3rd level nested unordered list item 1</td>
</tr>
<tr>
<td>2. Ordered list item 2</td>
</tr>
</tbody>
</table>

- **Paragraphs Inside Lists**
  
  If list items are separated by blank lines, Markdown will wrap the items in a paragraph in the output.

<table>
<thead>
<tr>
<th>* List item 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>* List item 2</td>
</tr>
</tbody>
</table>

  For both DITA and HTML output, this would result in:

  ```html
  <ul>
  <li><p>List item 1</p></li>
  <li><p>List item 2</p></li>
  </ul>
  ```

- **Multiple Paragraphs Inside Lists**
  
  List items may consist of multiple paragraphs. Each subsequent paragraph in a list item must be indented by either 4 spaces or one tab. Optionally, you can also indent each line of a paragraph to make it look nicer.

<table>
<thead>
<tr>
<th>1. This is a list item with two paragraphs. Lorem ipsum dolor sit amet, consectetur adipiscing elit. Aliquam hendrerit mi posuere lectus. Vestibulum enim wisi, viverra nec, fringilla in, laoreet vitae, risus. Donec sit amet nisl. Aliquam semper ipsum sit amet velit.</th>
</tr>
</thead>
<tbody>
<tr>
<td>2. Suspendisse id sem consectetur libero luctus adipiscing.</td>
</tr>
</tbody>
</table>

- **Blockquotes Inside Lists**
To put a *blockquote* within a list item, the blockquote delimiters (>) need to be indented so that it is under the first letter of the text after the list item marker.

*   A list item with a blockquote:
    > This is a blockquote
    > inside a list item.

- **Code Blocks Inside Lists**

To put a code block within a list item, insert an empty line in between the list item and the code block, and the code block needs to be indented twice (with 8 spaces or 2 tabs), or if you are using the triple backticks method, the opening triple backtick needs to be indented with 4 spaces or 1 tab.

*   A list item with a code block:
    ```
    This is a code block inside a list item
    ````

- **Task Lists**

You can create task lists by prefacing list items with square brackets ([ ]). To mark a task as complete, use [x].

- **Example: Task Lists**

- [ ] Unfinished task 1
- [x] Finished task 2

- **Definition Lists**

You can create definition lists by using a colon plus a space for each list item.

- **Example: Definition Lists**

  Term 1
  : Definition A
  : Definition B

- **Tables**

You can create tables in the Markdown editor by using pipes (|) and hyphens (–).

- **Creating a Table**

  Pipes are used to separate each column, while hyphens are used to create column headers. The pipes on either end of the table are optional. Cells can vary in width and do not need to be perfectly aligned within columns, but there must be at least three hyphens in each column of the header row.

<table>
<thead>
<tr>
<th>First Header</th>
<th>Second Header</th>
</tr>
</thead>
<tbody>
<tr>
<td>Column 1 Row 1 Cell</td>
<td>Column 2 Row 1 Cell</td>
</tr>
<tr>
<td>Column 1 Row 2 Cell</td>
<td>Column 2 Row 2 Cell</td>
</tr>
</tbody>
</table>

- **Formatting Rules in Table Cells**

You can use formatting rules inside the cells of the table (such as links, inline code blocks, and text styling).

<table>
<thead>
<tr>
<th>First Header</th>
<th>Second Header</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>inline code</code></td>
<td>Content with <strong>bold text</strong> inside cell</td>
</tr>
</tbody>
</table>
• **Aligning Text in Tables**

You can align text to the left, right, or center of a column by including colons (:) to the left, right, or on both sides of the hyphens within the header row.

<table>
<thead>
<tr>
<th>Left-aligned</th>
<th>Center-aligned</th>
<th>Right-aligned</th>
</tr>
</thead>
<tbody>
<tr>
<td>:---</td>
<td>:---:</td>
<td>---:</td>
</tr>
<tr>
<td>Content Cell</td>
<td>Content Cell</td>
<td>Content Cell</td>
</tr>
</tbody>
</table>

**Emoji**

You can add *emoji* in the Markdown editor by surrounding the EMOJICODE with colons (:EMOJICODE:).

• **Example: Emoji**

```markdown
:smile:
:laughing:
```

The resulting emoticons will appear in the output, but they are not displayed in the *Preview* pane.

For a full list of available emoji codes, see *Emoji Cheat Sheet*.

**Backslash Escapes**

You can ignore Markdown formatting by using backslash escapes (\) to generate literal characters that would otherwise have special meaning in the Markdown syntax. For example, if you want to surround a word with literal asterisks (instead of an italic or emphasis tag), you can use backslashes to escape the asterisks.

\*literal asterisks\*

The Markdown editor provides backslash escapes for the following characters:

\  backslash
`  backtick
*  asterisk
_  underscore
{  curly braces
[  square brackets
(  parentheses
#  hash mark
+  plus sign
-  minus sign (hyphen)
.  dot
!  exclamation mark

**Automatic Escaping for Special Characters**

The Markdown editor includes support for automatically escaping special characters such as angle brackets (< >) and ampersands (&). If you want to use them as literal characters, you must escape them as entities, as in the table below. The exception to this is in HTML output, if the special characters for a valid tag (for example, <b>), they are treated as literal characters and escaping is not necessary.

<table>
<thead>
<tr>
<th>Literal Character</th>
<th>Escaping Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;</td>
<td>&lt;</td>
</tr>
<tr>
<td>&gt;</td>
<td>&gt;</td>
</tr>
<tr>
<td>&amp;</td>
<td>&amp;</td>
</tr>
</tbody>
</table>
Footnotes
The Markdown editor in Oxygen XML Editor supports normal and inline footnotes. The following examples show the required syntax.

- **Example: Normal Footnote**

  Here is a footnote reference,[^1]

  ^[^1]: Here is the footnote.

- **Example: Normal Footnote with Multiple Blocks**

  Here is a footnote reference,[^longnote]

  ^[^longnote]: Here is the footnote with multiple blocks.

  Subsequent paragraphs are indented with 4 spaces or 1 tab to show that they belong to the previous footnote.

- **Example: Inline Footnote**

  Here is an inline note.^[Inlines notes are easier to write, since you don't have to pick an identifier and move down to type the note.]

Actions Available in the Markdown Editor on page 663

Spell Checking

Oxygen XML Editor includes an automatic (as-you-type) spell checking feature, as well as a manual spell checking action to open a Spell check dialog box that offers a variety of options.

To manually check spelling in the current document, use the ABC Check Spelling action on the toolbar or from the Edit menu.
The Spelling dialog box contains the following:

**Unrecognized word**
Displays the word that cannot be found in the selected dictionary. The word is also highlighted in the XML document.

**Replace with**
The character string that will replace the misspelled word.

**Guess**
Displays a list of words suggested to replace the unknown word. Double-click a word to automatically insert it in the document and resume the spell checking process.

**Default language**
Allows you to select the default language dictionary used by the spelling engine.

**Paragraph language**
In an XML document, you can mix content written in multiple languages. You can set the language code in the `lang` or `xml:lang` attribute for any particular section and Oxygen XML Editor will automatically instruct the spell checker engine to apply the appropriate language dictionary for that section.

**Begin at cursor position**
Instructs the spell checker to begin checking the document starting from the current cursor position.

**Action Buttons**

**Replace**
Use this button to replace the unrecognized word with the selected word from the **Replace with** field.

**Replace All**
Use this button to replace all occurrences of the unrecognized word with the selected word from the **Replace with** field.

**Ignore**
Ignores the first occurrence of the unrecognized word and allows you to continue checking the document. Oxygen XML Editor skips the content of the XML elements *marked to be ignored*.

**Ignore All**
Ignores all instances of the unrecognized word in the current document.
Learn
Adds the unrecognized word to the list of valid words.

Options
Opens the Spell Check preferences page where you can configure various options in regards to the feature.

AutoCorrect Misspelled Words on page 686

Spell Check Dictionaries and Term Lists
Oxygen XML Editor uses the Hunspell engine for the spell checking feature. The Hunspell spell checking engine is open source and has an LGPL license. It is designed for languages with rich morphology and complex compounding or character encoding. Each language-country variant combination have their own specific dictionaries. Oxygen XML Editor includes the following built-in dictionaries for the spell checker:

- English (US) [en_US]
- English (UK) [en_GB]
- French [fr]
- German [de_DE]
- Spanish [es_ES]

Other Hunspell Dictionaries
You can also download Hunspell dictionaries for other languages and add them to the Oxygen XML Editor spell checker. An example of a website that includes numerous dictionary files is: http://extensions.services.openoffice.org/dictionary. If you cannot find a Hunspell dictionary that is already built for your language, you can build the dictionary you need. To build a full Hunspell dictionary, follow these instructions and then add the dictionary to the Oxygen XML Editor spell checker by following this procedure.

Personalized Term Lists
Authoring in certain areas of expertise (for example, the pharmaceutical or automobile industries) might require the use of specific terms that are not part of the standard spell checker dictionary. To avoid marking these terms as errors, Oxygen XML Editor provides a way of adding personalized term lists to the spell check engine. This involves creating a term list file that the spell checker will recognize and it is similar to the file Oxygen XML Editor uses for storing learned words.

The term list files are specific for each language and can be specific to each domain or area of expertise (for example, legal, medical, automotive). They can also be used to control forbidden words.

Adding Spell Check Term Lists on page 682
Building and Testing Hunspell Dictionaries

Adding Custom Dictionaries and Term Lists
The Oxygen XML Editor spell checker allows you to add customized Hunspell dictionaries and personalized term lists. The Hunspell dictionary mechanism requires a dictionary file (with a .dic file extension) and an affix file (with an .aff file extension). The personalized term lists are custom files (with a .tdi file extension) that you can create to include specialized terms or specify forbidden words in the Oxygen XML Editor spell checker.

You can add dictionaries and personalized term lists to the default folder where they are stored or specify your own custom locations. You can view the default storage location in the Spell Check Dictionaries preferences page and the Include dictionaries and term list from option allows you to choose a custom storage location. All the dictionaries and term lists for a particular language that are found in either location are merged and used by the spell checker in Oxygen XML Editor.

Replacing a Spell Check Dictionary on page 682
Adding Spell Check Dictionaries

There are three possible scenarios for adding Hunspell dictionaries to the Oxygen XML Editor spell checker:

- You can download a pre-built Hunspell dictionary and add it to the spell checking mechanism.
- You can create a custom Hunspell dictionary file that defines your own list of words and add it to the spell checking mechanism.
- You can build your own full Hunspell dictionary and add it to the spell checking mechanism.

Download and Add a Pre-Built Hunspell Dictionary

To add a downloaded pre-built dictionary, follow these steps:

1. Download the files needed for your dictionary. You will need a dictionary file (with a .dic file extension) and an affix file (with an .aff file extension). If the dictionary does not include an affix file (.aff), you can create one and leave it empty, but it is needed for the mechanism to work properly. An example of a website that includes numerous dictionary files is: http://extensions.services.openoffice.org/dictionary.

   Important: The name of the files should begin with a two letter prefix that indicates the language it should be attached to, followed by an underscore or hyphen, and then a descriptive name (for example, en_US_medical.dic for a medical dictionary in the US version of the English language or en_medical.dic for a less specific English medical dictionary). For a list of language codes, see https://en.wikipedia.org/wiki/List_of_ISO_639-1_codes.

2. Open the Preferences dialog box (Options > Preferences) and go to Editor > Spell Check > Dictionaries.

3. Choose one of the following two options for adding the downloaded files.
   a. Copy both files (.dic and .aff) to the default directory displayed in the Dictionaries and term lists default folder option.
   b. Copy both files (.dic and .aff) to any other directory, enable the Include dictionaries and term list from option, and select that directory. If you choose this option, make sure you read this important note.

4. Restart the application for the spell checker to start using the new dictionary.

Create a Custom Hunspell Dictionary that Defines a List of Words

To create a custom Hunspell dictionary that defines your own list of words, follow these steps:

1. Create a dictionary file (with a .dic file extension) and an affix file (with an .aff file extension). The affix file (.aff) can be left empty, but it is needed for the mechanism to work properly.

   Important: The name of the files should begin with a two letter prefix that indicates the language it should be attached to, followed by an underscore or hyphen, and then a descriptive name (for example, en_US_medical.dic for a medical dictionary in the US version of the English language or en_medical.dic for a less specific English medical dictionary). For a list of language codes, see https://en.wikipedia.org/wiki/List_of_ISO_639-1_codes.

2. In the dictionary file (.dic extension), add the words you want to be included in your custom dictionary. Add one word per row and the first line needs to contain the number of words, as in the following example:

   2
   parabola
   asimptotic

3. Open the Preferences dialog box (Options > Preferences) and go to Editor > Spell Check > Dictionaries.

4. Choose one of the following two options for saving the files.
   a. Save both files (.dic and .aff) to the default directory displayed in the Dictionaries and term lists default folder option.
   b. Save both files (.dic and .aff) to any other directory, enable the Include dictionaries and term list from option, and select that directory. If you choose this option, make sure you read this important note.

5. Restart the application for the spell checker to start using the new dictionary.
Build and Add a Full Hunspell Dictionary

To build and add a full Hunspell dictionary, follow these steps:

1. Follow these instructions: Building and Testing Hunspell Dictionaries.

   **Result:** You should end up with a dictionary file (with a `.dic` file extension) and an affix file (with an `.aff` file extension). The affix file (.aff) can be empty, but it is needed for the mechanism to work properly.

   **Important:** The name of the files should begin with a two letter prefix that indicates the language it should be attached to, followed by an underscore or hyphen, and then a descriptive name (for example, `en_US_medical.dic` for a medical dictionary in the US version of the English language or `en_medical.dic` for a less specific English medical dictionary). For a list of language codes, see https://en.wikipedia.org/wiki/List_of_ISO_639-1_codes.

2. Open the Preferences dialog box (Options > Preferences) and go to Editor > Spell Check > Dictionaries.

3. Choose one of the following two options for saving the files.

   a. Save both files (.dic and .aff) to the default directory displayed in the Dictionaries and term lists default folder option.
   
   b. Save both files (.dic and .aff) to any other directory, enable the Include dictionaries and term list from option, and select that directory. If you choose this option, make sure you read this important note.

4. Restart the application for the spell checker to start using the new dictionary.

**Related information**

Adding Spell Check Term Lists on page 682

Adding Spell Check Term Lists

You can create personalized term lists that are used to store specialized terms or control forbidden words. They can then be added to one of the directories that store the spell check dictionaries and the spell checker will be merge them with all the dictionaries and other term lists for a particular language.

Create and Add Personalized Term Lists

To create and add a personalized term list, follow these steps:

1. Create a term list file (with a .tdi file extension). The name of the file must begin with a two letter prefix that indicates the language it should be attached to, followed by an underscore or hyphen, and then a descriptive name (for example, `en_US_myterms.tdi` for term list in the US version of the English language or `en_myterms.tdi` for a less specific English term list). For a list of language codes, see https://en.wikipedia.org/wiki/List_of_ISO_639-1_codes.

2. In the term list file (.tdi extension), add the terms you want to be included in your custom dictionary. If you need to specify forbidden terms, those words simply need to be preceded by an asterisk. Add one word per row, as in the following example:

   ```
   parabola
   asimptotic
   *hyperbola
   ```

3. Open the Preferences dialog box (Options > Preferences) and go to Editor > Spell Check > Dictionaries.

4. Choose one of the following two options for saving the file.

   a. Save the file (.tdi) to the default directory displayed in the Dictionaries and term lists default folder option.
   
   b. Save the file (.tdi) to any other directory, enable the Include dictionaries and term list from option, and select that directory. If you choose this option, make sure you read this important note.

5. Restart the application for the spell checker to start using the new term list.

Adding Spell Check Dictionaries on page 681

Replacing a Spell Check Dictionary

There are several possible scenarios for replacing an existing Hunspell dictionary for the Oxygen XML Editor spell checker:

- You can download a pre-built Hunspell dictionary and replace an existing dictionary with it.
• You can build your own full Hunspell dictionary and replace an existing dictionary with it.

**Download a Pre-Built Hunspell Dictionary and Replace an Existing One**

To replace an existing dictionary with a downloaded pre-built dictionary, follow these steps:

1. Download the files needed for your dictionary. You will need a *dictionary* file (with a .dic file extension) and an *affix* file (with an .aff file extension). If the dictionary does not include an affix file (.aff), you can create one and leave it empty, but it is needed for the mechanism to work properly. An example of a website that includes numerous dictionary files is: [http://extensions.services.openoffice.org/dictionary](http://extensions.services.openoffice.org/dictionary).

2. Open the Preferences dialog box (Options > Preferences) and go to Editor > Spell Check > Dictionaries.

3. Choose one of the following two options to replace existing files:

   a. Replace the existing files (.dic and .aff) for the particular language in the default directory displayed in the Dictionaries and term lists default folder option. Leave the Include dictionaries and term list from option disabled.

   b. Replace existing files (.dic and .aff) for the particular language in a directory specified in the Include dictionaries and term list from option. If you choose this option, make sure you read this important note.

   1. **Important:** Do not alter the naming convention. The name of the files must begin with a two letter prefix that indicates the language it should be attached to (for example, en_US.dic for a US English dictionary or en.dic for a less specific English dictionary). For a list of language codes, see [https://en.wikipedia.org/wiki/List_of_ISO_639-1_codes](https://en.wikipedia.org/wiki/List_of_ISO_639-1_codes).

4. Restart the application for the spell checker to start using the new dictionary.

**Build a Full Hunspell Dictionary and Replace an Existing One**

To replace an existing dictionary with a full Hunspell dictionary that you build, follow these steps:

1. Follow these instructions: Building and Testing Hunspell Dictionaries.

   **Result:** You should end up with a *dictionary* file (with a .dic file extension) and an *affix* file (with an .aff file extension). The affix file (.aff) can be empty, but it is needed for the mechanism to work properly.

2. Open the Preferences dialog box (Options > Preferences) and go to Editor > Spell Check > Dictionaries.

3. Choose one of the following two options to replace existing files:

   a. Replace the existing files (.dic and .aff) for the particular language in the default directory displayed in the Dictionaries and term lists default folder option. Leave the Include dictionaries and term list from option disabled.

   b. Replace existing files (.dic and .aff) for the particular language in a directory specified in the Include dictionaries and term list from option. If you choose this option, make sure you read this important note.

4. Restart the application for the spell checker to start using the new dictionary.

**Related information**

*Adding Custom Dictionaries and Term Lists* on page 680

**Learned Words**

Spell checker engines rely on dictionaries to decide if a word is spelled correctly. To instruct the spell checker engine that an unknown word is actually correctly spelled, you need to add that word to a list of learned words. There are two ways to do this:

• Invoke the contextual menu on an unknown word, then select Learn word.

• Press the Learn button from the *Spelling dialog box* that is invoked by using the Check Spelling action on the toolbar.

   **Note:** To delete items from the list of learned words, use the Delete learned words option in the Editor > Spell Check > Dictionaries preferences page.

**Ignored Words (Elements)**

There are certain XML elements (such as programlisting, codeblock, or screen) in which you may want the content to always be skipped during the spell check process. This can be done in one of several ways:
• You can skip through them manually, word by word, using the **Ignore** button in the *Spelling* dialog box that is invoked by using the ✔️ **Check Spelling** action on the toolbar.

• You can automatically skip the content of certain elements by maintaining a set of known element names that should never be checked. You can manage this set of element names by using the **Ignore elements section** in the **Spell Check** preferences page.

### Automatic Spell Check

Oxygen XML Editor includes an option to automatically check the spelling as you type. This feature is disabled by default, but it can be enabled and configured in the **Spell Check** preferences page. When the **Automatic Spell Check option** is enabled, unknown words are underlined and some actions are available in the contextual menu to help you correct the word or prevent the word from being reported in the future.

**Figure 417: Automatic Spell Checking in Author Mode**

**Figure 418: Automatic Spell Checking in Text Mode**

The contextual menu includes the following actions:

**Delete Repeated Word**

Allows you to delete words that were repeated in consecutive order.

**List of Suggestions**

A list of words suggested by the spell checking engine as possible replacements for the unknown word.

**Learn Word**

Allows you to add the current unknown word to the persistent dictionary of *learned words*.

**Spell check options (Available in Author mode only)**

Opens the **Spell Check preferences page**.

**Other actions**

This submenu give you access to all the usual contextual menu actions.

**Related information**

*Learned Words* on page 683
Spell Check Multiple Files

The **Check Spelling in Files** action allows you to check the spelling on multiple local or remote documents. This action is available in the following locations:

- The **Edit** menu.
- The contextual menu of the **Project** view.
- The contextual menu of the **DITA Maps Manager** view.

