If you want to see the dependencies of a schema, select the desired schema in the Navigator view and choose Resource Dependencies from the contextual menu.

Figure 497: Resource Hierarchy/Dependencies View - Dependencies for tblDecl.mod.rng

The following actions are available in the Resource Hierarchy/Dependencies view:

- **Refresh**
  
  Refreshes the Hierarchy/Dependencies structure.

- **Stop**
Stops the hierarchy/dependencies computing.

**Show Hierarchy**

Allows you to choose a resource to compute the hierarchy structure.

**Show Dependencies**

Allows you to choose a resource to compute the dependencies structure.

**Configure**

Allows you to configure a scope to compute the dependencies structure. There is also an option for automatically using the defined scope for future operations.

**History**

Provides access to the list of previously computed dependencies. Use the `Clear history` button to remove all items from this list.

The contextual menu contains the following actions:

**Open**

Opens the resource. You can also double-click a resource in the Hierarchy/Dependencies structure to open it.

**Copy location**

Copies the location of the resource.

**Move resource**

Moves the selected resource.

**Rename resource**

Renames the selected resource.

**Show Resource Hierarchy**

Shows the hierarchy for the selected resource.

**Show Resource Dependencies**

Shows the dependencies for the selected resource.

**Add to Master Files**

Adds the currently selected resource in the Master Files directory (page 581).

**Expand All**

Expands all the children of the selected resource from the Hierarchy/Dependencies structure.

**Collapse All**
Collapses all children of the selected resource from the Hierarchy/Dependencies structure.

**Tip:** When a recursive reference is encountered in the Hierarchy view, the reference is marked with a special icon 🗡.

**Note:** The Move resource or Rename resource actions give you the option to update the references to the resource (page 1130).

Moving/Renaming RNG Resources

You can move and rename a resource presented in the Resource/Hierarchy Dependencies view, using the Rename resource and Move resource refactoring actions from the contextual menu.

When you select the Rename action in the contextual menu of the Resource/Hierarchy Dependencies view, the Rename resource dialog box is displayed. The following fields are available:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references** - Select this option to update the references to the resource you are renaming.

When you select the Move action from the contextual menu of the Resource/Hierarchy Dependencies view, the Move resource dialog box is displayed. The following fields are available:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - Select this option to update the references to the resource you are moving, in accordance with the new location and name.

If the Update references of the moved resource(s) option is selected, a Preview option (which opens the Preview dialog box) is available for both actions. The Preview dialog box presents a list with the resources that are updated.

**Note:** Updating the references of a resource that is resolved through a catalog is not supported. Also, the update references operation is not supported if the path to the renamed or moved resource contains entities.

Related Information:

- Search and Refactor Operations Scope (page 904)
Relax NG Schema Component Dependencies View

The Component Dependencies view allows you to see the dependencies for a selected component. This is helpful if you want to see where components are used in the entire hierarchy. For example, if you want to find all the references where a given component is used.

If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

To see the dependencies of a RelaxNG component:

1. Right-click the desired component in the editor or Outline view.
2. Select the Component Dependencies action from the contextual menu.

The action is available for all named defines.

If a component contains multiple references, a small table is displayed at the bottom of the view that contains all the references. When a recursive reference is encountered, it is marked with a special icon.

Figure 498: Component Dependencies View - Hierarchy for xhtml.rng

The Component Dependencies view includes the following toolbar actions:

- **Refresh**
  
  Refreshes the dependencies structure.

- **Stop**
Stops the dependency computation.

Configure

Allows you to choose the search scope for computing the dependencies structure. This is helpful for making sure all imported/included resources are computed.

History

Allows you to select from a list of the most recently used dependency computations.

In addition, the following actions are available in the contextual menu:

Go to First Reference

Selects the first reference of the currently selected component in the dependencies tree.

Go to Component

Shows the definition of the currently selected component in the dependencies tree.

Related Information:

- Search and Refactor Operations Scope (page 904)

Searching and Refactoring Actions in RNG Schemas

Search Actions

The following search actions can be applied on named *defines* and are available from the Search submenu in the contextual menu of the current editor:

Search References

Searches all references of the item found at current cursor position in the defined scope, if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box is displayed and you have the possibility to define another search scope.

Search References in

Searches all references of the item found at current cursor position in the file or files that you specify when define a scope in the Search References dialog box.

Search Declarations
Search Declarations in

Searches all declarations of the item found at current cursor position in the file or files that you specify when you define a scope for the search operation.

Search Occurrences in File

Searches all occurrences of the item at the cursor position in the currently edited file.

The following action is available from the XSL menu:

Go to Definition

Moves the cursor to the definition of the current element in the Relax NG (full syntax) schema.

Note: You can also use the Ctrl + Single-Click (Command + Single-Click on OS X) shortcut on a reference to display its definition.

Refactoring Actions

The following refactoring actions can be applied on named defines and are available from the Refactoring submenu in the contextual menu of the current editor:

Rename Component

Allows you to rename the current component (in-place). The component and all its references in the document are highlighted with a thin border and the changes you make to the component at the cursor position are updated in real time to all occurrences of the component. To exit the in-place editing, press the Esc or Enter key on your keyboard.

Rename Component in

Opens a dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the Preview button, you can view the files to be affected by the action.

Figure 499: Rename Identity Constraint Dialog Box
RNG Quick Assist Support

The Quick Assist support (page 2710) improves the development work flow, offering fast access to the most commonly used actions when you edit schema documents.

The Quick Assist feature (page 2710) is activated automatically when the cursor is positioned over the name of a component. It is accessible via a yellow bulb icon (✓) placed at the current line in the stripe on the left side of the editor. Also, you can invoke the quick assist menu by using the Ctrl + 1 (Meta 1 on Mac OS X) keyboard shortcuts.

Figure 500: RNG Quick Assist Support

The Quick Assist support offers direct access to the following actions:

- Rename Component in
  Renames the component and all its dependencies.

- Search Declarations
Searches the declaration of the component in a predefined scope. It is available only when the context represents a component name reference.

**Search References**

Searches all references of the component in a predefined scope.

**Component Dependencies**

Searches the component dependencies in a predefined scope.

**Change Scope**

Configures the scope that will be used for future search or refactor operations.

**Rename Component**

Allows you to rename the current component in-place.

**Search Occurrences**

Searches all occurrences of the component within the current file.

**Configuring a Custom Datatype Library for a RELAX NG Schema**

A RELAX NG schema can declare a custom datatype library for the values of elements found in XML document instances. The datatype library must be developed in Java and it must implement the interface specified on the www.thaiopensource.com website.

The JAR *(page 2707)* file containing the custom library and any other dependent JAR file must be added to the classpath of the application, that is the JAR files must be added to the folder `{ECLIPSE-INSTALL-DIR}/lib` and a line `<library name="lib/custom-library.jar"/>` must be added for each JAR file to the file `{ECLIPSE-INSTALL-DIR}/plugin.xml` in the `<runtime>` element.
To load the custom library, restart the Eclipse platform.

**Editing NVDL Schemas**

Some complex XML documents are composed by combining elements and attributes from namespaces. Furthermore, the schemas that define these namespaces are not even developed in the same schema language. In such cases, it is difficult to specify in the document all the schemas that must be taken into account for validation of the XML document or for content completion. An NVDL (Namespace Validation Definition Language) schema can be used. This schema allows the application to combine and interleave multiple schemas of different types (W3C XML Schema, RELAX NG schema, Schematron schema) in the same XML document.

Oxygen XML Editor plugin offers support for editing NVDL schema files in the following editing modes:

- **Text editing mode** *(page 1049)* - Allows you to edit NVDL schema files in a source editing mode, along with a schema design pane with two tabs that offer a **Full Model View** *(page 1171)* and **Logical Model View** *(page 1172).*
- **Grid editing mode** *(page 292)* - Displays NVDL schema files in a structured spreadsheet-like grid.
- **Author editing mode** - The visual **Author** mode is also available for Relax NG schema files, presenting them in a compact and easy to understand representation.

For information about applying and detecting schemas, see **Associating a Schema to XML Documents** *(page 887).*

**Related Information:**

- **Associating a Schema to XML Documents** *(page 887)*

---

**NVDL Schema Diagram**

This section explains how to use the graphical diagram of a NVDL schema.

**Introduction to NVDL Schema Diagram Editor**

Oxygen XML Editor plugin provides a simple, expressive, and easy-to-read schema diagram editor for NVDL schemas.
With this new feature you can easily develop complex schemas, print them on multiple pages or save them as JPEG, PNG, and BMP images. It helps both schema authors in developing the schema and content authors that are using the schema to understand it.

Oxygen XML Editor plugin is the only XML Editor to provide a side by side source and diagram presentation and have them real-time synchronized:

- The changes you make in the Editor are immediately visible in the Diagram (no background parsing).
- Changing the selected element in the diagram, selects the underlying code in the source editor.

**Full Model View**

When you create a schema document or open an existing one, the editor panel is divided in two sections: one containing the schema diagram and the second the source code. The diagram view has two tabbed panes offering a **Full Model View** and a **Logical Model View** (page 1172).

---

**Figure 501: NVDL Schema Editor - Full Model View**

![NVDL Schema Editor - Full Model View](image)
The **Full Model View** renders all the NVDL elements with intuitive icons. This representation coupled with the synchronization support makes the schema navigation easy.

Double-click any diagram component to edit its properties.

**Logical Model View**

The **Logical Model View** presents the compiled schema in the form of a single pattern. The patterns that form the element content are defined as top level patterns with generated names. These names are generated depending on the elements name class.

*Figure 502: Logical Model View for an NVDL Schema*

---

**Actions Available in the Diagram Editor**

The contextual menu offers the following actions:

- **Show only the selected component**
  
  Depending on its state (selected/not selected), either the selected component or all the diagram components are shown.

- **Show Annotations**
  
  Depending on its state (selected/not selected), the documentation nodes are shown or hidden.

- **Auto expand to references**
  
  This option controls how the schema diagram is automatically expanded. For instance, if you select it and then edit a top-level element or you trigger a diagram refresh, the diagram will be expanded until it reaches the referenced components. If this option is
left unchecked, only the first level of the diagram is expanded, showing the top-level elements. For large schemas, the editor disables this option automatically.

**Collapse Children**
Collapses the children of the selected view.

**Expand Children**
Expands the children of the selected view.

**Print Selection**
Prints the selected view.

**Save as Image**
Saves the current selection as image, in JPEG, BMP, SVG or PNG format.

**Refresh**
Refreshes the schema diagram according to the changes in your code (changes in your imported documents or those that are not reflected automatically in the compiled schema).

If the schema is not valid, you see only an error message in the [Logical Model View](page 1172) instead of the diagram.

**Validating NVDL Schema Documents**

By default, NVDL schema files are validated as you type. To change this, open the [Preferences](page 55) dialog box, go to **Editor > Document Checking**, and deselect the [Enable automatic validation](page 109).

To validate an NVDL schema document manually, select the Validate action from the Validation toolbar drop-down menu or the XML menu. When Oxygen XML Editor plugin validates an NVDL schema file, it expands all the included modules so the entire schema hierarchy is validated. The validation problems are highlighted directly in the editor, making it easy to locate and fix any issues.

**Related Information:**

• [Validating XML Documents Against a Schema](page 856)

**Content Completion in NVDL Schemas**
The intelligent **Content Completion Assistant (page 2704)** allows you to quickly identify and insert elements, attributes, and attribute values that are valid in the current editing context. All available proposals are listed in a pop-up menu displayed at the current cursor position.

The **Content Completion Assistant** is enabled by default. To disable it, open the Preferences dialog box (page 55), go to Editor > Content Completion, and deselect the Enable content completion option (page 101).

When active, the **Content Completion Assistant** displays a list of context-sensitive proposals valid at the current cursor position. It can be manually activated with the **Ctrl + Space (Command + Space on OS X)** shortcut. You can navigate through the list of proposals by using the **Up** and **Down** keys on your keyboard. For each selected item in the list, the **Content Completion Assistant** displays a documentation window. You can customize the size of the documentation window by dragging its top, right, and bottom borders.

To insert the selected proposal in **Text** mode, do one of the following:

- Press **Enter** or **Tab** to insert both the start and end tags and position the cursor inside the start tag in a position suitable for inserting attributes.
- Press **Ctrl + Enter (Command + Enter on OS X)** to insert both the start and end tags and positions the cursor between the tags in a position where you can start typing content.

If you are using the concept of **master files (page 2708)** to import/include modules, the **Content Completion Assistant** collects its components starting from the **master files**. The **master files** can be defined in the project or in the associated validation scenario. For more information about the **Master Files** support in Oxygen XML Editor plugin, see **Defining Master Files at Project Level (page 581)**.

The **Content Completion Assistant** also offers additional information for the element and attribute proposals in the form of schema annotations that is displayed in a tooltip.

**Figure 503: NVDL Content Completion Assistant**

Syntax Highlighting in NVDL Schemas
Oxygen XML Editor plugin supports syntax highlighting in **Text** mode to make it easier to read the semantics of the structured content by displaying each type of code in different colors and fonts.

To customize the colors or styles used for the syntax highlighting colors for NVDL schemas, follow these steps:

1. Open the **Preferences** dialog box *(page 55)*.
2. Go to **Editor > Syntax Highlight** *(page 149)*.
3. Select and expand the **XML** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.
5. Select the **XML** tab in the **Preview** pane to see the effects of your changes.

**Tip:** Oxygen XML Editor plugin also allows you to specify syntax highlighting colors for specific XML elements and attributes with specific namespace prefixes. This can be done in the **Editor > Syntax Highlight > Elements/Attributes by Prefix** preferences page *(page 150)*.

### Related Information:
- **Syntax Highlight Preferences** *(page 149)*

---

### NVDL Outline View

The **Outline** view for NVDL schemas presents a list with the named or anonymous rules that appear in the diagram and it allows for quick access to a rule by name. By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

### NVDL Schema Component Dependencies View

The **Component Dependencies** view allows you to see the dependencies for a selected component. This is helpful if you want to see where components are used in the entire hierarchy. For example, if you want to find all the references where a given component is used.

If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

To see the dependencies of an NVDL component:

1. Right-click the desired component in the editor or **Outline** view.
2. Select the **Component Dependencies** action from the contextual menu.

The action is available for all named modes.

If a component contains multiple references, a small table is displayed at the bottom of the view that contains all the references. When a recursive reference is encountered, it is marked with a special icon.

*Figure 504: Component Dependencies View - Hierarchy for test.nvdl*

The **Component Dependencies** view includes the following toolbar actions:

- **Refresh**
  
  Refreshes the dependencies structure.

- **Stop**
  
  Stops the dependency computation.

- **Configure**

  Allows you to choose the search scope for computing the dependencies structure. This is helpful for making sure all imported/included resources are computed.

- **History**

  Allows you to select from a list of the most recently used dependency computations.

In addition, the following actions are available in the contextual menu:

- **Go to First Reference**

  Selects the first reference of the currently selected component in the dependencies tree.

- **Go to Component**

  Shows the definition of the currently selected component in the dependencies tree.
Searching and Refactoring Actions in NVDL Schemas

**Search Actions**

The following search actions can be applied on `name`, `useMode`, and `startMode` attributes and are available from the Search submenu in the contextual menu of the current editor:

- **Search References**
  Searches all references of the item found at current cursor position in the defined scope, if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box is displayed and you have the possibility to define another search scope.

- **Search References in**
  Searches all references of the item found at current cursor position in the file or files that you specify when define a scope in the Search References dialog box.

- **Search Declarations**
  Searches all declarations of the item found at current cursor position in the defined scope if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box will be displayed and you have the possibility to define another search scope.

- **Search Declarations in**
  Searches all declarations of the item found at current cursor position in the file or files that you specify when you define a scope for the search operation.

- **Search Occurrences in File**
  Searches all occurrences of the item at the cursor position in the currently edited file.

The following action is available from the XSL menu:

- **Go to Definition**
  Moves the cursor to its definition in the schema used by the NVDL to validate it.

**Note:** You can also use the Ctrl + Single-Click (Command + Single-Click on OS X) shortcut on a reference to display its definition.
Refactoring Actions

The following refactoring actions can be applied on `name`, `useMode`, and `startMode` attributes and are available from the Refactoring submenu in the contextual menu of the current editor:

**Rename Component**

Allows you to rename the current component (in-place). The component and all its references in the document are highlighted with a thin border and the changes you make to the component at the cursor position are updated in real time to all occurrences of the component. To exit the in-place editing, press the Esc or Enter key on your keyboard.

![Rename Component in](image)

Opens a dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the Preview button, you can view the files to be affected by the action.

Figure 505: Rename Identity Constraint Dialog Box

Editing JSON Documents

Oxygen XML Editor plugin includes a document template to help you get started with JSON documents. The template is called JSON and it can be found in the New Document folder in the New from templates wizard (page 554).

This section explains the features of the Oxygen XML Editor plugin JSON Editor and how to use them.
For more information about JSON editing support, watch our video demonstration:

https://www.youtube.com/embed/wglkagwSDrU

Editing JSON Documents in Text Mode

When editing JSON documents in the **Text** editing mode, the usual text editing actions *(page 618)* are available, along with other editor-specific actions, including:

- Find/Replace *(page 584)*
- Drag and Drop *(page 626)*
- Validation *(page 1181)*
- Format and Indent (Pretty Print) *(page 645)*

**Note:** You can run XPath expressions on opened JSON documents, but in **Text** mode the XPath results cannot be mapped in the document. However, they can be mapped in the **Grid** editing mode. You can use the **Grid** button at the bottom of the editor panel to switch to that editing mode.

Navigating References in JSON Documents

When editing JSON documents (or JSON Schema), you can easily navigate JSON Pointer references and hyperlinks by using the **CTRL + Click** shortcut. Holding the **CTRL** key while hovering over a JSON Pointer references or hyperlink will change the reference to a clickable link.

# Related Information:

- Editing JSON Documents in Grid Mode *(page 1179)*

Editing JSON Documents in Grid Mode

Oxygen XML Editor plugin allows you to view and edit the JSON documents in the **Grid** mode *(page 292)*. The JSON is represented in **Grid** mode as a compound layout of nested tables in which the JSON data and structure can be easily manipulated with table-specific operations or drag and drop operations on the grid components.

*Figure 506: JSON Editor Grid Mode*
You can also use the following JSON-specific contextual actions:

**Array**

Useful when you want to convert a JSON value to array.

**Insert value before**

Inserts a value before the currently selected one.

**Insert value after**

Inserts a value after the currently selected one.

**Append value as child**

Appends a value as a child of the currently selected value.

You can customize the JSON grid appearance ([page 131](#)) according to your needs. For instance, you can change the font, the cell background, foreground, or even the colors from the table header gradients. The default width of the columns can also be changed.

Related Information:

- Grid Editing Mode ([page 292](#))
Validating JSON Documents

Oxygen XML Editor plugin includes a built-in JSON validator that is used to validate JSON documents against JSON Schemas, as well as a built-in JSON Well-Formedness validator (based on the free JAVA source code available on www.json.org).

For more information, see the following video demonstration:

https://www.youtube.com/embed/3JEL6nFUozQ

Checking Well-Formedness in JSON Documents

A Well-formed JSON document is a sequence of Unicode code points that strictly conforms to the JSON grammar defined by the JSON Data Interchange Syntax specification. By default, Oxygen XML Editor plugin automatically checks the document for Well-formedness as you type.

Check for Well-Formedness Manually

To manually check documents for Well-Formedness:

• Select the Check Well-Formedness (Alt + Shift + V, W (Command + Alt + V, W on OS X)) action from the Validation drop-down menu on the toolbar or from the XML menu.
• A selection of files can be checked for well-formedness by selecting the Check Well-Formedness action from the Validate submenu when invoking the contextual menu in the Navigator view (page 250).

Result: If any errors are found, the result is displayed in the message panel at the bottom of the editor. Each error is displayed as one record in the result list and is accompanied by an error message. Clicking the record will open the document containing the error and highlight its approximate location.

Example: A non Well-formed JSON Document

```json
{"person": { "name": "John Doe" }
```

This would result in the following error:

Expected a ',', or ')'
To resolve the error, click the record in the result list and it will locate and highlight the approximate position of the error. In this case, you would need to identify where the missing end bracket needs to be placed.

Validating JSON Documents Against JSON Schema

A *Valid* JSON document is a *Well-Formed* document that also conforms to the rules of a JSON Schema that defines the legal syntax of a JSON document. The purpose of the JSON schema is to define the legal properties and values of a JSON document.

This section contains topics that explain the automatic and manual validation possibilities in Oxygen XML Editor plugin, how validation errors are presented, and information about built-in validation scenarios.

For information about how to associate a JSON schema for the purposes of validation, see *Associating a JSON Schema Through a Validation Scenario* (page 1189).

Automatic Validation

By default, Oxygen XML Editor plugin is configured to automatically mark validation errors in the JSON document as you are editing. The *Enable automatic validation* option (page 109) in the *Document Checking* preferences page (page 108) controls whether or not all validation errors and warnings will automatically be highlighted in the editor panel.

The automatic validation starts parsing the document and marking the errors after a configurable delay (page 109) from the last key typed. Errors are highlighted with underline markers in the main editor panel and small rectangles on the right side ruler of the editor panel. Hovering over a validation error presents a tooltip message with more details about the error.

Related Information:

- Manual Validation Actions (page 1182)
- Presenting Validation Errors in JSON Documents (page 1183)

Manual Validation Actions

You can choose to validate JSON documents at any time by using the manual validation actions that are available in Oxygen XML Editor plugin.
Manual Validation Actions

To manually validate the currently edited document, use one of the following actions:

☑️ Validate (Alt + Shift + V, V)

Available from the ☑️ Validation drop-down menu on the toolbar, the JSON menu, or from the Validate submenu when invoking the contextual menu in the Navigator view (page 250).

Validate with

Available from the ☑️ Validation drop-down menu on the toolbar or the JSON menu.

This action opens a dialog box that allows you to specify a schema for validating the current document (page 1189).

Validate with Schema

Available from the Validate submenu when invoking the contextual menu in the Navigator view (page 250).

This action opens a dialog box that allows you to specify a schema for validating the current document (page 1189).

Other Validation Options

To clear the error markers added to the Problems view in the last validation, select ✗ Clear Validation Markers from the Validate submenu when invoking the contextual menu in the Navigator view.

Tip: If a large number of validation errors are detected and the validation process takes too long, you can limit the maximum number of reported errors in the Document Checking preferences page (page 108).

Related Information:

- Automatic Validation (page 1182)
- Presenting Validation Errors in JSON Documents (page 1183)
Validation errors and warnings in JSON documents are presented in various locations within the interface.

**Validation Marker Locations**

Validation issues are marked in the following locations:

- In the main editing pane, with the issue underlined in a color according to the type of issue.
- In the right-side vertical stripe, with a marker that is colored according to the type of issue.
- In the **Outline** view, with an icon that is colored according to the type of issue.

**Validation Marker Colors**

The colors for each type of issue are as follows:

- **Validation Errors** [Red] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the **Attributes** view are colored in red.
- **Validation Warnings** [Yellow] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the **Attributes** view are colored in yellow.
- **Validation Info** [Blue] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the **Attributes** view are colored in blue.

You can configure the colors and how the various types of validation problems are rendered from the Eclipse **Annotations** preferences page (Window ('Eclipse’ on Mac OSX) > Preferences > General > Editors > Text Editors > Annotations).

**Validation Markers in the Right-Side Stripe**

Also, the stripe on the right side of the editor panel is designed to display the issues found during the validation process and to help you locate them in the document. The stripe contains the following:

**Upper Part of the Stripe**

A success indicator square will turn green if the validation is successful or only info messages are found, red if validation errors are found, or yellow if only validation warnings are found. More details about the issues are displayed in a tool tip when you hover over indicator square. If there are numerous problems, only the first three are presented in the tool tip.

**Middle Part of the Stripe**
Errors are presented with red markers, warnings with yellow markers, and info message with blue markers. If you want to limit the number of markers that are displayed, open the Preferences dialog box (page 55), go to Editor > Document checking, and specify the desired limit in the Maximum number of validation highlights option (page 108).

Clicking a marker will highlight the corresponding text area in the editor. The validation message is also displayed both in a tooltip (when hovering over the marker) and in the message area on the bottom of the application.

Bottom Part of the Stripe

Two navigation arrows (↩) allow you to jump to the next or previous issue. The same actions can be triggered from Document > Automatic validation > Next error (Ctrl + Period (Command + Period on OS X)) and Document > Automatic validation > Previous error (Ctrl + Comma (Command + Comma on OS X)).

Hovering Over Validation Issues

Hovering over a validation issue presents a tooltip message with more details about the problem. Also, when hovering over an issue, pressing F2 will change the focus to the tooltip.

Details About Validation Issues

- Information about the issue is also displayed in the message area on the bottom of the editor panel (clicking the Document checking options button opens the Document Checking preferences page (page 108) where you can configure some validation options.
- Status messages from every validation action are logged in the Console view (page 612) (the Enable Oxygen consoles option (page 161) must be selected in the View preferences page).
- If you want to see all the validation messages grouped in the Results view (page 267), you should use the Validate action from the toolbar or JSON menu. This action also collects the validation messages and displays them in the Problems view if the validated file is in the current workspace or in a custom Errors view if the validated file is outside the workspace.

Creating a JSON Validation Scenario

Validation scenarios can be used to associate one or more JSON Schemas with a JSON document (page 1189).

Creating a JSON Validation Scenario

To create a validation scenario, follow these steps:
1. Select the `Configure Validation Scenario(s)` action in one of the following ways:
   - From the toolbar.
   - From the JSON menu.
   - From the Validate submenu, when invoking the contextual menu on a file in the Navigator view (page 250).

   **Step Result:** The `Configure Validation Scenario(s)` dialog box is displayed.

2. Click the **New** button.

   **Step Result:** A validation scenario configuration dialog box is displayed.

   ![Validation Scenario Configuration Dialog Box](image)

   This scenario configuration dialog box allows you to configure the following information and options:

   **Name**
   
   The name of the validation scenario.

   **URL of the file to validate**
   
   The URL of the main module that includes the current module. It is also the entry module of the validation process when the current one is validated. To edit the URL, click its cell and specify the URL of the main module by doing one of the following:
   
   - Enter the URL in the text field or select it from the drop-down list.
   - Use the `· Browse` drop-down button to browse for a local, remote, or archived file.
   - Use the `· Insert Editor Variable` button to insert an editor variable (page 201) or a custom editor variable (page 208).
File type

The type of the document that is validated in the current validation unit. Oxygen XML Editor plugin automatically selects the file type depending on the value of the URL of the file to validate field.

Validation engine

For normal JSON documents, the Default engine should be used. For JSON Schemas, you could use the Default engine (if they have a schema version specified) or the JSON Schema Validator. The latter does not require a schema version to be specified. If the version is missing, JSON Schema draft-04 will be used as a default.

Automatic validation

If this option is selected, the validation operation defined by this row is also applied by the automatic validation feature (page 856). If the Automatic validation feature is disabled in the Document Checking preferences page (page 108), then this option is ignored, as the preference setting has a higher priority.

Schema

Displays the specified schema.

Specify Schema

Opens the Specify Schema dialog box that allows you to set a schema to be used for validating JSON documents.

Move Up

Moves the selected scenario up one spot in the list.

Move Down

Moves the selected scenario down one spot in the list.

Add

Adds a new validation unit to the list.
Remove

Removes an existing validation unit from the list.

3. Configure any of the existing validation units according to the information above. You can use the buttons at the bottom of the table to add, remove, or move validation units.

4. Press **OK**.

**Result:** The newly created validation scenario will now be included in the list of scenarios in the **Configure Validation Scenario(s)** dialog box. You can select the scenario in this dialog box to associate it with the current document and press the **Apply associated** button to run the validation scenario.

Sharing JSON Validation Scenarios

The validation scenarios and their settings can be shared with other users by exporting them to a specialized scenarios file (page 200) that can then be imported.

Resolving References with an XML Catalog

If a reference to a remote JSON schema must be used but a local copy of the schema should actually be preferred for performance reasons, the reference can be resolved to the local copy with an XML Catalog (page 2712).

For example, if the JSON schema contains a reference to a remote schema such as:

```
{"$ref": "http://json-schema.org/example/geo.json"}
```

the reference can be resolved to a local copy of the schema by inserting the following catalog entry:

```
<uri name="http://json-schema.org/example/geo.json" uri="schemas/geo.json"/>
```

**Related Information:**

- Working with XML Catalogs (page 897)

Associating a Schema to JSON Documents

To provide as-you-type validation and to compute valid proposals for the **Content Completion Assistant** (page 2704), Oxygen XML Editor plugin requires a schema to be associated with the JSON document. The schema specifies how the internal structure is defined.
Detecting the Schema(s) for Validation and Content Completion

For validation, Oxygen XML Editor plugin tries to detect the JSON Schema by searching in the following order:

1. The schema referenced in validation stages from the validation scenario(s) *(page 1189)* associated with the current JSON document.
2. If a schema is not detected, then it falls back to the schema associated directly in the JSON document *(page 1191)*.

**Tip:** To quickly open the schema used for validating the current document, select the Open Associated Schema action from the toolbar (or JSON menu).

Associating a JSON Schema Through a Validation Scenario

Oxygen XML Editor plugin uses the rules defined in the detected JSON schema to report errors and warnings during automatic and manual validations that help maintain the structural integrity of your JSON documents. There are several methods that can be used to validate with a JSON schema.

Configure a Validation Scenario and Specify the JSON Schema

You can specify the schema to be used for validation directly in the JSON validation scenario *(page 1185)*. To associate a JSON schema to a validation scenario to be used whenever the scenario is invoked, follow these steps:

1. Select the Configure Validation Scenario(s) from the toolbar, from the JSON menu, or from the Validate submenu when invoking the contextual menu on a file in the Navigator view *(page 250)*.
2. Press the New button to create a new validation scenario *(page 1185)* or the Edit button to modify an existing one.
3. Add or configure validation units according to your needs and click the Specify Schema button.
4. Select the schema to be associated with the validation unit.
5. Click OK on both dialog boxes.

**Result:** The JSON schema is now associated with that validation scenario whenever it is invoked.
Use the Validate with Action to Specify a JSON Schema for Validating the Current Document

To validate the current document using a specified schema, follow these steps:

1. Select the **Validation with** action from the **Validation** drop-down menu on the toolbar (or **JSON** menu).

   **Step Result:** The **Validate with** dialog box is displayed:

   ![Validate with Dialog Box](image)

   This dialog box contains the following options:
   - **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S). You can specify the URL by using the text field, the history drop-down, the ![Insert Editor Variables](page 201) button, or the browsing actions in the ![Browse drop-down list.
   - **Schema type** - Select **JSON** for the schema type (other types of schema will not work with JSON documents).

2. Select the schema to be associated with the manual validation.
3. Click **OK**.

   **Result:** The current document is validated using the JSON schema you specified.

Use the Validate with Schema Action to Specify a JSON Schema for Validating all Selected JSON Documents

To validate multiple JSON documents using a specified JSON schema, follow these steps:

1. Select all the JSON documents you want to validate in the **Navigator** view.
2. Invoke the contextual menu (right-click) and select the **Validate with Schema** action from the **Validate** submenu.
Step Result: The Validate with dialog box is displayed:

Figure 510: Validate with Dialog Box

This dialog box contains the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S). You can specify the URL by using the text field, the history drop-down, the :insert editor variables (page 201) button, or the browsing actions in the :insert browse drop-down list.

- **Schema type** - Select **JSON** for the schema type (other types of schema will not work with JSON documents).

3. Select the JSON schema that you want to use to validate all selected JSON documents.
4. Click **OK**.

Result: The selected JSON documents are validated using the JSON schema you specified.

Associating a Schema Directly in JSON Documents

**Associate Schema Action**

The schema used by the Content Completion Assistant (page 2704) and document validation engine can be associated with the current document by using the **Associate Schema** action. The association can specify a relative file path or a URL of the schema.

To associate a JSON Schema to the current JSON document, follow these steps:

1. Select the **Associate Schema** action from the toolbar (or JSON menu).

   **Step Result:** The Associate Schema dialog box is displayed:

   Figure 511: Associate Schema Dialog Box
This dialog box contains the following options for JSON documents:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S).

- **Use path relative to file location** - Select this option if the JSON instance document and the associated schema contain relative paths. The location of the schema file is inserted in the JSON instance document as a relative file path. This practice allows you, for example, to share these documents with other users without running into problems caused by multiple project locations on physical disk.

2. Select the JSON Schema that will be associated with the JSON document.

3. Click **OK**.

**Result:** A `$schema` property is added at the beginning of the document with its value set to the specified URL. If the document already contained a schema association, the old association will be replaced with the new one.

**Tip:** To quickly open the schema used for validating the current document, select the **Open Associated Schema** action from the toolbar (or JSON menu).

### Content Completion Assistant in JSON

Oxygen XML Editor plugin includes an intelligent *Content Completion Assistant (page 2704)* that offers rapid, inline identification and insertion of JSON structures. Oxygen XML Editor plugin shows the available entries that are valid at the current editing location.

The *Content Completion Assistant* is enabled by default. To disable it, open the **Preferences** dialog box (page 55), go to **Editor > Content Completion**, and deselect the **Enable content completion** option (page 101).

*Figure 512: Content Completion Assistant in JSON*
Content Completion and the Associated Schema

The Content Completion Assistant feature is schema-driven and the list of proposals in the Content Completion Assistant (page 2704) depend on the associated JSON Schema. For information about ways to associate a schema to a JSON document, see the Associating a Schema to JSON Documents (page 1188) section.

Using the Content Completion Assistant in JSON

The feature is activated in Text mode for JSON documents by:

- Typing a quote symbol (" ) to insert a property or value.
- Pressing Ctrl + Space (Command + Space on OS X) or Alt + ForwardSlash (Command + Alt + ForwardSlash on OS X).

You can navigate through the list of proposals by using the Up and Down keys on your keyboard. In some cases, the Content Completion Assistant displays a documentation window with information about the particular proposal (page 1194). You can also change the size of the documentation window by dragging its top, right, and bottom borders.

To insert the selected proposal, press Enter or Tab.

Types of Proposals Listed in the Content Completion Assistant for JSON

The proposals that populate the Content Completion Assistant for JSON documents depend on the structure defined in the associated JSON Schema. The types of structure proposed in the content completion window include:

- JSON properties
- JSON values
- JSON arrays
- JSON objects

The number and type of proposals displayed by the Content Completion Assistant is dependent on the cursor’s current position in the JSON document and the child items displayed within a given context are defined by the structure of the specified JSON Schema.

Code Templates in the Content Completion

Oxygen XML Editor plugin includes a set of built-in code templates for JSON documents that can be selected from the Content Completion Assistant. The code templates are displayed with a .: symbol in
the content completion list. You can also define your own code templates and share them with others. For more information, see Code Templates (page 639).

Schema Annotations in JSON Content Completion

A schema annotation is a documentation snippet that appears in the Content Completion Assistant (page 2704) offering more information about the current proposal.

This feature is enabled by default, but you can disable it by deselecting the Show annotations in Content Completion Assistant (page 103) option in the Annotations preferences page.

Collecting Annotations from the JSON Schema

In a JSON Schema, the annotations are specified in the value of the title and description properties like this:

```json
"idType": {
   "title": "The 'id' property",
   "description": "Specifies a required ID for this person.",
   "type": "string",
   "maxLength": 20
}
```

Syntax Highlighting in JSON Documents

Oxygen XML Editor plugin supports syntax highlighting in Text mode to make it easier to read the semantics of the structured content by displaying each type of code in different colors and fonts.

To customize the colors or styles used for the syntax highlighting colors for JSON files, follow these steps:

1. Open the Preferences dialog box (page 55).
2. Go to Editor > Syntax Highlight (page 149).
3. Select and expand the JSON section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.

You can see the effects of your changes in the Preview pane.

Related Information:
Folding in JSON

In a large JSON document, the data enclosed in the curly bracket characters `{}` can be collapsed so that only the needed data remains in focus. The folding features available for XML documents (page 625) are also available in JSON documents.

JSON Outline View

The Outline view for JSON documents displays the list of all the components of the JSON document you are editing. By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

Outline View Features

The Outline view allows you to:

- Quickly navigate through the document by selecting nodes in the Outline tree.
- Move elements by dragging them to a new position in the tree structure.
• Highlight elements in the editor area. It is synchronized with the editor area, so when you make a selection in the editor area, the corresponding nodes are highlighted in the Outline view, and vice versa.
• View document errors, as they are highlighted in the Outline view. A tooltip also provides more information about the nature of the error when you hover over the faulted element.

Outline View Interface

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

The upper part of the Outline view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (such as *, ?) and separate multiple patterns with commas.

It also includes a View menu in the top-right corner that presents the following options to help you filter the view even further.

Filter returns exact matches

The text filter of the Outline view returns only exact matches.

Selection update on cursor move

Controls the synchronization between Outline view and source document. The selection in the Outline view can be synchronized with the cursor moves or the changes in the editor. Selecting one of the components from the Outline view also selects the corresponding item in the source document.

Flat presentation mode of the filtered results

When active, the application flattens the filtered result elements to a single level.

Drop and Drop Actions in the Outline View

Entire JSON properties, objects, and arrays can be moved or copied in the edited document using only the mouse in the Outline view with drag-and-drop operations. Several drag and drop actions are possible:

• If you drag a JSON node in the Outline view and drop it on another node, then the dragged node will be moved after the drop target.
• If you hold the mouse pointer over the drop target for a short time before the drop then the drop target node will be expanded first and the dragged node will be moved inside the drop target.
• You can also drop a node before or after another node if you hold the mouse pointer towards the upper or lower part of the target. A marker will indicate whether the drop will be performed before or after the target node.
• If you hold down the (Ctrl (Command on OS X)) key after dragging, a copy operation will be performed instead of a move.

Contextual Menu Actions

The following actions are available in the contextual menu of the JSON Outline view:

- **Cut**
  Cuts the currently selected component.

- **Copy**
  Copies the currently selected component.

- **Paste**
  Pastes the copied component.

- **Delete**
  Deletes the currently selected component.

- **Expand All**
  Expands the structure of a component in the Outline view.

- **Collapse All**
  Collapses the structure of all the component in the Outline view.

JSON to XML Converter

Oxygen XML Editor plugin includes a useful and simple tool for converting JSON files to XML. It can be found in the XML Tools menu.

To convert a JSON document to XML, follow these steps:

1. Select the **JSON to XML** action from the XML Tools menu. The JSON to XML dialog box is displayed:

   *Figure 514: JSON to XML Dialog Box*
2. Choose or enter the **Input URL** of the JSON document.

3. Choose the path of the **Output file** that will contain the resulting XML document.

4. Select the **Open in Editor** option to open the resulting XML document in the main editing pane.

5. Click the **Convert** button.

The original JSON document is now converted to an XML document.

*Figure 515: Example: XML to JSON Operation Result*

---

**Online JSON to XML Converter**

For a simple ONLINE tool for converting a single JSON file to XML, or vice versa, go to: [https://www.oxygenxml.com/xml_json_converter.html](https://www.oxygenxml.com/xml_json_converter.html).

**XML to JSON Converter**
Oxygen XML Editor plugin includes a useful and simple tool for converting XML files to JSON. It can be found in the **XML Tools** menu.

To convert an XML document to JSON, follow these steps:

1. Select the **XML to JSON** action from the **XML Tools** menu. The **XML to JSON** dialog box is displayed:

   *Figure 516: XML to JSON Dialog Box*

   ![XML to JSON Dialog Box](image)

2. Choose or enter the **Input URL** of the XML document.
3. Choose the path of the **Output file** that will contain the resulting JSON document.
4. Select the **Open in Editor** option to open the resulting JSON document in the main editing pane.
5. Click the **Convert** button.

The original XML document is now converted to a JSON document.

*Figure 517: Example: XML to JSON Operation Result*
Online XML to JSON Converter

For a simple ONLINE tool for converting a single XML file to JSON, or vice versa, go to: https://www.oxygenxml.com/xml_json_converter.html.

Contextual Menu Actions in JSON Documents

When editing JSON documents, Oxygen XML Editor plugin provides the following actions in the contextual menu:

- **Cut, Copy, Paste**
  
  Executes the typical editing actions on the currently selected content.

- **Copy JSON Pointer**
  
  Creates a JSON Pointer at the current cursor location and copies the expression that denotes the JSON pointer to the system clipboard.

- **Copy XPath**
  
  Copies the XPath expression of the current property from the current editor to the clipboard.
Go to Matching Bracket

Moves the cursor to the end bracket that matches the start bracket, or vice versa.

Open File at Cursor

Opens the file at the cursor position in a new panel. If the file path represents a directory path, it will be opened in system file browser. If the file at the specified location does not exist, an error dialog box is displayed and it includes a Create new file button that starts the New document wizard. This allows you to choose the type or the template for the file. If the action succeeds, the file is created with the referenced location and name and is opened in a new editor panel.

Transforming and Querying JSON Documents

Oxygen XML Editor plugin provides the ability to transform JSON documents to XML or HTML through XSLT or XQuery processing. You also have access to some powerful tools for querying JSON through XPath expressions or XQuery.

For more information about transforming and querying in JSON, watch our video demonstration:

https://www.youtube.com/embed/9yHqSAWHwiw

Transforming JSON Documents with XSLT

It is possible to transform JSON documents through XSLT processing. To do so, follow these steps:

1. Create an XSLT 3.0 stylesheet that has the xsl:initial-template. You can use one of the following two templates available in the New Document Wizard.
   - XSLT Stylesheet for JSON - Processes a JSON document by using a json-doc() function and matches the JSON properties from the JSON map.
   - XSLT Stylesheet for JSON to XML - Processes a JSON document by using a json-to-xml() function and matches the converted XML content.

2. Create a new XSLT transformation scenario for your stylesheet.

3. Reference the JSON document that you want to transform using one of these two methods:
   - In the transformation scenario, click the Parameters button in the XSLT tab and add a parameter that specifies the URL to your JSON document in its value. For example, if you are transforming one of the built-in templates mentioned above, the input parameter is added by default and you could specify the URL in its value.
   - Specify the URL to your JSON document in the stylesheet you created. For example, if you use one of the built-in templates mentioned above, you would specify the URL in the value of the input parameter (in the xsl:param element).

4. Run the transformation.
Tip: There are some sample files in the 
\[OXYGEN_INSTALL_DIR\]/samples/json/transform folder that can be used to transform a JSON document to XML or HTML.

Related Information:

- Blog: Transforming JSON
- XSLT Functions on JSON Data

Transforming JSON Documents with XQuery

It is possible to transform JSON documents through XQuery processing. To do so, follow these steps:

2. Create a new XQuery transformation scenario for your XQuery file.
3. Reference the JSON document that you want to transform using one of these two methods:
   - In the transformation scenario, click the Parameters button in the XQuery tab and add a parameter that specifies the URL to your JSON document in its value.
   - Specify the URL to your JSON document in the XQuery file you created.
4. Run the transformation.

Tip: There is a sample XQuery file in the 
\[OXYGEN_INSTALL_DIR\]/samples/json/transform folder that can be used to transform a JSON document.

Querying JSON Documents with XPath or XQuery

Oxygen XML Editor plugin provides a dedicated XPath/XQuery Builder view that allows you to compose complex XPath or XQuery expressions and execute them over JSON documents.

XPath/XQuery Builder View

You can also use the XPath/XQuery view to run XPath and XQuery expressions over a JSON document. For XPath expressions, the document is converted to XML and the XPath is executed over the converted XML document. For XQuery, you need to reference the JSON document in your XQuery content. For more information about this view, see XPath Builder View (page 1902).

Figure 518: XPath/XQuery Builder View for JSON
Editing JSON Schema Documents

The purpose of the JSON schema is to define the legal properties and values of a JSON document to keep it valid and well formed. When editing JSON Schema, all of the same features in the JSON editor (page 1178) are available.

Oxygen XML Editor plugin includes a new document template to help you get started creating a JSON Schema document. The template is called JSON Schema and it can be found in the New Document folder in the New from templates wizard (page 554). You can also customize your own JSON Schema templates (page 557) and specify other versions (draft 04, 06, or 07).

For information about using a JSON Schema to validate documents, see Validating JSON Documents Against JSON Schema (page 1182)

For information about how to associate a JSON schema for the purposes of validation, see Associating a JSON Schema Through a Validation Scenario (page 1189).

Validating JSON Schema Documents

A Valid JSON Schema document is a Well-Formed document that also conforms to the JSON meta-schema rules that defines the legal syntax of a JSON Schema document.

If a JSON document includes a meta-schema URL in the document root with the "$schema" key, the file will be validated as a JSON Schema against the specified meta-schema.

Quick Reference

- If there is a "$schema": "http://json-schema.org/draft-04/schema" property in the schema root, then Draft 4 will be used.
• If there is a "$schema": "http://json-schema.org/draft-06/schema" property in the schema root, then Draft 6 will be used.
• If there is a "$schema": "http://json-schema.org/draft-07/schema" property in the schema root, then Draft 7 will be used.
• If there is a "$schema" property in the schema root, but with a different draft value, then an error will be displayed ("no meta-schema is known with URI").
• If none of these are found, then it's validated as a simple JSON instance.
• You could also select the JSON Schema Validator in a JSON validation scenario (page 1185) and it will use the version specified in the JSON Schema, or if a version is not specified, the JSON Schema draft-04 will be used.

For information about how to associate a JSON schema for the purposes of validation, see Associating a JSON Schema Through a Validation Scenario (page 1189).

Editing StratML Documents

Strategy Markup Language (StratML) is an XML vocabulary and schema for strategic plans. Oxygen XML Editor plugin supports StratML Part 1 (Strategic Plan) and StratML Part 2 (Performance Plans and Reports) and provides templates for the following documents:

• Strategic Plan (StratML Part 1)
• Performance Plan (StratML Part 2)
• Performance Report - (StratML Part 2)
• Strategic Plan - (StratML Part 2)

You can view the components of a StratML document in the Outline view (page 257). Oxygen XML Editor plugin implements a default XML with XSLT transformation scenario for this document type, called StratML to HTML.

Editing XLIFF Documents

XLIFF (XML Localization Interchange File Format) is an XML-based format that was designed to standardize the way multilingual data is passed between tools during a localization process. Oxygen XML Editor plugin provides the following support for editing XLIFF documents:

XLIFF Version 1.2, 2.0, and 2.1 Support:

• New document templates for XLIFF documents.
• A default CSS file (xliff.css) used for rendering XLIFF content in Author mode is stored in \[OXYGEN_INSTALL_DIR\]/frameworks/xliff/css/.

• Validation and content completion support using local catalogs. The default catalog (catalog.xml) for version 1.2 is stored in \[OXYGEN_INSTALL_DIR\]/frameworks/xliff/schemas/1.2, for version 2.0 in \[OXYGEN_INSTALL_DIR\]/frameworks/xliff/schemas/2.0, and for version 2.1 in \[OXYGEN_INSTALL_DIR\]/frameworks/xliff/schemas/2.1.

**XLIFF Version 2.0 and 2.1 Enhanced Support:**

Support for validating XLIFF 2.0 and 2.1 documents using modules. For version 2.0, the default modules are stored in \[OXYGEN_INSTALL_DIR\]/frameworks/xliff/schemas/2.0/modules and for version 2.1, they are stored in \[OXYGEN_INSTALL_DIR\]/frameworks/xliff/schemas/2.1.

**Editing XLIFF Documents in Author Mode**

By default, when you create a new XLIFF document from a template (page 554), Oxygen XML Editor plugin opens it in Text mode. Aside from the normal editing features found in Text mode, you can also switch to Author mode where Oxygen XML Editor plugin offers some special form controls specifically for XLIFF documents. These form controls simply allow you to add or edit XLIFF attribute values and content in a visual mode.

For XLIFF version 2.0 and 2.1 documents, you can also change the style of the visual editing mode. The Styles drop-down menu on the toolbar offers the following styles that are specifically designed to render XLIFF 2.0 and 2.1 documents in Author mode:

• Default
• Classic
• Translate

**Editing JavaScript Documents**

This section explains the features of the Oxygen XML Editor plugin JavaScript Editor and how you can use them.

**JavaScript Editing Actions**

Oxygen XML Editor plugin allows you to create and edit JavaScript files and assists you with useful features such as syntax highlight, content completion, and outline view. To enhance your editing
experience, you can select entire blocks (parts of text delimited by brackets) by double-clicking somewhere inside the brackets.

Figure 519: JavaScript Editor Text Mode

```javascript
function change_side(front) { 
  switch ($(,'#version-switch').text()) {
    case 'Original':
      $('#holder').html($( '#div .original[id]').html());
      make_clickable();
      break;
    case 'Translation 1':
      $('#holder').html($( '#div .translation[1]').filter(':first').html());
      $('#version-switch').text('Translation 1');
      break;
    case 'Translation 2':
      $('#holder').html($( '#div .translation[2]').filter(':last').html());
      $('#version-switch').text('Original');
      break;
  }
}
```

The contextual menu of the JavaScript editor offers the following actions:

- **Cut**
  Allows you to cut fragments of text from the editing area.

- **Copy**
  Allows you to copy fragments of text from the editing area.

- **Paste**
  Allows you to paste fragments of text in the editing area.

- **Toggle Comment**
  Allows you to comment a line or a fragment of the JavaScript document you are editing. This option inserts a single comment for the entire fragment you want to comment.

- **Toggle Line Comment**
  Allows you to comment a line or a fragment of the JavaScript document you are editing. This option inserts a comment for each line of the fragment you want to comment.

- **Go to Matching Bracket**
  Use this option to find the closing, or opening bracket, matching the bracket at the cursor position. When you select this option, Oxygen XML Editor plugin moves the cursor to the matching bracket, highlights its row, and decorates the initial bracket with a rectangle.

**Note**: A rectangle decorates the opening or closing bracket that matches the current one, at all times.
Source

Allows you to select one of the following actions:

- **To Lower Case**
  Converts the selection content to lower case characters.

- **To Upper Case**
  Converts the selection content to upper case characters.

- **Capitalize Lines**
  Converts to upper case the first character of every selected line.

- **Join and Normalize Lines**
  Joins all the rows you select to one row and normalizes the content.

- **Insert new line after**
  Inserts a new line after the line at the cursor position.

Modify all matches

Use this option to modify (in-place) all the occurrences of the selected content. When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Open

Allows you to select one of the following actions:

- **Open File at Cursor** - select this action to open the source of the file located at the cursor position
- **Open File at Cursor in System Application** - select this action to open the source of the file located at the cursor position with the application that the system associates with the file

Compare

Select this option to open the Compare Files tool to compare the file you are editing with a file you choose in the dialog box.

Validating JavaScript Files

You have the possibility to validate the JavaScript document you are editing. Oxygen XML Editor plugin uses the Mozilla Rhino library for validation. For more information about this library, go to
http://www.mozilla.org/rhino/doc.html. The JavaScript validation process checks for errors in the syntax. Calling a function that is not defined is not treated as an error by the validation process. The interpreter discovers this error when executing the faulted line. Oxygen XML Editor plugin can validate a JavaScript document both on-request and automatically.

Content Completion in JavaScript Documents

When you edit a JavaScript document, the Content Completion Assistant (page 2704) presents you a list of the elements you can insert at the cursor position. It can be manually activated with the Ctrl + Space (Command + Space on OS X) shortcut.

For an enhanced assistance, JQuery methods are also presented. The following icons decorate the elements in the content completion list of proposals depending on their type:

- 🔷 - function
- 🟦 - variable
- 🟢 - object
- 🔴 - property
- 🔵 - method

**Note:** These icons decorate both the elements from the content completion list of proposals and from the Outline view (page 1209).

Figure 520: JavaScript Content Completion Assistant
The Content Completion Assistant collects:

- Method names from the current file and from the library files.
- Functions and variables defined in the current file.

If you edit the content of a function, the content completion list of proposals contains all the local variables defined in the current function, or in the functions that contain the current one.

Syntax Highlighting in JavaScript Documents

Oxygen XML Editor plugin supports syntax highlighting in Text mode to make it easier to read the semantics of the structured content by displaying each type of code in different colors and fonts.

To customize the colors or styles used for the syntax highlighting colors for JavaScript files, follow these steps:

1. Open the Preferences dialog box (page 55).
2. Go to Editor > Syntax Highlight (page 149).
3. Select and expand the JavaScript section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.

You can see the effects of your changes in the Preview pane.

Related Information:

- Syntax Highlight Preferences (page 149)

JavaScript Outline View

Oxygen XML Editor plugin present a list of all the components of the JavaScript document you are editing in the Outline view. By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

Figure 521: JavaScript Outline View
The following icons decorate the elements in the Outline view depending on their type:

- `function` - function
- `variable` - variable
- `object` - object
- `property` - property
- `method` - method

The contextual menu of the JavaScript Outline view contains the usual Cut, Copy, Paste, and Delete actions. From the Settings menu, you can select the Update selection on cursor move option to synchronize the Outline view with the editing area.

Editing XProc Scripts

XProc is an XML pipeline language that can be used to script transformations. An XProc script is edited as an XML document that is validated against a RELAX NG schema, or if the script has an associated transformation scenario, then the XProc engine selected in the scenario is used as the validating engine (if the XProc engine supports validation). The default engine for XProc scenarios is a version of the Calabash engine that comes bundled with Oxygen XML Editor plugin version 21.0.
XProc Content Completion

Oxygen XML Editor plugin helps you edit a XProc scripts through the Content Completion Assistant (page 2704), offering proposals that are valid at the cursor position. It can be manually activated with the Ctrl + Space (Command + Space on OS X) shortcut.

The content completion inside the element `input/inline` from the XProc namespace `http://www.w3.org/ns/xproc` offers elements from the following schemas depending both on the `port` attribute and the parent of the `input` element. When invoking the content completion inside the XProc element `inline`, the list of content completion proposals is populated as follows:

- If the value of the `port` attribute is `stylesheet` and the `xslt` element is the parent of the `input` elements, the Content Completion Assistant offers XSLT elements.
- If the value of the `port` attribute is `schema` and the `validate-with-relax-ng` element is the parent of the `input` element, the Content Completion Assistant offers RELAX NG schema elements.
- If the value of the `port` attribute is `schema` and the `validate-with-xml-schema` element is the parent of the `input` element, the Content Completion Assistant offers XML Schema schema elements.
- If the value of the `port` attribute is `schema` and the `validate-with-schematron` element is the parent of the `input` element, the Content Completion Assistant offers either ISO Schematron elements or Schematron 1.5 schema elements.
- If the above cases do not apply, then the Content Completion Assistant offers elements from all the schemas from the above cases.

Figure 522: XProc Content Completion
XProc Syntax Highlighting

The XProc editor assists you in writing XPath expressions by offering dedicated coloring schemes for syntax highlighting.

To customize the colors or styles used for the syntax highlighting colors for XProc, follow these steps:

1. Open the Preferences dialog box (page 55).
2. Go to Editor > Syntax Highlight (page 149).
3. Select and expand the XML section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.
5. Select the XML tab in the Preview pane to see the effects of your changes.

Enabling Extensions in Calabash

If you are using the default Calabash engine, it is possible to configure extensions (for a list of the valid extensions, see http://xmlcalabash.com/docs/reference/cfg.extension.html).

To configure an extension:

1. Edit the following file: $OXYGEN_INSTALL_DIR/lib/xproc/calabash/engine.xml.
2. Add the extension and its value as a system-property, as in the following example:

   `<system-property name="com.xmlcalabash.allow-text-results" value="true"/>

- XProc Preferences (page 179)

Editing Schematron Schemas

Schematron is a simple and powerful Structural Schema Language for making assertions about patterns found in XML documents. It relies almost entirely on XPath query patterns for defining rules
and checks. Schematron validation rules allow you to specify a meaningful error message. This error message is provided to you if an error is encountered during the validation stage.

There are numerous online resources out there to help you get started with writing Schematron rules. Here are just a few that might help you:

- Guide to Schema Writing with Schematron
- Presentation: Schematron Development with Oxygen

Oxygen XML Editor plugin assists you in editing Schematron documents with schema-based content completion, syntax highlight, search and refactor actions, and dedicated icons for the Outline view (page 1221). You can create a new Schematron schema using one of the Schematron templates available in the New from Templates wizard (page 554).

For information about applying and detecting Schematron schemas, see Associating a Schema to XML Documents (page 887).

Validating XML Documents Against Schematron

The Skeleton XSLT processor is used for validation and conforms with ISO Schematron or Schematron 1.5. It allows you to validate XML documents against Schematron schemas (page 1215) or against combined RELAX NG / W3C XML Schema and Schematron.

How to Specify the Query Language Binding

You can specify the query language binding to be used in the Schematron schema by doing the following:

- For embedded ISO Schematron, open the Preferences dialog box (page 55), go to XML > XML Parser > Schematron, and select it in the Embedded rules query language binding option (page 175).
- For standalone ISO Schematron, specify the version by setting the query language to be used in a queryBinding attribute on the schema root element. For more information, see the Query Language Binding section of the Schematron specifications.
- For Schematron 1.5 (standalone and embedded), open the Preferences dialog box (page 55), go to XML > XML Parser > Schematron, and select the version in the XPath Version option (page 176).

Multi-Lingual Support in Schematron Messages

You can specify the desired language for the validation messages in the Schematron Preferences page (page 175). The Schematron validation messages can be presented in multiple languages by
defining the language for each message using the Schematron diagnostics. For more information, see the Use of Schematron for Multi-Lingual Schemas specification.

How to Customize Color Schemes in Schematron

The Schematron editor renders the XPath expressions with dedicated color schemes. To customize the coloring schemes, open the Preferences dialog box (page 55) and go to Editor > Syntax Highlight.

Schematron Transformation Scenario

When you create a Schematron document, Oxygen XML Editor plugin provides a built-in transformation scenario. You can use this scenario to obtain the XSLT style-sheet corresponding to the Schematron schema. You can apply this XSLT stylesheet to XML documents to obtain the Schematron validation results.

For more information about the Schematron support in Oxygen XML Editor plugin, watch our video demonstrations:

https://www.youtube.com/embed/HdcZA3DJi7E

https://www.youtube.com/embed/y3u3wlO92e4

https://www.youtube.com/embed/FQNSsg57S4E

Related Information:

- Editing XML Documents in Text Mode (page 614)
- Associating a Schema to XML Documents (page 887)

Editing Schematron Schema in the Master Files Context

Smaller interrelated modules that define a complex Schematron cannot be correctly edited or validated individually, due to their interdependency with other modules. For example, a diagnostic defined in a main schema document is not visible when you edit an included module. Oxygen XML Editor plugin provides the support for defining the main module (or modules), thus allowing you to edit any of the imported/included schema files in the context of the larger schema structure.
You can set a main Schematron document either using the master files support from the Navigator view (page 581), or using a validation scenario.

To set a main file using a validation scenario, add validation units that point to the main schemas. Oxygen XML Editor plugin warns you if the current module is not part of the dependencies graph computed for the main schema. In this case, it considers the current module as the main schema.

The advantages of editing in the context of main file include:

- Correct validation of a module in the context of a larger schema structure.
- Content Completion Assistant (page 2704) displays all the referable components valid in the current context. This include components defined in modules other than the currently edited one.

Presenting Schematron Validation Issues

The possible issues that might occur during the validation process when validating XML documents against Schematron are presented with colored underlines in the editing pane, colored markers in the right vertical stripe, and details about the issues are presented in the Problems tab at the bottom area of the Oxygen XML Editor plugin window. Each error is flagged with a severity level that can be: warning, error, fatal or info.

To set a severity level, Oxygen XML Editor plugin looks for the following information:

- The role attribute, which can have one of the following values:
  - warn or warning - Sets the severity level to warning. By default, underlined with a yellow squiggly line in the editing pane and a yellow marker in the right vertical stripe.
  - error - Sets the severity level to error. By default, underlined with a red squiggly line in the editing pane and a red marker in the right vertical stripe.
  - fatal - Sets the severity level to fatal. By default, underlined with a red squiggly line in the editing pane and a red marker in the right vertical stripe.
  - info or information - Sets the severity level to information. By default, underlined with a blue squiggly line in the editing pane and a blue marker in the right vertical stripe.

- The start of the message, after trimming leading white-spaces. Oxygen XML Editor plugin looks to match the following exact string of characters (case-sensitive):
  - Warning: - Sets the severity level to warning. By default, underlined with a yellow squiggly line in the editing pane and a yellow marker in the right vertical stripe.
  - Error: - Sets the severity level to error. By default, underlined with a red squiggly line in the editing pane and a red marker in the right vertical stripe.
  - Fatal: - Sets the severity level to fatal. By default, underlined with a red squiggly line in the editing pane and a red marker in the right vertical stripe.
- **Info**: Sets the severity level to *info*. By default, underlined with a blue squiggly line in the editing pane and a blue marker in the right vertical stripe.

- If none of the previous rules match, Oxygen XML Editor plugin sets the severity level to *error*. By default, underlined with a red squiggly line in the editing pane and a red marker in the right vertical stripe.

## Integrating Schematron Rules in a Framework and Sharing Them

Custom **Schematron** rules are a great way to ensure consistency for XML authoring, especially when there is a large team working on the same set of documents. You can use **Schematron** for numerous use cases. For example, to restrict certain elements from being used, to impose restrictions on the amount of text for an element, or to impose restrictions on certain elements based on various attribute values or text content set in other elements. Furthermore, you can define quick fixes for each **Schematron** rule (page 1233) to offer technical writers proposed solutions for reported problems.

Once you define the **Schematron** rules, they can be shared with the other members of your team by integrating them in a **framework** (page 2706) (document type) configuration.

### How to Integrate Schematron Rules in a Framework

To integrate a Schematron rule in an existing framework bundled with the application, follow these steps:

1. Create a folder structure for an extended framework and save it somewhere on disk where you have full write access (for example, custom_frameworks/dita-extension).
2. In that new folder structure, create another folder that will contain all of your custom Schematron files (for example, `custom_frameworks/dita-extension/rules`).

3. Define the Schematron rules in an existing or new Schematron file and save it in the folder you created in step 2. There are numerous online resources out there to help you get started with writing Schematron rules. Here are just a few that might help you:
   - Guide to Schema Writing with Schematron
   - Presentation: Schematron Development with Oxygen

4. Open the Preferences dialog box (page 55) and go to Document Type Association > Locations (page 71). In this preferences page, add the path to your `custom_frameworks` folder in the Additional frameworks directories list, then click OK or Apply to save your changes.

5. Go to the Document Type Association preferences page (page 69) and select a framework configuration (for example, DITA) and use the Extend button to create an extension for it.

6. Give the extension an appropriate name (for example, DITA - Custom), select External for the Storage option, and specify an appropriate path to your framework configuration file (for example, `path/to/.../custom_frameworks/dita-extension/dita-extension.framework`).

7. Make whatever changes you desire to the extension, then go to the Validation tab, edit the default validation scenario (select the scenario and click the Edit button), and add an extra validation unit to it (one that uses your custom Schematron file). For more details about editing validation scenarios, see Configuring Validation Scenarios for a Framework (page 2054).

8. Click OK to close the dialog box and then OK or Apply to save the changes to the Document Type Association preferences page (page 69).

9. Open an XML document that matches your framework configuration and test the new rule.

10. You can continue to refine the Schematron and develop additional rules as needed.

**Sharing Schematron Rules**

To share Schematron rules with other members of your team, you simply need to share the framework where you integrated the Schematron rules. There are several methods for sharing frameworks and you can find details here: Sharing a Custom Framework (page 2086).

Related Information:

- Defining Schematron Quick Fixes (page 1233)
- Associating a Schema in Validation Scenarios Defined in the Document Type (page 892)
- Sharing a Custom Framework (page 2086)
Validating Schematron Documents

By default, a Schematron schema is validated as you type. To change this, open the Preferences dialog box (page 55), go to Editor > Document Checking, and deselect the Enable automatic validation option (page 109).

To validate a Schematron document manually, select the Validate action from the Validation toolbar drop-down menu or the XML menu. When Oxygen XML Editor plugin validates a Schematron schema, it expands all the included modules so the entire schema hierarchy is validated. The validation problems are highlighted directly in the editor, making it easy to locate and fix any issues.

Oxygen XML Editor plugin offers an error management mechanism capable of pinpointing errors in XPath expressions and in the included schema modules.

Related Information:
• Presenting Schematron Validation Issues (page 1215)

Content Completion in Schematron Documents

Oxygen XML Editor plugin helps you edit a Schematron schema through the Content Completion Assistant (page 2704), offering proposals that are valid at the cursor position. It can be manually activated with the Ctrl + Space (Command + Space on OS X) shortcut.

When you edit the value of an attribute that refers a component, the proposed components are collected from the entire schema hierarchy. For example, if the editing context is phase/active/@pattern, the Content Completion Assistant proposes all the defined patterns.

Note: For Schematron resources, the Content Completion Assistant collects its components starting from the master files (page 2708). The master files can be defined in the project or in the associated validation scenario. For further details about the Master Files support go to Defining Master Files at Project Level (page 581).

If the editing context is an attribute value that is an XPath expression (such as assert/@test or report/@test), the Content Completion Assistant offers the names of XPath functions, the XPath axes, and user-defined variables.

The Content Completion Assistant displays XSLT 1.0 functions and optionally XSLT 2.0 / 3.0 functions in the attributes path, select, context, subject, test depending on the Schematron options (page 175) that are set in Preferences pages. If the Saxon 6.5.5 namespace (xmlns:saxon="http://..."
icl.com/saxon“) or the Saxon 9.8.0.12 namespace is declared in the Schematron schema
(xmlns:saxon="http://saxon.sf.net/“) the content completion also displays the XSLT Saxon
extension functions as in the following figure:

Figure 523: XSLT Extension Functions in Schematron Schema Content Completion

The Content Completion Assistant also includes code templates that can be used to quickly insert
code fragments (page 639) into Schematron documents.

SyntaxHighlighting in Schematron

Oxygen XML Editor plugin supports syntax highlighting in Text mode to make it easier to read the
semantics of the structured content by displaying each type of code in different colors and fonts.

To customize the colors or styles used for the syntax highlighting colors for Schematron schemas,
follow these steps:

1. Open the Preferences dialog box (page 55).
2. Go to Editor > Syntax Highlight (page 149).
3. Select and expand the XML section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors
to the right of the pane.
5. Select the XML tab in the Preview pane to see the effects of your changes.

Tip: Oxygen XML Editor plugin also allows you to specify syntax highlighting colors for specific
XML elements and attributes with specific namespace prefixes. This can be done in the Editor >
Syntax Highlight > Elements/Attributes by Prefix preferences page (page 150).

Related Information:

- Syntax Highlight Preferences (page 149)
Embedding Schematron Rules in XML Schema or RELAX NG

Schematron rules can be embedded into an XML Schema through annotations (using the `appinfo` element), or in any element on any level of a RELAX NG Schema (taking into account that the RELAX NG validator ignores all elements that are not in the RELAX NG namespace).

Oxygen XML Editor plugin accepts such documents as Schematron validation schemas and it is able to extract and use the embedded rules.

Validating XML Documents with XML Schema and Embedded Schematron

To validate an XML document with XML Schema and its embedded Schematron, you can associate the document like this:

```
<?xml-model href="percent.xsd" type="application/xml" schematypens="http://purl.oclc.org/dsdl/schematron"?>
```

Validating XML Documents with Relax NG and Embedded Schematron

To validate an XML document with RELAX NG schema and its embedded Schematron rules, you need to associate the document with both schemas like this:

```
<?xml-model href="percent.rng" type="application/xml" schematypens="http://relaxng.org/ns/structure/1.0"?>
<?xml-model href="percent.rng" type="application/xml" schematypens="http://purl.oclc.org/dsdl/schematron"?>
```

The second association validates your document with Schematron rules extracted from the RELAX NG Schema.

**Note:** When you work with XML Schema or Relax NG documents that have embedded Schematron rules Oxygen XML Editor plugin provides two built-in validation scenarios: Validate XML Schema with embedded Schematron for XML schema, and Validate Relax NG with embedded Schematron for Relax NG. You can use one of these scenarios to validate the embedded Schematron rules.

Example: Embedded Schematron in XML Schema

```
<xsd:appinfo>
  <sch:pattern>
    <sch:rule context="..."/>
  </sch:pattern>
</xsd:appinfo>
```
Example: Embedded Schematron in Relax NG Schema

```xml
<grammar
    xmlns="http://relaxng.org/ns/structure/1.0"
    xmlns:sch="http://purl.oclc.org/dsdl/schematron">
    <sch:pattern>
        <sch:rule context="...">
            <sch:assert test="...">Message.</sch:assert>
        </sch:rule>
    </sch:pattern>
    <start>..............</start>
</grammar>
```

Related Information:

- Embedding Schematron Quick Fixes in Relax NG or XML Schema (page 1249)

Schematron Outline View

The Outline view for Schematron schemas presents a list of components in a tree-like structure and it allows for quick access to a component by name. By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

*Figure 524: Schematron Outline View*
The following actions are available in the View menu on the Outline view action bar:

**Filter returns exact matches**

The text filter of the Outline view returns only exact matches.

**Selection update on cursor move**

Controls the synchronization between Outline view and source document. The selection in the Outline view can be synchronized with the cursor moves or the changes in the editor. Selecting one of the components from the Outline view also selects the corresponding item in the source document.

**Flat presentation mode of the filtered results**

When active, the application flattens the filtered result elements to a single level.

**Show comments and processing instructions**

Show/hide comments and processing instructions in the Outline view.

**Show element name**

Show/hide element name.

**Show text**

Show/hide additional text content for the displayed elements.

**Show attributes**

Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from the Outline preferences panel (page 197).

**Configure displayed attributes**

Displays the XML Structured Outline preferences page (page 197).

The following contextual menu actions are also available in the Outline view:

**Append Child**
Displays a list of elements that you can insert as children of the current element.

**Insert Before**
Displays a list of elements that you can insert as siblings of the current element, before the current element.

**Insert After**
Displays a list of elements that you can insert as siblings of the current element, after the current element.

**Edit Attributes**
Opens a dialog box that allows you to edit the attributes of the currently selected component.

**Toggle Comment**
Comments/uncomments the currently selected element.

**Cut**
Cuts the currently selected component.

**Copy**
Copies the currently selected component.

**Delete**
Deletes the currently selected component.

**Expand All**
Expands the structure of a component in the Outline view.

**Collapse All**
Collapses the structure of all the component in the Outline view.

The upper part of the Outline view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (such as `*`, `?`) and separate multiple patterns with commas.

**Schematron Resource Hierarchy/Dependencies View**

The Resource Hierarchy/Dependencies view allows you to see the hierarchy/dependencies for a Schematron schema. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.
If you want to see the hierarchy of a schema, select the desired schema in the Navigator view (page 250) and choose Resource Hierarchy from the contextual menu.

**Figure 525: Resource Hierarchy/Dependencies View**

If you want to see the dependencies of a schema, select the desired schema in the Navigator view (page 250) and choose Resource Dependencies from the contextual menu.

**Figure 526: Resource Hierarchy/Dependencies View - Dependencies for table_abstract.sch**

The following actions are available in the Resource Hierarchy/Dependencies view:

- **Refresh**
  
  Refreshes the Hierarchy/Dependencies structure.

- **Stop**
  
  Stops the hierarchy/dependencies computing.

- **Show Hierarchy**
  
  Allows you to choose a resource to compute the hierarchy structure.

- **Show Dependencies**
  
  Allows you to choose a resource to compute the dependencies structure.