This action opens the **Check Spelling in Files** dialog box that allows you to define the scope and several other options. After you configure the settings for the operation, click the **Check All** button to check the spelling in all specified files. The spelling corrections are displayed in the **Results view** at the bottom of the editor and you can group the reported errors as a tree with two levels.

![Check Spelling in Files Dialog Box](image)

**Figure 419: Check Spelling in Files Dialog Box**

The following scopes are available:

- **All opened files** - The spell check is performed in all opened files.
- **Directory of the current file** - All the files in the folder of the current edited file.
- **Project files** - All files from the current project.
- **Selected project files** - The selected files from the current project.
- **Specified path** - Checks the spelling in the files located at a path that you specify.

The **Options** section includes the following options:

- **File filter** - Allow you to filter the files from the selected scope.
- **Recurse subdirectories** - When enabled, the spell check is performed recursively for the specified scope. The one exception is that this option is ignored if the scope is set to **All opened files**.
- **Include hidden files** - When enabled, the spell check is also performed in the hidden files.
- **Spell Check Options** - The spell check processor uses the options available in the **Spell Check preferences panel**.

When you invoke the **Check Spelling in Files** action in the **DITA Maps Manager** view, a slightly different version of the dialog box is displayed:
The following scopes are available:

- **Current DITA Map hierarchy** - All the files referenced in the currently selected DITA map, opened in the DITA Maps Manager view
- **Specified path** - checks the spelling in the files located at a path that you specify

---

**AutoCorrect Misspelled Words**

Oxygen XML Editor includes an *AutoCorrect* feature to automatically correct misspelled words, as well as to insert certain symbols or other text, as you type in Author mode. Oxygen XML Editor includes a default list of commonly misspelled words and symbols, but you can modify the list to suit your needs. You can also choose to have the *AutoCorrect* feature use suggestions from the main spell checker. The suggestions will only be used if the misspelled words are not found in the Replacements Table.

When enabled, the *AutoCorrect* feature can be used to do the following:

- Automatically correct misspelled words while you edit in Author mode.
- Easily insert symbols. For example, if you want to insert a ® character, you would type (R).
- Quickly insert text fragments.

*AutoCorrect* is enabled by default. To configure this feature, open the Preferences dialog box (Options > Preferences) and go to Editor > Edit Modes > Author > AutoCorrect.

The actual operation of replacing a word is triggered by a space, dash, or certain punctuation characters (, . ; : ? ! ' ) ] ). After a correction, the affected string is highlighted. The highlight is removed upon the next editing action (text insertion or deletion). If you hover over the highlight, a small widget appears below the word. If you hover over the widget, it expands and you can click it to present a drop-down list that includes the following options:

- **Change back to "[original word]"** - Reverts the correction back to its original form.
- **Stop Automatically Correcting "[original word]"** - This option is presented if the correction is performed based on the AutoCorrect Replacements Table and selecting it will delete the corresponding entry from the Replacements Table.
- **Learn Word "[original word]"** - This option is presented if the Use additional suggestions from the spell checker option is enabled in the AutoCorrect preferences page and the correction is performed based on the Spell Checker. Selecting this option will add the item to the list of learned words.
- **AutoCorrect options** - Opens the AutoCorrect preferences page that allows you to configure the feature.
The AutoCorrect feature results in the following types of substitutions in regards to case-sensitivity:

- Words with all lower-case characters will be replaced with lower-case substitutions (for example, "abotu" is replaced with "about").
- Words with irregular-case characters will be replaced with lower-case substitutions ("ABotU" is replaced with "about").
- Words with all upper-case characters will be replaced with upper-case substitutions ("ABOTU" is replaced with "ABOUT").
- Words starting with an upper-case character will be replaced with substitutions having the same pattern ("Abotu" is replaced with "About").

The AutoCorrect feature also uses the list of ignored elements from the Spell Check preferences page. All elements (along with their descendant elements) included in this list will be ignored by the AutoCorrect engine.

Related information

Spell Checking on page 678

Add Dictionaries for the AutoCorrect Feature

To add new dictionaries for the AutoCorrect mechanism, or to replace an existing one, follow these steps:

1. Download an AutoCorrect dictionary file for the desired language. The file needs to have a .dat file extension. An example of a website that includes some AutoCorrect dictionary files is: OpenOffice Extensions Search Page.
2. Open the Preferences dialog box (Options > Preferences) and go to Editor > Edit Modes > Author > AutoCorrect > Dictionaries.
3. Choose one of the following two options for adding the downloaded files.
   a) Copy the downloaded .dat file to the default directory displayed in the Dictionaries default folder option. Note that if you are replacing an existing dictionary file, this is the best option.
   b) Copy the downloaded .dat file to any other directory, enable the Include dictionaries from option, and select that directory. If you choose this option, make sure you read this important note.
4. Restart the application for the AutoCorrect mechanism to start using the new dictionary.

Loading Large Documents

When you open a document with a file size larger than the limit configured in Open/Save preferences, Oxygen XML Editor prompts you to choose whether you want to optimize the loading of the document for large files or for huge files.

If your file has a size smaller than 300 MB, the recommended approach is Optimize loading for large files. For documents that exceed 300 MB the recommended approach is Optimize loading for huge files.

File Sizes Smaller than 300 MB

For editing large documents (file size up to 300 Megabytes), a special memory optimization is implemented on loading such a file so that the total memory allocated for the application is not exceeded.

A temporary buffer file is created on disk so you have to make sure that the available free disk space is at least double the size of the large file that you want to edit. For example, Oxygen XML Editor can load a 200-Megabytes file using a minimum memory setting of 512 Megabytes and at least 400-Megabytes free disk space.

The increase of the maximum size of editable files includes the following restrictions:

- A file larger than the value of the above option is edited only in Text mode.
- The automatic validation is not available when editing a very large file.
• The XPath filter is disabled in the Find/Replace dialog box.
• The bidirectional Unicode support (right-to-left writing) is disabled.
• The option Format and indent the document on open is disabled for non-XML documents. For XML documents, it is done optimizing the memory usage but without respecting the options set in the Format preferences page.
• Less precise localizations for the results of an XPath expression.

File Sizes Greater than 300 MB

Files tend to become larger and larger mostly because they are frequently used as a format for database export or for porting between different database formats. Traditional text editors simply cannot handle opening these huge export files, some having sizes exceeding one gigabyte, because all the file content must be loaded in memory before the user can actually view it.

The file is split in multiple pages (each having about 1MB in size). Each page is individually loaded (and edited) in the Text mode by using the special horizontal slider located at the top of the editing area. The loading operation is very fast and has no upper limit for the size of the loaded file.

The increase of the maximum size of editable files includes the following restrictions:

• For XML files, only the UTF-8, UTF-16, and ASCII encodings are handled; for all non-XML files, the content is considered to be UTF-8.
• Files can be edited in Text editing mode only.
• The automatic validation is disabled.
• The XPath filter is disabled in the Find/Replace dialog box.
• The bidirectional Unicode support (right-to-left writing) is disabled.
• The Format and indent the document on open option is disabled for non-XML documents. For XML documents, the format and indent operation it is done optimizing the memory usage, but it ignores the options set in the Format preferences page.
• The Outline view is not supported.
• The file content is soft wrapped by default.
• The Find/Replace dialog box only supports the Find action.
• Saving changes is possible if Safe save is activated.
• The undo operation is not available if you go to other pages and come back to the modified page. The Undo operation loses its previous states if the back and forth between

Scratch Buffer

A handy addition to the document editing is the Scratch Buffer view used for storing fragments of arbitrary text during the editing process. It can be used to drop bits of paragraphs (including arbitrary XML markup fragments) while rearranging and editing the document and also to drag and drop fragments of text from the scratch buffer to the editor panel. The Scratch Buffer is basically a text area offering XML syntax highlight. The view contextual menu contains basic edit actions such as Cut, Copy, and Paste.

Handling Read-Only Files

If a file marked as read-only is opened in Oxygen XML Editor you can by default perform modifications to it. This behavior is controlled by the Can edit read only files option. When attempting to save such files you will be prompted to save them to another location.

You can check out the read-only state of the file by looking in the Properties view. If you modify the file properties from the operating system and the file becomes writable, you can modify it on the spot without having to reopen it.

The read-only state is marked with a lock decoration that appears in the editor tab and specified in the tooltip for a certain tab.
Editing Documents with Long Lines

When working with documents that contain lines of text that exceed the boundaries of your monitor, you might want to see the text wrapped. To do so, use one of the following methods:

- Press Ctrl + Shift + Y (Command + Shift + Y on OS X) to toggle the line wrap feature for the current document only.
- Enable the Line wrap option in the Text preferences page to apply the line wrap to all documents.

Features that Might be Affected by Wrapping Lines of Text

Documents that contain thousands of characters per line can affect the performance of Oxygen XML Editor Text mode. When a certain line length limit is reached (controlled from the Optimize loading for documents with lines longer than (Characters) on page 98 option), Oxygen XML Editor prompts you to wrap the lines of text. By doing so, the following features may be affected to maintain a reasonable level of productivity:

- The editor uses the Monospaced font.
- You cannot set font styles.
- Automatic validation is disabled.
- Automatic spell checking is disabled.
- When editing XML documents, the XPath field is disabled in the Find/Replace dialog box.
- Less precise localization for executed XPath expressions in XML documents. The XPath executions use SAX sources for a smaller memory footprint. We recommend using XPath 2.0 instead of XPath 1.0 because it features an increased execution speed and uses a smaller memory footprint. Running an XPath expression requires additional memory of about 2 or 3 times the size of the document on disk.

XML Digital Signatures

This chapter explains how to apply and verify digital signatures on XML documents.

Digital Signatures Overview

Digital signatures are widely used as security tokens, not just in XML. A digital signature provides a mechanism for assuring integrity of data, the authentication of its signer, and the non-repudiation of the entire signature to an external party:

- A digital signature must provide a way to verify that the data has not been modified or replaced to ensure integrity.
- The signature must provide a way to establish the identity of the data's signer for authentication.
- The signature must provide the ability for the data's integrity and authentication to be provable to a third party for non-repudiation.

A public key system is used to create the digital signature and it's also used for verification. The signature binds the signer to the document because digitally signing a document requires the originator to create a hash of the message and then encrypt that hash value with their own private key. Only the originator has that private key and that person is the only one who can encrypt the hash so that it can be unencrypted using their public key. The recipient, upon receiving both the message and the encrypted hash value, can decrypt the hash value, knowing the originator's public key. The recipient must also try to generate the hash value of the message and compare the newly generated hash value with the unencrypted hash value received from the originator. If the hash values are identical, it proves that the originator created the message, because only the actual originator could encrypt the hash value correctly.

XML Signatures can be applied to any digital content (data object), including XML (see W3C Recommendation, XML-Signature Syntax and Processing). An XML Signature may be applied to the content of one or more resources:

- Enveloped or enveloping signatures are applied over data within the same XML document as the signature
- Detached signatures are applied over data external to the signature element; the signature is "detached" from the content it signs. This definition typically applies to separate data objects, but it also includes the instance where the signature and data object reside within the same XML document but are sibling elements.

The XML Signature is a method of associating a key with referenced data. It does not normatively specify how keys are associated with persons or institutions, nor the meaning of the data being referenced and signed.
The original data is not actually signed. Instead, the signature is applied to the output of a chain of canonicalization and transformation algorithms, which are applied to the data in a designated sequence. This system provides the flexibility to accommodate whatever "normalization" or desired preprocessing of the data that might be required or desired before subjecting it to being signed.

To canonicalize something means to put it in a standard format that everyone generally uses. Since the signature is dependent on the content it is signing, a signature produced from a non-canonicalized document could possibly be different from one produced from a canonicalized document. The canonical form of an XML document is physical representation of the document produced by the method described in this specification. The term canonical XML refers to XML that is in canonical form. The XML canonicalization method is the algorithm defined by this specification that generates the canonical form of a given XML document or document subset. The term XML canonicalization refers to the process of applying the XML canonicalization method to an XML document or document subset. XML canonicalization is designed to be useful for applications that require the ability to test whether or not the information content of a document or document subset has been changed. This is done by comparing the canonical form of the original document before application processing with the canonical form of the document result of the application processing.

A digital signature over the canonical form of an XML document or document subset would allows the signature digest calculations to be oblivious to changes in the original document's physical representation. During signature generation, the digest is computed over the canonical form of the document. The document is then transferred to the relying party, which validates the signature by reading the document and computing a digest of the canonical form of the received document. The equivalence of the digests computed by the signing and relying parties (hence, the equivalence of the canonical forms for which they were computed) ensures that the information content of the document has not been altered since it was signed.

The following canonicalization algorithms are used in Oxygen XML Editor: Canonical XML (or Inclusive XML Canonicalization) (XMLC14N) and Exclusive XML Canonicalization (EXCC14N). The first is used for XML where the context doesn't change while the second was designed for canonicalization where the context might change.

Inclusive Canonicalization copies all the declarations, even if they are defined outside of the scope of the signature, and all the declarations you might use will be unambiguously specified. Inclusive Canonicalization is useful when it is less likely that the signed data will be inserted in other XML document and it is the safer method from the security perspective because it requires no knowledge of the data that are to be secured to safely sign them. A problem may occur if the signed document is moved into another XML document that has other declarations because the Inclusive Canonicalization will copy them and the signature will be invalid.

Exclusive Canonicalization just copies the namespaces you are actually using (the ones that are a part of the XML syntax). It does not look into attribute values or element content, so the namespace declarations required to process these are not copied. This is useful if you have a signed XML document that you want to insert into other XML documents (or you need self-signed structures that support placement within various XML contexts), as it will ensure the signature is verified correctly each time.

The canonicalization method can specify whether or not comments should be included in the canonical form output by the XML canonicalization method. If a canonical form contains comments corresponding to the comment nodes in the input node-set, the result is called canonical XML with comments. In an uncommented canonical form comments are removed, including delimiter for comments outside document element.

The three operations, Canonicalize, Sign, and Verify Signature, are available from the Source submenu when invoking the contextual menu in Text mode or from the Tools menu.

Certificates on page 690
Canonicalizing Files on page 691
Signing Files on page 692
Verifying Signature on page 693

Certificates
A certificate is a digitally signed statement from the issuer (an individual, an organization, a website or a firm), saying that the public key (and some other information) of some other entity has a particular value. When data is digitally signed, the signature can be verified to check the data integrity and authenticity. Integrity means that the data has not been modified. Authenticity means the data comes indeed from the entity that claims to have created and signed it. Certificates are kept in special repositories called keystores.
A keystore is an encrypted file that contains private keys and certificates. All keystore entries (key and trusted certificate entries) are accessed via unique aliases. An alias must be assigned for every new entry of either a key or certificate as a reference for that entity. No keystore can store an entity if its alias already exists in that keystore and cannot store trusted certificates generated with keys in its keystore.

In Oxygen XML Editor there are provided two types of keystores: Java Key Store (JKS) and Public-Key Cryptography Standards version 12 (PKCS-12). A keystore file is protected by a password. In a PKCS 12 keystore you should not store a certificate without alias together with other certificates, with or without alias, as in such a case the certificate without alias cannot be extracted from the keystore.

To configure the options for a certificate or to validate it, open the Preferences dialog box (Options > Preferences) and go to XML > XML Signing Certificates. This opens the certificates preferences page.

Digital Signatures Overview on page 689

Canonicalizing Files

You can select the canonicalization algorithm to be used for a document from the dialog box that is displayed by using the Canonicalize action that is available from the Source submenu when invoking the contextual menu in Text mode or from the Tools menu.

The Canonicalize dialog box allows you to set the following options:

- **Input URL** - Available if the Canonicalize action was selected from the Tools menu. It allows you to specify the location of the input file.
- **Exclusive** - If selected, the exclusive (uncommented) canonicalization method is used.
  
  **Note:** Exclusive Canonicalization just copies the namespaces you are actually using (the ones that are a part of the XML syntax). It does not look into attribute values or element content, so the namespace declarations required to process these are not copied. This is useful if you have a signed XML document that you want to insert into other XML documents (or you need self-signed structures that support placement within various XML contexts), as it will ensure the signature is verified correctly each time.

- **Exclusive with comments** - If selected, the exclusive with comments canonicalization method is used.
- **Inclusive** - If selected, the inclusive (uncommented) canonicalization method is used.

![Figure 422: Canonicalization Settings Dialog Box](image)
Note: Inclusive Canonicalization copies all the declarations, even if they are defined outside of the scope of the signature, and all the declarations you might use will be unambiguously specified. Inclusive Canonicalization is useful when it is less likely that the signed data will be inserted in other XML document and it is the safer method from the security perspective because it requires no knowledge of the data that are to be secured to safely sign them. A problem may occur if the signed document is moved into another XML document that has other declarations because the Inclusive Canonicalization will copy them and the signature will be invalid.

- **Inclusive with comments** - If selected, the inclusive with comments canonicalization method is used.
- **XPath** - The XPath expression provides the fragments of the XML document to be signed.
- **Output** - Available if the Canonicalize action was selected from the Tools menu. It allows you to specify the output file path where the signed XML document will be saved.
- **Open in editor** - If checked, the output file will be opened in the editor.

Related information

*Digital Signatures Overview* on page 689

**Signing Files**

You can select the type of signature to be used for documents from a signature settings dialog box. To open this dialog box, select the Sign action from the Source submenu when invoking the contextual menu in Text mode or from the Tools menu.

![Signature Settings Dialog Box](image)

**Figure 423: Signature Settings Dialog Box**

The following options are available:

- **Input** - Available if the Sign action was selected from the Tools menu. Specifies the location of the input URL.
- **Transformation Options** - See the Digital Signature Overview section for more information about these options.
• **None** - If selected, no canonicalization algorithm is used.
• **Exclusive** - If selected, the exclusive (uncommented) canonicalization method is used.

  Note: Exclusive Canonicalization just copies the namespaces you are actually using (the ones that are a part of the XML syntax). It does not look into attribute values or element content, so the namespace declarations required to process these are not copied. This is useful if you have a signed XML document that you want to insert into other XML documents (or you need self-signed structures that support placement within various XML contexts), as it will ensure the signature is verified correctly each time.

• **Exclusive with comments** - If selected, the exclusive with comments canonicalization method is used.
• **Inclusive** - If selected, the inclusive (uncommented) canonicalization method is used.

  Note: Inclusive Canonicalization copies all the declarations, even if they are defined outside of the scope of the signature, and all the declarations you might use will be unambiguously specified. Inclusive Canonicalization is useful when it is less likely that the signed data will be inserted in other XML document and it is the safer method from the security perspective because it requires no knowledge of the data that are to be secured to safely sign them. A problem may occur if the signed document is moved into another XML document that has other declarations because the Inclusive Canonicalization will copy them and the signature will be invalid.

• **Inclusive with comments** - If selected, the inclusive with comments canonicalization method is used.

• **XPath** - The XPath expression provides the fragments of the XML document to be signed.
• **ID** - Provides ID of the XML element to be signed.
• **Envelope** - If selected, the *enveloped* signature is used. See the Digital Signature Overview for more information.
• **Detached** - If selected, the *detached* signature is used. See the Digital Signature Overview for more information.
• **Append KeyInfo** - If this option is checked, the *ds:KeyInfo* element will be added in the signed document.
• **Signature algorithm** - The algorithm used for signing the document. The following options are available: RSA with SHA1, RSA with SHA256, RSA with SHA384, and RSA with SHA512.
• **Output** - Available if the *Sign* action was selected from the *Tools* menu. Specifies the path of the output file where the signed XML document will be saved.
• **Open in editor** - If checked, the output file will be opened in Oxygen XML Editor.

- [Verifying Signature](#) on page 693

### Verifying Signature

You can verify the signature of a file by selecting the **Verify Signature** action from the **Source** submenu when invoking the contextual menu in **Text** mode or from the **Tools** menu. The **Verify Signature** dialog box then allows you to specify the location of the file whose signature is verified.

If the signature is valid, a dialog box displays the name of the signer. Otherwise, an error shows details about the problem.

### Example of How to Digitally Sign XML Files or Content

Suppose you want to digitally sign an XML document, but more specifically, suppose you have multiple instances of the same element in the document and you just want to sign a specific ID. Oxygen XML Editor includes a signature tool that allows you to digitally sign XML documents or specific content.

The Oxygen XML Editor installation directory includes a *samples* folder that contains a file called *personal.xml*. For the purposes of this example, this file will be used to demonstrate how to digitally sign specific content. Notice that this file...
has multiple person elements inside the personnel element. Suppose you want to digitally sign the specific person element that contains the id=robert.taylor. To do this, follow this procedure:

1. Open the personal.xml file in Oxygen XML Editor in Text editing mode.
2. Right-click anywhere in the editor and select the Sign action from the Source submenu. The Sign dialog box is displayed.
   
   Tip: If you want to sign a file but create a new output file so that the original file remains unchanged, use the Sign action from the Tools menu. Selecting the action from this menu will allow you to choose an input file and output file in the Sign dialog box.

3. If Oxygen XML Editor cannot find a valid certificate, click the link at the top of the dialog box to configure a valid certificate. This opens the XML Signing Certificates preferences page that allows you to configure and validate a certificate.
4. Once a valid certificate is recognized, continue to configure the Sign dialog box.
   a) Select one of the Transformation Options. For the purposes of this example, select the Inclusive with comments option.
   b) Specify the appropriate XPath expression for the specific element that needs to be signed. For this example, type /personnel/person in the XPath text box.
   c) Enter the specific ID that needs to be signed. For this example, type robert.taylor in the ID field.
   d) Select the Envelope option and leave the other options as their default values.

   The digital signature is added at the end of the XML document, just before the end tag. It is always added at the end of the document, even if you only sign specific content within the document.
5. You can verify the signature by choosing the Verify Signature action from the Source submenu of the contextual menu.

Compare Files or Directories

Oxygen XML Editor provides a simple means of performing file and folder comparisons. You can see the differences in your files and folders and merge the changes. You can also use the file comparison to compare fragments or files inside zip-based archives.

There are two types of comparison tools: Compare Directories or Compare Files. These utilities are available from the Tools menu or can be opened as stand-alone applications from the Oxygen XML Editor installation folder (diffDirs.exe and diffFiles.exe).

Starting the Tools from a Command Line

The comparison tools can also be started by using command-line arguments. In the installation folder there are two executable shells (diffFiles.bat and diffDirs.bat on Windows, diffFiles.sh and diffDirs.sh on Unix/Linux, diffFilesMac.sh and diffDirsMac.sh on OS X). To specify files or directories to compare, you can pass command-line arguments to each of these shells. The arguments can point to file or folder paths in directories or archives (supported formats: zip, docx, and xlsx).

Directory Comparison Example

To start a comparison between the two directories, use the following construct:

diffDirs.bat/diffDirs.sh/diffDirsMac.sh [directory path 1] [directory path 2]. If you pass only one argument, you are prompted to manually choose the second directory or archive.

For example, to start a comparison between two Windows directories, the command line would look like this:

diffDirs.bat "c:\documents new" "c:\documents old"

Tip: If there are spaces in the path names, surround the paths with quotes.

File Comparison Example
To start a comparison between 2 or 3 files, use the following construct:

diffFiles.bat/diffFiles.sh/diffFilesMac.sh [path to left file] [path to right file] [path to base file].

If three files are specified, the tool will start in the 3-way comparison mode. If only two files are specified, the tool will start in the 2-way comparison mode. The first specified file will be added to the left panel in the comparison tool, the second file to the right panel, and the optional third file will be the base (ancestor) file used for a 3-way comparison. If you pass only one argument, you are prompted to manually choose another file.

For example, to do a 3-way comparison on Windows, the command line would look like this:

diffFiles.bat "c:\docs\file 1" "c:\docs\file 2" c:\docs\basefile

Tip: If there are spaces in the path names, surround the paths with quotes.

Compare Files

The Compare Files tool can be used to compare files or XML file fragments. The tool provides a mechanism for comparing two files or fragments, as well as the mechanism for a three-way comparison. The utility is available from the Tools menu or can be opened as a stand-alone application from the Oxygen XML Editor installation folder (diffFiles.exe).

Figure 424: Compare Files Tool

Starting the Tool from a Command Line

The file comparison tool can also be started by using command-line arguments. In the installation folder there is an executable shell (diffFiles.bat on Windows, diffFiles.sh on Unix/Linux, diffFilesMac.sh on OS X). To specify the files to compare, you can pass command-line arguments using the following construct:

diffFiles.bat/diffFiles.sh/diffFilesMac.sh [path to left file] [path to right file] [path to 3-way base file].

If three files are specified, the tool will start in the 3-way comparison mode. If only two files are specified, the tool will start in the 2-way comparison mode. The first specified file will be added to the left panel in the comparison tool, the second file to
the right panel, and the optional third file will be the base (ancestor) file used for a 3-way comparison. If you pass only one argument, you are prompted to manually choose another file.

You can also start the file comparison tool from an external application by using the [-ext] argument and there are some additional arguments that are allowed. To see all the details for the command line construct, type diffFiles.bat --help in the command line.

For example, to do a 3-way comparison on Windows, the command line might look like this:

```
diffFiles.bat "c:\docs\file 1" "c:\docs\file 2" c:\docs\basefile
```

**Tip:** If there are spaces in the path names, surround the paths with quotes.

### Two-Way Comparisons

The **Compare Files** tool can be used to compare the differences between two files or XML fragments.

#### Compare Files

To perform a two-way comparison, follow these steps:

1. Open a file in the left panel and the file you want to compare it to in the right panel. You can specify the path by using the text field, the history drop-down, or the browsing tools in the *Browse* drop-down menu.

   **Step Result:** The selected files are opened in the two side-by-side editors. A text perspective is used to offer a better view of the differences.

2. To highlight the differences between the two files, click the **Perform File Differencing** button from the toolbar.

3. You can use the drop-down menu on the left side of the toolbar to change the *algorithm* for the operation.

4. You can also use the **Diff Options** button to access the **Files Comparison** preferences page where you can choose to ignore certain types of markup and configure various options.

5. If you are comparing XML documents using the XML Fast or XML Accurate algorithms, you can enter an XPath 2.0 expression in the *Ignore nodes by XPath* text field to ignore certain nodes from the comparison.

The resulting comparison will show you differences between the two files. The line numbers on each side and colored marks on the right-side vertical stripe help you to quickly identify the locations of the differences. Adjacent changes are grouped into blocks of changes. This layout allows you to easily identify and focus on a group of related changes.

![Figure 425: Two-Way Differences](image)

#### Highlighting Colors

The differences are also highlighted in several colors, depending on the type of change, and dynamic lines connect the compared fragments in the middle section between the two panes. The highlighting colors can be customized in the **Files Comparison / Appearance preferences page**, but the default colors and their shades mean the following:

- **Pink** - Identifies modifications on either side.
- **Gray** - Identifies an addition of a node in the left side (your outgoing changes).
- **Blue** - Identifies an addition of a node in the right side (incoming changes).
- **Lighter Shade** - Identifies blocks of changes that can be merged in their entirety.
- **Darker Shade** - Identifies specific changes within the blocks that can be merged more precisely.

#### Compare Fragments

To compare XML file fragments, you need to copy and paste the fragments you want to compare into each side, without selecting a file. If a file is already selected, you need to close it using the **Close** button, before pasting the fragments. If you save modified fragments, a dialog box opens that allows you to save the changes as a new document.

#### Navigate Differences

---

Editing Documents 696
To navigate through differences, do one of the following:

- Use the navigation buttons on the toolbar (or in the Compare menu).
- Select a block of differences by clicking its small colored marker in the overview ruler located in the right-most part of the window. At the top of the overview ruler there is a success indicator that turns green where there are no differences, or red if differences are found.
- Click a colored area in between the two text editors.

**Editing Actions**

You can edit the files directly in either editing pane. The two editors are constantly synchronized and the differences are refreshed when you save the modified document or when you click the Perform File Differencing button.

A variety of actions are available on the toolbar and in the various menus (these same actions are also available in the contextual menu in both editing panes). The tool also includes some inline actions to help you merge, copy, or remove changes. When you select a change, the following inline action widgets are available, depending on the type of change:

- **Append left change to right and Append right change to left**
  
  Copies the content of the selected change from one side and appends it on the other, according to the content of the corresponding change. As a result, the side where the arrow points to will contain the changes from both sides.

- **Copy change from left to right and Copy change from right to left**
  
  Replaces the content of a change from one side with the content of the corresponding change from the other side.

- **Remove change**
  
  Rejects the change on the particular side and preserves the particular content on the other side.

**Two-Way Diff Algorithms**

Oxygen XML Editor offers the following two-way diff algorithms to compare files or fragments:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).

- **Characters** - Computes the differences at character level, meaning that it compares two files or fragments looking for identical characters.

- **Words** - Computes the differences at word level, meaning that it compares two files or fragments looking for identical words.

- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text.

- **Syntax Aware** - Computes differences for known file types or fragments. This algorithm splits the files or fragments into sequences of tokens and computes the differences between them. The meaning of a token depends on the type of compared files or fragments.

Known file types include those listed in the New dialog box, such as XML file types (XSLT files, XSL-FO files, XSD files, RNG files, NVDL files, etc.), XQuery file types (.xquery, .xq, .xqy, .xqm extensions), DTD file types (.dtd, .ent, .mod extensions), TEXT file type (.txt extension), or PHP file type (.php extension).

For example:

- When comparing XML files or fragments, a token can be one of the following:
  - The name of an XML tag
  - The < character
  - The /> sequence of characters
  - The name of an attribute inside an XML tag
  - The = sign
  - The " character
  - An attribute value
  - The text string between the start tag and the end tag (a text node that is a child of the XML element corresponding to the XML tag that encloses the text string)
When comparing plain text, a token can be any continuous sequence of characters or any continuous sequence of whitespaces, including a new line character.

- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

### Three-Way Comparisons

Oxygen XML Editor also includes a three-way comparison feature to help you solve conflicts and merge changes between multiple modifications. It is especially helpful for teams who have multiple authors editing and committing the same documents. It provides a comparison between a local change, another change, and the original base revision. Some additional advantages include:

- Visualize and merge content that was modified by you and another member of your team.
- Marks differences correctly even when the document structure is rearranged.
- Allows you to merge XML-relevant modifications.

#### Figure 426: Three-Way Comparison

**Compare Files**

To perform a three-way comparison, follow these steps:

1. Open a file in the left panel and the file you want to compare it to in the right panel. You can specify the path by using the text field, the history drop-down, or the browsing tools in the **Browse** drop-down menu.

   **Step Result:** The selected files are opened in the two side-by-side editors. A text perspective is used to offer a better view of the differences.

2. Click the **Three-Way Comparison** button on the toolbar and select the base file in the **Base** field. You can specify the path by using the text field, the history drop-down, or the browsing tools in the **Browse** drop-down menu.

3. To highlight the differences, click the **Perform File Differencing** button on the toolbar.

4. You can use the drop-down menu on the left side of the toolbar to change the algorithm for the operation.

5. You can also use the **Diff Options** button to access the **Files Comparison** preferences page where you can choose to ignore certain types of markup and configure various options.

The resulting comparison will show you differences between the two files, as well as differences between either of them and the base (ancestor) file. The line numbers on each side and colored marks on the right-side vertical stripe help you to quickly identify the locations of the differences. Adjacent changes are grouped into blocks of changes.

#### Figure 427: Three-Way Differences
Highlighting Colors

The differences are also highlighted in several colors, depending on the type of change, and dynamic lines connect the compared fragments in the middle section between the two panes. The highlighting colors can be customized in the Files Comparison / Appearance preferences page, but the default colors and their shades mean the following:

- **Pink** - Identifies blocks of changes that include conflicts.
- **Gray** - Identifies your outgoing changes that do not include conflicts.
- **Blue** - Identifies incoming changes that do not include conflicts.
- **Lighter Shade** - Identifies blocks of changes that can be merged in their entirety.
- **Darker Shade** - Identifies specific changes within the blocks that can be merged more precisely.

Navigate Differences

To navigate through differences, do one of the following:

- Use the navigation buttons on the toolbar (or in the Compare menu).
- Select a block of differences by clicking its small colored marker in the overview ruler located in the right-most part of the window. At the top of the overview ruler there is a success indicator that turns green where there are no differences, or red if differences are found.
- Click a colored area in between the two text editors.

Editing Actions

You can edit the files directly in either editing pane. The two editors are constantly synchronized and the differences are refreshed when you save the modified document or when you click the Perform File Differencing button.

A variety of actions are available on the toolbar and in the various menus (these same actions are also available in the contextual menu in both editing panes). The tool also includes some inline actions to help you merge, copy, or remove changes. When you select a change, the following inline action widgets are available, depending on the type of change:

- **Append left change to right** and **Append right change to left**
  - Copies the content of the selected change from one side and appends it on the other, according to the content of the corresponding change. As a result, the side where the arrow points to will contain the changes from both sides.

- **Copy change from left to right** and **Copy change from right to left**
  - Replaces the content of a change from one side with the content of the corresponding change from the other side.

- **Remove change**
  - Rejects the change on the particular side and preserves the particular content on the other side.

Three-Way Diff Algorithms

Oxygen XML Editor offers the following three-way diff algorithms to compare files:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text.
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

Second Level Comparisons

For both two-way and three-way comparisons, Oxygen XML Editor automatically performs a second level comparison for the Lines, XML Fast, and XML Accurate algorithms. After the first comparison is finished, the second level comparisons for the Lines algorithm is processed on text nodes using a word level comparison, meaning that it looks for identical words. For the XML Fast and XML Accurate algorithms, the second level comparison is processed using a syntax-aware comparison, meaning that it looks for identical tokens. This second level comparison makes it easier to spot precise differences and you can merge or reject the precise modifications.
Note: If a modified text fragment contains XML markup (such as processing instructions, XML comments, CData, or elements), the second level comparison will not automatically be performed. In this case you can manually select a second level comparison by doing a word level or character level comparison.

To do a word level comparison, select Show word level details from the contextual menu or Compare menu.

To do a character level comparison, select Show Character Level details from the contextual menu or Compare menu.

Toolbar and Contextual Menu Actions of the Compare Files Tool
The toolbar of the Compare Files tool contains operations that can be performed on the source and target files or XML fragments. Many of the actions are also available in the contextual menu.

Figure 431: Compare Toolbar
The following actions are available:

**Algorithm**
This drop-down menu allows you to select one of the following diff algorithms (depending on whether it is a two-way or three-way comparison):

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Characters** - Computes the differences at character level, meaning that it compares two files or fragments looking for identical characters.
- **Words** - Computes the differences at word level, meaning that it compares two files or fragments looking for identical words.
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text.
- **Syntax Aware** - Computes differences for the file types or fragments known by Oxygen XML Editor, taking the syntax (the specific types of tokens) into consideration.
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

**Diff Options**
Opens the `Files Comparison` preferences page where you can configure various options.

**Three-Way Comparison**
Toggle action that allows you to perform a three-way comparison between the two files displayed in the two editing panes and a base (ancestor) file.

**Perform Files Differencing**
Looks for differences between the two files displayed in the left and right side panels.

**Ignore Whitespaces**
Enables or disables the whitespace ignoring feature. Ignoring whitespace means that before performing the comparison, the application normalizes the content and trims its leading and trailing whitespaces.

**Synchronized scrolling**
Enables or disables synchronized scrolling so that a selected difference can be seen on both sides of the application window. This option is enabled by default.

**Format and Indent Both Files (Ctrl + Shift + P (Command + Shift + P on OS X))**
Formats and indents both files before comparing them. Use this option for comparisons that contain long lines that make it difficult to spot differences.

**Note:** When comparing two JSON files, the **Format and Indent Both Files** action will automatically sort the keys in both files the same to make it easier to compare.

**Copy Change from Right to Left**
Copies the selected difference from the file in the right panel to the file in the left panel.

**Copy All Changes from Right to Left**
Copies all changes from the file in the right panel to the file in the left panel.

**Next Block of Changes (Ctrl + Period (Command + Period on OS X))**
Jumps to the next block of changes. This action is disabled when the cursor is positioned on the last change block or when there are no changes.
Note: A change block groups one or more consecutive lines that contain at least one change.

Previous Block of Changes (Ctrl + Comma (Command + Comma on OS X))
Jumps to the previous block of changes. This action is disabled when the cursor is positioned on the first change block or when there are no changes.

Next Change (Ctrl + Shift + Period (Command + Shift + Period on OS X))
Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is disabled when the cursor is positioned on the last change or when there are no changes.

Previous Change (Ctrl + Shift + Comma (Command + Shift + M on OS X))
Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is disabled when the cursor is positioned on the first change or when there are no changes.

Copy All Changes from Left to Right
Copies all changes from the file in the left panel to the file in the right panel.

Copy Change from Left to Right
Copies the selected difference from the file in the left panel to the file in the right panel.

Ignore Nodes by XPath
You can use this text field to enter an XPath expression to ignore certain nodes from the comparison. It will be processed as XPath version 2.0. You can also enter the name of the node to ignore all nodes with the specified name (for example, if you want to ignore all ID attributes from the document, you could simply enter @id). This field is only available when comparing XML documents using the XML Fast or XML Accurate algorithms.

Note: If an XPath expression is specified in the Ignore nodes by XPath option in the Diff / File Comparison preferences page, that one is used as a default when the application is started. If you then enter an expression in this field on the toolbar, this one will be used instead of the default. If you delete the expression from this field, neither will be used.

First Change (Ctrl + B (Command + B on OS X))
Jumps to the first change.

Base
Available for three-way comparisons. It is the base file that will be compared with the files opened in the left and right editors. You can specify the path to the file by using the text field, its history drop-down, or the browsing tools in the Browse drop-down menu.

Left-Side (Source) File
You can specify the path to the file to be compared on the left side (source) by using the text field, its history drop-down, or the browsing tools in the Browse drop-down menu.

Save
Saves the changes made in the source (left-side) file.

Reload
Reloads the source (left-side) file.

Close
Closes the source (left-side) file.

Right-Side (Target) File
You can specify the path to the file to be compared on the right side (target) by using the text field, its history drop-down, or the browsing tools in the Browse drop-down menu.

Save
Saves the target (right-side) file.
Compare Files Tool Menus

The menus in the Compare Files tool contain some of the same actions that are on the toolbar, as well as some common actions that are identical to the same actions in the Oxygen XML Editor menus. The menu actions include:

**File Menu**

**Source > Open**
Browses for a file that will be displayed in the left panel.

**Source > Open URL**
Browses for a remote file that will be displayed in the left panel.

**Source > Open File from Archive**
Browses an archive for a file that will be displayed in the left panel.

**Source > Reload**
Reloads the file in the left panel.

**Source > Save**
Saves the changes made to the file in the left panel.

**Source > Save As**
Allows you to choose a destination to save the file in the left panel.

**Source > Close**
Closes the file in the left panel.

**Target > Open**
Browses for a file that will be displayed in the right panel.

**Target > Open URL**
Browses for a remote file that will be displayed in the right panel.

**Target > Open File from Archive**
Browses an archive for a file that will be displayed in the right panel.

**Target > Reload**
Reloads the file in the right panel.

**Target > Save**
Saves the changes made to the file in the right panel.

**Target > Save As**
Allows you to choose a destination to save the file in the right panel.

**Target > Close**
Closes the file in the right panel.

**Base > Open**
Browses for a file that will be compared with both files in a *three-way comparison*.

**Base > Open URL**
Browses for a remote file that will be compared with both files in a *three-way comparison*.
Base > Open File from Archive
Browses an archive for a file that will be compared with both files in a three-way comparison.

Close (Ctrl + W (Command + W on OS X))
Closes the application.

Edit Menu

Cut
Cut the selection from the currently focused editor panel to the clipboard.

Copy
Copy the selection from the currently focused editor panel to the clipboard.

Paste
Paste content from the clipboard into the currently focused editor panel.

Select all
Selects all content in the currently focused editor panel.

Undo
Undo changes in the currently focused editor panel.

Redo
Redo changes in the currently focused editor panel.

Find Menu

Find/Replace
Perform find/replace operations in the currently focused editor panel.

Find Next
Go to the next match using the same options as the last find operation. This action runs in both editor panels.

Find Previous
Go to the previous match using the same options as the last find operation. This action runs in both editor panels.

Compare Menu

Three-Way Comparison
Toggle action that allows you to perform a three-way comparison between the two files displayed in the two editing panes and a base (ancestor) file.

Perform Files Differencing
Looks for differences between the two files displayed in the left and right side panels.

Next Block of Changes (Ctrl + Period (Command + Period on OS X))
Jumps to the next block of changes. This action is disabled when the cursor is positioned on the last change block or when there are no changes.

Note: A change block groups one or more consecutive lines that contain at least one change.

Previous Block of Changes (Ctrl + Comma (Command + Comma on OS X))
Jumps to the previous block of changes. This action is disabled when the cursor is positioned on the first change block or when there are no changes.

Next Change (Ctrl + Shift + Period (Command + Shift + Period on OS X))
Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is disabled when the cursor is positioned on the last change or when there are no changes.
Previous Change (Ctrl + Shift + Comma (Command + Shift + M on OS X))
Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is disabled when the cursor is positioned on the first change or when there are no changes.

Last Change (Ctrl + E (Command + E on OS X))
Jumps to the last change.

First Change (Ctrl + B (Command + B on OS X))
Jumps to the first change.