- **Configure**
  
  Allows you to configure a scope to compute the dependencies structure. There is also an option for automatically using the defined scope for future operations.

- **History**
Provides access to the list of previously computed dependencies. Use the Clear history button to remove all items from this list.

The contextual menu contains the following actions:

- **Open**
  
  Opens the resource. You can also double-click a resource in the Hierarchy/Dependencies structure to open it.

- **Copy location**
  
  Copies the location of the resource.

- **Move resource**
  
  Moves the selected resource.

- **Rename resource**
  
  Renames the selected resource.

- **Show Resource Hierarchy**
  
  Shows the hierarchy for the selected resource.

- **Show Resource Dependencies**
  
  Shows the dependencies for the selected resource.

- **Add to Master Files**
  
  Adds the currently selected resource in the Master Files directory (page 581).

- **Expand All**
  
  Expands all the children of the selected resource from the Hierarchy/Dependencies structure.

- **Collapse All**
  
  Collapses all children of the selected resource from the Hierarchy/Dependencies structure.

**Tip:** When a recursive reference is encountered in the Hierarchy view, the reference is marked with a special icon.

**Note:** The Move resource or Rename resource actions give you the option to update the references to the resource (page 1225).

Moving/Renaming Schematron Resources
You can move and rename a resource presented in the Resource/Hierarchy Dependencies view, using the Rename resource and Move resource refactoring actions from the contextual menu.

When you select the Rename action in the contextual menu of the Resource/Hierarchy Dependencies view, the Rename resource dialog box is displayed. The following fields are available:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references** - Select this option to update the references to the resource you are renaming.

When you select the Move action from the contextual menu of the Resource/Hierarchy Dependencies view, the Move resource dialog box is displayed. The following fields are available:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - Select this option to update the references to the resource you are moving, in accordance with the new location and name.

If the Update references of the moved resource(s) option is selected, a Preview option (which opens the Preview dialog box) is available for both actions. The Preview dialog box presents a list with the resources that are updated.

**Highlight Component Occurrences in Schematron Documents**

When you position your mouse cursor over a component in a Schematron document, Oxygen XML Editor plugin searches for the component declaration and all its references and highlights them automatically.

Customizable colors are used: one for the component definition and another one for component references. Occurrences are displayed until another component is selected.

To change the default behavior of Highlight Component Occurrences, open the Preferences dialog box (page 55) and go to Editor > Mark Occurrences. You can also trigger a search using the Search > Search Occurrences in File Ctrl + Shift + U (Command + Shift + U on OS X) action from contextual menu. Matches are displayed in separate tabs of the Results view (page 267).
Search Actions

The following search actions can be applied on pattern, phase, or diagnostic types and are available from the Search submenu in the contextual menu of the current editor:

- **Search References**
  Searches all references of the item found at current cursor position in the defined scope, if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box is displayed and you have the possibility to define another search scope.

- **Search References in**
  Searches all references of the item found at current cursor position in the file or files that you specify when define a scope in the Search References dialog box.

- **Search Declarations**
  Searches all declarations of the item found at current cursor position in the defined scope if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box will be displayed and you have the possibility to define another search scope.

- **Search Declarations in**
  Searches all declarations of the item found at current cursor position in the file or files that you specify when you define a scope for the search operation.

- **Search Occurrences in File**
  Searches all occurrences of the item at the cursor position in the currently edited file.

Refactoring Actions

The following refactoring actions can be applied on pattern, phase, or diagnostic types and are available from the Refactoring submenu in the contextual menu of the current editor:

- **Rename Component**
  Allows you to rename the current component (in-place). The component and all its references in the document are highlighted with a thin border and the changes you make to the component at the cursor position are updated in real time to all occurrences of the component. To exit the in-place editing, press the Esc or Enter key on your keyboard.

- **Rename Component in**
Opens a dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the Preview button, you can view the files to be affected by the action.

**Figure 527: Rename Identity Constraint Dialog Box**

Searching and Refactoring Operations Scope in Schematron Documents

The *scope* is a collection of documents that define the context of a search and refactor operation. To control it you can use the Change scope operation, available in the Quick Fix action set or on the Resource Hierarchy/Dependency View toolbar. You can restrict the scope to the current project or to one or multiple working sets (page 2712). The Use only Master Files, if enabled checkbox allows you to restrict the scope of the search and refactor operations to the resources from the Master Files directory. Click read more for details about the Master Files support (page 581).

**Figure 528: Define Scope Dialog Box**
The scope you define is applied to all future search and refactor operations until you modify it. Contextual menu actions allow you to add or delete files, folders, and other resources to the working set (page 2712) structure.

Quick Assist Support in Schematron Documents

The Quick Assist support (page 2710) improves the development work flow, offering fast access to the most commonly used actions when you edit schema documents.

The Quick Assist feature (page 2710) is activated automatically when the cursor is positioned over the name of a component. It is accessible via a yellow bulb icon (💡) placed at the current line in the stripe on the left side of the editor. Also, you can invoke the quick assist menu by using the Ctrl + 1 (Meta 1 on Mac OS X) keyboard shortcuts.

Figure 529: Schematron Quick Assist Support

The Quick Assist support offers direct access to the following actions:

- **Rename Component in**
  Renames the component and all its dependencies.

- **Search Declarations**
  Searches the declaration of the component in a predefined scope. It is available only when the context represents a component name reference.

- **Search References**
  Searches all references of the component in a predefined scope.

- **Component Dependencies**
  Searches the component dependencies in a predefined scope.

- **Change Scope**
  Configures the scope that will be used for future search or refactor operations.

- **Rename Component**
Allows you to rename the current component in-place.

Search Occurrences

Searches all occurrences of the component within the current file.

Schematron Unit Test (XSpec)

XSpec is a behavior driven development (BDD) framework for XSLT, XQuery, and Schematron. XSpec consists of syntax for describing the behavior of your XSLT, XQuery, or Schematron code, and some code that enables you to test your code against those descriptions.

Creating a Schematron Unit Test

To create a Schematron Unit Test, go to File > New > Schematron Unit Test. This is simple document template to help you get started.

Running a Schematron Unit Test

To run a Unit Test, open the XSpec file in an editor and click ☰ Apply Transformation Scenario(s) on the main toolbar. This will run the built-in Run XSpec Test transformation scenario that is defined in the XSpec framework (page 2706).

Testing a Stylesheet

An XSpec file contains one or more test scenarios.

Example

Suppose you have this Schematron rule that says sections should have a title:

```
<sch:pattern>
    <sch:rule context="section">
        <sch:assert test="title" id="a002">
            section should have a title
        </sch:assert>
    </sch:rule>
</sch:pattern>
```

The XSpec test could look like this:

```
<x:description xmlns:x="http://www.jenitennison.com/xslt/xspec" schematron="demo-01.sch"/>
```
The `sch:assert` with the `id="a002"` is not expected to be triggered on the first section since it includes a title. This requirement is expressed with the `x:expect-not-assert` element.

Since the second section does not have a title, you would expect the Schematron rule to be triggered and this requirement is expressed with the `x:expect-assert` element.

For more details about how to write Schematron tests and various samples, see [https://github.com/xspec/xspec/wiki/Writing-Scenarios-for-Schematron#writing-tests](https://github.com/xspec/xspec/wiki/Writing-Scenarios-for-Schematron#writing-tests).

### Adding a Catalog to an XSpec Transformation

If your Schematron needs a catalog, you can add one to the XSpec transformation by doing one of the following:

- If you are using a project (page 571) in Oxygen XML Editor plugin, create a `catalog.xml` file in the project directory. This catalog will then be loaded automatically.
- Edit (page 1498) the Run XSpec Test transformation scenario, go to the Parameters tab (page 1461), and set the value of the catalog parameter to the location of your catalog file.

### Editing Schematron Quick Fixes
Oxygen XML Editor plugin provides support for editing the Schematron Quick Fixes (page 886). You can define a library of Quick Fixes by editing them directly in the current Schematron file or in a separate file. Oxygen XML Editor plugin assists you in editing Schematron Quick Fixes with schema-based content completion, syntax highlighting, and validation as you type.

For information about applying and detecting the Schematron schemas that include SQF, see Associating a Schema to XML Documents (page 887).

**Schematron Quick Fixes (SQF)**

Oxygen XML Editor plugin provides support for Schematron Quick Fixes (page 2710) (SQF). They help you resolve issues that appear in XML documents that are validated against Schematron schemas by offering you solution proposals. The Schematron Quick Fixes are an extension of the Schematron language and they allow you to define fixes for Schematron validation messages. Specifically, they are associated with assert or report messages.

A typical use case is using Schematron Quick Fixes to assist content authors with common editing tasks. For example, you can use Schematron rules to automatically report certain validation warnings (or errors) when performing regular editing tasks, such as inserting specific elements or changing IDs to match specific naming conventions. For more details and examples, see the following blog post: http://blog.oxygenxml.com/2015/05/schematron-checks-to-help-technical.html.

**Displaying the Schematron Quick Fix Proposals**

The defined Schematron Quick Fixes are displayed on validation errors in Text mode and Author mode.

*Figure 530: Example of a Schematron Quick Fix*
Defining Schematron Quick Fixes

You can define and customize Schematron Quick Fixes (page 2710) directly in the current Schematron file or in a separate Schematron file. The Schematron Quick Fixes are an extension of the Schematron language and they allow you to define fixes for Schematron error messages. You can refer the Quick Fixes from the assert or report elements in the values of the sqf:fix attributes.

Defining a Schematron Quick Fix

The basics of a Schematron Quick Fix is defined by an ID, name, description, and the operations to be executed.

- **ID** - Defined by the id attribute from the fix element and must be unique in the current context. It is used to refer the Quick Fix from a report or assert element.
- **Name** - The name of the Quick Fix is defined by the title element.
- **Description** - Defined by the text in the paragraphs (p) of the description element.
- **Operations** - The following basic types of operations (elements) (page 1235) are supported:
  - <sqf:add> Element - To add a new node or fragment in the document.
  - <sqf:delete> Element - To remove a node from the document.
  - <sqf:replace> Element - To replace a node with another node or fragment.
  - <sqf:stringReplace> Element - To replace text content with other text or a fragment.

Figure 531: Schematron Quick Fix Components
The assertion message that generates the Quick Fix is added as the description of the problem to be fixed. The title is presented as the name of the Quick Fix. The content of the paragraphs (p) within the description element are presented in the tooltip message when the Quick Fix is selected.

### Additional Elements Supported in the Schematron Quick Fixes

**<sqf:user-entry>**

This element defines a value that must be set manually by the user. For more information, see User Entry SQF Operation (page 1239).

**<sqf:call-fix>**

This element calls another Quick Fix within a Quick Fix. The called Quick Fix must be defined globally or in the same Schematron rule as the calling Quick Fix. A calling Quick Fix adopts the activity elements of the called Quick Fix and should not include other activity elements. You can also specify which parameters are sent by using the `<sqf:with-param>` child element.

**<sqf:group>**

Allows you to group multiple Quick Fixes and refer them from an assert or report element.

**<sqf:fixes>**

Is defined globally and contains global fixes and groups of fixes.

**<sqf:copy-of>**

Used to copy the selected nodes that are specified by the select attribute. The element with its attribute is treated as an xsl:copy-of with a select attribute, as defined in the XSLT specification.
Defines a parameter for a *Quick Fix*. If the parameter is defined as `abstract` then the `type` and default value should not be specified and the fix can be called from an abstract pattern that defines this parameter.

**Other SQF Notes**

**Note:** The `sqf:default-fix` attribute is ignored in Oxygen XML Editor plugin.

For more details on editing Schematron *Quick Fixes*, go to: [Schematron Quick Fix Specifications](#).

**Basic Schematron Quick Fix Operations**

There are four basic operations that can be executed in a Schematron *Quick Fix* (page 2710): *Add, Delete, Replace, and String Replace*.

**Add**

The `<sqf:add>` element allows you to add a node to the instance. An anchor node is required to select the position for the new node. The anchor node can be selected by the match attribute. Otherwise, it is selected by the context attribute of the rule.

The target attribute defines the name of the node to be added. It is required if the value of the node-type attribute is set to anything other than "comment".

The `<sqf:add>` element has a position attribute and it determines the position relative to the anchor node. The new node could be specified as the first child of the anchor node, the last child of the anchor node, before the anchor node, or after the anchor node (`first-child` is the default value). If you want to add an attribute to the anchor node, do not use the position attribute.

**Note:** If you insert an element and its content is empty, Oxygen XML Editor plugin will insert the required element content.

**An Example of the `<sqf:add>` Element:**

```xml
<schema xmlns="http://purl.oclc.org/dsd1/schematron"
   xmlns:sqf="http://www.schematron-quickfix.com/validator/process"
   queryBinding="xslt2">
   <pattern>
   <rule context="head">
   <assert test="title" sqf:fix="addTitle">title element missing.</assert>
   <sqf:fix id="addTitle">
   <sqf:description>
```

```xml
```
Specific Add Operations:

- **Insert Element** - To insert an element, use the `<sqf:add>` element, set the value of the `node-type` to "element", and specify the element QName ([page 2710](#)) with the `target` attribute. If the element has a prefix, it must be defined in the Schematron using a namespace declaration (`<ns uri="namespace" prefix="prefix"/>`).

- **Insert Attribute** - To insert an attribute, use the `<sqf:add>` element, set the value of the `node-type` to "attribute", and specify the attribute QName ([page 2710](#)) with the `target` attribute. If the attribute has a prefix, it must be defined in the Schematron using a namespace declaration (`<ns uri="namespace" prefix="prefix"/>`).

- **Insert Fragment** - If the `node-type` is not specified, the `<sqf:add>` element will insert an XML fragment. The XML fragment must be well formed. You can specify the fragment in the `add` element or by using the `select` attribute.

- **Insert Comment** - To insert a comment, use the `<sqf:add>` element and set the value of the `node-type` to "comment".

- **Insert Processing Instruction** - To insert a processing instruction, use the `<sqf:add>` element, set the value of the `node-type` to "pi" or "processing-instruction", and specify the name of the processing instruction in the `target` attribute.

**Delete**

The `<sqf:delete>` element allows you to remove any type of node (such as elements, attributes, text, comments, or processing instructions). To specify nodes for deletion the `<sqf:delete>` element can include a `match` attribute that is an XPath expression (the default value is `.`). If the `match` attribute is not included, it deletes the context node of the Schematron rule.

**An Example of the `<sqf:delete>` Element:**

```xml
<schema xmlns="http://purl.oclc.org/dsdl/schematron" queryBinding="xslt2"
    xmlns:sqf="http://www.schematron-quickfix.com/validator/process">
    <pattern>
        <rule context="*[@xml:lang]">
```
Replace

The `<sqf:replace>` element allows you to replace nodes. Similar to the `<sqf:delete>` element, it can include a `match` attribute. Otherwise, it replaces the context node of the rule. The `<sqf:replace>` element has three tasks. It identifies the nodes to be replaced, defines the replacing nodes, and defines their content.

An Example of the `<sqf:replace>` Element:

```xml
<schema xmlns="http://purl.oclc.org/dsdl/schematron"
  xmlns:sqf="http://www.schematron-quickfix.com/validator/process"
  queryBinding="xslt2">
  <pattern>
    <rule context="title">
      <report test="exists(ph)" sqf:fix="resolvePh" role="warn">
        ph element is not allowed in title.</report>
      <sqf:fix id="resolvePh">
        <sqf:description>
          <sqf:title>Change the ph element into text</sqf:title>
        </sqf:description>
        <sqf:replace match="ph">
          <value-of select="."/>
        </sqf:replace>
      </sqf:fix>
    </rule>
  </pattern>
</schema>
```

Other Attributes for Replace Operations:
• **node-type** - Determines the type of the replacing node. The permitted values include:
  ◦ *keep* - Keeps the node type of the node to be replaced.
  ◦ *element* - Replaces the node with an element.
  ◦ *attribute* - Replaces the node with an attribute.
  ◦ *pi* - Replaces the node with a processing instruction.
  ◦ *comment* - Replaces the node with a comment.

• **target** - By using a *QName (page 2710)* it gives the replacing node a name. This is necessary when the value of the *node-type* attribute is anything other than "comment".

• **select** - Allows you to choose the content of the replacing nodes. You can use XPath expressions with the *select* attribute. If the *select* attribute is not specified then the content of the `<sqf:replace>` element is used instead.

### String Replace

The `<sqf:stringReplace>` element is different from the others. It can be used to find a sub-string of text content and replace it with nodes or other strings.

**Attributes for the String Replace Operation:**

• **match** - Allows you to select text nodes that contain the sub-strings you want to replace.

• **select** - Allows you to select the replacing fragment, in case you do not want to set it in the content of the *stringReplace* element.

• **regex** - Matches the sub-strings using a regular expression.

**Note:** Consider the following information about using regular expressions in the *stringReplace* element:

◦ The regular expressions from this operation are compiled as Java regular expressions. For more information, see [https://docs.oracle.com/javase/7/docs/api/java/util/regex/Pattern.html](https://docs.oracle.com/javase/7/docs/api/java/util/regex/Pattern.html).

◦ The *j flag* allows you to use the standard Java regular expression engine, which allows native Java regular expression syntax. This allows, for example, the use of \b in a regular expression to match word boundaries. For more information, see [http://www.saxonica.com/html/documentation/functions/fn/matches.html](http://www.saxonica.com/html/documentation/functions/fn/matches.html).

◦ Regular expressions in the `<sqf:stringReplace>` element always have the *dot matches all* flag set to "true". Therefore, the line terminator will also be matched by the regular expression.
• flags - Specifies flags to control the interpretation of the regular expression (given in the regex attribute).

⚠️ Attention: The context of the content within the <sqf:stringReplace> element is set to the whole text node, rather than the current sub-string.

An Example of the <sqf:stringReplace> Element:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<sch:schema xmlns:sch="http://purl.oclc.org/dsdl/schematron"
            xmlns:sqf="http://www.schematron-quickfix.com/validator/process"
            queryBinding="xs1t2">
    <sch:pattern>
        <sch:rule context="text()">
            <sch:report test="matches(., 'Oxygen', 'i')">
                sqf:fix="changeWord">The oXygen word is not allowed</sch:report>
                <sqf:fix id="changeWord">
                    <sqf:description>
                        <sqf:title>Replace word with product</sqf:title>
                    </sqf:description>
                    <sqf:stringReplace regex="Oxygen" flags="i">
                        <ph keyref="product"/>
                    </sqf:stringReplace>
                </sqf:fix>
            </sch:report>
        </sch:rule>
    </sch:pattern>
</sch:schema>
```

Related Information:

• User Entry SQF Operation (page 1239)

• Restricting Quick Fix Operations (page 1240)

User Entry SQF Operation

The <sqf:user-entry> element defines a value that must be set manually by the user. If multiple user-entry elements are defined, Oxygen XML Editor plugin will display a dialog box for each one, in which the user can specify values. Also, the <user-entry> element can be used as an XPath variable where the XPath variable is the name of the user-entry. Note that the default attribute defines a
default value for the operation by using an XPath expression (as in the example below) and its value will be presented in the user entry dialog box.

**An Example of the `<sqf:user-entry>` Element:**

```
<sqf:fix id="editTitle">
  <sqf:description>
    <sqf:title>Edit the journal title</sqf:title>
  </sqf:description>
  <sqf:user-entry name="newTitle" default="@title">
    <sqf:description>
      <sqf:title>Edit the title:</sqf:title>
    </sqf:description>
  </sqf:user-entry>
  <sqf:replace match="@title" target="title" node-type="keep" select="$newTitle"/>
</sqf:fix>
```

**Related Information:**

- [Basic Schematron Quick Fix Operations (page 1235)](page1235)

**Restricting Quick Fix Operations**

To restrict a Quick Fix (page 2710) or a specific operation to only be available if certain conditions are met, the `use-when` attribute can be included in the `<sqf:fix>` element or any of the SQF operation elements. The condition of the `use-when` attribute is an XPath expression and the fix or operation will be performed only if the condition is satisfied. In the following example, the `use-when` condition is applied to the `<sqf:fix>` element:

```
<sqf:fix id="last" use-when="$colWidthSummarized - 100 lt $lastWidth" role="replace">
  <sqf:description>
    <sqf:title>Subtract excessive width from the last element.</sqf:title>
  </sqf:description>
  <let name="delta" value="$colWidthSummarized - 100"/>
  <sqf:add match="html:col[last()]" target="width" node-type="attribute">
    <let name="newWidth" value="number(substring-before(@width,'%')) - $delta"/>
    <value-of select="concat($newWidth,'%")"/>
  </sqf:add>
</sqf:fix>
```
Related Information:

- Basic Schematron Quick Fix Operations (page 1235)

Formatting/Indenting Content Inserted by SQF Operations

Content that is inserted by the Add, Replace, or String Replace Schematron Quick Fix (page 2710) operations is automatically indented unless you set the value of the xml:space attribute to preserve on the operation element. There are several methods available to format the content that is inserted:

- **xsl:text** - You can use an xsl:text element to format the inserted content and keep the automatic indentation, as in the following example:

```xml
<sqf:add position="last-child">
    <row><xsl:text>
        <entry>First column</entry><xsl:text>
        <entry>Second column</entry><xsl:text>
    </row><xsl:text>
</sqf:add>
```

- **xml:space** - Use the xml:space attribute and set its value to preserve to format the content and specify the spacing between elements, as in the following example:

```xml
<sqf:add node-type="element" target="codeblock" xml:space="preserve">
    /* a long sample program */
    Do forever
    Say "Hello, World"
    End</sqf:add>
```

Related Information:

- Basic Schematron Quick Fix Operations (page 1235)

Executing Schematron Quick Fixes in Other Documents
You can apply Schematron Quick Fixes (page 2710) over nodes from referenced documents (using XInclude or external entities), and you can access them as nodes in your current document.

Also, you can apply the Quick Fixes over other documents using the doc() function in the value of the match attribute. For example, you can add a new key in the keylist.xml file using the following operation:

```xml
<sqf:add match="doc('keylist.xml')/KeyList" target="Key"
    node-type="element" select="Key2"/>
```

Generate Multiple Similar Quick Fixes

You can generate the same Schematron Quick Fix (page 2710) for multiple matches. To do this, you can add the use-for-each attribute inside the sqf:fix element and for each match of the XPath expression in the value of the use-for-each attribute, a Quick Fix will be presented to the user. The XPath expression does not change the context of the Quick Fix. If you want to access the current match from the XPath expression, you can use the $sqf:current variable.

Example:

Suppose you want to restrict the user from entering more than 4 list items in a list. The following example presents an error on any list that has more than 4 list items and offers a Quick Fix with multiple proposals where the user would specify which list item to remove.

```xml
<sch:rule context="ul">
    <sch:report test="count(li) gt 4" sqf:fix="removeAnyItem">
        The list cannot contain more than 4 entries.
    </sch:report>
    <sqf:fix id="removeAnyItem" use-for-each="1 to count(li)"
        $sqf:current">
        <sqf:description>
            <sqf:title>Remove item #<sch:value-of select="$sqf:current"/></sqf:title>
        </sqf:description>
        <sqf:delete match="li[$sqf:current]"/>
    </sqf:fix>
</sch:rule>
```

Localizing SQF Messages

Oxygen XML Editor plugin provides support for presenting Schematron Quick Fix messages in multiple languages. The language used for the SQF messages is the language specified in the Message Language option in the Schematron preferences page (page 176). If you want to
provide an alternative message for a specific language, you can reference IDs or key values for the specific alternate text phrase. In Oxygen XML Editor plugin, the alternate text phrase is defined in a `sch:diagnostic` element and it can be used in conjunction with `sch:assert` or `sch:report` elements.

**Example:**

The following example presents a quick fix with a different message depending on whether the user's language is English or German.

```
<sch:rule context="dog">
  <sch:assert test="bone" diagnostics="d_en d_de" sqf:fix="addBone" >
    A dog should have a bone.</sch:assert>

  <sqf:fix id="addBone">
    <sqf:description>
      <sqf:title ref="fix_en fix_de" xml:lang="en">Add a bone</sqf:title>
      <sqf:p ref="fix_desc_en fix_desc_de" xml:lang="en">Add bone element as child</sqf:p>
    </sqf:description>
    <sqf:add node-type="element" target="bone"/>
  </sqf:fix>
</sch:rule>
```

```
<sch:diagnostics xml:lang="en">
  <sch:diagnostic id="d_en">A dog should have a bone. </sch:diagnostic>
  <sch:diagnostic id="fix_en">Add a bone </sch:diagnostic>
  <sch:diagnostic id="fix_desc_en">Add a bone element as child</sch:diagnostic>
</sch:diagnostics>
```

```
<sch:diagnostics xml:lang="de">
  <sch:diagnostic id="d_de">Ein Hund sollte ein Bein haben. </sch:diagnostic>
  <sch:diagnostic id="fix_de">Fügen Sie einen Knochen hinzu </sch:diagnostic>
  <sch:diagnostic id="fix_desc_de">Fügen Sie ein Knochenelement als untergeordnetes Element hinzu</sch:diagnostic>
</sch:diagnostics>
```

Integrating SQF in a Framework and Sharing Them
You can use Schematron *Quick Fixes (page 2710)* to assist your content authors by imposing rules for an entire *framework (page 2706)* (document type) and offering fixes when a rule violation is detected.

For example, if you are using DITA, you may want your contributors to avoid inserting a figure (*fig* element) inside a paragraph (*p* element) that contains other content since it may result in undesirable placement or spacing in the output. The Schematron rule and its *Quick Fix* for this particular use-case could look like this:

```xml
<schema xmlns="http://purl.oclc.org/dsdl/schematron"
         xmlns:sqf="http://www.schematron-quickfix.com/validator/process"
         queryBinding="xslt2">
  <pattern id="check.figure.location">
    <rule context="p/fig">
      <report test="true()" role="warn" sqf:fix="moveAfter">
        A figure inside a paragraph doesn't transform well into PDF. </report>
      <sqf:fix id="moveAfter">
        <sqf:description>
          <sqf:title>Move after the paragraph.</sqf:title>
        </sqf:description>
        <let name="figToMove" value="."/>
        <sqf:add match="parent::p" select="$figToMove" position="after"/>
        <sqf:delete match="."/>
      </sqf:fix>
    </rule>
  </pattern>
</schema>
```

The result of this example would be that the user will see a warning if they insert a *fig* element inside a *p* element and they are presented with the option of selecting the *Quick Fix* that would move the figure outside the paragraph.

**How to Integrate SQF in a Framework**

To integrate a Schematron *Quick Fix* in a *framework (page 2706)*, follow these steps:

1. Create a folder structure for an extended framework and save it somewhere on disk where you have full write access (for example, *custom_frameworks/dita-extension*).
2. In that new folder structure, create another folder that will contain all of your custom Schematron files (for example, *custom_frameworks/dita-extension/rules*).
3. Define the Schematron **Quick Fix for a rule** *(page 1233)* in an existing or new Schematron file and save it in the folder you created in step 2.

4. Open the **Preferences** dialog box *(page 55)* and go to **Document Type Association > Locations** *(page 71)*. In this preferences page, add the path to your `custom_frameworks` folder in the **Additional frameworks directories** list, then click **OK** or **Apply** to save your changes.

5. Go to the **Document Type Association** preferences page *(page 69)* and select a **framework** configuration (for example, **DITA**) and use the **Extend** button to create an extension for it.

6. Give the extension an appropriate name (for example, **DITA - Custom**), select **External** for the **Storage** option, and specify an appropriate path to your framework configuration file (for example, `path/to/.../custom_frameworks/dita-extension/dita-extension.framework`).

7. Make whatever changes you desire to the extension, then go to the **Validation** tab, edit the default validation scenario (select the scenario and click the **Edit** button), and add an extra validation unit to it (one that uses your custom Schematron file that includes the SQF). For more details about editing validation scenarios, see Configuring Validation Scenarios for a Framework *(page 2054)*.

8. Click **OK** to close the dialog box and then **OK** or **Apply** to save the changes to the **Document Type Association** preferences page *(page 69)*.

9. Add a reference to the Schematron file that includes the SQF in your **framework** by following the procedure in Associating a Schema in Validation Scenarios Defined in the Document Type *(page 892)*.

10. Open a document in your **framework** and test the new rule and **Quick Fix**.

11. You can continue to refine the Schematron and develop additional rules as needed.

**Sharing Schematron Quick Fixes**

To share Schematron Quick Fixes with other members of your team, you simply need to share the framework where you integrated the SQF. There are several methods for sharing frameworks and you can find details here: Sharing a Custom Framework *(page 2086)*.

**Related Information:**

- Defining Schematron Quick Fixes *(page 1233)*
- Basic Schematron Quick Fix Operations *(page 1235)*
- Associating a Schema in Validation Scenarios Defined in the Document Type *(page 892)*
Validating Schematron Quick Fixes

By default, Schematron Quick Fixes (page 2710) are validated as you edit them within the Schematron file or while editing them in a separate file. To change this, open the Preferences dialog box (page 55), go to Editor > Document Checking, and deselect the Enable automatic validation option (page 109).

To validate Schematron Quick Fixes manually, select the Validate action from the Validation toolbar drop-down menu or the XML menu. The validation problems are highlighted directly in the editor, making it easy to locate and fix any issues.

Related Information:

- Presenting Validation Errors in Text Mode (page 271)

Content Completion in SQF

Oxygen XML Editor plugin helps you edit Schematron Quick Fixes (page 2710) embedded in a Schematron document by offering proposals that are valid at the cursor position in a Content Completion Assistant (page 2704). It can be manually activated with the Ctrl + Space (Command + Space on OS X) shortcut.

When you edit the value of an attribute that references a Quick Fix ID, the ids are collected from the entire definition scope. For example, if the editing context is assert/@sqf:fix, the Content Completion Assistant proposes all fixes defined locally and globally.

If the editing context is an attribute value that is an XPath expression (such as sqf:add/@match or replace/@select), the Content Completion Assistant offers the names of XPath functions, the XPath axes, and user-defined variables and parameters.
The Content Completion Assistant displays XSLT 1.0 functions (and optionally XSLT 2.0 / 3.0 functions) in the attributes path, select, context, subject, and test, depending on the Schematron options (page 175) that are set in Preferences pages. If the Saxon 6.5.5 namespace (xmlns:saxon="http://icl.com/saxon") or the Saxon 9.8.0.12 namespace is declared in the Schematron schema (xmlns:saxon="http://saxon.sf.net/") the content completion also displays the XSLT Saxon extension functions.

Highlight Quick Fix Occurrences in SQF

When you position your mouse cursor over a Quick Fix (page 2710) ID in a Schematron document, Oxygen XML Editor plugin searches for the Quick Fix declaration and all its references and highlights them automatically.

Customizable colors are used: one for the Quick Fix definition and another one for its references. Occurrences are displayed until another Quick Fix is selected.

To change the default behavior of Highlight Component Occurrences, open the Preferences dialog box (page 55) and go to Editor > Mark Occurrences. You can also trigger a search using the Search > Search Occurrences in File (Ctrl + Shift + U (Command + Shift + U on OS X)) action from contextual menu. Matches are displayed in separate tabs of the Results view (page 267).

Searching and Refactoring Operations in SQF

Search Actions

The following search actions can be applied on Quick Fix (page 2710) IDs and are available from the Search submenu in the contextual menu of the current editor:

Search References

Searches all references of the item found at current cursor position in the defined scope, if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box is displayed and you have the possibility to define another search scope.

Search References in

Searches all references of the item found at current cursor position in the file or files that you specify when define a scope in the Search References dialog box.

Search Declarations
Searches all declarations of the item found at current cursor position in the defined scope if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box will be displayed and you have the possibility to define another search scope.

**Search Declarations in**

Searches all declarations of the item found at current cursor position in the file or files that you specify when you define a scope for the search operation.

**Search Occurrences in File**

Searches all occurrences of the item at the cursor position in the currently edited file.

**Refactoring Actions**

The following refactoring actions can be applied on Quick Fix IDs and are available from the Refactoring submenu in the contextual menu of the current editor:

**Rename Component**

Allows you to rename the current component (in-place). The component and all its references in the document are highlighted with a thin border and the changes you make to the component at the cursor position are updated in real time to all occurrences of the component. To exit the in-place editing, press the Esc or Enter key on your keyboard.

**Rename Component in**

Opens a dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the Preview button, you can view the files to be affected by the action.

*Figure 532: Rename Identity Constraint Dialog Box*
Embedding Schematron Quick Fixes in Relax NG or XML Schema

Schematron Quick Fixes (page 2710) can be embedded into an XML Schema through annotations (using the appinfo element), or in a Schematron rule embedded in the RELAX NG Schema. For more information about embedding Schematron in XML Schema or Relax NG, see Embedding Schematron Rules in XML Schema or RELAX NG (page 1220).

Oxygen XML Editor plugin is able to extract and use the embedded Schematron Quick Fixes. To make the embedded Schematron Quick Fixes available, follow these steps:

1. Define a validation against a schema (page 856).
2. For the Schema type, choose XML Schema or Relax NG.
3. Select the Embedded Schematron rules option.

Example: Embedded Schematron Quick Fix in XML Schema

```
<xsd:appinfo>
  <sch:pattern>
    <sch:rule context="...">
      <sch:assert test="..." sqf:fix="fixId">Message.</sch:assert>
      <sqf:fix id="fixId">
        ...
      </sqf:fix>
    </sch:rule>
  </sch:pattern>
</xsd:appinfo>
```
Example: Embedded Schematron Quick Fix in Relax NG

```xml
<grammar
    xmlns="http://relaxng.org/ns/structure/1.0"
    xmlns:sch="http://purl.oclc.org/dsdl/schematron">
  <sch:pattern>
    <sch:rule context="...">
      <sch:assert test="..." sqf:fix="fixId">Message.</sch:assert>
      <sqf:fix id="fixId">
        ......
      </sqf:fix>
    </sch:rule>
  </sch:pattern>
  <start>
    ..............
  </start>
</grammar>
```

Tip: For more extensive examples, see the samples in the `[OXYGEN_INSTALL_DIR]/samples/schematron` folder.

Editing XHTML Documents

Oxygen XML Editor plugin provides support for editing XHTML files. Oxygen XML Editor plugin includes XHTML catalogs and document templates to help you get started. You can also find a sample file in the `[OXYGEN_INSTALL_DIR]/samples/xhtml` folder.

The XHTML editing features include:

Framework-specific Support

The built-in XHTML framework (page 1344) includes new document templates, XHTML-specific validation, content completion, and built-in transformation scenarios.
Source Editing

You can edit XHTML files in the **Text editing mode** *(page 614)* (XML source editor) using all of its **useful features** *(page 614)*.

**Syntax Highlighting**

XHTML documents with embedded CSS, JS, PHP, and JSP scripts are rendered with dedicated coloring schemes. To customize them, open the **Preferences** dialog box *(page 55)* and go to **Editor > Syntax Highlight** *(page 149)*. Select and expand the **XHTML** section in the top pane and you can see the effects of your changes in the **Preview** pane.

Visual Editing

You can edit XHTML files in the **visual Author editing mode** *(page 672)* using all of its **authoring features** *(page 672)*.

**XHTML-specific Author Mode Actions**

A variety of **Author Mode** default actions *(page 1346)* are available on the toolbar, in the contextual menu, and in the **XHTML** menu.

**XHTML-specific CSS Rendering**

Oxygen XML Editor plugin includes built-in default CSS files used for rendering XHTML content in **Author mode** *(page 1344)*.

**Print Ready CSS Style**

You can select **+Print ready** from the **Styles** toolbar drop-down menu to render XHTML documents with an **alternate CSS style** *(page 2703)* that displays the document in **Author** mode similar to how the document will look when printed.

Import HTML as XHTML

Oxygen XML Editor plugin includes support for **importing HTML files as an XML document** *(page 2002)*.

Remote Editing

Oxygen XML Editor plugin has built-in support for **editing documents that are stored on remote servers through FTP, SFTP, and WebDAV protocols** *(page 562)*, allowing you to edit XHTML pages from your web server.

- XHTML Document Type (Framework) *(page 1344)*
Editing Markdown Documents

Markdown was created as a lightweight markup language with plain text formatting syntax designed to provide a syntax that is very easy to read and write, and to convert it to HTML and other formats. It is often used by content contributors who want a quick and easy way to write content without having to take their fingers off the keyboard and without having to learn numerous codes or shortcuts, and it can easily be shared interchangeably between virtually any types of contributor and system.

Oxygen XML Editor plugin provides a built-in Markdown editor that allows you to convert Markdown syntax to HTML or DITA and it includes a preview panel to help you visualize the final output. Aside from the plain text syntax that is common amongst most Markdown applications, the editor in Oxygen XML Editor plugin also integrates many other powerful features that content authors are accustomed to using for other types of documents. Some of these additional unique features include:

- Additional toolbar and contextual menu actions.
- Automatic validation to help keep the syntax valid.
- Dedicated syntax highlighting to make Markdown documents even easier to read and write.
- Unique features for creating Markdown documents directly in DITA maps (page 2705) and converting Markdown documents to DITA topics.
- Specialized syntax rules to combine popular syntax features from several specifications.

Markdown Editor

Oxygen XML Editor plugin provides an intuitive, dynamic, and easy-to-use Markdown editor for writing and converting Markdown documents. It is a split-screen editor with two panels that are synchronized in real-time. The left side is a simple text editor that is specially designed for writing Markdown syntax. The right side is a WYSIWYG style preview of how changes will look in the output.

Markdown Text Editor Pane (Left Side)

The left pane is a simple text editor that is refined to accept Markdown syntax. At the same time, you still have many of the actions, options, and features that you are used to when editing any other type of document in Oxygen XML Editor plugin.

The features of this special editor that are unique for Markdown documents include:

- **Unique Markdown Syntax Rules** - The Markdown editor in Oxygen XML Editor plugin uses an integration of rules (page 1262) that combine rules from common default Markdown syntax along with many of the rules used in the GitHub Flavored Markdown syntax.
• **Syntax Highlighting** - The Oxygen XML Editor plugin syntax highlighting feature is integrated into the Markdown text editor to make it easier to read and write Markdown syntax. You can even customize the colors and styles for the syntax highlighting (page 1258).

• **Automatic Spell Checking** - The Markdown editor supports the Oxygen XML Editor plugin automatic spell checking feature (page 596) that reports possible misspelled words as you type. You simply need to select the Automatic spell check option in the Spell Check preferences page (page 145), then click the Select editors button and select Markdown Editor.

• **Helpful Toolbar and Contextual Menu Actions** - A variety of unique actions (page 1255) are available from the toolbar to help you insert proper Markdown syntax. The contextual menu also includes some common editing actions, as well as unique actions to export (convert) Markdown documents to HTML or DITA.

**WYSIWYG Preview Pane (Right Side)**

The right pane is a WYSIWYG Preview pane that shows a visual representation of how changes made in the left-side text editor will be converted to HTML or DITA output. The changes you make in the text editor are parsed continually and they are immediately visible in the Preview pane. There are two tabs available in the Preview pane, one for visualizing DITA output and one for visualizing HTML output. You can switch between the two tabs at the bottom of the pane.

The Preview pane includes the following unique features:

• **WYSIWYG Visualization** - This pane presents the Markdown syntax from the left-side text editor in a visual WYSIWYG style interface that is automatically synchronized as you type.

• **Export Options** - The DITA tab includes a contextual menu action to export (convert) the current Markdown document to a DITA topic (page 1258). Similarly, the HTML tab includes a contextual menu action to export (convert) it to an XHTML document (page 1258).

• **Automatic Validation** - As you edit Markdown documents, they are validated automatically (page 1259). The conversion engine constantly tries to parse your changes and if a change results in an error that prevents the parser from converting the syntax, an error message will be displayed in the Preview pane or Results view (page 267) at the bottom of the editor.

• **Print Feature** - The Markdown editor includes a Print action that is available in the contextual menu and it allows you to configure options for printing the current document as you see it in the Preview pane.

• **Preview Markup** - The Markdown editor includes a Tags Display Mode drop-down menu (page 1257) that is available on the toolbar and it allows you to control the amount of markup that is displayed in the Preview pane.

• **Specialized DITA Features** - The Markdown editor includes some unique, specialized features to integrate it with the powerful DITA support (page 1259) in Oxygen XML Editor plugin.

*Figure 533: Markdown Editor in Oxygen XML Editor plugin*
Creating New Markdown Documents

To create a new Markdown document in Oxygen XML Editor plugin, follow these steps:

1. Click the **New** button on the toolbar or select **File > New**.
2. Select the **Markdown** document template.
3. Click **Next**.
4. Choose the storage path and a file name for the new document.
5. Click the **Finish** button.

### Actions Available in the Markdown Editor

Aside from the actions that are available in Oxygen XML Editor plugin for any type of document (such as the actions in the various menus and the common sections of the toolbar), a variety of unique actions are also available in the Markdown editor, from the toolbar and contextual menu.

#### Toolbar Actions

The following default actions are readily available on the toolbar when editing Markdown documents:

- **Header (1st Level)**
  
  Inserts an [atx-style first level header](page 1262) at the cursor position.

- **Header (2st Level)**
  
  Inserts an [atx-style second level header](page 1262) at the cursor position.

- **Header (3rd Level)**
  
  Inserts an [atx-style third level header](page 1262) at the cursor position.

- **Horizontal Rule**
  
  Inserts a [horizontal rule](page 1263) at the cursor position.

- **Bold (Strong)**
  
  Marks the selected text with [bold](page 1264).

- **Italic (Emphasis)**
  
  Marks the selected text with [italics](page 1264).

- **Strikethrough**
  
  Marks the selected text with a [strikethrough](page 1264).

- **Code Block**
Inserts (or surrounds selected text in) a **codeblock (page 1268)**.

**Blockquote**

Inserts a **blockquote (page 1267)** at the cursor position.

**Insert Link**

Opens the **Insert Link** dialog box that allows you to define a **link (page 1264)** to insert at the cursor position.

*Figure 534: Insert Link Dialog Box*

![Insert Link Dialog Box](image)

**Insert Image**

Opens the **Insert Image** dialog box that allows you to define an **image (page 1266)** to insert at the cursor position. You can type the URL of the image you want to insert or use browsing actions in the **Browse** drop-down menu.

*Figure 535: Insert Link Dialog Box*

![Insert Image Dialog Box](image)

**Insert Ordered List**

Inserts an **ordered list (page 1270)** at the cursor position. Three child list items are also automatically inserted by default. You can also use this action to convert selected content to an ordered list.

**Insert Unordered List**

Inserts an **unordered list (page 1270)** at the cursor position. Three child list items are also automatically inserted by default. You can also use this action to convert selected content to an unordered list.
Insert Task List

Inserts a task list (page 1272) at the cursor position. Three child list items are also automatically inserted by default. You can also use this action to convert selected content to a task list.

Insert Table

Inserts a table (page 1272) at the cursor position.

Tags Display Mode drop-down menu

Allows you to control the amount of markup that is displayed in the Preview pane and offers the following choices:

- **Full Tags with Attributes**
  Displays full tag names with attributes for both block and inline elements.

- **Full Tags**
  Displays full tag names without attributes for both block and inline elements.

- **Block Tags**
  Displays full tag names for block elements and simple tags without names for inline elements.

- **Inline Tags**
  Displays full tag names for inline elements, while block elements are not displayed.

- **Partial Tags**
  Displays simple tags without names for inline elements, while block elements are not displayed.

- **No Tags**
  No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

Configure Tags Display Mode

Opens the Author preferences page (page 110) where you can configure options regarding tags, such as the default Tags Display Mode, Tags Background Color, Tags Foreground Color, and Tags Font.
Contextual Menu Actions

The following default actions are available in the contextual menu when editing Markdown documents:

- **Cut, Copy, Paste**
  
  Use these actions to execute the typical editing actions on the currently selected content.

- **Show/Hide Preview**
  
  A toggle action that shows or hides the Preview pane.

- **Export as DITA Topic**
  
  Converts the current Markdown document into a DITA topic.

- **Export as HTML**
  
  Converts the current Markdown document into an XHTML document.

- **Print (Available in the Preview pane)**
  
  Opens a page setup dialog box that allows you to configure printing options for the current document.

Syntax Highlighting in the Markdown Editor

Oxygen XML Editor plugin supports syntax highlighting in the Markdown editor to make it easier to read the semantics of the structured content by displaying each type of XML code in different colors and fonts.

To customize the colors or styles used for the syntax highlighting colors for Markdown documents, follow these steps:

1. Open the Preferences dialog box *(page 55).*
2. Go to Editor > Syntax Highlight (page 149).
3. Select and expand the Markdown section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.

You can see the effects of your changes in the Preview pane.

Related Information:

- Syntax Highlight Preferences (page 149)
- Markdown Editor (page 1252)

**Automatic Validation in Markdown Documents**

Markdown documents are validated automatically as you type. The conversion engine constantly tries to parse your changes to display the results in the Preview pane. If a change results in an error that prevents the parser from converting the syntax, an error message will be displayed in the DITA tab or in the Results view (page 267) at the bottom of the editor.

The types of errors that will be reported include the following:

- Improper order of headers.
- The syntax in a documents begins with something other than a 1st level header.
- Tags are not closed properly if XHTML markup is used in the document.
- Invalid tag names if XHTML markup is used in the document.
- Markup is not well formed if XHTML markup is used in the document.

Related Information:

- Markdown Editor (page 1252)

**Working with Markdown Documents in DITA**

Oxygen XML Editor plugin includes some unique features that allow you to easily integrate Markdown documents in a DITA project. This is especially helpful for teams that have contributors who are familiar with the Markdown syntax, but they want their output to be generated from DITA projects. The integration between the Markdown editor and DITA includes actions to export or convert Markdown
documents to DITA topics and the DITA tab in the Preview pane provides a visualization of how the topic will look after conversion.

Export Markdown as a DITA Topic

The Markdown editor includes an option to quickly convert the current Markdown document into a DITA topic. The Export as DITA Topic action is available in the contextual menu.

The conversion creates a new XML file that is defined as a DITA topic and opens it in the Text editing mode. You can then work with the document as you would with any other DITA topic, although you may need to manually correct some issues where the parser could not properly map Markdown syntax to DITA markup.

Working with Markdown Documents in the DITA Maps Manager

Oxygen XML Editor plugin has some specialized features that allow you to integrate Markdown documents directly into your DITA project using the DITA Maps Manager (page 2400). The following features are available for Markdown documents in the DITA Maps Manager view:

- **Insert Reference to Markdown Document** - You can use the New, Reference, and Reference to the currently edited file actions from the Append Child, Insert Before, or Insert After submenu when invoking the contextual menu in the DITA Maps Manager to insert a reference to a Markdown document at the selected location in the map. Markdown documents will be inserted as a topic reference (topicref element) with the format attribute set to markdown.

- **Validate Markdown Documents in DITA Maps** - When you use the Validate and Check for Completeness action from the DITA Maps Manager toolbar to check the integrity of the structure of a DITA map, Markdown documents that are referenced in the DITA map will be converted to DITA topics in the background and validated the same as any other DITA topic.

- **Transforming DITA Maps with Markdown Documents** - When transforming DITA maps that have Markdown documents referenced, the transformation will convert the Markdown documents to normal DITA output without you needing to manually convert the Markdown documents to DITA topics.

- **Manually Convert Markdown Documents to DITA Topics** - If you need to use DITA semantics that are not possible in Markdown syntax (such as content references, related links, and other DITA-specific syntax), you can manually convert the Markdown document into a DITA topic. To do so, right-click the Markdown document in the DITA Maps Manager and select Refactoring > Convert Markdown to DITA Topic. This will open a dialog box that allows you to configure options for converting the document to an XML file that is defined as a DITA topic.

Figure 536: Convert Markdown to DITA Topic Dialog Box
This dialog box includes the following options:

**Destination**

The destination path for the new DITA topic.

**File Name**

Presents the current name and allows you to change it.

**Update references**

Select this option to update all references of the file in the DITA map and in the files referenced from the DITA map.

**Delete Markdown file**

If selected, the Markdown version of the file is deleted when the document is converted into a DITA file. If deselected (default value), when the document is converted into a DITA file, the original Markdown file is also preserved in its current location.

**Preview**

Select this button to display a preview of the changes Oxygen XML Editor plugin is about to make.

**Convert**

Select this button to perform the conversion. If the Markdown file has format="markdown", it will be converted to a DITA topic. If it has format="mdita", it will be converted to a LightWeight DITA topic.

**Tip:** Oxygen XML Editor plugin comes with a sample ditamap project for converting Markdown to DITA. Go to the Navigator view (page 250), open the sample.xpr project, and navigate to the dita/markdown-dita folder.

**Related Information:**
Markdown Editor Syntax Rules and Specifications

The Markdown editor in Oxygen XML Editor plugin uses rules that were integrated from the most common set of default Markdown syntax rules along with many of the GitHub Flavored Markdown rules.

The Oxygen XML Editor plugin implementation of the most commonly used syntax rules are as follows:

**Headers**

The Markdown editor supports two styles of headers, *Setext* and *Atx*.

**Setext Style**

Setext-style headers are underlined using equal signs (for first-level headers) and dashes (for second-level headers). Any number of equal signs or dashes will result in the same output.

**Example: Setext Style Headers**

<table>
<thead>
<tr>
<th>First-Level Header (H1)</th>
</tr>
</thead>
<tbody>
<tr>
<td>============</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Second-Level Header (H2)</th>
</tr>
</thead>
<tbody>
<tr>
<td>=============</td>
</tr>
</tbody>
</table>

**Atx Style**

Atx-style headers use 1-6 hash characters at the start of the line, corresponding to header levels 1-6. Optionally, you may close atx-style headers. This is purely cosmetic and the closing hashes
do not need to match the number of hashes used to open the header. It is the number of opening
hashes that determines the header level.

**Example: Atx Style Headers**

| \# H1 text \# |
| \## H2 text |
| ### H3 text ###### |
| #### H4 text |
| ##### H5 text ### |
| ###### H6 text |

**Horizontal Rules (for HTML output only)**

You can produce a horizontal rule tag ( `<hr />` ) by placing three or more hyphens, asterisks, or
underscores on a line by themselves (they also need to be preceded and followed by a blank line).
Optionally, they can be separated by spaces.

**Example: Horizontal Rules**

```
* * *
*****
---------------------------------------
_ _ _ _
```

**Paragraphs and Line Breaks**

A paragraph is simply one or more consecutive lines of text, separated by one or more blank lines.
The text at the beginning of a paragraph should not be indented with spaces or tabs. To create a new
paragraph, simply insert a blank line in between them.

⚠️ **Important:** When converting to HTML, if you break a paragraph on multiple lines (without a blank
line in between them), it will create a break tag ( `<br />` ). When converting to DITA, the text is kept in
a single paragraph in this case and a blank line is required to break a paragraph. This behavior differs
slightly from the default Markdown rules.

**Example: Paragraphs**

This is a paragraph that contains
Styling Text

The Markdown editor supports some syntax rules for styling text (such as bold, italic, or strikethrough).

- **Italic (Emphasis)** - Text wrapped with one asterisk or underscore produces an italic (emphasis) tag.

  *italic*
  _italic_

- **Bold (Strong)** - Text wrapped with two asterisks or underscores produces a bold (strong) tag.

  **bold**
  __bold__

- **Strikethrough** - In HTML only, text wrapped with two tildes (~~) produces a strikethrough tag.

  ~~strikethrough~~

Tip: You can also combine these styling rules. For example, **BoldText _ItalicText_ BoldText** would produce italicized text within bold text. Also, if you surround an asterisk or underscore with spaces, it will be treated as a literal asterisk or underscore. To produce a literal asterisk or underscore at a position where it would otherwise be used as an styling delimiter, you can escape it with a backslash (for example, \*literal asterisks\*).

Links

The Markdown editor supports two types of links, *inline* and *reference*. In both cases, it begins with link text that is delimited by [square brackets].

- **Inline Links**

  To create an inline link, use a set of regular parentheses immediately after the closing square bracket for the link text. Inside the parentheses, put the URL where you want the link to point, and optionally a title surrounded in quotes. Also, if you referencing a local resource on the same server, you can use relative paths.

Examples: Inline Link
With a title:

Text with [example link text](http://www.example.com/path "Title") inline link and title.

Without a title:

Text with [example link text](http://www.example.com/path) inline link without a title.

Relative path:

Text with [example link text](/relative_path/) inline link with relative path.

• Reference Links

Reference-type links use a second set of square brackets that include a label (link identifier) to identify the link (it may consist of letters, numbers, spaces, and punctuation and it is not case-sensitive). You can optionally use a space to separate the sets of brackets. The labels (link identifiers) are only used for creating the links and do not appear in the output.

Text with [link text1][id 1] a reference-type link and [link text2][id_2] another one.

Then, somewhere in the document, you need to define your link label on a line by itself. The link identifier must be within square brackets followed by a colon, then after one or more spaces the URL for the link. Optionally this can be followed by a title enclosed in single quotes, double quotes, or parentheses. Also, the link may optionally be enclosed in angle brackets (< >).

[id 1]: http://example1.com/ "Optional Title"
[id_2]: <http://example2.com/> "Optional Title2"

Other notes about Reference Links:

◦ You can put the title on a second line and use extra spaces or tabs for padding. This is useful for aesthetics when the URL is long.

[id]: http://example.com/long/path/to/resource/here
"Optional Title Here"

◦ The label (link identifier) can be missing, in which case the link text (in square brackets) is used as the name.

[My Link][]

and then defined as:
Automatic Links

The Markdown editor supports a shortcut style for creating automatic links for URLs and email addresses. You simply surround the URL or email address with angle brackets.

**Note:** These automatic links only work properly in HTML conversions. The Preview pane may display them properly in the DITA tab, but the DITA output will not properly recognize the format.

- **URLs**

  By surrounding a URL with angle brackets, you can show the actual text of the URL while also making it clickable in the output.

  `<http://example.com/>`

  For example, in HTML it is converted to:

  `<a href="http://example.com/">http://example.com/</a>`

- **Email Addresses**

  Automatic links for email addresses work similarly, except that Markdown will also perform a bit of randomized decimal and hex entity-encoding to help obscure your address from address-harvesting spambots.

  `<address@example.com>`

  In HTML, it is converted to something like:

  `<a href="&#x6D;ailto:addres&#115;@example.co&#109;e&#x2E;&#99;&#111;"">address@example.com</a>`

Images

The Markdown editor uses an image syntax that is intended to resemble the syntax for links, allowing for the same two types: *inline* and *reference*. In both cases, the syntax for images begin with an exclamation mark, followed by `alt` attribute text surrounded by square brackets., and then followed by a set of parentheses that contain the URL or path to the image.
• **Inline Images**

For inline images, use a set of regular parentheses immediately after the closing square bracket for the `alt` attribute text. Inside the parentheses, put the URL or path of the image, and optionally a title surrounded in quotes.

**Examples: Inline Images**

With a title:

```
Text with ![Alt text](/path/to/img.jpg "Optional title") inline image and a title.
```

Without a title:

```
Text with ![Alt text](/path/to/img.jpg) inline link without a title.
```

• **Reference Images**

For reference-type images, use a second set of square brackets that include a label (image identifier) to identify the image (it may consist of letters, numbers, spaces, and punctuation and it is not case-sensitive). You can optionally use a space to separate the sets of brackets. The labels (image identifiers) do not appear in the output.

```
Text with ![Alt text1][id] a reference-type image.
```

Then, somewhere in the document, you need to define your image label on a line by itself. The image identifier must be within square brackets followed by a colon, then after one or more spaces the URL or path of the image. Optionally this can be followed by a title enclosed in single quotes, double quotes, or parentheses.

```
[id]: url/to/image "Optional Title"
```

**Blockquotes**

The Markdown editor uses email-style greater than characters (>) for blockquotes. You only need to put the `>` before the first line of a hard-wrapped paragraph, but it looks better (and is more clear) if you put a `>` before every line.

• **Example: Blockquotes**

```
> This is a blockquote with two paragraphs. Lorem ipsum dolor sit amet, consectetur adipiscing elit. Aliquam hendrerit mi posuere lectus. Vestibulum enim wisi, viverra nec, fringilla in, laoreet vitae, risus.
> ```
Donec sit amet nisl. Aliquam semper ipsum sit amet velit. Suspendisse id sem consectetur libero luctus adipiscing.

- **Blockquotes** can be nested by adding additional levels of > characters.

**Example: Nested Blockquotes**

```markdown
> This is the first level of quoting.
>
> > This is nested blockquote.
>
> Back to the first level.
```

- **Blockquotes** can also contain other Markdown elements (such as headers, lists, and code blocks).

**Example: Blockquotes with Other Markdown Elements**

```markdown
> ## This is a header.

> 1. This is the first list item.
> 2. This is the second list item.

> Here's some example code:

> return shell_exec("echo $input | $markdown_script")
```

**Quoting Code (Inline and Code Blocks)**

The Markdown editor supports quoting code or commands inline within a sentence or in distinct blocks.

- **Inline**

  You can quote or emphasize code within a sentence (inline) with single backticks (`). The text within the backticks will not be formatted.

**Example: Inline Code Emphasis**

```markdown
This is a normal sentence with a `code` in the middle.
```

- **Code Blocks**
You can format code or text into its own distinct block by inserting a blank line before and after the content and using at least 4 spaces (or 1 tab), or by using opening and closing triple backticks (` ` `) on separate lines.

**Example: Code Block**

```
This is a normal paragraph:

This is a code block

This is a normal paragraph:

```

One level of indentation is removed from each line of a codeblock and it continues until it reaches a line that is not indented (or until the closing backticks).

**Example: Code Block with Indentation**

```
tell application "something"
  beep
end tell
```

For example, in HTML the result would look like this:

```html
<pre><code>tell application "Foo"
  beep
end tell
</code></pre>
```

You can also add an optional language identifier to enable syntax highlighting in your code blocks. The Oxygen XML Editor plugin Markdown editor supports the following languages: Java, JavaScript, CSS, and Python.

**Example: Syntax Highlighting in Code Block**

```
```
css
input[type="submit"] {
  color: white;
  font-weight: bold;
```
Inline XHTML (for HTML output only)

The Markdown editor supports writing inline XHTML. Since Markdown is just a writing format, it requires a conversion for publishing purposes. If you are using the HTML conversion, for any markup that is not covered by Markdown syntax, you can simply use XHTML syntax.

**Example: Inline XHTML**

```
This is a regular paragraph.

<table>
  <tr>
    <td>Col 1</td>
    <td>Col 2</td>
  </tr>
</table>

This is another regular paragraph.
```

Lists

The Markdown editor supports ordered and unordered lists. You can also insert blockquotes (page 1267) and code blocks (page 1268) inside list items. List markers typically start at the left margin, but may be indented by up to three spaces.

- **Unordered Lists**

  For unordered lists, you can use asterisks (*), plus signs (+), and hyphens (-) interchangeably.

  * List item 1
  + List item 2
  - List item 3

- **Ordered Lists**

  For ordered lists, use numbers followed by periods. The actual numbers you use have no effect on the output. It simply converts them to list items within an ordered list an the actual number of list items will determine the numbers in the output.

  1. List item 1
  8. List item 2
5. List item 3

- **Nested Lists**

You can create nested lists by indenting lines by two spaces.

1. Ordered list item 1
   1. Nested ordered list item 1
   2. Nested ordered list item 2
      * 2nd level nested unordered list item 1
      * 2nd level nested unordered list item 2
      * 3rd level nested unordered list item 1
   2. Ordered list item 2

- **Paragraphs Inside Lists**

If list items are separated by blank lines, Markdown will wrap the items in a paragraph in the output.

* List item 1
* List item 2

For both DITA and HTML output, this would result in:

```html
<ul>
  <li><p>List item 1</p></li>
  <li><p>List item 2</p></li>
</ul>
```

- **Multiple Paragraphs Inside Lists**

List items may consist of multiple paragraphs. Each subsequent paragraph in a list item must be indented by either 4 spaces or one tab. Optionally, you can also indent each line of a paragraph to make it look nicer.

1. This is a list item with two paragraphs. Lorem ipsum dolor sit amet, consectetuer adipiscing elit. Aliquam hendrerit mi posuere lectus.
   Vestibulum enim wisi, viverra nec, fringilla in, laoreet vitae, risus. Donec sit amet nisl. Aliquam semper ipsum sit amet velit.

2. Suspendisse id sem consectetuer libero luctus adipiscing.
- **Blockquotes Inside Lists**

  To put a *blockquote* within a list item, the blockquote delimiters (>) need to be indented so that it is under the first letter of the text after the list item marker.

  * A list item with a blockquote:
    > This is a blockquote
    > inside a list item.

- **Code Blocks Inside Lists**

  To put a code block within a list item, insert an empty line in between the list item and the code block, and the code block needs to be indented twice (with 8 spaces or 2 tabs), or if you are using the triple backticks method, the opening triple backtick needs to be indented with 4 spaces or 1 tab.

  * A list item with a code block:
    ```
    This is a code block inside a list item
    ...
    This is a code block inside a list item using the backticks method
    ```

**Task Lists**

You can create task lists by prefacing list items with a hyphen followed by a space followed by square brackets (- [ ]). To mark a task as complete, use - [x].

**Example: Task Lists**

- [ ] Unfinished task 1
- [x] Finished task 2

**Definition Lists**

You can create definition lists by using a colon plus a space for each list item.

**Example: Definition Lists**

Term 1
: Definition A
: Definition B
Tables

You can create tables in the Markdown editor by using pipes (|) and hyphens (-).

• Creating a Table

Pipes are used to separate each column, while hyphens are used to create column headers. The pipes on either end of the table are optional. Cells can vary in width and do not need to be perfectly aligned within columns, but there must be at least three hyphens in each column of the header row.

<table>
<thead>
<tr>
<th>First Header</th>
<th>Second Header</th>
</tr>
</thead>
<tbody>
<tr>
<td>-------------</td>
<td>--------------</td>
</tr>
<tr>
<td>Column 1 Row 1 Cell</td>
<td>Column 2 Row 1 Cell</td>
</tr>
<tr>
<td>Column 1 Row 2 Cell</td>
<td>Column 2 Row 2 Cell</td>
</tr>
</tbody>
</table>

• Formatting Rules in Table Cells

You can use formatting rules inside the cells of the table (such as links, inline code blocks, and text styling).

<table>
<thead>
<tr>
<th>First Header</th>
<th>Second Header</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>inline code</code></td>
<td>Content with <strong>bold text</strong> inside cell</td>
</tr>
</tbody>
</table>

• Aligning Text in Tables

You can align text to the left, right, or center of a column by including colons (:) to the left, right, or on both sides of the hyphens within the header row.

<table>
<thead>
<tr>
<th>Left-aligned</th>
<th>Center-aligned</th>
<th>Right-aligned</th>
</tr>
</thead>
<tbody>
<tr>
<td>:---</td>
<td>:---:</td>
<td>---:</td>
</tr>
<tr>
<td>Content Cell</td>
<td>Content Cell</td>
<td>Content Cell</td>
</tr>
</tbody>
</table>

• Joining Cells (Span a Cell Over Multiple Columns)

You can join cells horizontally (span a cell over multiple columns) by using multiple consecutive pipe characters (|) to the right of the particular cell. The number of consecutive pipes indicate the number of columns the cell will span (|| for two, ||| for three, and so on).

<table>
<thead>
<tr>
<th>First Header</th>
<th>Second Header</th>
<th>Third Header</th>
<th>Fourth Header</th>
</tr>
</thead>
<tbody>
<tr>
<td>-------------</td>
<td>--------------</td>
<td>-------------</td>
<td>--------------</td>
</tr>
<tr>
<td>Content Cell</td>
<td><em>Cell Span Over 3 Columns</em></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Emoji

You can add *emoji* in the Markdown editor by surrounding the EMOJICODE with colons (`:EMOJICODE:`).

**Example: Emoji**

```plaintext
:smile:
:laughing:
```

The resulting emoticons will appear in the output, but they are not displayed in the *Preview* pane.

For a full list of available emoji codes, see [Emoji Cheat Sheet](#).

Backslash Escapes

You can ignore Markdown formatting by using backslash escapes (`\`) to generate literal characters that would otherwise have special meaning in the Markdown syntax. For example, if you want to surround a word with literal asterisks (instead of an italic or emphasis tag), you can use backslashes to escape the asterisks.

```plaintext\"literal asterisks\"
```

The Markdown editor provides backslash escapes for the following characters:

<table>
<thead>
<tr>
<th>Backslash</th>
<th>Backtick</th>
<th>Asterisk</th>
<th>Underscore</th>
<th>Curly Braces</th>
<th>Square Brackets</th>
<th>Parentheses</th>
<th>Hash Mark</th>
<th>Plus Sign</th>
<th>Minus Sign (Hyphen)</th>
<th>Dot</th>
<th>Exclamation Mark</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>\</code></td>
<td>``</td>
<td><code>*</code></td>
<td><code>_</code></td>
<td><code>{</code></td>
<td><code>[]</code></td>
<td><code>()</code></td>
<td><code>#</code></td>
<td><code>+</code></td>
<td><code>-</code></td>
<td><code>.</code></td>
<td><code>!</code></td>
</tr>
</tbody>
</table>

Automatic Escaping for Special Characters

The Markdown editor includes support for automatically escaping special characters such as angle brackets (`<>`) and ampersands (`&`). If you want to use them as literal characters, you must escape them as entities, as in the table below. The exception to this is in HTML output, if the special
characters for a valid tag (for example, `<b>`), they are treated as literal characters and escaping is not necessary.

<table>
<thead>
<tr>
<th>Literal Character</th>
<th>Escaping Code</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;</code></td>
<td><code>&amp;lt;</code></td>
</tr>
<tr>
<td><code>&gt;</code></td>
<td><code>&amp;gt;</code></td>
</tr>
<tr>
<td><code>&amp;</code></td>
<td><code>&amp;amp;</code></td>
</tr>
</tbody>
</table>

**Footnotes**

The Markdown editor in Oxygen XML Editor plugin supports normal and inline footnotes. The following examples show the required syntax.

- **Example: Normal Footnote**

  Here is a footnote reference,[^1]

  [^1]: Here is the footnote.

- **Example: Normal Footnote with Multiple Blocks**

  Here is a footnote reference,[^longnote]

  [^longnote]: Here is the footnote with multiple blocks.

  Subsequent paragraphs are indented with 4 spaces or 1 tab to show that they belong to the previous footnote.

- **Example: Inline Footnote**

  Here is an inline note.^[Inlines notes are easier to write, since you don’t have to pick an identifier and move down to type the note.]

Built-in XML Frameworks (Document Types)

Oxygen XML Editor plugin includes a variety of specialized editors, views, and features that are dynamic according to the type of document that you open or create. Oxygen XML Editor plugin includes fully supported built-in frameworks (page 2706) for the most popular XML document types with a full set of features, as well as support for other document types with more generic features.

The built-in frameworks (page 2706) are defined according to a set of rules and a variety of settings that improve editing capabilities for its particular file type. These settings include:

- A default grammar used for validation and content completion in both Author mode and Text mode.
- CSS stylesheets for rendering XML documents in Author mode.
- User actions invoked from toolbars or menus in Author mode.
- Built-in transformation scenarios used for publishing XML documents.
- XML Catalogs (page 2712) used for mapping resources.
- New document templates to make it easy to create XML documents.
- User-defined extensions for customizing the interaction with the content author in Author mode.

It is also possible to create and configure your own custom frameworks (document types). For more information, see the Creating and Configuring Custom Frameworks (page 2037) section.

DocBook 4 Document Type (Framework)

DocBook is a very popular set of tags for describing books, articles, and other prose documents, particularly technical documentation. DocBook provides a vast number of semantic element tags, divided into three broad categories: structural, block-level, and inline. DocBook content can then be published in a variety of formats, including HTML, PDF, WebHelp, and EPUB.

File Definition

A file is considered to be a DocBook 4 document when one of the following conditions are true:

- The root element name is book or article.
• The PUBLIC ID of the document contains the string -//OASIS//DTD DocBook XML.

Default Document Templates

There are a variety of default DocBook 4 templates available when creating new documents from templates (page 554) and they can be found in: Framework Templates > DocBook 4.

The default templates for DocBook 4 documents are located in the \[OXYGEN_INSTALL_DIR\]/frameworks/docbook/templates/Docbook 4 folder.

Default Schema for Validation and Content Completion

The default schema that is used if one is not detected in the DocBook 4 file is docbookxi.dtd and it is stored in \[OXYGEN_INSTALL_DIR\]/frameworks/docbook/4.5/dtd/.

Default CSS

The default CSS files used for rendering DocBook content in Author mode are stored in \[OXYGEN_INSTALL_DIR\]/frameworks/docbook/css/.

By default, these default CSS files are merged with any that are specified in the document. For more information, see Configuring and Managing Multiple CSS Styles for a Framework (page 2063).

Default XML Catalog

The default XML Catalog (page 2712), catalog.xml, is stored in \[OXYGEN_INSTALL_DIR\]/frameworks/docbook/.

Transformation Scenarios

Oxygen XML Editor plugin includes numerous built-in DocBook transformation scenarios that allow you to transform DocBook 4 documents to a variety of outputs, such as WebHelp, PDF, HTML, HTML Chunk, XHTML, XHTML Chunk, and EPUB. All of them are listed in the DocBook 4 section in the Configure Transformation Scenario(s) dialog box (page 1502).

For more information, see the DocBook Transformation Scenarios (page 1409) section.

DocBook 4 Author Mode Actions

A variety of actions are available in the DocBook 4 framework (page 2706) that can be added to the DocBook4 menu, the Author Custom Actions toolbar, the contextual menu, and the Content Completion Assistant (page 2704).

DocBook 4 Toolbar Actions

The following default actions are readily available on the DocBook (Author Custom Actions) toolbar when editing in Author mode (by default, most of them are also available in the DocBook4 menu and in various submenus of the contextual menu):

- **Bold**
  Emphasizes the selected text by surrounding it with `<emphasis role="bold">` tag. You can use this action on multiple non-contiguous selections.

- **Italic**
  Emphasizes the selected text by surrounding it with `<emphasis role="italic">` tag. You can use this action on multiple non-contiguous selections.

- **Underline**
  Emphasizes the selected text by surrounding it with `<emphasis role="underline">` tag. You can use this action on multiple non-contiguous selections.

- **Link Actions Drop-Down Menu**
  The following link actions are available from this menu:
  
  **Cross reference (link)**
  
  Opens a dialog box that allows you to select a target to insert as a hypertext link.
Cross reference (xref)

Inserts a cross reference to other parts of the document.

Web Link (ulink)

Inserts a link that addresses its target with a URL (Universal Resource Locator).

Insert OLink

Opens an OLink dialog box that allows you to insert a link that addresses its target indirectly, using the targetdoc and targetptr values that are present in a Targetset (page 1313) file.

Figure 537: Insert OLink Dialog Box

After you choose the Targetset URL, the structure of the target documents is presented. For each target document (targetdoc), its content is displayed allowing you to easily identify the targetptr for the olink element that will be inserted. You can also use the search fields to quickly identify a target. If you already know the values for targetdoc and targetptr, you can insert them directly in the corresponding fields. You can also edit an olink using the Edit OLink action that is available on the contextual menu. The last used Targetset URL will be used to identify the edited target.
To insert XREF text into the \oLink, enter the text in the xref\text field and make sure the Insert xref\text in the O\Link option is selected.

Insert URI

Inserts a URI element. The URI identifies a Uniform Resource Identifier (URI) in content.

Insert Image

Opens a dialog box that allows you to select the path of an image to insert at the cursor position (page 798). Depending on the current location, an image-type element is inserted. If the action is invoked between two block elements (such as paragraphs), the dialog box also allows you to provide a title.

Insert Media Resource

Opens a Choose Media dialog box (page 830) that allows you to select the URL of a media object to be inserted into a document at the cursor position. The result will be that a reference to the specified video, audio, or embedded HTML frame is inserted and rendered in Author mode so that it can be played directly from there.

Insert XInclude

Opens a dialog box that allows you to browse and select content to be included and automatically generates the corresponding XInclude instruction.

§ · Section Drop-Down Menu

The following actions are available from this menu:

· Insert Section

Inserts a new section or subsection in the document, depending on the current context. For example, if the current context is sect1, then a sect2 is inserted. By default, this action also inserts a para element as a child node. The para element can be deleted if it is not needed.

· Promote Section (Ctrl + Alt + LeftArrow (Command + Alt + LeftArrow on OS X))

Promotes the current node as a sibling of the parent node.

· Demote Section (Ctrl + Alt + RightArrow (Command + Alt + RightArrow on OS X))

Demotes the current node a child of the previous node.

· Insert Paragraph

Insert a new paragraph element at current cursor position.
∑ Insert Equation

Opens the XML Fragment Editor that allows you to insert and edit MathML notations (page 832).

### Insert Row Below

Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

### Delete Row(s)

Deletes the table row located at cursor position or multiple rows in a selection.

### Insert Column After

Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

### Delete Column(s)

Deletes the table column located at cursor position or multiple columns in a selection.

### Table Properties

Opens the Table properties dialog box that allows you to configure properties of a table (such as frame borders).

### Join Cells

Joins the content of the selected cells (both horizontally and vertically).

### Split Cell

Splits the cell at the cursor location. If Oxygen XML Editor plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

### DocBook4 Menu Actions

The following additional actions can be found in the DocBook4 menu when editing in Author mode:

#### Paste special submenu

This submenu includes the following special paste actions that are specific to the DocBook 4 framework:

**Paste As XInclude**

Allows you to create an `xi:include` element that references a DocBook element copied from Author mode. The operation fails if the copied element does not have a declared ID.

**Paste as link**
Allows you to create a `link` element that references a DocBook element copied from **Author** mode. The operation fails if the copied element does not have a declared ID.

**Paste as xref**

Allows you to create an `xref` element that references a DocBook element copied from **Author** mode. The operation fails if the copied element does not have a declared ID.

**Tₜ Subscript**

Surrounds the selected text with a `subscript` tag, used for inserting a character (number, letter, or symbol) that will appear slightly below the baseline and slightly smaller than the rest of the text.

**T⁺ Superscript**

Surrounds the selected text with a `superscript` tag, used for inserting a character (number, letter, or symbol) that will appear slightly above the baseline and slightly smaller than the rest of the text.

**Table submenu**

In addition to the table actions available on the toolbar, the following actions are available in this submenu:

- **Insert Row Above**

  Inserts a new table row with empty cells above the current row. This action is available when the cursor is positioned inside a table.

- **Insert Rows**

  Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (Above or Below the current row).

- **Insert Column Before**

  Inserts a column before the current one.

- **Insert Columns**

  Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (Above or Below the current column).

- **Insert Cell**

  Inserts a new empty cell depending on the current context. If the cursor is positioned between two cells, Oxygen XML Editor plugin a new cell at
cursor position. If the cursor is inside a cell, the new cell is created after the current cell.

**ID Options**

Opens the **ID Options** dialog box that allows you to configure options for generating IDs in **Author** mode. The dialog box includes the following:

**ID Pattern**

The pattern for the ID values that will be generated. This text field can be customized using constant strings or any of the Oxygen XML Editor plugin Editor Variables (page 201).

**Element name or class value to generate ID for**

The elements for which ID values will be generated, specified using class attribute values. To customize the list, use the Add, Edit, or Remove buttons.

**Auto generate IDs for elements**

If selected, Oxygen XML Editor plugin will automatically generate unique IDs for the elements listed in this dialog box when they are created in **Author** mode.

**Remove IDs when copying content**

This option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs. If this option is not selected, IDs are always retained when you copy or cut content and paste it in the same document or other documents. If this option is selected, IDs are never retained for copied content, but if you cut the content, they are preserved for the first paste action (and not retained for any subsequent paste actions).

**Generate IDs**

Oxygen XML Editor plugin generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the **ID Options** dialog box that are found in the current selection.
**Note:** The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

**Refresh References**

You can use this action to manually trigger a refresh and update of all referenced resources.

**Tags display mode Submenu**

- **Full Tags with Attributes**
  Displays full tag names with attributes for both *block* and *inline elements*. Oxygen XML Editor plugin

- **Full Tags**
  Displays full tag names without attributes for both *block* and *inline elements*.

- **Block Tags**
  Displays full tag names for *block elements* and simple tags without names for *inline elements*.

- **Inline Tags**
  Displays full tag names for *inline elements*, while *block elements* are not displayed.

- **Partial Tags**
  Displays simple tags without names for *inline elements*, while *block elements* are not displayed.

- **No Tags**
  No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

**Configure Tags Display Mode**

Use this option to go to the **Author preferences page** where you can configure the **Tags Display Mode** options.

**Profiling/Conditional Text Submenu**

- **Edit Profiling Attributes**
  Allows you to configure the profiling attributes and their values.

- **Show Profiling Colors and Styles**
  Select this option to turn on conditional styling.
Show Profiling Attributes

Select this option to turn on conditional text markers. They are displayed at the end of conditional text blocks, as a list of attribute name and their currently set values.

Show Excluded Content

When this option is selected, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, deselect this option.

List of all profiling condition sets that match the current document type

You can click a listed condition set (page 752) to activate it.

Profiling Settings

Opens the profiling options preferences page (page 119), where you can manage profiling attributes and profiling conditions sets. You can also configure the profiling styles and colors options from the colors/styles preferences page (page 122) and the attributes rendering preferences page (page 121).

DocBook 4 Contextual Menu Actions

In addition to many of the DocBook 4 toolbar actions (page 1279) and the general Author mode contextual menu actions (page 840), the following DocBook 4 framework-specific actions are also available in the contextual menu when editing in Author mode:

Paste special submenu

This submenu includes the following special paste actions that are specific to the DocBook 4 framework:

Paste As XInclude

Allows you to create an \texttt{xinclude} element that references a DocBook element copied from Author mode. The operation fails if the copied element does not have a declared ID.

Paste as link

Allows you to create a \texttt{link} element that references a DocBook element copied from Author mode. The operation fails if the copied element does not have a declared ID.

Paste as xref
Allows you to create an `<xref>` element that references a DocBook element copied from Author mode. The operation fails if the copied element does not have a declared ID.

**Image Map Editor**

This action is available in the contextual menu when it is invoked on an image. This action applies an image map to the current image (if one does not already exist) and opens the Image Map Editor dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.

**Table Actions**

The following table editing actions are available in the contextual menu when it is invoked on a table:

- **Insert Rows**
  
  Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (Above or Below the current row).

- **Delete Row(s)**
  
  Deletes the table row located at cursor position or multiple rows in a selection.

- **Insert Columns**
  
  Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (Above or Below the current column).

- **Delete Column(s)**
  
  Deletes the table column located at cursor position or multiple columns in a selection.

- **Join Cells**
  
  Joins the content of the selected cells (both horizontally and vertically).

- **Split Cell**
  
  Splits the cell at the cursor location. If Oxygen XML Editor plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

- **Sort**
  
  Sorts cells or list items in a table.
Table Properties

Opens the Table properties dialog box that allows you to configure properties of a table (such as frame borders).

Other Actions submenu

This submenu give you access to all the usual contextual menu actions.

Link > Edit OLink

Opens a dialog box that allows you edit an existing OLink. See the Insert OLink action for more information.

Generate IDs

Oxygen XML Editor plugin generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the ID Options dialog box that are found in the current selection.

Note: The Generate IDs action does not overwrite existing ID values. It only affects elements that do not already have an id attribute.

DocBook 4 Drag/Drop (or Copy/Paste) Actions

Dragging a file from the Navigator view (page 250) or DITA Maps Manager view (page 2400) and dropping it into a DocBook 4 document that is edited in Author mode, creates a link to the dragged file (the ulink DocBook element) at the drop location. Copy and paste actions work the same.

You can also drag images or media files from your system explorer or the Navigator view (page 250) and drop them into a DocBook 4 document (or copy and paste). This will insert the appropriate element at the drop or paste location (for example, dropping/pasting an image will insert the inlinegraphic DocBook element with a fileref attribute).

Tip: For information about customizing Author mode actions for a particular framework (page 2706) (document type), see the Configuring Actions, Menus, Toolbars, Content Completion for a Framework (page 2038) section.

Related Information:
Inserting an olink in DocBook Documents

The olink element is used for linking to resources outside the current DocBook document. The targetdoc attribute is used for the document ID that contains the target element and the targetptr attribute for the ID of the target element (the value of an id or xml:id attribute). The combination of those two attributes provides a unique identifier to locate cross references.

For example, a Mail Administrator Guide with the document ID MailAdminGuide might contain a chapter about user accounts, like this:

```xml
<chapter id="user_accounts">
<title>Administering User Accounts</title>
<para>blah blah</para>
</chapter>
```

You can form a cross reference to that chapter by adding an olink, as in the following example:

```xml
<olink targetdoc="MailAdminGuide" targetptr="user_accounts">user accounts</olink>
```

You may need to update your

```xml
<olink targetdoc="MailAdminGuide" targetptr="user_accounts">user accounts</olink>
```

when you get a new machine.

To use an olink to create links between documents, follow these steps:

1. Decide which documents are to be included in the domain for cross referencing.
   A unique ID must be assigned to each document that will be referenced with an olink. It is usually added as an id (or xml:id for DocBook5) attribute to the root element of the document.

2. Decide on your output hierarchy.
   For creating links between documents, the relative locations of the output documents must be known. Before going further you must decide the names and locations of the output directories for all the documents from the domain. Each directory will be represented by an element `<dir name="directory_name">`, in the target database document.

3. Create the target database document.
   Each collection of documents has a master target database document that is used to resolve all olinks from that collection. The target database document is an XML file that is created once. It provides a means for pulling in the target data for each document. The database document is static and all the document data is pulled in dynamically.
**Tip:** Oxygen XML Editor plugin includes a built-in new document template called **DocBook Targetset Map** available in the **New from templates wizard (page 554)** that will help you get started.

**Example:** The following is an example of a target database document. It structures a collection of documents in a **sitemap** element that provides the relative locations of the outputs (HTML in this example). Then it pulls in the individual target data using system entity references to target data files that will be created in the next step.

```xml
<?xml version="1.0" encoding="utf-8"?>
<!DOCTYPE targetset [ 
<!ENTITY ugtargets SYSTEM "file:///doc/userguide/target.db"> 
<!ENTITY agtargets SYSTEM "file:///doc/adminguide/target.db"> 
<!ENTITY reftargets SYSTEM "file:///doc/man/target.db"> ]>
<targetset>
  <targetsetinfo>
    Description of this target database document, which is for the examples in olink doc.
  </targetsetinfo>

  <!-- Site map for generating relative paths between documents -->
  <sitemap>
    <dir name="documentation">
      <dir name="guides">
        <dir name="mailuser">
          <document targetdoc="MailUserGuide"
                     baseuri="userguide.html">
            &ugtargets;
          </document>
        </dir>
      </dir>
      <dir name="mailadmin">
        <document targetdoc="MailAdminGuide">
            &agtargets;
        </document>
      </dir>
    </dir>
  </sitemap>
</targetset>
```
4. Generate the target data files by executing a DocBook transformation scenario. Before applying the transformation, you need to edit the transformation scenario, go to the Parameters tab, and make sure the value of the collect.xref.targets parameter is set to yes. The default name of a target data file is target.db, but it can be changed by setting an absolute file path in the targets.filename parameter.

Example: An example of a target.db file:

```
<div element="book" href="#MailAdminGuide" number="1" targetptr="user_accounts">
  <ttl>Administering User Accounts</ttl>
  <xreftext>How to administer user accounts</xreftext>
</div>

<tt>First Part</tt>

<tt>Part I, "First Part"</tt>

<tt>Chapter Title</tt>

<tt>Chapter 1, Chapter Title</tt>

<tt>Section1 Title</tt>

<xreftext>xreflabel_here</xreftext>

<tt>Section1 Title</tt>

<xreftext>xreflabel_here</xreftext>
```

5. Insert olink elements in the DocBook documents. When editing a DocBook XML document in Author mode, the Insert OLink action is available in the Link drop-down menu from the toolbar. This action opens the Insert OLink dialog box that allows you to select the target of an olink from the list of all possible targets from a specified target database document (specified in the Targetset URL field). Once a Targetset URL is selected, the structure of the target documents is presented. For each target document (targetdoc), its content is displayed, allowing you to easily identify the appropriate targetptr. You can also use the search fields to quickly identify a target. If you already know the values...
for the `targetdoc` and `targetptr` attributes, you can insert them directly in the corresponding fields.

**Example:** In the following image, the target database document is called `target.xml`, `dbadmin` is selected for the target document (`targetdoc`), and `bldinit` is selected as the value for the `targetptr` attribute. Notice that you can also add XREF text into the `olink` by using the `xref` field.

![Insert OLink Dialog Box](image)

6. Process a DocBook transformation for each document to generate the output.
   a. Edit the transformation scenario and set the value of the `target.database.document` parameter to be the URL of the target database document.
   b. Apply the transformation scenario.

**DocBook 5 Document Type (Framework)**

*DocBook* is a very popular set of tags for describing books, articles, and other prose documents, particularly technical documentation. DocBook provides a vast number of semantic element tags, divided into three broad categories: structural, *block-level*, and *inline*. DocBook content can then be published in a variety of formats, including HTML, PDF, WebHelp, and EPUB.
File Definition

A file is considered to be a DocBook 5 document when the namespace is http://docbook.org/ns/docbook.

Default Document Templates

There are a variety of default DocBook 5 templates available when creating new documents from templates (page 554) and they can be found in: Framework Templates > DocBook 5 > DocBook 5.0 and Framework Templates > DocBook 5 > DocBook 5.1.

New document templates for both DocBook 5 documents are located in the [OXYGEN_INSTALL_DIR]/frameworks/docbook/templates/Docbook5.0 folder.

New document templates for both DocBook 5.1 documents are located in the [OXYGEN_INSTALL_DIR]/frameworks/docbook/templates/Docbook5.1 folder.

Default Schema for Validation and Content Completion

The default schema that is used if one is not detected is docbookxi.rng and it is stored in [OXYGEN_INSTALL_DIR]/frameworks/docbook/5.0/rng/ (or for DocBook 5.1 in [OXYGEN_INSTALL_DIR]/frameworks/docbook/5.1/rng/). Other types of schemas for various DocBook versions are also located in various folders inside the [OXYGEN_INSTALL_DIR]/frameworks/docbook/ directory.

Default CSS

The default CSS files used for rendering DocBook content in Author mode is stored in [OXYGEN_INSTALL_DIR]/frameworks/docbook/css/.

By default, these default CSS files are merged with any that are specified in the document. For more information, see Configuring and Managing Multiple CSS Styles for a Framework (page 2063).

Transformation Scenarios

Oxygen XML Editor plugin includes numerous built-in DocBook transformation scenarios that allow you to transform DocBook 5 documents to a variety of outputs, such as WebHelp, PDF, HTML, HTML Chunk, XHTML, XHTML Chunk, and EPUB. Oxygen XML Editor plugin also includes a DocBook 5.1 transformation scenario for Assembly documents (page 1310). All of them are listed in the DocBook 5 section in the Configure Transformation Scenario(s) dialog box (page 1502).

For more information, see the DocBook Transformation Scenarios (page 1409) section.

DocBook 5 Author Mode Actions

A variety of actions are available in the DocBook 5 framework (page 2706) that can be added to the DocBook5 menu, the Author Custom Actions toolbar, the contextual menu, and the Content Completion Assistant (page 2704).

DocBook 5 Toolbar Actions

The following default actions are readily available on the DocBook (Author Custom Actions) toolbar when editing in Author mode (by default, most of them are also available in the DocBook5 menu and in various submenus of the contextual menu):

**Bold**

Emphasizes the selected text by surrounding it with `<emphasis role="bold">` tag. You can use this action on multiple non-contiguous selections.

**Italic**
Emphasizes the selected text by surrounding it with `<emphasis role="italic">` tag. You can use this action on multiple non-contiguous selections.

- **Underline**

   Emphasizes the selected text by surrounding it with `<emphasis role="underline">` tag. You can use this action on multiple non-contiguous selections.

- **Link Actions Drop-Down Menu**

   The following link actions are available from this menu:

   **Cross reference (link)**
   
   Opens a dialog box that allows you to select a target to insert as a hypertext link.

   **Cross reference (xref)**
   
   Inserts a cross reference to other parts of the document.

   **Web Link (ulink)**
   
   Inserts a link that addresses its target with a URL (Universal Resource Locator).

   **Insert OLink**
   
   Opens an OLink dialog box that allows you to insert a link that addresses its target indirectly, using the targetdoc and targetptr values that are present in a Targetset (page 1313) file.

   *Figure 539: Insert OLink Dialog Box*
After you choose the Targetset URL, the structure of the target documents is presented. For each target document (targetdoc), its content is displayed allowing you to easily identify the targetptr for the olink element that will be inserted. You can also use the search fields to quickly identify a target. If you already know the values for targetdoc and targetptr, you can insert them directly in the corresponding fields. You can also edit an olink using the Edit OLink action that is available on the contextual menu. The last used Targetset URL will be used to identify the edited target.

To insert XREF text into the olink, enter the text in the xreftext field and make sure the Insert xreftext in the OLink option is selected.

**Insert URI**

Inserts a URI element. The URI identifies a Uniform Resource Identifier (URI) in content.

**Insert Image**

Opens a dialog box that allows you to select the path of an image to insert at the cursor position (page 798). Depending on the current location, an image-type element is inserted. If the action is invoked between two block elements (such as paragraphs), the dialog box also allows you to provide a title.

**Insert Media Resource**
Opens a Choose Media dialog box (page 830) that allows you to select the URL of a media object to be inserted into a document at the cursor position. The result will be that a reference to the specified video, audio, or embedded HTML frame is inserted and rendered in Author mode so that it can be played directly from there.

**Insert XInclude**

Opens a dialog box that allows you to browse and select content to be included and automatically generates the corresponding XInclude instruction.

### Section Drop-Down Menu

The following actions are available from this menu:

- **Insert Section**
  
  Inserts a new section or subsection in the document, depending on the current context. For example, if the current context is `sect1`, then a `sect2` is inserted. By default, this action also inserts a `para` element as a child node. The `para` element can be deleted if it is not needed.

- **Promote Section** (Ctrl + Alt + LeftArrow (Command + Alt + LeftArrow on OS X))
  
  Promotes the current node as a sibling of the parent node.

- **Demote Section** (Ctrl + Alt + RightArrow (Command + Alt + RightArrow on OS X))
  
  Demotes the current node a child of the previous node.

- **Insert Paragraph**
  
  Insert a new paragraph element at current cursor position.

- **Insert Equation**
  
  Opens the XML Fragment Editor that allows you to insert and edit MathML notations (page 832).

- **Insert List Item**
  
  Inserts a list item in the current list type.

- **Insert Ordered List**
  
  Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

- **Insert Itemized List**
Inserts an itemized list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an itemized list.

Insert Variable List
Inserts a DocBook variable list. A child list item is also inserted automatically by default. You can also use this action to convert selected paragraphs or other types of lists to a variable list.

Insert Procedure List
Inserts a DocBook procedure element. A step child item is also inserted automatically. You can also use this action to convert selected paragraphs or other types of lists to a procedure list.

Sort
Sorts cells or list items in a table.

Insert Table
Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a block element (page 2703)) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

Note: If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that Only lists, paragraphs, or inline content can be converted to tables.

Insert Row Below
Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

Delete Row(s)
Deletes the table row located at cursor position or multiple rows in a selection.

Insert Column After
Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

Delete Column(s)
Deletes the table column located at cursor position or multiple columns in a selection.
Table Properties

Opens the Table properties dialog box that allows you to configure properties of a table (such as frame borders).

Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell

Splits the cell at the cursor location. If Oxygen XML Editor plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

DocBook5 Menu Actions

The following additional actions can be found in the DocBook5 menu when editing in Author mode:

Paste special submenu

This submenu includes the following special paste actions that are specific to the DocBook 5 framework:

Paste As XInclude

Allows you to create an xi:include element that references a DocBook element copied from Author mode. The operation fails if the copied element does not have a declared ID.

Paste as link

Allows you to create a link element that references a DocBook element copied from Author mode. The operation fails if the copied element does not have a declared ID.

Paste as xref

Allows you to create an xref element that references a DocBook element copied from Author mode. The operation fails if the copied element does not have a declared ID.

Subscript

Surrounds the selected text with a subscript tag, used for inserting a character (number, letter, or symbol) that will appear slightly below the baseline and slightly smaller than the rest of the text.

Superscript
Surrounds the selected text with a *superscript* tag, used for inserting a character (number, letter, or symbol) that will appear slightly above the baseline and slightly smaller than the rest of the text.

**Table submenu**

In addition to the table actions available on the toolbar, the following actions are available in this submenu:

- **Insert Row Above**
  
  Inserts a new table row with empty cells above the current row. This action is available when the cursor is positioned inside a table.

- **Insert Rows**
  
  Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (**Above** or **Below** the current row).

- **Insert Column Before**
  
  Inserts a column before the current one.

- **Insert Columns**
  
  Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (**Above** or **Below** the current column).

- **Insert Cell**
  
  Inserts a new empty cell depending on the current context. If the cursor is positioned between two cells, Oxygen XML Editor plugin a new cell at cursor position. If the cursor is inside a cell, the new cell is created after the current cell.

**ID Options**

Opens the **ID Options** dialog box that allows you to configure options for generating IDs in **Author** mode. The dialog box includes the following:

- **ID Pattern**
  
  The pattern for the ID values that will be generated. This text field can be customized using constant strings or any of the Oxygen XML Editor plugin Editor Variables (page 201).

- **Element name or class value to generate ID for**
The elements for which ID values will be generated, specified using class attribute values. To customize the list, use the Add, Edit, or Remove buttons.

**Auto generate IDs for elements**

If selected, Oxygen XML Editor plugin will automatically generate unique IDs for the elements listed in this dialog box when they are created in Author mode.

**Remove IDs when copying content**

This option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs. If this option is not selected, IDs are always retained when you copy or cut content and paste it in the same document or other documents. If this option is selected, IDs are never retained for copied content, but if you cut the content, they are preserved for the first paste action (and not retained for any subsequent paste actions).

**Generate IDs**

Oxygen XML Editor plugin generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the ID Options dialog box that are found in the current selection.

**Note:** The Generate IDs action does not overwrite existing ID values. It only affects elements that do not already have an id attribute.

**Refresh References**

You can use this action to manually trigger a refresh and update of all referenced resources.

**Tags display mode Submenu**

**Full Tags with Attributes**

Displays full tag names with attributes for both block (page 2703) and inline elements (page 2707) Oxygen XML Editor plugin.

**Full Tags**
Displays full tag names without attributes for both block and inline elements.

- **Block Tags**
  Displays full tag names for block elements and simple tags without names for inline elements.

- **Inline Tags**
  Displays full tag names for inline elements, while block elements are not displayed.

- **Partial Tags**
  Displays simple tags without names for inline elements, while block elements are not displayed.

- **No Tags**
  No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

**Configure Tags Display Mode**

Use this option to go to the Author preferences page where you can configure the Tags Display Mode options.

**Profiling/Conditional Text Submenu**

- **Edit Profiling Attributes**
  Allows you to configure the profiling attributes and their values.

- **Show Profiling Colors and Styles**
  Select this option to turn on conditional styling.

- **Show Profiling Attributes**
  Select this option to turn on conditional text markers. They are displayed at the end of conditional text blocks, as a list of attribute name and their currently set values.

- **Show Excluded Content**
  When this option is selected, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, deselect this option.

**List of all profiling condition sets that match the current document type**

You can click a listed condition set to activate it.
**Profiling Settings**

Opens the profiling options preferences page (page 119), where you can manage profiling attributes and profiling conditions sets. You can also configure the profiling styles and colors options from the colors/styles preferences page (page 122) and the attributes rendering preferences page (page 121).

**DocBook 5 Contextual Menu Actions**

In addition to many of the DocBook 5 toolbar actions (page 1295) and the general Author mode contextual menu actions (page 840), the following DocBook 5 framework-specific actions are also available in the contextual menu when editing in Author mode:

мышь Past special submenu

This submenu includes the following special paste actions that are specific to the DocBook 5 framework:

**Paste As XInclude**

Allows you to create an xi:include element that references a DocBook element copied from Author mode. The operation fails if the copied element does not have a declared ID.

**Paste as link**

Allows you to create a link element that references a DocBook element copied from Author mode. The operation fails if the copied element does not have a declared ID.

**Paste as xref**

Allows you to create an xref element that references a DocBook element copied from Author mode. The operation fails if the copied element does not have a declared ID.

**Image Map Editor**

This action is available in the contextual menu when it is invoked on an image. This action applies an image map to the current image (if one does not already exist) and opens the Image Map Editor dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.

**Table Actions**

The following table editing actions are available in the contextual menu when it is invoked on a table:
Insert Rows

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (Above or Below the current row).

Delete Row(s)

Deletes the table row located at cursor position or multiple rows in a selection.

Insert Columns

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (Above or Below the current column).

Delete Column(s)

Deletes the table column located at cursor position or multiple columns in a selection.

Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell

Splits the cell at the cursor location. If Oxygen XML Editor plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

Sort

Sorts cells or list items in a table.

Table Properties

Opens the Table properties dialog box that allows you to configure properties of a table (such as frame borders).

Other Actions submenu

This submenu give you access to all the usual contextual menu actions.

Link > Edit OLink

Opens a dialog box that allows you edit an existing OLink. See the Insert OLink action for more information.

Generate IDs
Oxygen XML Editor plugin generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the ID Options dialog box that are found in the current selection.

**Note:** The Generate IDs action does not overwrite existing ID values. It only affects elements that do not already have an id attribute.

**DocBook 5 Drag/Drop (or Copy/Paste) Actions**

Dragging a file from the Navigator view (page 250) or DITA Maps Manager view (page 2400) and dropping it into a DocBook 5 document that is edited in Author mode, creates a link to the dragged file (the link DocBook element) at the drop location. Copy and paste actions work the same.

You can also drag images or media files from your system explorer or the Navigator view (page 250) and drop them into a DocBook 5 document (or copy and paste). This will insert the appropriate element at the drop or paste location (for example, dropping/pasting an image will insert the imageobject DocBook element with an imagedata child element and a fileref attribute).

**Tip:** For information about customizing Author mode actions for a particular framework (page 2706) (document type), see the Configuring Actions, Menus, Toolbars, Content Completion for a Framework (page 2038) section.

**Related Information:**

- Configuring Actions, Menus, Toolbars, Content Completion for a Framework (page 2038)

**Inserting an olink in DocBook Documents**

The olink element is used for linking to resources outside the current DocBook document. The targetdoc attribute is used for the document ID that contains the target element and the targetptr attribute for the ID of the target element (the value of an id or xml:id attribute). The combination of those two attributes provides a unique identifier to locate cross references.
For example, a Mail Administrator Guide with the document ID MailAdminGuide might contain a chapter about user accounts, like this:

```xml
<chapter id="user_accounts">
<title>Administering User Accounts</title>
<para>blah blah</para>
</chapter>
```

You can form a cross reference to that chapter by adding an `<olink>`, as in the following example:

```xml
You may need to update your
<olink targetdoc="MailAdminGuide" targetptr="user_accounts">
user accounts
</olink>
when you get a new machine.
```

To use an `<olink>` to create links between documents, follow these steps:

1. Decide which documents are to be included in the domain for cross referencing.
   A unique ID must be assigned to each document that will be referenced with an `<olink>`. It is usually added as an `id` (or `xml:id` for DocBook5) attribute to the root element of the document.

2. Decide on your output hierarchy.
   For creating links between documents, the relative locations of the output documents must be known. Before going further you must decide the names and locations of the output directories for all the documents from the domain. Each directory will be represented by an element: `<dir name="directory_name">`, in the target database document.

3. Create the target database document.
   Each collection of documents has a master target database document that is used to resolve all `<olinks>` from that collection. The target database document is an XML file that is created once. It provides a means for pulling in the target data for each document. The database document is static and all the document data is pulled in dynamically.

   **Tip:** Oxygen XML Editor plugin includes a built-in new document template called **DocBook Targetset Map** available in the **New from templates wizard** *(page 554)* that will help you get started.

   **Example:** The following is an example of a target database document. It structures a collection of documents in a `<sitemap>` element that provides the relative locations of the outputs (HTML in this example). Then it pulls in the individual target data using system entity references to target data files that will be created in the next step.

```xml
<?xml version="1.0" encoding="utf-8"?>
<!DOCTYPE targetset [
4. Generate the target data files by executing a DocBook transformation scenario.

Before applying the transformation, you need to edit the transformation scenario, go to the **Parameters** tab, and make sure the value of the `collect.xref.targets` parameter is set to **yes**.
The default name of a target data file is *target.db*, but it can be changed by setting an absolute file path in the `targets.filename` parameter.

**Example:** An example of a *target.db* file:

```xml
<book href="#MailAdminGuide" number="1" targetptr="user_accounts">
  <ttl>Administering User Accounts</ttl>
  <xreftext>How to administer user accounts</xreftext>
</book>

```part`` number="I">
  <ttl>First Part</ttl>
  <xreftext>Part I, “First Part”</xreftext>
</part>

```chapter`` number="1">
  <ttl>Chapter Title</ttl>
  <xreftext>Chapter 1, Chapter Title</xreftext>
</chapter>