Copy All Changes from Right to Left
Copies all changes from the file in the right panel to the file in the left panel.

Copy All Changes from Left to Right
Copies all changes from the file in the left panel to the file in the right panel.

Copy Change from Right to Left
Copies the selected difference from the file in the right panel to the file in the left panel.

Copy Change from Left to Right
Copies the selected difference from the file in the left panel to the file in the right panel.

Show Word Level Details
Provides a word-level comparison of the selected change.

Show Character Level Details
Provides a character-level comparison of the selected change.

Format and Indent Both Files (Ctrl + Shift + P (Command + Shift + P on OS X))
Formats and indents both files before comparing them. Use this option for comparisons that contain long lines that make it difficult to spot differences.

Note: When comparing two JSON files, the Format and Indent Both Files action will automatically sort the keys in both files the same to make it easier to compare.

Options Menu
Preferences
Opens the preferences dialog box that includes numerous pages of options that can be configured.

Menu Shortcut Keys
Opens the Menu Shortcut Keys option page where you can configure keyboard shortcuts available for menu items.

Reset Global Options
Resets options to their default values. Note that this option appears only when the tool is executed as a stand-alone application.

Import Global Options
Allows you to import an options set that you have previously exported.

Export Global Options
Allows you to export the current options set to a file.

Help Menu
Help (F1)
Opens a Help dialog box that displays the User Manual at a section that is appropriate for the context of the current cursor position.
Use Online Help
If this option is enabled, when you select Help or press F1 while hovering over any part of the interface, Oxygen XML Editor attempts to open the help documentation in online mode. If this option is disabled or an internet connection fails, the help documentation is opened in offline mode.

Report problem
Opens a dialog box that allows the user to write the description of a problem that was encountered while using the application. You can change the URL where the reported problem is sent by using the com.oxygenxml.report.problems.url system property. The report is sent in XML format through the report parameter of the POST HTTP method.

Support Center
Opens the Oxygen XML Editor Support Center web page in a browser.

Compare Directories
The Compare Directories tool can be used to compare and manage changes to files and folders within the structure of your directories. The utility is available from the Tools menu or can be opened as a stand-alone application from the Oxygen XML Editor installation folder (diffDirs.exe).

![Figure 432: Compare Directories Tool](image)

**Starting the Tool from a Command Line**
The directory comparison tool can also be started by using command-line arguments. In the installation folder there is an executable shell (diffDirs.bat on Windows, diffDirs.sh on Unix/Linux, diffDirsMac.sh on OS X). To specify the directories to compare, you can pass command-line arguments using the following construct:

```
diffDirs.bat/diffDirs.sh/diffDirsMac.sh [directory path 1] [directory path 2]
```

If you pass only one argument, you are prompted to manually choose the second directory or archive.

For example, to start a comparison between two Windows directories, the command line would look like this:

```
diffDirs.bat "c:\documents new" "c:\documents old"
```
Tip: If there are spaces in the path names, surround the paths with quotes.

Directory Comparisons

To perform a directory comparison, follow these steps:

1. Select a folder in the left panel and the folder you want to compare it to in the right panel. You can specify the path by using the text field, the history drop-down, or the Browse for local directory action in the Browse drop-down menu.

   **Step Result:** The selected directory structures are opened in the two side-by-side panels.

2. To highlight the differences between the two folders, click the Perform Directories Differencing button from the toolbar.

3. You can also use the Diff Options button to access the Directories Comparison preferences page where you can configure various options.

To compare the content of two archives, follow these steps:

1. Use the Browse for archive file action in the Browse drop-down menu to select the archives in the left and right panels.

2. By default, the supported archives are not treated as directories and the comparison is not performed on the files inside them. To make Oxygen XML Editor treat supported archives as directories, enable the Look in archives option in the Directories Comparison preferences page.

3. To highlight the differences, click the Perform Directories Differencing button from the toolbar.

The directory comparison results are presented using two tree-like structures showing the files and folders, including their name, size, and modification date. A column that contains graphic symbols separates the two tree-like structures. The graphic symbols can be one of the following:

- An X symbol, when a file or a folder exists in only one of the compared directories.
- A symbol, when a file exists in both directories but the content differs. The same sign appears when a collapsed folder contains differing files.

The color used for the symbol and the directory or file name can be customized in the Directories Comparison / Appearance preferences page. You can double-click lines marked with the symbol to open a Compare Files window, which shows the differences between the two files.

The directories that contain files that differ are expanded automatically so that you can focus directly on the differences. You can merge the contents of the directories by using the copy actions. If you double-click (or press Enter) on a line with a pair of files, Oxygen XML Editor starts a file comparison between the two files, using the Compare Files tool.

**Related information**

*Compare Files* on page 695

**Toolbar and Contextual Menu Actions of the Compare Directories Tool**

The toolbar of the Compare Directories tool contains operations that can be performed on the compared directory structure. Some of the toolbar actions are also available in the contextual menu.

---

**Figure 433: Compare toolbar**

**Toolbar Actions**

- **Perform Directories Differencing**
  
  Looks for differences between the two directories displayed in the left and right side of the application window.

- **Perform Files Differencing**

  Opens the Compare Files tool that allows you to compare the currently selected files.
Copy Change from Right to Left
Copies the selected change from the right side to the left side (if there is no file/folder in the right side, the left file/folder is deleted).

Copy Change from Left to Right
Copies the selected change from the left side to the right side (if there is no file/folder in the left side, the right file/folder is deleted).

Binary Compare
Performs a byte-level comparison on the selected files.

Diff Options
Opens the Directory Comparison preferences page where you can configure various options.

Show Only Modifications
Displays a more uncluttered file structure by hiding all identical files.

File and folder filters
Differences can be filtered using three combo boxes: Include files, Exclude files, and Exclude folders. They come with predefined values and are editable to allow custom values. All of them accept multiple comma-separated values and the * and ? wildcards. For example, to filter out all JPEG and GIF image files, edit the Exclude files filter box to read *.jpeg, *.png. Each filter includes a drop-down menu with the latest 15 filters applied.

Contextual Menu Actions

Perform Files Differencing
Opens the Compare Files tool that allows you to compare the currently selected files.

Binary Compare
Performs a byte-level comparison on the selected files.

Copy Change from Right to Left
Copies the selected difference from the file in the right panel to the file in the left panel.

Copy Change from Left to Right
Copies the selected difference from the file in the left panel to the file in the right panel.

Open
If the action is invoked on a file, the selected file is opened in Oxygen XML Editor. If the action is invoked on a directory, the selected directory is opened in the default file browser for your particular operating system.

Open in System Application
Opens the selected file in the system application that is associated with that type of file. The action is available when launching the Compare Directories tool from the Tools menu in Oxygen XML Editor.

Show in Explorer
Opens the default file browser for your particular operating system with the selected file highlighted.

Compare Directories Tool Menus
The menus in the Compare Directories tool contain some of the same actions that are on the toolbar, as well as some common actions that are identical to the same actions in the Oxygen XML Editor menus. The menu actions include:

File Menu

Close (Ctrl + W (Command + W on OS X))
Closes the application.
Compare Menu

Perform Directories Differencing
Looks for differences between the two directories displayed in the left and right side of the application window.

Perform Files Differencing
Opens the Compare Files tool that allows you to compare the currently selected files.

Copy Change from Right to Left
Copies the selected change from the right side to the left side (if there is no file/folder in the right side, the left file/folder is deleted).

Copy Change from Left to Right
Copies the selected change from the left side to the right side (if there is no file/folder in the left side, the right file/folder is deleted).

Options Menu

Preferences
Opens the preferences dialog box that includes numerous pages of options that can be configured.

Menu Shortcut Keys
Opens the Menu Shortcut Keys option page where you can configure keyboard shortcuts available for menu items.

Reset Global Options
Resets options to their default values. Note that this option appears only when the tool is executed as a stand-alone application.

Import Global Options
Allows you to import an options set that you have previously exported.

Export Global Options
Allows you to export the current options set to a file.

Help Menu

Help (F1)
Opens a Help dialog box that displays the User Manual at a section that is appropriate for the context of the current cursor position.

Use Online Help
If this option is enabled, when you select Help or press F1 while hovering over any part of the interface, Oxygen XML Editor attempts to open the help documentation in online mode. If this option is disabled or an internet connection fails, the help documentation is opened in offline mode.

Report problem
Opens a dialog box that allows the user to write the description of a problem that was encountered while using the application. You can change the URL where the reported problem is sent by using the com.oxygenxml.report.problems.url system property. The report is sent in XML format through the report parameter of the POST HTTP method.

Support Center
Opens the Oxygen XML Editor Support Center web page in a browser.

Compare Images
You can use the Compare Directories tool to compare images. If you double-click a line that contains two different images, the Compare images window is displayed. This dialog box presents the images in the left and right sides, scaled to fit the available view area. You can use the contextual menu actions to scale the images to their original size or scale them down to fit in the view area.

The supported image types are: GIF, JPG, JPEG, PNG, and BMP.
Compare Directories Against a Base (3-Way)

The **Compare Directories Against a Base (3-way)** tool allows you to perform three-way comparisons on directories to help you identify and merge changes between multiple modifications of the same directory structure. It is especially helpful for teams that have multiple authors contributing documents to the same directory system. It offers information about conflicts and changes, and includes actions to easily merge, accept, overwrite, or ignore changes to the directory system.

**How to Perform 3-Way Directory Comparisons**

To perform a 3-way directories comparison, follow these steps:

1. Select **Compare Directories Against a Base (3-way)** from the **Tools** menu.

   **Step Result:** This opens a dialog box that allows you to select the 3 file sets that will be used for the comparison.

2. Select the file sets to be compared:

   - **Base directory** - This is the original (base) file set before any modifications were made by your or others.
   - **Directory with your changes** - This is the file set with changes that you have made. This file set will be displayed in the left panel in the comparison tool.
   - **Directory with changes made by others** - This is the file set with changes made by others that you want to merge with your changes. This file set will be displayed in the right panel in the comparison tool.

3. Click the **Compare** button to compare the file sets and open the comparison tool.

4. Use the features and actions described in the next section to identify and merge the changes.
3-Way Directory Comparison Tool: Features and Actions

The 3-way directory comparison tool includes the following features and actions:

**Number of Changes and Conflicts**

The first thing you see in the tool is grand total of all the changes made by others, changes made by you, and the number of conflicts.

**Filter Buttons**

You can filter the list of modifications with the following toggle buttons:

- **Show all files**
  
  Use this button to show all modified and unmodified files, as well as conflicts.

- **Show only files modified by you and others**
  
  Filters the list to show all files that have been modified, including conflicts.

- **Show only files modified by others**
  
  Filters the list to only show the files that were modified by others.

- **Show only files modified by you**
  
  Filters the list to only show the files that were modified by you.

- **Show only conflicting files**
  
  Filters the list to only show files that contain conflicts.

**List of files**

This panel shows the list of files in the compared file sets based upon the filter button that is selected. You can see the file path and its status. You can double-click any file to open it in the file comparison panels (the file from your file set is shown next to the file from the other file set).
in the left panel while the file from the other file set is shown in the right panel). If you right-click a file in the list, you have access to the following contextual menu actions:

**Show modifications (Double-Click)**

Opens the file in the comparison panels. The file from your file set is shown in the left panel and the file from the other file set is shown in the right panel. If the file only exists in one of the file sets, then the panel for the other file set is blank.

** ⇩ Accept non-conflicting changes**

Merges all non-conflicting changes made by others (in the selected files) with your changes. For the files that were modified by both you and others, the tool will try to merge the changes automatically.

**Overwrite your changes**

Overwrites the changes you made to the selected files with the changes made by others.

**Ignore changes made by others**

Ignores the changes made by others to the selected files and keeps your changes.

**⇦ Accept all non-conflicting changes**

Click this button to accept all non-conflicting changes (in all files) made by others and merge them with your own changes. For the files that were modified by both you and others, the tool will try to merge the changes automatically.

**File Comparison Panels**

If you double-click a file in the list (or select **Show modifications** from the contextual menu), the files are opened in this file comparison section. The file from your file set is shown in the left panel and the file from the other file set is shown in the right panel. The toolbar includes the following actions and options:

**Algorithm**

This drop-down menu allows you to select one of the following diff algorithms to be used for file comparisons:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text.
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

**Diff Options**

Opens the **Files Comparison preferences page** where you can configure various options.

**Perform Files Differenting**

Looks for differences between the two files displayed in the left and right side panels.

**Ignore Whitespaces**

Enables or disables the whitespace ignoring feature. Ignoring whitespace means that before performing the comparison, the application normalizes the content and trims its leading and trailing whitespaces.

**Synchronized scrolling**

Toggles synchronized scrolling. When enabled, a selected difference can be seen in both panels.

**Format and Indent Both Files (Ctrl + Shift + P (Command + Shift + P on OS X))**

Formats and indents both files before comparing them. Use this option for comparisons that contain long lines that make it difficult to spot differences.

**Note:** When comparing two JSON files, the **Format and Indent Both Files** action will automatically sort the keys in both files the same to make it easier to compare.
Copy Change from Right to Left
Copies the selected difference from the file in the right panel to the file in the left panel.

Copy All Changes from Right to Left
Copies all changes from the file in the right panel to the file in the left panel.

Next Block of Changes (Ctrl + Period (Command + Period on OS X))
Jumps to the next block of changes. This action is disabled when the cursor is positioned on the last change block or when there are no changes.

Note: A change block groups one or more consecutive lines that contain at least one change.

Previous Block of Changes (Ctrl + Comma (Command + Comma on OS X))
Jumps to the previous block of changes. This action is disabled when the cursor is positioned on the first change block or when there are no changes.

Next Change (Ctrl + Shift + Period (Command + Shift + Period on OS X))
Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is disabled when the cursor is positioned on the last change or when there are no changes.

Previous Change (Ctrl + Shift + Comma (Command + Shift + M on OS X))
Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is disabled when the cursor is positioned on the first change or when there are no changes.

Ignore Nodes by XPath
You can use this text field to enter an XPath expression to ignore certain nodes from the comparison. It will be processed as XPath version 2.0. You can also enter the name of the node to ignore all nodes with the specified name (for example, if you want to ignore all ID attributes from the document, you could simply enter @id). This field is only available when comparing XML documents using the XML Fast or XML Accurate algorithms.

Note: If an XPath expression is specified in the Ignore nodes by XPath option in the Diff / File Comparison preferences page, that one is used as a default when the application is started. If you then enter an expression in this field on the toolbar, this one will be used instead of the default. If you delete the expression from this field, neither will be used.

First Change (Ctrl + B (Command + B on OS X))
Jumps to the first change.

Left-Side File (your changes)
Above the panel you can see the file path and the following two buttons:

Save
Saves changes made to the file.

Reload
Reloads the file.

Right-Side File (changes made by others)
Above the panel you can see the file path and the following two buttons:

Reload
Reloads the file.

Displaying Changes in the File Comparison Panels
The line numbers on each side and colored marks on the right-side vertical stripe help you to quickly identify the locations of the differences. Adjacent changes are grouped into blocks of changes.
The differences are also highlighted in several colors, depending on the type of change, and dynamic lines connect the compared fragments in the middle section between the two panes. The highlighting colors can be customized in the Files Comparison / Appearance preferences page, but the default colors and their shades mean the following:

- **Pink** - Identifies modifications on either side.
- **Gray** - Identifies an addition of a node in the left side (your outgoing changes).
- **Blue** - Identifies an addition of a node in the right side (incoming changes).
- **Lighter Shade** - Identifies blocks of changes that can be merged in their entirety.
- **Darker Shade** - Identifies specific changes within the blocks that can be merged more precisely.

**Direct Editing Actions in the File Comparison Panels**

You can edit the files directly in the left pane (your local changes). The two editors are constantly synchronized and the differences are refreshed when you save the modified document or when you click the Perform File Differencing button.

A variety of actions are available in the contextual menu in both editing panes. The tool also includes some inline actions to help you merge, copy, or remove changes. When you select a change, the following inline action widgets are available, depending on the type of change:

- **Append right change to left**
  - Copies the content of the selected change from the right side and appends it on the left side.

- **Copy change from right to left**
  - Replaces the content of a change in the left side with the content of the change in the right side.

- **Remove change**
  - Removes the change from the left side.

**Related information**

*Compare Directories* on page 706

*Compare Files* on page 695
A document type or framework is associated to an XML file according to a set of rules. It also includes a variety of settings that improve editing capabilities in the Author mode for its particular file type. These settings include:

- A default grammar used for validation and content completion in both Author mode and Text mode.
- CSS stylesheets for rendering XML documents in Author mode.
- User actions invoked from toolbars or menus in Author mode.
- Predefined scenarios used for transformations for the class of XML documents defined by the document type.
- XML catalogs.
- Directories with file templates.
- User-defined extensions for customizing the interaction with the content author in Author mode.

Oxygen XML Editor includes built-in support for many common document types. Each document type is defined in a framework. You can create new frameworks or make changes to existing frameworks to suit your individual requirements.

To see a video on configuring a framework in Oxygen XML Editor, go to https://www.oxygenxml.com/demo/FrameworkConfiguration.html.

Related information

Document Type Association Advanced Customization on page 1113
Oxygen XML Editor includes a variety of specialized editors, views, and features that are dynamic according to the type of document that you open or create. The type of documents that are supported include the most popular predefined XML frameworks that include a full set of features as well as other document types that include more generic or common features.

### Predefined Document Types

The following predefined document types (frameworks) are fully supported in Oxygen XML Editor and each of these document types include built-in transformation scenarios, validation, content completion, file templates, default CSS files for rendering content in Author mode, and default actions for editing in Author mode:

- **DocBook 4** - A document type standard for books, articles, and other prose documents (particularly technical documentation).
- **DocBook 5** - An enhanced (version 5) document type standard designed for a variety of documents (particularly technical documentation).
- **DITA** - An XML-based architecture designed for authoring, producing, and delivering technical information.
- **DITA Map** - A document type that collects and organizes references to DITA topics or other maps.
- **XHTML** - Extensible HyperText Markup Language includes the same depth of expression as HTML, but also conforms to XML syntax.
- **TEI ODD** - Text Encoding Initiative One Document Does it all is an XML-conformant specification that allows you to create TEI P5 schema in a literate programming style.
- **TEI P4** - The Text Encoding Initiative guidelines is a standard for the academic community that collectively define an XML format for text that is primarily semantic rather than presentational.
- **TEI P5** - The Text Encoding Initiative guidelines is a standard for the academic community that collectively define an XML format for text that is primarily semantic rather than presentational.
- **JATS** - The NISO Journal Article Tag Suite is a technical standard that defines an XML format for scientific literature.

### Other Supported Document Types

Oxygen XML Editor also provides limited support (including file templates) for editing a variety of other document types. All the specialized views, editors, actions, and options are dynamic according to the type of file that is opened or created. Other document types that are supported in Oxygen XML Editor include:

- **DocBook Targetset** - For resolving cross-references when using olinks.
- **Ant Build Scripts** - A tool for automating software build processes, written in Java and primarily intended for use with Java.
- **XSLT Stylesheets** - A document type that provides a visual mode for editing XSLT stylesheets.
- **WSDL** - Web Services Description Language is an XML language for describing the functionality offered by a web service.
- **Schematron** - For making assertions about the presence or absence of patterns in XML documents. This document type applies to the ISO Schematron version.
- **Schematron Quick Fixes (SQF)** - An extension of the ISO standard Schematron, allows developers to define QuickFixes for Schematron errors.
- **XProc** - A document type for processing XProc script files.
- **XML Schema** - Documents that provide support for editing annotations.
- **SVG** - Scalable Vector Graphics is a language for describing two-dimensional graphics in XML.
- **MathML** - Mathematical Markup Language (2.0 and 3.0) is an application of XML for describing mathematical notations.
- **XLIFF (1.2 & 2.0)** - XML Localization Interchange File Format is a standard for passing data between tools during a localization process.
- **XQuery** - The common query language for XML.
- **CSS** - Cascading Style Sheets is a language used for describing the look and formatting of a document.
- **LESS** - A dynamic style sheet language that can be compiled into CSS.
- **Relax NG Schema** - A schema language that specifies a pattern for the structure and content of an XML document.
- **NVDL Schema** - Namespace Validation Dispatching Language allows you to specify sections of XML documents to be validated against various schemas.
- **JSON** - JavaScript Object Notation is a lightweight data-interchange format.
- **JavaScript** - Programming language of HTML and the Web.
- **XML Spec** - A markup language for W3C specifications and other technical reports.
- **DITAVAL** - DITA conditional processing profile to identify the values you want to conditionally process for a particular output, build, or other purpose.
- **Daisy** - A technical standard for digital audio books, periodicals, and computerized text. It is designed to be an audio substitute for print material.
- **EAD** - Encoded Archival Description is an XML standard for encoding archival finding aids.
- **KML** - Keyhole Markup Language is an XML notation for expressing geographic visualization in maps and browsers.
- **Maven Project & Settings** - Project or settings file for Maven build automation tool that is primarily used for Java projects.
- **Oasis XML Catalog** - A document that describes a mapping between external entity references and locally-cached equivalents.