```sect1`` number="1" targetptr="src_chapter">
  <ttl>Section1 Title</ttl>
  <xreftext>xreflabel_here</xreftext>
</sect1>
```

5. Insert **olink** elements in the DocBook documents.

When editing a DocBook XML document in **Author** mode, the **Insert OLink** action is available in the **Link** drop-down menu from the toolbar. This action opens the **Insert OLink** dialog box that allows you to select the target of an **olink** from the list of all possible targets from a specified target database document (specified in the **Targetset URL** field). Once a **Targetset URL** is selected, the structure of the target documents is presented. For each target document (*targetdoc*), its content is displayed, allowing you to easily identify the appropriate **targetptr**. You can also use the search fields to quickly identify a target. If you already know the values for the **targetdoc** and **targetptr** attributes, you can insert them directly in the corresponding fields.

**Example:** In the following image, the target database document is called *target.xml*, *dbadmin* is selected for the target document (*targetdoc*), and *bldinit* is selected as the value for the **targetptr** attribute. Notice that you can also add XREF text into the **olink** by using the **xreftext** field.

*Figure 540: Insert OLink Dialog Box*
6. Process a DocBook transformation for each document to generate the output.
   a. Edit the transformation scenario and set the value of the `target.database.document` parameter to be the URL of the target database document.
   b. Apply the transformation scenario.

DocBook 5.1 Assembly

The DocBook Assembly document type was introduced with DocBook 5.1 and it is used to define the hierarchy and relationships for a collection of resources. It is especially helpful for topic-oriented authoring scenarios since it assembles a set of resources (such as DocBook 5.1 topics (page 1311)) to form a hierarchical structure for a larger publication.

An Assembly document usually has four major parts:

- **Resources** - Identifies a collection of resources (such as topics). An Assembly may identify one or more collections.

- **Structure** - Identifies an artifact to be assembled. A document in this case is the particular collection of resources (such as topics) that forms the documentation. Within the `structure` element, an `output` element can be used to identify the type of output to be generated and `module` elements can be used to identify the resources to be included. An Assembly may identify one or more structures.
- **Relationships** - Identifies relationships between resources. These relationships may be manifested in any number of structures during assembly. An Assembly may identify any number of relationships.
- **Transformations** - Identifies transformations that can be applied during assembly. An Assembly may identify any number of transformations.

For detailed information about the DocBook Assembly document type, see DocBook 5.1: The Definitive Guide - DocBook Assemblies.

**File Definition**

A file is considered to be an Assembly when the root name is `assembly`.

**Default Document Templates**

A default Assembly document template is available when creating new documents from templates (page 554) and it can be found in: Framework Templates > DocBook 5 > DocBook 5.1.

The default template for DocBook Assembly documents is located in the `\[OXYGEN_INSTALL_DIR\]/frameworks/docbook/templates/Docbook5.1` folder.

**Default Schema for Validation and Content Completion**

The default schema that is used if one is not detected is `docbookxi.rng` and it is stored in `\[OXYGEN_INSTALL_DIR\]/frameworks/docbook/5.1/rng/`.

**Transformation Scenarios**

Oxygen XML Editor plugin includes a built-in transformation scenario that can be applied on an Assembly file to generate an assembled (merged) DocBook file. The scenarios is called DocBook Assembly and is found in the DocBook 5 section in the Configure Transformation Scenario(s) dialog box (page 1502).

**Resources**

- DocBook 5.1: The Definitive Guide - DocBook Assemblies
- Docbook 5.1 Specifications
- Sample files: `\[OXYGEN_INSTALL_DIR\]/samples/docbook/v5/assembly/

DocBook 5.1 Topic
The DocBook Topic document type was introduced with DocBook 5.1 and it is used as a modular unit of documentation. It is similar to the concept of the DITA Topic and can be used as modular resources in conjunction with DocBook 5.1 Assembly (page 1310) documents.

**File Definition**

A DocBook file is considered to be a Topic when the root name is `topic`.

**Default Document Templates**

A default Topic document template is available when creating new documents from templates (page 554) and it can be found in: Framework Templates > DocBook 5 > DocBook 5.1.

The default template for DocBook Assembly documents is located in the `{OXYGEN_INSTALL_DIR}/frameworks/docbook/templates/Docbook5.1` folder.

**Default Schema for Validation and Content Completion**

The default schema that is used if one is not detected is `docbookxi.rng` and it is stored in `{OXYGEN_INSTALL_DIR}/frameworks/docbook/5.1/rng/`.

**Transformation Scenarios**

Since DocBook Topics are modular resources, they are assembled and transformed in the DocBook Assembly transformation process (page 1311). You can also use any of the built-in DocBook transformation scenarios to transform individual DocBook Topics to a variety of outputs, such as PDF, HTML, EPUB, and more. They are found in the DocBook 5 section in the Configure Transformation Scenario(s) dialog box (page 1502).

**Resources**

- DocBook 5.1: The Definitive Guide - Topic
- Docbook 5.1 Specifications
- Sample files: `{OXYGEN_INSTALL_DIR}/samples/docbook/v5/assembly/`
DocBook Targetset Document Type (Framework)

DocBook Targetset documents are used to resolve cross references with the DocBook olink.

File Definition

A file is considered to be a Targetset when the root name is targetset.

Default Document Templates

A default DocBook Targetset Map document template is available when creating new documents from templates (page 554) and it can be found in: Framework Templates > DocBook Targetset.

The default template for DocBook Targetset documents is located in the [OXYGEN_INSTALL_DIR]/frameworks/docbook/templates/Targetset folder.

Default Schema for Validation and Content Completion

The default schema, targetdatabase.dtd, for this type of document is stored in [OXYGEN_INSTALL_DIR]/frameworks/docbook/xsl/common/.

DITA Topics Document Type (Framework)

The Darwin Information Typing Architecture (DITA) is an XML-based architecture for authoring, producing, and delivering technical information. It divides content into small, self-contained topics that you can reuse in various deliverables. The extensibility of DITA permits organizations to define specific information structures while still using standard tools to work with them. DITA content is created as topics, each an individual XML file. Typically, each topic has a defined primary objective.
and structure, and DITA also includes several specialized topic types (task, concept, reference, glossary entry).

For much more detailed information, resources, and instructions, see the DITA Authoring (page 2390) chapter.

**File Definition**

A file is considered to be a DITA topic document when one of the following conditions are true:

- The root element name is one of the following: concept, task, reference, dita, or topic.
- The PUBLIC ID of the document is a PUBLIC ID for the elements listed above.
- The root element of the file has an attribute named DITAArchVersion for the "http://dita.oasis-open.org/architecture/2005/" namespace. This enhanced case of matching is only applied when the Enable DTD/XML Schema processing in document type detection option (page 70) is selected from the Document Type Association preferences page (page 69).

**Default Document Templates**

There are a variety of default DITA topic templates available when creating new documents from templates (page 554) and they can be found in various folders inside: Framework Templates > DITA.

The default templates for DITA topic documents are located in the 
\[OXYGEN_INSTALL_DIR\]/frameworks/dita/templates/topic folder.

**Default Schema for Validation and Content Completion**

Default schemas that are used if one is not detected in the DITA documents are stored in the various folders inside \DITA-OT-DIR/dtd/ or \DITA-OT-DIR/schema/.

**Default CSS**

The default CSS files used for rendering DITA content in Author mode are stored in the various folders inside: \OXYGEN_INSTALL_DIR\/frameworks/dita/css/.

By default, these default CSS files are merged with any that are specified in the document. For more information, see Configuring and Managing Multiple CSS Styles for a Framework (page 2063).

**Default XML Catalogs**

The default XML Catalogs (page 2712) for the DITA topic document type are as follows:
Transformation Scenarios

Oxygen XML Editor plugin includes built-in transformation scenarios that allow you to transform individual DITA Topics to a XHTML or PDF output. They can be found in the DITA section in the Configure Transformation Scenario(s) dialog box (page 1502).

DITA Topic Author Mode Actions

A variety of actions are available for the DITA framework (page 2706) that can be found on the toolbar, the contextual menu, or the DITA menu.

DITA Toolbar Actions

The following default actions are readily available on the DITA (Author Custom Actions) toolbar when editing in Author mode (by default, most of them are also available in the DITA menu and in various submenus of the contextual menu):
**Bold**

Surrounds the selected text with a `b` tag. You can use this action on multiple non-contiguous selections.

**Italic**

Surrounds the selected text with an `i` tag. You can use this action on multiple non-contiguous selections.

**Underline**

Surrounds the selected text with a `u` tag. You can use this action on multiple non-contiguous selections.

**Link Actions Drop-Down Menu**

The following link actions are available from this menu:

**Cross Reference**

Opens the Cross Reference (xref) dialog box (page 2572) that allows you to insert a link to a target DITA resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map (page 2705) structure. Once the target resource has been selected, you can also target specific elements within that resource. For more information, see Linking in DITA Topics (page 2571).

**File Reference**

Opens the File Reference dialog box (page 2572) that allows you to insert a link to a target non-DITA file resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. For more information, see Linking in DITA Topics (page 2571).

**Web Link**

Opens the Web Link dialog box (page 2573) that allows you to insert a link to a target web-related resource at the current location within a document. The target resource can be a URL or a key that is already defined in your DITA map structure. For more information, see Linking in DITA Topics (page 2571).

**Related Link to Topic**

Opens the Cross Reference (xref) dialog box (page 2573) that allows you to insert a link to a target DITA resource in a related links section at the
bottom of the current document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. Once the target resource has been selected, you can also target specific elements within that resource. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics (page 2571).

Related Link to File

Opens the File Reference dialog box (page 2573) that allows you to insert a link to a target non-DITA file resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics (page 2571).

Related Link to Web Page

Opens the Web Link dialog box (page 2573) that allows you to insert a link to a target web-related resource in a related links section at the bottom of the current document. The target resource can be a URL or a key that is already defined in your DITA map structure. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics (page 2571).

Insert Image

Opens the Insert Image dialog box (page 2471) that allows you to configure the properties of an image to be inserted into a DITA document at the cursor position.

Insert Media Resource

Opens the Insert Media dialog box (page 2475) that allows you to select and configure the properties of a media object to be inserted into a DITA document at the cursor position. The result will be that a reference to the specified video, audio, or embedded HTML frame is inserted in an object element and it is rendered in Author mode so that it can be played directly from there.

Insert Section Drop-Down Menu

The following insert actions are available from this menu:

§ Insert Section

Inserts a new section element in the document, depending on the current context.

$ Insert Concept
Inserts a new `concept` element, depending on the current context. Concepts provide background information that users must know before they can successfully work with a product or interface.

**Insert Task**

Inserts a new `task` element, depending on the current context. Tasks are the main building blocks for task-oriented user assistance. They generally provide step-by-step instructions that will help a user to perform a task.

**Insert Topic**

Inserts a new `topic` element, depending on the current context. Topics are the basic units of DITA content and are usually organized around a single subject.

**Insert Reference**

Inserts a new `reference` element, depending on the current context. A reference is a top-level container for a reference topic.

**Insert Paragraph**

Inserts a new paragraph at current cursor position.

**Reuse Content**

This action provides a mechanism for reusing content fragments. It opens the Reuse Content dialog box (page 2542) that allows you to insert several types of references to reusable content at the cursor position. The types of references that you can insert using this dialog box include content references (conref) (page 2543), content key references (conkeyref) (page 2545), or key references to metadata (keyref) (page 2548).

**Insert step or list item**

Inserts a new list or step item in the current list type.

**Insert Unordered List**

Inserts an unordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an unordered list.

**Insert Ordered List**

Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.
Sort

Sorts cells or list items in a table.

Insert Table

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a block element (page 2703)) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

Note: If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that Only lists, paragraphs, or inline content can be converted to tables.

Insert Row Below

Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

Delete Row(s)

Deletes the table row located at cursor position or multiple rows in a selection.

Insert Column After

Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

Delete Column(s)

Deletes the table column located at cursor position or multiple columns in a selection.

Table Properties

Opens the Table properties dialog box that allows you to configure properties of a table (such as frame borders).

Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell

Splits the cell at the cursor location. If Oxygen XML Editor plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.
DITA Contextual Menu Actions

In addition to many of the DITA toolbar actions ([page 1315]) and the general Author mode contextual menu actions ([page 840]), there are numerous DITA-specific actions that are available in the contextual menu when editing DITA documents in Author mode (most of them are also available in the DITA menu at the top of the interface):

- **Edit Attributes**
  Displays an in-place attributes editor ([page 322]) that allows you to manage the attributes of an element.

- **Edit Profiling Attributes**
  Allows you to change the profiling attributes ([page 746]) defined on all selected elements.

- **Cut (Ctrl + X (Command + X on OS X))**
  Removes the current selected content from the document and places it in the clipboard.

- **Copy (Ctrl + C (Command + C on OS X))**
  Places a copy of the current selected content in the clipboard.

- **Paste (Ctrl + V (Command + V on OS X))**
  Inserts the current clipboard content into the document at the cursor position.

- **Paste special submenu**
  This submenu includes the following special paste actions that are specific to the DITA framework:

  - **Paste as content reference**
    Inserts a content reference (a DITA element with a `conref` attribute) to the DITA XML element from the clipboard. An entire DITA XML element with an ID attribute must be present in the clipboard when the action is invoked. The `conref` attribute will point to this ID value.

  - **Paste as content key reference**
    Allows you to indirectly reference content using the `conkeyref` attribute. When the DITA content is processed, the key references are resolved using key definitions from DITA maps ([page 2705]). To use this action, you must first do the following:

    1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
2. In the DITA Maps Manager view, make sure that the Root map combo box (page 2405) points to the correct map that stores the keys.

3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the DITA Maps Manager, select Edit Properties, and enter a value in the Keys field.

**Paste as link**

Looks for the first element with an ID value in the clipboard and inserts an `<xref>` that points to that element. If no elements with an ID value are found, a message will appear that informs you that to use this action, the clipboard contents must include at least one element with a declared ID.

**Paste as link (keyref)**

Inserts a link to the element that you want to reference. To use this action, you must first do the following:

1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
2. In the DITA Maps Manager view, make sure that the Root map combo box (page 2405) points to the correct map that stores the keys.
3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the DITA Maps Manager, select Edit Properties, and enter a value in the Keys field.

**Insert submenu**

This submenu includes the following insert actions that are specific to the DITA framework:

- **Insert Table**

  Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a block element (page 2703)) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).
**Note:** If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that **Only lists, paragraphs, or inline content can be converted to tables.**

**Insert Image**

Inserts an image reference *(page 798)* at the cursor position. Depending on the current location, an image-type element is inserted.

**Insert Media Resource**

Opens a **Choose Media dialog box** *(page 830)* that allows you to select the URL of a media object to be inserted into a document at the cursor position. The result will be that a reference to the specified video, audio, or embedded HTML frame is inserted and rendered in **Author** mode so that it can be played directly from there.

**Insert Equation**

Opens the **XML Fragment Editor** that allows you to insert and edit MathML notations *(page 832).*

**Insert Paragraph**

Inserts a new paragraph at current cursor position.

**Insert Section**

Inserts a new `section` element in the document, depending on the current context.

**Insert Topic**

Inserts a new `topic` element, depending on the current context. Topics are the basic units of DITA content and are usually organized around a single subject.

**Insert Entity**

Allows you to insert a predefined entity or character entity. Surrogate character entities (range `#x10000` to `#x10FFFF`) are also accepted.

Character entities can be entered in one of the following forms:

- `#<decimal value>` - e. g. `#65`
- `&#<decimal value>` - e. g. `&#65`
- `#x<hexadecimal value>` - e. g. `#x41`
- `&#x<hexadecimal value>` - e. g. `&#x41`

**Image Map Editor**
This action is available in the contextual menu when it is invoked on an image. This action applies an image map to the current image (if one does not already exist) and opens the Image Map Editor dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.

Table Actions

The following table editing actions are available in the contextual menu when it is invoked on a table:

- **Insert Rows**
  
  Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (Above or Below the current row).

- **Delete Row(s)**
  
  Deletes the table row located at cursor position or multiple rows in a selection.

- **Insert Columns**
  
  Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (Above or Below the current column).

- **Delete Column(s)**
  
  Deletes the table column located at cursor position or multiple columns in a selection.

- **Join Cells**
  
  Joins the content of the selected cells (both horizontally and vertically).

- **Split Cell**
  
  Splits the cell at the cursor location. If Oxygen XML Editor plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

- **Sort**
  
  Sorts cells or list items in a table.

- **Table Properties**
  
  Opens the Table properties dialog box that allows you to configure properties of a table (such as frame borders).

Other Actions submenu
This submenu gives you access to all the usual contextual menu actions.

🔗 Link submenu

The following link actions are available from this submenu:

Cross Reference

Opens the Cross Reference (xref) dialog box (page 2572) that allows you to insert a link to a target DITA resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map (page 2705) structure. Once the target resource has been selected, you can also target specific elements within that resource. For more information, see Linking in DITA Topics (page 2571).

File Reference

Opens the File Reference dialog box (page 2572) that allows you to insert a link to a target non-DITA file resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. For more information, see Linking in DITA Topics (page 2571).

Web Link

Opens the Web Link dialog box (page 2573) that allows you to insert a link to a target web-related resource at the current location within a document. The target resource can be a URL or a key that is already defined in your DITA map structure. For more information, see Linking in DITA Topics (page 2571).

Related Link to Topic

Opens the Cross Reference (xref) dialog box (page 2573) that allows you to insert a link to a target DITA resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. Once the target resource has been selected, you can also target specific elements within that resource. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics (page 2571).

Related Link to File

Opens the File Reference dialog box (page 2573) that allows you to insert a link to a target non-DITA file resource in a related links section at the bottom of the current document. The target resource can be the location
of a file or a key that is already defined in your DITA map structure. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics (page 2571).

**Related Link to Web Page**

Opens the Web Link dialog box (page 2573) that allows you to insert a link to a target web-related resource in a related links section at the bottom of the current document. The target resource can be a URL or a key that is already defined in your DITA map structure. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics (page 2571).

**Sort**

Available when invoked on a list, it opens a dialog box where you can configure a sorting operation for an entire list or a selection of list items.

**Generate IDs**

Oxygen XML Editor plugin generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the ID Options dialog box that are found in the current selection.

**Note:** The Generate IDs action does not overwrite existing ID values. It only affects elements that do not already have an id attribute.

**Reuse submenu**

This submenu includes the following actions regarding reusing content in DITA:

**Reuse Content**

This action provides a mechanism for reusing content fragments. It opens the Reuse Content dialog box (page 2542) that allows you to insert several types of references to reusable content at the cursor position. The types of references that you can insert using this dialog box include content references (conref) (page 2543), content key references (conkeyref) (page 2545), or key references to metadata (keyref) (page 2548).

**Push Current Element**
Opens the **Push current element** dialog box ([page 2552](#)) that allows content from a source topic to be inserted into another topic without any special coding in the topic where the content will be re-used.

### Edit Content Reference

This action is available for elements with a `conref` or `conkeyref` attribute. It opens the **Edit Content Reference** dialog box that allows you to edit the source location (or key) and source element of a content reference (or content key reference), and the reference details (`conref` / `conkeyref` and `conrefend` attributes). For more information, see **Reuse Content Dialog Box ([page 2542](#)).**

### Replace Reference with Content

Replaces the referenced fragment (`conref` or `conkeyref`) at the cursor position with its content from it source. This action is useful if you want to make changes to the content in the currently edited document without changing the referenced fragment in its source location. If the source content includes references to other topics/resources (`hrefs`), the operation also resolves those references relative to the new location. Attributes are preserved according to the following priority:

1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a `-dita-use-conref-target` value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for `id` attributes.

### Replace All References with Content

Replaces all referenced fragments (`keyref`, `conref`, or `conkeyref`) in the current document with the content. Attributes are preserved according to the following priority:

1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a `-dita-use-conref-target` value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for `id` attributes.

For `keyrefs` inside `xref` or `link` elements, the `keyref` attribute is changed to an `href` attribute, while the rest of the content for the `keyref` is replaced with its source content.
If the source content includes references to other topics/resources (hrefs), the operation also resolves those references relative to the new location.

**Remove Content Reference**

Removes the content reference (conref or conkeyref) inside the element at the cursor position.

**Create Reusable Component**

Creates a reusable component from the selected fragment of text. For more information, see Creating a Reusable Content Component (page 2555).

**Insert Reusable Component**

Inserts a reusable component at cursor location. For more information, see Inserting a Reusable Content Component (page 2556).

**Search References (Ctrl + Shift + G)**

Finds the references to the id attribute value for the element at the current cursor position, in all the topics contained in the current DITA map (page 2705) (opened in the DITA Maps Manager view (page 2400)). If no references are found for the current element, a dialog box will be displayed that offers you the option of searching for references to its ancestor elements.

*Figure 541: Search References to Ancestors Dialog Box*

**Show Key Definition**

Available for elements that have a conkeyref or keyref attribute set (or elements with an ancestor element that has a conkeyref or keyref attribute). It computes the key name and opens the DITA map (page 2705) that contains the definition of the key with the element that defines that key selected.

**About Element submenu**

This submenu includes the following actions:

**Style Guide**

Opens the DITA Style Guide Best Practices for Authors in your browser and displays a topic that is relevant to the element at the cursor position.
When editing DITA documents, this action is available in the contextual menu of the editing area (under the **About Element** sub-menu), in the **DITA** menu, and in some of the documentation tips that are displayed by the **Content Completion Assistant (page 2704)**.

**Browse reference manual**

Opens a reference to the documentation of the XML element closest to the cursor position in a web browser.

**Go to Definition**

Moves the cursor to the definition of the current element.

**Select submenu**

This submenu allows you to select the following:

**Element**

Selects the entire element at the current cursor position.

**Content**

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

**Parent**

Selects the entire parent element at the current cursor position.

**Text submenu**

This submenu contains the following actions:

**To Lower Case**

Converts the selected content to lower case characters.

**To Upper Case**

Converts the selected content to upper case characters.

**Capitalize Sentences**

Converts to upper case the first character of every selected sentence.

**Capitalize Words**

Converts to upper case the first character of every selected word. 0034

**Count Words**
Counts the number of words and characters (no spaces) in the entire document or in the selection for regular content and read-only content.

Note: The content marked as deleted with change tracking (page 2711) is ignored when counting words.

Convert Hexadecimal Sequence to Character (Ctrl + Shift + H (Command + Shift + H on OS X))

Converts a sequence of hexadecimal characters to the corresponding Unicode character (page 602). The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the 0x or 0X prefix. Examples of valid sequences and the characters they will be converted to:

- 0x0045 will be converted to E
- 0X0125 to #
- 265 to #
- 2190 to #

Note: For more information about finding the hexadecimal value of a character, see Finding the Decimal, Hexadecimal, or Character Entity Equivalent (page 609).

Refactoring submenu

Contains a series of actions designed to alter the XML structure of the document:

- Toggle Comment

Encloses the currently selected text in an XML comment, or removes the comment if it is commented.

Move Up (Alt + UpArrow)

Moves the current node or selected nodes in front of the previous node.

Move Down (Alt + DownArrow)

Moves the current node or selected nodes after the subsequent node.

Split Element
Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

**Join Elements**

Joins two adjacent block elements (page 2703) that have the same name. The action is available only when the cursor position is between the two adjacent block elements. Also, joining two block elements can be done by pressing the Delete or Backspace keys and the cursor is positioned between the boundaries of these two elements.

**Surround with Tags (Alt + Shift + E)**

Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

- If the Position cursor between tags option (page 101) is selected in the Content Completion preferences page, the cursor is placed between the start and end tag.
- If the Position cursor between tags option (page 101) is not selected in the Content Completion preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

**Surround with '[tag]' (Alt + Shift + ForwardSlash)**

Surround the selected content with the last tag used.

**Rename Element**

The element from the cursor position, and any elements with the same name, can be renamed according to the options from the Rename dialog box.

**Delete Element Tags**

Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the Delete or Backspace keys.

**Remove All Markup**

Removes all the XML markup inside the selected block of content and keeps only the text content.

**Remove Text**
Removes the text content of the selected block of content and keeps the markup intact with empty elements.

**DITA Refactoring Actions**

A variety of built-in XML refactoring operations that pertain to DITA documents with some of the information preconfigured based upon the current context.

**Change Topic ID to File Name**

Use this operation to change the ID of a topic to be the same as its file name.

**Convert CALS Tables to Simple Tables**

Use this operation to convert DITA CALS tables to simple tables. If you invoke this operation from a nested table (a table inside a table), only the nested table will be affected. If it is invoked on a parent table that contains nested tables, all of the contained tables will be converted.

**Convert conrefs to conkeyrefs**

Use this operation to convert `conref` attributes to `conkeyref` attributes.

**Convert Simple Tables to CALS Tables**

Use this operation to convert DITA simple tables to CALS tables. If you invoke this operation from a nested table (a table inside a table), only the nested table will be affected. If it is invoked on a parent table that contains nested tables, all of the contained tables will be converted.

**Convert to Concept**

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

**Convert to General Task**

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA General Task is a less restrictive alternative to the Strict Task information type.

**Convert to Reference**

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).
Convert to Task

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

Convert to Topic

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

Convert to Troubleshooting

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

Rename Key

Available when invoked on a key, and can be used to quickly rename a key. It also updates all references to it. Note that it does not work on DITA 1.3 key scopes.

Attributes Refactoring Actions

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

Add/Change attribute

Allows you to change the value of an attribute or insert a new one.

Convert attribute to element

Allows you to change an attribute into an element.

Delete attribute

Allows you to remove one or more attributes.

Rename attribute

Allows you to rename an attribute.

Replace in attribute value

Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

Comments Refactoring Actions

Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.
Delete comments

Allows you to delete comments found inside one or more elements.

Elements Refactoring Actions

Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

Delete element

Allows you to delete elements.

Delete element content

Allows you to delete the content of elements.

Insert element

Allows you to insert new elements.

Rename element

Allows you to rename elements.

Unwrap element

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

Wrap element

Allows you to surround elements with element tags.

Wrap element content

 Allows you to surround the content of elements with element tags.

Fragments Refactoring Actions

Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

Insert XML fragment

Allows you to insert an XML fragment.

Replace element content with XML fragment

Allows you to replace the content of elements with an XML fragment.

Replace element with XML fragment
Allows you to replace elements with an XML fragment.

**Review submenu**

This submenu includes the following actions:

- **Track Changes**
  Enables or disables the *Track Changes (page 2711)* support for the current document.

- **Accept Change(s) and Move to Next**
  Accepts the *Tracked Change (page 2711)* located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a *deletion or insertion* change, only the selected content is accepted.

- **Accept All Changes**
  Accepts all *Tracked Changes (page 2711)* in the current document.

- **Reject Change(s) and Move to Next**
  Rejects the *Tracked Change (page 2711)* located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a *deletion or insertion* change, only the selected content is rejected.

- **Reject All Changes**
  Rejects all *Tracked Changes (page 2711)* in the current document.

- **Comment Change**
  Opens a dialog box that allows you to add a comment to an existing *Tracked Change (page 2711)*. The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

- **Highlight**
  Enables the highlighting tool that allows you to mark text in your document.

- **Colors**
  Allows you to select the color for highlighting text.

- **Stop highlighting**
  Use this action to deactivate the highlighting tool.
Remove highlight(s)

Use this action to remove highlighting from the document.

Create Comment

Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).

Show/Edit Comment

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

Remove Comment

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

Manage Reviews

Opens the Review view (page 742).

Folding submenu

This submenu includes the following actions:

- **Toggle Fold**
  Toggles the state of the current fold.

- **Collapse Other Folds** (Ctrl + NumPad/ (Command + NumPad/ on OS X))
  Folds all the elements except the current element.

- **Collapse Child Folds** (Ctrl + NumPad- (Command + NumPad- on OS X))
  Folds the elements indented with one level inside the current element.

- **Expand Child Folds** (Ctrl + NumPad+ (Command + NumPad+ on OS X))
  Unfolds all child elements of the currently selected element.

- **Expand All** (Ctrl + NumPad* (Command + NumPad* on OS X))
  Unfolds all elements in the current document.

Inspect Styles

Opens the CSS Inspector view (page 329) that allows you to examine the CSS rules that match the currently selected element.

Options
Opens the Author mode options page (page 110).

**DITA Drag/Drop (or Copy/Paste) Actions**

Dragging a file from the Navigator view (page 250) or DITA Maps Manager view (page 2400) and dropping it into a DITA document that is edited in Author mode, creates a link to the dragged file (the `xref` DITA element with the `href` attribute) at the drop location. Copy and paste actions work the same.

You can also drag images or media files from your system explorer or the Navigator view (page 250) and drop them into a DITA document (or copy and paste). This will insert the appropriate element at the drop or paste location (for example, dropping/pasting an image will insert the DITA `image` element with an `href` attribute).

**Tip:** For information about customizing Author mode actions for a particular framework (page 2706) (document type), see the Configuring Actions, Menus, Toolbars, Content Completion for a Framework (page 2038) section.

**Related Information:**

- Configuring Actions, Menus, Toolbars, Content Completion for a Framework (page 2038)

**DITA Map Document Type (Framework)**

*DITA maps* (page 2705) are documents that collect and organize references to DITA topics to indicate the relationships between the topics. They can be used as a container for topics used to transform a collection of content into a publication and they offer a sequence and structure to the topics. They can also serve as outlines or tables of contents for DITA deliverables and as build manifests for DITA projects. *DITA maps* allow scalable reuse of content across multiple contexts. Maps can reference topics or other maps, and can contain a variety of content types and metadata.

For much more detailed information, resources, and instructions, see the DITA Authoring (page 2390) chapter.

**File Definition**

A file is considered to be a *DITA map* document when one of the following conditions are true:

- The root element name is one of the following: `map`, `bookmap`. 
• The public ID of the document is -//OASIS//DTD DITA Map or -//OASIS//DTD DITA BookMap.
• The root element of the file has an attribute named class that contains the value map/map and a DITAArchVersion attribute from the http://dita.oasis-open.org/architecture/2005/ namespace. This enhanced case of matching is only applied when the Enable DTD/XML Schema processing in document type detection option (page 70) from the Document Type Association preferences page (page 69) is selected.

Default Document Templates

There are a variety of default DITA map templates available when creating new documents from templates (page 554) and they can be found in various folders inside: Framework Templates > DITA Map.

The default templates for DITA map documents are located in the [OXYGEN_INSTALL_DIR]/frameworks/sita/templates/map folder.

Default Schema for Validation and Content Completion

Default schemas that are used if one is not detected in the DITA map document are stored in the various folders inside DITA-OT-DIR/dtd/ or DITA-OT-DIR/schema/.

Default CSS

The default CSS files used for rendering DITA content in Author mode are stored in the various folders inside: [OXYGEN_INSTALL_DIR]/frameworks/dita/css/.

By default, these default CSS files are merged with any that are specified in the document. For more information, see Configuring and Managing Multiple CSS Styles for a Framework (page 2063).

Default XML Catalogs

The default XML Catalogs (page 2712) for the DITA map document type are as follows:

• [OXYGEN_INSTALL_DIR]/frameworks/dita/catalog.xml
• DITA-OT-DIR/catalog-dita.xml

Transformation Scenarios

Oxygen XML Editor plugin includes numerous built-in transformation scenarios that allow you to transform DITA maps to a variety of outputs, such as WebHelp, PDF, ODF, XHTML, EPUB, and CHM.
All of them are listed in the DITA Map section in the Configure Transformation Scenario(s) dialog box (page 1502).

For more information, see the DITA Map Transformation Scenarios (page 1383) section.

**DITA Map Author Mode Actions**

A variety of actions are available in the DITA map (page 2705) framework (page 2706) that can be added to the DITA menu, the Author Custom Actions toolbar, the contextual menu, and the Content Completion Assistant (page 2704).

**DITA Map Toolbar and Menu Actions**

When a DITA map is opened in Author mode, the following default actions are available on the DITA Map Author Custom Actions toolbar (by default, they are also available in the DITA menu and in various submenus of the contextual menu):

- **Insert New Topic**
  
  Opens a New DITA topic dialog box (page 2459) that allows you to create a new topic and inserts a reference to it at the cursor position.
Insert Topic Reference

Opens the Insert Reference dialog box (page 2426) that allows you to insert and configure a reference to a topic at the cursor position.

Reuse Content

Opens the Reuse Content dialog box (page 2542) that allows you to insert and configure a content reference (conref) or a content key reference (conkeyref) at the cursor position.

Insert Topic Heading

Opens the Insert Reference dialog box (page 2426) that allows you to insert a topic heading at the cursor position.

Insert Topic Group

Opens the Insert Reference dialog box (page 2426) that allows you to insert a topic group at the cursor position.

Insert Relationship Table

Opens a dialog box that allows you to configure the relationship table to be inserted. The dialog box allows you to configure the number of rows and columns of the relationship table, if the header will be generated and if the title will be added.

Relationship Table Properties

Allows you to change the properties of rows in relationship tables.

Insert Relationship Row

Inserts a new table row with empty cells. The action is available when the cursor position is inside a table.

Insert Relationship Column

Inserts a new table column with empty cells after the current column. The action is available when the cursor position is inside a table.

Delete Relationship Column

Deletes the table column where the cursor is located.

Delete Relationship Row

Deletes the table row where the cursor is located.

Move Up

Moves the selected node up one position on its same level.
Move Down

Moves the selected node down one position on its same level.

Promote

Moves the selected node up one level to the level of its parent node.

Demote

Moves the selected node down one level to the level of its child nodes.

DITA Menu Actions

The following additional actions can be found in the DITA menu when editing a DITA map in Author mode:

Refresh References

You can use this action to manually trigger a refresh and update of all referenced resources.

Tags display mode Submenu

Full Tags with Attributes

Displays full tag names with attributes for both block (page 2703) and inline elements (page 2707).

Full Tags

Displays full tag names without attributes for both block and inline elements.

Block Tags

Displays full tag names for block elements and simple tags without names for inline elements.

Inline Tags

Displays full tag names for inline elements, while block elements are not displayed.

Partial Tags

Displays simple tags without names for inline elements, while block elements are not displayed.

No Tags
No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

**Configure Tags Display Mode**

Use this option to go to the *Author preferences page* *(page 110)* where you can configure the *Tags Display Mode* options.

**Profiling/Conditional Text Submenu**

**Edit Profiling Attributes**

Allows you to configure the *profiling attributes* *(page 746)* and their values.

**Show Profiling Colors and Styles**

Select this option to turn on conditional styling.

**Show Profiling Attributes**

Select this option to turn on conditional text markers. They are displayed at the end of conditional text blocks, as a list of attribute name and their currently set values.

**Show Excluded Content**

When this option is selected, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, deselect this option.

**List of all profiling condition sets that match the current document type**

You can click a listed *condition set* *(page 752)* to activate it.

**Profiling Settings**

Opens the *profiling options preferences page* *(page 119)*, where you can manage profiling attributes and profiling conditions sets. You can also configure the profiling styles and colors options from the *colors/styles preferences page* *(page 122)* and the *attributes rendering preferences page* *(page 121)*.

**ID Options**

Opens the *ID Options* dialog box that allows you to configure options for generating IDs in *Author* mode. The dialog box includes the following:

**ID Pattern**

The pattern for the ID values that will be generated. This text field can be customized using constant strings or any of the Oxygen XML Editor plugin *Editor Variables* *(page 201)*.
Element name or class value to generate ID for

The elements for which ID values will be generated, specified using class attribute values. To customize the list, use the Add, Edit, or Remove buttons.

Auto generate IDs for elements

If selected, Oxygen XML Editor plugin will automatically generate unique IDs for the elements listed in this dialog box when they are created in Author mode.

Remove IDs when copying content in the same document

When copying and pasting content in the same document, this option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs. To retain the element IDs, deselect this option.

Note: This option does not have an effect on content that is cut and pasted.

Generate IDs

Oxygen XML Editor plugin generates unique IDs for the current element (or elements), depending on how the action is invoked:

• When invoked on a single selection, an ID is generated for the selected element at the cursor position.
• When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the ID Options dialog box that are found in the current selection.

Note: The Generate IDs action does not overwrite existing ID values. It only affects elements that do not already have an id attribute.

DITA Map Contextual Menu Actions

In addition to many of the DITA Map toolbar actions (page 1338) and the general Author mode contextual menu actions (page 840), the following DITA map framework-specific actions are also available in the contextual menu when editing in Author mode:

🔗 Edit Properties
Opens the **Edit Properties** dialog box that allows you to configure the properties of a selected node. For more details about this dialog box, see *Edit Properties Dialog Box (page 2436)*.

**Generate IDs**

Oxygen XML Editor plugin generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the **ID Options** dialog box that are found in the current selection.

**Note:** The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

**Search References**

Finds the references to the `href` or `keys` attribute value of the topic/map reference element at the current cursor position, in all the topics from the current **DITA map** (opened in the **DITA Maps Manager view (page 2400)**). The current topic/map reference element must have an `href` or `keys` attribute defined to complete the search.

**Show Key Definition**

Available for elements that have a `conkeyref` or `keyref` attribute set (or elements with an ancestor element that has a `conkeyref` or `keyref` attribute). It computes the key name and opens the **DITA map (page 2705)** that contains the definition of the key with the element that defines that key selected.

**DITA Map Drag/Drop Actions**

Dragging a file from the **Navigator view (page 250)** or **DITA Maps Manager view (page 2400)** and dropping it into a **DITA map** document that is edited in **Author** mode creates a link to the dragged file (a `topicref` element, `chapter`, `part`, etc.) at the drop location.

**Open Topic from DITA Map in Author Mode**

When a **DITA map** is opened in **Author** mode, you can click the `#` icon to the left of a topic to open that particular topic in the editor.
Tip: For information about customizing Author mode actions for a particular framework (page 2706) (document type), see the Configuring Actions, Menus, Toolbars, Content Completion for a Framework (page 2038) section.

Related Information:

- Configuring Actions, Menus, Toolbars, Content Completion for a Framework (page 2038)

XHTML Document Type (Framework)

The Extensible HyperText Markup Language (XHTML), is a markup language that has the same depth of expression as HTML, but also conforms to XML syntax.

File Definition

A file is considered to be an XHTML document when the root element name is `html`.

Default Document Templates

There are a variety of default XHTML templates available when creating new documents from templates (page 554) and they can be found in: Framework Templates > XHTML.

The default templates for XHTML documents are located in the `[OXYGEN_INSTALL_DIR]/frameworks/xhtml/templates/` folder.

Default Schema for Validation and Content Completion

Default schemas that are used if one is not detected in the XHTML file are stored in the following locations:

- XHTML 1.0 - `[OXYGEN_INSTALL_DIR]/frameworks/xhtml/dtd/` or `[OXYGEN_INSTALL_DIR]/frameworks/xhtml/nvdl/`.
- XHTML 1.1 - `[OXYGEN_INSTALL_DIR]/frameworks/xhtml11/dtd/` or `[OXYGEN_INSTALL_DIR]/frameworks/xhtml11/schema/`.
- XHTML 5 - `[OXYGEN_INSTALL_DIR]/frameworks/xhtml/xhtml5 (epub3)/`. 
Default CSS

The default CSS files used for rendering XHTML content in Author mode are stored in
\[OXYGEN_INSTALL_DIR\]/frameworks/xhtml/css/.

By default, these default CSS files are merged with any that are specified in the document. For more information, see Configuring and Managing Multiple CSS Styles for a Framework (page 2063).

Default XML Catalogs

The default XML Catalogs (page 2712) for the XHTML document type are as follows:

- \[OXYGEN_INSTALL_DIR\]/frameworks/xhtml/dtd/xhtmlcatalog.xml
- \[OXYGEN_INSTALL_DIR\]/frameworks/relaxng/catalog.xml
- \[OXYGEN_INSTALL_DIR\]/frameworks/nvdl/catalog.xml
- \[OXYGEN_INSTALL_DIR\]/frameworks/xhtml11/dtd/xhtmlcatalog.xml
- \[OXYGEN_INSTALL_DIR\]/frameworks/xhtml11/schema/xhtmlcatalog.xml
- \[OXYGEN_INSTALL_DIR\]/xhtml5 (epub3)/catalog-compat.xml

Transformation Scenarios

Oxygen XML Editor plugin includes built-in transformation scenarios that allow you to transform XHTML documents to several types of DITA document types (topic, task, concept, reference). They can be found in the XHTML section in the Configure Transformation Scenario(s) dialog box (page 1502).

Related Information:

- Editing XHTML Documents (page 1250)

- XHTML Specifications
XHTML Author Mode Actions

A variety of actions are available in the XHTML framework (page 2706) that can be added to the XHTML menu, the Author Custom Actions toolbar, the contextual menu, and the Content Completion Assistant (page 2704).

XHTML Toolbar Actions

The following default actions are readily available on the XHTML (Author Custom Actions) toolbar when editing in Author mode (by default, they are also available in the XHTML menu and some of them are in various submenus of the contextual menu):

- **Bold**
  Changes the style of the selected text to *bold* by surrounding it with `<b>` tag. You can use this action on multiple non-contiguous selections.

- **Italic**
  Changes the style of the selected text to *italic* by surrounding it with `<i>` tag. You can use this action on multiple non-contiguous selections.

- **Underline**
  Changes the style of the selected text to *underline* by surrounding it with `<u>` tag. You can use this action on multiple non-contiguous selections.

- **Link**
  Inserts an `<a>` element with an `href` attribute at the cursor position. You can type the URL of the reference you want to insert or use the browsing actions in the `Browse` drop-down menu.

- **Insert Image**
  Inserts a graphic object at the cursor position. This is done by inserting an `<img>` element regardless of the current context. The following graphical formats are supported: GIF, JPG, JPEG, BMP, PNG, SVG.

- **Insert Media Resource**
  Opens a Choose Media dialog box (page 830) that allows you to select the URL of a media object to be inserted into a document at the cursor position. The result will be that a reference to the specified video, audio, or embedded HTML frame is inserted and rendered in Author mode so that it can be played directly from there.

- **Headings**
  Drop-down Menu
A drop-down menu that includes actions for inserting `h1`, `h2`, `h3`, `h4`, `h5`, `h6` elements.

- **Insert Paragraph**
  Insert a new paragraph element at current cursor position.

- **Insert Equation**
  Opens the XML Fragment Editor that allows you to insert and edit MathML notations (page 832).

- **Insert List Item**
  Inserts a list item in the current list type.

- **Insert Unordered List**
  Inserts an unordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an unordered list.

- **Insert Ordered List**
  Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

- **Insert a definition list at the cursor position**
  Inserts a definition list (`dl` element) with one list item (`dt` child element and a `dd` child element). You can also use this action to convert selected paragraphs or other types of lists to a definition list.

- **Sort**
  Sorts cells or list items in a table.

- **Insert Table**
  Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a block element (page 2703)) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

**Note:** If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that Only lists, paragraphs, or inline content can be converted to tables.
**Insert Row Below**

Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

**Insert Row Above**

Inserts a new table row with empty cells above the current row. This action is available when the cursor is positioned inside a table.

**Insert Column After**

Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

**Insert Cell**

Inserts a new empty cell depending on the current context. If the cursor is positioned between two cells, Oxygen XML Editor plugin a new cell at cursor position. If the cursor is inside a cell, the new cell is created after the current cell.

**Delete Column(s)**

Deletes the table column located at cursor position or multiple columns in a selection.

**Delete Row(s)**

Deletes the table row located at cursor position or multiple rows in a selection.

**Join Cells**

Joins the content of the selected cells (both horizontally and vertically).

**Split Cell**

Splits the cell at the cursor location. If Oxygen XML Editor plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

**XHTML Menu Actions**

The following additional actions can be found in the XHTML menu when editing in Author mode (some of them are also available in the contextual menu):

**Table submenu**

In addition to the table actions available on the toolbar, the following actions are available in this submenu:

**Insert Rows**
Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (Above or Below the current row).

**Insert Column Before**

Inserts a column before the current one.

**Insert Columns**

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (Above or Below the current column).

**Refresh References**

You can use this action to manually trigger a refresh and update of all referenced resources.

**Tags display mode Submenu**

**Full Tags with Attributes**

Displays full tag names with attributes for both block (page 2703) and inline elements (page 2707). Oxygen XML Editor plugin

**Full Tags**

Displays full tag names without attributes for both block and inline elements.

**Block Tags**

Displays full tag names for block elements and simple tags without names for inline elements.

**Inline Tags**

Displays full tag names for inline elements, while block elements are not displayed.

**Partial Tags**

Displays simple tags without names for inline elements, while block elements are not displayed.

**No Tags**

No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

**Configure Tags Display Mode**
Use this option to go to the Author preferences page (page 110) where you can configure the Tags Display Mode options.

Profiling/Conditional Text Submenu

Edit Profiling Attributes

Allows you to configure the profiling attributes (page 746) and their values.

Show Profiling Colors and Styles

Select this option to turn on conditional styling.

Show Profiling Attributes

Select this option to turn on conditional text markers. They are displayed at the end of conditional text blocks, as a list of attribute name and their currently set values.

Show Excluded Content

When this option is selected, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, deselect this option.

List of all profiling condition sets that match the current document type

You can click a listed condition set (page 752) to activate it.

Profiling Settings

Opens the profiling options preferences page (page 119), where you can manage profiling attributes and profiling conditions sets. You can also configure the profiling styles and colors options from the colors/styles preferences page (page 122) and the attributes rendering preferences page (page 121).

XHTML Contextual Menu Actions

In addition to many of the XHTML toolbar actions (page 1346) and the general Author mode contextual menu actions (page 840), the following XHTML framework-specific actions are also available in the contextual menu when editing in Author mode:

Image Map Editor

This action is available in the contextual menu when it is invoked on an image. This action applies an image map to the current image (if one does not already exist) and opens the Image Map Editor dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.
Table Actions

The following table editing actions are available in the contextual menu when it is invoked on a table:

Insert Rows

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (Above or Below the current row).

Delete Row(s)

Deletes the table row located at cursor position or multiple rows in a selection.

Insert Columns

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (Above or Below the current column).

Delete Column(s)

Deletes the table column located at cursor position or multiple columns in a selection.

Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell

Splits the cell at the cursor location. If Oxygen XML Editor plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

Sort

Sorts cells or list items in a table.

Table Properties

Opens the Table properties dialog box that allows you to configure properties of a table (such as frame borders).

Other Actions submenu

This submenu gives you access to all the usual contextual menu actions.

XHTML Drag/Drop (or Copy/Paste) Actions
Dragging a file from the **Navigator view** (page 250) or **DITA Maps Manager view** (page 2400) and dropping it into an XHTML document that is edited in **Author mode**, creates a link to the dragged file (the `a` element with the `href` attribute) at the drop location. Copy and paste actions work the same.

You can also drag images or media files from your system explorer or the **Navigator view** (page 250) and drop them into an XHTML document (or copy and paste). This will insert the appropriate element at the drop or paste location (for example, dropping/pasting an image will insert the `img` element with the `src` attribute).

**Tip:** For information about customizing **Author mode** actions for a particular **framework** (page 2706) (document type), see the **Configuring Actions, Menus, Toolbars, Content Completion for a Framework** (page 2038) section.

### TEI P5 Document Type (Framework)

The **TEI (Text Encoding Initiative)** document type is an international and interdisciplinary standard that enables libraries, museums, publishers, and individual scholars to represent a variety of literary and linguistic texts for online research, teaching, and preservation.

#### File Definition

A file is considered to be a TEI P5 document when one of the following conditions are true:

- The document namespace is `http://www.tei-c.org/ns/1.0`.
- The public ID of the document is `-//TEI P5`.

#### Default Document Templates

There are a variety of default **TEI P5** templates available when creating new documents from templates (page 554) and they can be found in: **Framework Templates > TEI P5**.

The default templates for TEI P5 documents are located in the `OXYGEN_INSTALL_DIR`/frameworks/tei/templates/TEI P5 folder.
**Default Schema for Validation and Content Completion**

The default schema that is used if one is not detected in the TEI P5 document is `tei_all.rng` and it is stored in `{OXYGEN_INSTALL_DIR}/frameworks/tei/xml/tei/custom/schema/relaxng/`.

**Default CSS**

The default CSS files used for rendering TEI content in Author mode are stored in `{OXYGEN_INSTALL_DIR}/frameworks/tei/xml/tei/css/`.

By default, these default CSS files are merged with any that are specified in the document. For more information, see Configuring and Managing Multiple CSS Styles for a Framework (page 2063).

**Default XML Catalogs**

The default XML Catalogs (page 2712) for the TEI P5 document type are as follows:

- `{OXYGEN_INSTALL_DIR}/frameworks/tei/xml/tei/schema/dtd/catalog.xml`
- `{OXYGEN_INSTALL_DIR}/frameworks/tei/xml/tei/custom/schema/dtd/catalog.xml`
- `{OXYGEN_INSTALL_DIR}/frameworks/tei/xml/tei/stylesheet/catalog.xml`

**Transformation Scenarios**

Oxygen XML Editor plugin includes built-in transformation scenarios that allow you to transform TEI P5 documents to a variety of outputs, such as PDF, XHTML, EPUB, DOCX, and ODT. They can be found in the TEI P5 section in the Configure Transformation Scenario(s) dialog box (page 1502).

**Resources**

**Related Information:**

- Editing XML Documents in Author Mode (page 672)
- Editing XML Documents in Text Mode (page 614)
TEI P5 Author Mode Actions

A variety of actions are available in the TEI P5 framework that can be added to the TEI P5 menu, the Author Custom Actions toolbar, the contextual menu, and the Content Completion Assistant.

TEI P5 Toolbar Actions

The following default actions are readily available on the TEI P5 toolbar when editing in Author mode (by default, they are also available in the TEI P5 menu and some of them are in various submenus of the contextual menu):

- **Bold**
  Changes the style of the selected text to bold by surrounding it with `hi` tag and setting the `rend` attribute to `bold`. You can use this action on multiple non-contiguous selections.

- **Italic**
  Changes the style of the selected text to italic by surrounding it with `hi` tag and setting the `rend` attribute to `italic`. You can use this action on multiple non-contiguous selections.

- **Underline**
  Changes the style of the selected text to underline by surrounding it with `hi` tag and setting the `rend` attribute to `ul`. You can use this action on multiple non-contiguous selections.

- **Insert Section**
  Inserts a new section or subsection, depending on the current context. For example, if the current context is `div1`, then a `div2` is inserted. By default, this action also inserts a paragraph element as a child node.

- **Insert Paragraph**
  Insert a new paragraph element at current cursor position.

- **Insert Image**
  Inserts an image reference at the cursor position. Depending on the current location, an image-type element is inserted.
- **Insert List Item**
  Inserts a list item in the current list type.

- **Insert Ordered List**
  Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

- **Insert Itemized List**
  Inserts an itemized list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an itemized list.

- **Sort**
  Sorts cells or list items in a table.

- **Insert Table**
  Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a block element) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

  **Note:** If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that **Only lists, paragraphs, or inline content can be converted to tables**.

- **Insert Row Below**
  Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

- **Insert Column After**
  Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

- **Insert Cell**
  Inserts a new empty cell depending on the current context. If the cursor is positioned between two cells, Oxygen XML Editor plugin a new cell at cursor position. If the cursor is inside a cell, the new cell is created after the current cell.

- **Delete Column(s)**
Deletes the table column located at cursor position or multiple columns in a selection.

Delete Row(s)

Deletes the table row located at cursor position or multiple rows in a selection.

Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell

Splits the cell at the cursor location. If Oxygen XML Editor plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

TEI P5 Menu Actions

The following additional actions can be found in the TEI P5 menu when editing in Author mode (some of them are also available in the contextual menu):

Table submenu

In addition to the table actions available on the toolbar, the following actions are available in this submenu:

Insert Row Above

Inserts a new table row with empty cells above the current row. This action is available when the cursor is positioned inside a table.

Insert Rows

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (Above or Below the current row).

Insert Column Before

Inserts a column before the current one.

Insert Columns

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (Above or Below the current column).

ID Options

Opens the ID Options dialog box that allows you to configure options for generating IDs in Author mode. The dialog box includes the following:
ID Pattern

The pattern for the ID values that will be generated. This text field can be customized using constant strings or any of the Oxygen XML Editor plugin Editor Variables (page 201).

Element name or class value to generate ID for

The elements for which ID values will be generated, specified using class attribute values. To customize the list, use the Add, Edit, or Remove buttons.

Auto generate IDs for elements

If selected, Oxygen XML Editor plugin will automatically generate unique IDs for the elements listed in this dialog box when they are created in Author mode.

Remove IDs when copying content in the same document

When copying and pasting content in the same document, this option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs. To retain the element IDs, deselect this option.

Note: This option does not have an effect on content that is cut and pasted.

Generate IDs

Oxygen XML Editor plugin generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the ID Options dialog box that are found in the current selection.

Note: The Generate IDs action does not overwrite existing ID values. It only affects elements that do not already have an id attribute.

Refresh References

You can use this action to manually trigger a refresh and update of all referenced resources.

Tags display mode Submenu
Full Tags with Attributes
Displays full tag names with attributes for both block and inline elements. Oxygen XML Editor plugin

Full Tags
Displays full tag names without attributes for both block and inline elements.

Block Tags
Displays full tag names for block elements and simple tags without names for inline elements.

Inline Tags
Displays full tag names for inline elements, while block elements are not displayed.

Partial Tags
Displays simple tags without names for inline elements, while block elements are not displayed.

No Tags
No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

Configure Tags Display Mode
Use this option to go to the Author preferences page (page 110) where you can configure the Tags Display Mode options.

Profiling/Conditional Text Submenu

Edit Profiling Attributes
Allows you to configure the profiling attributes (page 746) and their values.

Show Profiling Colors and Styles
Select this option to turn on conditional styling.

Show Profiling Attributes
Select this option to turn on conditional text markers. They are displayed at the end of conditional text blocks, as a list of attribute name and their currently set values.

Show Excluded Content
When this option is selected, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, deselect this option.

**List of all profiling condition sets that match the current document type**

You can click a listed condition set (*page 752*) to activate it.

**Profiling Settings**

Opens the profiling options preferences page (*page 119*), where you can manage profiling attributes and profiling conditions sets. You can also configure the profiling styles and colors options from the colors/styles preferences page (*page 122*) and the attributes rendering preferences page (*page 121*).

**TEI Contextual Menu Actions**

In addition to many of the TEI toolbar actions (*page 1354*) and the general Author mode contextual menu actions (*page 840*), the following TEI framework-specific actions are also available in the contextual menu when editing in Author mode:

**Image Map Editor**

This action is available in the contextual menu when it is invoked on an image. This action applies an image map to the current image (if one does not already exist) and opens the Image Map Editor dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.

**Table Actions**

The following table editing actions are available in the contextual menu when it is invoked on a table:

**Insert Rows**

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (*Above* or *Below* the current row).

**Delete Row(s)**

Deletes the table row located at cursor position or multiple rows in a selection.

**Insert Columns**
Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (Above or Below the current column).

- **Delete Column(s)**
  Deletes the table column located at cursor position or multiple columns in a selection.

- **Join Cells**
  Joins the content of the selected cells (both horizontally and vertically).

- **Split Cell**
  Splits the cell at the cursor location. If Oxygen XML Editor plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

- **Sort**
  Sorts cells or list items in a table.

- **Table Properties**
  Opens the Table properties dialog box that allows you to configure properties of a table (such as frame borders).

**Other Actions submenu**
This submenu give you access to all the usual contextual menu actions.

**TEI P5 Drag/Drop Actions**

Dragging a file from the Navigator view (page 250) or DITA Maps Manager view (page 2400) and dropping it into a TEI P5 document that is edited in Author mode, creates a link to the dragged file (the ptr element with the target attribute) at the drop location. Dragging an image file from the default file system application (Windows Explorer on Windows or Finder on Mac OS X, for example) and dropping it into a TEI P5 document inserts a graphic element (the graphic element with the url attribute) at the drop location, similar to the Insert Image toolbar action.

**Tip:** For information about customizing Author mode actions for a particular framework (page 2706) (document type), see the Configuring Actions, Menus, Toolbars, Content Completion for a Framework (page 2038) section.
Customization of TEI Frameworks Using the Latest Sources

The TEI P5 (page 1352) framework (page 2706) is available as a public project at the following SVN repository: https://github.com/TEIC/oxygen-tei. This project is the base for customizing a TEI framework.

To customize a TEI framework, follow this procedure:

1. Check out the project on a local computer from the SVN repository.
   This action is done with an SVN client application that creates a working copy of the SVN repository on a local computer.

2. Customize the TEI framework in Oxygen XML Editor plugin.
   a. Set the Oxygen XML Editor plugin frameworks folder to the oxygen/frameworks subfolder of the folder of the SVN working copy.
      Open the Preferences dialog box (page 55), go to Global, and set the path of the SVN working copy in the Use custom frameworks option.
   b. Open the Preferences dialog box (page 55), go to Document Type Association > Locations, and select Custom.

3. Build a JAR (page 2707) file with the TEI framework.
   The SVN project includes a build.xml file that can be used for building a JAR file using the Ant tool. The command that should be used:
   ant -f build.xml

4. Distribute the JAR file to the users that need the customized TEI framework.
   The command from the above step creates a file tei.zip in the dist subfolder of the SVN project. Each user that needs the customized TEI framework will receive the tei.zip file and will unzip it in the frameworks folder of the Oxygen XML Editor plugin install folder.

Customization of TEI Frameworks Using the Compiled Sources

The following procedure describes how to update to the latest stable version of TEI Schema and TEI XSL, already integrated in the TEI framework (page 2706) for Oxygen XML Editor plugin.
1. Go to https://code.google.com/p/oxygen-tei/;
2. Go to Downloads;
3. Download the latest uploaded .zip file;
4. Unpack the .zip file and copy its content in the Oxygen XML Editor plugin frameworks folder.

TEI ODD Document Type (Framework)

The TEI ODD (Text Encoding Initiative - One Document Does it all) document type is a TEI XML-conformant specification format that allows you to create a custom TEI P5 schema in a literate programming fashion. A system of XSLT stylesheets called Roma was created by the TEI Consortium for manipulating the ODD files.

File Definition

A file is considered to be a TEI ODD document when the following conditions are true:

- The file extension is .odd.
- The document namespace is http://www.tei-c.org/ns/1.0.

Default Document Templates

There is a default TEI ODD document template available when creating new documents from templates (page 554) and they can be found in: Framework Templates > TEI ODD.

The default template is located in the [OXYGEN_INSTALL_DIR]/frameworks/tei/templates/TEI ODD folder.

Default Schema for Validation and Content Completion

The default schema that is used if one is not detected in the TEI ODD document is tei_odds.rng and it is stored in [OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/custom/schema/relaxng/.

Default CSS

The default CSS files used for rendering TEI ODD content in Author mode are stored in [OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/css/.
By default, these default CSS files are merged with any that are specified in the document. For more information, see Configuring and Managing Multiple CSS Styles for a Framework (page 2063).

**Default XML Catalogs**

The default XML Catalogs (page 2712) for the TEI ODD document type are as follows:

- `[[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/custom/schema/catalog.xml`
- `[[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/schema/catalog.xml`

**Transformation Scenarios**

Oxygen XML Editor plugin includes built-in transformation scenarios that allow you to transform TEI ODD documents to a variety of outputs, such as PDF, XHTML, EPUB, DOCX, ODT, RNG, DTD, and XML Schema. They can be found in the TEI ODD section in the Configure Transformation Scenario(s) dialog box (page 1502).

**Resources**

- Oxygen Video Tutorial: Editing TEI Documents in Author Mode
- TEI: Getting Started with ODD

Related Information:

- Editing XML Documents in Author Mode (page 672)
- Editing XML Documents in Text Mode (page 614)

**TEI ODD Author Mode Actions**

A variety of actions are available in the TEI ODD framework (page 2706) that can be added to the TEI ODD menu, the Author Custom Actions toolbar, the contextual menu, and the Content Completion Assistant (page 2704).
TEI ODD Toolbar Actions

The following default actions are readily available on the TEI ODD (Author Custom Actions) toolbar when editing in Author mode (by default, they are also available in the TEI ODD menu and some of them are in various submenus of the contextual menu):

**Bold**

Changes the style of the selected text to **bold** by surrounding it with `<hi>` tag and setting the `rend` attribute to `bold`. You can use this action on multiple non-contiguous selections.

**Italic**

Changes the style of the selected text to *italic* by surrounding it with `<hi>` tag and setting the `rend` attribute to `italic`. You can use this action on multiple non-contiguous selections.

**Underline**

Changes the style of the selected text to *underline* by surrounding it with `<hi>` tag and setting the `rend` attribute to `ul`. You can use this action on multiple non-contiguous selections.

**Insert Section**

Inserts a new section or subsection, depending on the current context. For example, if the current context is `div1`, then a `div2` is inserted. By default, this action also inserts a paragraph element as a child node.

**Insert Paragraph**

Insert a new paragraph element at current cursor position.

**Insert Image**

Inserts an image reference (page 798) at the cursor position. Depending on the current location, an image-type element is inserted.

**Insert List Item**

Inserts a list item in the current list type.

**Insert Ordered List**

Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

**Insert Itemized List**
Inserts an itemized list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an itemized list.

- **Insert Table**
  
  Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a block element) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

  **Note:** If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that **Only lists, paragraphs, or inline content can be converted to tables.**

- **Insert Row Below**
  
  Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

- **Insert Column After**
  
  Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

- **Insert Cell**
  
  Inserts a new empty cell depending on the current context. If the cursor is positioned between two cells, Oxygen XML Editor plugin a new cell at cursor position. If the cursor is inside a cell, the new cell is created after the current cell.

- **Delete Column(s)**
  
  Deletes the table column located at cursor position or multiple columns in a selection.

- **Delete Row(s)**
  
  Deletes the table row located at cursor position or multiple rows in a selection.

- **Join Cells**
  
  Joins the content of the selected cells (both horizontally and vertically).

- **Split Cell**
  
  Splits the cell at the cursor location. If Oxygen XML Editor plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.
TEI ODD Menu Actions

The following additional actions can be found in the TEI ODD menu when editing in Author mode (some of them are also available in the contextual menu):

Table submenu

In addition to the table actions available on the toolbar, the following actions are available in this submenu:

- **Insert Row Above**
  
  Inserts a new table row with empty cells above the current row. This action is available when the cursor is positioned inside a table.

- **Insert Rows**
  
  Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (Above or Below the current row).

- **Insert Column Before**
  
  Inserts a column before the current one.

- **Insert Columns**
  
  Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (Above or Below the current column).

ID Options

Opens the ID Options dialog box that allows you to configure options for generating IDs in Author mode. The dialog box includes the following:

- **ID Pattern**
  
  The pattern for the ID values that will be generated. This text field can be customized using constant strings or any of the Oxygen XML Editor plugin Editor Variables (page 201).

- **Element name or class value to generate ID for**
  
  The elements for which ID values will be generated, specified using class attribute values. To customize the list, use the Add, Edit, or Remove buttons.

- **Auto generate IDs for elements**
If selected, Oxygen XML Editor plugin will automatically generate unique IDs for the elements listed in this dialog box when they are created in Author mode.

Remove IDs when copying content in the same document

When copying and pasting content in the same document, this option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs. To retain the element IDs, deselect this option.

Note: This option does not have an effect on content that is cut and pasted.

Generate IDs

Oxygen XML Editor plugin generates unique IDs for the current element (or elements), depending on how the action is invoked:

• When invoked on a single selection, an ID is generated for the selected element at the cursor position.
• When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the ID Options dialog box that are found in the current selection.

Note: The Generate IDs action does not overwrite existing ID values. It only affects elements that do not already have an id attribute.

Refresh References

You can use this action to manually trigger a refresh and update of all referenced resources.

Tags display mode Submenu

Full Tags with Attributes

Displays full tag names with attributes for both block (page 2703) and inline elements (page 2707). Oxygen XML Editor plugin

Full Tags

Displays full tag names without attributes for both block and inline elements.

Block Tags
Displays full tag names for *block elements* and simple tags without names for *inline elements*.

### Inline Tags
Displays full tag names for *inline elements*, while *block elements* are not displayed.

### Partial Tags
Displays simple tags without names for *inline elements*, while *block elements* are not displayed.

### No Tags
No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

#### Configure Tags Display Mode
Use this option to go to the Author preferences page (page 110) where you can configure the Tags Display Mode options.

### Profiling/Conditional Text Submenu

#### Edit Profiling Attributes
Allows you to configure the profiling attributes (page 746) and their values.

#### Show Profiling Colors and Styles
Select this option to turn on conditional styling.

#### Show Profiling Attributes
Select this option to turn on conditional text markers. They are displayed at the end of conditional text blocks, as a list of attribute name and their currently set values.

#### Show Excluded Content
When this option is selected, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, deselect this option.

#### List of all profiling condition sets that match the current document type
You can click a listed condition set (page 752) to activate it.

#### Profiling Settings
Opens the profiling options preferences page (page 119), where you can manage profiling attributes and profiling conditions sets. You can also configure the profiling styles and colors options from the *colors/styles*.
preferences page (page 122) and the attributes rendering preferences page (page 121).

**TEI Contextual Menu Actions**

In addition to many of the TEI toolbar actions (page 1363) and the *general Author* mode contextual menu actions (page 840), the following TEI framework-specific actions are also available in the contextual menu when editing in Author mode:

**Table Actions**

The following table editing actions are available in the contextual menu when it is invoked on a table:

**Insert Rows**

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (Above or Below the current row).

**Delete Row(s)**

Deletes the table row located at cursor position or multiple rows in a selection.

**Insert Columns**

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (Above or Below the current column).

**Delete Column(s)**

Deletes the table column located at cursor position or multiple columns in a selection.

**Join Cells**

Joins the content of the selected cells (both horizontally and vertically).

**Split Cell**

Splits the cell at the cursor location. If Oxygen XML Editor plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

**Sort**

Sorts cells or list items in a table.

**Table Properties**
Opens the **Table properties** dialog box that allows you to configure properties of a table (such as frame borders).

**Other Actions submenu**

This submenu gives you access to all the usual contextual menu actions.

### TEI ODD Drag/Drop Actions

Dragging a file from the [Navigator view](page 250) or [DITA Maps Manager view](page 2400) and dropping it into a TEI ODD document that is edited in **Author** mode, creates a link to the dragged file (the `ptr` element with the `target` attribute) at the drop location.

ℹ️ **Tip:** For information about customizing **Author** mode actions for a particular framework (page 2706) (document type), see the [Configuring Actions, Menus, Toolbars, Content Completion for a Framework](page 2038) section.

---

**Related Information:**

- [Configuring Actions, Menus, Toolbars, Content Completion for a Framework](page 2038)

---

### jTEI Document Type (Framework)

The **jTEI (Journal of the Text Encoding Initiative)** document type is a highly restrictive customization (only about 80 elements are included) of the TEI P5 framework.

**File Definition**

A file is considered to be a **jTEI** document when the root element is named `TEI`, it is in the namespace `http://www.tei-c.org/ns/1.0`, and the `@rend` attribute is set to `"jTEI"`.

**Default Document Templates**

There is a default **jTEI Article** template available when creating new documents from templates (page 554) and they can be found in: Framework Templates > TEI JTEI.

The default template is located in the `[OXYGEN_INSTALL_DIR]/frameworks/tei/templates/TEI jTEI` folder.
Default Schema for Validation and Content Completion

The default schema that is used if one is not detected is `tei_jtei.rng` and it is stored in 
`[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/custom/schema/relaxng/`.

Default CSS

The default CSS file (`jtei.css`) that is used for rendering jTEI in Author mode is stored in 
`[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/css/`.

By default, these default CSS files are merged with any that are specified in the document. For more information, see Configuring and Managing Multiple CSS Styles for a Framework (page 2063).

Default XML Catalogs

The default XML Catalogs (page 2712) for jTEI are as follows:

- `[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/schema/dtd/catalog.xml`
- `[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/custom/schema/dtd/catalog.xml`
- `[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/stylesheet/catalog.xml`

Transformation Scenarios

Oxygen XML Editor plugin includes built-in transformation scenarios that allow you to transform jTEI documents to PDF and ODT. They can be found in the TEI JTEI section in the Configure Transformation Scenario(s) dialog box (page 1502).

- Editing XML Documents in Text Mode (page 614)
JATS Document Type (Framework)

The JATS (NISO Journal Article Tag Suite) document type is a technical standard that defines an XML format for scientific literature.

File Definition

A file is considered to be a JATS document when the PUBLIC ID of the document contains the string -//NLM//DTD.

Default Document Templates

There are some default JATS templates available when creating new documents from templates (page 554) and they can be found in: Framework Templates > JATSKit - NISO JATS and NLM BITS

The default templates for JATS documents are located in the {OXYGEN_INSTALL_DIR}/frameworks/jats/templates/ folder.

Default Schema for Validation and Content Completion

Default schemas that are used if one is not detected in the JATS document are stored in {OXYGEN_INSTALL_DIR}/frameworks/jats/lib/schemas/.

Default CSS

The default CSS files used for rendering JATS content in Author mode are stored in {OXYGEN_INSTALL_DIR}/frameworks/jats/lib/author-css/.

By default, these default CSS files are merged with any that are specified in the document. For more information, see Configuring and Managing Multiple CSS Styles for a Framework (page 2063).

Default XML Catalog

The default XML Catalog (page 2712), jatskit-catalog.xml, is stored in {OXYGEN_INSTALL_DIR}/frameworks/jats/lib/schemas/.
Transformation Scenarios

Oxygen XML Editor plugin includes built-in transformation scenarios that allow you to transform JATS documents to a variety of outputs, such as PDF, HTML, and EPUB. They can be found in the JATSKit section in the Configure Transformation Scenario(s) dialog box (page 1502).

- Editing XML Documents in Text Mode (page 614)

JATS Author Mode Actions

A variety of actions are available in the JATS framework (page 2706) that can be added to the JATS menu, the Author Custom Actions toolbar, the contextual menu, and the Content Completion Assistant (page 2704).

JATS Toolbar Actions

The following default actions are readily available on the JATS (Author Custom Actions) toolbar when editing in Author mode (by default, they are also available in the JATS menu and in various submenus of the contextual menu):

Paragraph Level Drop-Down Menu

- Insert Paragraph
  
  Insert a new paragraph element at current cursor position.

- Insert Unordered List
  
  Inserts an unordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an unordered list.
Insert Ordered List

Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

Boxed Text

Inserts or wraps content in a box with a shaded background.

Code

Inserts or wraps content in a code element.

Display Quote

Inserts or wraps content in a disp-quote element.

Figure

Inserts a fig element with a title (inside a caption element). This action opens a dialog box that allows you to enter the text for the title for the figure.

Graphic Figure

Inserts a fig element with a title (inside a caption element), and a graphic element. A dialog box is displayed that allows you to enter the title for the figure, followed by a dialog box that allows you to select the URL of the graphic to be inserted.

Bold

Surrounds the selected text with a bold tag. You can use this action on multiple non-contiguous selections.

Italic

Surrounds the selected text with an italic tag. You can use this action on multiple non-contiguous selections.

Underline

Surrounds the selected text with an underline tag. You can use this action on multiple non-contiguous selections.

Monospace

Inserts or wraps content with a monospace element.

Insert Image
Inserts an image reference (page 798) at the cursor position. Depending on the current location, an image-type element is inserted.

**Insert List Item**

Inserts a list item in the current list type.

**Insert MathML**

Opens the XML Fragment Editor that allows you to insert and edit MathML notations (page 832).

**Subscript**

Surrounds the selected text with a subscript tag, used for inserting a character (number, letter, or symbol) that will appear slightly below the baseline and slightly smaller than the rest of the text.

**Superscript**

Surrounds the selected text with a superscript tag, used for inserting a character (number, letter, or symbol) that will appear slightly above the baseline and slightly smaller than the rest of the text.

**JATS Menu Actions**

The following additional actions can be found in the JATS menu when editing in Author mode:

**Refresh References**

You can use this action to manually trigger a refresh and update of all referenced resources.

**Tags display mode Submenu**

- **Full Tags with Attributes**
  
  Displays full tag names with attributes for both block (page 2703) and inline elements (page 2707).

- **Full Tags**
  
  Displays full tag names without attributes for both block and inline elements.

- **Block Tags**
  
  Displays full tag names for block elements and simple tags without names for inline elements.

- **Inline Tags**
Displays full tag names for *inline elements*, while *block elements* are not displayed.

**Partial Tags**

Displays simple tags without names for *inline elements*, while *block elements* are not displayed.

**No Tags**

No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

**Configure Tags Display Mode**

Use this option to go to the [Author preferences page](#) (page 110) where you can configure the Tags Display Mode options.

**Profiling/Conditional Text Submenu**

**Edit Profiling Attributes**

Allows you to configure the profiling attributes (page 746) and their values.

**Show Profiling Colors and Styles**

Select this option to turn on conditional styling.

**Show Profiling Attributes**

Select this option to turn on conditional text markers. They are displayed at the end of conditional text blocks, as a list of attribute name and their currently set values.

**Show Excluded Content**

When this option is selected, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, deselect this option.

**List of all profiling condition sets that match the current document type**

You can click a listed condition set (page 752) to activate it.

**Profiling Settings**

Opens the profiling options preferences page (page 119), where you can manage profiling attributes and profiling conditions sets. You can also configure the profiling styles and colors options from the colors/styles preferences page (page 122) and the attributes rendering preferences page (page 121).
JATS Drag/Drop Actions

Dragging a file from the **Navigator view** ([page 250](#)) or **DITA Maps Manager view** ([page 2400](#)) and dropping it into a JATS document that is edited in **Author** mode, creates a link to the dragged file (the `<ext-link>` element with the `xlink:href` attribute) at the drop location. Dragging an image file from the default file system application (Windows Explorer on Windows or Finder on Mac OS X, for example) and dropping it into a JATS document inserts an image element (the `<inline-graphic>` element with the `xlink:href` attribute) at the drop location, similar to the **Insert Image** toolbar action.

**Tip:** For information about customizing **Author** mode actions for a particular **framework** ([page 2706](#)) (document type), see the **Configuring Actions, Menus, Toolbars, Content Completion for a Framework** ([page 2038](#)) section.

---

Related Information:

- [Configuring Actions, Menus, Toolbars, Content Completion for a Framework](#)

---

EPUB Document Type (Framework)

**EPUB** is an e-book file format that is a ZIP archive and can be downloaded and read on devices such as phones, tablets, computers, or e-readers. You can view the contents and structure of this type of file ([page 1910](#)) in the **Navigator** view or main editing pane.

Three distinct **frameworks** ([page 2706](#)) are supported for the EPUB document type:

- **NCX** - A declarative global navigation definition.
- **OCF** - The Open Container Format (OCF) defines a mechanism by which all components of an Open Publication Structure (OPS) can be combined into a single file system entity.
- **OPF** - The Open Packaging Format (OPF) defines the mechanism by which all components of a published work that conforms to the Open Publication Structure (OPS) standard (including metadata, reading order, and navigational information) are packaged in an OPS Publication.

**Note:** Oxygen XML Editor plugin supports OPF 2.0, OPF 3.0, and OPF 3.1.

---

File Definition

A file is considered to be an **EPUB** document if it has a file extension of `.epub`.
Default Document Templates

There are a variety of default EPUB templates available when creating new documents from templates (page 554) and they can be found the following folders in Framework Templates: NCX, OCF, OPF 2.0, OPF 3.0, and OPF 3.1.

- The default templates for the NCX document types are located in the `\[OXYGEN_INSTALL_DIR\]/frameworks/ncx/templates` folder.
- The default templates for the OCF document types are located in the `\[OXYGEN_INSTALL_DIR\]/frameworks/ocf/templates` folder.
- The default template for the OPF 2.0 document type is located in the `\[OXYGEN_INSTALL_DIR\]/frameworks/opf/templates/2.0` folder.
- The default template for the OPF 3.0 document type is located in the `\[OXYGEN_INSTALL_DIR\]/frameworks/opf/templates/3.0` folder.
- The default template for the OPF 3.1 document type is located in the `\[OXYGEN_INSTALL_DIR\]/frameworks/opf/templates/3.1` folder.

Default Schema

The default schema files for the various types of EPUB document types are located in the following directories:

- The default schema files for the NCX document types are located in the `\[OXYGEN_INSTALL_DIR\]/frameworks/ncx/schemas` folder.
- The default schema files for the OCF document types are located in the `\[OXYGEN_INSTALL_DIR\]/frameworks/ocf/schemas` folder.
- The default schema files for the OPF 2.0 document type is located in the `\[OXYGEN_INSTALL_DIR\]/frameworks/opf/schemas/2.0` folder.
- The default schema files for the OPF 3.0 document type is located in the `\[OXYGEN_INSTALL_DIR\]/frameworks/opf/schemas/3.0` folder.
- The default schema files for the OPF 3.1 document type is located in the `\[OXYGEN_INSTALL_DIR\]/frameworks/opf/schemas/3.1` folder.

Related Information:

- Working with Archive Files (page 1912)
Other Supported Document Types

Along with the fully supported built-in frameworks (document types) (page 1277), Oxygen XML Editor plugin also provides limited support (including document templates) for editing a variety of other document types. All the specialized views, editors, actions, and options are dynamic according to the type of file that is opened or created. Other document types that are supported in Oxygen XML Editor plugin include:

- EPUB (NCX, OCF, OPF 2.0, 3.0, & 3.1) (page 1377) - A standard for e-book files.
- OOOXML (page 1912) - An XML-based file format for representing spreadsheets, charts, presentations, and word processing documents.
- ODF (page 1912) - A free and open-source XML-based file format for electronic office documents, such as spreadsheets, charts, presentations, and word processing documents.
- DocBook Targetset (page 1313) - For resolving cross-references when using olinks.
- XSLT Stylesheets (page 957) - A document type that provides a visual mode for editing XSLT stylesheets.
- WSDL (page 1119) - Web Services Description Language is an XML language for describing the functionality offered by a web service.
- Schematron (page 1212) - For making assertions about the presence or absence of patterns in XML documents. This document type applies to the ISO Schematron version.
- Schematron Quick Fixes (SQF) (page 886) - An extension of the ISO standard Schematron, allows developers to define Quick Fixes (page 2710) for Schematron errors.
- XProc (page 1210) - A document type for processing XProc script files.
- XML Schema (page 1012) - Documents that provide support for editing annotations.
- MathML (page 832) - Mathematical Markup Language (2.0 and 3.0) is an application of XML for describing mathematical notations.
- XLIFF (1.2, 2.0, 2.1) (page 1204) - XML Localization Interchange File Format is a standard for passing data between tools during a localization process.
- XQuery (page 1099) - The common query language for XML.
- CSS (page 1144) - Cascading Style Sheets is a language used for describing the look and formatting of a document.
- Relax NG Schema (page 1150) - A schema language that specifies a pattern for the structure and content of an XML document.
- NVDL Schema (page 1170) - Namespace Validation Dispatching Language allows you to specify sections of XML documents to be validated against various schemas.
- JSON (page 1178) - JavaScript Object Notation is a lightweight data-interchange format.
- Markdown (page 1252) - A lightweight markup language with plain text formatting syntax that can be converted to HTML or DITA.
• **JavaScript** *(page 1205)* - Programming language of HTML and the Web.
• **XMLSpec** - A markup language for W3C specifications and other technical reports.
• **DITAVAL** - DITA conditional processing profile to identify the values you want to conditionally process for a particular output, build, or other purpose.
• **Daisy** - A technical standard for digital audio books, periodicals, and computerized text. It is designed to be an audio substitute for print material.
• **EAD** - Encoded Archival Description is an XML standard for encoding archival finding aids.
• **KML** - Keyhole Markup Language is an XML notation for expressing geographic visualization in maps and browsers.
• **Maven Project & Settings** - Project or settings file for Maven build automation tool that is primarily used for Java projects.
• **Oasis XML Catalog** - An XML Catalog *(page 2712)* document that describes a mapping between external entity references and locally-cached equivalents.
• **Other Non-XML Files** *(page 570)* - Oxygen XML Editor plugin also includes a simple text editor and a variety of helpful features for creating and editing non-XML files.
10. Publishing

XML documents can be transformed into a variety of user-friendly output formats that can be viewed by end users. This process is known as a *transformation*.

Oxygen XML Editor plugin includes numerous built-in transformation possibilities to publish XML content in various output formats (such as WebHelp, PDF, CHM, EPUB, JavaHelp, Eclipse Help, XHTML, etc.)

For transformations that are not included in your installed version of Oxygen XML Editor plugin, simply install the tool chain required to perform the specific transformation and process the files in accordance with the processor instructions. A multitude of target formats are possible. The basic condition for a transformation to any format is that your source document is well-formed.

**Transformation Scenarios**

A transformation scenario is a set of complex operations and settings that gives you the possibility to obtain outputs of multiple types (XML, HTML, PDF, EPUB, etc.) from the same source of XML files and stylesheets.

**Note:** You need to use the appropriate stylesheet according to the source definition and the desired output. For example, if you want to transform into an HTML format using a DocBook stylesheet, your source XML document should conform with the DocBook DTD.

Executing a transformation scenario implies multiple actions, such as:

- Validating the input file.
- Obtaining intermediate output files (for example, formatting objects for the XML to PDF transformation).
- Using transformation engines to produce the output.

Before transforming an XML document in Oxygen XML Editor plugin, you need to define a transformation scenario to apply to that document. A scenario is a set of values for various parameters that define a transformation. It is not related to a particular document, but rather to a document type. Oxygen XML Editor plugin included preconfigured built-in transformation scenarios (*page* 1382), but you can also create new transformation scenarios (*page* 1415).
When creating new transformation scenarios, the types that are available include:

- **Scenarios that Apply to XML Files** - This type of scenario contains the location of an XSLT stylesheet that is applied on the edited XML document, as well as other transformation parameters. For more information, see XML Transformation with XSLT *(page 1416)* and XML Transformation with XQuery *(page 1433)*.

- **Scenarios that Apply to XSLT Files** - This type of scenario contains the location of an XML document that the edited XSLT stylesheet is applied to, as well as other transform parameters. For more information, see XSLT Transformation *(page 1463)*.

- **Scenarios that Apply to XQuery Files** - This type of scenario contains the location of an XML source, that the edited XQuery file is applied to, as well as other transform parameters. When the XML source is a native XML database, the XML source field of the scenario is empty because the XML data is read with XQuery-specific functions, such as `document()` . When the XML source is a local XML file, the URL of the file is specified in the XML input field of the scenario. For more information, see XQuery Transformation *(page 1489)*.

- **Scenarios that Apply to SQL Files** - This type of scenario specifies a database connection for the database server that runs the SQL file that is associated with the scenario. The data processed by the SQL script is located in the database.

- **Scenarios that Apply to XProc Files** - This type of scenario contains the location of an XProc script, as well as other transform parameters. For more information, see SQL Transformation *(page 1497)*.

- **DITA-OT Scenarios** - This type of scenario provides the parameters for an Ant transformation that executes a DITA-OT build script. Oxygen XML Editor plugin includes a built-in version of Ant and a built-in version of DITA-OT, although you can also set other versions in the scenario. For more information, see DITA OT Transformation *(page 1444)*.

- **ANT Scenarios** - This type of scenario contains the location of an Ant build script, as well as other transform parameters. For more information, see Ant Transformation *(page 1459)*.

**Note:**

Status messages generated during the transformation process are displayed in the Console view *(page 612)* (the Enable Oxygen consoles option *(page 161)* must be selected in the View preferences page *(page 160)*).

**Built-in Transformation Scenarios**

Oxygen XML Editor plugin includes preconfigured built-in transformation scenarios that are used for common transformations. They can be found in the various sections in the Configure Transformation Scenario(s) dialog box *(page 1502)* or Transformation Scenarios view *(page 1507)*. All the built-in document types (frameworks) *(page 2706)* that are included in Oxygen XML Editor plugin have
various transformation scenarios in their specific sections, including the most popular frameworks, such as DITA, DocBook, TEI, XHTML, JATS, OXOXML, and more.

To obtain the desired output, use one of the following actions from the toolbar or Transform submenu in the contextual menu of the Navigator view (page 250):

- **Apply Transformation Scenario(s) (Alt + Shift + T, T (Command + Alt + T, T on OS X))** - If you have associated transformation scenarios for the current document, this action will simply apply the association (page 1501) and begin the transformation process. If an association is not detected, this action will open the Configure Transformation Scenario(s) dialog box (page 1502) where you can choose the scenarios you want to apply.

- **Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Alt + T, C on OS X))** - This action will open the Configure Transformation Scenario(s) dialog box (page 1502) where you can choose the scenarios you want to apply.

**Note:**

- You can apply a transformation even if the current document is not associated with a transformation scenario.
- If the document contains an xml-stylesheet processing instruction that references an XSLT stylesheet (commonly used to display the document in web browsers), Oxygen XML Editor plugin prompts you to associate the document with a built-in transformation scenario.
- The default transformation scenario is suggested based on the processing instruction from the edited document.

**Related Information:**

- Creating New Transformation Scenarios (page 1415)
- Editing a Transformation Scenario (page 1498)
- Configure Transformation Scenario(s) Dialog Box (page 1502)
- Applying Associated Transformation Scenarios (page 1501)
- Transformation Scenarios View (page 1507)
Built-in transformation scenarios allow you to transform DITA maps to a variety of outputs, such as WebHelp, PDF, ODF, XHTML, EPUB, CHM, Kindle, and MS Word. Oxygen XML Editor plugin also includes a special Run DITA-OT Integrator that can be used to integrate a DITA-OT plugin and a DITA Map Metrics Report transformation that generates a statistics report for your DITA map. All of them are listed in the DITA Map section in the Configure Transformation Scenario(s) dialog box.

A variety of transformations scenarios are available for DITA maps:

- Built-in transformation scenarios allow you to transform a DITA map to a variety of outputs, such as WebHelp, PDF, ODF, XHTML, EPUB, CHM, Kindle, and MS Word.
- Run DITA-OT Integrator - Use this transformation scenario if you want to integrate a DITA-OT plugin. This scenario runs an Ant task that integrates all the plugins from the DITA-OT/plugins directory.
- DITA Map Metrics Report - Use this type of transformation scenario if you want to generate a DITA map statistics report. It contains information such as:
  - The number of processed maps and topics.
  - Content reuse percentage.
  - Number of elements, attributes, words, and characters used in the entire DITA map structure.
  - DITA conditional processing attributes used in the DITA maps.
  - Processing instructions.
  - External links.
  - All @outputclass attribute values gathered from the DITA project.

⚠️ Important: If you have cross references that point to content outside the scope of the DITA map, that referenced content will not be counted. For example, if you have links to topics that are not included in the DITA map hierarchy, the content in those topics is ignored when generating the statistics.

Related Information:

- Editing a Transformation Scenario
- Configure Transformation Scenario(s) Dialog Box
- Applying Associated Transformation Scenarios
DITA content can be transformed into several types of WebHelp Responsive systems (with or without a feedback section). The WebHelp Responsive layout and features ([page 1598]) are designed to adapt to any device and screen size to provide an optimal viewing and interaction experience. Oxygen XML Editor plugin also provides numerous possibilities for customizing the WebHelp Responsive output ([page 1675]).

**WebHelp Responsive Transformation Scenario**

To publish a *DITA map* ([page 2705]) as *WebHelp Responsive* output, follow these steps:

1. Select the ![Configure Transformation Scenario(s)](page 2400) action from the *DITA Maps Manager* ([page 2400]) toolbar.
2. Select the *DITA Map WebHelp Responsive* scenario from the *DITA Map* section.
3. If you want to configure the transformation, click the *Edit* button.

**Step Result:** This opens an *Edit scenario* configuration dialog box that allows you to configure various options in the following tabs:

- **Templates Tab** ([page 2607]) - This tab contains a set of built-in publishing templates ([page 1632]) that you can use for the layout of your WebHelp system output. You can also create your own publishing templates or edit existing ones ([page 1675]).
- **Parameters Tab** ([page 2614]) - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the *Parameters section* ([page 1386]) below for details about the most commonly used parameters for WebHelp Responsive transformations.
- **Filters Tab** ([page 2616]) - This tab allows you to filter certain content elements from the generated output.
- **Advanced Tab** ([page 2617]) - This tab allows you to specify some advanced options for the transformation scenario.
- **Output Tab** ([page 2619]) - This tab allows you to configure options that are related to the location where the output is generated.

4. Click *Apply associated* to process the transformation.

When the *DITA Map WebHelp Responsive* transformation is complete, the output is automatically opened in your default browser.

**WebHelp Responsive with Feedback Transformation Scenario**

To publish a *DITA map* ([page 2705]) as a *WebHelp Responsive with Feedback* system, follow these steps:
1. Select the **Configure Transformation Scenario(s)** action from the **DITA Maps Manager (page 2400)** toolbar.

2. Select the **DITA Map WebHelp Responsive with Feedback** scenario from the **DITA Map** section.

3. If you want to configure the transformation, click the **Edit** button.

   **Step Result:** This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:
   
   - **Templates Tab (page 2607)** - This tab contains a set of built-in publishing templates (page 1632) that you can use for the layout of your WebHelp system output. You can also **create your own publishing templates or edit existing ones (page 1675)**.
   - **Parameters Tab (page 2614)** - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the **Parameters section (page 1386)** below for details about the most commonly used parameters for WebHelp Responsive transformations.
   - **Filters Tab (page 2616)** - This tab allows you to filter certain content elements from the generated output.
   - **Advanced Tab (page 2617)** - This tab allows you to specify some advanced options for the transformation scenario.
   - **Output Tab (page 2619)** - This tab allows you to configure options that are related to the location where the output is generated.

4. Click **Apply associated** to begin the transformation.

5. Enter the documentation product ID (value for the **webhelp.product.id** parameter) and the documentation version (value for the **webhelp.product.version** parameter).

   When the **DITA Map WebHelp Responsive with Feedback** transformation is complete, your default browser opens the **installation.html** file. This file contains information about the output location, system requirements, installation instructions, and deployment of the output. Follow the **instructions to complete the system deployment (page 1614)**.

### Parameters for Customizing WebHelp Responsive Output

To customize a transformation scenario, you can edit various parameters, including the following most commonly used ones:

- **default.language**
  
  This parameter is used if the language is not detected in the **DITA map**. The default value is **en-us**.

- **clean.output**
Deletes all files from the output folder before the transformation is performed (only `no` and `yes` values are valid and the default value is `no`).

**editlink.remote.ditamap.url**

Use this parameter in conjunction with `editlink.web.author.url` to add an *Edit* link next to the topic title in the WebHelp output. When a user clicks the link, the topic is opened in Oxygen XML Web Author where they can make changes that can be saved to a file server. The value should be set as the custom URL of the *main DITA map*. For example, a GitHub custom URL might look like this: `https://getFileContent/oxyengxml/userguide/master/UserGuide.ditamap`.

**editlink.web.author.url**

This parameter needs to be used in conjunction with `editlink.remote.ditamap.url` to add an *Edit* link next to the topic title in the WebHelp output. When a user clicks the link, the topic is opened in Oxygen XML Web Author where they can make changes that can be saved to a file server. The value should be set as the URL of the Web Author installation. For example: `https://www.oxygenxml.com/oxygen-xml-web-author/`.

**editlink.present.only.path.to.topic**

When this parameter is set to "true", the DITA topic path is displayed to the right of each topic title in the WebHelp Responsive output. Also, when this parameter is used, the `editlink.remote.ditamap.url` and `editlink.web.author.url` parameters are ignored.

**fix.external.refs.com.oxygenxml** *(Only supported when the DITA OT transformation process is started from Oxygen XML Editor plugin)*

The DITA Open Toolkit usually has problems processing references that point to locations outside of the directory of the processed *DITA map*. This parameter is used to specify whether or not the application should try to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content. Allowed values: `true` or `false` (default).

**force.unique**

When set to `true` (default value), the transformation will be forced to create unique output files for each instance of a resource when a map contains multiple references to a single topic.

**use.stemming**

Controls whether or not you want to include stemming search algorithms into the published output (default setting is `false`).

**webhelp.custom.resources**
The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

**webhelp.favicon**

The file path that points to an image to be used as a favicon in the WebHelp output.

**webhelp.reload.stylesheet**

Set this parameter to `true` if you have out of memory problems when generating WebHelp. It will increase processing time but decrease the memory footprint. The default value is `false`.

**webhelp.search.custom.excludes.file**

The path of the file that contains name patterns for HTML files that should not be indexed by the WebHelp search engine. Each exclude pattern must be on a new line. The patterns are considered to be relative to the output directory, and they accept wildcards such as `*` (matches zero or more characters) or `?` (matches one character). For more information about the patterns, see [https://ant.apache.org/manual/dirtasks.html#patterns](https://ant.apache.org/manual/dirtasks.html#patterns).

**webhelp.search.japanese.dictionary**

The file path of the dictionary that will be used by the Kuromoji morphological engine for indexing Japanese content in the WebHelp pages. The encoding for the dictionary must be `UTF8`.

**webhelp.search.enable.pagination**

Specifies whether or not search results will be displayed on multiple pages. Allowed values are `yes` or `no`.

**webhelp.search.page.numberOfItems**

Specifies the number of search results items displayed on each page. This parameter is only used when the `webhelp.search.enable.pagination` parameter is enabled.

**webhelp.search.ranking**

If this parameter is set to `false` then the 5-star rating mechanism is no longer included in the search results that are displayed on the Search tab (default setting is `true`).

**webhelp.show.changes.and.comments**

When set to `yes`, user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is `no`.

**webhelp.sitemap.base.url**

Base URL for all the `loc` elements in the generated `sitemap.xml` file. The value of a `loc` element is computed as the relative file path from the `href` attribute of a `topicref` element from the DITA map, appended to this base URL value. The `loc`
element is mandatory in sitemap.xml. If you leave this parameter set to its default empty value, then the sitemap.xml file is not generated.

**webhelp.sitemap.change.frequency**

The value of the changefreq element in the generated sitemap.xml file. The changefreq element is optional in sitemap.xml. If you leave this parameter set to its default empty value, then the changefreq element is not added in sitemap.xml. Allowed values: <empty string> (default), always, hourly, daily, weekly, monthly, yearly, never.

**webhelp.sitemap.priority**

The value of the priority element in the generated sitemap.xml file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The priority element is optional in sitemap.xml. If you leave this parameter set to its default empty value, then the priority element is not added in sitemap.xml.

**Parameters Specific to WebHelp Responsive Output**

**webhelp.default.collection.type.sequence**

Specifies if the sequence value will be used by default when the collection-type attribute is not specified. This option is helpful if you want to have Next and Previous navigational buttons generated for all HTML pages. Allowed values are no (default) and yes.

**webhelp.enable.search.autocomplete**

Specifies if the Autocomplete feature is enabled in the WebHelp search text field. The default value is yes.

**webhelp.fragment.after.body**

In the generated output it displays a given XHTML fragment after the page body. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.logo_and_title**

In the generated output it displays a given XHTML fragment after the logo and title. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.main.page.search**

In the generated output it displays a given XHTML fragment after the search field. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.
webhelp.fragment.after.toc_or_tiles

In the generated output it displays a given XHTML fragment after the table of contents or tiles in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.top_menu

In the generated output it displays a given XHTML fragment after the top menu. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.body

In the generated output it displays a given XHTML fragment before the page body. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.logo_and_title

In the generated output it displays a given XHTML fragment before the logo and title. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.main.page.search

In the generated output it displays a given XHTML fragment before the search field. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.toc_or_tiles

In the generated output it displays a given XHTML fragment before the table of contents or tiles in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.top_menu

In the generated output it displays a given XHTML fragment before the top menu. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.footer

In the generated output it displays a given XHTML fragment as the page footer. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.head
In the generated output it inserts a given XHTML fragment in the `<head>` element. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.welcome**

In the generated output it displays a given XHTML fragment as a welcome message (or title). The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.merge.nested.topics.related.links**

Specifies if the related links from nested topics will be merged with the links in the parent topic. Thus the links will be moved from the topic content to the related links component and all of the links from the same group (for example, Related Tasks, Related References, Related Information) are merged into a single group. The default value is `yes`.

**webhelp.search.stop.words.exclude**

Specifies a list of words that will be excluded from the default list of stop words that are filtered out before the search processing. Use comma separators to specify more than one word (for example: `if, for, is`).

**webhelp.show.breadcrumb**

Specifies if the breadcrumb component will be presented in the output. The default value is `yes`.

**webhelp.show.child.links**

Specifies if child links will be generated in the output for all topics that have subtopics. The default value is `no`.

**webhelp.show.indexterms.link**

Specifies if an icon that links to the index will be presented in the output. The default value is `yes`.

**webhelp.show.main.page.tiles**

Specifies if the tiles component will be presented in the main page of the output. For a tree style layout, this parameter should be set to `no`.

**webhelp.show.main.page.toc**

Specifies if the table of contents will be presented in the main page of the output. The default value is `yes`.

**webhelp.show.navigation.links**

Specifies if navigation links will be presented in the output. The default value is `yes`. 
webhelp.show.print.link

Specifies if a print link or icon will be presented within each topic in the output. The default value is yes.

webhelp.show.related.links

Specifies if the related links component will be presented in the WebHelp Responsive output. The default value is yes. The webhelp.merge.nested.topics.related.links parameter can used in conjunction with this one to merge the related links from nested topics into the links in the parent topic.

webhelp.show.publication.toc

Specifies if a table of contents will be presented on the left side of each topic in the output. The default value is yes.

webhelp.show.topic.toc

Specifies if a topic table of contents will be presented on the right side of each topic in the output. This table of contents contains links to each <section> within the current topic that contains an @id attribute and the section corresponding to the current scroll position is highlighted. The default value is yes.

webhelp.show.top.menu

Specifies if a menu will be presented at the topic of the main page in the output. The default value is yes.

webhelp.publication.toc.hide.chunked.topics

Specifies if the table of contents will contain links for chunked topics. The default value is yes.

webhelp.publication.toc.links

Specifies which links will be included in the table of contents. The possible values are:

- **chapter** (default) - The TOC will include links for the current topic, its children, its siblings, and its direct ancestor (including the direct ancestor's siblings), and the parent chapter.
- **topic** - The TOC will only include links for the current topic and its direct children.
- **all** - The TOC will include all links.

webhelp.publication.toc.tooltip.position

By default, if a topic contains a shortdesc element, its content is displayed in a tooltip when the user hovers over its link in the table of contents. This parameter controls whether or not this tooltip is displayed and its position relative to the link. The possible values are:
webhelp.top.menu.depth

Specifies the maximum depth level of the topics that will be included in the top menu. The default value is 3. A value of 0 means that the menu has unlimited depth.

webhelp.topic.collapsible.elements.initial.state

Specifies the initial state of collapsible elements (tables with titles, nested topics with titles, sections with titles, index term groups). The possible values are collapsed or expanded (default value).

DITA Map to WebHelp Classic Transformation

DITA content can be transformed into several types of WebHelp Classic systems (with or without a feedback section). The WebHelp Classic layout and features (page 1512) are designed for desktop systems and include a familiar classical style. Oxygen XML Editor plugin also provides numerous possibilities for customizing the WebHelp Classic output (page 1545).

WebHelp Classic Transformation Scenario

To publish a DITA map (page 2705) as a WebHelp Classic system, follow these steps:

1. Select the Configure Transformation Scenario(s) action from the DITA Maps Manager (page 2400) toolbar.
2. Select the DITA Map WebHelp Classic scenario from the DITA Map section.
3. If you want to configure the transformation, click the Edit button.

Step Result: This opens an Edit scenario configuration dialog box that allows you to configure various options in the following tabs:
Skins Tab (page 2606) - This tab contains a set of built-in skins that you can use for the layout of your WebHelp system output.

Parameters Tab (page 2614) - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the Parameters section (page 1395) below for details about the most commonly used parameters for WebHelp Responsive transformations.

Filters Tab (page 2616) - This tab allows you to filter certain content elements from the generated output.

Advanced Tab (page 2617) - This tab allows you to specify some advanced options for the transformation scenario.

Output Tab (page 2619) - This tab allows you to configure options that are related to the location where the output is generated.

4. Click **Apply associated** to process the transformation.

When the DITA Map WebHelp Classic transformation is complete, the output is automatically opened in your default browser.

### WebHelp Classic with Feedback Transformation Scenario

To publish a **DITA map** (page 2705) as a **WebHelp Classic with Feedback** system, follow these steps:

1. Select the **Configure Transformation Scenario(s)** action from the DITA Maps Manager (page 2400) toolbar.
2. Select the DITA Map WebHelp Classic with Feedback scenario from the DITA Map section.
3. If you want to configure the transformation, click the **Edit** button.

**Step Result:** This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:

- **Skins Tab** (page 2606) - This tab contains a set of built-in skins that you can use for the layout of your WebHelp system output.
- **Parameters Tab** (page 2614) - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the Parameters section (page 1395) below for details about the most commonly used parameters for WebHelp Responsive transformations.
- **Filters Tab** (page 2616) - This tab allows you to filter certain content elements from the generated output.
- **Advanced Tab** (page 2617) - This tab allows you to specify some advanced options for the transformation scenario.
- **Output Tab** (page 2619) - This tab allows you to configure options that are related to the location where the output is generated.

4. Click **Apply associated** to begin the transformation.
5. Enter the documentation product ID (value for the `webhelp.product.id` parameter) and the documentation version (value for the `webhelp.product.version` parameter).

When the DITA Map WebHelp Classic with Feedback transformation is complete, your default browser opens the `installation.html` file. This file contains information about the output location, system requirements, installation instructions, and deployment of the output. Follow the instructions to complete the system deployment (page 1614).

For more information about the feedback-enabled WebHelp system, watch our video demonstration:

https://www.youtube.com/embed/eoQ2uxHvppE

**Parameters for Customizing WebHelp Classic Output**

To customize a transformation scenario, you can edit various parameters, including the following most commonly used ones:

- **default.language**
  
  This parameter is used if the language is not detected in the DITA map. The default value is `en-us`.

- **clean.output**
  
  Deletes all files from the output folder before the transformation is performed (only `no` and `yes` values are valid and the default value is `no`).

- **fix.external.refs.com.oxygenxml** (Only supported when the DITA OT transformation process is started from Oxygen XML Editor plugin)

  The DITA Open Toolkit usually has problems processing references that point to locations outside of the directory of the processed DITA map. This parameter is used to specify whether or not the application should try to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content. Allowed values: `true` or `false` (default).

- **force.unique**

  When set to `true` (default value), the transformation will be forced to create unique output files for each instance of a resource when a map contains multiple references to a single topic.

- **use.stemming**

  Controls whether or not you want to include stemming search algorithms into the published output (default setting is `false`).

- **webhelp.body.script**
URL value that specifies the location of a well-formed XHTML file containing the custom script that will be copied in the `<body>` section of every WebHelp page.

`webhelp.copyright`

Adds a small copyright text that appears at the end of the Table of Contents pane.

`webhelp.custom.resources`

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

`webhelp.favicon`

The file path that points to an image to be used as a favicon in the WebHelp output.

`webhelp.footer.file`

Path to an XML file that includes the footer content for your WebHelp output pages. You can use this parameter to integrate social media features (such as widgets for Facebook™, Twitter™, Google Analytics, or Google+™). The file must be well-formed, each widget must be in separate `<div>` or `<span>` element, and the code for each `<script>` element is included in an XML comment (also, the start and end tags for the XML comment must be on a separate line). The following code excerpt is an example for adding a Facebook™ widget:

```xml
<div id="facebook">
  <div id="fb-root"/>
  <script>
    <!-- (function(d, s, id) { var js, fjs = d.getElementsByTagName(s)[0];
        if (d.getElementById(id)) return;
        js = d.createElement(s); js.id = id;
        js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
        fjs.parentNode.insertBefore(js, fjs); }
    (document, 'script', 'facebook-jssdk')); -->
  </script>
  <div data-share="true" data-show-faces="true" data-action="like"
    data-layout="standard" class="fb-like">
  </div>
</div>
```

`webhelp.footer.include`

Specifies whether or not to include footer in each WebHelp page. Possible values:

- yes
- no

If set to no, no footer is added to the WebHelp pages. If set to yes and the `webhelp.footer.file` parameter has a value, then the content of that file is used as footer. If the `webhelp.footer.file` has no value then a default Oxygen footer is inserted in each WebHelp page.
webhelp.google.search.results
A file path that specifies the location of a well-formed XHTML file containing the Google Custom Search Engine element `gcse:searchresults-only`. You can use all supported attributes for this element. It is recommend to set the `linkTarget` attribute to `frm` for frameless (`iframe`) version of WebHelp or to `contentWin` for the frameset version of WebHelp. The default value for this attribute is `_blank` and the search results will be loaded in a new window. If this parameter is not specified, the following code will be used:
```xml
<gcse:searchresults-only linkTarget="frm"></gcse:searchresults-only>
```

webhelp.google.search.script
A file path that specifies the location of a well-formed XHTML file containing the Custom Search Engine script from Google.

webhelp.head.script
URL value that specifies the location of a well-formed XHTML file containing the custom script that will be copied in the `<head>` section of every WebHelp page.

webhelp.logo.image.target.url
Specifies a target URL that is set on the logo image. When you click the logo image, you will be redirected to this address.

webhelp.logo.image
Specifies a path to an image displayed as a logo in the left side of the output header.

webhelp.reload.stylesheet
Set this parameter to `true` if you have out of memory problems when generating WebHelp. It will increase processing time but decrease the memory footprint. The default value is `false`.

webhelp.search.custom.excludes.file
The path of the file that contains name patterns for HTML files that should not be indexed by the WebHelp search engine. Each exclude pattern must be on a new line. The patterns are considered to be relative to the output directory, and they accept wildcards such as `*` (matches zero or more characters) or `?` (matches one character). For more information about the patterns, see [https://ant.apache.org/manual/dirtasks.html#patterns](https://ant.apache.org/manual/dirtasks.html#patterns).

webhelp.search.japanese.dictionary
The file path of the dictionary that will be used by the Kuromoji morphological engine for indexing Japanese content in the WebHelp pages. The encoding for the dictionary must be UTF8.

webhelp.search.ranking
If this parameter is set to `false` then the 5-star rating mechanism is no longer included in the search results that are displayed on the **Search** tab (default setting is `true`).

**webhelp.show.changes.and.comments**

When set to `yes`, user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is `no`.

**webhelp.sitemap.base.url**

Base URL for all the `loc` elements in the generated `sitemap.xml` file. The value of a `loc` element is computed as the relative file path from the `href` attribute of a `topicref` element from the **DITA map**, appended to this base URL value. The `loc` element is mandatory in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `sitemap.xml` file is not generated.

**webhelp.sitemap.change.frequency**

The value of the `changefreq` element in the generated `sitemap.xml` file. The `changefreq` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `changefreq` element is not added in `sitemap.xml`. Allowed values: `<empty string>` (default), `always`, `hourly`, `daily`, `weekly`, `monthly`, `yearly`, `never`.

**webhelp.sitemap.priority**

The value of the `priority` element in the generated `sitemap.xml` file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The `priority` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `priority` element is not added in `sitemap.xml`.

**DITA Map to PDF - based on HTML5 and CSS Transformation**

Oxygen XML Editor plugin includes a built-in **DITA Map PDF - based on HTML5 & CSS** transformation scenario based on a **DITA-OT CSS-based PDF Publishing plugin** that converts DITA maps to PDF using a CSS-based processing engine and an HTML5 intermediate format. Oxygen XML Editor plugin
comes bundled with a built-in CSS-based PDF processing engine called **Oxygen PDF Chemistry**. Oxygen XML Editor plugin also supports a few third-party processors.

For those who are familiar with CSS, this makes it very easy to style and customize the PDF output of your DITA projects without having to work with *xsl:fo* customizations. This transformation also includes some built-in publishing templates that you can use for the layout of your PDF output and you can create your own templates or edit existing ones.

The following CSS-based PDF processors can be used:

- **Oxygen PDF Chemistry** - A built-in processor that is bundled with Oxygen XML Editor plugin. For more information, see the Oxygen PDF Chemistry User Guide. This is the supported processor.
- **Prince Print with CSS** (not included in the Oxygen XML Editor plugin installation kit) - A third-party component that needs to be purchased from http://www.princexml.com.
- **Antenna House Formatter** (not included in the Oxygen XML Editor plugin installation kit) - A third-party component that needs to be purchased from http://www.antennahouse.com/antenna1/formatter/.

**How to Create the Transformation Scenario**

To create a **DITA Map PDF - based on HTML5 & CSS** transformation scenario, follow these steps:

1. Click the Configure Transformation Scenario(s) button from the DITA Maps Manager toolbar.
2. Select **DITA Map PDF - based on HTML5 & CSS**.
3. If you want to configure the transformation, click the Edit button.

**Step Result:** This opens an Edit scenario configuration dialog box that allows you to configure various options in the following tabs:

- **Templates Tab** (page 2607) - This tab contains a set of built-in publishing templates that you can use for the layout of your WebHelp system output. You can also create your own publishing templates by saving one from the gallery and changing it.
- **CSS Processor** Tab - This is where you choose the processor type. You can select between Oxygen PDF Chemistry, Prince XML, or Antenna House.
- **Parameters Tab** (page 2614) - This tab includes numerous parameters that can be set to customize your WebHelp system output.
- **Filters Tab** (page 2616) - This tab allows you to filter certain content elements from the generated output.
- **Advanced Tab** (page 2617) - This tab allows you to specify some advanced options for the transformation scenario.
- **Output Tab** (page 2619) - This tab allows you to configure options that are related to the location where the output is generated.
4. In the Parameters tab, configure any of the following parameters (if applicable):
   • **args.css** - Specifies a path to a custom CSS to be used in addition to those specified in the publishing template. The files must have URL syntax and be separated using semicolons. Also, the **dita.css.list** parameter must be left empty to use these files in addition to the selection in the Styles drop-down menu.
   • **css.processor.path.chemistry** (if you are using the Oxygen PDF Chemistry processor) - Specifies the path to the Oxygen PDF Chemistry executable file that will be run to generate the PDF. If this parameter is not set, your system's PATH environment variable will be used to find and start the Oxygen PDF Chemistry processor.
   • **css.processor.path.prince** (if you are using the Prince Print with CSS processor) - Specifies the path to the Prince executable file that will be run to produce the PDF. If you installed Prince using its default settings, you can leave this blank.
   • **css.processor.path.antenna-house** (if you are using the Antenna House Formatter processor) - Specifies the path to the Antenna House executable file that will be run to produce the PDF. If you installed Antenna House using its default settings, you can leave this blank.
   • **show.changes.and.comments** - When set to yes, user comments, replies to comments, and tracked changes are published in the PDF output. The default value is no.
   • **figure.title.placement** - Controls the position of the figure title relative to the image. Allowed values are "top" and "bottom", "top" is the default

5. Click OK and run the transformation scenario.

**Customizing the Output**

For information about customizing the output, see CSS-based DITA to PDF Customization (page 1755).

**Related Information:**

- Editing a Transformation Scenario (page 1498)
- Configure Transformation Scenario(s) Dialog Box (page 1502)
- Oxygen PDF Chemistry User Guide
- CSS-based DITA to PDF Customization (page 1755)

DITA Map to PDF - based on DITA and CSS (WYSIWYG) (Deprecated)
Attention: This transformation scenario was deprecated starting with version 21.0. If you have configured scenarios associated to your project based on this transformation scenario, you will still be able to use them, but for new transformations, it is recommended to use the DITA Map PDF - based on HTML5 & CSS transformation scenario (page 1398) instead.

Oxygen XML Editor plugin includes a built-in DITA Map to PDF - based on DITA & CSS (WYSIWYG) transformation scenario based on a DITA-OT CSS-based PDF Publishing plugin that convert DITA maps to PDF using a CSS-based processing engine. Oxygen XML Editor plugin also comes bundled with a built-in CSS-based PDF processing engine called Oxygen PDF Chemistry. For those who are familiar with CSS, this makes it very easy to style and customize the PDF output of your DITA projects without having to work with \texttt{xsl:fo} customizations. Oxygen XML Editor plugin also supports a few third-party processors.

The following processors are supported:

- **Oxygen PDF Chemistry** - A built-in processor that is bundled with Oxygen XML Editor plugin. For more information, see the Oxygen PDF Chemistry User Guide.
- **Prince XML** (not included in the Oxygen XML Editor plugin installation kit) - A third-party component that needs to be purchased from http://www.princexml.com.
- **Antenna House Formatter** (not included in the Oxygen XML Editor plugin installation kit) - A third-party component that needs to be purchased from http://www.antennahouse.com/antenna1/formatter/.

**DITA Map to PDF - based on DITA and CSS (WYSIWYG) Transformation Scenario**

To create a DITA Map to PDF - based on DITA & CSS (WYSIWYG) transformation scenario, follow these steps:

1. Click the **Configure Transformation Scenario(s)** button from the DITA Maps Manager (page 2400) toolbar.
2. Select DITA Map to PDF - based on DITA & CSS (WYSIWYG).
3. If you want to configure the transformation, click the **Edit** button.

Step Result: This opens an Edit scenario configuration dialog box that allows you to configure various options in the following tabs:

- **CSS Processor Tab** - This is where you choose the processor type. You can select between Oxygen PDF Chemistry, Prince XML, or Antenna House.
- **Parameters Tab** (page 2614) - This tab includes numerous parameters that can be set to customize your WebHelp system output.
- **Filters Tab** (page 2616) - This tab allows you to filter certain content elements from the generated output.
4. In the **Parameters** tab, configure any of the following parameters (if applicable):

- **args.css** - Specifies a path to a custom CSS (page 1782) to be used in addition to those specified in the `dita.css.list` parameter OR in addition to the CSS that is currently selected in the **Styles** drop-down menu. The files must have URL syntax and be separated using semicolons. Also, the `dita.css.list` parameter must be left empty to use these files in addition to the selection in the **Styles** drop-down menu.

- **dita.css.list** - Specifies a list of CSS URLs to be used by the PDF processor (instead of the default CSS files). The files must have URL syntax and be separated using semicolons. If the value is empty, the CSS associated with the current selection from the **Styles** drop-down menu is used.

- **css.processor.path.chemistry** (if you are using the Oxygen PDF Chemistry processor) - Specifies the path to the Oxygen PDF Chemistry executable file that will be run to generate the PDF. If this parameter is not set, your system's PATH environment variable will be used to find and start the Oxygen PDF Chemistry processor.

- **css.processor.path.prince** (if you are using the Prince Print with CSS processor) - Specifies the path to the Prince executable file that will be run to produce the PDF. If you installed Prince using its default settings, you can leave this blank.

- **css.processor.path.antenna-house** (if you are using the Antenna House Formatter processor) - Specifies the path to the Antenna House executable file that will be run to produce the PDF. If you installed Antenna House using its default settings, you can leave this blank.

- **show.changes.and.comments** - When set to yes, user comments, replies to comments, and tracked changes are published in the PDF output. The default value is no.

- **figure.title.placement** - Controls the position of the figure title relative to the image. Allowed values are "top" and "bottom", "top" is the default

5. Click **OK** and run the transformation scenario.

### Customizing the Output

The **DITA-OT CSS-based PDF Publishing plugin** makes it very easy to style and customize the PDF output of your DITA projects without having to work with xsl:fo customizations. You can style the PDF output by simply using a custom CSS to change the styling and then re-running the transformation scenario until you get the desired result.

For more information about customizing the output, see: **CSS-based DITA to PDF Customization** (page 1755).
Changing the Style of an Element

To change the style of a particular element, you need to create an additional CSS file that will store the customization rules. Once you have created this file, you need to instruct the editor how to use this additional CSS. This can be done in two ways:

- Specify the path to your custom CSS using the `args.css` parameter:
  1. Edit a `DITA Map to PDF - based on DITA & CSS (WYSIWYG)` transformation scenario.
  2. In the Parameters tab, specify the path to your custom CSS files in the `args.css` parameter.
  3. Click OK and run the transformation scenario.

  This method is appropriate if you just want to apply the styling customization to the output.

- Create an alternate CSS for the DITA document type:
  1. Follow the procedure for adding an alternate CSS file in Customizing Author Mode Using CSS Files Associated with a Framework (page 2061).
  2. Once you have configured your CSS as an additional layer, you can select it from the Styles drop-down menu (on the toolbar) (page 2063).
  3. Run the `DITA Map to PDF - based on DITA & CSS (WYSIWYG)` transformation scenario and the customization rules from the additional CSS will be visible in the produced PDF.

  This method allows you to have many customization CSS files and simply select the one that you need at any time for both the output and the rendering in Author mode.

Related Information:

- Editing a Transformation Scenario (page 1498)
- Configure Transformation Scenario(s) Dialog Box (page 1502)
- Configuring and Managing Multiple CSS Styles for a Framework (page 2063)
- CSS Inspector View (page 329)
- Oxygen PDF Chemistry User Guide
- CSS-based DITA to PDF Customization (page 1755)
Oxygen XML Editor plugin comes bundled with the DITA Open Toolkit that provides a mechanism for converting *DITA maps (page 2705)* to PDF output.

**Creating a DITA Map to PDF - based on XSL-FO Transformation Scenario**

To create a *DITA Map to PDF - based on XSL-FO* transformation scenario, follow these steps:

1. Click the **Configure Transformation Scenario(s)** button from the **DITA Maps Manager (page 2400)** toolbar.
2. Select **DITA Map PDF - based on XSL-FO** and click the **Edit** button (or use the **Duplicate** button if your **framework (page 2706)** is read-only).
3. Use the various tabs to configure the transformation scenario. In the **Parameters** tab, you can use a variety of parameters to customize the output. For example, the following parameters are just a few of the most commonly used ones:
   - **show.changes.and.comments** - If set to *yes*, user comments, replies to comments, and *tracked changes* are published in the PDF output.
   - **customization.dir** - Specifies the path to a customization directory.
   - **editlink.remote.ditamap.url** - When this parameter is set to "true", the DITA topic path is displayed to the right of each topic title in the PDF output.
4. Click **OK** and then the **Apply Associated** button to run the transformation scenario.

**Related Information:**

- XSL FO-based DITA to PDF Customization (page 1887)

**DITA Map to MS Office Word Transformation**

Oxygen XML Editor plugin comes bundled with a transformation scenario that allows you to convert *DITA maps (page 2705)* to Microsoft Office Word documents. It utilizes the DITA to Word plugin created by Jarno Elovirta. This plugin contains a Word document named **Normal.docx** (located in: `{OXYGEN_INSTALL_DIR}/frameworks/dita/DITA-OT3.x/plugins/com.elovirta.ooxml/resources`) that is used by the transformation scenario as a template to generate the final Word document.

**Tip:** You can make general modifications to the **Normal.docx** template file to alter the published output.
Configuring the Transformation Scenario

To configure an **DITA Map to MS Office Word** transformation scenario, follow these steps:

1. Open the DITA map in the **DITA Maps Manager (page 2400)**.
2. Click the **Configure Transformation Scenario(s)** button from the **DITA Maps Manager (page 2400)** toolbar.
3. Select **DITA Map MS Office Word**.
4. For advanced customizations, in the **Parameters** tab you can use any of the following parameters that are unique to this transformation scenario to specify paths to files that affect the output in various ways:
   - `dotx.file` - Specifies the path to a Word template file (.docx) that will be used in the transformation to generate the final Word document. Set this parameter if you want to use a different template file other than the Normal.docx file that is used by default.
   - `document.flat.xsl` - Specifies the path to a pre-process clean-up stylesheet.
   - `core.xsl` - Specifies the path to a core metadata stylesheet.
   - `custom.xsl` - Specifies the path to a custom metadata stylesheet.
   - `document.xsl` - Specifies the path to a main document stylesheet.
   - `comments.xsl` - Specifies the path to a comments stylesheet.
   - `numbering.xsl` - Specifies the path to a list and title numbering stylesheet.
   - `footnotes.xsl` - Specifies the path to a footnote stylesheet.
   - `document.xml.xsl` - Specifies the path to a document relations metadata stylesheet.
   - `inkscape.exec` - Specifies the path to an Inkscape (open-source vector graphics editor) executable file.
5. Click **OK** and run the transformation scenario.

**Result:** The result of the transformation will automatically be opened in your system's default word processing application (such as Microsoft Word).

---

**DITA Map to CHM (Compiled HTML Help) Transformation**
To perform a *Compiled HTML Help (CHM)* transformation, Oxygen XML Editor plugin needs Microsoft HTML Help Workshop to be installed on your computer. Oxygen XML Editor plugin automatically detects HTML Help Workshop and uses it.

**Note:** HTML Help Workshop might fail if the files used for transformation contain accents in their names, due to different encodings used when writing the `.hhp` and `.hhc` files. If the transformation fails to produce the CHM output but the `.hhp` (HTML Help Project) file is already generated, you can manually try to build the CHM output using HTML Help Workshop.

### Changing the Output Encoding

Oxygen XML Editor plugin uses the `htmlhelp.locale` parameter to correctly display specific characters of different languages in the output of the *Compiled HTML Help (CHM)* transformation. By default, the DITA Map CHM transformation scenario that comes bundled with Oxygen XML Editor plugin has the `htmlhelp.locale` parameter set to `en-US`.

To customize this parameter, follow this procedure:

1. Use the ✓ Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Alt + T, C on OS X)) action from the toolbar or the XML menu.
2. Select the DITA Map CHM transformation scenario and click the Edit button.
3. In the Parameter tab, search for the `htmlhelp.locale` parameter and change its value to the desired language tag.

**Note:** The format of the `htmlhelp.locale` parameter is LL-CC, where LL represents the language code (e.g., `en`), and CC represents the country code (e.g., `us`). The language codes are contained in the ISO 639-1 standard and the country codes are contained in the ISO 3166-1 standard. For further details about language tags, go to [http://www.rfc-editor.org/rfc/rfc5646.txt](http://www.rfc-editor.org/rfc/rfc5646.txt).

### DITA Map to Kindle Transformation

Oxygen XML Editor plugin requires KindleGen to generate Kindle output from DITA maps (page 2705). To install KindleGen for use by Oxygen XML Editor plugin, follow these steps:

1. Go to [www.amazon.com/kindleformat/kindlegen](http://www.amazon.com/kindleformat/kindlegen) and download the zip file that matches your operating system.
2. Unzip the file on your local disk.
3. Start Oxygen XML Editor plugin and open a DITA map in the DITA Maps Manager view (page 2400).
4. Click the **Configure Transformation Scenario(s)** button.

5. Select the **DITA Map Kindle** transformation and press the **Edit** button to edit it.

6. Go to **Parameters** tab and set the `kindlegen.executable` parameter as the path to the `KindleGen` directory.

7. Accept the changes.

### Run DITA OT Integrator Transformation

Oxygen XML Editor plugin comes bundled with a transformation scenario designed to integrate DITA-OT plugins (page 2709). These DITA-OT plugins are used for various customizations. It is called **Run DITA-OT Integrator** and is found in the **DITA Map** section of the **Configure Transformation Scenario(s)** dialog box (page 1502).

⚠️ **Attention:** The integration will be performed on the DITA-OT version specified in the **DITA Open Toolkit** section of the **DITA** preferences page (page 66).

### Running the Transformation Scenario

To integrate a DITA OT plugin, follow these steps:

1. If Oxygen XML Editor plugin was installed in the default location, you may need to restart and run it as an administrator.

2. Select the **Apply Transformation Scenario(s)** or **Configure Transformation Scenario(s)** (page 1502) action from the **DITA Maps Manager** toolbar (you could also use the same action on the main toolbar or open the **Transformation Scenarios** view (page 1507)).

3. Select the **Run DITA-OT Integrator** transformation scenario. If the **integrator** is not visible, select the **Show all scenarios** action that is available in the **Settings** drop-down menu.

4. **Apply the scenario** (page 1501).

5. Check the **Results** panel at the bottom of the application to make sure the build was successful.

6. Restart Oxygen XML Editor plugin with your normal permissions.

### Related Information:

Solving DITA Transformation Errors

If a DITA transformation results in errors or warnings, the information is displayed in the message panel at the bottom of the editor. The information includes the severity, description of the problem, the name of the resource, and the path of the resource.

To help prevent and solve DITA transformation problems, follow these steps:

1. **Validate the DITA map (page 2446)** by using the Validate and Check for Completeness action that is available on the DITA Maps Manager (page 2400) toolbar and in the DITA Maps menu.
2. If this action results in validation errors, solve them prior to executing the transformation. Also, you should pay attention to the warning messages because they may identify problems in the transformation.
3. Run the DITA transformation scenario (page 1444).
4. If the transformation results in errors or warnings, they are displayed in the Results panel (page 267) at the bottom of the editor. The following information is presented to help you troubleshoot the problems:
   - **Severity** - The first column displays the following icons that indicate the severity of the problem:
     - Informational - The transformation encountered a condition of which you should be aware.
     - Warning - The transformation encountered a problem that should be corrected.
     - Error - The transformation encountered a more severe problem, and the output is affected or cannot be generated.
   - **Info** - You can click the See More icon to open a web page that contains details about DITA-OT error messages.
   - **Description** - A description of the problem.
   - **Resource** - The name of the transformation resource.
   - **System ID** - The path of the transformation resource.
5. Use this information or other resources from the online DITA-OT community to solve the transformation problems before re-executing the transformation scenario.
6. If you need to contact the Oxygen technical support team, they will need you to send the entire transformation scenario execution log. To obtain it:
   a. Go to the Options > Preferences > DITA preferences page and set the Show console output option to Always.
   b. Execute the transformation scenario again. The console output messages are displayed in the DITA OT view.
   c. Copy the entire log, save it in a text file, then send it to the Oxygen technical support team.
d. After your issue has been solved, go back to the Options > Preferences > DITA preferences page and set the Show console output option to When build fails.

DocBook Transformation Scenarios

Built-in transformation scenarios allow you to transform DocBook documents to a variety of outputs, such as WebHelp, PDF, HTML, HTML Chunk, XHTML, XHTML Chunk, and EPUB. Oxygen XML Editor plugin also includes a DocBook 5.1 transformation scenario for Assembly documents. All of them are listed in the DocBook 4 and DocBook 5 sections in the Configure Transformation Scenario(s) dialog box (page 1502).

Related Information:

- Editing a Transformation Scenario (page 1498)

- Configure Transformation Scenario(s) Dialog Box (page 1502)

- Applying Associated Transformation Scenarios (page 1501)

DocBook to WebHelp Classic Transformation

DocBook documents can be transformed into several types of WebHelp systems (with or without a feedback section). The WebHelp Classic layout and features (page 1512) are designed for desktop systems and include a familiar classical style. Oxygen XML Editor plugin also provides numerous possibilities for customizing the WebHelp Classic output (page 1545).

WebHelp Classic Transformation Scenario

To publish a DocBook document as a WebHelp Classic system, follow these steps:

1. Click the Configure Transformation Scenario(s) action from the toolbar.
2. Select the DocBook WebHelp Classic scenario from the DocBook 4 or DocBook 5 section.
3. Click Apply associated.
When the DocBook WebHelp Classic transformation is complete, the output is automatically opened in your default browser.

WebHelp Classic with Feedback Transformation Scenario

To publish a DocBook document as a WebHelp Classic with Feedback system, follow these steps:

1. Click Configure Transformation Scenarios.
2. Select the DocBook WebHelp Classic with Feedback scenario from the DocBook 4 or DocBook 5 section.
3. Click Apply associated.
4. Enter the documentation product ID and the documentation version.

When the DocBook WebHelp Classic with Feedback transformation is complete, your default browser opens the installation.html file. This file contains information about the output location, system requirements, installation instructions, and deployment of the output. Follow the instructions to complete the system deployment. For more information, see Deploying a Feedback-Enabled System (page 1614).

For more information about the feedback-enabled WebHelp system, watch our video demonstration:

https://www.youtube.com/embed/eoQ2uxHvppE

Customizing DocBook WebHelp Transformation Scenarios

To customize a DocBook WebHelp transformation scenario, you can edit various parameters, including the following most commonly used ones:

**default.language**

This parameter is used if the language is not detected in the DITA map. The default value is en-us.

**clean.output**

Deletes all files from the output folder before the transformation is performed (only no and yes values are valid and the default value is no).

**l10n.gentext.default.language**

This parameter is used to identify the correct stemmer that differs from language to language. For example, for English the value of this parameter is en or for French it is fr, and so on.

**use.stemming**
Controls whether or not you want to include stemming search algorithms into the published output (default setting is `false`).

**webhelp.copyright**

Adds a small copyright text that appears at the end of the Table of Contents pane.

**webhelp.custom.resources**

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

**webhelp.favicon**

The file path that points to an image to be used as a favicon in the WebHelp output.

**webhelp.footer.file**

Path to an XML file that includes the footer content for your WebHelp output pages. You can use this parameter to integrate social media features (such as widgets for Facebook™, Twitter™, Google Analytics, or Google+™). The file must be well-formed, each widget must be in separate `div` or `span` element, and the code for each `script` element is included in an XML comment (also, the start and end tags for the XML comment must be on a separate line). The following code exert is an example for adding a Facebook™ widget:

```xml
<div id="facebook">
  <div id="fb-root"/>
  <script>
    !(function(d, s, id) { var js, fjs = d.getElementsByTagName(s)[0];
      if (d.getElementById(id)) return;
      js = d.createElement(s); js.id = id;
      js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
      fjs.parentNode.insertBefore(js, fjs); }
    (document, 'script', 'facebook-jssdk')); -->
  <div data-share="true" data-show-faces="true" data-action="like"
    data-layout="standard" class="fb-like"/>
</div>
```

**webhelp.footer.include**

Specifies whether or not to include footer in each WebHelp page. Possible values: `yes`, `no`. If set to `no`, no footer is added to the WebHelp pages. If set to `yes` and the `webhelp.footer.file` parameter has a value, then the content of that file is used as footer. If the `webhelp.footer.file` has no value then a default Oxygen footer is inserted in each WebHelp page.
**webhelp.logo.image.target.url**

Specifies a target URL that is set on the logo image. When you click the logo image, you will be redirected to this address.

**webhelp.logo.image**

Specifies a path to an image displayed as a logo in the left side of the output header.

**webhelp.product.id (available only for Feedback-enabled systems)**

This parameter specifies a short name for the documentation target, or product (for example, mobile-phone-user-guide, hvac-installation-guide).

**Note:** You can deploy documentation for multiple products on the same server.

**Restriction:** The following characters are not allowed in the value of this parameter: `< > / \ ' ( ) { } = ; * % + & .

**webhelp.product.version (available only for Feedback-enabled systems)**

Specifies the documentation version number (for example, 1.0, 2.5, etc.). New user comments are bound to this version.

**Note:** Multiple documentation versions can be deployed on the same server.

**Restriction:** The following characters are not allowed in the value of this parameter: `< > / \ ' ( ) { } = ; * % + & .

**webhelp.search.ranking**

If this parameter is set to `false` then the 5-star rating mechanism is no longer included in the search results that are displayed on the Search tab (default setting is `true`).

**webhelp.skin.css**

Path to a CSS file that sets the style theme in the WebHelp Classic output. It can be one of the built-in skin CSS from the `OXYGEN_INSTALL_DIR\frameworks\docbook\xsl\com.oxygenxml.webhelp.classic\predefined-skins` directory, or it can be a custom skin CSS generated with the Oxygen Skin Builder web application.

**Related Information:**

DocBook to DITA Transformation

Oxygen XML Editor plugin includes a built-in transformation scenario that is designed to convert DocBook content to DITA. This transformation scenario is based upon a DITA Open Toolkit plugin that is available at sourceforge.net.

To convert a DocBook document to DITA, follow these steps:

1. Use one of the following two methods to begin the transformation process:
   • To apply the transformation scenario to a newly opened file, use the **Apply Transformation Scenario(s)** (Alt + Shift + T, T (Command + Alt + T, T on OS X)) action from the toolbar or the XML menu.
   • To customize the transformation or change the scenario that is associated with the document, use the **Configure Transformation Scenario(s)** (Alt + Shift + T, C (Command + Alt + T, C on OS X)) action from the toolbar or the XML menu.

2. Select the **DocBook to DITA** transformation scenario in the DocBook 4 or DocBook 5 section.

3. Click the **Apply associated** button to run the transformation.

   **Step Result:** The transformation will convert as many of the DocBook elements into equivalent DITA elements as it can recognize in its mapping process. For elements that cannot be mapped, the transformation will insert XML comments so that you can see which elements could not be converted.

4. Adjust the resulting DITA composite to suit your needs. You may have to remove comments, fix validation errors, adjust certain attributes, or split the content into individual topics.

Related Information:

- **Editing a Transformation Scenario** (page 1498)
- **Configure Transformation Scenario(s) Dialog Box** (page 1502)

DocBook to PDF Transformation

Oxygen XML Editor plugin includes a built-in transformation scenario that is designed to convert DocBook content to PDF.
To convert a DocBook document to PDF, follow these steps:

1. Use one of the following two methods to begin the transformation process:
   - To apply the transformation scenario to a newly opened file, use the **Apply Transformation Scenario(s)** (Alt + Shift + T, T (Command + Alt + T, T on OS X)) action from the toolbar or the XML menu.
   - To customize the transformation or change the scenario that is associated with the document, use the **Configure Transformation Scenario(s)** (Alt + Shift + T, C (Command + Alt + T, C on OS X)) action from the toolbar or the XML menu.

2. Select the **DocBook PDF** transformation scenario in the **DocBook 4** or **DocBook 5** section.
3. Click the **Apply associated** button to run the transformation.

For information about customizing the PDF output for DocBook content, see [DocBook to PDF Output Customization (page 1899)](#).

### Related Information:

- [Editing a Transformation Scenario (page 1498)](#)
- [Configure Transformation Scenario(s) Dialog Box (page 1502)](#)
- [DocBook to PDF Output Customization (page 1899)](#)

### DocBook to EPUB Transformation

Oxygen XML Editor plugin includes a built-in transformation scenario that is designed to convert DocBook content to EPUB. The EPUB specification recommends the use of OpenType fonts (recognized by their .otf file extension) whenever possible. To use a specific font, follow these steps:

1. Declare it in your CSS file, as in the following example:

```css
@font-face { 
  font-family: "MyFont";
  font-weight: bold;
  font-style: normal;
  src: url(fonts/MyFont.otf);
}
```
2. In the CSS, specify where this font is used. To set it as default for h1 elements, use the `font-family` rule, as in the following example:

```css
h1 {
  font-size: 20pt;
  margin-bottom: 20px;
  font-weight: bold;
  font-family: "MyFont";
  text-align: center;
}
```

3. Open the Configure Transformation Scenario(s) dialog box (page 1502), select the DocBook EPUB transformation scenario in the DocBook 4 or DocBook 5 section, and click Edit.

4. In the Parameters tab, set the `epub.embedded.fonts` parameter to `fonts/MyFont.otf`. If you need to provide more files, use commas to separate their file paths.

   **Note:** The `html.stylesheet` parameter allows you to include a custom CSS in the output EPUB.

5. Run the transformation scenario.

**DocBook PDF (Show Change Tracking and Comments)**

Oxygen XML Editor plugin includes a built-in transformation scenario that is designed to show tracked changes and comment in DocBook to PDF output.

To include comments and tracked changes (stored within your DocBook 5 documents) in the PDF output, follow these steps:

1. Click the Configure Transformation Scenario(s) button.
2. Select DocBook PDF (Show Change Tracking and Comments) in the DocBook 5 section.
3. If you need to configure the transformation, click the Edit (page 1498) or Duplicate (page 1500) button, make your changes to the scenario, and click OK.
4. Click the Apply Associated button to run the transformation scenario.

   **Result:** Comment threads and tracked changes will now appear in the PDF output. Details about each comment or change will be available in the footer section for each page.

**Creating New Transformation Scenarios**
Defining a transformation scenario is the first step in the process of transforming a document. This section includes information on the types of new scenarios that are available in Oxygen XML Editor plugin and how to create each type of transformation.

**XML Transformation with XSLT**

This type of transformation specifies the transformation parameters and location of an XSLT stylesheet that is applied to the edited XML document. This scenario is useful when you develop an XML document and the XSLT document is in its final form.

To create an **XML transformation with XSLT** scenario, use one of the following methods:

- Use the Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Alt + T, C on OS X)) action from the toolbar or the XML menu. Then click the New button and select XML transformation with XSLT.
- Go to Window > Show View and select Transformation Scenarios to display this view (page 1507). Click the New Scenario drop-down menu button and select XML transformation with XSLT.

Both methods open the New Scenario dialog box.

The upper part of the dialog box allows you to specify the Name of the transformation scenario.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

**XSLT Tab**

When you create a new transformation scenario (page 1415) or edit an existing one (page 1498), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The XSLT tab contains the following options:

**XML URL**

Specifies the source XML file. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (page 201) button, or the browsing actions in the Browse drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.

**Note:** If the transformer engine is Saxon 9.x and a custom URI resolver is configured in the advanced Saxon preferences page (page 195), the XML input of the transformation is passed to that
URI resolver. If the transformer engine is one of the built-in XSLT 2.0 / 3.0 engines and the name of an initial template (page 1417) is specified in the scenario, the XML URL field can be empty. The XML URL field can also be empty if you use external XSLT processors (page 1432). Otherwise, a value is mandatory in this field.

**XSL URL**

Specifies the source XSL file that the transformation will use. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (page 201) button, or the browsing actions in the Browse drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

**Use "xml-stylesheet" declaration**

If selected, the scenario applies the stylesheet specified explicitly in the XML document with the xml-stylesheet processing instruction. By default, this option is deselected and the transformation applies the XSLT stylesheet that is specified in the XSL URL field.

**Transformer**

This drop-down menu presents all the transformation engines available to Oxygen XML Editor plugin for performing a transformation. These include the built-in engines and the external engines defined in the Custom Engines preferences page (page 181). The engine you choose is used as the default transformation engine. Also, if an XSLT or XQuery document does not have an associated validation scenario, this transformation engine is used in the validation process (if it provides validation support).

**Advanced options**

Allows you to configure the advanced options of the Saxon HE/PE/EE engine (page 1420) for the current transformation scenario. To configure the same options globally, go to the Saxon-HE/PE/EE preferences page (page 192). For the current transformation scenario, these Advanced options override the options configured in that preferences page.

**Parameters**

Opens a Configure parameters dialog box (page 1418) that allows you to configure the XSLT parameters used in the current transformation. In this dialog box, you can also configure the parameters for additional XSLT stylesheets (page 1418). If the XSLT transformation engine is custom-defined, you cannot use this dialog box to configure the parameters sent to the custom engine. Instead, you can copy all parameters from the dialog box using contextual menu actions and edit the custom XSLT engine to include the necessary parameters in the command line that starts the transformation process.
Extensions

Opens a dialog box for configuring the XSLT extension JARS or classes (page 1419) that define extension Java functions or extension XSLT elements used in the transformation.

Additional XSLT stylesheets

Opens a dialog box for adding XSLT stylesheets (page 1420) that are applied on the main stylesheet specified in the XSL URL field. This is useful when a chain of XSLT stylesheets must be applied to the input XML document.

XSLT Parameters

The global parameters of the XSLT stylesheet used in a transformation scenario can be configured by using the Parameters button in the XSLT tab of a new or edited transformation scenario dialog box.

The resulting dialog box includes a table that displays all the parameters of the current XSLT stylesheet, all imported and included stylesheets, and all additional stylesheets (page 1420), along with their descriptions and current values. You can also add, edit, and remove parameters, and you can use the Filter text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

If the XPath column is selected, the parameter value is evaluated as an XPath expression before starting the XSLT transformation.

Example:

For example, you can use expressions such as:

```
doc('test.xml')//entry
//person[@atr='val']
```

Note:

1. The doc function solves the argument relative to the XSL stylesheet location. You can use full paths or editor variables (page 201) (such as ${cfdu} [current file directory]) to specify other locations: doc('${cfdu}/test.xml')/*
2. You cannot use XSLT Functions. Only XPath functions are allowed.

Below the table, the following actions are available for managing the parameters:

New

Opens the Add Parameter dialog box that allows you to add a new parameter to the list. An editor variable (page 201) can be inserted in the text box using the Insert
**Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

**Edit**

Opens the **Edit Parameter** dialog box that allows you to edit the selected parameter. An editor variable *(page 201)* can be inserted in the text box using the ➝ **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

**Unset**

 Resets the selected parameter to its default value. Available only for edited parameters with set values.

**Delete**

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

The bottom panel presents the following:

- The default value of the parameter selected in the table.
- A description of the parameter, if available.
- The system ID of the stylesheet that declares it.

**Related Information:**

- **Editor Variables** *(page 201)*

---

**XSLT Extensions**

The **Extensions** button opens a dialog box that allows you to specify the **JARS** *(page 2707)* and classes that contain extension functions called from the XSLT file of the current transformation scenario. You can use the **Add**, **Edit**, and **Remove** buttons to configure the extensions.

---

**Tip:** You can specify the path to the resources using wildcards (for example, **${oxygenHome}/lib/*.*.jar**).

An extension function called from the XSLT file of the current transformation scenario will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item to be moved and press the ➤ **Move up** or ➣ **Move down** buttons.
Additional XSLT Stylesheets

Use the Additional XSLT Stylesheets button in the XSLT tab to display a list of additional XSLT stylesheets to be used in the transformation and you can add files to the list or edit existing entries. The following actions are available:

Add

Adds a stylesheet in the Additional XSLT stylesheets list using a file browser dialog box. You can type an editor variable (page 201) in the file name field of the browser dialog box. The name of the stylesheet will be added in the list after the current selection.

Remove

Deletes the selected stylesheet from the Additional XSLT stylesheets list.

Up

Moves the selected stylesheet up in the list.

Down

Moves the selected stylesheet down in the list.

Advanced Saxon HE/PE/EE XSLT Transformation Options

The XSLT transformation scenario allows you to configure advanced options that are specific for the Saxon HE (Home Edition), PE (Professional Edition), and EE (Enterprise Edition) engines. They are the same options as those in the Saxon HE/PE/EE preferences page (page 192) but they are configured as a specific set of transformation options for each transformation scenario, while the values set in the preferences page apply as global options. The advanced options configured in a transformation scenario override the global options defined in the preferences page.

Saxon-HE/PE/EE Options

The advanced options for Saxon 9.8.0.12 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE) are as follows:

Mode ("-im")

A Saxon-specific option that sets the initial mode for the transformation. If this value is also specified in a configuration file (page 1420), the value in this option takes precedence.

Template ("-it")

A Saxon-specific option that sets the name of the initial XSLT template to be executed. If this value is also specified in a configuration file (page 1420), the value in this option takes precedence.
Use a configuration file ("-config")

Select this option if you want to use a Saxon 9.8.0.12 configuration file that will be executed for the XSLT transformation and validation processes. You can specify the path to the configuration file by entering it in the URL field, or by using the Insert Editor Variables button, or using the browsing actions in the Browse drop-down list.

Debugger trace into XPath expressions (applies to debugging sessions)

Instructs the XSLT Debugger (page 2025) to step into XPath expressions.

Enable Optimizations ("-opt")

This option is selected by default, which means that optimization is enabled. If not selected, the optimization is suppressed, which is helpful when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

Line numbering ("-l")

Line numbers where errors occur are included in the output messages.

Expand attributes defaults ("-expand")

Specifies whether or not the attributes defined in the associated DTD or XML Schema are expanded in the output of the transformation you are executing.

DTD validation of the source ("-dtd")

Specifies whether or not the source document will be validated against their associated DTD. You can choose from the following:

- On - Requests DTD validation of the source file and of any files read using the document() function.
- Off - (default setting) Suppresses DTD validation.
- Recover - Performs DTD validation but treats the errors as non-fatal.

Note: Any external DTD is likely to be read even if not used for validation, since DTDs can contain definitions of entities.

Recoverable errors ("-warnings")

Specifies how dynamic errors are handled. The following options can be selected:

- Recover silently ("silent") - Continues processing without reporting the error.
- Recover with warnings ("recover") - Issues a warning but continues processing.
- **Signal the error and do not attempt recovery** (*fatal*) - Issues an error and stops processing.

**Strip whitespaces** (*-strip*)

Specifies how the *strip whitespaces* operation is handled. You can choose one of the following values:

- **All** (*all*) - Strips *all* whitespace text nodes from source documents before any further processing, regardless of any `xml:space` attributes in the source document.
- **Ignore** (*ignorable*) - Strips *all* ignorable whitespace text nodes from source documents before any further processing, regardless of any `xml:space` attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
- **None** (*none*) - Strips *no* whitespace before further processing.

**Saxon-PE/EE Options**

The following advanced options are specific for Saxon 9.8.0.12 Professional Edition (PE) and Enterprise Edition (EE) only:

**Register Saxon-JS extension functions and instructions**

Registers the Saxon-CE extension functions and instructions when compiling a stylesheet using the Saxon 9.8.0.12 processors.

- **Note:** Saxon-CE, being JavaScript-based, was designed to run inside a web browser. This means that you will use Oxygen XML Editor plugin only for developing the Saxon-CE stylesheet, leaving the execution part to a web browser. See more details about [executing such a stylesheet on Saxonica's website](http://[URL]).

**Allow calls on extension functions** (*-ext*)

If selected, the stylesheet is allowed to call external Java functions. This does not affect calls on integrated extension functions, including Saxon and EXSLT extension functions. This option is useful when loading an untrusted stylesheet (such as from a remote site using `http://[URL]`). It ensures that the stylesheet cannot call arbitrary Java methods and thus gain privileged access to resources on your machine.

**Enable assertions** (*-ea*)

In XSLT 3.0, you can use the `<xsl:assert>` element to make assertions in the form of XPath expressions, causing a dynamic error if the assertion turns out to be false. If this option is selected, XSLT 3.0 `<xsl:assert>` instructions are enabled. If it is not selected (default), the assertions are ignored.
Saxon-EE Options

The advanced options that are specific for Saxon 9.8.0.12 Enterprise Edition (EE) are as follows:

**XML Schema version**

Use this option to change the default XML Schema version for this transformation. To change the default XML Schema version globally, open the Preferences dialog box (page 55) and go to XML > XML Parser > XML Schema and use the Default XML Schema version option (page 177).

**Validation of the source file ("-val")**

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

- **Schema validation ("strict")** - This mode requires an XML Schema and allows for parsing the source documents with strict schema-validation enabled.
- **Lax schema validation ("lax")** - If an XML Schema is provided, this mode allows for parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

**Validation errors in the result tree treated as warnings ("-outval")**

Normally, if validation of result documents is requested, a validation error is fatal. Selecting this option causes such validation failures to be treated as warnings.

**Write comments for non-fatal validation errors of the result document**

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

**Enable streaming mode**

Selecting this option will allow an XSLT to run in streaming mode. It is not selected by default.

**Other Options**

**Initializer class**

Equivalent to the `-init` Saxon command-line argument. The value is the name of a user-supplied class that implements the `net.sf.saxon.lib.Initializer` interface. This initializer is called during the initialization process, and may be used to set any options required on the configuration programmatically. It is particularly useful for tasks such
as registering extension functions, collations, or external object models, especially in Saxon-HE where the option cannot be set via a configuration file. Saxon only calls the initializer when running from the command line, but the same code may be invoked to perform initialization when running user application code.

Using Saxon Integrated Extension Functions

Saxon, the transformation and validation engine used by Oxygen XML Editor plugin, can be customized by adding custom functions (called Integrated Extension Functions) that can be called from XPath.

To define such a function, follow these steps:

1. Create a file with a Java class that extends net.sf.saxon.lib.ExtensionFunctionDefinition. Here is an example:

```java
private static class ShiftLeft extends ExtensionFunctionDefinition {
    @Override
    public StructuredQName getFunctionQName() {
        return new StructuredQName("eg", "http://example.com/saxon-extension", "shift-left");
    }

    @Override
    public SequenceType[] getArgumentTypes() {
        return new SequenceType[] {SequenceType.SINGLE_INTEGER, SequenceType.SINGLE_INTEGER};
    }

    @Override
    public SequenceType getResultType(SequenceType[] suppliedArgumentTypes) {
        return SequenceType.SINGLE_INTEGER;
    }

    @Override
    public ExtensionFunctionCall makeCallExpression() {
        return new ExtensionFunctionCall() {
            public SequenceIterator call(SequenceIterator[] arguments, XPathContext context)
                throws XPathException {
            }
        }
    }
}
```
```java
long v0 = ((IntegerValue)arguments[0].next()).longValue();
long v1 = ((IntegerValue)arguments[1].next()).longValue();
long result = v0 << v1;
return Value.asIterator(Int64Value.makeIntegerValue(result));
}
}
```
• **XML URL as input** - The FO processor is applied to the input XML file.

**Method**

The output format of the FO processing. The available options depend on the selected processor type.

**Processor**

Specifies the FO processor to be used for the transformation. It can be the built-in Apache FOP processor or an **external processor** (*page 164*).

**Output Tab (XSLT Transformations)**

When you *create a new transformation scenario* (*page 1415*) or *edit an existing one* (*page 1498*), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Output** tab contains the following options:

**Prompt for file**

At the end of the transformation, a file browser dialog box is displayed for specifying the path and name of the file that stores the transformation result.

**Save As**

The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the **Insert Editor Variables** (*page 201*) button, or the **Browse** button.

**Open in Browser/System Application**

If selected, Oxygen XML Editor plugin automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows PDF files are often opened in *Acrobat Reader*).

**Note:** To set the web browser that is used for displaying HTML/XHTML pages, go to *Window > Preferences > General > Web Browser* and specify it there.

• **Output file** - When *Open in Browser/System Application* is selected, you can use this button to automatically open the default output file at the end of the transformation.

• **Other location** - When *Open in Browser/System Application* is selected, you can use this option to open the file specified in this field at the end of the transformation.

You can specify the path by using the text field, the **Insert Editor Variables** (*page 201*) button, or the **Browse** button.
Open in editor

When this is option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

Show in results view as

You can choose to view the results in one of the following:

- **XML** - If this is selected, Oxygen XML Editor plugin displays the transformation result in an XML viewer panel at the bottom of the application window with syntax highlighting (page 149).
- **XHTML** - This option is only available if Open in Browser/System Application is not selected. If selected, Oxygen XML Editor plugin displays the transformation result in a built-in XHTML browser panel at the bottom of the application window.

⚠️ **Important**: When transforming very large documents, you should be aware that selecting this option may result in very long processing times. This drawback is due to the built-in Java XHTML browser implementation. To avoid delays for large documents, if you want to see the XHTML result of the transformation, you should use an external browser by selecting the Open in Browser/System Application option instead.

- **Image URLs are relative to** - If Show in results view as XHTML is selected, this option specifies the path used to resolve image paths contained in the transformation result. You can specify the path by using the text field, the Insert Editor Variables (page 201) button, or the Browse button.

⚠️ **Attention**: If your input XSLT contains `<xsl:result-document>` elements, then the secondary results will be saved to the specified URIs while the principal result is specified in this Output tab. For more information, see: https://www.w3.org/TR/xslt-30/#element-result-document.

Oxygen XML Editor plugin Browser View

The Oxygen XML Editor plugin Browser view is automatically displayed in the views pane of the Eclipse window to display HTML output from XSLT transformations. It contains a tab for each file with HTML results displayed in the view.

*Figure 542: Browser View*
The Oxygen XML Editor plugin Text view is automatically displayed in the views pane of the Eclipse window to display text output from XSLT transformations, FO processor info, warnings, and error messages. It contains a tab for each file with text results displayed in the view.

**Figure 543: Text View**

**Text View Contextual Menu Actions**

The following actions are available when the contextual menu is invoked in this view:

- **Clear**
  - Removes all content from the view.

- **Copy**
  - Copies the selected content to the clipboard.

- **Select All**
Selects all content in the view.

Format and Indent

Formats (pretty-prints (page 2709)) the content in this view.

Find/Replace

Allows you to perform search and replace operations.

Save Results

Saves the content in the view to a file in text format.

Configuring an XSLT Processor for Generating Output

This section explains how to configure an XSLT processor and extensions for such a processor in Oxygen XML Editor plugin.

Supported XSLT Processors

Oxygen XML Editor plugin includes the following XSLT processors:

- **Xalan 2.7.2** - Xalan-Java is an XSLT processor for transforming XML documents into HTML, text, or other XML document types. It implements XSL Transformations (XSLT) Version 1.0 and XML Path Language (XPath) Version 1.0.

- **Saxon 6.5.5** - Saxon 6.5.5 is an XSLT processor that implements the Version 1.0 XSLT and XPath with a number of powerful extensions. This version of Saxon also includes many of the new features that were first defined in the XSLT 1.1 working draft, but for conformance and portability reasons these are not available if the stylesheet header specifies `version="1.0"`.

- **Saxon 9.8.0.12 Home Edition (HE), Professional Edition (PE)** - Saxon-HE/PE implements the basic conformance level for XSLT 2.0 / 3.0 and XQuery 1.0. The term `basic XSLT 2.0 / 3.0 processor` is defined in the draft XSLT 2.0 / 3.0 specifications. It is a conformance level that requires support for all features of the language other than those that involve schema processing. The HE product remains open source, but removes some of the more advanced features that are present in Saxon-PE.

- **Saxon 9.8.0.12 Enterprise Edition (EE)** - Saxon EE is the schema-aware edition of Saxon and it is one of the built-in processors included in Oxygen XML Editor plugin. Saxon EE includes an XML Schema processor, and schema-aware XSLT, XQuery, and XPath processors.

The validation in schema aware transformations is done according to the XML Schema 1.0 or 1.1. This can be configured in Preferences (page 176).

**Note:** Oxygen XML Editor plugin implements a Saxon framework that allows you to create Saxon configuration files. Two templates are available: *Saxon collection catalog* and *Saxon*
configuration. Both of these templates support content completion, element annotation, and attribute annotation.

**Note:** Saxon can use the ICU-J localization library (saxon9-icu.jar) to add support for sorting and date/number formatting in a wide variety of languages. This library is not included in the Oxygen XML Editor plugin installation kit. However, Saxon will use the default collation and localization support available in the currently used JRE. To enable this capability, follow these steps:

2. Unpack the downloaded archive.
3. Create a new XSLT transformation scenario (or edit an existing one). In the XSLT tab, click the **Extensions** button to open the list of additional libraries used by the transformation process.
4. Click **Add** and browse to the folder where you unpacked the downloaded archive and choose the saxon9-icu.jar file.

Note that the saxon9-icu.jar should NOT be added to the application library folder because it will conflict with another version of the ICU-J library that comes bundled with Oxygen XML Editor plugin.

• **Saxon-CE (Client Edition)** is Saxonica's implementation of XSLT 2.0 for use on web browsers. Oxygen XML Editor plugin provides support for editing stylesheets that contain Saxon-CE extension functions and instructions. This support improves the validation, content completion, and syntax highlighting.

**Note:** Saxon-CE, being JavaScript-based, was designed to run inside a web browser. This means that you will use Oxygen XML Editor plugin only for developing the Saxon-CE stylesheet, leaving the execution part to a web browser. See more details about [executing such a stylesheet on Saxonica's website](http://www.saxonica.com).

**Note:** A specific template, named **Saxon-CE stylesheet**, is available in the **New from Templates wizard** (page 554).

• **Xsltproc (libxslt)** - Libxslt is the XSLT C library developed for the Gnome project. Libxslt is based on libxml2, the XML C library developed for the Gnome project. It also implements most of the EXSLT set of processor-portable extensions, functions, and some of Saxon's evaluate and expression extensions.

Oxygen XML Editor plugin uses Libxslt through its command-line tool (Xsltproc). Depending on your operating system, you must download the Libxslt libraries on your machine from [http://xmlsoft.org/XSLT/downloads.html](http://xmlsoft.org/XSLT/downloads.html) and place them in a local folder. Then you need to update the
**PATH** environmental variable to contain the parent folder where the `xsltproc` executable is located.

**Tip:** As an example, a Windows installation of the Xsltproc engine would follow these steps:

2. Unzip all of them into the same folder of your choice.
3. Edit the **PATH** environment variable and add the `bin` folder for all four archives:

   ![Edit environment variable](image)

4. Restart Oxygen XML Editor plugin.

   **Result:** You can now use the `xsltproc` processor as an XSLT engine in the XSLT transformation scenario.

**Note:** The Xsltproc processor can be configured from the **XSLTPROC** options page (page 196).

**CAUTION:** There is a known problem where file paths that contain spaces are not handled correctly in the LiBXML processor. For example, the built-in **XML Catalog** files of the built-in document types (DocBook, TEI, DITA, etc.) are not handled properly by LIBXML if Oxygen XML Editor plugin is installed in the default location on Windows (C:\Program Files). This is because the built-in **XML catalog** files are stored in the `{OXYGEN_INSTALL_DIR}/frameworks` subdirectory of the installation directory, and in this case it contains a space character.

- **MSXML 4.0** - MSXML 4.0 is available only on Windows platforms. It can be used for transformation (page 1415) and validation of XSLT stylesheets (page 961).

Oxygen XML Editor plugin uses the Microsoft XML parser through its command-line tool `msxsl.exe`.

Since `msxsl.exe` is only a wrapper, Microsoft Core XML Services (MSXML) must be installed on the computer. Otherwise, you will get a corresponding warning. You can get the latest Microsoft XML parser from [Microsoft web-site](http://microsoft.com).
• **MSXML.NET** - MSXML.NET is available only on Windows platforms. It can be used for transformation (page 1415) and validation of XSLT stylesheets (page 961).

Oxygen XML Editor plugin performs XSLT transformations and validations using the .NET Framework XSLT implementation (System.Xml.Xsl.XslTransform class) through the `nxslt` command-line utility. The `nxslt` version included in Oxygen XML Editor plugin is 1.6.

You should have the .NET Framework version 1.0 already installed on your system. Otherwise, you will get the following warning: MSXML.NET requires .NET Framework version 1.0 to be installed. Exit code: 128.

You can get the .NET Framework version 1.0 from the Microsoft website.

• **.NET 1.0** - A transformer based on the System.Xml 1.0 library available in the .NET 1.0 and .NET 1.1 frameworks from Microsoft (http://msdn.microsoft.com/xml/). It is available only on Windows.

You should have the .NET Framework version 1.0 or 1.1 already installed on your system. Otherwise, you will get the following warning: MSXML.NET requires .NET Framework version 1.0 to be installed. Exit code: 128.

You can get the .NET Framework version 1.0 from the Microsoft website.

• **.NET 2.0** - A transformer based on the System.Xml 2.0 library available in the .NET 2.0 Framework from Microsoft. It is available only on Windows.

You should have the .NET Framework version 2.0 already installed on your system. Otherwise, you will get the following warning: MSXML.NET requires .NET Framework version 2.0 to be installed. Exit code: 128.

You can get the .NET Framework version 2.0 from the Microsoft website.

**Configuring Custom XSLT Processors**

Oxygen XML Editor plugin allows you to configure custom processors to be used for running XSLT and XQuery transformations.

To add a new custom processor, follow these steps:

1. Open the **Preferences** dialog box (page 55) and go to XML > XSLT-FO-XQuery > Custom Engines.
2. Click the **New** button at the bottom of the dialog box.
3. Configure the parameters for the custom engine (page 181).
4. Click **OK**.
Note: You can not use these custom engines in the Debugger perspective (page 2007).

The output messages of a custom processor are displayed in an output view at the bottom of the application window. If an output message follows the format of an Oxygen XML Editor plugin linked message (page 866), clicking it highlights the location of the message in an editor panel containing the file referenced in the message.

Related Information:

- Custom Engines Preferences (page 181)

Configuring the XSLT Processor Extensions Paths

The Xalan and Saxon processors support the use of extension elements and extension functions. Unlike a literal result element, which the stylesheet simply transfers to the result tree, an extension element performs an action. The extension is usually used because the XSLT stylesheet fails in providing adequate functions for accomplishing a more complex task.

For more information about how to use extensions, see the following links:

- Saxon 6.5.5 - http://saxon.sourceforge.net/saxon6.5.5/extensions.html

To set an XSLT processor extension (a directory or a jar file), use the Extensions button (page 1417) in the Edit scenario dialog box.

XML Transformation with XQuery

This type of transformation specifies the transform parameters and location of an XQuery file that is applied to the edited XML document.

Use the XML transformation with XQuery scenario to apply a transformation in which an XQuery file queries an XML file for the output results.

To create an XML transformation with XQuery scenario, use one of the following methods:

- Use the Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Alt + T, C on OS X)) action from the toolbar or the XML menu. Then click the New button and select XML transformation with XQuery.
Go to Window > Show View and select Transformation Scenarios to display this view (page 1507). Click the New Scenario drop-down menu button and select XML transformation with XQuery.

Both methods open the New Scenario dialog box.

The upper part of the dialog box allows you to specify the Name of the transformation scenario.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

XQuery Tab

When you create a new transformation scenario (page 1415) or edit an existing one (page 1498), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The XQuery tab contains the following options:

**XML URL**

Specifies the source XML file. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (page 201) button, or the browsing actions in the Browse drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.

*Note:* If the transformer engine is Saxon 9.x and a custom URI resolver is configured in the advanced Saxon preferences page (page 195), the XML input of the transformation is passed to that URI resolver.

**XQuery URL**

Specifies the source XQuery file to be used for the transformation. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (page 201) button, or the browsing actions in the Browse drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

**Transformer**

This drop-down menu presents all the transformation engines available to Oxygen XML Editor plugin for performing a transformation. These include the built-in engines and the external engines defined in the Custom Engines preferences page (page 181). The engine you choose is used as the default transformation engine. Also, if an XSLT or
XQuery document does not have an associated validation scenario, this transformation engine is used in the validation process (if it provides validation support).

**Advanced options**

Allows you to configure the advanced options of the Saxon HE/PE/EE engine (page 1437) for the current transformation scenario. To configure the same options globally, go to the Saxon-HE/PE/EE preferences page (page 192). For the current transformation scenario, these Advanced options override the options configured in that preferences page.

**Parameters**

Opens the Configure parameters dialog box (page 1435) for configuring the XQuery parameters. You can use the buttons in this dialog box to add, edit, or remove parameters. If the XQuery transformation engine is custom-defined, you can not use this dialog box to set parameters. Instead, you can copy all parameters from the dialog box using contextual menu actions and edit the custom XQuery engine to include the necessary parameters in the command line that starts the transformation process.

**Extensions**

Opens a dialog box for configuring the XQuery extension JARS or classes (page 1437) that define extension Java functions or extension XSLT elements used in the transformation.

**XQuery Parameters**

The global parameters of the XQuery file used in a transformation scenario can be configured by using the Parameters button in the XQuery tab.

The resulting dialog box includes a table that displays all the parameters of the current XQuery file, along with their descriptions and current values. You can also add, edit, and remove parameters, and use the Filter text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

If the XPath column is selected, the parameter value is evaluated as an XPath expression before starting the XQuery transformation.

**Example:**

For example, you can use expressions such as:

```xml
doc('test.xml')//entry
//person[@atr='val']
```

**Note:**
1. The `doc` function solves the argument relative to the XQuery file location. You can use full paths or editor variables (page 201) (such as `${cfdu}` [current file directory]) to specify other locations:
   
   ```xml
   doc('${cfdu}/test.xml')//*
   ```

2. Only XPath functions are allowed.

Below the table, the following actions are available for managing the parameters:

**New**

Opens the Add Parameter dialog box that allows you to add a new parameter to the list. An editor variable (page 201) can be inserted in the text box using the Insert Editor Variables button. If the Evaluate as XPath option is selected, the parameter will be evaluated as an XPath expression.

**Edit**

Opens the Edit Parameter dialog box that allows you to edit the selected parameter. An editor variable (page 201) can be inserted in the text box using the Insert Editor Variables button. If the Evaluate as XPath option is selected, the parameter will be evaluated as an XPath expression.

**Unset**

Resets the selected parameter to its default value. Available only for edited parameters with set values.

**Delete**

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

The bottom panel presents the following:

- The default value of the parameter selected in the table.
- A description of the parameter, if available.
- The system ID of the stylesheet that declares it.

**Related Information:**

- Editor Variables (page 201)
XQuery Extensions

The Extensions button is used to specify the JAR (page 2707) and classes that contain extension functions called from the XQuery file of the current transformation scenario. You can use the Add, Edit, and Remove buttons to configure the extensions.

An extension function called from the XQuery file of the current transformation scenario will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item to be moved and press the Move up or Move down buttons.

Advanced Saxon HE/PE/EE XQuery Transformation Options

The XQuery transformation scenario allows you to configure advanced options that are specific for the Saxon HE (Home Edition), PE (Professional Edition), and EE (Enterprise Edition) engines. They are the same options as those in the Saxon HE/PE/EE preferences page (page 186) but they are configured as a specific set of transformation options for each transformation scenario, while the values set in the preferences page apply as global options. The advanced options configured in a transformation scenario override the global options defined in the preferences page.

Saxon-HE/PE/EE Options

The advanced options for Saxon 9.8.0.12 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE) are as follows:

- **Use a configuration file ("-config")**
  Sets a Saxon 9.8.0.12 configuration file that is used for XQuery transformation and validation scenarios.

- **Enable Optimizations ("-opt")**
  This option is selected by default, which means that optimization is enabled. If not selected, the optimization is suppressed, which is helpful when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

- **Use linked tree model ("-tree:linked")**
  This option activates the linked tree model.

- **Recoverable errors ("-warnings")**
  Specifies how dynamic errors are handled. The following options can be selected:
  
  - Recover silently ("silent") - Continues processing without reporting the error.
  - Recover with warnings ("recover") - Issues a warning but continues processing.
• **Signal the error and do not attempt recovery** ("fatal") - Issues an error and stops processing.

**Strip whitespaces** ("-strip")

Specifies how the *strip whitespaces* operation is handled. You can choose one of the following values:

• **All** ("all") - Strips *all* whitespace text nodes from source documents before any further processing, regardless of any `xml:space` attributes in the source document.

• **Ignore** ("ignorable") - Strips all *ignorable* whitespace text nodes from source documents before any further processing, regardless of any `xml:space` attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.

• **None** ("none") - Strips *no* whitespace before further processing.

**Saxon-PE/EE Options**

The following advanced options are specific for Saxon 9.8.0.12 Professional Edition (PE) and Enterprise Edition (EE) only:

**Allow calls on extension functions** ("-ext")

If selected, calls on external functions are allowed. Selecting this option is recommended in an environment where untrusted stylesheets may be executed. It also disables user-defined extension elements and the writing of multiple output files, both of which carry similar security risks.

**Saxon-EE Options**

The advanced options that are specific for Saxon 9.8.0.12 Enterprise Edition (EE) are as follows:

**Validation of the source file** ("-val")

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

• **Schema validation** ("strict") - This mode requires an XML Schema and allows for parsing the source documents with strict schema-validation enabled.

• **Lax schema validation** ("lax") - If an XML Schema is provided, this mode allows for parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.

• **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.
Validation errors in the result tree treated as warnings ("-outval")

Normally, if validation of result documents is requested, a validation error is fatal. Selecting this option causes such validation failures to be treated as warnings.

Write comments for non-fatal validation errors of the result document

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

Enable XQuery update ("-update:(on|off)")

This option controls whether or not XQuery update syntax is accepted. The default value is off.

Backup files updated by XQuery ("-backup:(on|off)")

If selected, backup versions for any XML files updated with an XQuery Update are generated. This option is available when the Enable XQuery update option is selected.

Other Options

Initializer class

Equivalent to the -init Saxon command-line argument. The value is the name of a user-supplied class that implements the net.sf.saxon.lib.Initializer interface. This initializer is called during the initialization process, and may be used to set any options required on the configuration programmatically. It is particularly useful for tasks such as registering extension functions, collations, or external object models, especially in Saxon-HE where the option cannot be set via a configuration file. Saxon only calls the initializer when running from the command line, but the same code may be invoked to perform initialization when running user application code.

FO Processor Tab (XQuery Transformations)

When you create a new transformation scenario (page 1415) or edit an existing one (page 1498), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The FO Processor tab contains the following options:

Perform FO Processing

Specifies whether or not an FO processor is applied (either the built-in Apache FOP engine or an external engine defined in Preferences) during the transformation.
Input

Choose between the following options to specify which input file to use:

- **XQuery result as input** - The FO processor is applied to the result of the XQuery transformation that is defined in the XQuery tab.
- **XML URL as input** - The FO processor is applied to the input XML file.

Method

The output format of the FO processing. The available options depend on the selected processor type.

Processor

Specifies the FO processor to be used for the transformation. It can be the built-in Apache FOP processor or an external processor (page 164).

Output Tab (XQuery Transformations)

When you create a new transformation scenario (page 1415) or edit an existing one (page 1498), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Output** tab contains the following options:

**Present as a sequence**

Selecting this option will reduce the time necessary to fetch the full results, as it will only fetch the first chunk of the results.

**Prompt for file**

At the end of the transformation, a file browser dialog box is displayed for specifying the path and name of the file that stores the transformation result.

**Save As**

The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the 📁 Insert Editor Variables (page 201) button, or the 🏷️ Browse button.

**Open in Browser/System Application**

If selected, Oxygen XML Editor plugin automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows PDF files are often opened in Acrobat Reader).

**Note:** To set the web browser that is used for displaying HTML/XHTML pages, go to Window > Preferences > General > Web Browser and specify it there.
• **Output file** - When **Open in Browser/System Application** is selected, you can use this button to automatically open the default output file at the end of the transformation.

• **Other location** - When **Open in Browser/System Application** is selected, you can use this option to open the file specified in this field at the end of the transformation.

You can specify the path by using the text field, the **Insert Editor Variables** (page 201) button, or the **Browse** button.

**Open in editor**

When this is option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

**Show in results view as**

You can choose to view the results in one of the following:

• **XML** - If this is selected, Oxygen XML Editor plugin displays the transformation result in an XML viewer panel at the bottom of the application window with syntax highlighting (page 149).

• **XHTML** - This option is only available if **Open in Browser/System Application** is not selected. If selected, Oxygen XML Editor plugin displays the transformation result in a built-in XHTML browser panel at the bottom of the application window.

⚠️ **Important**: When transforming very large documents, you should be aware that selecting this option may result in very long processing times. This drawback is due to the built-in Java XHTML browser implementation. To avoid delays for large documents, if you want to see the XHTML result of the transformation, you should use an external browser by selecting the **Open in Browser/System Application** option instead.

• **Image URLs are relative to** - If **Show in results view as XHTML** is selected, this option specifies the path used to resolve image paths contained in the transformation result. You can specify the path by using the text field, the **Insert Editor Variables** (page 201) button, or the **Browse** button.

XML to PDF Transformation with CSS
This type of transformation uses the Oxygen PDF Chemistry processing engine to obtain PDF output by applying CSS styling to the edited XML document. This scenario is useful for those who are familiar with CSS and want to obtain PDF output as its final form.

To create an XML to PDF transformation with CSS scenario, use one of the following methods:

- Use theConfigure Transformation Scenario(s) (Alt + Shift + T, C (Command + Alt + T, C on OS X)) action from the toolbar or the XML menu. Then click the New button and select XML to PDF transformation with CSS.
- Go to Window > Show View and select Transformation Scenarios to display this view (page 1507). Click the + • New Scenario drop-down menu button and select XML to PDF transformation with CSS.

Both methods open the New Scenario dialog box.

The upper part of the dialog box allows you to specify the Name of the transformation scenario.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

For more information about the Oxygen PDF Chemistry processing engine and numerous tips for customizing the output, see the Oxygen Chemistry User Guide.

CSS Tab (XML to PDF with CSS Transformations)

When you create a new transformation scenario (page 1415) or edit an existing one (page 1498), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The CSS tab contains the following options:

**XML URL**

Specifies the source XML file. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables button, or the browsing actions in the • Browse drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.

**CSS URL**

Optionally, you can use this option to specify the location of a custom CSS file to be applied to the transformation. If this option is left blank, only the CSS referenced directly from the document will be applied. You can specify the path by using the text field, its
history drop-down, the Insert Editor Variables button, or the browsing actions in the Browse drop-down list.

Processor options link

Opens the CSS-based Processors preferences page where you can configure some options for generating PDF output.

Output Tab (XML to PDF with CSS Transformations)

When you create a new transformation scenario or edit an existing one, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The Output tab contains the following options:

Output File section

Save As

The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the Insert Editor Variables button, or the Browse button.

Open in Browser/System Application

If selected, Oxygen XML Editor plugin automatically opens the result of the transformation in a system application associated with the PDF file type (for example, in Windows PDF files are often opened in Acrobat Reader).

Debugging section

Dump the intermediate annotated XML

Select this option to include (dump) the intermediate, annotated XML file in the same location as the output file. This can be used for debugging purposes.

Dump the FO file

Select this option to include (dump) the FO file (before it is converted to PDF) in the same location as the output file. This can be used for debugging purposes.

Console options link

Opens the CSS-based Processors preferences page where you can configure some options for generating PDF output.
DITA OT Transformation

This type of transformation specifies the parameters for an Ant transformation that executes a DITA-OT build script. Oxygen XML Editor plugin includes a built-in version of Ant and a built-in version of DITA-OT, but other versions can be set in the scenario.

To create a **DITA OT Transformation** scenario, use one of the following methods:

- Use the 📋 Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Alt + T, C on OS X)) action from the DITA Maps Manager toolbar, main toolbar, or the XML menu. Then click the **New** button and select **DITA OT Transformation**.

- Go to Window > Show View and select 📋 Transformation Scenarios to display this view (page 1507). Click the 🔄 New Scenario drop-down menu button and select **DITA OT Transformation**.

Both methods open the **DITA Transformation Type** dialog box that presents the list of possible outputs.

*Figure 544: DITA Transformation Type Dialog Box*

![DITA Transformation Type Dialog Box](image)

Select the desired type of output and click **OK**. This opens the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation. Some of these tabs are only available for certain output types (for example, a **Skins** tab is only available for WebHelp Classic and WebHelp Classic with Feedback output types, a **Templates** tab is available only for WebHelp Responsive and WebHelp Responsive with Feedback, and a **FO Processor** tab is available for PDF output).

*Skins Tab (DITA OT Transformations)*
When you create a new transformation scenario (page 1415) or edit an existing one (page 1498), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Skins** tab is available for DITA OT transformations with **WebHelp Classic** or **WebHelp Classic with Feedback** output types and it provides a set of built-in skins that you can use as a base for your WebHelp system output.

A skin is a collection of CSS properties that can alter the look of the output by changing colors, font types, borders, margins, and paddings. This allows you to rapidly adapt the look and feel of your output.

*Figure 545: Skins Tab*

The **Skins** tab includes the following sections:

**Built-in Skins**

This sections presents the built-in skins that are included in Oxygen XML Editor plugin. The built-in skins cover a wide range of chromatic themes, ranging from a very light one to a high-contrast variant. To see how the skin looks when applied on a sample documentation project that is stored on the Oxygen XML Editor plugin website, press the **Online preview** link.

**Custom Skins**

You can use this section to customize the look of the output.

**CSS File**
You can set this field to point to a custom CSS stylesheet or customized skin. A custom CSS file will overwrite a skin selection.

**Note:** The output can also be styled by setting the `args.css` parameter in the **Parameters tab**. The properties taken from the stylesheet referenced in this parameter take precedence over the properties declared in the skin set in the **Skins tab**.

**Create custom skin**

Use this link to open the [WebHelp Skin Builder](#) (page 1545) tool.

**Templates Tab (DITA OT Transformations)**

When you create a new transformation scenario (page 1415) or edit an existing one (page 1498), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Templates** tab is available for DITA OT transformations with WebHelp Responsive, WebHelp Responsive with Feedback, or PDF - based on HTML5 & CSS output types and it provides a set of built-in publishing templates (page 1632). You can use one of them to publish your documentation or as a starting point for a new publishing template.

**Figure 546: Templates Tab**
Filtering and Previewing Templates

You can click on the tags at the top of the pane to filter the templates and narrow your search. Each built-in template also includes an Online preview icon in the bottom-right corner that opens a webpage in your default browser providing a sample of how the main page will look when that particular template is used to generate the output.

Built-in Templates Locations

Oxygen XML Editor plugin scans the following locations to find the built-in templates to display in the dialog box:

- **WebHelp Responsive Templates** - All built-in WebHelp Responsive publishing templates are stored in the following directory: `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/templates`.
- **PDF - based on HTML5 & CSS** - All built-in PDF publishing templates are stored in the following directories:
  - `DITA-OT-DIR/plugins/com.oxygenxml.pdf.css/templates`
  - `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/templates`

Custom Templates Locations

Oxygen XML Editor plugin scans the locations specified in the DITA > Publishing preferences page (page 68) to find custom templates to display in the dialog box. You can access that preferences page directly from the Template tab by clicking on the Configure Publishing Templates Gallery link.

Selecting Custom Templates

Once you are finished configuring your template, you can click the Choose Custom Publishing Template link to select your template.

You can also add your custom templates (page 1678) to the list of templates displayed in the Templates tab. To do this, store them in a directory, then click the Configure Publishing Templates Gallery link to open the DITA > Publishing preferences page (page 68) where you can add that directory to the list. All the templates contained in your template directory will be displayed in the preview pane along with all the built-in templates.

Save Template As Button

You can use the Save template as button (at the bottom-left of the transformation dialog box) to export the currently selected template into a new template package that can be used as a starting
point to create your own custom template (page 1770). Clicking this button will open a template package configuration dialog box (page 1449) that contains some options and displays the parameters that will be exported to your template package.

**Template Errors**

When the Templates tab is opened, all templates (built-in and custom) are loaded and validated. Specifically, certain elements in the template descriptor file are checked for validity. If errors are encountered that prevents the template from loading, the following message will be displayed toward the bottom of the dialog box:

![Some templates could not be loaded. More details](image)

If you click the More details link, a window will open with more information about the encountered error. For example, it might offer a hint for which element is missing from the expected descriptor file structure.

Also, if a template could be loaded, but certain elements could not be found in the descriptor file, a warning icon (⚠️) will be displayed on the template's image (in the Templates tab of the transformation dialog box). For example, this happens if a valid preview-image element cannot be found.

**Sharing Publishing Template**

To share a publishing template with others, following these steps:

1. Copy your template in a new folder.
2. Go to Options > Preferences > DITA > Publishing (page 68) and add that new folder to the list.
3. Switch the option as the bottom of that preferences page to Project Options.
4. Share your project file (.xpr).

For more information about customizing publishing templates, watch our video demonstration:

https://www.youtube.com/embed/zNmXfKWXwO8

Related Information:

- Publishing Templates (page 1632)
- Publishing Template Package Contents for PDF Customizations (page 1764)
Template Package Configuration Dialog Box

The Save template as button (at the bottom-left of the transformation dialog box for WebHelp Responsive or PDF - based on HTML5 & CSS transformations) can be used to export the currently selected template into a new template package that can be used as a starting point to create your own custom template (page 1770). The result will be a ZIP archive that contains a template descriptor file and other resources (such as CSS files) that were attached to the selected template.

Clicking the Save template as button opens a template package configuration dialog box contains the following options and components:

- **Name**
  Required field used to specify the name for the new template. This will become the text value of the name element in the template descriptor file. This information is displayed as the name of the template in the transformation scenario dialog box.

- **Description**
  Optional field used to specify a template description. This will become the text value of the description element in the template descriptor file. This information is displayed when the user hovers over the template in the transformation scenario dialog box.

- **Parameter Table**
  This table displays the parameters that will be exported. Only relevant parameters are exported. The parameters and their values will be inserted in the parameters section of the template descriptor file. If any of the parameter values point to a file path that references a template resource (such as CSS files, custom HTML fragments, images), those resources will automatically be copied to the new template package and their references will be changed accordingly.

  **Note:** Additional resources that are referenced in CSS files or other resources will not be copied to the new template package, so you will need to copy them manually and update their references in the template descriptor file.

- **Include WebHelp Customization**
  The same publishing template package can contain both a WebHelp Responsive and PDF customization and you can use the same template in both types of transformations (DITA Map WebHelp Responsive (page 1384) or DITA Map to PDF - based on HTML5)
& CSS (page 1398). This option specifies that the custom template will include a WebHelp Responsive customization.

**Include HTML Page Layout Files**

For **WebHelp Responsive** customizations, select this option if you want to copy the default **HTML Page Layout Files (page 1649)** into your template package. They are helpful if you want to change the structure of the generated HTML pages.

**Include PDF Customization**

The same publishing template package can contain both a WebHelp Responsive and PDF customization and you can use the same template in both types of transformations (**DITA Map WebHelp Responsive (page 1384)** or **DITA Map to PDF - based on HTML5 & CSS (page 1398)**). This option specifies that the custom template will include a PDF customization.

**Save as**

Use this field to specify the name and path of the ZIP file where the template will be saved.

*Figure 547: Template Package Configuration Dialog Box*

**Related Information:**

- Publishing Templates (page 1632)
FO Processor Tab (DITA OT Transformations)

When you create a new transformation scenario (page 1415) or edit an existing one (page 1498), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **FO Processor** tab is available for DITA OT transformations with a **PDF** output type.

This tab allows you to select an FO Processor to be used for the transformation.

*Figure 548: FO Processor Configuration Tab*

You can choose one of the following processors:

- **Apache FOP**
  
  The default processor that comes bundled with Oxygen XML Editor plugin.

- **XEP**
  
  The **RenderX** XEP processor. If XEP is already installed, Oxygen XML Editor plugin displays the detected installation path under the drop-down menu. XEP is considered installed if it was detected in one of the following sources:

  - XEP was configured as an external FO Processor in the **FO Processors** option page (page 164).
• The system property `com.oxygenxml.xep.location` was set to point to the XEP executable file for the platform (for example: `xep.bat` on Windows).
• XEP was installed in the `DITA-OT-DIR/plugins/org.dita.pdf2/lib` directory of the Oxygen XML Editor plugin installation directory.

**Antenna House**

The Antenna House (AH Formatter) processor. If Antenna House is already installed, Oxygen XML Editor plugin displays the detected installation path under the drop-down menu. Antenna House is considered installed if it was detected in one of the following sources:

• Environment variable set by Antenna House installation (the newest installation version will be used).
• Antenna House was added as an external FO Processor in the Oxygen XML Editor plugin preferences pages.

To further customize the PDF output obtained from the Antenna House processor, follow these steps:

1. **Edit** the transformation scenario.
2. Open the **Parameters** tab *(page 2614)*.
3. Add the `env.AXF_OPT` parameter and point to the Antenna House configuration file.

**Related Information:**

• [FO Processors Preferences](page 164)
• [XSL-FO (Apache FOP) Processor for Generating PDF Output](page 1479)

**Parameters Tab (DITA OT Transformations)**

When you create a new transformation scenario *(page 1415)* or edit an existing one *(page 1498)*, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Parameters** tab allows you to configure the parameters sent to the DITA-OT build file.

The table in this tab displays all the parameters that the DITA-OT documentation specifies as available for each chosen type of transformation (for example, XHTML or PDF), along with their description and current values. You can find more information about each parameter in the DITA OT Documentation.
You can also add, edit, and remove parameters, and you can use the text box to filter or search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

Depending on the type of a parameter, its value can be one of the following:

- A simple text field for simple parameter values.
- A combo box with some predefined values.
- A file chooser and an editor variable (page 201) selector to simplify setting a file path as the value of a parameter.

Note: To input parameter values at runtime, use the ask editor variable (page 202) in the Value column.

Below the table, the following actions are available for managing parameters:

**New**

Opens the Add Parameter dialog box that allows you to add a new parameter to the list. You can specify the Value of the parameter by using the Insert Editor Variables (page 201) button or the Browse button.

**Unset**

Resets the selected parameter to its default value. Available only for edited parameters with set values.

**Edit**

Opens the Edit Parameter dialog box that allows you to change the value of the selected parameter or its description.

**Delete**

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

### Parameters Contributed by an Oxygen Publishing Template

Transformation parameters that are defined in an Oxygen Publishing Template (page 1762) descriptor file are displayed in italics. After creating a publishing template (page 1770) and adding it to the templates gallery (page 1678), when you select the template in the Templates tab (page 2607), the Parameters tab will automatically be updated to include the parameters defined in the template descriptor file.
Feedback Tab (DITA OT Transformations)

When you create a new transformation scenario (page 1415) or edit an existing one (page 1498), a configuration dialog box allows you to customize the transformation with various options in several tabs.

⚠️ Attention: This tab is for a feature that has not yet been implemented. To check the progress of the feature, see https://feedback.oxygenxml.com/.

The Feedback tab is available for the WebHelp Responsive transformation type and can be used to connect the published WebHelp Responsive output to an Oxygen Feedback server to provide a comment section in the output where users can offer feedback and ask questions.

When you configure the Oxygen Feedback server, you will retrieve an HTML fragment during site creation procedure. Click the Edit button at the bottom-right of this tab to open a dialog box where you will paste the HTML fragment (using keyboard shortcut keys or contextual menu actions).

Filters Tab (DITA Transformations)

When you create a new transformation scenario (page 1415) or edit an existing one (page 1498), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The Filters tab allows you to add filters to remove certain content elements from the generated output.

Figure 549: Edit Filters Tab
You can choose one of the following options to define filters:

**Use DITAVAL file**

If you already have a DITAVAL file associated with the DITA map (page 2705), you can specify the file to be used when filtering content. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (page 201) button, or the browsing actions in the Browse drop-down list. You can find out more about constructing a DITAVAL file in the DITA Documentation.

⚠️ **Attention:** If a filter file is specified in the args.filter parameter (in the Parameters tab (page 2614)), that file takes precedence over a DITAVAL file specified here.

**Use profiling condition set**

Sets the profiling condition set (page 2643) that will be applied to your transformation.

**Exclude from output all elements with any of the following attributes**

By using the New, Edit, or Delete buttons at the bottom of the pane, you can configure a list of attributes (name and value) to exclude all elements that contain any of these attributes from the output.

Advanced Tab (DITA OT Transformations)
When you create a new transformation scenario (page 1415) or edit an existing one (page 1498), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Advanced** tab allows you to specify advanced options for the transformation scenario.

![Advanced Settings Tab](image)

You can specify the following parameters:

**Custom build file**

If you use a custom DITA-OT build file, you can specify the path to the customized build file. If empty, the `build.xml` file from the `dita.dir` parameter that is configured in the Parameters tab (page 2614) is used. You can specify the path by using the text field, the ![Insert Editor Variables](image) button, or the ![Browse](image) button.

**Build target**

Optionally, you can specify a build target for the build file. If no target is specified, the default `init` target is used.

**Additional arguments**

You can specify additional command-line arguments to be passed to the transformation (such as `--verbose`).
Ant Home

You can choose between the default or custom Ant installation to run the transformation.

Java Home

You can choose between the default or custom Java installation to run the transformation. The default path is the Java installation that is used by Oxygen XML Editor plugin.

Note: It may be possible that the used Java version is incompatible with the DITA Open Toolkit engine. For example, DITA-OT 2.0 and newer requires Java 1.7 or newer. Thus, if you encounter related errors running the transformation, consider installing a Java VM that is supported by the DITA OT publishing engine and using it in the Java Home text field.

JVM Arguments

This parameter allows you to set specific parameters for the Java Virtual Machine used by Ant. For example, if it is set to \(-\text{xmx384m}\), the transformation process is allowed to use 384 megabytes of memory. When performing a large transformation, you may want to increase the memory allocated to the Java Virtual Machine. This will help avoid Out of Memory error messages (\texttt{OutOfMemoryError}).

Libraries

By default, Oxygen XML Editor plugin adds libraries (as high priority) that are not transformation-dependent and also patches for certain DITA Open Toolkit bugs. You can use this button to specify additional libraries (\texttt{JAR} (page 2707) files or additional class paths) to be used by the transformer.

Tip: You can specify the path to the additional libraries using wildcards (for example, \$\{oxygenHome\}/lib/*.jar).

Output Tab (DITA OT Transformations)

When you create a new transformation scenario (page 1415) or edit an existing one (page 1498), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The Output tab allows you to configure options that are related to the location where the output is generated.

Figure 551: Output Settings Tab
You can specify the following parameters:

**Base directory**

All the relative paths that appear as values in parameters are considered relative to the base directory. The default value is the directory where the transformed map is located. You can specify the path by using the text field, the Insert Editor Variables (page 201) button, or the Browse button.

**Temporary files directory**

This directory is used to store pre-processed temporary files until the final output is obtained. You can specify the path by using the text field, the Insert Editor Variables (page 201) button, or the Browse button.

**Output directory**

The folder where the content of the final output is stored. You can specify the path by using the text field, the Insert Editor Variables (page 201) button, or the Browse button.

Note: If the DITA map (page 2705) or topic is opened from a remote location or a ZIP file, the parameters must specify absolute paths.

**Open in Browser/System Application**
If selected, Oxygen XML Editor plugin automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows PDF files are often opened in Acrobat Reader).

Note: To set the web browser that is used for displaying HTML/XHTML pages, go to Window > Preferences > General > Web Browser and specify it there.

- **Output file** - When Open in Browser/System Application is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When Open in Browser/System Application is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the Insert Editor Variables button, or the Browse button.

**Open in editor**

When this is option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

**Ant Transformation**

This type of transformation allows you to configure the options and parameters of an Ant build script.

An Ant transformation scenario is usually associated with an Ant build script. Oxygen XML Editor plugin runs an Ant transformation scenario as an external process that executes the Ant build script with the built-in Ant distribution (Apache Ant (page 2703) version 1.9.8) that is included with the application, or optionally with a custom Ant distribution configured in the scenario.

Tip: Certain Ant tasks require additional JAR libraries (for example, Ant mail tasks). The additional libraries can be added by editing the Ant transformation scenario, and in the Output tab, click the Libraries button (page 1460) in the bottom right corner. This opens a dialog box where you can add JAR libraries. For a list of library dependencies, see https://ant.apache.org/manual/install.html#librarydependencies.

To create an Ant transformation scenario, use one of the following methods:

- Use the Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Alt + T, C on OS X)) action from the toolbar or the XML menu. Then click the New button and select ANT transformation.
Go to Window > Show View and select Transformation Scenarios to display this view (page 1507). Click the + New Scenario drop-down menu button and select ANT transformation.

Both methods open the transformation configuration dialog box.

The upper part of the dialog box allows you to specify the Name of the transformation scenario.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

Options Tab (Ant Transformations)

When you create a new transformation scenario (page 1415) or edit an existing one (page 1498), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The Options tab allows you to specify the following options:

Working directory

The path of the current directory of the Ant external process. You can specify the path by using the text field, the Insert Editor Variables (page 201) button, or the Browse button.

Build file

The Ant script file that is the input of the Ant external process. You can specify the path by using the text field, the Insert Editor Variables (page 201) button, or the Browse button.

Build target

Optionally, you can specify a build target for the Ant script file. If no target is specified, the Ant target that is specified as the default in the Ant script file is used.

Additional arguments

You can specify additional command-line arguments to be passed to the transformation (such as -verbose ).

Ant Home

You can choose between the default or custom Ant installation to run the transformation.

Java Home

You can choose between the default or custom Java installation to run the transformation. The default path is the Java installation that is used by Oxygen XML Editor plugin.
### JVM Arguments

This parameter allows you to set specific parameters for the Java Virtual Machine used by Ant. For example, if it is set to `-Xmx384m`, the transformation process is allowed to use 384 megabytes of memory. When performing a large transformation, you may want to increase the memory allocated to the Java Virtual Machine. This will help avoid *OutOfMemoryError* messages.

### Libraries

By default, Oxygen XML Editor plugin adds libraries (as high priority) that are not transformation-dependent and also patches for certain DITA Open Toolkit bugs. You can use this button to specify additional libraries (*JAR* files or additional class paths) to be used by the transformer.

**Tip:** You can specify the path to the additional libraries using wildcards (for example, `${oxygenHome}/lib/*.jar`).

#### Parameters Tab (Ant Transformations)

When you [create a new transformation scenario](page:1415) or [edit an existing one](page:1498), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Parameters** tab allows you to configure the parameters that are accessible as Ant properties in the Ant build script.

The table displays all the parameters that are available in the Ant build script, along with their description and current values. You can also add, edit, and remove parameters, and use the **Filter** text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

Depending on the type of a parameter, its value can be one of the following:

- A simple text field for simple parameter values.
- A combo box with some predefined values.
- A file chooser and an **editor variable** selector to simplify setting a file path as the value of a parameter.

**Note:** To input parameter values at runtime, use the **ask editor variable** in the **Value** column.

Below the table, the following actions are available for managing parameters:

- **New**
Opens the Add Parameter dialog box that allows you to add a new parameter to the list. You can specify the Value of the parameter by using the Insert Editor Variables (page 201) button or the Browse button.

Edit

Opens the Edit Parameter dialog box that allows you to change the value of the selected parameter or its description.

Delete

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

Output Tab (Ant Transformations)

When you create a new transformation scenario (page 1415) or edit an existing one (page 1498), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The Output tab contains the following options:

Open

Allows you to specify the file to open automatically when the transformation is finished. This is usually the output file of the Ant process. You can specify the path by using the text field, the Insert Editor Variables (page 201) button, or the Browse button.

- In System Application - The file specified in the Open text box is opened in the system application that is set in the operating system as the default application for that type of file (for example, in Windows PDF files are often opened in Acrobat Reader).
- In Editor - The file specified in the Open text box is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor).

Show console output

Allows you to specify when to display the console output log in the message panel at the bottom of the editor. The following options are available:

- When build fails - Displays the console output log only if the build fails.
- Always - Displays the console output log, regardless of whether or not the build fails.
XSLT Transformation

This type of transformation specifies the parameters and location of an XML document that the edited XSLT stylesheet is applied on. This scenario is useful when you develop an XSLT document and the XML document is in its final form.

To create an XSLT transformation scenario, use one of the following methods:

- Use the Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Alt + T, C on OS X)) action from the toolbar or the XML menu. Then click the New button and select XSLT transformation.
- Go to Window > Show View and select Transformation Scenarios to display this view (page 1507). Click the New Scenario drop-down menu button and select XSLT transformation.

Both methods open the New Scenario dialog box.

The upper part of the dialog box allows you to specify the Name of the transformation scenario.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

XSLT Tab

When you create a new transformation scenario (page 1415) or edit an existing one (page 1498), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The XSLT tab contains the following options:

**XML URL**

Specifies the source XML file. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (page 201) button, or the browsing actions in the Browse drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.

Note: If the transformer engine is Saxon 9.x and a custom URI resolver is configured in the advanced Saxon preferences page (page 195), the XML input of the transformation is passed to that URI resolver. If the transformer engine is one of the built-in XSLT 2.0 / 3.0 engines and the name of an initial template (page 1417) is specified in the scenario, the XML URL field can be empty. The XML URL field can also be empty if you use external XSLT processors (page 1432). Otherwise, a value is mandatory in this field.
**XSL URL**

Specifies the source XSL file that the transformation will use. You can specify the path by using the text field, its history drop-down, the ![Insert Editor Variables](page 201) button, or the browsing actions in the ![Browse](drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

**Use "xml-stylesheet" declaration**

If selected, the scenario applies the stylesheet specified explicitly in the XML document with the `xml-stylesheet` processing instruction. By default, this option is deselected and the transformation applies the XSLT stylesheet that is specified in the XSL URL field.

**Transformer**

This drop-down menu presents all the transformation engines available to Oxygen XML Editor plugin for performing a transformation. These include the built-in engines and the external engines defined in the Custom Engines preferences page (page 181). The engine you choose is used as the default transformation engine. Also, if an XSLT or XQuery document does not have an associated validation scenario, this transformation engine is used in the validation process (if it provides validation support).

**Advanced options**

Allows you to configure the advanced options of the Saxon HE/PE/EE engine (page 1420) for the current transformation scenario. To configure the same options globally, go to the Saxon-HE/PE/EE preferences page (page 192). For the current transformation scenario, these Advanced options override the options configured in that preferences page.

**Parameters**

Opens a Configure parameters dialog box (page 1418) that allows you to configure the XSLT parameters used in the current transformation. In this dialog box, you can also configure the parameters for additional XSLT stylesheets (page 1418). If the XSLT transformation engine is custom-defined, you can not use this dialog box to configure the parameters sent to the custom engine. Instead, you can copy all parameters from the dialog box using contextual menu actions and edit the custom XSLT engine to include the necessary parameters in the command line that starts the transformation process.

**Extensions**

Opens a dialog box for configuring the XSLT extension JARS or classes (page 1419) that define extension Java functions or extension XSLT elements used in the transformation.
Additional XSLT stylesheets

Opens a dialog box for adding XSLT stylesheets (page 1420) that are applied on the main stylesheet specified in the XSL URL field. This is useful when a chain of XSLT stylesheets must be applied to the input XML document.

XSLT Parameters

The global parameters of the XSLT stylesheet used in a transformation scenario can be configured by using the Parameters button in the XSLT tab of a new or edited transformation scenario dialog box.

The resulting dialog box includes a table that displays all the parameters of the current XSLT stylesheet, all imported and included stylesheets, and all additional stylesheets (page 1420), along with their descriptions and current values. You can also add, edit, and remove parameters, and you can use the Filter text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

If the XPath column is selected, the parameter value is evaluated as an XPath expression before starting the XSLT transformation.

Example:

For example, you can use expressions such as:

```xml
doc('test.xml')//entry
//person[@atr='val']
```

Note:

1. The doc function solves the argument relative to the XSL stylesheet location. You can use full paths or editor variables (page 201) (such as ${cfdu} [current file directory]) to specify other locations: `doc('${cfdu}/test.xml')//*`

2. You cannot use XSLT Functions. Only XPath functions are allowed.

Below the table, the following actions are available for managing the parameters:

**New**

Opens the Add Parameter dialog box that allows you to add a new parameter to the list. An editor variable (page 201) can be inserted in the text box using the Insert Editor Variables button. If the Evaluate as XPath option is selected, the parameter will be evaluated as an XPath expression.

**Edit**
Opens the **Edit Parameter** dialog box that allows you to edit the selected parameter. An editor variable ([page 201](#)) can be inserted in the text box using the **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

**Unset**

Resets the selected parameter to its default value. Available only for edited parameters with set values.

**Delete**

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

The bottom panel presents the following:

- The default value of the parameter selected in the table.
- A description of the parameter, if available.
- The system ID of the stylesheet that declares it.

**Related Information:**

- Editor Variables ([page 201](#))

**XSLT Extensions**

The **Extensions** button opens a dialog box that allows you to specify the [JARS (page 2707)](#) and classes that contain extension functions called from the XSLT file of the current transformation scenario. You can use the **Add**, **Edit**, and **Remove** buttons to configure the extensions.

**Tip:** You can specify the path to the resources using wildcards (for example, `{oxygenHome}/lib/*.*.jar`).

An extension function called from the XSLT file of the current transformation scenario will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item to be moved and press the **Move up** or **Move down** buttons.

**Additional XSLT Stylesheets**

Use the **Additional XSLT Stylesheets** button in the **XSLT** tab to display a list of additional XSLT stylesheets to be used in the transformation and you can add files to the list or edit existing entries. The following actions are available:
Add

Adds a stylesheet in the Additional XSLT stylesheets list using a file browser dialog box. You can type an editor variable (page 201) in the file name field of the browser dialog box. The name of the stylesheet will be added in the list after the current selection.

Remove

Deletes the selected stylesheet from the Additional XSLT stylesheets list.

Up

Moves the selected stylesheet up in the list.

Down

Moves the selected stylesheet down in the list.

Advanced Saxon HE/PE/EE XSLT Transformation Options

The XSLT transformation scenario allows you to configure advanced options that are specific for the Saxon HE (Home Edition), PE (Professional Edition), and EE (Enterprise Edition) engines. They are the same options as those in the Saxon HE/PE/EE preferences page (page 192) but they are configured as a specific set of transformation options for each transformation scenario, while the values set in the preferences page apply as global options. The advanced options configured in a transformation scenario override the global options defined in the preferences page.

Saxon-HE/PE/EE Options

The advanced options for Saxon 9.8.0.12 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE) are as follows:

Mode ("-im")

A Saxon-specific option that sets the initial mode for the transformation. If this value is also specified in a configuration file (page 1420), the value in this option takes precedence.

Template ("-it")

A Saxon-specific option that sets the name of the initial XSLT template to be executed. If this value is also specified in a configuration file (page 1420), the value in this option takes precedence.

Use a configuration file ("-config")

Select this option if you want to use a Saxon 9.8.0.12 configuration file that will be executed for the XSLT transformation and validation processes. You can specify the path to the configuration file by entering it in the URL field, or by using the ✂️ Insert
Editor Variables button, or using the browsing actions in the Browse drop-down list.

Debugger trace into XPath expressions (applies to debugging sessions)

Instructs the XSLT Debugger (page 2025) to step into XPath expressions.

Enable Optimizations ("-opt")

This option is selected by default, which means that optimization is enabled. If not selected, the optimization is suppressed, which is helpful when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

Line numbering ("-l")

Line numbers where errors occur are included in the output messages.

Expand attributes defaults ("-expand")

Specifies whether or not the attributes defined in the associated DTD or XML Schema are expanded in the output of the transformation you are executing.

DTD validation of the source ("-dtd")

Specifies whether or not the source document will be validated against their associated DTD. You can choose from the following:

• On - Requests DTD validation of the source file and of any files read using the document() function.
• Off - (default setting) Suppresses DTD validation.
• Recover - Performs DTD validation but treats the errors as non-fatal.

Note: Any external DTD is likely to be read even if not used for validation, since DTDs can contain definitions of entities.

Recoverable errors ("-warnings")

Specifies how dynamic errors are handled. The following options can be selected:

• Recover silently ("silent") - Continues processing without reporting the error.
• Recover with warnings ("recover") - Issues a warning but continues processing.
• Signal the error and do not attempt recovery ("fatal") - Issues an error and stops processing.

Strip whitespaces ("-strip")

Specifies how the strip whitespaces operation is handled. You can choose one of the following values:
• **All** ("all") - Strips all whitespace text nodes from source documents before any further processing, regardless of any \texttt{xml:space} attributes in the source document.

• **Ignore** ("ignorable") - Strips all ignorable whitespace text nodes from source documents before any further processing, regardless of any \texttt{xml:space} attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.

• **None** ("none") - Strips no whitespace before further processing.

**Saxon-PE/EE Options**

The following advanced options are specific for Saxon 9.8.0.12 Professional Edition (PE) and Enterprise Edition (EE) only:

**Register Saxon-JS extension functions and instructions**

Registers the Saxon-CE extension functions and instructions when compiling a stylesheet using the Saxon 9.8.0.12 processors.

**Note:** Saxon-CE, being JavaScript-based, was designed to run inside a web browser. This means that you will use Oxygen XML Editor plugin only for developing the Saxon-CE stylesheet, leaving the execution part to a web browser. See more details about executing such a stylesheet on Saxonica's website.

**Allow calls on extension functions ("-ext")**

If selected, the stylesheet is allowed to call external Java functions. This does not affect calls on integrated extension functions, including Saxon and EXSLT extension functions. This option is useful when loading an untrusted stylesheet (such as from a remote site using \texttt{http://[URL]}). It ensures that the stylesheet cannot call arbitrary Java methods and thus gain privileged access to resources on your machine.

**Enable assertions ("-ea")**

In XSLT 3.0, you can use the \texttt{xsl:assert} element to make assertions in the form of XPath expressions, causing a dynamic error if the assertion turns out to be false. If this option is selected, XSLT 3.0 \texttt{xsl:assert} instructions are enabled. If it is not selected (default), the assertions are ignored.

**Saxon-EE Options**

The advanced options that are specific for Saxon 9.8.0.12 Enterprise Edition (EE) are as follows:

**XML Schema version**
Use this option to change the default XML Schema version for this transformation. To change the default XML Schema version globally, open the Preferences dialog box (page 55) and go to XML > XML Parser > XML Schema and use the Default XML Schema version option (page 177).

Validation of the source file ("-val")

Requests schema-based validation of the source file and of any files read using document() or similar functions. It can have the following values:

- **Schema validation ("strict")** - This mode requires an XML Schema and allows for parsing the source documents with strict schema-validation enabled.
- **Lax schema validation ("lax")** - If an XML Schema is provided, this mode allows for parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

Validation errors in the result tree treated as warnings ("-outval")

Normally, if validation of result documents is requested, a validation error is fatal. Selecting this option causes such validation failures to be treated as warnings.

- **Write comments for non-fatal validation errors of the result document**
  The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

Enable streaming mode

Selecting this option will allow an XSLT to run in streaming mode. It is not selected by default.

Other Options

**Initializer class**

Equivalent to the -init Saxon command-line argument. The value is the name of a user-supplied class that implements the net.sf.saxon.lib.Initializer interface. This initializer is called during the initialization process, and may be used to set any options required on the configuration programmatically. It is particularly useful for tasks such as registering extension functions, collations, or external object models, especially in Saxon-HE where the option cannot be set via a configuration file. Saxon only calls the initializer when running from the command line, but the same code may be invoked to perform initialization when running user application code.
Using Saxon Integrated Extension Functions

Saxon, the transformation and validation engine used by Oxygen XML Editor plugin, can be customized by adding custom functions (called Integrated Extension Functions) that can be called from XPath.

To define such a function, follow these steps:

1. Create a file with a Java class that extends net.sf.saxon.lib.ExtensionFunctionDefinition. Here is an example:

```java
private static class ShiftLeft extends ExtensionFunctionDefinition {
    @Override
    public StructuredQName getFunctionQName() {
        return new StructuredQName("eg", "http://example.com/saxon-extension", "shift-left");
    }

    @Override
    public SequenceType[] getArgumentTypes() {
        return new SequenceType[] {SequenceType.SINGLE_INTEGER, SequenceType.SINGLE_INTEGER};
    }

    @Override
    public SequenceType getResultType(SequenceType[] suppliedArgumentTypes) {
        return SequenceType.SINGLE_INTEGER;
    }

    @Override
    public ExtensionFunctionCall makeCallExpression() {
        return new ExtensionFunctionCall() {
            public SequenceIterator call(SequenceIterator[] arguments, XPathContext context) throws XPathException {
                long v0 = ((IntegerValue)arguments[0].next()).longValue();
                long v1 = ((IntegerValue)arguments[1].next()).longValue();
                long result = v0<<v1;
                return Value.asIterator(Int64Value.makeIntegerValue(result));
            }
        };
    }
}
```
2. Compile the class and add it to a JAR file.
3. Add a file called \texttt{net.sf.saxon.lib.ExtensionFunctionDefinition} that contains the fully qualified name of the Java class in the \texttt{META-INF/services/} folder of the JAR file.

\begin{itemize}
\item \textbf{Note:} To add more function definitions in the same JAR file, you need to add their fully qualified names on different lines.
\end{itemize}

To enable Oxygen XML Editor plugin to pick up your custom function definition, the JAR file should be added to the classpath of the transformer. Here are some possibilities:

\begin{itemize}
\item If you develop a framework, you just need to link the JAR file in the \textbf{Classpath} tab (page 76).
\item In a validation scenario (page 869), you can use the \textbf{Extensions} button to open a dialog box where you can add libraries.
\item In a transformation scenario, you can use the \textbf{Extensions} button in the \textbf{XSLT} tab (page 1417) to open a dialog box where you can add libraries.
\end{itemize}

\textbf{FO Processor Tab (XSLT Transformations)}

When you create a new transformation scenario (page 1415) or edit an existing one (page 1498), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The \textbf{FO Processor} tab contains the following options:

\begin{itemize}
\item \textbf{Perform FO Processing}
  Specifies whether or not an FO processor is applied (either the built-in Apache FOP engine or an external engine defined in Preferences) during the transformation.
\item \textbf{Input}
  Choose between the following options to specify which input file to use:
  \begin{itemize}
  \item \textbf{XSLT result as input} - The FO processor is applied to the result of the XSLT transformation that is defined in the XSLT tab.
  \item \textbf{XML URL as input} - The FO processor is applied to the input XML file.
  \end{itemize}
\item \textbf{Method}
\end{itemize}
The output format of the FO processing. The available options depend on the selected processor type.

**Processor**

Specifies the FO processor to be used for the transformation. It can be the built-in Apache FOP processor or an external processor (page 164).

**Output Tab (XSLT Transformations)**

When you create a new transformation scenario (page 1415) or edit an existing one (page 1498), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Output** tab contains the following options:

**Prompt for file**

At the end of the transformation, a file browser dialog box is displayed for specifying the path and name of the file that stores the transformation result.

**Save As**

The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the ✉ Insert Editor Variables (page 201) button, or the ☁ Browse button.

**Open in Browser/System Application**

If selected, Oxygen XML Editor plugin automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows PDF files are often opened in Acrobat Reader).

Note: To set the web browser that is used for displaying HTML/XHTML pages, go to Window > Preferences > General > Web Browser and specify it there.

- **Output file** - When Open in Browser/System Application is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When Open in Browser/System Application is selected, you can use this option to open the file specified in this field at the end of the transformation.
  
  You can specify the path by using the text field, the ✉ Insert Editor Variables (page 201) button, or the ☁ Browse button.

**Open in editor**
When this option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

**Show in results view as**

You can choose to view the results in one of the following:

- **XML** - If this is selected, Oxygen XML Editor plugin displays the transformation result in an XML viewer panel at the bottom of the application window with syntax highlighting (page 149).
- **XHTML** - This option is only available if **Open in Browser/System Application** is not selected. If selected, Oxygen XML Editor plugin displays the transformation result in a built-in XHTML browser panel at the bottom of the application window.

⚠️ **Important**: When transforming very large documents, you should be aware that selecting this option may result in very long processing times. This drawback is due to the built-in Java XHTML browser implementation. To avoid delays for large documents, if you want to see the XHTML result of the transformation, you should use an external browser by selecting the **Open in Browser/System Application** option instead.

- **Image URLs are relative to** - If **Show in results view as XHTML** is selected, this option specifies the path used to resolve image paths contained in the transformation result. You can specify the path by using the text field, the 📔 *Insert Editor Variables* (page 201) button, or the 📦 *Browse* button.

⚠️ **Attention**: If your input XSLT contains `<xsl:result-document>` elements, then the secondary results will be saved to the specified URIs while the principal result is specified in this **Output** tab. For more information, see: [https://www.w3.org/TR/xslt-30/#element-result-document](https://www.w3.org/TR/xslt-30/#element-result-document).

**Configuring an XSLT Processor for Generating Output**

This section explains how to configure an XSLT processor and extensions for such a processor in Oxygen XML Editor plugin.

**Supported XSLT Processors**

Oxygen XML Editor plugin includes the following XSLT processors:
• **Xalan 2.7.2** - **Xalan-Java** is an XSLT processor for transforming XML documents into HTML, text, or other XML document types. It implements XSL Transformations (XSLT) Version 1.0 and XML Path Language (XPath) Version 1.0.

• **Saxon 6.5.5** - **Saxon 6.5.5** is an XSLT processor that implements the Version 1.0 XSLT and XPath with a number of powerful extensions. This version of Saxon also includes many of the new features that were first defined in the XSLT 1.1 working draft, but for conformance and portability reasons these are not available if the stylesheet header specifies `version="1.0"`.

• **Saxon 9.8.0.12 Home Edition (HE), Professional Edition (PE)** - **Saxon-HE/PE** implements the basic conformance level for XSLT 2.0 / 3.0 and XQuery 1.0. The term **basic XSLT 2.0 / 3.0 processor** is defined in the draft XSLT 2.0 / 3.0 specifications. It is a conformance level that requires support for all features of the language other than those that involve schema processing. The HE product remains open source, but removes some of the more advanced features that are present in Saxon-PE.

• **Saxon 9.8.0.12 Enterprise Edition (EE)** - **Saxon EE** is the schema-aware edition of Saxon and it is one of the built-in processors included in Oxygen XML Editor plugin. Saxon EE includes an XML Schema processor, and schema-aware XSLT, XQuery, and XPath processors.

The validation in schema aware transformations is done according to the XML Schema 1.0 or 1.1. This can be configured in Preferences (page 176).

**Note:** Oxygen XML Editor plugin implements a Saxon framework that allows you to create Saxon configuration files. Two templates are available: **Saxon collection catalog** and **Saxon configuration**. Both of these templates support content completion, element annotation, and attribute annotation.

**Note:** Saxon can use the **ICU-J localization library** (**saxon9-icu.jar**) to add support for sorting and date/number formatting in a wide variety of languages. This library is not included in the Oxygen XML Editor plugin installation kit. However, Saxon will use the default collation and localization support available in the currently used JRE. To enable this capability, follow these steps:

2. Unpack the downloaded archive.
3. Create a new XSLT transformation scenario (or edit an existing one). In the **XSLT** tab, click the **Extensions** button to open the list of additional libraries used by the transformation process.
4. Click **Add** and browse to the folder where you unpacked the downloaded archive and choose the **saxon9-icu.jar** file.
Note that the `saxon9-icu.jar` should NOT be added to the application library folder because it will conflict with another version of the ICU-J library that comes bundled with Oxygen XML Editor plugin.

- **Saxon-CE (Client Edition)** is Saxonica's implementation of XSLT 2.0 for use on web browsers. Oxygen XML Editor plugin provides support for editing stylesheets that contain Saxon-CE extension functions and instructions. This support improves the validation, content completion, and syntax highlighting.

  ![Note: Saxon-CE, being JavaScript-based, was designed to run inside a web browser. This means that you will use Oxygen XML Editor plugin only for developing the Saxon-CE stylesheet, leaving the execution part to a web browser. See more details about executing such a stylesheet on Saxonica's website.](image)

  ![Note: A specific template, named Saxon-CE stylesheet, is available in the New from Templates wizard (page 554).](image)

- **Xsltproc (libxslt)** - Libxslt is the XSLT C library developed for the Gnome project. Libxslt is based on libxml2, the XML C library developed for the Gnome project. It also implements most of the EXSLT set of processor-portable extensions, functions, and some of Saxon's evaluate and expression extensions.

  Oxygen XML Editor plugin uses Libxslt through its command-line tool (`Xsltproc`). Depending on your operating system, you must download the Libxslt libraries on your machine from [http://xmlsoft.org/XSLT/downloads.html](http://xmlsoft.org/XSLT/downloads.html) and place them in a local folder. Then you need to update the `PATH` environmental variable to contain the parent folder where the `xsltproc` executable is located.

  ![Tip: As an example, a Windows installation of the Xsltproc engine would follow these steps:](image)

  2. Unzip all of them into the same folder of your choice.
  3. Edit the `PATH` environment variable and add the `bin` folder for all four archives:
4. Restart Oxygen XML Editor plugin.

**Result:** You can now use the `xsltproc` processor as an XSLT engine in the XSLT transformation scenario.

**Note:** The Xsltproc processor can be configured from the [XSLTPROC options page](page 196).

**CAUTION:** There is a known problem where file paths that contain spaces are not handled correctly in the LIBXML processor. For example, the built-in [XML Catalog](page 2712) files of the built-in document types (DocBook, TEI, DITA, etc.) are not handled properly by LIBXML if Oxygen XML Editor plugin is installed in the default location on Windows (C:\Program Files). This is because the built-in XML catalog files are stored in the `[OXYGEN_INSTALL_DIR]/frameworks` subdirectory of the installation directory, and in this case it contains a space character.

- **MSXML 4.0** - MSXML 4.0 is available only on Windows platforms. It can be used for transformation ([page 1415](#)) and validation of XSLT stylesheets ([page 961](#)).

Oxygen XML Editor plugin uses the Microsoft XML parser through its command-line tool `msxsl.exe`.

Since `msxsl.exe` is only a wrapper, Microsoft Core XML Services (MSXML) must be installed on the computer. Otherwise, you will get a corresponding warning. You can get the latest Microsoft XML parser from [Microsoft web-site](#).

- **MSXML .NET** - MSXML .NET is available only on Windows platforms. It can be used for transformation ([page 1415](#)) and validation of XSLT stylesheets ([page 961](#)).

Oxygen XML Editor plugin performs XSLT transformations and validations using the .NET Framework XSLT implementation ([System.Xml.Xsl.XslTransform class](#)) through the `nxslt` command-line utility. The `nxslt` version included in Oxygen XML Editor plugin is 1.6.

You should have the .NET Framework version 1.0 already installed on your system. Otherwise, you will get the following warning: MSXML.NET requires .NET Framework version 1.0 to be installed. Exit code: 128.
You can get the .NET Framework version 1.0 from the Microsoft website.

**.NET 1.0** - A transformer based on the `System.Xml` 1.0 library available in the .NET 1.0 and .NET 1.1 frameworks from Microsoft (http://msdn.microsoft.com/xml/). It is available only on Windows.

You should have the .NET Framework version 1.0 or 1.1 already installed on your system. Otherwise, you will get the following warning: MSXML.NET requires .NET Framework version 1.0 to be installed. Exit code: 128.

You can get the .NET Framework version 1.0 from the Microsoft website.

**.NET 2.0** - A transformer based on the `System.Xml` 2.0 library available in the .NET 2.0 Framework from Microsoft. It is available only on Windows.

You should have the .NET Framework version 2.0 already installed on your system. Otherwise, you will get the following warning: MSXML.NET requires .NET Framework version 2.0 to be installed. Exit code: 128.

You can get the .NET Framework version 2.0 from the Microsoft website.

### Configuring Custom XSLT Processors

Oxygen XML Editor plugin allows you to configure custom processors to be used for running XSLT and XQuery transformations.

To add a new custom processor, follow these steps:

1. Open the Preferences dialog box (page 55) and go to XML > XSLT-FO-XQuery > Custom Engines.
2. Click the + New button at the bottom of the dialog box.
3. Configure the parameters for the custom engine (page 181).
4. Click OK.

**Note:** You cannot use these custom engines in the Debugger perspective (page 2007).

The output messages of a custom processor are displayed in an output view at the bottom of the application window. If an output message follows the format of an Oxygen XML Editor plugin linked message (page 866), clicking it highlights the location of the message in an editor panel containing the file referenced in the message.

**Related Information:**
Configuring the XSLT Processor Extensions Paths

The Xalan and Saxon processors support the use of extension elements and extension functions. Unlike a literal result element, which the stylesheet simply transfers to the result tree, an extension element performs an action. The extension is usually used because the XSLT stylesheet fails in providing adequate functions for accomplishing a more complex task.

For more information about how to use extensions, see the following links:

- Saxon 6.5.5 - http://saxon.sourceforge.net/saxon6.5.5/extensions.html

To set an XSLT processor extension (a directory or a jar file), use the Extensions button (page 1417) in the Edit scenario dialog box.

XSL-FO (Apache FOP) Processor for Generating PDF Output

The Oxygen XML Editor plugin installation package is distributed with the Apache FOP that is a Formatting Objects processor for transforming your XML documents to PDF. FOP is a print and output independent formatter driven by XSL Formatting Objects. FOP is implemented as a Java application that reads a formatting object tree and renders the resulting pages to a specified output.

To see the version of the built-in XSL-FO processor for your installation, go to Help > About > Libraries and search for Apache FOP.

Other FO processors can be configured in the FO Processors preferences page (page 164).

Add a Font to the Built-in FO Processor - Simple Version

If the font that must be set to Apache FOP is one of the fonts that are installed in the operating system you should follow the next steps for creating and setting a FOP configuration file that looks for the font that it needs in the system fonts. It is a simplified version of the procedure for setting a custom font in Apache FOP (page 1481).

1. Register the font in FOP configuration. (This is not necessary for DITA PDF transformations, skip to the next step)
a. Create a FOP configuration file that specifies that FOP should look for fonts in the installed fonts of the operating system.

```xml
<fop version="1.0">
  <renderers>
    <renderer mime="application/pdf">
      <fonts>
        <auto-detect/>
      </fonts>
    </renderer>
  </renderers>
</fop>
```

b. Open the Preferences dialog box (page 55), go to XML > XSLT/FO/XQuery > FO Processors, and enter the path of the FOP configuration file in the Configuration file text field.

2. Set the font on the document content.  
   This is done usually with XSLT stylesheet parameters and depends on the document type processed by the stylesheet.
   - For DocBook documents you can start with the built-in scenario called DocBook PDF, edit the XSLT parameters (page 1416) and set the font name (for example, Arial Unicode MS) to the parameters body.font.family and title.font.family.
   - For TEI documents you can start with the built-in scenario called TEI PDF, edit the XSLT parameters (page 1416) and set the font name (for example, Arial Unicode MS) to the parameters bodyFont and sansFont.
   - For DITA transformations to PDF using DITA-OT you should modify the following two files:
     - DITA-OT-DIR/plugins/org.dita.pdf2/cfg/fo/font-mappings.xml - The font-face element included in each element physical-font having the attribute char-set="default" must contain the name of the font (for example, Arial Unicode MS)
     - DITA-OT-DIR/plugins/org.dita.pdf2.fop/fop/conf/fop.xconf - An element auto-detect must be inserted in the element fonts, which is inside the element renderer that has the attribute mime="application/pdf".

```xml
<renderer mime="application/pdf">
  .
  <fonts>
    <auto-detect/>
  </fonts>
  .
</renderer>
```
Add a Font to the Built-in FO Processor - Advanced Version

If an XML document is transformed to PDF using the built-in Apache FOP processor but it contains some Unicode characters that cannot be rendered by the default PDF fonts, then a special font that is capable to render these characters must be configured and embedded in the PDF result.

⚠️ **Important:** On Windows, fonts are located into the `C:\Windows\Fonts` directory. On Mac, they are placed in `/Library/Fonts`. To install a new font on your system, it’s enough to copy it in the `Fonts` directory. If a special font is installed in the operating system, there is a simple way of telling FOP to look for it. See the simplified procedure for adding a font to FOP (page 1479).

1. Locate the font.

   First, find out the name of a font that has the glyphs for the special characters you used. One font that covers most characters, including Japanese, Cyrillic, and Greek, is Arial Unicode MS.

2. Register the font in the FOP configuration.

   📝 **Note:** DITA PDF transformations have their own fop.xconf (`DITA-OT-DIR/plugins/org.dita.pdf2.fop/fop/conf/fop.xconf`). If the font is not installed in the system, it needs to be referenced in the fop.xconf.

   a. For information about registering the font in the FOP Configuration, see: [https://xmlgraphics.apache.org/fop/2.3/fonts.html](https://xmlgraphics.apache.org/fop/2.3/fonts.html).
   b. Open the Preferences dialog box (page 55), go to XML > XSLT/FO/XQuery > FO Processors, and enter the path of the FOP configuration file in the Configuration file text field.

3. Set the font on the document content.

   This is usually done with XSLT stylesheet parameters and depends on the document type processed by the stylesheet.

   **DocBook Example:** For DocBook documents, you can start with the built-in scenario called DocBook PDF, edit the XSLT parameters (page 1416), and set the font name (for example, Arialuni) to the parameters `body.font.family` and `title.font.family`.

   **TEI Example:** For TEI documents, you can start with the built-in scenario called TEI PDF, edit the XSLT parameters (page 1416), and set the font name (for example, Arialuni) to the parameters `bodyFont` and `sansFont`.

   **DITA Example:** For DITA to PDF transformations using DITA-OT modify the following two files:
• `DITA-OT-DIR/plugins/org.dita.pdf2/cfg/fo/font-mappings.xml` - The font-face element included in each element physical-font having the attribute charset="default" must contain the name of the font.

• `DITA-OT-DIR/plugins/org.dita.pdf2/fop/conf/fop.xconf` - An element font must be inserted in the element fonts, which is inside the element renderer that has the attribute mime="application/pdf".

For more information, see: https://xmlgraphics.apache.org/fop/2.1/fonts.html.

Adding Libraries to the Built-in FO Processor (XML with XSLT and FO)

Starting with Oxygen XML Editor plugin version 20.0, both hyphenation and PDF image support are enabled by default in the built-in Apache FO processor. For older version of Oxygen XML Editor plugin, use the following procedures to enable such support.

### Adding Hyphenation Support for XML with XSLT Transformation Scenarios

If you want to add newer hyphenation libraries or you are using an older version of Oxygen XML Editor plugin, follow this procedure:

1. Create a folder called `fop` in the `{OXYGEN_INSTALL_DIR}/lib` folder.
2. Download the compiled JAR (page 2707) from OFFO.
3. Copy the `fop-hyph.jar` file into the `{OXYGEN_INSTALL_DIR}/lib/fop` folder.
4. Restart Oxygen XML Editor plugin.

### Adding Support for PDF Images

To add support for PDF images in an older version of Oxygen XML Editor plugin, follow these steps:

1. Create a folder called `fop` in the `{OXYGEN_INSTALL_DIR}/lib` folder.
2. Download the `fop-pdf-images` JAR libraries.
3. Copy the libraries into the `{OXYGEN_INSTALL_DIR}/lib/fop` folder.
4. Restart Oxygen XML Editor plugin.

### How to Enable Debugging for FO Processor Transformations

If you encounter errors when running PDF transformations that use an FO processor, it is possible to enable debugging/logging to help you identify the problem. To enable debugging/logging for FO processing, follow this procedure:
1. Locate and edit the following configuration file: \{OXYGEN_INSTALL_DIR\}/tools/config/log4j.xml.

**Note:** You need write access to this folder, so if you do not have administrator permissions, you may first need to copy the file to another location where you have write access.

2. Edit the **priority** element (inside the **root** element) and change its value to **debug**.

3. Save the file in the original location.

4. Restart Oxygen XML Editor plugin and re-run the transformation.

**Tip:** It is recommended that you use a small input file when trying to reproduce the problem, to make it easier to analyze the data in the log.

5. Once you are finished with the debugging session, remember to edit the log4j.xml file and change the **priority** element back to its original value. Otherwise, performance could be affected.

XProc Transformation

This type of transformation specifies the parameters and location of an XProc script.

A sequence of transformations described by an XProc script can be executed with an XProc transformation scenario. To create an **XProc transformation** scenario, use one of the following methods:

- Use the **Configure Transformation Scenario(s)** (Alt + Shift + T, C (Command + Alt + T, C on OS X)) action from the toolbar or the XML menu. Then click the **New** button and select **XProc transformation**.

- Go to **Window > Show View** and select **Transformation Scenarios** to display this view (page 1507). Click the ✉ · **New Scenario** drop-down menu button and select **XProc transformation**.

Both methods open the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

**Related Information:**

- Integrating an External XProc Engine (page 1488)
XProc Tab

When you create a new transformation scenario (page 1415) or edit an existing one (page 1498), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The XProc tab contains the following options:

**XProc URL**

Specify the source XSL file to be used by the transformation. You can specify the path by using the text field, its history drop-down, the \( \text{Insert Editor Variables} \) button, or the browsing actions in the \( \text{Browse} \) drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

**Processor**

Allows you to select the XProc engine to be used for the transformation. You can select the Add-on for Calabash XProc engine or a custom engine that is configured in the XProc Preferences page (page 179).

Inputs Tab (XProc Transformations)

When you create a new transformation scenario (page 1415) or edit an existing one (page 1498), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The Inputs tab contains a list with the ports that the XProc script uses to read input data. Use the Filter text box to search for a specific term in the entire ports collection.

Each input port has an assigned name in the XProc script. The XProc engine reads data from the URL specified in the URL column.

The following actions are available for managing the input ports:

**New**

Opens an Edit dialog box that allows you to add a new port and its URL. The built-in editor variables (page 201) and custom editor variables (page 208) can be used to specify the URL.

**Edit**
Opens an **Edit** dialog box that allows you to modify the selected port and its URL. The built-in editor variables *(page 201)* and custom editor variables *(page 208)* can be used to specify the URL.

**Delete**

Removes the selected port from the list. It is available only for new ports that have been added to the list.

**Parameters Tab (XProc Transformations)**

When you *create a new transformation scenario* *(page 1415)* or *edit an existing one* *(page 1498)*, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Parameters** tab presents a list of ports and parameters collected from the XProc script. The tab is divided into three sections:

- **List of Ports**
  
  In this section, you can use the **New** and **Delete** buttons to add or remove ports.

- **List of Parameters**
  
  This section presents a list of parameters for each port and includes columns for the parameter name, namespace URI, and its value. Use the Filter text box to search for a specific term in the entire parameters collection. You can use the **New** and **Delete** buttons to add or remove parameters. You can edit the value of each cell in this table by double-clicking the cell. You can also sort the parameters by clicking the column headers.

- **Editor Variable Information**
  
  The built-in editor variables *(page 201)* and custom editor variables *(page 208)* can be used for specifying the URI. The message pane at the bottom of the dialog box provides more information about the editor variables that can be used.

**Outputs Tab (XProc Transformations)**

When you *create a new transformation scenario* *(page 1415)* or *edit an existing one* *(page 1498)*, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Outputs** tab displays a list of output ports (along with the URL) collected from the XProc script. Use the Filter text box to search for a specific term in the entire ports collection. You can also sort the columns by clicking the column headers.

The following actions are available for managing the output ports:
New

Opens an **Edit** dialog box that allows you to add a new output port and its URL. An *editor variable* ([page 201]) can be inserted for the URL by using the **Insert Editor Variables** button. There is also a **Show in transformation results view** option that allows you to select whether or not the results will be displayed in the output **Results view** ([page 267]).

**Edit**

Opens an **Edit** dialog box that allows you to edit an existing output port and its URL. An *editor variable* ([page 201]) can be inserted for the URL by using the **Insert Editor Variables** button. There is also a **Show in transformation results view** option that allows you to select whether or not the results will be displayed in the output **Results view** ([page 267]).

**Delete**

Removes the selected output port from the list. It is available only for new ports that have been added to the list.

Additional options that are available at the bottom of this tab include:

**Open in Editor**

If this option is selected, the XProc transformation result is automatically opened in an editor panel.

**Open in Browser/System Application**

If this option is selected, you can specify a file to be opened at the end of the XProc transformation in the browser or system application that is associated with the file type. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** ([page 201]) button, or the browsing actions in the **Browse** drop-down list.

**Results**

The result of the XProc transformation can be displayed as a sequence in an output view with two sections:

- A list with the output ports on the left side.
- The content that correspond to the selected output port on the right side.

*Figure 552: XProc Transformation Results View*
Options Tab (XProc Transformations)

When you create a new transformation scenario (page 1415) or edit an existing one (page 1498), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The Options tab displays a list of the options collected from the XProc script. The tab is divided into two sections:

List of Options

This section presents a list of options and includes columns for the option name, namespace URI, and its value. Use the Filter text box to search for a specific term in the entire options collection. You can use the New and Delete buttons to add or remove options. You can edit the value of each cell in this table by double-clicking the cell. You can also sort the parameters by clicking the column headers. The names of edited options are displayed in bold.

Editor Variable Information

The built-in editor variables (page 201) and custom editor variables (page 208) can be used for specifying the URI. This section provides more information about the editor variables that can be used.

Calabash XProc Processor for Generating PDF Output

To generate PDF output from your XProc pipeline (when using the Calabash XProc processor), follow these steps:

1. Open the \{OXYGEN_INSTALL_DIR\}/lib/xproc/calabash/engine.xml file.
2. Uncomment the `<system-property name="com.xmlcalabash.fo-processor" value="com.xmlcalabash.util.FoXEP"/>` system property.
3. Uncomment the `<system-property name="com.renderx.xep.CONFIG" file="../../tools/xep/xep.xml"/>` system property. Edit the `file` attribute to point to the configuration file that is usually located in the XEP installation folder.
4. Uncomment the references to the XEP libraries. Edit them to point to the matching library names from the XEP installation directory.
5. Restart Oxygen XML Editor plugin.

Integrating an External XProc Engine

Oxygen XML Editor plugin includes a bundled version of the Calabash XProc engine that can be used for XProc transformations and validation, but you can also integrate other external XProc engines. When you edit an XProc transformation scenario, there is a Processor drop-down menu where you can select the XProc engine to be used for the transformation.

If you do not need the external XProc engine to be used for automatic validation or pass parameters/ports and it is not Java-based, you can simply add the external engine by using the XProc preferences page (page 179). Otherwise, if the external engine is Java-based, or it has validation support, or it has the ability to receive parameters or ports passed from the transformation, you need to integrate it using the plugin extension procedure below.

For example, there is a public project on GitHub that is an implementation for integrating Morgana XProc with Oxygen XML Editor plugin: https://github.com/xml-project/support-for-xmleditor. Also, the Javadoc documentation of the XProc API is available for download from the application website as a zip file: xprocAPI.zip.

To create an XProc integration project, follow these steps:

1. Move the oxygen.jar file from \{OXYGEN_INSTALL_DIR\}/lib to the lib folder of your project.
2. Implement the ro.sync.xml.transformer.xproc.api.XProcTransformerInterface interface.
3. Create a Java archive (JAR) (page 2707) from the classes you created.
4. Create an engine.xml file according to the engine.dtd file. The attributes of the engine element are as follows:
   a. name - The name of the XProc engine.
   b. description - A short description of the XProc engine.
   c. class - The complete name of the class that implements ro.sync.xml.transformer.xproc.api.XProcTransformerInterface.
   d. version - The version of the integration.
   e. engineVersion - The version of the integrated engine.
   f. vendor - The name of the vendor / implementer.
   g. supportsValidation - true if the engine supports validation (otherwise, false).
The `engine` element has only one child, `runtime`. The `runtime` element contains several `library` elements with the `name` attribute containing the relative or absolute location of the libraries necessary to run this integration.

5. Create a new folder (for example, named `MyXprocEngine`) and place the `engine.xml` and all the libraries necessary to run the new integration in that folder.

6. Place that new folder (i.e. `MyXprocEngine`) inside a new plugin folder. This new plugin folder should also contain a `plugin.xml` file that points to the new engine folder (i.e. `MyXprocEngine`).
   The `plugin.xml` file would look like this:

   ```xml
   <plugin
       id="morgana.xproc.addon"
       name="Contribute Morgana XProc"
       description="Contribute Morgana XProc"
       version="1.0"
       vendor="SyncroSoft"
       class="ro.sync.exml.plugin.Plugin"
       classLoaderType="preferReferencedResources">
     <extension type="AdditionalXProcEngine" path="MyXprocEngine/*"></extension>
   </plugin>
   ```

   Related Information:

   - Editing XProc Scripts (page 1210)
   - Creating an XProc Transformation Scenario (page 1483)

XQuery Transformation

This type of transformation specifies the parameters and location of an XML source that the edited XQuery file is applied on.

**Note:** When the XML source is a native XML database, the source field of the scenario is empty because the XML data is read with XQuery-specific functions, such as `document()`. When the XML source is a local XML file, the URL of the file is specified in the input field of the scenario.

To create an **XQuery transformation** scenario, use one of the following methods:
• Use the Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Alt + T, C on OS X)) action from the toolbar or the XML menu. Then click the New button and select XQuery transformation.

• Go to Window > Show View and select Transformation Scenarios to display this view (page 1507). Click the New Scenario drop-down menu button and select XQuery transformation.

Both methods open the New Scenario dialog box.

The upper part of the dialog box allows you to specify the Name of the transformation scenario.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

XQuery Tab

When you create a new transformation scenario (page 1415) or edit an existing one (page 1498), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The XQuery tab contains the following options:

XML URL

Specifies the source XML file. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (page 201) button, or the browsing actions in the Browse drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.

Note: If the transformer engine is Saxon 9.x and a custom URI resolver is configured in the advanced Saxon preferences page (page 195), the XML input of the transformation is passed to that URI resolver.

XQuery URL

Specifies the source XQuery file to be used for the transformation. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (page 201) button, or the browsing actions in the Browse drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

Transformer

This drop-down menu presents all the transformation engines available to Oxygen XML Editor plugin for performing a transformation. These include the built-in engines and
the external engines defined in the Custom Engines preferences page (page 181). The engine you choose is used as the default transformation engine. Also, if an XSLT or XQuery document does not have an associated validation scenario, this transformation engine is used in the validation process (if it provides validation support).

**Advanced options**

Allows you to configure the advanced options of the Saxon HE/PE/EE engine (page 1437) for the current transformation scenario. To configure the same options globally, go to the Saxon-HE/PE/EE preferences page (page 192). For the current transformation scenario, these **Advanced options** override the options configured in that preferences page.

**Parameters**

Opens the Configure parameters dialog box (page 1435) for configuring the XQuery parameters. You can use the buttons in this dialog box to add, edit, or remove parameters. If the XQuery transformation engine is custom-defined, you cannot use this dialog box to set parameters. Instead, you can copy all parameters from the dialog box using contextual menu actions and edit the custom XQuery engine to include the necessary parameters in the command line that starts the transformation process.

**Extensions**

Opens a dialog box for configuring the XQuery extension JARS or classes (page 1437) that define extension Java functions or extension XSLT elements used in the transformation.

**XQuery Parameters**

The global parameters of the XQuery file used in a transformation scenario can be configured by using the **Parameters** button in the **XQuery** tab.

The resulting dialog box includes a table that displays all the parameters of the current XQuery file, along with their descriptions and current values. You can also add, edit, and remove parameters, and use the **Filter** text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

If the **XPath** column is selected, the parameter value is evaluated as an XPath expression before starting the XQuery transformation.

**Example:**

For example, you can use expressions such as:

```xml
<doc('test.xml')/entry
  //person[@atr='val']
```
Note:

1. The `doc` function solves the argument relative to the XQuery file location. You can use full paths or `editor variables (page 201)` (such as `${cfdu} [current file directory]`) to specify other locations:
   
   ```xml
   doc('${cfdu}/test.xml')/*
   ```

2. Only XPath functions are allowed.

Below the table, the following actions are available for managing the parameters:

**New**

Opens the **Add Parameter** dialog box that allows you to add a new parameter to the list. An `editor variable (page 201)` can be inserted in the text box using the **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

**Edit**

Opens the **Edit Parameter** dialog box that allows you to edit the selected parameter. An `editor variable (page 201)` can be inserted in the text box using the **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

**Unset**

Resets the selected parameter to its default value. Available only for edited parameters with set values.

**Delete**

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

The bottom panel presents the following:

- The default value of the parameter selected in the table.
- A description of the parameter, if available.
- The system ID of the stylesheet that declares it.

**Related Information:**

- Editor Variables (page 201)
**XQuery Extensions**

The **Extensions** button is used to specify the JAR (page 2707) and classes that contain extension functions called from the XQuery file of the current transformation scenario. You can use the **Add**, **Edit**, and **Remove** buttons to configure the extensions.

An extension function called from the XQuery file of the current transformation scenario will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item to be moved and press the ↑ Move up or ↓ Move down buttons.

**Advanced Saxon HE/PE/EE XQuery Transformation Options**

The XQuery transformation scenario allows you to configure advanced options that are specific for the Saxon HE (Home Edition), PE (Professional Edition), and EE (Enterprise Edition) engines. They are the same options as those in the Saxon HE/PE/EE preferences page (page 186) but they are configured as a specific set of transformation options for each transformation scenario, while the values set in the preferences page apply as global options. The advanced options configured in a transformation scenario override the global options defined in the preferences page.

**Saxon-HE/PE/EE Options**

The advanced options for Saxon 9.8.0.12 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE) are as follows:

- **Use a configuration file ("-config")**
  
  Sets a Saxon 9.8.0.12 configuration file that is used for XQuery transformation and validation scenarios.

- **Enable Optimizations ("-opt")**
  
  This option is selected by default, which means that optimization is enabled. If not selected, the optimization is suppressed, which is helpful when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

- **Use linked tree model ("-tree:linked")**
  
  This option activates the linked tree model.

- **Recoverable errors ("-warnings")**
  
  Specifies how dynamic errors are handled. The following options can be selected:

  - **Recover silently ("silent")** - Continues processing without reporting the error.
  - **Recover with warnings ("recover")** - Issues a warning but continues processing.
• **Signal the error and do not attempt recovery** ("fatal") - Issues an error and stops processing.

**Strip whitespaces** ("-strip")

Specifies how the *strip whitespaces* operation is handled. You can choose one of the following values:

• **All** ("all") - Strips all whitespace text nodes from source documents before any further processing, regardless of any `xml:space` attributes in the source document.

• **Ignore** ("ignorable") - Strips all ignorable whitespace text nodes from source documents before any further processing, regardless of any `xml:space` attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.

• **None** ("none") - Strips no whitespace before further processing.

**Saxon-PE/EE Options**

The following advanced options are specific for Saxon 9.8.0.12 Professional Edition (PE) and Enterprise Edition (EE) only:

**Allow calls on extension functions** ("-ext")

If selected, calls on external functions are allowed. Selecting this option is recommended in an environment where untrusted stylesheets may be executed. It also disables user-defined extension elements and the writing of multiple output files, both of which carry similar security risks.

**Saxon-EE Options**

The advanced options that are specific for Saxon 9.8.0.12 Enterprise Edition (EE) are as follows:

**Validation of the source file** ("-val")

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

• **Schema validation** ("strict") - This mode requires an XML Schema and allows for parsing the source documents with strict schema-validation enabled.

• **Lax schema validation** ("lax") - If an XML Schema is provided, this mode allows for parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.

• **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.
Validation errors in the result tree treated as warnings ("-outval")

Normally, if validation of result documents is requested, a validation error is fatal. Selecting this option causes such validation failures to be treated as warnings.

Write comments for non-fatal validation errors of the result document

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

Enable XQuery update ("-update:(on|off)")

This option controls whether or not XQuery update syntax is accepted. The default value is off.

Backup files updated by XQuery ("-backup:(on|off)")

If selected, backup versions for any XML files updated with an XQuery Update are generated. This option is available when the Enable XQuery update option is selected.

Other Options

Initializer class

Equivalent to the -init Saxon command-line argument. The value is the name of a user-supplied class that implements the net.sf.saxon.lib.Initializer interface. This initializer is called during the initialization process, and may be used to set any options required on the configuration programmatically. It is particularly useful for tasks such as registering extension functions, collations, or external object models, especially in Saxon-HE where the option cannot be set via a configuration file. Saxon only calls the initializer when running from the command line, but the same code may be invoked to perform initialization when running user application code.

FO Processor Tab (XQuery Transformations)

When you create a new transformation scenario (page 1415) or edit an existing one (page 1498), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The FO Processor tab contains the following options:

Perform FO Processing

Specifies whether or not an FO processor is applied (either the built-in Apache FOP engine or an external engine defined in Preferences) during the transformation.
Input

Choose between the following options to specify which input file to use:

- **XQuery result as input** - The FO processor is applied to the result of the XQuery transformation that is defined in the XQuery tab.
- **XML URL as input** - The FO processor is applied to the input XML file.

Method

The output format of the FO processing. The available options depend on the selected processor type.

Processor

Specifies the FO processor to be used for the transformation. It can be the built-in Apache FOP processor or an external processor (page 164).

Output Tab (XQuery Transformations)

When you create a new transformation scenario (page 1415) or edit an existing one (page 1498), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Output** tab contains the following options:

**Present as a sequence**

Selecting this option will reduce the time necessary to fetch the full results, as it will only fetch the first chunk of the results.

**Prompt for file**

At the end of the transformation, a file browser dialog box is displayed for specifying the path and name of the file that stores the transformation result.

**Save As**

The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the 📀 Insert Editor Variables (page 201) button, or the 🗄️ Browse button.

**Open in Browser/System Application**

If selected, Oxygen XML Editor plugin automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows PDF files are often opened in Acrobat Reader).

**Note:** To set the web browser that is used for displaying HTML/XHTML pages, go to Window > Preferences > General > Web Browser and specify it there.
• **Output file** - When **Open in Browser/System Application** is selected, you can use this button to automatically open the default output file at the end of the transformation.

• **Other location** - When **Open in Browser/System Application** is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the ![Insert Editor Variables](page 201) button, or the ![Browse](button).

**Open in editor**

When this option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

**Show in results view as**

You can choose to view the results in one of the following:

• **XML** - If this is selected, Oxygen XML Editor plugin displays the transformation result in an XML viewer panel at the bottom of the application window with syntax highlighting (page 149).

• **XHTML** - This option is only available if **Open in Browser/System Application** is not selected. If selected, Oxygen XML Editor plugin displays the transformation result in a built-in XHTML browser panel at the bottom of the application window.

⚠️ **Important**: When transforming very large documents, you should be aware that selecting this option may result in very long processing times. This drawback is due to the built-in Java XHTML browser implementation. To avoid delays for large documents, if you want to see the XHTML result of the transformation, you should use an external browser by selecting the **Open in Browser/System Application** option instead.

• **Image URLs are relative to** - If **Show in results view as XHTML** is selected, this option specifies the path used to resolve image paths contained in the transformation result. You can specify the path by using the text field, the ![Insert Editor Variables](page 201) button, or the ![Browse](button).

**SQL Transformation**

This type of transformation specifies a database connection for the database server that runs the SQL file associated with the scenario. The data processed by the SQL script is located in the database.
To create an SQL transformation scenario, use one of the following methods:

- Use the Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Alt + T, C on OS X)) action from the toolbar or the XML menu. Then click the New button and select SQL transformation.
- Go to Window > Show View and select Transformation Scenarios to display this view (page 1507). Click the New Scenario drop-down menu button and select SQL transformation.

Both methods open the New Scenario dialog box. This dialog box allows you to configure the following options that control the transformation:

**Name**
The unique name of the SQL transformation scenario.

**SQL URL**
Allows you to specify the URL of the SQL script. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (page 201) button, or the browsing actions in the Browse drop-down list.

**Connection**
Allows you to select a connection from a drop-down list. To configure a connection, use the Advanced options button to open the Data Source preferences page (page 60).

**Parameters**
Allows you to add or configure parameters for the transformation.

**Editing a Transformation Scenario**

Editing a transformation scenario is useful if you need to configure some of its parameters.

**Note:** Since transformation scenarios that are associated with built-in frameworks (page 2706) are read-only, to edit one of these scenarios you will need to duplicate it and edit the duplicated scenario (page 1500).

To configure an existing transformation scenario, follow these steps:

1. Select the Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Alt + T, C on OS X)) action from the toolbar or the XML menu.
   
   **Step Result:** The Configure Transformation Scenario(s) dialog box (page 1502) is opened.

2. Select the particular transformation scenario and click the Edit button at the bottom of the dialog box or from the contextual menu.
Tip: You could also select the scenario and the Edit button in the Transformation Scenarios view (page 1507) to achieve the same result.

Result: This will open an Edit scenario configuration dialog box that allows you to configure various options in several tabs, depending on the type of transformation scenario that was selected.

Figure 553: Edit Scenarios Configuration Dialog Box

Transformation Types

The Configure Transformation Scenario(s) dialog box (page 1502) contains a Type column that shows you the transformation type for each of the listed scenarios. Each type of transformation contains includes some tabs with various configuration options.

The following is a list of the transformation types and their particular tabs (click the name of each tab below to see details about all the options that are available):

- **DITA OT** - This type of transformation includes configurable options in the following tabs:
  - Skins Tab (page 2606) (Available for WebHelp Classic and WebHelp Classic with Feedback)
  - Templates Tab (page 2607) (Available for WebHelp Responsive and WebHelp Responsive with Feedback)
  - FO Processor Tab (page 2612) (Available for PDF output)
  - Parameters Tab (page 2614)
  - Filters Tab (page 2616)
  - Advanced Tab (page 2617)
  - Output Tab (page 2619)

- **ANT** - This type of transformation includes configurable options in the following tabs:
  - Options Tab (page 1460)
  - Parameters Tab (page 1461)
  - Output Tab (page 1462)
• **XSLT** - This type of transformation includes configurable options in the following tabs:
  ◦ XSLT Tab *(page 1416)*
  ◦ FO Processor Tab *(page 1425)*
  ◦ Output Tab *(page 1426)*

• **XProc** - This type of transformation includes configurable options in the following tabs:
  ◦ XProc Tab *(page 1484)*
  ◦ Inputs Tab *(page 1484)*
  ◦ Parameters Tab *(page 1485)*
  ◦ Outputs Tab *(page 1485)*
  ◦ Options Tab *(page 1487)*

• **XQuery** - This type of transformation includes configurable options in the following tabs:
  ◦ XQuery Tab *(page 1434)*
  ◦ FO Processor Tab *(page 1439)*
  ◦ Output Tab *(page 1440)*

### Related Information:

- Creating New Transformation Scenarios *(page 1415)*
- Duplicating a Transformation Scenario *(page 1500)*
- Configure Transformation Scenario(s) Dialog Box *(page 1502)*
- Applying Associated Transformation Scenarios *(page 1501)*

### Duplicating a Transformation Scenario

Duplicating a transformation scenario is useful for creating a scenario that is similar to an existing one or to edit a built-in transformation scenario.

To configure an existing transformation scenario, follow these steps:

1. Select the Configure Transformation Scenario(s) *(Alt + Shift + T, C (Command + Alt + T, C on OS X))* action from the toolbar or the XML menu.

   **Step Result:** The Configure Transformation Scenario(s) dialog box *(page 1502)* is opened.

2. Select the particular transformation scenario and click the **Duplicate** button at the bottom of the dialog box or from the contextual menu.
Tip: You could also select the scenario and the Duplicate button in the Transformation Scenarios view (page 1507) to achieve the same result.

Result: This will open an Edit scenario configuration dialog box that allows you to configure various options in several tabs, depending on the type of transformation scenario that was selected. For information about all the specific options in the various tabs, see the Transformation Types section (page 1499).

Related Information:

- Creating New Transformation Scenarios (page 1415)
- Editing a Transformation Scenario (page 1498)

Applying Associated Transformation Scenarios

If you have associated transformation scenarios for the current document (in the Configure Transformation Scenario(s) dialog box (page 1502) or Transformation Scenarios view (page 1507)), Oxygen XML Editor plugin included an Apply Transformation Scenario(s) action that allows you to quickly apply the associated transformation scenarios on the current document. Note that if an association is not detected, this action will open the Configure Transformation Scenario(s) dialog box (page 1502) where you can choose the scenarios you want to apply.

The Apply Transformation Scenario(s) action can be initiated from any of the following methods:

- Use the Alt + Shift + T, T (Command + Alt + T, T on OS X)) keyboard shortcut.
- Click the Apply Transformation Scenario(s) button on the main toolbar.
- Click the Apply Transformation Scenario(s) button on the toolbar in the Transformation Scenarios view (page 1507).
- Right-click a file in the Navigator view (page 250) and select Transform > Apply Transformation Scenario(s).
- Use the Apply Associated button in the Configure Transformation Scenario(s) dialog box (page 1502).

Related Information:
Configure Transformation Scenario(s) Dialog Box

You can use the Configure Transformation Scenario(s) dialog box for editing existing transformation scenarios (page 1498) or creating new ones (page 1415).

To open this dialog box, use the Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Alt + T, C on OS X)) action from the toolbar or the XML menu.

Figure 554: Configure Transformation Scenario(s) Dialog Box

Top Section

The top section of the dialog box contains a filter that allows you to search through the scenarios list and the Settings button allows you to configure the following options:
Show all scenarios

Select this option to display all the available scenarios, regardless of the document they are associated with.

Show only the scenarios available for the editor

Select this option to only display the scenarios that Oxygen XML Editor plugin can apply for the current document type.

Show associated scenarios

Select this option to only display the scenarios associated with the document you are editing.

Import scenarios

This option opens the Import scenarios dialog box that allows you to select the scenarios file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Editor plugin ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

- Keep or replace the existing scenario.
- Keep both scenarios.

Note: When you keep both scenarios, Oxygen XML Editor plugin adds imported to the name of the imported scenario.

Export selected scenarios

Use this option to export selected scenarios individually. Oxygen XML Editor plugin creates a scenarios file that contains the scenarios that you export. This is useful if you want to share scenarios with others or export them to another computer.

Middle Section

The middle section of the dialog box displays the scenarios that you can apply to the current document. The following columns are used to display the transformation scenarios:

- **Association** - The checkboxes in this column mark whether or not a transformation scenario is associated with the current document.
- **Scenario** - This column presents the names of the transformation scenarios.
- **Type** - If the Show Type contextual menu option is selected, this column displays the type of the transformation scenario. For further details about the types of transformation scenarios that are available in Oxygen XML Editor plugin, see the Transformation Types section (page 1499).
• **Storage** - If the **Show Storage** contextual menu option is selected, this column displays where a transformation scenario is stored.

To sort each column you can left-click its header. The contextual menu of each header also includes the following actions:

**Show Type**

Use this option to display the transformation type of each scenario.

**Show Storage**

Use this option to display the storage location of the scenarios.

**Group by Type**

Select this option to group the scenarios by their type.

**Group by Storage**

Select this option to group the scenarios by their storage location.

**Ungroup all**

Select this option to ungroup all the scenarios.

**Reset Layout**

Select this option to restore the default settings of the layout.

Each transformation scenario listed in the middle section of the dialog box also includes the following contextual menu actions:

**Edit**

This button opens the **Edit Scenario** configuration dialog box *(page 1498)* that allows you to configure the options of the transformations scenario.

**Duplicate**

Use this button to create a duplicate transformation scenario *(page 1500)*.

**Remove**

Use this button to remove custom transformation scenarios.

**Import scenarios**

This option opens the **Import scenarios** dialog box that allows you to select the scenarios file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Editor plugin ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:
• Keep or replace the existing scenario.
• Keep both scenarios.

**Note:** When you keep both scenarios, Oxygen XML Editor plugin adds imported to the name of the imported scenario.

**Export selected scenarios**

Use this option to export selected scenarios individually. Oxygen XML Editor plugin creates a scenarios file that contains the scenarios that you export. This is useful if you want to share scenarios with others or export them to another computer.

**Bottom Section**

The bottom section of the dialog box contains the following actions and information:

**Association follows selection**

Select this checkbox to automatically associate selected transformation scenarios with the current document. This option can also be used for multiple selections.

**Note:** When this option is selected, the Association column is hidden.

**New**

This button allows you to create a new transformation scenario (page 1415).

**Edit**

This button opens the Edit Scenario dialog box that allows you to configure the options of the transformations scenario. For information about all the specific options in the various tabs, see the Transformation Types section (page 1499).

**Note:** If you try to edit a transformation scenario associated with a defined document type, Oxygen XML Editor plugin displays a warning message to inform you that this is not possible and gives you the option to create a duplicate transformation scenario (page 1500) to edit instead.

**Duplicate**

Use this button to create a duplicate transformation scenario (page 1500).

**Remove**

Use this button to remove transformation scenarios.

**Note:** Removing scenarios associated with a defined document type is not allowed.
**Associated scenarios section**

Displays the scenarios that are associated with the current document. Selecting a checkbox in the **Association column** (page 1503) in the list of scenarios will add that scenario to this section. To remove a scenario from being associated with the current document, simply click the remove icon (❌) to the right of the scenario name.

**Save and close**

Saves the current configuration and closes the dialog box.

**Apply associated**

Use this button to apply the associated scenarios and run the transformation on the current document.

**Cancel**

Cancels any changes made in the dialog box and reverts to the previously saved association.

Your selections in the **Configure Transformation Scenarios(s)** dialog box are persistent so the configured associations for the current document will be remembered after the dialog box is closed.

**Related Information:**

- Editing a Transformation Scenario (page 1498)
- Duplicating a Transformation Scenario (page 1500)
- Applying Associated Transformation Scenarios (page 1501)
- Creating New Transformation Scenarios (page 1415)
- Sharing Transformation Scenarios (page 1507)

**Batch Transformations**

A transformation action can be applied on a batch of selected files from the contextual menu of the **Navigator view** (page 255) without having to open the files involved in the transformation. You can apply the same scenario to a batch of files or multiple scenarios to a single file or batch of files.
1. Select the files you want to transform and from the contextual menu, select Transform > Configure Transformation Scenario(s) to choose one or more transformation scenarios to be applied on all the files in the logical folder.

2. Use Oxygen XML Editor plugin editor variables (page 201) to specify the input and output files. This ensures that each file from the selected set of resources is processed and that the output is not overwritten by the subsequent processing.
   a. Edit the transformation scenario to make sure the appropriate editor variable (page 201) is assigned for the input file. For example, for a DocBook PDF transformation, make sure the XML URL input box is set to the ${currentFileURL} editor variable (page 205). For a DITA PDF transformation, make sure the args.input parameter is set to the ${cf} editor variable (page 205).
   b. Edit the transformation scenario to make sure the appropriate editor variable is assigned for the output file. For example, for an XML transformation with XSLT, switch to the Output tab and set the path of the output file using a construct of editor variables (page 201), such as ${cfd}/${cfn}.html.

3. Now that logical folder has been associated with one or more transformation scenarios, whenever you want to apply the same batch transformation you can select Transform > Transform with from the contextual menu and the same previously associated scenario(s) will be applied.

4. If you want a different type of transformation to be applied to each file inside the logical folder, associate individual scenarios for each file and select Transform > Apply Transformation Scenario(s) from the contextual menu of the logical folder.

Related Information:

- Editor Variables (page 201)

Sharing Transformation Scenarios

The transformation scenarios and their settings can be shared with other users by exporting them to a specialized scenarios file (page 200) that can then be imported.

Transformation Scenarios View

You can manage the transformation scenarios by using the Transformation Scenarios view. To open this view, select Window > Show View > Transformation Scenarios.
Oxygen XML Editor plugin supports multiple scenarios association. To associate multiple scenarios with a document, select the checkboxes in front of each scenario. You can also associate multiple scenarios with a document from the Configure Transformation Scenario(s) dialog box (page 1502).

By default, Oxygen XML Editor plugin presents the items in the following order:

1. Scenarios that match the current framework (page 2706).
2. Scenarios that match the current project.
3. Scenarios that match other frameworks.

**Toolbar/Contextual Menu Actions and Options**

The following actions and options are available on the toolbar or in the contextual menu:

- **Apply selected scenarios**
  Select this option to run the current transformation scenario.

- **Debug selected scenario**
Select this option to switch to the **Debugger perspective (page 2709)** and initialize it with the parameters from the scenario (the XML, XSLT, or XQuery input, the transformation engine, the XSLT parameters).

- **New**

  This drop-down menu contains a list of the **scenarios that you can create (page 1415)**. Oxygen XML Editor plugin determines the most appropriate scenarios for the current type of file and displays them at the beginning of the list, followed by the rest of the scenarios.

- **Duplicate**

  Adds a new scenario to the list that is a duplicate of the current scenario. It is useful for creating a scenario that is similar to an existing one.

- **Edit**

  Opens the dialog box that allows you to configure various options in several tabs, depending on the type of transformation scenario that was selected. For information about all the specific options in the various tabs, see the **Transformation Types section (page 1499)**.

- **Remove**

  Removes the current scenario from the list. This action is also available by using the **Delete** key.

- **Import scenarios**

  This option opens the **Import scenarios** dialog box that allows you to select the **scenarios** file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Editor plugin ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

  - Keep or replace the existing scenario.
  - Keep both scenarios.

  **Note:** When you keep both scenarios, Oxygen XML Editor plugin adds **imported** to the name of the imported scenario.

- **Export selected scenarios**

  Use this option to export transformation and validation scenarios individually. Oxygen XML Editor plugin creates a **scenarios** file that contains the scenarios that you export.

- **Settings**
This drop-down menu allows you to configure the following options (many of these options are also available if you right-click the name of a column):

**Show all scenarios**
Select this option to display all the available scenarios, regardless of the document they are associated with.

**Show only the scenarios available for the editor**
Select this option to only display the scenarios that Oxygen XML Editor plugin can apply for the current document type.

**Show associated scenarios**
Select this option to only display the scenarios associated with the document you are editing.

**Import scenarios**
This option opens the Import scenarios dialog box that allows you to select the scenarios file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Editor plugin ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

- Keep or replace the existing scenario.
- Keep both scenarios.

**Note:** When you keep both scenarios, Oxygen XML Editor plugin adds imported to the name of the imported scenario.

**Export selected scenarios**
Use this option to export selected scenarios individually. Oxygen XML Editor plugin creates a scenarios file that contains the scenarios that you export. This is useful if you want to share scenarios with others or export them to another computer.

**Show Type**
Use this option to display the transformation type of each scenario.

**Show Storage**
Use this option to display the storage location of the scenarios.

**Group by Type**
Select this option to group the scenarios by their type.

**Group by Storage**

Select this option to group the scenarios by their storage location.

**Ungroup all**

Select this option to ungroup all the scenarios.

**Reset Layout**

Select this option to restore the default settings of the layout.

Your selections in the Transformation Scenarios view are persistent so the configured associations for the current document will be remembered whenever the document is opened.

### WebHelp Output Customization

**Oxygen XML WebHelp** provides the ability to generate two different types of output, **WebHelp Responsive** and **WebHelp Classic**. Both types include a feedback-enabled variant and each has its own set of options and features. The **WebHelp Responsive** variants are available for DITA documents while the **WebHelp Classic** variants are available for both DITA and DocBook.

WebHelp Classic Output

The **WebHelp Classic** variant is designed for desktop systems when feedback from users is not necessary and it is available for DocBook and DITA document types. The **WebHelp Classic with Feedback** variant also includes a feedback system that allows your users to make comments and allows you to manage and reply to them. This section contains information about configuring a WebHelp Classic system and customizing the output.

This type of WebHelp system can be generated by using one of the following transformation scenarios:

- **DITA Map WebHelp Classic** transformation scenario *(page 1393)*
- **DITA Map WebHelp Classic with Feedback** transformation scenario *(page 1394)*
- **DocBook WebHelp Classic** transformation scenario *(page 1409)*
- **DocBook WebHelp Classic with Feedback** transformation scenario *(page 1410)*

WebHelp Classic Output Layout and Features

**Layout of the WebHelp Classic System Interface**

The layout of the **WebHelp Classic** system is comprised of the following components:

**Left Pane or Frame**

This section on the left side of the help system includes the following tabs:

**Content**

A typical table of contents style presentation of your content. You can use the **Expand all**/**Collapse all** buttons to expand or collapse all the topics presented in the Table of Contents.
**Note:** You can enhance the appearance of items in the *Table of Contents*. See the *Customizing WebHelp Classic Output* chapter (page 1545) for more details.

**Index**

Presents the index terms for your content. If your content does not contain any `indexterm` elements, this tab is not generated.

**Search Results**

This tab is generated when the *Search* field is used. It presents the search results in the form of links to topics where the search terms are found, along with a rating scheme for each result. For more details, see the *Search Feature section* (page 1516).

**Upper Pane or Frame**

The upper section of the help system includes the following features:

**Search Field**

Use this feature to perform searches in your content. When you enter search terms in this field, the results are displayed in the *Search Results* tab in the left section of the help system, along with a rating scheme for each result. For more details, see the *Search Feature section* (page 1516).

**Frames Option**

Click on this option to display the output rendered in HTML frames.

**Print Option**

Opens a dialog box with various printing options and a print preview.

**Navigation Links**

You can navigate through the content of your output using the navigation links or arrows in the upper-right part of the page. These arrows allow you to move to the ↑ Parent topic, ← Previous topic, or ⇔ Next topic. Links to the parent topics of the currently opened topic are also presented at the top of the page. For DITA output, these navigation links are controlled by the `collection-type` attribute. For example, if you set `collection-type="sequence"` on a parent topic reference, navigation links will be generated in the output for that topic and all of its child topics.
Tip: To hide the Parent, Next, and Previous links, you can edit the transformation scenario and set the value of the `args.hide.parent.link` parameter to `yes`.

Main Pane or Frame

The content of the help pages are rendered and displayed in this main section.

Figure 556: WebHelp Classic Output

WebHelp Classic with Feedback Enabled

The WebHelp Classic with Feedback variant also contains a Comments section at the bottom of each topic. This section is where you can interact with users through a comment system. For information about deploying a feedback-enabled system, see Deploying a Feedback-Enabled System (page 1614).

Figure 557: WebHelp Classic with Feedback Comments Section
To add a new comment, click the Add New Comment button, or click Reply to add a comment to an existing thread. You can click on the Log in button on the right side of this bar to be authenticated as a user and your user name will be included in any comments that you add. If you do not have a user name, you can click on the Sign Up button to create a new user.

After you log in, your name and user name are displayed in the Comments bar, along with the Log off and Edit buttons. Click the Edit button to open the User Profile dialog box where you can customize the following options:

- **Your Name** - You can use this field to edit the initial name that you used to create your user profile.

- **Your email address** - You can use this field to edit the initial email address that you used to create your profile.

- You can choose to receive an email in the following situations:
  - When a comment is left on a page that you commented on.
  - When a comment is left on any topic in the WebHelp Classic system.
  - When a reply is left to one of my comments.

- **New Password** - Allows you to enter a new password for your user account.
Note: The Current Password field from the top of the User Profile is mandatory if you want to save the changes you make.

If you are an administrator, you can manage user information and comments. For more information, see Managing Users and Comments in a Feedback-Enabled System (page 1617).

WebHelp Classic Search Engine

Search Rules

Rules that are applied during a search include:

- You can use quotes to perform an exact search for multiple word phrases (for example, "grow flowers" will only return results if both words are found consecutively and exactly as they are typed in the search field). This type of search is known as a phrase search.
- Boolean Search is supported using the following operators: and, or, not. When there are two adjacent search terms without an operator, or is used as the default search operator (for example, grow flowers is the same as grow or flowers).
- The space character separates keywords (an expression such as grow flowers counts as two separate keywords: grow and flowers).
- indexterm and keywords DITA elements are an effective way to increase the ranking of a page (for example, content inside a keywords element weighs more than an H1 HTML element).
- Words composed by merging two or more words with colon (":"), minus ("-"), underline ("_"), or dot ("." ) characters count as a single word.
- Your search terms should contain two or more characters (note that stop words will be ignored). This rule does not apply to CJK (Chinese, Japanese, Korean) languages.

5-Star Rating Mechanism and Sorting

The Search feature is also enhanced with a rating mechanism that computes scores for every result that matches the search criteria. These scores are then translated into a 5-star rating scheme and the stars are displayed to the right of each result. The search results are sorted depending on the following:

- Search entries that satisfy the phrase search criterion are presented first.
- The number of keywords found in a single page (the higher the number, the better).
- The context (for example, a word found in a title, scores better than a word found in unformatted text). The search ranking order, sorted by relevance is as follows:
  - The search term is included in a meta keyword.
  - The search term is in the title of the page.
  - The search term is in bold text in a paragraph.
The search term is in normal text in a paragraph.

**Excluded Terms**

To improve performance, the Search feature excludes certain stop words. For example, the English version of the stop words includes: a, an, and, are, as, at, be, but, by, for, if, in, into, is, it, no, not, of, on, or, such, that, the, their, then, there, these, they, this, to, was, will, with.

**WebHelp Classic Search Results Tab**

When you enter search terms in the Search field at the top of the help system, the results are displayed in the Search Results tab in the left section. When you click on a result in the Search Results tab, that result is displayed in the main pane with the search terms highlighted. If you press Enter with the Search field empty, the highlights are removed.

*Figure 558: WebHelp Classic Search Results Tab*
Missing Terms

If you enter multiple search terms (other than stop words), for any result that the search engine found at least one term but not one or more of the other terms, the Missing terms will be listed below each result.

Tag Element Scoring Values

HTML tag elements are also assigned a scoring value and these values are evaluated for the search results. For information about editing these values, see How to Change Element Scoring in Search Results (page 1564).

Browser Compatibility

This output format is compatible with the most recent versions of the following common browsers:

- Edge
- Internet Explorer (IE 10 or newer)
- Chrome
- Firefox
- Safari
- Opera

⚠️ Important: Due to some security restrictions in certain browsers (Google Chrome and Internet Explorer), WebHelp Classic pages loaded from the local system (through URLs of the file:///... format) may not work properly. It is recommended that you load WebHelp Classic pages in Google Chrome or Internet Explorer only from a web server (with a URL such as http://your.server.com/webhelp/index.html or http://localhost/web_pages/index.html).

⚠️ Warning: Due to some restrictions in web browsers regarding JavaScript code, the frameless version (index.html start page) of the WebHelp Classic system should only be loaded from a web server (with a URL such as http://your.server.com/webhelp/index.html or http://localhost/web_pages/index.html). When loading WebHelp Classic pages from the local file system, the frameset version (index_frames.html start page) of the WebHelp Classic system should be used instead (file:///...).

Deploying a Feedback-Enabled System

System Requirements

The feedback-enabled WebHelp system requires a standard server deployment. You can request this from your server administrator and it requires the following system components:

- A Web server (such as Apache Web Server)
- A MySQL or MariaDB database server
- A database admin tool (such as phpMyAdmin)
- PHP Version 5.1.6 or later

The WebHelp system supports most of the recent versions of the following browsers: Chrome, Firefox, Edge, Internet Explorer, Safari, Opera.

**Create WebHelp with Feedback Database**

The WebHelp with Feedback system needs a database to store user details and the actual feedback, and a user added to it with all privileges. After this is created, you should have the following information:

- Database name
- Username
- Password

Exactly how you create the database and user depends on your web host and your particular needs.

**Example:**

The following procedure uses phpMyAdmin to create a MySQL database for the feedback system and a MySQL user with privileges for that database. The feedback system uses these credentials to connect to the database.

Using phpMyAdmin to create a database:

1. Access the phpMyAdmin instance running on your server.
2. Click Databases (in the right frame) and then create a database. You can give it any name you want (for example comments).
3. Create a user with connection privileges for this database.
4. Under localhost, in the right frame, click Privileges and then at the bottom of the page click the reload the privileges link.

**Deploying the WebHelp with Feedback Output**

If you have a web server configured with PHP and MySQL, you can deploy the WebHelp with Feedback output by following these steps:

1. Connect to your server using an FTP client.
2. Locate the home directory (from now on, referred to as DOCUMENT_ROOT) of your server.
3. Copy the transformation output folder into the DOCUMENT_ROOT folder.
4. Rename it to something relevant (for example, myProductWebHelp).
5. Open the output folder (for example, http://[YOUR_SERVER]/myProductWebHelp/). You are redirected to the installation wizard. Proceed with the installation as follows:
   a. Verify that the prerequisites are met.
   b. Press Start Installation.
   c. Configure the Deployment Settings section. Default values are provided, but you should adjust them as needed.

   **Tip:** You can change some of the options later. The installation creates a config.php file in [OXYGEN_WEBHELP_INSTALL_DIR]/feedback/resources/php/config/config.php where all your configuration options are stored.

d. Configure the MySQL Database Connection Settings section. Use the information (database name, username, password) from the Create WebHelp with Feedback Database section (page 1614) to fill-in the appropriate text boxes.

   **Warning:** Selecting the Create new database structure option will overwrite any existing data in the selected database, if it already exists. Therefore, it is useful the first time you install the WebHelp with Feedback system, but you do not want to select this option on subsequent deployments.

e. If you are using a domain (such as OpenLDAP or Active Directory) to manage users in your organization, select the Enable LDAP Authentication option. This will allow you to configure the LDAP server, which will provide information and credentials for users who will access the WebHelp system. Also, this will allow you to choose which of the domain users will have administrator privileges.

f. If the Create new database structure option is selected, the Create WebHelp Administrator Account section becomes available. Here you can set the administrator account data. The administrator is able to moderate new posts and manage WebHelp users.

The same database can be used to store comments for multiple WebHelp with Feedback deployments. If a topic is available in multiple deployments and there are comments associated with it, you can choose to display the comments in all deployments that share the database. To do this, select the Display comments from other products option. In the Display comments from section, a list with the deployments sharing the same database is displayed. Select the deployments allowed to share common feedback.

**Note:** You can restrict the displayed comments of a product depending on its version. If you have two products that use the same database and you restrict one of them to display comments starting from a certain version, the comments of the other product are also displayed from the specified version onwards.

g. Press Next Step.
h. Remove the installation folder from your web server.
Important: When you publish subsequent iterations of your WebHelp with Feedback system, you will not upload the /install folder in the output, as you only need it uploaded the first time you create the installation. On subsequent uploads, you will just upload the other output files.

i. In your Web browser, go to your WebHelp with Feedback system main page.

Testing Your WebHelp with Feedback System

To test your system, create a user and post a comment. Check to see if the notification emails are delivered to your email inbox.

Note: To read debug messages generated by the system:

1. Enable JavaScript logging by doing one of the following:
   - Open the log.js file, locate the var log= new Log(Level.NONE); line, and change the logging level to: Level.INFO, Level.DEBUG, Level.WARN, or Level.ERROR.
   - Append ?log=true to the WebHelp URL.
2. Inspect the PHP and Apache server log files.

Documentation Product ID and Version

When you run a WebHelp with Feedback transformation scenario, by default you are prompted for a documentation product ID and version number. This is needed when multiple WebHelp systems are deployed on the same server. Think of your WebHelp output as a product. If you have three different WebHelp outputs, you have three different products (each with their own unique documentation product ID). This identifier is included in a configuration file so that comments are tied to a particular output (product ID and version number).

Note: The WebHelp with Feedback installation includes a configuration option (Display comments from other products) that allows you to choose to have comments visible in other specified products.

Related Information:

- Managing Users and Comments in a Feedback-Enabled System (page 1617)
Refreshing the Content of a Feedback-Enabled System

It is common to update the content of an existing installation of a **WebHelp with Feedback** system on a regular basis. In this case, reinstalling the whole system is not a viable option since it might result in the loss of the comments associated with your topics. Also, reconfiguring the system every time you want to refresh it may be time consuming.

Fortunately, you can refresh just the content without losing the comments or the initial system configuration. To do so, follow these steps:

1. Execute the transformation scenario that produces the **WebHelp with Feedback** output directory.
2. Go to the output directory (specified in the **Output** tab of the transformation scenario), locate the `\feedback\resources\php\config\config.php` file, and delete it.
3. Locate the `\feedback\install` directory and delete it.
4. Copy the remaining structure of the output folder and paste it into your **WebHelp with Feedback** system installation directory, overwriting the existing content.

Managing Users and Comments in a Feedback-Enabled System

When you installed the **WebHelp with Feedback** system the first time (assuming the **Create new database structure** option ([page 1615](#)) was selected), you should have been prompted to create an administrator account (or a user named `administrator` was created by default). As an administrator, you have access to manage comments posted in your feedback-enabled WebHelp system. You can also manage the user information (such as role, status, or notification options).

To manage comments and user information, follow these steps:

1. At the bottom of each specific topic there is a **Comments** navigation bar and on the right side there is a **Log in** button. Click this button and log in with your administrator credentials. This gives you access to an **Admin Panel** button.
2. Click the **Admin Panel** button to display an administration page.

*Figure 559: Administrative Page*
3. Use this page to manage the following options:

**Delete Orphaned Comments**

Allows you to delete comments that are no longer associated with a topic in your WebHelp system.

**Delete Pending Users**

Allows you to delete user accounts that you do not wish to activate.

**View All Posts**

Allows you to view all the comments that are associated with topics in your WebHelp system.

**Export Comments**

Allows you to export all posts associated with topics in your WebHelp system into an XML file.

**Set Version**

Use this action to display comments starting with a particular version.

**Manage User Information**

To edit the details for a user, click on the corresponding row. This opens a window that allows you to customize the following information associated with the user:

**Name**

The full name of the user.

**Level**

Use this field to modify the privilege level (role) for the selected user. You can choose from the following:

- **User** - Regular user, able to post comments and receive e-mail notifications.
- **Moderator** - In addition to the regular User rights, this type of user has access to the Admin Panel where a moderator can view, delete, export comments, and set the version of the feedback-enabled WebHelp system.
- **Admin** - Full administrative privileges. Can manage WebHelp-specific settings, users, and their comments.

**Company**

The name of the organization associated with the user.

**E-Mail**
The contact email address for the user. This is also the address where the WebHelp system sends notifications.

**WebHelp Notification**

When selected, the user receives notifications when comments are posted anywhere in your feedback-enabled WebHelp system.

**Reply Notification**

When selected, the user receives notifications when comments are posted as a reply to one of their comments.

**Page Notification**

When selected, the user receives notifications when comments are posted on a topic where they previously posted a comment.

**Date**

The date the user registered is displayed.

**Status**

Use this drop-down list to change the status of the user. You can choose from the following:

- **Created** - The user is created but does not yet have any rights for the feedback-enabled WebHelp system.
- **Validated** - The user is able to use the feedback-enabled WebHelp system.
- **Suspended** - The user has no rights for the feedback-enabled WebHelp system.

**Warning:** The key used for identifying the page a comment is attached to is the relative file path to the output page. Since the output file and folder names mirror the source, any change to the file name (or its folder) in the source will affect the comments associated with that WebHelp page. If you change the file name or path, the comment history for that topic will become orphaned (a change to the topic ID does not affect the comment history).

**Context-Sensitive WebHelp Classic System**

Context-sensitive help systems assist users by providing specific informational topics for certain components of a user interface, such as a button or window. This mechanism works based on mappings between a unique ID defined in the topic and a corresponding HTML page.
Generating Context-Sensitive Help

When WebHelp Classic output is generated, the transformation process produces an XML mapping file called `context-help-map.xml` and copies it in the output folder of the transformation. This XML file maps an ID to a corresponding HTML page through an `appContext` element, as in the following example:

```xml
<map productID="oxy-webhelp" productVersion="1.1">
  <appContext helpID="myapp-functionid1" path="tasks/app-help1.html"/>
  <appContext helpID="myapp-functionid2" path="tasks/app-help1.html"/>
  . . .
</map>
```

The possible attributes are as follows:

**helpID**

A Unique ID provided by a topic from two possible sources (resourceid element or the id attribute that is set on the topic root element):

```
<resourceid
```

The `resourceid` element is mapped into the `appContext` element and can be specified in either the `topicref` within a DITA map or in a `prolog` within a DITA topic. The `resourceid` element accepts the following attributes:

- **appname** - A name for the external application that references the topic. If this attribute is not specified, its value is considered to be empty ("").
- **appid** - An ID used by an application to identify the topic.
- **id** - Specifies a value that is used by a specific application to identify the topic, but this attribute is ignored if an `appid` attribute is used. Also, starting with DITA 1.3, the `id` attribute was deprecated in favor of the `appid` attribute.

**Note:** Multiple `appid` values can be associated with a single `appname` value (and multiple `appname` values can be associated with a single `appid` value), but the values for both attributes work in combination to specify a specific ID for a specific application, and therefore each combination of values for the `appid` and `appname` attributes should be unique within the context of a single root map (page 2711). For example,
suppose that you need two different functions of an application to both open the same WebHelp page.

**Example: resourceid Specified in a DITA Map**

The `resourceid` element can be specified in a `topicmeta` element within a `topicref`.

```xml
<map title="App Help">
  <topicref href="app-help1.dita" type="task">
    <topicmeta>
      <resourceid appname="myapp" appid="functionid1"/>
      <resourceid appname="myapp" appid="functionid2"/>
    </topicmeta>
  </topicref>
</map>
```

**Example: resourceid Specified in a DITA Topic**

The `resourceid` element can be specified in a `prolog` element within a DITA topic.

```xml
<task id="app-help1">
  <title>My App Help</title>
  <prolog>
    <resourceid appname="myapp" appid="functionid1"/>
    <resourceid appname="myapp" appid="functionid2"/>
  </prolog>
  ...
</task>
```

For more information about the `resourceid` element, see DITA Specifications: `<resourceid>`.  

**id**

If a `resourceid` element is not declared in the DITA map or DITA topic (as described above), the `id` attribute that is set on the topic root element is mapped into the `appContext` element.

⚠️ **Important:** You should ensure that these defined IDs are unique in the context of the entire DITA project. If the IDs are not unique, the transformation scenario will display warning messages in the transformation console output and the help system will not work properly.
path

The path to a corresponding WebHelp page. This path is relative to the location of the context-help-map.xml mapping file.

productId (Applicable only if you are using the WebHelp Classic with Feedback transformation scenario)

The ID of the product for your documentation project.

productVersion (Applicable only if you are using the WebHelp Classic with Feedback transformation scenario)

The version of the product for your documentation project.

There are two ways of implementing context-sensitive help in your system:

• The XML mapping file can be loaded by a PHP script on the server side. The script receives the contextId value and will look it up in the XML file.

• Invoke one of the WebHelp system files index.html or index_frames.html and pass the contextId parameter with a specific value. The WebHelp system will automatically open the help page associated with the value of the contextId parameter.

Note: The contextId parameter is not case-sensitive.

The following example will open a frameless version of the WebHelp system showing the page associated with the ID dialog1ID:

index.html?contextId=dialog1ID

The following example will open a frameset version of the WebHelp system showing the page associated with the ID view1ID:

index_frames.html?contextId=view1ID

Tip: You can use an anchor (page 2703) in the contextId parameter to jump to a specific section in a document. For example, contextId=topicID#anchor.

Context-Sensitive Queries

You can use the URL field in your browser to search for topics in a context-sensitive WebHelp system with the assistance of the following parameters:

• contextId - The WebHelp JavaScript engine will look for this value in the context-help-map.xml mapping file and load the corresponding help page.
Note: You can use an anchor (page 2703) in the contextId parameter to jump to a specific section in a document. For example, contextId=topicID#anchor.

- appname - You can use this parameter in conjunction with contextId to search for this value in the corresponding appname attribute value (page 1525) in the mapping file.

http://localhost/webhelp/index.html?contextId=topicID&appname=myApplication

Generating WebHelp Classic Output for DITA

The publishing process can be initiated from a transformation scenario within Oxygen XML Editor/Author, from a command line outside Oxygen XML Editor/Author, or from an integration server.

Running from Oxygen XML Editor/Author

To publish DITA content to WebHelp Classic output from a transformation scenario inside Oxygen XML Editor/Author, use one of the following procedures, depending on whether or not you want a feedback section in your output.

WebHelp Classic Output

To publish a DITA map (page 2705) as a WebHelp Classic system, follow these steps:

1. Select the Configure Transformation Scenario(s) action from the DITA Maps Manager toolbar.
2. Select the DITA Map WebHelp Classic scenario from the DITA Map section.
3. If you want to configure the transformation, click the Edit button.

Step Result: This opens an Edit scenario configuration dialog box that allows you to configure various options in the following tabs:

- Templates Tab - This tab contains a set of built-in skins that you can use for the layout of your WebHelp system output.
- Parameters Tab - This tab includes numerous transformation parameters that can be set to customize your WebHelp system output.
- Filters Tab - This tab allows you to filter certain content elements from the generated output.
- Advanced Tab - This tab allows you to specify some advanced options for the transformation scenario.
- Output Tab - This tab allows you to configure options that are related to the location where the output is generated.
4. Click Apply associated to process the transformation.
When the DITA Map WebHelp Classic transformation is complete, the output is automatically opened in your default browser.

To further customize this transformation, you can edit various parameters, including the following most commonly used ones:

**WebHelp Classic with Feedback Output**

To publish a DITA map (page 2705) as a WebHelp Classic with Feedback system, follow these steps:

1. Select the Configure Transformation Scenario(s) action from the DITA Maps Manager toolbar.
2. Select the DITA Map WebHelp Classic with Feedback scenario from the DITA Map section.
3. If you want to configure the transformation, click the Edit button.

**Step Result:** This opens an Edit scenario configuration dialog box that allows you to configure various options in the following tabs:

- **Templates Tab** - This tab contains a set of built-in skins that you can use for the layout of your WebHelp system output.
- **Parameters Tab** - This tab includes numerous transformation parameters that can be set to customize your WebHelp system output.
- **Filters Tab** - This tab allows you to filter certain content elements from the generated output.
- **Advanced Tab** - This tab allows you to specify some advanced options for the transformation scenario.
- **Output Tab** - This tab allows you to configure options that are related to the location where the output is generated.

4. Click Apply associated to begin the transformation.
5. Enter the documentation product ID (value for the webhelp.product.id parameter) and the documentation version (value for the webhelp.product.version parameter).

When the DITA Map WebHelp Classic with Feedback transformation is complete, your default browser opens the installation.html file. This file contains information about the output location, system requirements, installation instructions, and deployment of the output. Follow the instructions to complete the system deployment (page 1614).

For more information about the feedback-enabled WebHelp system, watch our video demonstration:

https://www.youtube.com/embed/eoQ2uxHvppE
Running from Command Line

To publish to the WebHelp Classic output from a command line outside of Oxygen XML Editor/Author, you can use the dita startup script that comes bundled with DITA Open Toolkit distribution.

Required Arguments for the dita Command Startup Script:

```
DITA-OT-DIR (page 2706)\bin\[executable] -i [path_to_input.ditamap] -f [transformation_type]
```

**executable**

Windows - The dita.bat script located in: DITA-OT-DIR (page 2706)\bin\.

Linux/Mac OS X - The dita script file located in: DITA-OT-DIR (page 2706)/bin/.

**-i / -input**

Specifies the master file for your DITA documentation project. Typically this is a DITA map.

**-f / -format**

Specifies the transformation type. The Oxygen XML WebHelp Plugin contributes the following transformation types for DITA:

- **webhelp** - The transformation that produces WebHelp Classic output for desktop.
- **webhelp-feedback** - The transformation that produces feedback-enabled WebHelp Classic with Feedback for desktop.

Additional Options or Parameters:

You can also use DITA-OT options to modify the command behavior or additional configuration parameters that are contributed by the Oxygen XML WebHelp Plugin (page 1531).

```
DITA-OT-DIR (page 2706)\bin\[executable] -i [path_to_input.ditamap] -f [transformation_type] [option] -D[parameter=value]
```

**Command Line Examples:**

- **Windows**: dita.bat -i c:\mySample.ditamap -f webhelp-responsive -o c:\output -Dwebhelp.logo.image=C:\images\myLogo.jpg
- **Linux/Mac OS X**: dita -i /mySample.ditamap -f webhelp-responsive -o /output -Dwebhelp.logo.image=/images/myLogo.jpg
Additional WebHelp Parameters for DITA

You can append the following parameters to the command line that runs the transformation:

-Dwebhelp.copyright  (not available for WebHelp Responsive systems)

  Adds a small copyright text that appears at the end of the Table of Contents pane.

-Dwebhelp.custom.resources

  The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

-Dwebhelp.favicon

  The file path that points to an image to be used as a favicon in the WebHelp output.

-Dwebhelp.footer.file  (not available for WebHelp Responsive systems)

  Path to an XML file that includes the footer content for your WebHelp output pages. You can use this parameter to integrate social media features (such as widgets for Facebook™, Twitter™, Google Analytics, or Google+™). The file must be well-formed, each widget must be in separate div or span element, and the code for each script element is included in an XML comment (also, the start and end tags for the XML comment must be on a separate line). The following code exert is an example for adding a Facebook™ widget:

  <div id="facebook">
    <div id="fb-root"></div>
    <script>
      <!-- (function(d, s, id) { var js, fjs = d.getElementsByTagName(s)[0];
        if (d.getElementById(id)) return;
        js = d.createElement(s); js.id = id;
        js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
        fjs.parentNode.insertBefore(js, fjs); }
      (document, 'script', 'facebook-jssdk')); -->
    </script>
    <div data-share="true" data-show-faces="true" data-action="like"
    data-layout="standard" class="fb-like"/>
  </div>

-Dwebhelp.footer.include  (not available for WebHelp Responsive systems)

  Specifies whether or not to include footer in each WebHelp page. Possible values: yes, no. If set to no, no footer is added to the WebHelp pages. If set to yes and the webhelp.footer.file parameter has a value, then the content of that file is used
as footer. If the `webhelp.footer.file` has no value then a default Oxygen footer is inserted in each WebHelp page.

-D`webhelp.google.search.results`

A file path that specifies the location of a well-formed XHTML file containing the Google Custom Search Engine element `<gcse:searchresults-only>`. You can use all supported attributes for this element. It is recommended to set the `linkTarget` attribute to `frm` for frameless (iframe) version of WebHelp or to `contentWin` for the frameset version of WebHelp. The default value for this attribute is `_blank` and the search results will be loaded in a new window. If this parameter is not specified, the following code will be used:

`<gcse:searchresults-only linkTarget="frm"></gcse:searchresults-only>`

-D`webhelp.google.search.script`

A file path that specifies the location of a well-formed XHTML file containing the Custom Search Engine script from Google.

-D`webhelp.logo.image.target.url`

Specifies a target URL that is set on the logo image. When you click the logo image, you will be redirected to this address.

-D`webhelp.logo.image`

Specifies a path to an image displayed as a logo in the left side of the output header.

-D`webhelp.product.id` *(available only for Feedback-enabled systems)*

This parameter specifies a short name for the documentation target, or product (for example, `mobile-phone-user-guide`, `hvac-installation-guide`).

- **Note:** You can deploy documentation for multiple products on the same server.

- **Restriction:** The following characters are not allowed in the value of this parameter:

  `< > \ ' { } \ = ; * % + & .`

-D`webhelp.product.version` *(available only for Feedback-enabled systems)*

Specifies the documentation version number (for example, 1.0, 2.5, etc.). New user comments are bound to this version.

- **Note:** Multiple documentation versions can be deployed on the same server.

- **Restriction:** The following characters are not allowed in the value of this parameter:

  `< > \ ' { } \ = ; * % + & .`

-D`webhelp.search.japanese.dictionary`
The file path of the dictionary that will be used by the Kuromoji morphological engine for indexing Japanese content in the WebHelp pages. The encoding for the dictionary must be UTF8.

-Dwebhelp.search.ranking

If this parameter is set to false then the 5-star rating mechanism is no longer included in the search results that are displayed on the Search tab (default setting is true).

-Dwebhelp.show.changes.and.comments

When set to yes, user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is no.

-Dwebhelp.sitemap.base.url

Base URL for all the loc elements in the generated sitemap.xml file. The value of a loc element is computed as the relative file path from the href attribute of a topicref element from the DITA map, appended to this base URL value. The loc element is mandatory in sitemap.xml. If you leave this parameter set to its default empty value, then the sitemap.xml file is not generated.

-Dwebhelp.sitemap.change.frequency

The value of the changefreq element in the generated sitemap.xml file. The changefreq element is optional in sitemap.xml. If you leave this parameter set to its default empty value, then the changefreq element is not added in sitemap.xml. Allowed values: <empty string> (default), always, hourly, daily, weekly, monthly, yearly, never.

-Dwebhelp.sitemap.priority

The value of the priority element in the generated sitemap.xml file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The priority element is optional in sitemap.xml. If you leave this parameter set to its default empty value, then the priority element is not added in sitemap.xml.

-Dwebhelp.css (available only for WebHelp Classic and WebHelp Classic with Feedback systems)

Path to a CSS file that sets the style theme in the WebHelp Classic output. It can be one of the built-in skin CSS from the DITA-OT-DIR/plugins/com.oxygenxml.webhelp.classic/predefined-skins directory, or it can be a custom skin CSS generated with the Oxygen Skin Builder web application.

Parameters Specific to WebHelp Responsive Output (available only for WebHelp Responsive and WebHelp Responsive with Feedback systems)

-Dwebhelp.default.collection.type.sequence
Specifies if the `sequence` value will be used by default when the `collection-type` attribute is not specified. This option is helpful if you want to have *Next* and *Previous* navigational buttons generated for all HTML pages. Allowed values are `no` (default) and `yes`.

`-Dwebhelp.enable.search.autocomplete`

Specifies if the *Autocomplete* feature is enabled in the WebHelp search text field. The default value is `yes`.

`-Dwebhelp.fragment.after.body`

In the generated output it displays a given XHTML fragment after the page body. The value of the parameter can be either a *well-formed* XHTML fragment or a path to a file that contains a *well-formed* XHTML fragment.

`-Dwebhelp.fragment.after.logo_and_title`

In the generated output it displays a given XHTML fragment after the logo and title. The value of the parameter can be either a *well-formed* XHTML fragment or a path to a file that contains a *well-formed* XHTML fragment.

`-Dwebhelp.fragment.after.main.page.search`

In the generated output it displays a given XHTML fragment after the search field. The value of the parameter can be either a *well-formed* XHTML fragment or a path to a file that contains a *well-formed* XHTML fragment.

`-Dwebhelp.fragment.after.toc_or_tiles`

In the generated output it displays a given XHTML fragment after the table of contents or tiles in the main page. The value of the parameter can be either a *well-formed* XHTML fragment or a path to a file that contains a *well-formed* XHTML fragment.

`-Dwebhelp.fragment.after.top_menu`

In the generated output it displays a given XHTML fragment after the top menu. The value of the parameter can be either a *well-formed* XHTML fragment or a path to a file that contains a *well-formed* XHTML fragment.

`-Dwebhelp.fragment.before.body`

In the generated output it displays a given XHTML fragment before the page body. The value of the parameter can be either a *well-formed* XHTML fragment or a path to a file that contains a *well-formed* XHTML fragment.

`-Dwebhelp.fragment.before.logo_and_title`

In the generated output it displays a given XHTML fragment before the logo and title. The value of the parameter can be either a *well-formed* XHTML fragment or a path to a file that contains a *well-formed* XHTML fragment.
-Dwebhelp.fragment.before.main.page.search

In the generated output it displays a given XHTML fragment before the search field. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

-Dwebhelp.fragment.before.toc_or_tiles

In the generated output it displays a given XHTML fragment before the table of contents or tiles in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

-Dwebhelp.fragment.before.top_menu

In the generated output it displays a given XHTML fragment before the top menu. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

-Dwebhelp.fragment.footer

In the generated output it displays a given XHTML fragment as the page footer. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

-Dwebhelp.fragment.head

In the generated output it inserts a given XHTML fragment in the <head> element. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

-Dwebhelp.fragment.welcome

In the generated output it displays a given XHTML fragment as a welcome message (or title). The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

-Dwebhelp.merge.nested.topics.related.links

Specifies if the related links from nested topics will be merged with the links in the parent topic. Thus the links will be moved from the topic content to the related links component and all of the links from the same group (for example, Related Tasks, Related References, Related Information) are merged into a single group. The default value is yes.

-Dwebhelp.search.enable.pagination

Specifies whether or not search results will be displayed on multiple pages. Allowed values are yes or no.

-Dwebhelp.search.page.numberOfItems
Specifies the number of search results items displayed on each page. This parameter is only used when the webhelp.search.enable.pagination parameter is enabled.

-Dwebhelp.search.stop.words.exclude

Specifies a list of words that will be excluded from the default list of stop words that are filtered out before the search processing. Use comma separators to specify more than one word (for example: if,for,is).

-Dwebhelp.show.breadcrumb

Specifies if the breadcrumb component will be presented in the output. The default value is yes.

-Dwebhelp.show.child.links

Specifies if child links will be generated in the output for all topics that have subtopics. The default value is no.

-Dwebhelp.show.indexterms.link

Specifies if an icon that links to the index will be presented in the output. The default value is yes.

-Dwebhelp.show.main.page.tiles

Specifies if the tiles component will be presented in the main page of the output. For a tree style layout, this parameter should be set to no.

-Dwebhelp.show.main.page.toc

Specifies if the table of contents will be presented in the main page of the output. The default value is yes.

-Dwebhelp.show.navigation.links

Specifies if navigation links will be presented in the output. The default value is yes.

-Dwebhelp.show.print.link

Specifies if a print link or icon will be presented within each topic in the output. The default value is yes.

-Dwebhelp.show.publication.toc

Specifies if a table of contents will be presented on the left side of each topic in the output. The default value is yes.

-Dwebhelp.show.topic.toc

Specifies if a topic table of contents will be presented on the right side of each topic in the output. This table of contents contains links to each <section> within the current topic that contains an @id attribute and the section corresponding to the current scroll position is highlighted. The default value is yes.
--webhelp.show.top.menu

Specifies if a menu will be presented at the topic of the main page in the output. The default value is yes.

--webhelp.publication.toc.hide.chunked.topics

Specifies if the table of contents will contain links for chunked topics. The default value is yes.

--webhelp.publication.toc.links

Specifies which links will be included in the table of contents. The possible values are:

- **chapter** (default) - The TOC will include links for the current topic, its children, its siblings, and its direct ancestor (including the direct ancestor's siblings), and the parent chapter.
- **topic** - The TOC will only include links for the current topic and its direct children.
- **all** - The TOC will include all links.

--webhelp.publication.toc.tooltip.position

By default, if a topic contains a shortdesc element, its content is displayed in a tooltip when the user hovers over its link in the table of contents. This parameter controls whether or not this tooltip is displayed and its position relative to the link. The possible values are:

- **left** (default)
- **right**
- **top**
- **bottom**
- **hidden** - The tooltip will not be displayed.

--webhelp.top.menu.depth

Specifies the maximum depth level of the topics that will be included in the top menu. The default value is 3. A value of 0 means that the menu has unlimited depth.

--webhelp.topic.collapsible.elements.initial.state

Specifies the initial state of collapsible elements (tables with titles, nested topics with titles, sections with titles, index term groups). The possible values are collapsed or expanded (default value).

**Note:** Note that the `fix.external.refs.com.oxygenxml` parameter is not supported. This parameter is normally used to specify whether or not the application tries to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references.
Further Customization

If you need to further customize the transformation process, you can append other DITA-OT parameters as well. Any parameter that you want to append must follow the \-D model of the above parameters. For example, to append the `args.csspath` parameter, use:

`-Dargs.csspath=[CSS_FILE_PATH]`

where `[CSS_FILE_PATH]` is the location of the directory that contains the CSS file.

Related Information:

- Setting DITA-OT Parameters

Running from an Integration Server

Oxygen XML Editor plugin can be processed from an automatic publishing system, such as Jenkins or Travis.

Automating DITA to WebHelp Output with Jenkins

To integrate WebHelp output with the Jenkins continuous integration tool, follow these steps:

1. Create a Maven project to incorporate the DITA-OT that already integrates Oxygen XML Editor plugin.
2. Go to the root of your Maven project and edit the `pom.xml` file to include the following fragment:

```xml
<properties>
  <oxygen-webhelp>${basedir}/tools/plugins/com.oxygenxml.webhelp.responsive</oxygen-webhelp>
</properties>

<plugin>
  <artifactId>exec-maven-plugin</artifactId>
  <groupId>org.codehaus.mojo</groupId>
  <executions>
    <execution>
      <!-- Run our version calculation script -->
      <id>Version Calculation</id>
      <phase>generate-sources</phase>
      <goals>
        <goal>exec</goal>
      </goals>
    </execution>
  </executions>
</plugin>
```
3. Go to the Jenkins top page and create a new Jenkins job. Configure this job to suit your particular requirements, such as the build frequency and location of the Maven project.

Automating DITA to WebHelp Output with Travis CI

This topic assumes you have a DITA project hosted on a GitHub public or private repository.

The goal of this tutorial is to help you set up a Travis continuous integration job that automatically publishes your DITA project to GitHub pages after every commit. The published website will contain a feedback link on each page that would allow a contributor to easily suggest changes to the documentation by creating a pull request on GitHub with just a few clicks.

Enable the Travis CI Build

1. Sign in to Travis CI with your GitHub account, accepting the GitHub access permissions confirmation.
2. Once you are signed in, and you have synchronized your GitHub repositories, go to your profile page and enable Travis CI for the repository you want to build.

Configure the Travis CI Build in your GitHub Project

1. Checkout your GitHub project locally.
2. Copy the .travis folder from here to the root directory of your project.
3. In the root of your GitHub project, add a file called .travis.yml with the following content:

```yaml
language: dita
install:
  - echo "Installed"
script:
  - sh .travis/publish.sh
after_success:
  - sh .travis/deploy.sh
env:
```
global:
   - DITAMAP=/path/to/your/ditamap/file
   - DITAVAL=/path/to/your/ditaval/file
   - ANT_OPTS=-Xmx1024M

**Note:** Replace `/path/to/your/ditamap/file` and `/path/to/your/ditaval/file` with the appropriate paths to your DITA map and ditaval files.

4. Create a GitHub personal access token by following this procedure.
5. Define an environment variable in the repository settings that has the name `GH_TOKEN` and the value equal with the GitHub personal access token created earlier.

### Register Your License Key

1. Edit your `.gitignore` file (or create it if it does not already exist) and add the following line:

   ```plaintext
   licenseKey.txt
   ```

2. Copy your WebHelp license to the root of your GitHub project in a file called `licenseKey.txt`.

   **Important:** The `licenseKey.txt` file should not be committed to GitHub as it contains a license key that is issued only to you.

3. Encrypt the `license key file` and add it to the `.travis.yml` configuration file. This way only the Travis CI server will be able to decrypt it during the build process.

### Commit to GitHub

1. Commit the following files and folders and push the commit to GitHub:

   ```plaintext
   git add .gitignore licenseKey.txt.enc .travis.yml .travis/
   git commit -m "Set up the Travis CI publishing system"
   git push
   ```

2. Create a `gh-pages` branch in your GitHub project where the WebHelp output will be published. You can follow the procedure here.

### Generating WebHelp Classic Output for DocBook

The publishing process can be initiated from a transformation scenario within Oxygen XML Editor/Author or from a command line outside Oxygen XML Editor/Author.
Running from Oxygen XML Editor/Author

To publish DocBook content to WebHelp Classic output from a transformation scenario inside Oxygen XML Editor/Author, use one of the following procedures, depending on whether or not you want a feedback section in your output.

WebHelp Classic Output

To publish a DocBook document as a WebHelp Classic system, follow these steps:

1. Click the Configure Transformation Scenario(s) action from the toolbar.
2. Select the DocBook WebHelp Classic scenario from the DocBook 4 or DocBook 5 section.
3. Click Apply associated.

When the DocBook WebHelp Classic transformation is complete, the output is automatically opened in your default browser.

WebHelp Classic with Feedback Output

To publish a DocBook document as a WebHelp Classic with Feedback system, follow these steps:

1. Click Configure Transformation Scenarios.
2. Select the DocBook WebHelp Classic with Feedback scenario from the DocBook 4 or DocBook 5 section.
3. Click Apply associated.
4. Enter the documentation product ID and the documentation version.

When the DocBook WebHelp Classic with Feedback transformation is complete, your default browser opens the installation.html file. This file contains information about the output location, system requirements, installation instructions, and deployment of the output. Follow the instructions to complete the system deployment. For more information, see Deploying a Feedback-Enabled System (page 1614).

For more information about the feedback-enabled WebHelp system, watch our video demonstration:

https://www.youtube.com/embed/eoQ2uxHvppE
Running from Command Line

**PREREQUISITES:** Before you begin, the WebHelp DocBook distribution must be integrated into a DocBook XSL installation.

To run a DocBook to WebHelp transformation outside of Oxygen XML Editor/Author, use the following script file:

- **Windows** - [DocBook XSL directory]\com.oxygenxml.webhelp.classic\docbook.bat
- **Linux/Mac OS X** - [DocBook XSL directory]/com.oxygenxml.webhelp.classic/docbook.sh

Before running the script to generate output, you must customize it to specify various paths and transformation type. To do this, open the script file and edit the following variables:

- **JVM_INSTALL_DIR** - Specifies the path to the Java Virtual Machine installation directory on your disk.
- **ANT_INSTALL_DIR** - Specifies the path to the installation directory of Ant.
- **SAXON_6_DIR** - Specifies the path to the installation directory of Saxon 6.5.5.
- **SAXON_9_DIR** - Specifies the path to the installation directory of Saxon 9.1.0.8.
- **DOCBOOK_XSL_DIR** - Specifies the path to the installation directory of the DocBook XSL distribution.
- **TRANSTYPE** - Specifies the type of the transformation you want to apply. The Oxygen XML WebHelp Plugin contributes the following transformation types for DocBook:
  - **webhelp** - The transformation that produces WebHelp Classic output for desktop.
  - **webhelp-feedback** - The transformation that produces feedback-enabled WebHelp Classic with Feedback for desktop.
- **INPUT_DIR** - Specifies the path to the input directory, containing the input XML file.
- **XML_INPUT_FILE** - Specifies the name of the input XML file.
- **OUTPUT_DIR** - Specifies the path to the output directory where the transformation output is generated.
- **DOCBOOK_XSL_DIR_URL** - Specifies the path to the directory of the DocBook XSL distribution in URL format.

You can also add additional configuration parameters that are contributed by the Oxygen XML WebHelp Plugin (page 1542).

Additional WebHelp Parameters for DocBook

You can use various parameters in the command line to customize the transformation. Some of the most commonly used parameters include:
-Ddefault.language

This parameter is used if the language is not detected in the DITA map. The default value is en-us.

-Dclean.output

Deletes all files from the output folder before the transformation is performed (only no and yes values are valid and the default value is no).

-Dl10n.gentext.default.language

This parameter is used to identify the correct stemmer that differs from language to language. For example, for English the value of this parameter is en or for French it is fr, and so on.

-Duse.stemming

Controls whether or not you want to include stemming search algorithms into the published output (default setting is false).

-Dwebhelp.copyright

Adds a small copyright text that appears at the end of the Table of Contents pane.

-Dwebhelp.custom.resources

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

-Dwebhelp.favicon

The file path that points to an image to be used as a favicon in the WebHelp output.

-Dwebhelp.footer.file

Path to an XML file that includes the footer content for your WebHelp output pages. You can use this parameter to integrate social media features (such as widgets for Facebook™, Twitter™, Google Analytics, or Google+™). The file must be well-formed, each widget must be in separate div or span element, and the code for each script element is included in an XML comment (also, the start and end tags for the XML comment must be on a separate line). The following code exert is an example for adding a Facebook™ widget:

```xml
<div id="facebook">
  <div id="fb-root"/>
  <script>
    <!-- (function(d, s, id) { var js, fjs = d.getElementsByTagName(s)[0];
      if (d.getElementById(id)) return;
      js = d.createElement(s); js.id = id;
      js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
```
-Dwebhelp.footer.include

Specifies whether or not to include footer in each WebHelp page. Possible values:
  yes, no. If set to no, no footer is added to the WebHelp pages. If set to yes and the webhelp.footer.file parameter has a value, then the content of that file is used as footer. If the webhelp.footer.file has no value then a default Oxygen footer is inserted in each WebHelp page.

-Dwebhelp.logo.image.target.url

Specifies a target URL that is set on the logo image. When you click the logo image, you will be redirected to this address.

-Dwebhelp.logo.image

Specifies a path to an image displayed as a logo in the left side of the output header.

-Dwebhelp.product.id (available only for Feedback-enabled systems)

This parameter specifies a short name for the documentation target, or product (for example, mobile-phone-user-guide, hvac-installation-guide).

Note: You can deploy documentation for multiple products on the same server.

Restriction: The following characters are not allowed in the value of this parameter:
  < > \ ' ( ) { } = ; * % + & .

-Dwebhelp.product.version (available only for Feedback-enabled systems)

Specifies the documentation version number (for example, 1.0, 2.5, etc.). New user comments are bound to this version.

Note: Multiple documentation versions can be deployed on the same server.

Restriction: The following characters are not allowed in the value of this parameter:
  < > \ ' ( ) { } = ; * % + & .

-Dwebhelp.search.ranking

If this parameter is set to false then the 5-star rating mechanism is no longer included in the search results that are displayed on the Search tab (default setting is true).
Path to a CSS file that sets the style theme in the WebHelp Classic output. It can be one of the built-in skin CSS from the `OXYGEN_INSTALL_DIR\frameworks\docbook\xsl\com.oxygenxml.webhelp.classic\predefined-skins` directory, or it can be a custom skin CSS generated with the Oxygen Skin Builder web application.

If you need to further customize your transformation, other DocBook XSL parameters can be appended. Any parameter that you want to append must follow the `-D` model of the above parameters. For example, you can append the `html.stylesheet` parameter in the following form:

```
-Dhtml.stylesheet=/path/to/directory/of/stylesheet.css
```

Customizing WebHelp Classic Output

Oxygen XML WebHelp provides support for customizing the WebHelp Classic output to suit your specific needs. The WebHelp Classic type of output is designed for desktop systems and features a familiar tri-pane layout. You can use this system to publish DITA and DocBook document types. The WebHelp Classic with Feedback variant allows your users to add comments to your output.

To change the overall appearance of the WebHelp Classic output, you can use the visual WebHelp Skin Builder tool (page 1545), which does not require knowledge of CSS language. If you are familiar with CSS and coding, you can style your WebHelp output through your own custom stylesheets. You can also customize your output by modifying option and parameters in the transformation scenario.

This section includes topics that explain various ways to customize your WebHelp system output, such as how to improve the appearance of the Table of Contents, add logo images in the title area, integrate with social media, add custom headers and footers, and much more.

Changing the Layout and Styles

This section contains some topics that explain how to customize the layout and style of your WebHelp Classic output using custom CSS, inserting custom HTML content, and more.

WebHelp Skin Builder

The WebHelp Skin Builder is a simple, easy-to-use tool, specially designed to assist users to visually customize the look and feel of the WebHelp output. It is implemented as an online tool hosted on the Oxygen XML website and allows you to experiment with various styles and colors over a documentation sample.

To be able to use the Skin Builder, you need:

- An Internet connection and unrestricted access to Oxygen XML website.
- A late version web browser.

To start the **Skin Builder**, do one of the following:

- For DocBook or DITA WebHelp systems, use a web browser to go to [https://www.oxygenxml.com/webhelp-skin-builder](https://www.oxygenxml.com/webhelp-skin-builder).
- For DITA WebHelp systems, you can click the **Online preview** link in the **Skins tab** *(page 2606)* of a DITA OT transformation scenario. In the upper section of the preview, click the **Select Skin** button, then choose **Customize Skin**.

**Skin Builder Layout**

The left side panel of the **Skin Builder** is divided into 3 sections:

- **Actions** - Contains the following two buttons:
  - **Import** - Opens an **Import CSS** dialog box that allows you to load a CSS stylesheet and apply it over the documentation sample.
  - **Export** - Saves all properties as a CSS file.
- **Settings** - Includes a **Highlight selection** option that helps you identify the areas affected by a particular element customization.
  - When hovering an item in the customizable elements menu, the affected sample area is highlighted with a dotted blue border.
  - When an item in the customizable elements menu is selected, the affected sample area is highlighted with a solid red border.
- **Customize** - Provides a series of customizable elements organized under four main categories:
  - **Header**
  - **TOC Area**
  - **Vertical Splitter**
  - **Content**

For each customizable element, you can alter properties such as background color or font face. Any alteration made in the customizable elements menu is applied in real time over the sample area.

**Creating a Customization Skin**

1. You can start with one of the built-in skins or a CSS stylesheet applied over the sample using the **Import** button.
2. Use the elements in the **Customize** section to set properties that modify the look of the skin. By default, all customizable elements display a single property, but you can make more visible by clicking the **+ Add** button and choosing from the available properties.
Note: If you want to revert a particular property to its initial value, press the Reset button.

3. When you are happy with the skin customizations you have made, press the Export button. All settings will be saved in a CSS file.

**Applying a Custom Skin to a DITA Map to WebHelp Classic Transformation Scenario**

1. Start Oxygen XML Editor plugin.
2. Load the DITA map (page 2705) you want to produce as a WebHelp output.
3. Edit a DITA Map to WebHelp transformation scenario. Set the previously exported CSS file in the Custom section of the Skins tab.
4. Run the transformation to obtain the WebHelp output.

**Apply a Customization Skin to a DocBook to WebHelp Classic Transformation Scenario**

1. Start Oxygen XML Editor plugin.
2. Load the DocBook file you want to produce as a WebHelp output.
3. In the Parameters tab, set the webhelp.skin.css parameter to point to the previously exported CSS.
4. To customize the logo, use the following parameters: webhelp.logo.image and webhelp.logo.image.target.url.
5. Run the transformation to obtain the WebHelp output.

For more information about using the WebHelp Skin Builder, watch our video demonstration:

https://www.youtube.com/embed/32PGX-PQx0

**Related Information:**

- Skins Tab (DITA OT Transformations) (page 2606)

**How to Use CSS Styling to Customize WebHelp Output**

The most common way to customize the look and style of your WebHelp output is to use custom CSS styling. This method can be used to make small, simple styling changes or more advanced, precise changes. To implement the styling in your WebHelp output, you simply need to create the custom CSS
file and reference it in your transformation scenario or script. This custom file will be the final CSS to be applied so its content will override the styles in the other pre-existing CSS files.

**Using the CSS Inspector to Identify Content for Custom CSS File**

You can use your browser's CSS inspector to identify the pertinent code in the current CSS files and you can even make changes directly in the CSS inspector to test the results so that you know exactly what content to use in your custom CSS file.

In most popular browsers (such as Chrome, Firefox, and Edge), you can access the CSS inspector by using **F12** or by selecting **Inspect Element** (or simply **Inspect**) from the contextual menu.

**Tip:** When using Safari on Mac OS X, you must first enable the Develop menu by going to the Advanced settings and selecting **Show Develop menu in menu bar**. Then you can select **Show Web Inspector** from the Develop menu or click **Command + Option + I**.

**Referencing the Custom CSS Using Oxygen XML Editor/Author**

To use a custom CSS to style WebHelp output and use a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Create your custom CSS file.
2. Edit the WebHelp transformation scenario and open the **Parameters** tab.
   - For a DITA transformation, set the **args.css** parameter to the path of your custom CSS file. Also, set the **args.copycss** parameter to **yes** to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
   - For a DocBook transformation, set the **html.stylesheet** parameter to the path of your custom CSS file.
3. Run the WebHelp transformation scenario to generate the output.

**Referencing the Custom CSS Using a Script Outside of Oxygen XML Editor/Author**

**Important:** Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin ([https://www.oxygenxml.com/buy_webhelp.html](https://www.oxygenxml.com/buy_webhelp.html)).
- The Oxygen XML WebHelp Plugin must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To use a custom CSS to style WebHelp output and use a script outside of Oxygen XML Editor/Author, follow this procedure:
1. Create your custom CSS file.

2. Reference your custom CSS file:
   - For DITA transformations, use the `args.css` parameter in your transformation script and set its value to the path of your custom CSS file. Also, set the `args.copycss` parameter to `yes` to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
   - For DocBook transformations, use the `html.stylesheet` parameter in your transformation script and set its value to the path of your custom CSS file.

3. Execute the transformation script.

For example, a DITA script might look like this:

   - **Windows:**
     
     ```
     dita.bat -i c:\mySample.ditamap -f webhelp -Dargs.css=c:\myFile.css -Dargs.copycss=yes
     ```
   
   - **Mac OS X/ Linux:**
     
     ```
     dita -i /mySample.ditamap -f webhelp -Dargs.css=/myFile.css -Dargs.copycss=yes
     ```

How to Add Custom HTML Content in WebHelp Classic Output

You can add custom HTML content in the WebHelp Classic output by inserting it in a well-formed XML file that will be referenced in the transformation. This content may include references to additional JavaScript, CSS, and other types of resources, or such resources can be inserted inline within the HTML content that is inserted in the XML file.

Using Oxygen XML Editor/Author

To include custom HTML content in the WebHelp Classic output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Insert the HTML content in a well-formed XML file considering the following notes:
   - **Well-Formedness** - If the file is not a Well-formed XML document (page 854) (or fragments are not well-formed), the transformation will fail.

   A common use case is if you want to include several `script` or `link` elements. In this case, the XML fragment has multiple root elements and to make it well-formed, you can wrap it in an `html` element. This element tag will be filtered out and only its children will be copied to
the output documents. Similarly, you can wrap your content in head, body, html/head, or html/body elements.

- **Referencing Resources in the XML File** - You can include references to local resources (such as JavaScript or CSS files) by using the built-in `${oxygen-webhelp-output-dir}` macro to specify their paths relative to the output directory:

```html
<html>
  <script type="text/javascript" src="${oxygen-webhelp-output-dir}/js/test.js"></script>
  <link rel="stylesheet" type="text/css" href="${oxygen-webhelp-output-dir}/css/test.css" />
</html>
```

To copy the referenced resources to the output directory, follow the procedure in: How to Copy Additional Resources to Output Directory (page 1562).

- **Inline JavaScript or CSS Content**:  

  **JavaScript**:

  ```javascript
  /* Include JavaScript code here. */

  function myFunction() {
    return true;
  }
  </script>
  
  **CSS**:

  ```css
  /* Include CSS style rules here. */

  *{
    color:red
  }
  </css>
  
  **Note**: If you have special characters (for example, &, <) that break the well-formedness of the XML fragment, it is important to place this content inside an XML comment:

  ```javascript
  <script type="text/javascript">
    <!--
    /* Include JavaScript code here. */
  ```
function myFunction() {
    return true;
}
</script>

2. Edit the WebHelp Classic transformation scenario.
3. Go to the Parameters tab.
4. Edit the value of the webhelp.head.script parameter and set it to reference the URL of the XML file created in step 1. Your additional content will be included at the end of the head element of your output document.

   Note: If you want to include the content in the body element, use the webhelp.body.script parameter instead.

5. Click OK to save the changes and run the transformation scenario.

Using a Script Outside of Oxygen XML Editor/Author

⚠️ Important: Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin (https://www.oxygenxml.com/buy_webhelp.html).
- The Oxygen XML WebHelp Plugin must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To include custom HTML content in the WebHelp Classic output using a script outside of Oxygen XML Editor/Author (page 1528), follow this procedure:

1. Insert the HTML content in a well-formed XML file considering the following notes:
   - Well-Formedness - If the file is not a Well-formed XML document (page 854) (or fragments are not well-formed), the transformation will fail.

A common use case is if you want to include several script or link elements. In this case, the XML fragment has multiple root elements and to make it well-formed, you can wrap it in an html element. This element tag will be filtered out and only its children will be copied to the output documents. Similarly, you can wrap your content in head, body, html/head, or html/body elements.
• **Referencing Resources in the XML File** - You can include references to local resources (such as JavaScript or CSS files) by using the built-in `{{oxygen-webhelp-output-dir}}` macro to specify their paths relative to the output directory:

```html
<html>
    <script type="text/javascript" src="{{oxygen-webhelp-output-dir}}/js/test.js"></script>
    <link rel="stylesheet" type="text/css" href="{{oxygen-webhelp-output-dir}}/css/test.css"/>
</html>
```

To copy the referenced resources to the output directory, follow the procedure in: How to Copy Additional Resources to Output Directory (page 1562).

• **Inline JavaScript or CSS Content**:

**JavaScript**:

```html
<script type="text/javascript">
    /* Include JavaScript code here. */

    function myFunction() {
        return true;
    }
</script>
```

**CSS**:

```html
<style>
    /* Include CSS style rules here. */

    *{
        color:red
    }
</style>
```

**Note**: If you have special characters (for example, `&`, `<`) that break the well-formedness of the XML fragment, it is important to place this content inside an XML comment:

```html
<script type="text/javascript">
<!--
    /* Include JavaScript code here. */

    function myFunction() {
```
```java
return true;
}
-->
</script>
```

2. Use the `webhelp.head.script` parameter in your transformation script and set its value to reference the URL of the XML file created in step 1. Your additional content will be included at the end of the `head` element of your output document.

**Note:** If you want to include the content in the `body` element, use the `webhelp.body.script` parameter instead.

3. Execute the transformation script.

For example, a DITA script might look like this:

- **Windows:**
  ```
  dita.bat -i c:\mySample.ditamap -f webhelp -Dwebhelp.head.script=c:\myFile.xml
  ```

- **Mac OS X/ Linux:**
  ```
  dita -i /mySample.ditamap -f webhelp -Dwebhelp.head.script=/myFile.xml
  ```

**Related Information:**

- [How to Copy Additional Resources to Output Directory](page 1562)

**How to Change Number Styles for Ordered Lists**

Ordered lists (`ol`) are usually numbered in XHTML output using numerals. If you want to change the numbering to alphabetical, follow these steps:

1. Define a custom `outputclass` value and set it as an attribute of the ordered list, as in the following example:

```html
<ol outputclass="number-alpha">
  <li>A</li>
  <li>B</li>
  <li>C</li>
</ol>
```
2. Add the following code snippet in a custom CSS file:

```css
dojo.dList 
  list-style-type:lower-alpha;
}
```

3. Edit the WebHelp transformation scenario and open the Parameters tab.
   a. For a DITA transformation, set the `args.css` parameter to the path of your custom CSS file. Also, set the `args.copycss` parameter to `yes` to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
   b. For a DocBook transformation, set the `html.stylesheet` parameter to the path of your custom CSS file.
4. Run the transformation scenario.

How to Change the Icons in a WebHelp Classic Table of Contents

You can change the icons that appear in a WebHelp Classic table of contents by assigning new image files in a custom CSS file. By default, these icons are defined with the following CSS codes (the first example is the icon that appears for a collapsed menu and the second for an expanded menu):

```css
.hasSubMenuClosed{
  background: url('../img/book_closed16.png') no-repeat;
  padding-left: 16px;
  cursor: pointer;
}

.hasSubMenuOpened{
  background: url('../img/book_opened16.png') no-repeat;
  padding-left: 16px;
  cursor: pointer;
}
```

Using Oxygen XML Editor/Author

To assign other icons and use a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Create a custom CSS file that assigns your desired icons to the `.hasSubMenuClosed` and `.hasSubMenuOpened` properties.

```css
.hasSubMenuClosed{
  background: url('TOC-my-closed-button.png') no-repeat;
}
```
2. It is recommended that you store the image files in the same directory as the default icons.
   - For DITA transformations: `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\img\`
   - For DocBook transformations: `[OXYGEN_INSTALL_DIR]\frameworks\docbook\xsl\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\img\`

3. Edit the WebHelp transformation scenario and open the Parameters tab.
   - For a DITA transformation, set the `args.css` parameter to the path of your custom CSS file. Also, set the `args.copycss` parameter to `yes` to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
   - For a DocBook transformation, set the `html.stylesheet` parameter to the path of your custom CSS file.

4. Run the WebHelp transformation scenario to generate the output.

## Using a Script Outside of Oxygen XML Editor/Author

⚠️ **Important:** Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin (https://www.oxygenxml.com/buy_webhelp.html).
- The Oxygen XML WebHelp Plugin must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To assign other icons and use a script outside of Oxygen XML Editor/Author (page 1528), follow this procedure:

1. Create a custom CSS file that assigns your desired icons to the `.hasSubMenuClosed` and `.hasSubMenuOpened` properties.

```css
.hasSubMenuClosed{
    background: url('TOC-my-closed-button.png') no-repeat;
}

.hasSubMenuOpened{
    background: url('TOC-my-opened-button.png') no-repeat;
}
```
2. It is recommended that you store the image files in the same directory as the default icons.
   - For DITA transformations: $DITA-OT-DIR$/plugins/com.oxygenxml.webhelp.classic/oxygen-webhelp/resources/img/

3. Reference your custom CSS file:
   - For DITA transformations, use the $args.css$ parameter in your transformation script and set its value to the path of your custom CSS file. Also, set the $args.copycss$ parameter to $yes$ to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
   - For DocBook transformations, use the $html.stylesheet$ parameter in your transformation script and set its value to the path of your custom CSS file.

4. Execute the transformation script.

For example, a DITA script might look like this:

- **Windows:**
  ```
  dita.bat -i c:\mySample.ditamap -f webhelp -Dargs.css=c:\myFile.css -Dargs.copycss=yes
  ```

- **Mac OS X/ Linux:**
  ```
  dita -i /mySample.ditamap -f webhelp -Dargs.css=/myFile.css -Dargs.copycss=yes
  ```

**How to Customize the Appearance of Selected Items in the Table of Contents**

The appearance of selected items in the table of contents of WebHelp Classic output can be enhanced.

For example, to highlight the background of the selected item, follow these steps:

1. Locate the toc.css file in the following directory:
2. Edit that CSS file, find the $menuItemSelected$ class, and change the value of the $background$ property.
3. Run the transformation.
Note: You can also overwrite the same value from your own custom CSS and then specify the path to your CSS in the transformation scenario by doing one of the following:

- For DITA transformations, use the `args.css` parameter and set its value to the path of your custom CSS file. Also, set the `args.copycss` parameter to `yes` to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
- For DocBook transformations, use the `html.stylesheet` parameter and set its value to the path of your custom CSS file.

### How to Generate or Hide Navigation Links in WebHelp Classic Output

The WebHelp Classic output can contain navigation links (Previous/Next/Parent topic arrows) that can be used to navigate to the previous, next, or parent topic.

#### How to Generate Navigation Links in WebHelp Classic Output

The navigation links are controlled by the `collection-type` attribute. For example, if you set `collection-type="sequence"` on a parent topic reference in your DITA map, navigation links will be generated in the output for all of its child topics (from children to parent, and from child to previous sibling and next sibling).

```xml
<map id="example_map" title="Example Map">
<topicref href="/topics/ParentTopic.dita" collection-type="sequence">
<topicref href="/topics/Childtopic.dita"/>
</topicref>
</map>
```

#### How to Hide All Navigation Links in WebHelp Classic Output

To hide all navigation links, use the `args.hide.parent.link` parameter in the transformation and set its value to `no`.

### Adding Graphics and Media Resources

This section contains topics that explain how to add media resources to the published WebHelp Class output or to the output directory.

#### How to Add a Favicon in WebHelp Systems
You can add a custom favicon to your WebHelp output by simply using a parameter in the transformation scenario to point to your favicon image. This is available for DITA and DocBook WebHelp output using WebHelp Classic or WebHelp Classic with Feedback transformations.

Using Oxygen XML Editor/Author

To add a favicon to your WebHelp output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Edit the WebHelp transformation scenario and open the Parameters tab.
2. Locate the webhelp.favicon parameter and enter the file path that points to the image that will be use as the favicon.
3. Run the transformation scenario.

   **Result:** Browsers that provide favicon support will display the favicon (typically in the browser's address bar, in the list of bookmarks, and in the history).

Using a Script Outside of Oxygen XML Editor/Author

⚠️ **Important:** Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin (https://www.oxygenxml.com/buy_webhelp.html).
- The Oxygen XML WebHelp Plugin must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To add a favicon to your WebHelp output using a script outside of Oxygen XML Editor/Author, follow this procedure:

1. Specify the file path that points to the image that will be use as the favicon using the webhelp.favicon parameter.
2. Execute the transformation script.

   **Result:** Browsers that provide favicon support will display the favicon (typically in the browser's address bar, in the list of bookmarks, and in the history).

For example:

- **Windows:**
How to Add a Logo Image in the Title Area

You can customize WebHelp Classic output to include a logo in the title area. It will be displayed before the publication title. You can also specify a URL that can be used to send users to a specific website when they click the logo image.

This customization can be done using a transformation scenario from within Oxygen XML Editor/Author or using a command-line script outside of Oxygen XML Editor/Author.

Using Oxygen XML Editor/Author

To add a logo in the title area of your WebHelp output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Edit a WebHelp Classic transformation scenario, then open the Parameters tab.
2. Specify the path to your logo in the webhelp.logo.image parameter.
3. If you also want to add a link to your website when you click the logo image, set the URL in the webhelp.logo.image.target.url parameter.
4. Run the transformation scenario.

Using a Script Outside of Oxygen XML Editor/Author

⚠️ Important: Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin (https://www.oxygenxml.com/buy_webhelp.html).
- The Oxygen XML WebHelp Plugin must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To add a logo in the title area of your WebHelp output using a script outside of Oxygen XML Editor/Author, follow this procedure:

1. Specify the path to your logo using the webhelp.logo.image parameter.
2. If you also want to add a link to your website when you click the logo image, set the URL using the webhelp.logo.image.target.url parameter.
3. Execute the transformation script.

For example:

- **Windows**:

  ```
  dita.bat -f webhelp -Dwebhelp.logo.image=c:\myLogo.jpg -
  Dwebhelp.logo.image.target.url=http://sample-site.com
  ```

- **Mac OS X/ Linux**:

  ```
  dita -f webhelp -Dwebhelp.logo.image=/myLogo.jpg -
  Dwebhelp.logo.image.target.url=http://sample-site.com
  ```

---

**How to Add Video and Audio Objects in DITA WebHelp Classic**

You can insert references to video and audio media resources (such as videos, audio clips, or embedded HTML frames) in your DITA topics and then publish them to WebHelp output. The media objects can be played directly in all HTML5-based outputs, including WebHelp systems.

To add media objects in the WebHelp output generated from DITA documents, follow the procedures below.

**Adding Videos to DITA WebHelp Output**

1. Edit the DITA topic and insert a reference to the video through one of the following methods:
   - Use the **Insert Media Object** toolbar action (page 2475).
   - Drag (or copy) the video file from your system explorer or the **Navigator** view (page 250) and drop (or paste) it into your document.
   - Manually add an **object** element, as in one of the following examples:

     ```
     <object outputclass="video" type="video/mp4" data="MyVideo.mp4"/>
     ```

     or, instead of the **data** attribute, you can specify the video using a parameter like this:

     ```
     <object outputclass="video">
     <param name="src" value="videos/MyVideo.mp4"/>
     </object>
     ```

2. Apply a **DITA to WebHelp** transformation to obtain the output.

**Result:** The transformation converts the **object** element to an HTML5 **video** element.