*Document Type Association Preferences* on page 52

**DocBook 4 Document Type**

*DocBook* is a very popular set of tags for describing books, articles, and other prose documents, particularly technical documentation. DocBook provides a vast number of semantic element tags, divided into three broad categories: structural, block-level, and inline. DocBook content can then be published in a variety of formats, including HTML, PDF, WebHelp, and EPUB.

**File Definition**

A file is considered to be a *DocBook 4* document when one of the following conditions are true:

- The root element name is `book` or `article`.
- The PUBLIC ID of the document contains the string `-//OASIS//DTD DocBook XML`.

**Default Document Templates**

There are a variety of default *DocBook 4* templates available when creating *new documents from templates*, including *Article*, *Book*, *Chapter*, *Glossary*, *Section*, and more.

The default templates for DocBook 4 documents are located in the `$OXYGEN_INSTALL_DIR/frameworks/docbook/templates/Docbook 4` folder.

**Default Schema**

The default schema that is used if one is not detected in the DocBook 4 file is `docbookxi.dtd` and it is stored in `$OXYGEN_INSTALL_DIR/frameworks/docbook/4.5/dtd/`.

**Default CSS**

The default CSS files used for rendering DocBook content in *Author* mode are stored in `$OXYGEN_INSTALL_DIR/frameworks/docbook/css/`.

By default, these default CSS files are merged with any that are specified in the document. For more information, see *Selecting and Combining Multiple CSS Styles* on page 1197.

**Default XML Catalog**

The default XML catalog, `catalog.xml`, is stored in `$OXYGEN_INSTALL_DIR/frameworks/docbook/`.

DocBook 4 Author Mode Actions

A variety of actions are available in the DocBook 4 framework that can be added to the DocBook4 menu, the Author Custom Actions toolbar, the contextual menu, and the Content Completion Assistant.

DocBook 4 Toolbar Actions

The following default actions are readily available on the DocBook (Author Custom Actions) toolbar when editing in Author mode (by default, most of them are also available in the DocBook4 menu and in various submenus of the contextual menu):

- **Bold**
  Emphasizes the selected text by surrounding it with `<emphasis role="bold">` tag. You can use this action on multiple non-contiguous selections.

- **Italic**
  Emphasizes the selected text by surrounding it with `<emphasis role="italic">` tag. You can use this action on multiple non-contiguous selections.

- **Underline**
  Emphasizes the selected text by surrounding it with `<emphasis role="underline">` tag. You can use this action on multiple non-contiguous selections.

- **Link Actions Drop-Down Menu**
  The following link actions are available from this menu:

  - **Cross reference (link)**
    Opens a dialog box that allows you to select a target to insert as a hypertext link.

  - **Cross reference (xref)**
    Inserts a cross reference to other parts of the document.

  - **Web Link (ulink)**
    Inserts a link that addresses its target with a URL (Universal Resource Locator).

  - **Insert OLink**
    Opens an OLink dialog box that allows you to insert a link that addresses its target indirectly, using the targetdoc and targetptr values that are present in a Targetset file.
After you choose the Targetset URL, the structure of the target documents is presented. For each target document (targetdoc), its content is displayed allowing you to easily identify the targetptr for the olink element that will be inserted. You can also use the search fields to quickly identify a target. If you already know the values for targetdoc and targetptr, you can insert them directly in the corresponding fields. You can also edit an olink using the Edit OLink action that is available on the contextual menu. The last used Targetset URL will be used to identify the edited target.

To insert XREF text into the olink, enter the text in the xreftext field and make sure the Insert xreftext in the OLink option is enabled.

**Insert URI**
Inserts a URI element. The URI identifies a Uniform Resource Identifier (URI) in content.

**Insert Image**
Inserts an image reference at the cursor position. Depending on the current location, an image-type element is inserted.

**Insert XInclude**
Opens a dialog box that allows you to browse and select content to be included and automatically generates the corresponding XInclude instruction.

**Section Drop-Down Menu**
The following actions are available from this menu:

- **Insert Section**
  Inserts a new section or subsection in the document, depending on the current context. For example, if the current context is sect1, then a sect2 is inserted. By default, this action also inserts a para element as a child node. The para element can be deleted if it is not needed.
Promote Section (Ctrl + Alt + LeftArrow (Command + Alt + LeftArrow on OS X))
Promotes the current node as a sibling of the parent node.

Demote Section (Ctrl + Alt + RightArrow (Command + Alt + RightArrow on OS X))
Demotes the current node a child of the previous node.

Insert Paragraph
Insert a new paragraph element at current cursor position.

Insert Equation
Opens the XML Fragment Editor that allows you to insert and edit MathML notations.

Insert List Item
Inserts a list item in the current list type.

Insert Ordered List
Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

Insert Itemized List
Inserts an itemized list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an itemized list.

Insert Variable List
Inserts a DocBook variable list. A child list item is also inserted automatically by default. You can also use this action to convert selected paragraphs or other types of lists to a variable list.

Insert Procedure List
Inserts a DocBook procedure element. A step child item is also inserted automatically. You can also use this action to convert selected paragraphs or other types of lists to a procedure list.

Sort
Sorts cells or list items in a table.

Insert Table
Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content — text + markup — that is rendered inside a block element) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

Note: If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that Only lists, paragraphs, or inline content can be converted to tables.

Insert Row Below
Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

Delete Row(s)
Deletes the table row located at cursor position or multiple rows in a selection.

Insert Column After
Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

Delete Column(s)
Deletes the table column located at cursor position or multiple columns in a selection.

Table Properties
Opens the Table properties dialog box that allows you to configure properties of a table (such as frame borders).
Join Cells
Joins the content of the selected cells (both horizontally and vertically).

Split Cell
Splits the cell at the cursor location. If Oxygen XML Editor detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

DocBook4 Menu Actions
In addition, the following default actions are available in the DocBook4 menu when editing in Author mode:

Paste special submenu
This submenu includes the following special paste actions that are specific to the DocBook 4 framework:

Paste As XInclude
Allows you to create an \texttt{xi:include} element that references a DocBook element copied from Author mode. The operation fails if the copied element does not have a declared ID.

Paste as link
Allows you to create a \texttt{link} element that references a DocBook element copied from Author mode. The operation fails if the copied element does not have a declared ID.

Paste as xref
Allows you to create an \texttt{xref} element that references a DocBook element copied from Author mode. The operation fails if the copied element does not have a declared ID.

Table submenu
In addition to the table actions available on the toolbar, the following actions are available in this submenu:

Insert Row Above
Inserts a new table row with empty cells above the current row. This action is available when the cursor is positioned inside a table.

Insert Rows
Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (Above or Below the current row).

Insert Column Before
Inserts a column before the current one.

Insert Columns
Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (Above or Below the current column).

Insert Cell
Inserts a new empty cell depending on the current context. If the cursor is positioned between two cells, Oxygen XML Editor a new cell at cursor position. If the cursor is inside a cell, the new cell is created after the current cell.

ID Options
Opens the ID Options dialog box that allows you to configure options for generating IDs in Author mode. The dialog box includes the following:

ID Pattern
The pattern for the ID values that will be generated. This text field can be customized using constant strings or any of the Oxygen XML Editor \textit{Editor Variables}.

Element name or class value to generate ID for
The elements for which ID values will be generated, specified using class attribute values. To customize the list, use the Add, Edit, or Remove buttons.
Auto generate IDs for elements
If enabled, Oxygen XML Editor will automatically generate unique IDs for the elements listed in this dialog box when they are created in **Author** mode.

Remove IDs when copying content in the same document
When copying and pasting content in the same document, this option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs. To retain the element IDs, disable this option.

Note: This option does not have an effect on content that is *cut* and *pasted*.

Generate IDs
Oxygen XML Editor generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the **ID Options** dialog box that are found in the current selection.

Note: The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

Refresh References
You can use this action to manually trigger a refresh and update of all referenced resources.

Tags display mode Submenu

- **Full Tags with Attributes**
  Displays full tag names with attributes for both block level and in-line level elements.
- **Full Tags**
  Displays full tag names without attributes for both block level and in-line level elements.
- **Block Tags**
  Displays full tag names for block level elements and simple tags without names for in-line level elements.
- **Inline Tags**
  Displays full tag names for inline level elements, while block level elements are not displayed.
- **Partial Tags**
  Displays simple tags without names for in-line level elements, while block level elements are not displayed.
- **No Tags**
  No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

Configure Tags Display Mode
Use this option to go to the **Author preferences page** where you can configure the **Tags Display Mode** options.

Profiling/Conditional Text Submenu

- **Edit Profiling Attributes**
  Allows you to configure the **profiling attributes** and their values.

Show Profiling Colors and Styles
Select this option to turn on conditional styling.

Show Profiling Attributes
Select this option to turn on conditional text markers. They are displayed at the end of conditional text blocks, as a list of attribute name and their currently set values.

Show Excluded Content
When this option is enabled, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, disable this option.

List of all profiling condition sets that match the current document type
You can click a listed condition set to activate it.
Profiling Settings

Opens the profiling options preferences page, where you can manage profiling attributes and profiling conditions sets. You can also configure the profiling styles and colors options from the colors/styles preferences page and the attributes rendering preferences page.

DocBook 4 Contextual Menu Actions

In addition to many of the DocBook 4 toolbar actions and the general Author mode contextual menu actions, the following DocBook 4 framework-specific actions are also available in the contextual menu when editing in Author mode:

Paste special submenu

This submenu includes the following special paste actions that are specific to the DocBook 4 framework:

- **Paste As XInclude**
  Allows you to create an xi:include element that references a DocBook element copied from Author mode. The operation fails if the copied element does not have a declared ID.

- **Paste as link**
  Allows you to create a link element that references a DocBook element copied from Author mode. The operation fails if the copied element does not have a declared ID.

- **Paste as xref**
  Allows you to create an xref element that references a DocBook element copied from Author mode. The operation fails if the copied element does not have a declared ID.

Image Map Editor

This action is available in the contextual menu when it is invoked on an image. This action applies an image map to the current image (if one does not already exist) and opens the Image Map Editor dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.

Table Actions

The following table editing actions are available in the contextual menu when it is invoked on a table:

- **Insert Rows**
  Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (Above or Below the current row).

- **Delete Row(s)**
  Deletes the table row located at cursor position or multiple rows in a selection.

- **Insert Columns**
  Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (Above or Below the current column).

- **Delete Column(s)**
  Deletes the table column located at cursor position or multiple columns in a selection.

- **Join Cells**
  Joins the content of the selected cells (both horizontally and vertically).

- **Split Cell**
  Splits the cell at the cursor location. If Oxygen XML Editor detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

- **Sort**
  Sorts cells or list items in a table.

- **Table Properties**
  Opens the Table properties dialog box that allows you to configure properties of a table (such as frame borders).

Other Actions submenu

This submenu give you access to all the usual contextual menu actions.
Link > Edit OLink
Opens a dialog box that allows you edit an existing OLink. See the Insert OLink action for more information.

Generate IDs
Oxygen XML Editor generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the ID Options dialog box that are found in the current selection.

Note: The Generate IDs action does not overwrite existing ID values. It only affects elements that do not already have an id attribute.

DocBook 4 Drag/Drop Actions
Dragging a file from the Project view or DITA Maps Manager view and dropping it into a DocBook 4 document that is edited in Author mode, creates a link to the dragged file (the ulink DocBook element) at the drop location. Dragging an image file from the default file system application (Windows Explorer on Windows or Finder on Mac OS X, for example) and dropping it into a DocBook 4 document inserts an image element (for example, the inlinegraphic DocBook element with a fileref attribute) at the drop location, similar to the Insert Image toolbar action.

DocBook 4 Transformation Scenarios
Default transformation scenarios allow you to convert DocBook 4 to DocBook 5 documents and transform DocBook documents to a variety of outputs, such as WebHelp, PDF, HTML, HTML Chunk, XHTML, XHTML Chunk, and EPUB.

Related information
Editing a Transformation Scenario on page 871
Configure Transformation Scenario(s) Dialog Box on page 872

DocBook 4 to WebHelp Output
DocBook 4 documents can be transformed into several types of WebHelp systems.

WebHelp Classic Output
To publish a DocBook 4 document as a WebHelp Classic system, follow these steps:

1. Click the Configure Transformation Scenario(s) action from the toolbar (or the Document > Transformation menu).
3. Click Apply associated.

When the DocBook WebHelp Classic transformation is complete, the output is automatically opened in your default browser.

WebHelp Classic with Feedback Output
To publish a DocBook 4 document as a WebHelp Classic with Feedback system, follow these steps:

1. Click Configure Transformation Scenarios.
3. Click Apply associated.
4. Enter the documentation product ID and the documentation version.

When the DocBook WebHelp Classic with Feedback transformation is complete, your default browser opens the installation.html file. This file contains information about the output location, system requirements, installation instructions, and deployment of the output. Follow the instructions to complete the system deployment. For more information, see Deploying a Feedback-Enabled WebHelp System on page 891.
To watch our video demonstration about the feedback-enabled WebHelp system, go to https://www.oxygenxml.com/demo/Feedback_ENABLED_WebHelp.html.

**WebHelp Classic Mobile Output**

To publish a DocBook 4 document as a WebHelp Classic Mobile system, follow these steps:

1. Click **Configure Transformation Scenarios**.
3. Click **Apply associated**.

When the DocBook WebHelp Classic Mobile transformation is complete, the output is automatically opened in your default browser.

**Customizing WebHelp Transformation Scenarios**

To customize a DocBook WebHelp transformation scenario, you can edit various parameters, including the following most commonly used ones:

- `args.default.language`  
  This parameter is used if the language is not detected in the DITA map. The default value is `en-us`.

- `clean.output`  
  Deletes all files from the output folder before the transformation is performed (only `no` and `yes` values are valid and the default value is `no`).

- `l10n.gentext.default.language`  
  This parameter is used to identify the correct stemmer that differs from language to language. For example, for English the value of this parameter is `en` or for French it is `fr`, and so on.

- `use.stemming`  
  Controls whether or not you want to include stemming search algorithms into the published output (default setting is `false`).

- `webhelp.copyright`  
  Adds a small copyright text that appears at the end of the Table of Contents pane.

- `webhelp.custom.resources`  
  The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

- `webhelp/favicon`  
  The file path that points to an image to be used as a favicon in the WebHelp output.

- `webhelp/footer.file`  
  Path to an XML file that includes the footer content for your WebHelp output pages. You can use this parameter to integrate social media features (such as widgets for Facebook ™, Twitter ™, Google Analytics, or Google+ ™). The file must be well-formed, each widget must be in separate `div` or `span` element, and the code for each `script` element is included in an XML comment (also, the start and end tags for the XML comment must be on a separate line). The following code exert is an example for adding a Facebook ™ widget:

```xml
<div id="facebook">
  <div id="fb-root"/>
  <script>
    (function(d, s, id) { var js, fjs = d.getElementsByTagName(s)[0];
      if (d.getElementById(id)) return;
      js = d.createElement(s); js.id = id;
      js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
      fjs.parentNode.insertBefore(js, fjs);
    }(document, 'script', 'facebookjsdk'));
    </script>

    <div data-share="true" data-show-faces="true" data-action="like" data-layout="standard" class="fb-like"/>
  </div>
</div>
```

- `webhelp/footer.include`  
  Specifies whether or not to include footer in each WebHelp page. Possible values: `yes`, `no`. If set to `no`, no footer is added to the WebHelp pages. If set to `yes` and the `webhelp/footer.file` parameter has a value, then the content of that
file is used as footer. If the webhelp.footer.file has no value then the default Oxygen XML Editor footer is inserted in each WebHelp page.

webhelp.logo.image.target.url

Specifies a target URL that is set on the logo image. When you click the logo image, you will be redirected to this address.

webhelp.logo.image

Specifies a path to an image displayed as a logo in the left side of the output header.

webhelp.product.id (available only for Feedback-enabled systems)

This parameter specifies a short name for the documentation target, or product (for example, mobile-phone-user-guide, hvac-installation-guide).

Note: You can deploy documentation for multiple products on the same server.

Restriction: The following characters are not allowed in the value of this parameter: < > / \ ' ( ) { } = ; * % + &.

webhelp.product.version (available only for Feedback-enabled systems)

Specifies the documentation version number (for example, 1.0, 2.5, etc.). New user comments are bound to this version.

Note: Multiple documentation versions can be deployed on the same server.

Restriction: The following characters are not allowed in the value of this parameter: < > / \ ' ( ) { } = ; * % + &.

webhelp.search.japanese.dictionary

The file path of the dictionary that will be used by the Kuromoji morphological engine that Oxygen XML Editor uses for indexing Japanese content in the WebHelp pages.

webhelp.search.ranking

If this parameter is set to false then the 5-star rating mechanism is no longer included in the search results that are displayed on the Search tab (default setting is true).

webhelp.skin.css

Path to a CSS file that sets the style theme in the output WebHelp pages. It can be one of the predefined skin CSS from the OXYGEN_INSTALL_DIR\frameworks\docbook\xsl\com.oxygenxml.webhelp\predefined-skins directory, or it can be a custom skin CSS generated with the Oxygen Skin Builder web application.

Related information
WebHelp Classic Output on page 763
WebHelp Classic With Feedback Output on page 765
WebHelp Classic Mobile System on page 963
Customizing WebHelp Classic Systems on page 941
Customizing WebHelp Classic Mobile Systems on page 963

DocBook to PDF Output Customization

When the default layout and output of the DocBook to PDF transformation needs to be customized, follow these steps:

   You should start from a copy of the file
   [OXYGEN_INSTALL_DIR]/frameworks/docbook/xsl/fo/titlepage.templates.xml and customize it.
   The instructions for the spec file can be found here.

   An example of spec file:

   ```xml
   <t:titlepage-content t:side="recto">
   <mediaobject/>
   <title
```
2. Generate a new XSLT stylesheet from the title spec file from the previous step.
   Apply [OXYGEN_INSTALL_DIR]/frameworks/docbook/xsl/template/titlepage.xsl to the title spec file. The result is an XSLT stylesheet (for example, mytitlepages.xsl).

3. Import mytitlepages.xsl in a DocBook customization layer.
   The customization layer is the stylesheet that will be applied to the XML document. The mytitlepages.xsl should be imported with an element like this:

   `<xsl:import href="dir-name/mytitlepages.xsl"/>

4. Insert a logo image in the XML document.
   The path to the logo image must be inserted in the book/info/mediaobject element of the XML document.

5. Apply the customization layer to the XML document.
   A quick way is to duplicate the transformation scenario DocBook PDF that is included with Oxygen XML Editor and set the customization layer in the XSL URL property of the scenario.

Related information

Video demonstration for creating a DocBook customization layer in Oxygen XML Editor.

DocBook to EPUB Transformation

The EPUB specification recommends the use of OpenType fonts (recognized by their .otf file extension) when possible. To use a specific font, follow these steps:

1. Declare it in your CSS file, as in the following example:

   ```
   @font-face {
     font-family: "MyFont";
     font-weight: bold;
     font-style: normal;
     src: url(fonts/MyFont.otf);
   }
   ```

2. In the CSS, specify where this font is used. To set it as default for h1 elements, use the font-family rule, as in the following example:

   ```
   h1 {
     font-size:20pt;
     margin-bottom:20px;
     font-weight: bold;
     font-family: "MyFont";
     text-align: center;
   }
   ```

3. Open the Configure Transformation Scenario(s) dialog box, select the DocBook EPUB transformation scenario, and click Edit.

4. In the Parameters tab, set the epub.embedded.fonts parameter to fonts/MyFont.otf. If you need to provide more files, use commas to separate their file paths.
   
   ![Note: The html.stylesheet parameter allows you to include a custom CSS in the output EPUB.](image)

5. Run the transformation scenario.

DocBook to DITA Transformation

Oxygen XML Editor includes a built-in transformation scenario that is designed to convert DocBook content to DITA. This transformation scenario is based upon a DITA Open Toolkit plugin that is available at sourceforge.net.

To convert a DocBook document to DITA, follow these steps:
1. Use one of the following two methods to begin the transformation process:

   - To apply the transformation scenario to a newly opened file, use the **Apply Transformation Scenario(s) (Ctrl + Shift + T (Command + Shift + T on OS X))** action from the toolbar or the **Document > Transformation** menu.
   - To customize the transformation or change the scenario that is associated with the document, use the **Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on OS X))** action from the toolbar or the **Document > Transformation** menu.

2. Select the **DocBook to DITA** transformation scenario in the **DocBook 4** or **DocBook 5** section.

3. Click the **Apply associated** button to run the transformation.

   **Step Result:** The transformation will convert as many of the DocBook elements into equivalent DITA elements as it can recognize in its mapping process. For elements that cannot be mapped, the transformation will insert XML comments so that you can see which elements could not be converted.

4. Adjust the resulting DITA composite to suit your needs. You may have to remove comments, fix validation errors, adjust certain attributes, or split the content into individual topics.

### Inserting an olink in DocBook Documents

The *olink* element is used for linking to resources outside the current DocBook document. The *targetdoc* attribute is used for the document ID that contains the target element and the *targetptr* attribute for the ID of the target element (the value of an *id* or *xml:id* attribute). The combination of these two attributes provides a unique identifier to locate cross references.

For example, a *Mail Administrator Guide* with the document ID MailAdminGuide might contain a chapter about user accounts, like this:

```
<chapter id="user_accounts">
<title>Administering User Accounts</title>
<para>blah blah</para>
</chapter>
```

You can form a cross reference to that chapter by adding an *olink*, as in the following example:

```
You may need to update your
<olink targetdoc="MailAdminGuide" targetptr="user_accounts">user accounts</olink>
when you get a new machine.
```

To use an *olink* to create links between documents, follow these steps:

1. Decide which documents are to be included in the domain for cross referencing.
   A unique ID must be assigned to each document that will be referenced with an *olink*. It is usually added as an *id* (or *xml:id* for DocBook5) attribute to the root element of the document.

2. Decide on your output hierarchy.
   For creating links between documents, the relative locations of the output documents must be known. Before going further you must decide the names and locations of the output directories for all the documents from the domain. Each directory will be represented by an element: `<dir name="directory_name">`, in the target database document.

3. Create the target database document.
   Each collection of documents has a master target database document that is used to resolve all *olinks* from that collection. The target database document is an XML file that is created once. It provides a framework that pulls in the target data for each document. The database document is static and all the document data is pulled in dynamically.

The following is an example of a target database document. It structures a collection of documents in a *sitemap* element that provides the relative locations of the outputs (HTML in this example). Then it pulls in the individual target data using system entity references to target data files that will be created in the next step.

```xml
<?xml version="1.0" encoding="utf-8"?>
<!DOCTYPE targetset [ 
<!ENTITY ugtargets SYSTEM "file:///doc/userguide/target.db">  
<!ENTITY agtargets SYSTEM "file:///doc/adminguide/target.db">  
<!ENTITY refttargets SYSTEM "file:///doc/man/target.db"> ]>  
<targetset>
```
4. Generate the target data files by executing a DocBook transformation scenario.

Before applying the transformation, you need to edit the transformation scenario, go to the **Parameters** tab, and make sure the value of the `collect.xref.targets` parameter is set to `yes`. The default name of a target data file is `target.db`, but it can be changed by setting an absolute file path in the `targets.filename` parameter.

An example of a `target.db` file:

```xml
<xml element="book" href="#MailAdminGuide" number="1" targetptr="user_accounts">
  <xref text="How to administer user accounts"/>
  <xml element="part" href="#d5e4" number="1">
    <xml text="First Part"/>
    <xml element="chapter" href="#d5e6" number="1">
      <xml text="Chapter Title"/>
      <xml text="Section Title"/>
      <xref text="xreflabel_here"/>
    </xml>
  </xml>
</xml>
```

5. Insert **olink** elements in the DocBook documents.

When editing a DocBook XML document in **Author** mode, the **Insert OLink** action is available in the **Link** drop-down menu from the toolbar. This action opens the **Insert OLink** dialog box that allows you to select the target of an **olink** from the list of all possible targets from a specified target database document (specified in the **Targetset URL** field). Once a **Targetset URL** is selected, the structure of the target documents is presented. For each target document (`targetdoc`), its content is displayed, allowing you to easily identify the appropriate `targetptr`. You can also use the search fields to quickly identify a target. If you already know the values for the `targetdoc` and `targetptr` attributes, you can insert them directly in the corresponding fields.

In the following image, the target database document is called `target.xml`, `dbadmin` is selected for the target document (`targetdoc`), and `bldinit` is selected as the value for the `targetptr` attribute. Notice that you can also add XREF text into the **olink** by using the `xreftext` field.
6. Process a DocBook transformation for each document to generate the output.
   a) Edit the transformation scenario and set the value of the `target.database.document` parameter to be the URL of the target database document.
   b) Apply the transformation scenario.

**DocBook 5 Document Type**

DocBook is a very popular set of tags for describing books, articles, and other prose documents, particularly technical documentation. DocBook provides a vast number of semantic element tags, divided into three broad categories: structural, block-level, and inline. DocBook content can then be published in a variety of formats, including HTML, PDF, WebHelp, and EPUB.

**File Definition**

A file is considered to be a DocBook 5 document when the namespace is `http://docbook.org/ns/docbook`.

**Default Document Templates**

There are a variety of default DocBook 5 templates available when creating new documents from templates, including Article, Book, Chapter, Glossary, Section, and more.

The default templates for DocBook 5 documents are located in the ` frameworks/docbook/templates/Docbook 5` folder.

**Note:** Default templates for experimental DocBook 5.1 documents are also available in the ` frameworks/docbook/templates/Docbook 5.1 (Experimental)` directory.
Default Schema

The default schema that is used if one is not detected in the DocBook 5 file is docbookxi.rng and it is stored in [OXYGEN_INSTALL_DIR]/frameworks/docbook/5.0/rng/. Other types of schemas are also located in various folders inside the [OXYGEN_INSTALL_DIR]/frameworks/docbook/5.0/ directory (for example, XML Schema files are located in the xsd folder).

Default CSS

The default CSS files used for rendering DocBook content in Author mode is stored in [OXYGEN_INSTALL_DIR]/frameworks/docbook/css/.

By default, these default CSS files are merged with any that are specified in the document. For more information, see Selecting and Combining Multiple CSS Styles on page 1197.

Default XML Catalog

The default XML catalog, catalog.xml, is stored in [OXYGEN_INSTALL_DIR]/frameworks/docbook/5.0/.

Note: A default XML catalog and schema files for experimental DocBook 5.1 documents are also available in the [OXYGEN_INSTALL_DIR]/frameworks/docbook/5.1/ directory.

Adding Tables in DocBook on page 370

DocBook 5 Author Mode Actions

A variety of actions are available in the DocBook 5 framework that can be added to the DocBook5 menu, the Author Custom Actions toolbar, the contextual menu, and the Content Completion Assistant.

DocBook 5 Toolbar Actions

The following default actions are readily available on the DocBook (Author Custom Actions) toolbar when editing in Author mode (by default, most of them are also available in the DocBook5 menu and in various submenus of the contextual menu):

- **Bold**
  Emphasizes the selected text by surrounding it with <emphasis role="bold"> tag. You can use this action on multiple non-contiguous selections.

- **Italic**
  Emphasizes the selected text by surrounding it with <emphasis role="italic"> tag. You can use this action on multiple non-contiguous selections.

- **Underline**
  Emphasizes the selected text by surrounding it with <emphasis role="underline"> tag. You can use this action on multiple non-contiguous selections.

- **Link Actions Drop-Down Menu**
  The following link actions are available from this menu:
  - **Cross reference (link)**
    Opens a dialog box that allows you to select a target to insert as a hypertext link.
  - **Cross reference (xref)**
    Inserts a cross reference to other parts of the document.
Web Link (ulink)

Inserts a link that addresses its target with a URL (Universal Resource Locator).

Insert OLink

Opens an OLink dialog box that allows you to insert a link that addresses its target indirectly, using the targetdoc and targetptr values that are present in a Targetset file.

![Insert OLink Dialog Box](image)

Figure 439: Insert OLink Dialog Box

After you choose the Targetset URL, the structure of the target documents is presented. For each target document (targetdoc), its content is displayed allowing you to easily identify the targetptr for the olink element that will be inserted. You can also use the search fields to quickly identify a target. If you already know the values for targetdoc and targetptr, you can insert them directly in the corresponding fields. You can also edit an olink using the Edit OLink action that is available on the contextual menu. The last used Targetset URL will be used to identify the edited target.

To insert XREF text into the olink, enter the text in the xreftext field and make sure the Insert xreftext in the OLink option is enabled.

Insert URI

Inserts a URI element. The URI identifies a Uniform Resource Identifier (URI) in content.

Insert Image

Inserts an image reference at the cursor position. Depending on the current location, an image-type element is inserted.

Insert XInclude

Opens a dialog box that allows you to browse and select content to be included and automatically generates the corresponding XInclude instruction.
Section Drop-Down Menu

The following actions are available from this menu:

- **Insert Section**
  Inserts a new section or subsection in the document, depending on the current context. For example, if the current context is sect1, then a sect2 is inserted. By default, this action also inserts a \texttt{para} element as a child node. The \texttt{para} element can be deleted if it is not needed.

- **Promote Section (Ctrl + Alt + LeftArrow (Command + Alt + LeftArrow on OS X))**
  Promotes the current node as a sibling of the parent node.

- **Demote Section (Ctrl + Alt + RightArrow (Command + Alt + RightArrow on OS X))**
  Demotes the current node a child of the previous node.

- **Insert Paragraph**
  Insert a new paragraph element at current cursor position.

- **Insert Equation**
  Opens the XML Fragment Editor that allows you to insert and \textit{edit MathML notations}.

- **Insert List Item**
  Inserts a list item in the current list type.

- **Insert Ordered List**
  Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

- **Insert Itemized List**
  Inserts an itemized list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an itemized list.

- **Insert Variable List**
  Inserts a DocBook variable list. A child list item is also inserted automatically by default. You can also use this action to convert selected paragraphs or other types of lists to a variable list.

- **Insert Procedure List**
  Inserts a DocBook procedure element. A step child item is also inserted automatically. You can also use this action to convert selected paragraphs or other types of lists to a procedure list.

- **Sort**
  Sorts cells or list items in a table.

- **Insert Table**
  Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content — text + markup — that is rendered inside a block element) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

  **Note:** If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that \textit{Only lists, paragraphs, or inline content can be converted to tables}.

- **Insert Row Below**
  Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

- **Delete Row(s)**
  Deletes the table row located at cursor position or multiple rows in a selection.
**Insert Column After**
Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

**Delete Column(s)**
Deletes the table column located at cursor position or multiple columns in a selection.

**Table Properties**
Opens the Table properties dialog box that allows you to configure properties of a table (such as frame borders).

**Join Cells**
Joins the content of the selected cells (both horizontally and vertically).

**Split Cell**
Splits the cell at the cursor location. If Oxygen XML Editor detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

**DocBook5 Menu Actions**
In addition, the following default actions are available in the DocBook5 menu when editing in Author mode:

**Paste special submenu**
This submenu includes the following special paste actions that are specific to the DocBook 5 framework:

- **Paste As XInclude**
  Allows you to create an `xi:include` element that references a DocBook element copied from Author mode. The operation fails if the copied element does not have a declared ID.

- **Paste as link**
  Allows you to create a `link` element that references a DocBook element copied from Author mode. The operation fails if the copied element does not have a declared ID.

- **Paste as xref**
  Allows you to create an `xref` element that references a DocBook element copied from Author mode. The operation fails if the copied element does not have a declared ID.

**Table submenu**
In addition to the table actions available on the toolbar, the following actions are available in this submenu:

- **Insert Row Above**
  Inserts a new table row with empty cells above the current row. This action is available when the cursor is positioned inside a table.

- **Insert Rows**
  Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (Above or Below the current row).

- **Insert Column Before**
  Inserts a column before the current one.

- **Insert Columns**
  Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (Above or Below the current column).

- **Insert Cell**
  Inserts a new empty cell depending on the current context. If the cursor is positioned between two cells, Oxygen XML Editor a new cell at cursor position. If the cursor is inside a cell, the new cell is created after the current cell.

**ID Options**
Opens the ID Options dialog box that allows you to configure options for generating IDs in Author mode. The dialog box includes the following:
ID Pattern
The pattern for the ID values that will be generated. This text field can be customized using constant strings or any of the Oxygen XML Editor Editor Variables.

Element name or class value to generate ID for
The elements for which ID values will be generated, specified using class attribute values. To customize the list, use the Add, Edit, or Remove buttons.

Auto generate IDs for elements
If enabled, Oxygen XML Editor will automatically generate unique IDs for the elements listed in this dialog box when they are created in Author mode.

Remove IDs when copying content in the same document
When copying and pasting content in the same document, this option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs. To retain the element IDs, disable this option.

Note: This option does not have an effect on content that is cut and pasted.

Generate IDs
Oxygen XML Editor generates unique IDs for the current element (or elements), depending on how the action is invoked:

• When invoked on a single selection, an ID is generated for the selected element at the cursor position.
• When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the ID Options dialog box that are found in the current selection.

Note: The Generate IDs action does not overwrite existing ID values. It only affects elements that do not already have an id attribute.

Refresh References
You can use this action to manually trigger a refresh and update of all referenced resources.

Tags display mode Submenu

• Full Tags with Attributes
  Displays full tag names with attributes for both block level and in-line level elements.

• Full Tags
  Displays full tag names without attributes for both block level and in-line level elements.

• Block Tags
  Displays full tag names for block level elements and simple tags without names for in-line level elements.

• Inline Tags
  Displays full tag names for inline level elements, while block level elements are not displayed.

• Partial Tags
  Displays simple tags without names for in-line level elements, while block level elements are not displayed.

• No Tags
  No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

Configure Tags Display Mode
Use this option to go to the Author preferences page where you can configure the Tags Display Mode options.

Profiling/Conditional Text Submenu

• Edit Profiling Attributes
  Allows you to configure the profiling attributes and their values.

• Show Profiling Colors and Styles
  Select this option to turn on conditional styling.

• Show Profiling Attributes
  Select this option to turn on conditional text markers. They are displayed at the end of conditional text blocks, as a list of attribute name and their currently set values.
Show Excluded Content
When this option is enabled, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, disable this option.

List of all profiling condition sets that match the current document type
You can click a listed condition set to activate it.

Profiling Settings
Opens the profiling options preferences page, where you can manage profiling attributes and profiling conditions sets. You can also configure the profiling styles and colors options from the colors/styles preferences page and the attributes rendering preferences page.

DocBook 5 Contextual Menu Actions
In addition to many of the DocBook 5 toolbar actions and the general Author mode contextual menu actions, the following DocBook 5 framework-specific actions are also available in the contextual menu when editing in Author mode:

Paste special submenu
This submenu includes the following special paste actions that are specific to the DocBook 5 framework:

Paste As XInclude
Allows you to create an \texttt{xi:include} element that references a DocBook element copied from Author mode. The operation fails if the copied element does not have a declared ID.

Paste as link
Allows you to create a \texttt{link} element that references a DocBook element copied from Author mode. The operation fails if the copied element does not have a declared ID.

Paste as xref
Allows you to create an \texttt{xref} element that references a DocBook element copied from Author mode. The operation fails if the copied element does not have a declared ID.

Image Map Editor
This action is available in the contextual menu when it is invoked on an image. This action applies an image map to the current image (if one does not already exist) and opens the Image Map Editor dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.

Table Actions
The following table editing actions are available in the contextual menu when it is invoked on a table:

Insert Rows
Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (Above or Below the current row).

Delete Row(s)
Deletes the table row located at cursor position or multiple rows in a selection.

Insert Columns
Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (Above or Below the current column).

Delete Column(s)
Deletes the table column located at cursor position or multiple columns in a selection.

Join Cells
Joins the content of the selected cells (both horizontally and vertically).

Split Cell
Splits the cell at the cursor location. If Oxygen XML Editor detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.
Sort
Sorts cells or list items in a table.

Table Properties
Opens the Table properties dialog box that allows you to configure properties of a table (such as frame borders).

Other Actions submenu
This submenu gives you access to all the usual contextual menu actions.

Link > Edit OLink
Opens a dialog box that allows you to edit an existing OLink. See the Insert OLink action for more information.

Generate IDs
Oxygen XML Editor generates unique IDs for the current element (or elements), depending on how the action is invoked:
- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the ID Options dialog box that are found in the current selection.

Note: The Generate IDs action does not overwrite existing ID values. It only affects elements that do not already have an id attribute.

DocBook 5 Drag/Drop Actions
Dragging a file from the Project view or DITA Maps Manager view and dropping it into a DocBook 5 document that is edited in Author mode, creates a link to the dragged file (the link DocBook element) at the drop location. Dragging an image file from the default file system application (Windows Explorer on Windows or Finder on Mac OS X, for example) and dropping it into a DocBook 5 document inserts an image element (the imageobject DocBook element with an imagedata child element and a fileref attribute) at the drop location, similar to the Insert Image toolbar action.

DocBook 5 Transformation Scenarios
Default transformation scenarios allow you to transform DocBook 5 documents to a variety of outputs, such as WebHelp, PDF, HTML, HTML Chunk, XHTML, XHTML Chunk, and EPUB.

Related information
Editing a Transformation Scenario on page 871
Configure Transformation Scenario(s) Dialog Box on page 872

DocBook 5 to WebHelp Output
DocBook 5 documents can be transformed into several types of WebHelp systems.

WebHelp Classic Output
To publish a DocBook 5 document as a WebHelp Classic system, follow these steps:

1. Click the Configure Transformation Scenario(s) action from the toolbar (or the Document > Transformation menu).
2. Select the DocBook WebHelp Classic scenario from the DocBook 5 section.
3. Click Apply associated.

When the DocBook WebHelp Classic transformation is complete, the output is automatically opened in your default browser.

WebHelp Classic with Feedback Output
To publish a DocBook 5 document as a WebHelp Classic with Feedback system, follow these steps:

1. Click Configure Transformation Scenarios.
3. Click Apply associated.
4. Enter the documentation product ID and the documentation version.

When the **DocBook WebHelp Classic with Feedback** transformation is complete, your default browser opens the **installation.html** file. This file contains information about the output location, system requirements, installation instructions, and deployment of the output. Follow the instructions to complete the system deployment. For more information, see *Deploying a Feedback-Enabled WebHelp System* on page 891.

To watch our video demonstration about the feedback-enabled WebHelp system, go to [https://www.oxygenxml.com/demo/Feedback_Enabled_WebHelp.html](https://www.oxygenxml.com/demo/Feedback_Enabled_WebHelp.html).

**WebHelp Classic Mobile Output**

To publish a DocBook 5 document as a **WebHelp Classic Mobile** system, follow these steps:

1. Click **Configure Transformation Scenarios**.
2. Select the **DocBook WebHelp Classic Mobile** scenario from the **DocBook 5** section.
3. Click **Apply associated**.

When the **DocBook WebHelp Classic Mobile** transformation is complete, the output is automatically opened in your default browser.

**Customizing WebHelp Transformation Scenarios**

To customize a DocBook WebHelp transformation scenario, you can edit various parameters, including the following most commonly used ones:

- **args.default.language**
  This parameter is used if the language is not detected in the DITA map. The default value is `en-us`.

- **clean.output**
  Deletes all files from the output folder before the transformation is performed (only `no` and `yes` values are valid and the default value is `no`).

- **l10n.gentext.default.language**
  This parameter is used to identify the correct stemmer that differs from language to language. For example, for English the value of this parameter is `en` or for French it is `fr`, and so on.

- **use.stemming**
  Controls whether or not you want to include stemming search algorithms into the published output (default setting is `false`).

- **webhelp.copyright**
  Adds a small copyright text that appears at the end of the **Table of Contents** pane.

- **webhelp.custom.resources**
  The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

- **webhelp.favicon**
  The file path that points to an image to be used as a **favicon** in the WebHelp output.

- **webhelp.footer.file**
  Path to an XML file that includes the footer content for your WebHelp output pages. You can use this parameter to integrate social media features (such as widgets for Facebook™, Twitter™, Google Analytics, or Google+™). The file must be well-formed, each widget must be in separate **div** or **span** element, and the code for each **script** element is included in an XML comment (also, the start and end tags for the XML comment must be on a separate line). The following code excerpt is an example for adding a Facebook™ widget:

```xml
<div id="facebook">
  <div id="fb-root"></div>
  <script>
    (function(d, s, id) {
      var js, fjs = d.getElementsByTagName(s)[0];
      if (d.getElementById(id)) return;
      js = d.createElement(s); js.id = id;
      js.src = '//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0';
      fjs.parentNode.insertBefore(js, fjs);
    }(document, 'script', 'facebook-jssdk'));
  </script>
</div>
```
webhelp.footer.include

Specifies whether or not to include footer in each WebHelp page. Possible values: yes, no. If set to no, no footer is added to the WebHelp pages. If set to yes and the webhelp.footer.file parameter has a value, then the content of that file is used as footer. If the webhelp.footer.file has no value then the default Oxygen XML Editor footer is inserted in each WebHelp page.

webhelp.logo.image.target.url

Specifies a target URL that is set on the logo image. When you click the logo image, you will be redirected to this address.

webhelp.logo.image

Specifies a path to an image displayed as a logo in the left side of the output header.

webhelp.product.id (available only for Feedback-enabled systems)

This parameter specifies a short name for the documentation target, or product (for example, mobile-phone-user-guide, hvac-installation-guide).

Note: You can deploy documentation for multiple products on the same server.

Restriction: The following characters are not allowed in the value of this parameter: < > / \ ' ( ) { } = ; * % + &.

webhelp.product.version (available only for Feedback-enabled systems)

Specifies the documentation version number (for example, 1.0, 2.5, etc.). New user comments are bound to this version.

Note: Multiple documentation versions can be deployed on the same server.

Restriction: The following characters are not allowed in the value of this parameter: < > / \ ' ( ) { } = ; * % + &.

webhelp.search.japanese.dictionary

The file path of the dictionary that will be used by the Kuromoji morphological engine that Oxygen XML Editor uses for indexing Japanese content in the WebHelp pages.

webhelp.search.ranking

If this parameter is set to false then the 5-star rating mechanism is no longer included in the search results that are displayed on the Search tab (default setting is true).

webhelp.skin.css

Path to a CSS file that sets the style theme in the output WebHelp pages. It can be one of the predefined skin CSS from the OXYGEN_INSTALL_DIR\frameworks\docbook\xsl\com.oxygenxml.webhelp\predefined-skins directory, or it can be a custom skin CSS generated with the Oxygen Skin Builder web application.

Related information
WebHelp Classic Output on page 763
WebHelp Classic With Feedback Output on page 765
WebHelp Classic Mobile System on page 963
Customizing WebHelp Classic Systems on page 941
Customizing WebHelp Classic Mobile Systems on page 963

DocBook to PDF Output Customization

When the default layout and output of the DocBook to PDF transformation needs to be customized, follow these steps:

You should start from a copy of the file

```
[OXYGEN_INSTALL_DIR]/frameworks/docbook/xsl/fo/titlepage.templates.xml
```

and customize it. The instructions for the spec file can be found here.

An example of spec file:

```
<t:titlepage-content t:side="recto">
 <mediaobject/>
 <title
   t:named-template="book.verso.title"
   font-size="&hsize2;"
   font-weight="bold"
   font-family="{$title.font.family}"/>
 <corpauthor/>
...
</t:titlepage-content>
```

2. Generate a new XSLT stylesheet from the title spec file from the previous step.
   Apply `[OXYGEN_INSTALL_DIR]/frameworks/docbook/xsl/template/titlepage.xsl` to the title spec file. The result is an XSLT stylesheet (for example, `mytitlepages.xsl`).

3. Import `mytitlepages.xsl` in a DocBook customization layer.
   The customization layer is the stylesheet that will be applied to the XML document. The `mytitlepages.xsl` should be imported with an element like this:

```
<xsl:import href="dir-name/mytitlepages.xsl"/>
```

4. Insert a logo image in the XML document.
   The path to the logo image must be inserted in the `book/info/mediaobject` element of the XML document.

5. Apply the customization layer to the XML document.
   A quick way is to duplicate the transformation scenario DocBook PDF that is included with Oxygen XML Editor and set the customization layer in the XSL URL property of the scenario.

Related information

DocBook to EPUB Transformation

The EPUB specification recommends the use of OpenType fonts (recognized by their `.otf` file extension) when possible. To use a specific font, follow these steps:

1. Declare it in your CSS file, as in the following example:

   ```
   @font-face {
     font-family: "MyFont";
     font-weight: bold;
     font-style: normal;
     src: url(fonts/MyFont.otf);
   }
   ```

2. In the CSS, specify where this font is used. To set it as default for h1 elements, use the `font-family` rule, as in the following example:

   ```
   h1 {
     font-size:20pt;
     margin-bottom:10px;
     font-weight: bold;
     font-family: "MyFont";
     text-align: center;
   }
   ```

3. Open the Configure Transformation Scenario(s) dialog box, select the DocBook EPUB transformation scenario, and click Edit.

4. In the Parameters tab, set the `epub.embedded.fonts` parameter to `fonts/MyFont.otf`. If you need to provide more files, use commas to separate their file paths.

   **Note:** The `html.stylesheet` parameter allows you to include a custom CSS in the output EPUB.
5. Run the transformation scenario.

DocBook to DITA Transformation

Oxygen XML Editor includes a built-in transformation scenario that is designed to convert DocBook content to DITA. This transformation scenario is based upon a DITA Open Toolkit plugin that is available at sourceforge.net.

To convert a DocBook document to DITA, follow these steps:

1. Use one of the following two methods to begin the transformation process:
   - To apply the transformation scenario to a newly opened file, use theApply Transformation Scenario(s) (Ctrl + Shift + T (Command + Shift + T on OS X)) action from the toolbar or the Document > Transformation menu.
   - To customize the transformation or change the scenario that is associated with the document, use theConfigure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on OS X)) action from the toolbar or the Document > Transformation menu.

2. Select the DocBook to DITA transformation scenario in the DocBook 4 or DocBook 5 section.

3. Click theApply associated button to run the transformation.

   **Step Result:** The transformation will convert as many of the DocBook elements into equivalent DITA elements as it can recognize in its mapping process. For elements that cannot be mapped, the transformation will insert XML comments so that you can see which elements could not be converted.

4. Adjust the resulting DITA composite to suit your needs. You may have to remove comments, fix validation errors, adjust certain attributes, or split the content into individual topics.

Inserting an ol ink in DocBook Documents

The **ol ink** element is used for linking to resources outside the current DocBook document. The **targetdoc** attribute is used for the document ID that contains the target element and the **targetptr** attribute for the ID of the target element (the value of an id or xml:id attribute). The combination of those two attributes provides a unique identifier to locate cross references.

For example, a Mail Administrator Guide with the document ID MailAdminGuide might contain a chapter about user accounts, like this:

```xml
<chapter id="user_accounts">
<title>Administering User Accounts</title>
<para>blah blah</para>
</chapter>
```

You can form a cross reference to that chapter by adding an **ol ink**, as in the following example:

```xml
<olink targetdoc="MailAdminGuide" targetptr="user_accounts">user accounts</olink>
```

You may need to update your

```xml
<olink targetdoc="MailAdminGuide" targetptr="user_accounts">user accounts</olink>
```

when you get a new machine.

To use an **ol ink** to create links between documents, follow these steps:

1. Decide which documents are to be included in the domain for cross referencing.
   A unique ID must be assigned to each document that will be referenced with an **ol ink**. It is usually added as an id (or xml:id for DocBook5) attribute to the root element of the document.

2. Decide on your output hierarchy.
   For creating links between documents, the relative locations of the output documents must be known. Before going further you must decide the names and locations of the output directories for all the documents from the domain. Each directory will be represented by an element: `<dir name="directory_name">`, in the target database document.

3. Create the target database document.
   Each collection of documents has a master target database document that is used to resolve all **ol inks** from that collection. The target database document is an XML file that is created once. It provides a framework that pulls in the target data for each document. The database document is static and all the document data is pulled in dynamically.
The following is an example of a target database document. It structures a collection of documents in a sitemap element that provides the relative locations of the outputs (HTML in this example). Then it pulls in the individual target data using system entity references to target data files that will be created in the next step.

```xml
<?xml version="1.0" encoding="utf-8"?>
<!DOCTYPE targetset [ 
<!ENTITY ugtargets SYSTEM "file:///doc/userguide/target.db"> 
<!ENTITY agtargets SYSTEM "file:///doc/adminguide/target.db"> 
<!ENTITY reftargets SYSTEM "file:///doc/man/target.db"> ]>
<targetset>
<targetsetinfo>
Description of this target database document, which is for the examples in olink doc.
</targetsetinfo>
<!-- Site map for generating relative paths between documents -->
<sitemap>
<dir name="documentation">
<dir name="guides">
<document targetdoc="MailUserGuide" baseuri="userguide.html">
&amp;ugtargets;
</document>
</dir>
</dir>
<dir name="mailadmin">
<document targetdoc="MailAdminGuide">
&amp;agtargets;
</document>
</dir>
</dir>
<dir name="reference">
<dir name="mailref">
<document targetdoc="MailReference">
&amp;reftargets;
</document>
</dir>
</dir>
</dir>
</sitemap>
</targetset>

4. Generate the target data files by executing a DocBook transformation scenario.

Before applying the transformation, you need to edit the transformation scenario, go to the Parameters tab, and make sure the value of the collect.xref.targets parameter is set to yes. The default name of a target data file is target.db, but it can be changed by setting an absolute file path in the targets.filename parameter.

An example of a target.db file:

```xml
<element book href="#MailAdminGuide" number="1" targetptr="user_accounts">
<ttl>Administering User Accounts</ttl>
<xreftext>How to administer user accounts</xreftext>
<element part href="#d5e4" number="1">
<ttl>First Part</ttl>
<xreftext>Part I, "First Part"</xreftext>
<element chapter href="#d5e6" number="1">
<ttl>Chapter Titles</ttl>
<xreftext>Chapter 1, Chapter Title</xreftext>
<element sect1 href="#src_chapter" number="1" targetptr="src_chapter">
<ttl>Section Title</ttl>
<xreftext>xreflabel_here</xreftext>
</div>
</div>
</div>
</div>
```

When editing a DocBook XML document in Author mode, the Insert OLink action is available in the Link drop-down menu from the toolbar. This action opens the Insert OLink dialog box that allows you to select the target of an olink from the list of all possible targets from a specified target database document (specified in the Targetset URL field). Once a Targetset URL is selected, the structure of the target documents is presented. For each target document (targetdoc), its content is displayed, allowing you to easily identify the appropriate targetptr. You can also use the search fields to quickly identify a target. If you already know the values for the targetdoc and targetptr attributes, you can insert them directly in the corresponding fields.

In the following image, the target database document is called target.xml, dbadmin is selected for the target document (targetdoc), and bldinit is selected as the value for the targetptr attribute. Notice that you can also add XREF text into the olink by using the xreftext field.
6. Process a DocBook transformation for each document to generate the output.
   
   a) Edit the transformation scenario and set the value of the `target.database.document` parameter to be the URL of the target database document.
   
   b) Apply the transformation scenario.

**DocBook Targetset Document Type**

DocBook Targetset documents are used to resolve cross references with the DocBook OLink.

**File Definition**

A file is considered to be a Targetset when the root name is `targetset`.

**Default Document Templates**

A default DocBook Targetset - Map document template is available when creating new documents from templates. The default template for DocBook Targetset documents is located in the `\[OXYGEN_INSTALL_DIR\]/frameworks/docbook/templates/Targetset` folder.

**Default Schema**

The default schema, `targetdatabase.dtd`, for this type of document is stored in `\[OXYGEN_INSTALL_DIR\]/frameworks/docbook/xsl/common/`. 
DITA Topics Document Type

The Darwin Information Typing Architecture (DITA) is an XML-based architecture for authoring, producing, and delivering technical information. It divides content into small, self-contained topics that you can reuse in various deliverables. The extensibility of DITA permits organizations to define specific information structures while still using standard tools to work with them. DITA content is created as topics, each an individual XML file. Typically, each topic has a defined primary objective and structure, and DITA also includes several specialized topic types (task, concept, reference, glossary entry).

File Definition

A file is considered to be a DITA topic document when one of the following conditions are true:

- The root element name is one of the following: concept, task, reference, dita, or topic.
- The PUBLIC ID of the document is a PUBLIC ID for the elements listed above.
- The root element of the file has an attribute named DITAArchVersion for the “http://dita.oasis-open.org/architecture/2005/” namespace. This enhanced case of matching is only applied when the Enable DTD/XML Schema processing in document type detection option is enabled from the Document Type Association preferences page.

Default Document Templates

There are a variety of default DITA topic templates available when creating new documents from templates, including Concept, Gossentry, Reference, Task, Topic, and many more.

The default templates for DITA topic documents are located in the [OXYGEN_INSTALL_DIR]/frameworks/dita/templates/topic folder.

Default Schema

Default schemas that are used if one is not detected in the DITA documents are stored in the various folders inside DITA_OT_DIR/dtd/ or DITA_OT_DIR/schema/.

Default CSS

The default CSS files used for rendering DITA content in Author mode are stored in the various folders inside: [OXYGEN_INSTALL_DIR]/frameworks/dita/css/.

By default, these default CSS files are merged with any that are specified in the document. For more information, see Selecting and Combining Multiple CSS Styles on page 1197.

Default XML Catalogs

The default catalogs for the DITA topic document type are as follows:

- DITA_OT_DIR/catalog-dita.xml
- [OXYGEN_INSTALL_DIR]/frameworks/dita/catalog.xml
- [OXYGEN_INSTALL_DIR]/frameworks/dita/plugin/catalog.xml
- [OXYGEN_INSTALL_DIR]/frameworks/dita/styleguide/catalog.xml

Editing XML Documents in Author Mode on page 313
**DITA Author Mode Actions**

A variety of actions are available in the DITA framework that can be added to the DITA menu, the Author Custom Actions toolbar, the contextual menu, and the Content Completion Assistant.

**DITA Toolbar Actions**

The following default actions are readily available on the DITA (Author Custom Actions) toolbar when editing in Author mode (by default, most of them are also available in the DITA menu and in various submenus of the contextual menu):

- **Bold**
  
  Surrounds the selected text with a `<b>` tag. You can use this action on multiple non-contiguous selections.

- **Italic**
  
  Surrounds the selected text with an `<i>` tag. You can use this action on multiple non-contiguous selections.

- **Underline**
  
  Surrounds the selected text with a `<u>` tag. You can use this action on multiple non-contiguous selections.

- **Link Actions Drop-Down Menu**

  The following link actions are available from this menu:

  - **Cross Reference**
    
    Opens the **Cross Reference (xref) dialog box** that allows you to insert a link to a target resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. Once the target resource has been selected, you can also target specific elements within that resource. For more information, see [Linking in DITA Topics](#) on page 1581.

  - **File Reference**
    
    Opens the **File Reference dialog box** that allows you to insert a link to a target file resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. For more information, see [Linking in DITA Topics](#) on page 1581.

  - **Web Link**
    
    Opens the **Web Link dialog box** that allows you to insert a link to a target web-related resource at the current location within a document. The target resource can be a URL or a key that is already defined in your DITA map structure. For more information, see [Linking in DITA Topics](#) on page 1581.

  - **Related Link to Topic**
    
    Opens the **Cross Reference (xref) dialog box** that allows you to insert a link to a target resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. Once the target resource has been selected, you can also target specific elements within that resource. If a related links section does not already exist, this action creates one. For more information, see [Linking in DITA Topics](#) on page 1581.

  - **Related Link to File**
    
    Opens the **File Reference dialog box** that allows you to insert a link to a target file resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. If a related links section does not already exist, this action creates one. For more information, see [Linking in DITA Topics](#) on page 1581.

  - **Related Link to Web Page**
    
    Opens the **Web Link dialog box** that allows you to insert a link to a target web-related resource in a related links section at the bottom of the current document. The target resource can be a URL or a key that is already defined in your DITA map structure. If a related links section does not already exist, this action creates one. For more information, see [Linking in DITA Topics](#) on page 1581.

  - **Insert Image**
    
    Opens the **Insert Image dialog box** that allows you to configure the properties of an image to be inserted into a DITA document at the cursor position.
- **Insert Section Drop-Down Menu**

The following insert actions are available from this menu:

- **Insert Section**
  Inserts a new section element in the document, depending on the current context.

- **Insert Concept**
  Inserts a new concept element, depending on the current context. Concepts provide background information that users must know before they can successfully work with a product or interface.

- **Insert Task**
  Inserts a new task element, depending on the current context. Tasks are the main building blocks for task-oriented user assistance. They generally provide step-by-step instructions that will enable a user to perform a task.

- **Insert Topic**
  Inserts a new topic element, depending on the current context. Topics are the basic units of DITA content and are usually organized around a single subject.

- **Insert Reference**
  Inserts a new reference element, depending on the current context. A reference is a top-level container for a reference topic.

- **Insert Paragraph**
  Inserts a new paragraph at current cursor position.

- **Reuse Content**
  This action provides a mechanism for reusing content fragments. It opens the Reuse Content dialog box that allows you to insert several types of references to reusable content at the cursor position. The types of references that you can insert using this dialog box include content references (conref), content key references (conkeyref), or key references to metadata (keyref).

- **Insert step or list item**
  Inserts a new list or step item in the current list type.

- **Insert Unordered List**
  Inserts an unordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an unordered list.

- **Insert Ordered List**
  Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

- **Sort**
  Sorts cells or list items in a table.

- **Insert Table**
  Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content — text + markup — that is rendered inside a block element) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

  **Note:** If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that Only lists, paragraphs, or inline content can be converted to tables.

- **Insert Row Below**
  Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.
Delete Row(s)
Deletes the table row located at cursor position or multiple rows in a selection.

Insert Column After
Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

Delete Column(s)
Deletes the table column located at cursor position or multiple columns in a selection.

Table Properties
Opens the Table properties dialog box that allows you to configure properties of a table (such as frame borders).

Join Cells
Joins the content of the selected cells (both horizontally and vertically).

Split Cell
Splits the cell at the cursor location. If Oxygen XML Editor detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

DITA Menu Actions
In addition to the DITA toolbar actions, the following default actions are available in the DITA menu when editing in Author mode:

Reuse Content
This action provides a mechanism for reusing content fragments. It opens the Reuse Content dialog box that allows you to insert several types of references to reusable content at the cursor position. The types of references that you can insert using this dialog box include content references (conref), content key references (conkeyref), or key references to metadata (keyref).

Push Current Element
Opens the Push current element dialog box that allows content from a source topic to be inserted into another topic without any special coding in the topic where the content will be re-used.

Edit Content Reference
This action is available for elements with a conref or conkeyref attribute. It opens the Edit Content Reference dialog box that allows you to edit the source location (or key) and source element of a content reference (or content key reference), and the reference details (conref/conkeyref and conrefend attributes). For more information, see Reuse Content Dialog Box on page 1569.

Replace Reference with content
Replaces the referenced fragment (conref or conkeyref) at the cursor position with its content. This action is useful if you want to make changes to the content in the currently edited document without changing the referenced fragment in its source location.

Remove Content Reference
Removes the content reference (conref or conkeyref) inside the element at the cursor position.

Create Reusable Component
Creates a reusable component from the selected fragment of text. For more information, see Creating a Reusable Content Component on page 1576.

Insert Reusable Component
Inserts a reusable component at cursor location. For more information, see Inserting a Reusable Content Component on page 1577.

Paste special submenu
This submenu includes the following special paste actions that are specific to the DITA framework:
Paste as content reference

Inserts a content reference (a DITA element with a `conref` attribute) to the DITA XML element from the clipboard. An entire DITA XML element with an ID attribute must be present in the clipboard when the action is invoked. The `conref` attribute will point to this ID value.

Paste as content key reference

Allows you to indirectly reference content using the `conkeyref` attribute. When the DITA content is processed, the key references are resolved using key definitions from DITA maps. To use this action, you must first do the following:

1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
2. In the DITA Maps Manager view, make sure that the Root map combo box points to the correct map that stores the keys.
3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the DITA Maps Manager, select Edit Properties, and enter a value in the Keys field.

Paste as link

Inserts a link element or an `xref` (depending on the location of the paste operation) that points to the DITA XML element from the clipboard. An entire DITA XML element with an ID attribute must be present in the clipboard when the action is invoked. The `href` attribute of `link:href` will point to this ID value.

Paste as link (keyref)

Inserts a link to the element that you want to reference. To use this action, you must first do the following:

1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
2. In the DITA Maps Manager view, make sure that the Root map combo box points to the correct map that stores the keys.
3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the DITA Maps Manager, select Edit Properties, and enter a value in the Keys field.

Table submenu

In addition to the table actions available on the toolbar, the following actions are available in this submenu:

- **Insert Row Above**
  
  Inserts a new table row with empty cells above the current row. This action is available when the cursor is positioned inside a table.

- **Insert Rows**
  
  Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (Above or Below the current row).

- **Insert Column Before**
  
  Inserts a column before the current one.

- **Insert Columns**
  
  Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (Above or Below the current column).

- **Insert Cell**
  
  Inserts a new empty cell depending on the current context. If the cursor is positioned between two cells, Oxygen XML Editor a new cell at cursor position. If the cursor is inside a cell, the new cell is created after the current cell.

- **Insert > Σ Insert Equation**
  
  Opens the XML Fragment Editor that allows you to insert and `edit MathML notations`.

- **ID Options**
  
  Opens the ID Options dialog box that allows you to configure options for generating IDs in Author mode. The dialog box includes the following:
ID Pattern

The pattern for the ID values that will be generated. This text field can be customized using constant strings or any of the Oxygen XML Editor Editor Variables.

Element name or class value to generate ID for

The elements for which ID values will be generated, specified using class attribute values. To customize the list, use the Add, Edit, or Remove buttons.

Auto generate IDs for elements

If enabled, Oxygen XML Editor will automatically generate unique IDs for the elements listed in this dialog box when they are created in Author mode.

Remove IDs when copying content in the same document

When copying and pasting content in the same document, this option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs. To retain the element IDs, disable this option.

Note: This option does not have an effect on content that is cut and pasted.

Generate IDs

Oxygen XML Editor generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the ID Options dialog box that are found in the current selection.

Note: The Generate IDs action does not overwrite existing ID values. It only affects elements that do not already have an id attribute.

Browse DITA Style Guide

Opens the DITA Style Guide Best Practices for Authors in your browser and displays a topic that is relevant to the element at the cursor position. When editing DITA documents, this action is available in the contextual menu of the editing area (under the About Element sub-menu), in the DITA menu, and in some of the documentation tips that are displayed by the Content Completion Assistant.

Refresh References

You can use this action to manually trigger a refresh and update of all referenced resources.

Tags display mode Submenu

- Full Tags with Attributes
  
  Displays full tag names with attributes for both block level and in-line level elements.

- Full Tags
  
  Displays full tag names without attributes for both block level and in-line level elements.

- Block Tags
  
  Displays full tag names for block level elements and simple tags without names for in-line level elements.

- Inline Tags
  
  Displays full tag names for inline level elements, while block level elements are not displayed.

- Partial Tags
  
  Displays simple tags without names for in-line level elements, while block level elements are not displayed.

- No Tags
  
  No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

Configure Tags Display Mode

Use this option to go to the Author preferences page where you can configure the Tags Display Mode options.

Profiling/Conditional Text Submenu

- Edit Profiling Attributes
  
  Allows you to configure the profiling attributes and their values.
Show Profiling Colors and Styles
Select this option to turn on conditional styling.

Show Profiling Attributes
Select this option to turn on conditional text markers. They are displayed at the end of conditional text blocks, as a list of attribute name and their currently set values.

Show Excluded Content
When this option is enabled, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, disable this option.

List of all profiling condition sets that match the current document type
You can click a listed condition set to activate it.

Profiling Settings
Opens the profiling options preferences page, where you can manage profiling attributes and profiling conditions sets. You can also configure the profiling styles and colors options from the colors/styles preferences page and the attributes rendering preferences page.

DITA Contextual Menu Actions
In addition to many of the DITA toolbar actions and the general Author mode contextual menu actions, the following DITA framework-specific actions are also available in the contextual menu when editing in Author mode:

Paste special submenu
This submenu includes the following special paste actions that are specific to the DITA framework:

Paste as content reference
Inserts a content reference (a DITA element with a conref attribute) to the DITA XML element from the clipboard. An entire DITA XML element with an ID attribute must be present in the clipboard when the action is invoked. The conref attribute will point to this ID value.

Paste as content key reference
Allows you to indirectly reference content using the conkeyref attribute. When the DITA content is processed, the key references are resolved using key definitions from DITA maps. To use this action, you must first do the following:

1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
2. In the DITA Maps Manager view, make sure that the Root map combo box points to the correct map that stores the keys.
3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the DITA Maps Manager, select Edit Properties, and enter a value in the Keys field.

Paste as link
Inserts a link element or an xref (depending on the location of the paste operation) that points to the DITA XML element from the clipboard. An entire DITA XML element with an ID attribute must be present in the clipboard when the action is invoked. The href attribute of link/href will point to this ID value.

Paste as link (keyref)
Inserts a link to the element that you want to reference. To use this action, you must first do the following:

1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
2. In the DITA Maps Manager view, make sure that the Root map combo box points to the correct map that stores the keys.
3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the DITA Maps Manager, select Edit Properties, and enter a value in the Keys field.

Image Map Editor
This action is available in the contextual menu when it is invoked on an image. This action applies an image map to the current image (if one does not already exist) and opens the Image Map Editor dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.
Table Actions

The following table editing actions are available in the contextual menu when it is invoked on a table:

- **Insert Rows**
  Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (Above or Below the current row).

- **Delete Row(s)**
  Deletes the table row located at cursor position or multiple rows in a selection.

- **Insert Columns**
  Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (Above or Below the current column).

- **Delete Column(s)**
  Deletes the table column located at cursor position or multiple columns in a selection.

- **Join Cells**
  Joins the content of the selected cells (both horizontally and vertically).

- **Split Cell**
  Splits the cell at the cursor location. If Oxygen XML Editor detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

- **Sort**
  Sorts cells or list items in a table.

- **Table Properties**
  Opens the Table properties dialog box that allows you to configure properties of a table (such as frame borders).

- **Other Actions submenu**
  This submenu gives you access to all the usual contextual menu actions.

- **Insert > Insert Equation**
  Opens the XML Fragment Editor that allows you to insert and edit MathML notations.

Generate IDs

Oxygen XML Editor generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the ID Options dialog box that are found in the current selection.

  **Note:** The Generate IDs action does not overwrite existing ID values. It only affects elements that do not already have an id attribute.

Reuse submenu

This submenu includes the following actions in regards to reusing content in DITA:

- **Push Current Element**
  Opens the Push current element dialog box that allows content from a source topic to be inserted into another topic without any special coding in the topic where the content will be re-used.

- **Edit Content Reference**
  This action is available for elements with a conref or conkeyref attribute. It opens the Edit Content Reference dialog box that allows you to edit the source location (or key) and source element of a content reference (or content key reference), and the reference details (conref/conkeyref and conrefend attributes). For more information, see Reuse Content Dialog Box on page 1569.
Replace Reference with content
Replaces the referenced fragment (conref or conkeyref) at the cursor position with its content. This action is useful if you want to make changes to the content in the currently edited document without changing the referenced fragment in its source location.

Remove Content Reference
Removes the content reference (conref or conkeyref) inside the element at the cursor position.

Create Reusable Component
Creates a reusable component from the selected fragment of text. For more information, see Creating a Reusable Content Component on page 1576.

Insert Reusable Component
Inserts a reusable component at cursor location. For more information, see Inserting a Reusable Content Component on page 1577.

Search References (Ctrl + Shift + G)
Finds the references to the id attribute value for the element at the current cursor position, in all the topics contained in the current DITA map (opened in the DITA Maps Manager view). If no references are found for the current element, a dialog box will be displayed that offers you the option of searching for references to its ancestor elements.

Figure 441: Search References to Ancestors Dialog Box

Show Key Definition
Available for elements that have a conkeyref or keyref attribute set (or elements with an ancestor element that has a conkeyref or keyref attribute). It computes the key name and opens the DITA map that contains the definition of the key with the element that defines that key selected.

About Element submenu
This submenu includes the following actions:

Style Guide
Opens the DITA Style Guide Best Practices for Authors in your browser and displays a topic that is relevant to the element at the cursor position. When editing DITA documents, this action is available in the contextual menu of the editing area (under the About Element sub-menu), in the DITA menu, and in some of the documentation tips that are displayed by the Content Completion Assistant.

Browse reference manual
Opens a reference to the documentation of the XML element closest to the cursor position in a web browser.

Show Definition
Moves the cursor to the definition of the current element.

DITA Drag/Drop Actions
Dragging a file from the Project view or DITA Maps Manager view and dropping it into a DITA document that is edited in Author mode, creates a link to the dragged file (the xref DITA element with the href attribute) at the drop location. Dragging an image file from the default file system application (Windows Explorer on Windows or Finder on Mac OS X, for example) and dropping it into a DITA document inserts an image element (the image DITA element with the href attribute) at the drop location.

DITA Topic Transformation Scenarios
The following default transformation scenarios are available for individual DITA topics:
• **DITA XHTML** - Transforms a DITA topic to XHTML using DITA Open Toolkit.
• **DITA PDF** - Transforms a DITA topic to PDF using the DITA Open Toolkit and the Apache FOP engine.

**Related information**
- *Editing a Transformation Scenario* on page 871
- *Configure Transformation Scenario(s) Dialog Box* on page 872

**DITA Map Document Type**

DITA maps are documents that collect and organize references to DITA topics to indicate the relationships between the topics. They can be used as a container for topics used to transform a collection of content into a publication and they offer a sequence and structure to the topics. They can also serve as outlines or tables of contents for DITA deliverables and as build manifests for DITA projects. DITA maps allow scalable reuse of content across multiple contexts. Maps can reference topics or other maps, and can contain a variety of content types and metadata.

**File Definition**

A file is considered to be a DITA map document when one of the following conditions are true:

- The root element name is one of the following: map, bookmap.
- The public id of the document is `//OASIS//DTD DITA Map` or `//OASIS//DTD DITA BookMap`.
- The root element of the file has an attribute named `class` that contains the value `map/map` and a DITAArchVersion attribute from the `http://dita.oasis-open.org/architecture/2005/` namespace. This enhanced case of matching is only applied when the *Enable DTD/XML Schema processing in document type detection* option from the Document Type Association preferences page is enabled.

**Default Document Templates**

There are a variety of default DITA map templates available when creating new documents from templates, including Bookmap, Classification Map, Map, Subject Scheme, and more.

The default templates for DITA map documents are located in the `[OXYGEN_INSTALL_DIR]/frameworks/sita/templates/map` folder.

**Default Schema**

Default schemas that are used if one is not detected in the DITA map document are stored in the various folders inside `DITA_OT_DIR/DTD/` or `DITA_OT_DIR/schema/`.

**Default CSS**

The default CSS files used for rendering DITA content in Author mode are stored in the various folders inside: `[OXYGEN_INSTALL_DIR]/frameworks/dita/css/`.

By default, these default CSS files are merged with any that are specified in the document. For more information, see *Selecting and Combining Multiple CSS Styles* on page 1197.

**Default XML Catalogs**

The default catalogs for the DITA map document type are as follows:

- `[OXYGEN_INSTALL_DIR]/frameworks/dita/catalog.xml`
- `DITA_OT_DIR/catalog-dita.xml`

**Resources**

- *DITA Specifications*
- *DITA Style Guide Best Practices for Authors*
- *Oxygen Video Tutorial: DITA Maps Manager*

DITA Map Author Mode Actions

A variety of actions are available in the DITA Map framework that can be added to the DITA menu, the Author Custom Actions toolbar, the contextual menu, and the Content Completion Assistant.

DITA Map Toolbar and Menu Actions

When a DITA map is opened in Author mode, the following default actions are available on the DITA Map Author Custom Actions toolbar (by default, they are also available in the DITA menu and in various submenus of the contextual menu):

- **Insert New Topic**
  Opens a New DITA topic dialog box that allows you to create a new topic and inserts a reference to it at the cursor position.

- **Insert Topic Reference**
  Opens the Insert Reference dialog box that allows you to insert and configure a reference to a topic at the cursor position.

- **Reuse Content**
  Opens the Reuse Content dialog box that allows you to insert and configure a content reference (conref), or a content key reference (conkeyref) at the cursor position.

- **Insert Topic Heading**
  Opens the Insert Reference dialog box that allows you to insert a topic heading at the cursor position.

- **Insert Topic Group**
  Opens the Insert Reference dialog box that allows you to insert a topic group at the cursor position.

- **Insert Relationship Table**
  Opens a dialog box that allows you to configure the relationship table to be inserted. The dialog box allows you to configure the number of rows and columns of the relationship table, if the header will be generated and if the title will be added.

- **Relationship Table Properties**
  Allows you to change the properties of rows in relationship tables.

- **Insert Relationship Row**
  Inserts a new table row with empty cells. The action is available when the cursor position is inside a table.

- **Insert Relationship Column**
  Inserts a new table column with empty cells after the current column. The action is available when the cursor position is inside a table.

- **Delete Relationship Column**
  Deletes the table column where the cursor is located.

- **Delete Relationship Row**
  Deletes the table row where the cursor is located.

- **Move Up**
  Moves the selected node up one position on its same level.

- **Move Down**
  Moves the selected node down one position on its same level.

- **Promote (Alt + LeftArrow)**
  Moves the selected node up one level to the level of its parent node.

- **Demote (Alt + RightArrow)**
  Moves the selected node down one level to the level of its child nodes.
DITA Menu Actions

In addition, the following default actions are available in the DITA menu when editing a DITA map in Author mode:

Refresh References
You can use this action to manually trigger a refresh and update of all referenced resources.

Tags display mode Submenu

- Full Tags with Attributes
  Displays full tag names with attributes for both block level and in-line level elements.
- Full Tags
  Displays full tag names without attributes for both block level and in-line level elements.
- Block Tags
  Displays full tag names for block level elements and simple tags without names for in-line level elements.
- Inline Tags
  Displays full tag names for inline level elements, while block level elements are not displayed.
- Partial Tags
  Displays simple tags without names for in-line level elements, while block level elements are not displayed.
- No Tags
  No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

Configure Tags Display Mode
Use this option to go to the Author preferences page where you can configure the Tags Display Mode options.

Profiling/Conditional Text Submenu

- Edit Profiling Attributes
  Allows you to configure the profiling attributes and their values.
- Show Profiling Colors and Styles
  Select this option to turn on conditional styling.
- Show Profiling Attributes
  Select this option to turn on conditional text markers. They are displayed at the end of conditional text blocks, as a list of attribute name and their currently set values.
- Show Excluded Content
  When this option is enabled, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, disable this option.

List of all profiling condition sets that match the current document type
You can click a listed condition set to activate it.

- Profiling Settings
  Opens the profiling options preferences page, where you can manage profiling attributes and profiling conditions sets.
  You can also configure the profiling styles and colors options from the colors/styles preferences page and the attributes rendering preferences page.

ID Options

Opens the ID Options dialog box that allows you to configure options for generating IDs in Author mode. The dialog box includes the following:

ID Pattern
The pattern for the ID values that will be generated. This text field can be customized using constant strings or any of the Oxygen XML Editor Editor Variables.

Element name or class value to generate ID for
The elements for which ID values will be generated, specified using class attribute values. To customize the list, use the Add, Edit, or Remove buttons.
**Auto generate IDs for elements**

If enabled, Oxygen XML Editor will automatically generate unique IDs for the elements listed in this dialog box when they are created in **Author** mode.

**Remove IDs when copying content in the same document**

When copying and pasting content in the same document, this option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs. To retain the element IDs, disable this option.

**Note:** This option does not have an effect on content that is *cut* and *pasted*.

**Generate IDs**

Oxygen XML Editor generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the **ID Options** dialog box that are found in the current selection.

**Note:** The *Generate IDs* action does not overwrite existing ID values. It only affects elements that do not already have an *id* attribute.

**DITA Map Contextual Menu Actions**

In addition to many of the **DITA Map toolbar actions** and the **general Author mode contextual menu actions**, the following DITA map framework-specific actions are also available in the contextual menu when editing in **Author** mode:

**Edit Properties**

Opens the **Edit Properties** dialog box that allows you to configure the properties of a selected node. For more details about this dialog box, see **Edit Properties Dialog Box** on page 1532.

**Generate IDs**

Oxygen XML Editor generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the **ID Options** dialog box that are found in the current selection.

**Note:** The *Generate IDs* action does not overwrite existing ID values. It only affects elements that do not already have an *id* attribute.

**Search References**

Finds the references to the *href* or *keys* attribute value of the topic/map reference element at the current cursor position, in all the topics from the current DITA map (opened in the **DITA Maps Manager** view). The current topic/map reference element must have an *href* or *keys* attribute defined to complete the search.

**Show Key Definition**

Available for elements that have a *conkeyref* or *keyref* attribute set (or elements with an ancestor element that has a *conkeyref* or *keyref* attribute). It computes the key name and opens the DITA map that contains the definition of the key with the element that defines that key selected.

**DITA Map Drag/Drop Actions**

Dragging a file from the **Project view** or **DITA Maps Manager view** and dropping it into a DITA map document that is edited in **Author** mode creates a link to the dragged file (a *topicref* element, *chapter*, *part*, etc.) at the drop location.

**Open Topic from DITA Map in Author Mode**

When a DITA map is opened in **Author** mode, you can click the 🌐 icon to the left of a topic to open that particular topic in the editor.
DITA Map Transformation Scenarios

The following types of transformations scenarios are available for DITA maps:

- **Predefined transformation scenarios** allow you to transform a DITA map to a variety of outputs, such as PDF, ODF, XHTML, WebHelp, EPUB, and CHM files.

- **Run DITA-OT Integrator** - Use this transformation scenario if you want to integrate a DITA-OT plugin. This scenario runs an Ant task that integrates all the plugins from the DITA-OT/plugins directory.

- **DITA Map Metrics Report** - Use this type of transformation scenario if you want to generate a DITA map statistics report. They contain information such as:
  - The number of processed maps and topics.
  - Content reuse percentage.
  - Number of elements, attributes, words, and characters used in the entire DITA map structure.
  - DITA conditional processing attributes used in the DITA maps.
  - Words count.
  - Information types such as number of containing maps, bookmaps, or topics.

DITA Map to WebHelp Output

DITA maps can be transformed into a variety of WebHelp systems designed to suit your specific needs. This section contains the procedures for obtaining the output for the variants of the WebHelp system.

**Related information**

*WebHelp System Output* on page 885

*WebHelp Responsive Output*

To publish a DITA map as a *WebHelp Responsive* system, follow these steps:

1. Select the Configure Transformation Scenario(s) action from the DITA Maps Manager toolbar.
2. Select the DITA Map WebHelp Responsive scenario from the DITA Map section.
3. If you want to configure the transformation, click the Edit button.

**Step Result:** This opens an Edit scenario configuration dialog box that allows you to configure various options in the following tabs:

- **Templates Tab** - This tab contains a set of predefined skins that you can use for the layout of your WebHelp system output.
- **Parameters Tab** - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the Parameters section below for details about the most commonly used parameters for WebHelp Responsive transformations.
- **Filters Tab** - This tab allows you to filter certain content elements from the generated output.
- **Advanced Tab** - This tab allows you to specify some advanced options for the transformation scenario.
- **Output Tab** - This tab allows you to configure options that are related to the location where the output is generated.

4. Click Apply associated to process the transformation.

When the DITA Map WebHelp Responsive transformation is complete, the output is automatically opened in your default browser.

**Parameters for Customizing WebHelp Responsive Output**

To customize a transformation scenario, you can edit various parameters, including the following most commonly used ones:

**args.default.language**

This parameter is used if the language is not detected in the DITA map. The default value is `en-us`.

---

Document Types (Frameworks) 757
clean.output

Deletes all files from the output folder before the transformation is performed (only no and yes values are valid and the default value is no).

fix.external.refs.com.oxygenxml (Only supported when the DITA OT transformation process is started from Oxygen XML Editor)

The DITA Open Toolkit usually has problems processing references that point to locations outside of the directory of the processed DITA map. This parameter is used to specify whether or not the application should try to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content. Allowed values: true or false (default).

use.stemming

Controls whether or not you want to include stemming search algorithms into the published output (default setting is false).

webhelp.custom.resources

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

webhelp.favicon

The file path that points to an image to be used as a favicon in the WebHelp output.

webhelp.reload.stylesheet

Set this parameter to true if you have out of memory problems when generating WebHelp. It will increase processing time but decrease the memory footprint. The default value is false.

webhelp.search.custom.excludes.file

The path of the file that contains name patterns for HTML files that should not be indexed by the WebHelp search engine. Each exclude pattern must be on a new line. The patterns are considered to be relative to the output directory, and they accept wildcards such as ' * ' (matches zero or more characters) or ' ? ' (matches one character). For more information about the patterns, see https://ant.apache.org/manual/dirtasks.html#patterns.

webhelp.search.japanese.dictionary

The file path of the dictionary that will be used by the Kuromoji morphological engine that Oxygen XML Editor uses for indexing Japanese content in the WebHelp pages.

webhelp.search.ranking

If this parameter is set to false then the 5-star rating mechanism is no longer included in the search results that are displayed on the Search tab (default setting is true).

webhelp.show.changes.and.comments

When set to yes, user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is no.

webhelp.sitemap.base.url

Base URL for all the loc elements in the generated sitemap.xml file. The value of a loc element is computed as the relative file path from the href attribute of a topicref element from the DITA map, appended to this base URL value. The loc element is mandatory in sitemap.xml. If you leave this parameter set to its default empty value, then the sitemap.xml file is not generated.

webhelp.sitemap.change.frequency