```
<video controls="controls"><source type="video/mp4" src="MyVideo.mp4"></source>
```
Adding Audio Clips to DITA WebHelp Output

1. Edit the DITA topic and insert a reference to the audio clip through one of the following methods:
   • Use the Insert Media Object toolbar action (page 2475).
   • Drag (or copy) the audio file from your system explorer or the Navigator view (page 250) and drop (or paste) it into your document.
   • Manually add an object element, as in one of the following examples:

   ```xml
   <object outputclass="audio" type="audio/mpeg" data="MyClip.mp3"/>
   ```
   or, instead of the data attribute, you can specify the video using a parameter like this:

   ```xml
   <object outputclass="audio">
     <param name="src" value="audio/MyClip.mp3"/>
   </object>
   ```

2. Apply a DITA to WebHelp transformation to obtain the output.

   Result: The transformation converts the object element to an HTML5 audio element.

   ```html
   <audio controls="controls"> <source type="audio/mpeg" src="MyClip.mp3"></source> </audio>
   ```

Adding Embedded HTML Frames (such as YouTube videos) to DITA WebHelp Output

1. Edit the DITA topic and insert a reference to the embedded object by using the Insert Media Object toolbar action (page 2475) or by manually adding an object element, as in one of the following examples:

   ```xml
   <object outputclass="iframe" data="https://www.youtube.com/embed/m_vv2s5Trn4"/>
   ```
   or, instead of the data attribute, you can specify the object using a parameter like this:

   ```xml
   <object outputclass="iframe">
     <param name="src" value="http://www.youtube.com/embed/m_vv2s5Trn4"/>
   </object>
   ```

2. If you want the video to be allowed to play in full screen mode once the document is converted to XHTML output, also add an allowfullscreen parameter and set its value to true:

   ```xml
   <object outputclass="iframe" data="https://www.youtube.com/embed/m_vv2s5Trn4" allowfullscreen/>
   ```
Tip: If you copy the embed code from the source and paste it into the Insert Media dialog box (see the specific instructions: here (page 2477)), the allowfullscreen parameter will automatically be added and all you have to do is set the value to true.

3. Apply a DITA to WebHelp transformation to obtain the output.

Result: The transformation converts the object element to an HTML5 iframe element.

For more information, see the following video demonstration:

https://www.youtube.com/embed/llX11gS4WaU

Related Information:

• Adding Video, Audio, and Embedded HTML Resources in DITA Topics (page 2475)

How to Add Videos in DocBook WebHelp Classic Output

You can insert references to videos in your DocBook topics and then publish them to WebHelp Classic output. The videos can be played directly in all HTML5-based outputs, including WebHelp systems.

To add videos in the WebHelp Classic output generated from DocBook documents, follow these steps:

1. Edit the DocBook document and reference the video using an mediaobject element, as in the following example:

   <mediaobject>
     <videoobject>
       <videodata fileref="http://www.youtube.com/watch?v/VideoName"/>
     </videoobject>
   </mediaobject>

2. Apply a WebHelp or WebHelp with Feedback transformation scenario to obtain the output.

How to Copy Additional Resources to Output Directory
You can copy additional resources (such as JavaScript, CSS or other resources) to the output directory of a WebHelp system by using the `webhelp.custom.resources` parameter.

### Using Oxygen XML Editor/Author

To copy additional resources to the output directory using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Place all your resources in the same directory.
2. Edit the WebHelp transformation scenario, then open the **Parameters** tab.
3. Edit the value for the `webhelp.custom.resources` parameter and set it to the absolute path of the directory in step 1.
4. Click **OK** to save the changes to the transformation scenario.
5. Run the transformation scenario.

**Result:** All files from the new directory will be copied to the root of the WebHelp output directory.

### Using a Script Outside of Oxygen XML Editor/Author

⚠️ **Important:** Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:

- You must have a valid license for the [Oxygen XML WebHelp Plugin](https://www.oxygenxml.com/buy_webhelp.html).
- The [Oxygen XML WebHelp Plugin](https://www.oxygenxml.com/buy_webhelp.html) must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To copy additional resources to the output directory using a script outside of **Oxygen XML Editor/Author** (page 1528), follow this procedure:

1. Place all your resources in the same directory.
2. Specify the absolute path to that directory using the `webhelp.custom.resources` parameter.
3. Execute the transformation script.

**Result:** All files from the new directory will be copied to the root of the WebHelp output directory.

For example:

- **Windows:**
How to Publish MathML Formulas when Generating WebHelp from a Command Line

The DITA-OT distribution that comes bundled with Oxygen includes some additional pre-installed DITA-OT plugins that add support for properly displaying MathML formulas in the WebHelp output. However, if you are generating your WebHelp output from a command line, MathML formulas will not be displayed properly unless you install these plugins manually.

These plugins can be downloaded and installed from DITA 1.3 Support for Open Toolkit (https://github.com/dita-community/dita13-dita-ot-1.x-support). This plugin package adds DITA 1.3 support, including MathML.

How to Add Support for MathML when Generating WebHelp from a Command Line

1. Download and unzip the DITA 1.3 Support for Open Toolkit 1.x distribution package. It includes 4 DITA-OT plugins.
2. Copy the four plugin directories to your DITA-OT-DIR/plugins directory.
3. In the home directory of your DITA-OT installation, run the ant -f integrator.xml command.

Searching the Output

This section contains topics that explain how to customize some of the search features in WebHelp Classic output.

How to Change Element Scoring in Search Results

The WebHelp Search feature is enhanced with a rating mechanism that computes scores for every page that matches the search criteria. HTML tag elements are assigned a scoring value and these values are evaluated for the search results. The WebHelp directory includes a properties file that defines the scoring values for tag elements and this file can be edited to customize the values according to your needs.

To edit the scoring values of HTML tag element for enhancing WebHelp search results, follow these steps:
1. Edit the scoring properties file for DITA or DocBook WebHelp systems. The properties file includes instructions and examples to help you with your customization.
   a. For DITA WebHelp Classic systems, edit the following file: `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.classic\indexer\scoring.properties`.
   b. For DocBook WebHelp system, edit the following file: `[DocBook XSL directory]\com.oxygenxml.webhelp.classic\indexer\scoring.properties`.

   The values that can be edited in the `scoring.properties` file:

   - `h1 = 10`
   - `h2 = 9`
   - `h3 = 8`
   - `h4 = 7`
   - `h5 = 6`
   - `h6 = 5`
   - `b = 5`
   - `strong = 5`
   - `em = 3`
   - `i = 3`
   - `u = 3`
   - `div.toc = -10`
   - `title = 20`
   - `div.ignore = ignored`
   - `meta_keywords = 20`
   - `meta_indexterms = 20`
   - `meta_description = 25`
   - `shortdesc = 25`

2. Save your changes to the file.

3. Re-run your WebHelp transformation.

How to Exclude Certain DITA Topics from Search Results

There are several ways to exclude certain DITA resources from your WebHelp system's search results. This is useful if you have topics in your `DITA map (page 2705)` structure that you do not want to be included in search results for your WebHelp system. The first method involves setting a parameter in the WebHelp transformation scenario and the second involves setting an attribute for each DITA topic reference that you want to exclude.
**Transformation Parameter Method**

To exclude DITA topics from WebHelp search results using a transformation parameter, follow these steps:

1. Create a simple text file that will contain your excluded file patterns. Each pattern must be on a new line. The patterns are considered to be relative to the output directory and they accept wildcards such as ‘*’ (matches zero or more characters) or ‘?’ (matches one character). For more information about the patterns, see [https://ant.apache.org/manual/dirtasks.html#patterns](https://ant.apache.org/manual/dirtasks.html#patterns).

   Example: Suppose that in your project, you want to exclude all files located in the `resources` directory and all files located in the `topics` directory that have a `.bak` file extension. You could create a simple text file (for example, named `exclude.properties`), and add the following lines:

   ```
   resources/*
   topics/*/bak
   ```

2. Edit the WebHelp transformation scenario and open the Parameters tab.
3. Set the `webhelp.search.custom.excludes.file` parameter to specify the path to the file that contains the excluded file patterns (for example, `exclude.properties` in step 1).
4. Run the transformation scenario.

**Search Attribute Method**

The WebHelp Search engine does not index DITA topics that have the `@search` attribute set to `no`.

To exclude DITA topics from WebHelp search results using this attribute, follow these steps:

1. Edit the DITA map and for any `topicref` that you want to exclude from search results, set the `search` attribute to `no`.
   
   For example:

   ```
   <topicref href="/topics/internal-topic1.dita" search="no"/>
   ```

2. Save your changes to the DITA map.
3. Run your WebHelp system transformation scenario.

**How to Optimize Search Results in WebHelp Classic**

A DITA Map WebHelp transformation scenario can be configured to produce a `sitemap.xml` file that is used by search engines to aid crawling and indexing mechanisms. A `sitemap` lists all pages of a WebHelp system and allows webmasters to provide additional information about each page, such
as the date it was last updated, change frequency, and importance of each page in relation to other
pages in your WebHelp deployment.

The structure of the sitemap.xml file looks like this:

```xml
<urlset xmlns="http://www.sitemaps.org/schemas/sitemap/0.9">
  <url>
    <loc>http://www.example.com/topics/introduction.html</loc>
    <lastmod>2014-10-24</lastmod>
    <changefreq>weekly</changefreq>
    <priority>0.5</priority>
  </url>
  <url>
    <loc>http://www.example.com/topics/care.html#care</loc>
    <lastmod>2014-10-24</lastmod>
    <changefreq>weekly</changefreq>
    <priority>0.5</priority>
  </url>
  ...
</urlset>
```

Each page has a <url> element structure containing additional information, such as:

- **loc** - the URL of the page. This URL must begin with the protocol (such as http), if required by
  your web server. It is constructed from the value of the webhelp.sitemap.base.url parameter
  from the transformation scenario and the relative path to the page (collected from the href
  attribute of a topicref element in the DITA map).

  **Note:** The value must have fewer than 2,048 characters.

- **lastmod** (optional) - the date when the page was last modified. The date format is YYYY-MM-DD.

- **changefreq** (optional) - indicates how frequently the page is likely to change. This value provides
  general information to assist search engines, but may not correlate exactly to how often they
  crawl the page. Valid values are: always, hourly, daily, weekly, monthly, yearly, and never. The first time the sitemap.xml file is generated, the value is set based upon the value
  of the webhelp.sitemap.change.frequency parameter in the DITA WebHelp transformation
  scenario. You can change the value in each url element by editing the sitemap.xml file.

  **Note:** The value always should be used to describe documents that change each time they
  are accessed. The value never should be used to describe archived URLs.

- **priority** (optional) - the priority of this page relative to other pages on your site. Valid values range
  from 0.0 to 1.0. This value does not affect how your pages are compared to pages on other sites.
It only lets the search engines know which pages you deem most important for the crawlers. The first time the `sitemap.xml` file is generated, the value is set based upon the value of the `webhelp.sitemap.priority` parameter in the DITA WebHelp transformation scenario. You can change the value in each `url` element by editing the `sitemap.xml` file.

**Creating and Editing the `sitemap.xml` File**

Follow these steps to produce a `sitemap.xml` file for your WebHelp system, which can then be edited to fine-tune search engine optimization:

1. **Edit** the transformation scenario you currently use for obtaining your WebHelp output. This opens the **Edit DITA Scenario** dialog box.
2. Open the **Parameters** tab and set a value for the following parameters:
   - `webhelp.sitemap.base.url` - the URL of the location where your WebHelp system is deployed
     
     **Note:** This parameter is required for Oxygen XML Editor plugin to generate the `sitemap.xml` file.
   - `webhelp.sitemap.change.frequency` - how frequently the WebHelp pages are likely to change (accepted values are: `always`, `hourly`, `daily`, `weekly`, `monthly`, `yearly`, and `never`)
   - `webhelp.sitemap.priority` - the priority of each page (value ranging from 0.0 to 1.0)
3. Run the transformation scenario.
4. Look for the `sitemap.xml` file in the transformation's output folder. Edit the file to fine-tune the parameters of each page, according to your needs.

**How to Index Japanese Content in WebHelp Classic**

To optimize the indexing of Japanese content in WebHelp pages, the Lucene Kuromoji Japanese analyzer can be used. This analyzer is included in the **Oxygen XML Editor/Author** installation kit.

**Using Oxygen XML Editor/Author**

To activate the Japanese indexing in your WebHelp output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Set the language for your content to Japanese (depending on your framework):
   - **DITA:** Edit a **DITA to WebHelp** transformation scenario and in the **Parameters** tab, set the value of the `default.language` parameter to `ja-jp`.
     
     **Note:** Alternatively, you could set the `xml:lang` attribute on the root of the **DITA map (page 2705)** and the referenced topics to `ja-jp`. Another alternative for DITA output is to use the `webhelp.search.japanese.dictionary` parameter to specify a path to a Japanese
dictionary that will be used by the Kuromoji morphological engine (note that the encoding for the dictionary must be UTF8).

- **DocBook**: Edit a DocBook to WebHelp transformation scenario and in the Parameters tab, set the value of the l10n.gentext.default.language parameter to ja.

2. Run the WebHelp transformation scenario to generate the output.

### Using a Script Outside of Oxygen XML Editor/Author

**Important**: Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin (https://www.oxygenxml.com/buy_webhelp.html).
- The Oxygen XML WebHelp Plugin must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To activate the Japanese indexing in your WebHelp output using a script outside of Oxygen XML Editor/Author, follow this procedure:

1. Set the language for your content to Japanese (depending on your framework):
   - **DITA**: Use the args.default.language parameter in your transformation script and set its value to ja-jp.
     
     ![Note:](Note: Alternatively, you could set the xml:lang attribute on the root of the DITA map (page 2705) and the referenced topics to ja-jp. Another alternative for DITA output is to use the webhelp.search.japanese.dictionary parameter to specify a path to a Japanese dictionary that will be used by the Kuromoji morphological engine (note that the encoding for the dictionary must be UTF8).
   - **DocBook**: Use the l10n.gentext.default.language parameter in your transformation script and set its value to ja.

2. Execute the transformation script.

For example, a DITA script might look like this:

**Windows**:

```
dita.bat -i c:\mySample.ditamap -f webhelp -Dargs.default.language=ja-jp
```

**Mac OS X/ Linux**:

```
dita -i /mySample.ditamap -f webhelp -Dargs.default.language=ja-jp
```
Localization in WebHelp Classic Output

This section contains topics that explain the localization support for DITA or DocBook WebHelp Classic transformations.

How to Localize Email Notifications of WebHelp Classic with Feedback Output

The feedback-enabled WebHelp systems use emails to notify users when comments are posted. These emails are based on templates stored in the WebHelp directory. The default messages are in English, French, German, and Japanese. These messages are copied into the WebHelp system deployment directory during the execution of the corresponding transformation scenario.

Using Oxygen XML Editor/Author

To change the language of the emails for WebHelp Classic with Feedback output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Create the following directory, depending on your framework:
   - **DITA**: `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\php\templates\[Language code]` (where the `Language code` is the 2-digit code, such as `nl` for Dutch)
   - **DocBook**: `[DocBook XSL directory]\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\php\templates\[Language code]` (where the `Language code` is the 2-digit code, such as `nl` for Dutch)

2. Copy all English template files from the following directory (depending on your framework) and paste them into the directory you just created.
   - **DITA**: `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\php\templates\en`
   - **DocBook**: `[DocBook XSL directory]\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\php\templates\en`

3. Edit the HTML files from the following directory (depending on your framework) and translate the content into your language.
4. Edit a WebHelp Classic with Feedback transformation scenario and open the Parameters tab.
5. In the Parameters tab, look for the default.language parameter and set its value to the appropriate language code (for example, nl for Dutch).

Note: If you set the parameter to a value such as LanguageCode-CountryCode (for example, en-us), the transformation scenario will only use the language code.

6. Run the transformation scenario.

Using a Script Outside of Oxygen XML Editor/Author

Important: Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

• You must have a valid license for the Oxygen XML WebHelp Plugin (https://www.oxygenxml.com/buy_webhelp.html).
• The Oxygen XML WebHelp Plugin must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To change the language of the emails for WebHelp Classic with Feedback output using a script outside of Oxygen XML Editor/Author (page 1528), follow this procedure:

1. Create the following directory, depending on your framework:
   • DITA: DITA-OT-DIR\plugins\com.oxygenxml.webhelp.classic\oxygen-webhelp \resources\php\templates\[Language code] (where the Language code is the 2-digit code, such as nl for Dutch)
   • DocBook: [DocBook XSL directory]\com.oxygenxml.webhelp.classic \oxygen-webhelp\resources\php\templates\[Language code] (where the Language code is the 2-digit code, such as nl for Dutch)

2. Copy all English template files from the following directory (depending on your framework) and paste them into the directory you just created.
   • DITA: DITA-OT-DIR\plugins\com.oxygenxml.webhelp.classic\oxygen-webhelp \resources\php\templates\en
   • DocBook: [DocBook XSL directory]\com.oxygenxml.webhelp.classic \oxygen-webhelp\resources\php\templates\en
3. Edit the HTML files from the following directory (depending on your framework) and translate the content into your language.

- **DITA:** `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\php\templates\[Language code]\` (where the *Language code* is the 2-digit code, such as `nl` for Dutch)

- **DocBook:** `[DocBook XSL directory]\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\php\templates\[Language code]\` (where the *Language code* is the 2-digit code, such as `nl` for Dutch)

4. Use the `args.default.language` parameter in your transformation script and set its value to the appropriate language code (for example, `nl` for Dutch).

   **Note:** If you set the parameter to a value such as `LanguageCode-CountryCode` (for example, `en-us`), the transformation scenario will only use the language code.

5. Execute the transformation script.

For example, a DITA to WebHelp Classic with Feedback script might look like this:

- **Windows:**

  ```
dita.bat -i c:\mySample.ditamap -f webhelp-feedback -Dargs.default.language=nl
  ```

- **Mac OS X/ Linux:**

  ```
dita -i /mySample.ditamap -f webhelp-feedback -Dargs.default.language=nl
  ```

**How to Localize the Interface of DITA Map to WebHelp Classic Output**

Static labels used in the WebHelp output are stored in translation files that have the `strings-lang1-lang2.xml` name format, where `lang1` and `lang2` are ISO language codes. For example, the US English labels are kept in the `strings-en-us.xml` file.

These translation files are collected from two locations:

- **DITA-OT-DIR/xsl/common folder** - DITA-OT’s default translations (generated text for note, fig, and table elements).

- **DITA-OT-DIR/plugins/com.oxygenxml.webhelp.classic/oxygen-webhelp/resources/localization folder** - These translations are contributed by the WebHelp plugin and extend the default ones provided by DITA-OT. The labels defined in this folder take precedence over the DITA-OT defaults.

There are two major reasons you may want to use modify the translation files: to modify the existing strings or to translate to a new language.
Modifying the Existing Strings

To modify the generated text for WebHelp transformations, you need to create a DITA-OT extension plugin that uses the `dita.xsl.messages` extension point. The following procedure is for changing English labels, but you can adapt it for any language:

1. Create a `com.oxygenxml.webhelp.localization` plugin directory inside the `DITA-OT-DIR/plugins/` location.
2. Create a `plugin.xml` file inside that `com.oxygenxml.webhelp.localization` directory with the following content:
   ```xml
   <plugin id="com.oxygenxml.webhelp.localization">
     <require plugin="com.oxygenxml.webhelp.classic"/>
     <require plugin="com.oxygenxml.webhelp.responsive"/>
     <feature extension="dita.xsl.strings" file="webhelp-extension-strings.xml"/>
   </plugin>
   ``
3. Create a `webhelp-extension-strings.xml` file with the following content:
   ```xml
   <langlist>
     <lang xml:lang="en" filename="strings-en-us.xml"/>
     <lang xml:lang="en-us" filename="strings-en-us.xml"/>
   </langlist>
   ``
4. Copy the strings you want to change from the translation files (page 1572) to the `strings-en-us.xml` file. Make sure you leave the name attribute unchanged because this is the key used to look up the string. A sample content might be:
   ```xml
   <strings xml:lang="en-US">
     <str name="Figure">Fig</str>
     <str name="Draft comment">ADDRESS THIS DRAFT COMMENT</str>
   </strings>
   ``
5. Use the Run DITA-OT Integrator transformation scenario (page 1407) found in the DITA Map section in the Configure Transformation Scenario(s) dialog box (page 1502).

Adding a New Language

To add a new language for WebHelp transformations, you need to create a DITA-OT extension plugin that uses the `dita.xsl.messages` extension point. The following sample procedure is for adding translation files for the Polish language, but you can adapt it for any language:
1. Create a `com.oxygenxml.webhelp.localization` plugin directory inside the `DITA-OT-DIR/plugins` location.

2. Create a `plugin.xml` file inside that `com.oxygenxml.webhelp.localization` directory with the following content:

```xml
<plugin id="com.oxygenxml.webhelp.localization">
    <require plugin="com.oxygenxml.webhelp.classic"/>
    <require plugin="com.oxygenxml.webhelp.responsive"/>
    <feature extension="dita.xsl.strings" file="webhelp-extension-strings.xml"/>
</plugin>
```

3. Create a `webhelp-extension-strings.xml` file with the following content:

```xml
<langlist>
    <lang xml:lang="pl" filename="strings-pl-pl.xml"/>
    <lang xml:lang="pl-PL" filename="strings-pl-pl.xml"/>
</langlist>
```

5. In the `strings-pl-pl.xml` file, change the `@xml:lang` attribute on the root element that conforms with the new language.

```xml
<strings xml:lang="pl-PL">
    ...
</strings>
```

6. Translate the content of each `<str>` element (make sure to leave the `name` attribute unchanged).

**Result:**

```xml
<strings xml:lang="pl-PL">
    ...
    <str name="webhelp.content" js="true" php="false">Polish translation for "Content".</str>
    <str name="webhelp.search" js="true" php="false">Polish translation for "Search"</str>
    ...
</strings>
```
7. Copy the common DITA-OT strings defined in the `DITA-OT-DIR/xsl/common/strings-en-us.xml` file. It defines a set generated text available for HTML based transformations (such as `note`, `fig`, and `table` elements). Translate the content of each `str` element.

Result:

```xml
<strings xml:lang="pl-PL">
  ...
  <str name="webhelp.content" js="true" php="false">Polish translation for "Content".</str>
  <str name="webhelp.search" js="true" php="false">Polish translation for "Search"</str>
  ...
  <str name="Figure">Polish translation for "Figure"</str>
  <str name="Table">Polish translation for "Table"</str>
  ...
</strings>
```

8. Use the Run DITA-OT Integrator transformation scenario (page 1407) found in the DITA Map section in the Configure Transformation Scenario(s) dialog box (page 1502).

How to Localize the Interface of DocBook to WebHelp Classic Output

Static labels that are used in the WebHelp output are kept in translation files in the [DocBook XSL directory]/com.oxygenxml.webhelp.classic/oxygen-webhelp/resources/localization folder. Translation files have the `strings-lang1-lang2.xml` name format, where `lang1` and `lang2` are ISO language codes. For example, the US English text is kept in the `strings-en-us.xml` file.

To localize the interface of the WebHelp output for DocBook transformations, follow these steps:

1. Look for the `strings-[lang1]-[lang2].xml` file in [DocBook XSL directory]/com.oxygenxml.webhelp.classic/oxygen-webhelp/resources/localization directory (for example, the Canadian French file would be: `strings-fr-ca.xml`). If it does not exist, create one starting from the `strings-en-us.xml` file.
2. Translate all the labels from the above language file. Labels are stored in XML elements that have the following format: `<str name="Label name">Caption</str>`.

3. Make sure that the new XML file that you created in the previous two steps is listed in the file 
   `[DocBook XSL directory]/com.oxygenxml.webhelp.classic/oxygen-webhelp/resources/localization/strings.xml`. For example, a Canadian French file would be listed as: `<lang xml:lang="fr-ca" filename="strings-fr-ca.xml"/>`.

4. Edit any of the DocBook to WebHelp transformation scenarios (with or without feedback) and set the `l10n.gentext.default.language` parameter to the code of the language you want to localize (for example, `fr-ca` for Canadian French).

5. Run the transformation scenario to produce the WebHelp output.

- How to Index Japanese Content in WebHelp Classic (page 1568)

How to Activate Support for Right-to-Left (RTL) Languages

To activate support for RTL (right-to-left) languages in WebHelp output, edit the `DITA map (page 2705)` and set the `xml:lang` attribute on its root element (`map`). The corresponding attribute value can be set for following RTL languages:

- `ar-eg` - Arabic
- `he-il` - Hebrew
- `ur-pk` - Urdu

Integrating Social Media and Google Tools in the WebHelp Classic Output

Oxygen XML Editor plugin includes support for integrating some of the most popular social media sites in WebHelp output.

How to Add a Facebook Like Button in WebHelp Classic Output

It is possible to integrate Facebook™ into your `WebHelp Classic` output and the widget will appear in the footer sections of your WebHelp page.

Using Oxygen XML Editor/Author

To add a Facebook `Like` widget to your WebHelp output using a transformation scenario from within `Oxygen XML Editor/Author`, follow this procedure:
1. Go to the Facebook Developers website.
2. Fill-in the displayed form, then click the Get Code button.
3. Copy the two code snippets and paste them into a `<div>` element inside an XML file called `facebook-widget.xml`. Make sure you follow these rules:
   - The file must be well-formed.
   - The code for each `script` element must be included in an XML comment.
   - The start and end tags for the XML comment must be on a separate line.

   The content of the XML file should look like this:

   ```xml
   <div id="facebook">
       <div id="fb-root"/>
       <script>
           <!--
           (function(d, s, id) {
               var js, fjs = d.getElementsByTagName(s)[0];
               if (d.getElementById(id)) return;
               js = d.createElement(s); js.id = id;
               js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
               fjs.parentNode.insertBefore(js, fjs);
           })(document, 'script', 'facebook-jssdk'));

           -->
       </script>
       <div class="fb-like" data-layout="standard" data-action="like"
            data-show-faces="true" data-share="true"/>
   </div>
   ```

4. In Oxygen XML Editor/Author, click the Configure Transformation Scenario(s) action from the toolbar.
5. Select an existing WebHelp Classic transformation scenario (depending on your needs, it may be with or without feedback) and click the Duplicate button to open the Edit Scenario dialog box.
6. Switch to the Parameters tab and edit the `webhelp.footer.file` parameter to reference the `facebook-widget.xml` file that you created earlier.
7. Click Ok and run the transformation scenario.

**Using a Script Outside of Oxygen XML Editor/Author**

⚠️ **Important:** Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:
• You must have a valid license for the Oxygen XML WebHelp Plugin (https://www.oxygenxml.com/buy_webhelp.html).
• The Oxygen XML WebHelp Plugin must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To add a Facebook Like widget to your WebHelp output using a script outside of Oxygen XML Editor/Author (page 1528), follow this procedure:

1. Go to the Facebook Developers website.
2. Fill-in the displayed form, then click the Get Code button.
3. Copy the two code snippets and paste them into a <div> element inside an XML file called facebook-widget.xml. Make sure you follow these rules:
   • The file must be well-formed.
   • The code for each script element must be included in an XML comment.
   • The start and end tags for the XML comment must be on a separate line.

   The content of the XML file should look like this:

   ```xml
   <div id="facebook">
     <div id="fb-root"/>
     <script>
       <!--
         (function(d, s, id) {
           var js, fjs = d.getElementsByTagName(s)[0];
           if (d.getElementById(id)) return;
           js = d.createElement(s); js.id = id;
           js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
           fjs.parentNode.insertBefore(js, fjs);
         }(document, 'script', 'facebook-jssdk'));
       -->
     </script>
     <div class="fb-like" data-layout="standard" data-action="like"
      data-show-faces="true" data-share="true"/>
   </div>
   ```

4. Use the webhelp.footer.file parameter in your transformation script and set its value to reference the facebook-widget.xml file that you created earlier.
5. Execute the transformation script.

   For example:
   • Windows:
How to Add a Google+ Button in WebHelp Classic Output

It is possible to integrate Google into your WebHelp Classic output and the widget will appear in the footer section of your WebHelp page.

Using Oxygen XML Editor/Author

To add a Google+ widget to your WebHelp Classic output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Go to the Google Developers website.
2. Fill-in the displayed form. The preview area on the right side displays the code and a preview of the widget.
3. Copy the code snippet displayed in the preview area and paste it into a div element inside an XML file called google-plus-button.xml. Make sure that the content of the file is well-formed. The content of the XML file should look like this:

```xml
<div id="google-plus">
  <!-- Place this tag in your head or just before your close body tag. -->
  <script src="https://apis.google.com/js/platform.js" async defer></script>
  <!-- Place this tag where you want the +1 button to render. -->
  <div class="g-plusone" data-annotation="inline" data-width="300"></div>
</div>
```

4. In Oxygen XML Editor/Author, click the Configure Transformation Scenario(s) action from the toolbar.
5. Select an existing WebHelp Responsive transformation scenario (depending on your needs, it may be with or without feedback) and click the Duplicate button to open the Edit Scenario dialog box.
6. Switch to the Parameters tab and edit the webhelp.footer.file parameter to reference the google-plus-button.xml file that you created earlier.
7. Click Ok and run the transformation scenario.
Using a Script Outside of Oxygen XML Editor/Author

⚠️ Important: Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin (https://www.oxygenxml.com/buy_webhelp.html).
- The Oxygen XML WebHelp Plugin must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To add a Google+ widget to your WebHelp Classic output using a script outside of Oxygen XML Editor/Author (page 1528), follow this procedure:

1. Go to the Google Developers website.
2. Fill-in the displayed form. The preview area on the right side displays the code and a preview of the widget.
3. Copy the code snippet displayed in the preview area and paste it into a div element inside an XML file called google-plus-button.xml. Make sure that the content of the file is well-formed. The content of the XML file should look like this:

   ```xml
   <div id="google-plus">
     <!-- Place this tag in your head or just before your close body tag. -->
     <script src="https://apis.google.com/js/platform.js" async defer></script>

     <!-- Place this tag where you want the +1 button to render. -->
     <div class="g-plusone" data-annotation="inline" data-width="300"></div>
   </div>
   ```

4. Use the webhelp.footer.file parameter in your transformation script and set its value to reference the google-plus-button.xml file that you created earlier.
5. Execute the transformation script.

For example:

- Windows:

  ```bash
dita.bat -i c:\mySample.ditamap -f webhelp -Dwebhelp.footer.file=c:\google-plus-button.xml
  ```

- Mac OS X/ Linux:

  ```bash
dita -i /mySample.ditamap -f webhelp -Dwebhelp.footer.file=/google-plus-button.xml
  ```
How to Add Tweet Button in WebHelp Classic Output

It is possible to integrate Twitter into your WebHelp Classic output and the widget will appear in the footer section of your WebHelp page.

Using Oxygen XML Editor/Author

To add a Twitter Tweet widget to your WebHelp Classic output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Go to the Tweet button generator page.
2. Fill-in the displayed form. The Preview and code area displays the code that you will need.
3. Copy the code snippet displayed in the Preview and code area and paste it into a div element inside an XML file called tweet-button.xml. Make sure you follow these rules:
   • The file must be well-formed.
   • The code for each script element must be included in an XML comment.
   • The start and end tags for the XML comment must be on a separate line.

The content of the XML file should look like this:

```xml
<div id="twitter">
  <a href="https://twitter.com/share" class="twitter-share-button">Tweet</a>
  <script>
    !function(d, s, id) {
        var js, fjs = d.getElementsByTagName(s)[0], p = /^http:/.test(d.location) ? 'http': 'https';
        if (! d.getElementById(id)) {
            js = d.createElement(s);
            js.id = id;
            js.src = p + '//platform.twitter.com/widgets.js';
            fjs.parentNode.insertBefore(js, fjs);
        }
    };
    (document, 'script', 'twitter-wjs');
  </script>
</div>
```
4. In Oxygen XML Editor/Author, click the Configure Transformation Scenario(s) action from the toolbar.

5. Select an existing WebHelp Responsive transformation scenario (depending on your needs, it may be with or without feedback) and click the Duplicate button to open the Edit Scenario dialog box.

6. Switch to the Parameters tab and edit the webhelp.footer.file parameter to reference the tweet-button.xml file that you created earlier.

7. Click Ok and run the transformation scenario.

**Using a Script Outside of Oxygen XML Editor/Author**

⚠️ Important: Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin (https://www.oxygenxml.com/buy_webhelp.html).
- The Oxygen XML WebHelp Plugin must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To add a Twitter Tweet widget to your WebHelp Classic output using a script outside of Oxygen XML Editor/Author (page 1528), follow this procedure:

1. Go to the Tweet button generator page.

2. Fill-in the displayed form. The Preview and code area displays the code that you will need.

3. Copy the code snippet displayed in the Preview and code area and paste it into a div element inside an XML file called tweet-button.xml. Make sure you follow these rules:
   - The file must be well-formed.
   - The code for each script element must be included in an XML comment.
   - The start and end tags for the XML comment must be on a separate line.

The content of the XML file should look like this:

```xml
<div id="twitter">
  <a href="https://twitter.com/share" class="twitter-share-button">Tweet</a>
  <script>
    <!--
    !function (d, s, id) {
      var js, fjs = d.getElementsByTagName(s)[0], p = ^http://.test(d.location)
      ? 'http': 'https';
      if (! d.getElementById(id)) {
        js = d.createElement(s);
```

```xml
```
4. Use the `webhelp.footer.file` parameter in your transformation script and set its value to reference the `tweet-button.xml` file that you created earlier.

5. Execute the transformation script.

For example:

- **Windows:**

  ```bash
dita.bat -i c:\mySample.ditamap -f webhelp -Dwebhelp.footer.file=c:\tweet-button.xml
  ```

- **Mac OS X/ Linux:**

  ```bash
dita -i /mySample.ditamap -f webhelp -Dwebhelp.footer.file=/tweet-button.xml
  ```

---

How to Integrate Google Analytics in WebHelp Classic Output

You can use **Google Analytics** to track and report site data for your **WebHelp Classic** output.

**Using Oxygen XML Editor/Author**

To integrate **Google Analytics** into your WebHelp Classic output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Create a new **Google Analytics account** (if you do not already have one) and log on.
2. Choose the Analytics solution that best fits the needs of your website.
3. Follow the on-screen instructions to obtain a **Tracking Code** that contains your **Tracking ID**. A **Tracking Code** looks like this:

   ```html
   (function(i,s,o,g,r,a,m){i['GoogleAnalyticsObject']=r;i[r]=i[r]||function(){
   (i[r].q=i[r].q||[]).push(arguments)},i[r].l=1*new Date();a=s.createElement(o),
   m=s.getElementsByTagName(o)[0];a.async=1;a.src=g;m.parentNode.insertBefore(a,m)
   })(window,document,'script','//www.google-analytics.com/analytics.js','ga');

   ga('create', 'your_tracking_id', 'your_tracking_id');
   ga('send', 'pageview');
   ```

4. Use the `webhelp.footer.file` parameter in your transformation script and set its value to reference the `tweet-button.xml` file that you created earlier.

5. Execute the transformation script.

For example:

- **Windows:**

  ```bash
dita.bat -i c:\mySample.ditamap -f webhelp -Dwebhelp.footer.file=c:\tweet-button.xml
  ```

- **Mac OS X/ Linux:**

  ```bash
dita -i /mySample.ditamap -f webhelp -Dwebhelp.footer.file=/tweet-button.xml
  ```
4. Save the Tracking Code (obtained in the previous step) in a new XML file called googleAnalytics.xml. Note that the file should only contain the tracking code.

5. In Oxygen XML Editor/Author, click the Configure Transformation Scenario(s) action from the toolbar.

6. Select an existing WebHelp Responsive transformation scenario (depending on your needs, it may be with or without feedback) and click the Duplicate button to open the Edit Scenario dialog box.

7. Switch to the Parameters tab and edit the webhelp.footer.file parameter to reference the googleAnalytics.html file that you created earlier.

8. Click Ok and run the transformation scenario.

Using a Script Outside of Oxygen XML Editor/Author

⚠️ Important: Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin (https://www.oxygenxml.com/buy_webhelp.html).
- The Oxygen XML WebHelp Plugin must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To integrate Google Analytics into your WebHelp Classic output using a script outside of Oxygen XML Editor/Author (page 1528), follow this procedure:

1. Create a new Google Analytics account (if you do not already have one) and log on.
2. Choose the Analytics solution that best fits the needs of your website.
3. Follow the on-screen instructions to obtain a Tracking Code that contains your Tracking ID. A Tracking Code looks like this:

```html
<script>
(function(i,s,o,g,r,a,m){i['GoogleAnalyticsObject']=r;i[r]=i[r]||function()
(i[r].q=i[r].q||[]).push(arguments)},i[r].l=1*new Date();a=s.createElement(o),
m=s.getElementsByTagName(o)[0];a.async=1;a.src=g;m.parentNode.insertBefore(a,m)
)}(window,document,'script','//www.google-analytics.com/analytics.js','ga');

ga('create', 'UA-XXXXXXXX-X', 'auto');

ga('send', 'pageview');
</script>
```
4. Save the Tracking Code (obtained in the previous step) in a new XML file called `googleAnalytics.xml`. Note that the file should only contain the tracking code.

5. Use the `webhelp.footer.file` parameter in your transformation script and set its value to reference the `googleAnalytics.html` file that you created earlier.

6. Execute the transformation script.

   For example:
   - **Windows**:
     ```
     dita.bat -i c:\mySample.ditamap -f webhelp -Dwebhelp.footer.file=c:\googleAnalytics.xml
     ```
   - **Mac OS X/ Linux**:
     ```
     dita -i /mySample.ditamap -f webhelp -Dwebhelp.footer.file=/googleAnalytics.xml
     ```

---

### How to Integrate Google Search in WebHelp Classic Output

It is possible to integrate the **Google Search Engine** into your **WebHelp Classic** output and you can specify where you want the results to appear in your WebHelp page.

#### Using Oxygen XML Editor/Author

To integrate the **Google Search Engine** into your WebHelp Responsive output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

2. Select the **Create a custom search engine** button.
3. Follow the on-screen instructions to create a search engine for your site. At the end of this process you should obtain a code snippet that looks like this:

   ```html
   <script>
   (function() {
     var cx = '000888210889775888983:8mn4x_mf-yg';
     var gcse = document.createElement('script');
     gcse.type = 'text/javascript';
     gcse.async = true;
   </script>
   ```
4. Save the script into a well-formed HTML file called `googlecse.html`.

5. In Oxygen XML Editor/Author, click the `Configure Transformation Scenario(s)` action from the toolbar.

6. Select an existing WebHelp Responsive transformation scenario (depending on your needs, it may be with or without feedback) and click the `Duplicate` button to open the `Edit Scenario` dialog box.

7. Switch to the Parameters tab and edit the `webhelp.google.search.script` parameter to reference the `googlecse.html` file that you created earlier.

8. You can also use the `webhelp.google.search.results` parameter to choose where to display the search results.
   a. Create an HTML file with the following content:
      ```html
      <div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>
      ```
      (you must use the HTML5 version for the GCSE). For more information about other supported attributes, see Google Custom Search: Supported Attributes.
   b. Set the value of the `webhelp.google.search.results` parameter to the file path of the file you just created. If this parameter is not specified, the following code is used:
      ```html
      <div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>
      ```

9. Click Ok and run the transformation scenario.

**Using a Script Outside of Oxygen XML Editor/Author**

⚠️ **Important**: Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin ([https://www.oxygenxml.com/buy_webhelp.html](https://www.oxygenxml.com/buy_webhelp.html)).
- The Oxygen XML WebHelp Plugin must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To integrate the Google Search Engine into your WebHelp Classic output using a script outside of Oxygen XML Editor/Author (page 1528), follow this procedure:

1. Go to the Google Custom Search Engine page using your Google account.
2. Select the Create a custom search engine button.
3. Follow the on-screen instructions to create a search engine for your site. At the end of this process you should obtain a code snippet that looks like this:

```html
<script>
(function() {
  var cx = '000888210889775888983:8mn4x_mf-yg';
  var gcse = document.createElement('script');
  gcse.type = 'text/javascript';
  gcse.async = true;
  var s = document.getElementsByTagName('script')[0];
  s.parentNode.insertBefore(gcse, s);
})();
</script>
```

4. Save the script into a well-formed HTML file called `googlecse.html`.

5. Use the `webhelp.google.search.script` parameter in your transformation script and set its value to reference the `googlecse.html` file that you created earlier.

6. You can also use the `webhelp.google.search.results` parameter to choose where to display the search results.
   
   a. Create an HTML file with the following content:

   ```html
   <div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>
   ```

   (you must use the HTML5 version for the GCSE). For more information about other supported attributes, see Google Custom Search: Supported Attributes.

   b. Set the value of the `webhelp.google.search.results` parameter to the file path of the file you just created. If this parameter is not specified, the following code is used:

   ```html
   <div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>
   ```

7. Execute the transformation script.

   For example:

   - **Windows**:
     
     ```bash
dita.bat -i c:\mySample.ditamap -f webhelp -Dwebhelp.google.search.script=c:\googlecse.html -Dwebhelp.google.search.results=c:\myFile.html
     ```

   - **Mac OS X/ Linux**:
Overriding XSLT Processing Step of DITA WebHelp Classic Transformations

Since WebHelp output is primarily obtained by running XSLT transformations over the DITA input files (through the DITA Map WebHelp Classic transformation scenarios), one customization method would be to override the default XSLT templates that are used by the WebHelp transformations.

There are two methods available to override the XSLT stylesheets implied by the WebHelp transformation.

• The first method is to use one of the WebHelp XSLT-import extension points (page 1588) that allow you to import an XSLT stylesheet so that it becomes part of the normal build. This method uses the same mechanism as the DITA-OT XSLT-import extension points. Note that this method will affect all the outputs generated with the WebHelp system.
• The second method implies that you will create a DITA-OT extension plugin (page 1590) with a custom transtype and use an Ant build file to define the transformation process. The main difference from the first customization method is that you will not affect all WebHelp transformations. Only the transformations that use the declared plugin transtype will be affected.

WebHelp Classic XSLT-Import and XSLT-Parameter Extension Points

The WebHelp XSLT-import extension points allows you to extend the XSLT stylesheets associated with some of the WebHelp transformation steps. The DITA-OT plug-in installer adds an XSLT import statement in the default WebHelp XSLT so that the XSLT stylesheet referenced by the extension point becomes part of the normal build.

Example:

```xml
<plugin id="com.oxygenxml.webhelp.classic.extension">
  <feature extension="com.oxygenxml.webhelp.classic.xsl.dita2webhelp">
    <file>xsl/fixup.xsl"/>
  </feature>
</plugin>
```

⚠️ **Attention:** The customizations you make by using this extension point will affect all WebHelp transformations. If you want to have a customization that is only available for a certain transformation, use the Overriding a WebHelp XSLT Stylesheet from an Ant Build File (page 1590) method.
XSLT-Import Extension Points

The following extension points are available:

**com.oxygenxml.webhelp.classic.xsl.dita2webhelp**

Extension point to override the XSLT stylesheet (`dita2webhelpImpl.xsl`) that produces an HTML file for each DITA topic. The path to this stylesheet is: `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.classic\xsl\dita\desktop\dita2webhelpImpl.xsl`

**com.oxygenxml.webhelp.classic.xsl.createMainFiles**

Extension point to override the XSLT stylesheet (`createMainFilesImpl.xsl`) that produces the WebHelp main HTML page (`index.html`). The path to this stylesheet is: `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.classic\xsl\dita\desktop\createMainFilesImpl.xsl`

**com.oxygenxml.webhelp.classic.xsl.createTocXML**

Extension point to override the XSLT stylesheet (`tocDita.xsl`) that produces the `toc.xml` file. This file contains information extracted from the DITA map (page 2705) and it is mainly used to construct the WebHelp Table of Contents and navigational links. The path to this stylesheet is: `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.classic\xsl\dita\tocDita.xsl`.

XSLT-Parameter Extension Points

If your customization stylesheet declares one or more XSLT parameters and you want to control their values from the transformation scenario, you can use one of the following XSLT parameter extension points:

**com.oxygenxml.webhelp.classic.xsl.dita2webhelp.param**

Use this extension point to pass parameters to the stylesheet specified using the `com.oxygenxml.webhelp.classic.xsl.dita2webhelp` extension point (page 1589).

**com.oxygenxml.webhelp.classic.xsl.createMainFiles.param**

Use this extension point to pass parameters to the stylesheet specified using the `com.oxygenxml.webhelp.classic.xsl.createMainFiles` extension point (page 1589).

**com.oxygenxml.webhelp.classic.xsl.createTocXML.param**

Use this extension point to pass parameters to the stylesheet specified using the `com.oxygenxml.webhelp.classic.xsl.createTocXML` extension point (page 1589).

Related Information:
How to Override a WebHelp Classic XSLT Stylesheet from an Ant Build File

To create a WebHelp XSLT customization that is only available for a certain DITA OT transformation, the extension plugin should declare a custom transtype. The WebHelp XSLT stylesheets can be overridden from an ANT file provided by the DITA-OT extension plugin. From the Ant target associated with the plugin, you will specify a custom XSLT stylesheet that imports the original WebHelp stylesheet and add some customization templates.

The following procedure explains how to create a DITA-OT extension plugin that uses this extension method:

1. In the DITA-OT-DIR\plugins\ folder, create a folder for this plugin (for example, com.oxygenxml.webhelp.classic.custom).

2. Create a plugin.xml file (in the folder you created in step 1) that specifies a new DITA-OT transtype and the build file associated with the plugin. For example:

   ```xml
   <plugin id="com.oxygenxml.webhelp.classic.custom">
     <feature extension="dita.conductor.target.relative" file="integrator.xml"/>
     <transtype name="webhelp-classic-custom" extends="webhelp"
      desc="WebHelp Classic Customization"/>
   </plugin>
   ```

3. Create the integrator.xml file that will import the actual plugin Ant build file.

   ```xml
   <project basedir="." name="Webhelp Classic Customization">
     <import file="build.xml"/>
   </project>
   ```

4. Create the build.xml file that overrides the value of properties associated with the XSLT stylesheets used to produce HTML files (page 1592). The following Ant properties can be overridden to specify your customization stylesheets:

   ```
   args.wh.classic.topic.xsl
   ```
   Specify this property if you want to customize the XSLT stylesheet used to produce an HTML file for each topic (page 1592).

   ```
   args.wh.classic.create.main.files.xsl
   ```
Specify this property if you want to customize the XSLT stylesheet used to produce the main HTML files (page 1592).

args.wh.classic.createTocXML.xsl

Specify this property if you want to customize the XSLT stylesheet used to produce the toc.xml file (page 1593). The toc.xml file contains information extracted from DITA map and it is mainly used to create the WebHelp TOC.

For example, to customize a WebHelp Classic transformation type, the build file should look like:

```xml
<project basedir="." name="Webhelp Classic Customization">

<target name="dita2webhelp-classic-custom">
    <!--
    Override this property if you want to customize the XSLT stylesheet 
    used to produce an HTML file for each topic
    -->
    <property name="args.wh.classic.topic.xsl" value="${dita.plugin.com.oxygenxml.webhelp.classic.custom.dir}/xsl/dita2webhelpCustom.xsl"/>
    <!--
    Override this property if you want to customize the XSLT stylesheet 
    used to produce the main HTML file.
    -->
    <property name="args.wh.classic.create.main.files.xsl" value="${dita.plugin.com.oxygenxml.webhelp.classic.custom.dir}/xsl/createMainFilesCustom.xsl"/>
    <!--
    Override this property if you want to customize the XSLT stylesheet 
    used to produce the toc.xml file.
    -->
    <property name="args.wh.classic.createTocXML.xsl" value="${dita.plugin.com.oxygenxml.webhelp.classic.custom.dir}/xsl/createTocXMLCustom.xsl"/>
    <!--
    You need to delegate the build target:
    * dita2webhelp - for WebHelp Classic
    -->
    <antcall target="dita2webhelp"/>
</target>
</project>
```
5. Create an `xsl` directory in the plugin customization directory (that you created in step 1) to store the customized XSLT stylesheets.

6. Now that the extension plugin is created, install it in the DITA Open Toolkit (page 2665).

**Referencing the WebHelp XSLT Stylesheets from Your Customizations**

Note that your customization stylesheets should import the original stylesheets that they override. To reference the WebHelp stylesheets, you can use the `plugin:com.oxygenxml.dita-ot.plugin.webhelp` prefix. This prefix is rewritten by an XML catalog to the WebHelp root directory.

**Customizing the `dita2webhelp.xsl` Stylesheet**

The XSLT stylesheet that customizes the WebHelp `dita2webhelp.xsl` stylesheet should look like:

```xml
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    xmlns:math="http://www.w3.org/2005/xpath-functions/math"
    exclude-result-prefixes="xs math"
    version="2.0">
    <!--
    Import the original stylesheet used to produce an HTML file for each topic.
    -->
    <!--
    Add your customization templates here.
    -->
</xsl:stylesheet>
```

You need to import the following XSLT stylesheet:

```xml
```

**Customizing the `createMainFiles.xsl` Stylesheet**

The XSLT stylesheet that customizes the WebHelp `createMainFiles.xsl` stylesheet should look like:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    xmlns:math="http://www.w3.org/2005/xpath-functions/math"
    exclude-result-prefixes="xs math"
    version="2.0">
```
You need to import the following XSLT stylesheet:

```xml
<xsl:import href="plugin:com.oxygenxml.webhelp.classic:xsl/dita/desktop/createMainFiles.xsl"/>
```

### Customizing the `tocDita.xsl` File

The XSLT stylesheet that customizes the WebHelp `tocDita.xsl` stylesheet should look like:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    xmlns:math="http://www.w3.org/2005/xpath-functions/math"
    exclude-result-prefixes="xs math"
    version="2.0">
    <!--
    Import the original stylesheet used to produce the toc.xml file.
    -->
    <!--
    Add your customization templates here.
    -->
    </xsl:stylesheet>
```

### Miscellaneous Customization Topics

This section contains miscellaneous topics about how to customize the WebHelp Classic output.

**How to Disable Caching in WebHelp Classic Output**
In cases where a set of WebHelp Classic pages need to be updated on a regular basis to deliver the latest version of the documentation, the WebHelp pages should always be requested from the server upon re-loading it in a Web browser on the client side, rather than re-using an outdated cached version in the browser.

To disable caching in WebHelp Classic output, follow this procedure:

1. Edit the following XSL file for DITA or DocBook WebHelp systems:
   - For DITA WebHelp systems, edit the following file: 
     \com.oxygenxml.webhelp.classic\xsl\createMainFiles.xsl.
   - For DocBook WebHelp system, edit the following file: 
     \OXYGEN_INSTALL_DIR\frameworks\docbook\xsl
     \com.oxygenxml.webhelp.classic\xsl\createMainFiles.xsl.

2. Locate the following template in the XSL file: <xsl:template name="create-toc-common-file">
   and add the following code snippet:

   ```xml
   <meta http-equiv="Pragma" content="no-cache" />
   <meta http-equiv="Expires" content="-1" />
   ```

   **Note:** The code should look like this:

   ```xml
   <html>
   <head>
   <xsl:if test="$withFrames">
   <base target="contentwin"/>
   </xsl:if>
   <meta http-equiv="Content-Type" content="text/html; charset=utf-8"/>
   <!-- Disable caching of WebHelp pages in web browser. -->
   <meta http-equiv="Pragma" content="no-cache" />
   <meta http-equiv="Expires" content="-1" />
   ....
   ```

3. Save your changes to the file.
4. Re-run your WebHelp transformation scenario.

**How to Flag DITA Content in WebHelp Output**

Flagging content in WebHelp output involves defining a set of images that will be used for marking content across your information set.

To flag DITA content, you need to create a filter file that defines properties that will be applied on elements to be flagged. Generally, flagging is supported for *block elements* (page 2703) (such as
paragraphs), but not for phrase-level elements within a paragraph. This ensures that the images that will flag the content are easily scanned by the reader, instead of being buried in the text.

**Using Oxygen XML Editor/Author**

To flag content in the DITA Map to WebHelp output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Create a DITA filter file (DITAVAL) and add it in a directory of your choice (for example, named `myFile.ditaval`).
2. Define the property for the elements you want to be flagged. For example, if you want to flag any element that has the `audience` attribute set to `programmer`, the content of the DITAVAL file should look like this:

   ```xml
   <?xml version="1.0" encoding="UTF-8"?>
   <val>
   <prop att="audience" val="programmer" action="flag">
   <img src="D:\resource\delta.gif" alt="sample alt text"/>
   </prop>
   </val>
   ```

   Note that for an element to be flagged, at least one attribute-value pair needs to have a property declared in the DITAVAL file.
3. Edit a DITA Map to WebHelp transformation scenario.
4. Specify the DITAVAL file in the Filters tab (with the Use DITAVAL File option).
5. Run the transformation scenario.

**Using a Script Outside of Oxygen XML Editor/Author**

⚠️ **Important**: Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin ([https://www.oxygenxml.com/buy_webhelp.html](https://www.oxygenxml.com/buy_webhelp.html)).
- The Oxygen XML WebHelp Plugin must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To flag content in the DITA Map to WebHelp output using a script outside of **Oxygen XML Editor/Author**, follow this procedure:

1. Create a DITA filter file (DITAVAL) and add it in a directory of your choice (for example, named `myFile.ditaval`).
2. Define the property for the elements you want to be flagged. For example, if you want to flag any element that has the `audience` attribute set to `programmer`, the content of the DITAVAL file should look like this:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<val>
  <prop att="audience" val="programmer" action="flag">
    img="D:\resource\delta.gif" alt="sample alt text"/>
  </prop>
</val>
```

Note that for an element to be flagged, at least one attribute-value pair needs to have a property declared in the DITAVAL file.

3. Use the `args.filter` parameter in your transformation script and set its value to the path of the DITAVAL file you created.

4. Execute the transformation script.

For example:

- **Windows**:  
  ```
  dita.bat -i c:\mySampleMap.ditamap -f webhelp -Dargs.filter=c:\myFile.ditaval
  ```

- **Mac OS X/ Linux**:  
  ```
  dita -i /mySampleMap.ditamap -f webhelp -Dargs.filter=/myFile.ditaval
  ```

**How to Publish WebHelp Classic Output on a SharePoint Site**

Since WebHelp output must be published locally, on the same machine where the WebHelp process is running, to publish your files directly to a SharePoint library you need to map a network drive to connect to SharePoint and change your file extensions to `.aspx`, as described in the steps below.

**Using Oxygen XML Editor/Author**

To publish WebHelp Classic output on a SharePoint site and use a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Map a network drive to connect to your SharePoint library. For more information, see: [https://support.microsoft.com/en-us/kb/2616712](https://support.microsoft.com/en-us/kb/2616712).

2. Edit the WebHelp transformation scenario and open the `Parameters` tab.
   - For a DITA transformation, set the `args.outext` parameter to `.aspx`.
   - For a DocBook transformation, set the `html.ext` parameter to `.aspx`. 
3. Run the WebHelp transformation scenario to generate the output.

Using a Script Outside of Oxygen XML Editor/Author

⚠️ Important: Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

• You must have a valid license for the Oxygen XML WebHelp Plugin (https://www.oxygenxml.com/buy_webhelp.html).
• The Oxygen XML WebHelp Plugin must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To publish WebHelp Classic output on a SharePoint site and use a script outside of Oxygen XML Editor/Author (page 1528), follow this procedure:

1. Map a network drive to connect to your SharePoint library. For more information, see: https://support.microsoft.com/en-us/kb/2616712.
2. Use the following parameter to change your file extensions to .aspx:
   • For DITA transformations, use the args.outext parameter in your transformation script and set its value to .aspx.
   • For DocBook transformations, use the html.ext parameter in your transformation script and set its value to .aspx.
3. Execute the transformation script.

For example, a DITA script might look like this:

• Windows:
  ```
  dita.bat -i c:\mySample.ditamap -f webhelp -Dargs.outext=.aspx
  ```
• Mac OS X/ Linux:
  ```
  dita -i /mySample.ditamap -f webhelp -Dargs.outext=.aspx
  ```

WebHelp Responsive Output

The WebHelp Responsive features a very flexible layout, is designed to adapt to any screen size to provide an optimal viewing and interaction experience. It is based upon the Bootstrap responsive front-end framework and is available for DITA document types.

The WebHelp Responsive with Feedback variant also includes a feedback system that allows your users to add comments and allows you to manage and reply to them.
WebHelp Responsive output can be generated by using the DITA Map WebHelp Responsive (page 1385) or DITA Map WebHelp Responsive with Feedback transformation scenario (page 1385).

WebHelp Responsive Output Layout and Features

This section contains information about the layout and features of the WebHelp Responsive output.

Layout of the Responsive Page Types

You can select from several different styles of layouts (for example, by default, you can select either a tiles or tree style of layout). Furthermore, each layout includes a collection of skins that you can choose from, or you can customize your own.

Figure 560: WebHelp Responsive Output on a Normal Screen

Figure 561: WebHelp Responsive Output on a Narrow Screen
The Main Page is the home page generated in the WebHelp Responsive output. The main function of the home page is to display top-level information and provide links that help you easily navigate to any of the top-level topics of the publication. These links can be rendered in either a Tiles or Tree style of layout. The main page also consists of various other components, such as a logo, title, menu, search field, or index link.

**Main Page - Tiles Layout**

In the tiles presentation mode, a tile component is created for each chapter (first-level topic) in the publication. The tile presents a link to the topic and its short description.

*Figure 562: Main Page - Tiles Layout*
Main Page - Tree Layout

In the tree presentation mode, links to the first and second level topics in the publication are displayed using a tree-like component.

Figure 563: Main Page - Tree Layout
Main Page Components

The layout components displayed in the main page are:

**Publication Title**

The title of the publication. It is usually taken from the DITA map title.

**Logo**

---

Logo Component (page 1601)

Title Component (page 1601)

Search Input Component (page 1602)

Menu Component (page 1602)

Index Terms Link Component (page 1602)

Table of Contents Component (page 1602)

Footer Component (page 1602)
Displays a logo associated with the publication. Additionally you can set a target URL that will be opened when you click on the logo image.

The logo image can be specified using the `webhelp.logo.image` transformation parameter (page 1746). For the target URL, use the `webhelp.logo.image.target.url` parameter (page 1745).

**Menu**

Helps you to navigate to your documentation. This component presents a set of links to all topics from your publication. For information about customizing the menu, see How to Customize the Menu (page 1695) topic.

**Index Terms Link**

Presents a link to the index terms page. You can control if this component is displayed by using the `webhelp.show.indexterms.link` parameter (page 1749).

**Search Input**

Input text field allowing you to easily enter your search queries.

**Topic Tiles**

A tile associated with a main topic. Each topic tile has three sections that correspond to the topic title, short description, and image.

**Topic Tile Title**

Presents the navigation title of the associated topic.

**Topic Tile Short Description**

Presents the short description of the topic. It may be collected either from the topic or from the DITA map topic meta.

**Topic Tile Image**

Presents an image associated with the topic. The image association (page 1695) is done in the DITA map.

**Tree Table of Contents**

An area containing topic titles from first and second level of your publication.

**Page Footer**

WebHelp Responsive output footer.
The **Topic Page** is the page generated for each DITA topic in the WebHelp Responsive output. The HTML pages produced for each topic consist of the topic content along with various other additional components, such as a title, menu, navigation breadcrumb, print icon, or side table of contents.

*Figure 564: Topic Page*
```

**Topic Page Components**

The layout components displayed in this page are:

- **Publication Title**
  
  The title of the publication. It is usually taken from the DITA map title.

- **Logo**
  
  Displays a logo associated with the publication. Additionally you can set a target URL that will be opened when you click on the logo image.

  The logo image can be specified using the `webhelp.logo.image` transformation parameter (page 1746). For the target URL, use the `webhelp.logo.image.target.url` parameter (page 1745).

- **Menu**
  
  Helps you to navigate to your documentation. This component presents a set of links to all topics from your publication. For information about customizing the menu, see **How to Customize the Menu** (page 1695) topic.

- **Index Terms Link**
  
  Presents a link to the index terms page. You can control if this component is displayed by using the `webhelp.show.indexterms.link` parameter (page 1749).

- **Search Input**
  
  Input text field allowing you to easily enter your search queries.

- **Navigation Links**
  
  The navigation links (« Previous / Next arrows) can be used to navigate to the previous or next topic. These navigation links are controlled by the `collection-type` attribute. For example, if you set `collection-type="sequence"` on a parent topic
reference, navigation links will be generated in the output for that topic and all of its child topics. You can also use the `webhelp.default.collection.type.sequence` parameter and set its value to `yes` to generate navigation links for all topics, regardless of whether or not the `collection-type` attribute is present.

Tip: To hide the navigation links, you can edit the transformation scenario and set the value of the `webhelp.show.navigation.links` parameter to `no`.

**Expand/Collapse Sections Button**

Icon that expands or collapses sections listed in the side table of contents within a topic.

**Print Link**

A print icon that opens the print dialog box for your particular browser.

**Breadcrumb**

Presents the path of the current displayed DITA topic in documentation.

**Topic Content**

Presents the content of the associated DITA topic.

**Publication Table of Contents**

A Table of Content for the publication displayed in the left side.

**Topic Table of Contents (On this page links)**

A table of contents for the topic displayed on the right side with a heading named **On this page** and it contains links to each section within the current topic and the section corresponding to the current scroll position is highlighted. This component is generated for any topic that contains at least two `<section>` elements and each `<section>` must have an `@id` attribute.

**Page Footer**

WebHelp Responsive output footer.

**Search Page**

The **Search Page** presents search results in the WebHelp Responsive output. The HTML page consists of a search results component along with various other additional components, such as a title, menu, or index link.

When you enter search terms in the **Search** field, the results are displayed in a results page. When you click on a result, the topic is opened in the main pane and the search results are highlighted. If you
want to remove the colored highlights, click the 🇺🇸Toggle Highlights button at the top-right side of the page. The Search field also includes an autocomplete feature.

Figure 565: Search Results Page

The layout components displayed in the search page are:

- Logo Component (page 1607)
- Title Component (page 1606)
- Search Input Component (page 1607)
- Menu Component (page 1607)
- Index Terms Link Component (page 1607)
- Search Results Component (page 1607)
- Footer Component (page 1607)
Publication Title

The title of the publication. It is usually taken from the DITA map title.

Logo

Displays a logo associated with the publication. Additionally you can set a target URL that will be opened when you click on the logo image.

The logo image can be specified using the `webhelp.logo.image` transformation parameter (page 1746). For the target URL, use the `webhelp.logo.image.target.url` parameter (page 1745).

Menu

Helps you to navigate to your documentation. This component presents a set of links to all topics from your publication. For information about customizing the menu, see How to Customize the Menu (page 1695) topic.

Index Terms Link

Presents a link to the index terms page. You can control if this component is displayed by using the `webhelp.show.indexterms.link` parameter (page 1749).

Search Input

Input text field allowing you to easily enter your search queries.

Search Results

Each result includes the topic title that can be clicked to open that page. Under the title, a breadcrumb is displayed that shows the path of the topic and you can click any of the topics in the breadcrumb to open that particular page.

Page Footer

WebHelp Responsive output footer.

Autocomplete Suggestions in the Search Text Field

When you are typing in the search text field, proposals are presented to help you to compute the search query. The information proposed when you are typing is collected from:

- The search queries from the history of the previous searches.
- The titles collected from your documentation.
- Documentation index terms and keywords. For example, in a DITA topic, the keywords and index terms are specified in the topic prolog section like this:

```
<prolog>
<metadata>
```
Missing Terms

If you enter multiple search terms (other than stop words), for any result that the search engine found at least one term but not one or more of the other terms, the Missing terms will be listed below each result.

Related Information:

- WebHelp Responsive Search Engine (page 1610)

Index Terms Page

The Index Terms Page page consists of an index terms section along with various other additional components, such as a title, menu, or search field.

An alphabet that contains the first letter of the documentation index terms is generated at the top of the index page. Each letter represents a link to a specific indices section. The indexes are presented in multiple columns to make it easier to read this page.

Figure 566: Index Terms Page
Index Terms Page Components

The layout components displayed in this page are:

**Publication Title**

The title of the publication. It is usually taken from the DITA map title.

**Logo**
Displays a logo associated with the publication. Additionally you can set a target URL that will be opened when you click on the logo image.

The logo image can be specified using the \texttt{webhelp.logo.image} transformation parameter \cite{page 1746}. For the target URL, use the \texttt{webhelp.logo.image.target.url} parameter \cite{page 1745}.

\textbf{Menu}

Helps you to navigate to your documentation. This component presents a set of links to all topics from your publication. For information about customizing the menu, see \texttt{How to Customize the Menu} \cite{page 1695} topic.

\textbf{Index Terms Link}

Presents a link to the index terms page. You can control if this component is displayed by using the \texttt{webhelp.show.indextermslink} parameter \cite{page 1749}.

\textbf{Index Terms Alphabet}

An alphabet that contains the first letter of index terms. Each letter represents a link to a specific indices section.

\textbf{Index Terms}

The first letter of the index along with the list of index terms.

\textbf{Page Footer}

WebHelp Responsive output footer.

\textbf{Search Engine}

Search engine has two main components:

\textbf{Search indexer}

It is also known as a \texttt{spider}. This component is active when you publish your documentation to WebHelp and it is responsible for creating the \texttt{search index}. This component traverses all HTML pages (for DITA topics) to gather information.

\textbf{Search interface}

This component is an interface between the user and the \texttt{search index}. It helps the user to search through the \texttt{search index} and displays results in the search page.

\textbf{Search Field and Results Page}

When you enter search terms in the \texttt{Search} field, the results are displayed in a results page. When you click on a result, the topic is opened in the main pane and the search results are highlighted. If you
want to remove the colored highlights, click the Toggle Highlights button at the top-right side of the page. The Search field also includes an autocomplete feature.

Each result includes the topic title that can be clicked to open that page. Under the title, a breadcrumb is displayed that shows the path of the topic and you can click any of the topics in the breadcrumb to open that particular page.

If you enter multiple search terms (other than stop words), for any result that the search engine found at least one term but not one or more of the other terms, the Missing terms will be listed below each result.

5-Star Rating Mechanism and Sorting

The Search feature is also enhanced with a rating mechanism that computes scores for every result that matches the search criteria. These scores are then translated into a 5-star rating scheme and the stars are displayed to the right of each result. The search results are sorted depending on the following:

- Search entries that satisfy the phrase search criterion are presented first.
- The number of keywords found in a single page (the higher the number, the better).
- The context (for example, a word found in a title, scores better than a word found in unformatted text). The search ranking order, sorted by relevance is as follows:
  - The search term is included in a meta keyword.
  - The search term is in the title of the page.
  - The search term is in bold text in a paragraph.
  - The search term is in normal text in a paragraph.

Tag Element Scoring Values

HTML tag elements are also assigned a scoring value and these values are evaluated for the search results. For information about editing these values, see How to Change Element Scoring in Search Results (page 1708).

Search Rules

Rules that are applied during a search include:

- You can use quotes to perform an exact search for multiple word phrases (for example, "grow flowers" will only return results if both words are found consecutively and exactly as they are typed in the search field). This type of search is known as a phrase search.
• **Boolean Search** is supported using the following operators: *and*, *or*, *not*. When there are two adjacent search terms without an operator, *or* is used as the default search operator (for example, *grow flowers* is the same as *grow or flowers*).

• The space character separates keywords (an expression such as *grow flowers* counts as two separate keywords: *grow* and *flowers*).

• `indexterm` and `keywords` DITA elements are an effective way to increase the ranking of a page (for example, content inside a `keywords` element weighs more than an `H1` HTML element).

• Words composed by merging two or more words with colon (`:`), minus (`-`), underline (`_`), or dot (`.`) characters count as a single word.

• Your search terms should contain two or more characters (note that stop words will be ignored). This rule does not apply to CJK (Chinese, Japanese, Korean) languages.

### Excluded Terms

To improve performance, the **Search** feature excludes certain *stop words*. For example, the English version of the *stop words* includes: *a*, *an*, *and*, *are*, *as*, *at*, *be*, *but*, *by*, *for*, *if*, *in*, *into*, *is*, *it*, *no*, *not*, *of*, *on*, *or*, *such*, *that*, *the*, *their*, *then*, *there*, *these*, *they*, *this*, *to*, *was*, *will*, *with*.

**Related Information:**

- [WebHelp Responsive HTML5 Pages: Search Page](page 1605)

**Feedback System**

The **WebHelp Responsive with Feedback** variant contains a **Comments** section at the bottom of each topic. This section is where you can interact with users through a comment system. For information about deploying a feedback-enabled system, see [Deploying a Feedback-Enabled System](page 1614).

**Figure 567: WebHelp Responsive with Feedback Comments Section**
To add a new comment, click the **Add New Comment** button, or click **Reply** to add a comment to an existing thread. You can click on the **Log in** button on the right side of this bar to be authenticated as a user and your user name will be included in any comments that you add. If you do not have a user name, you can click on the **Sign Up** button to create a new user.

After you log in, your name and user name are displayed in the Comments bar, along with the **Log off** and **Edit** buttons. Click the **Edit** button to open the **User Profile** dialog box where you can customize the following options:

- **Your Name** - You can use this field to edit the initial name that you used to create your user profile.
- **Your email address** - You can use this field to edit the initial email address that you used to create your profile.
- You can choose to receive an email in the following situations:
  - When a comment is left on a page that you commented on.
  - When a comment is left on any topic in the WebHelp Classic system.
  - When a reply is left to one of my comments.
- **New Password** - Allows you to enter a new password for your user account.

**Note:** The **Current Password** field from the top of the **User Profile** is mandatory if you want to save the changes you make.

If you are an administrator, you can manage user information and comments. For more information, see Managing Users and Comments in a Feedback-Enabled System (page 1617).

**Related Information:**

Deploying a Feedback-Enabled System

System Requirements

The feedback-enabled WebHelp system requires a standard server deployment. You can request this from your server administrator and it requires the following system components:

- A Web server (such as Apache Web Server)
- A MySQL or MariaDB database server
- A database admin tool (such as phpMyAdmin)
- PHP Version 5.1.6 or later

The WebHelp system supports most of the recent versions of the following browsers: Chrome, Firefox, Edge, Internet Explorer, Safari, Opera.

Create WebHelp with Feedback Database

The WebHelp with Feedback system needs a database to store user details and the actual feedback, and a user added to it with all privileges. After this is created, you should have the following information:

- Database name
- Username
- Password

Exactly how you create the database and user depends on your web host and your particular needs.

Example:

The following procedure uses phpMyAdmin to create a MySQL database for the feedback system and a MySQL user with privileges for that database. The feedback system uses these credentials to connect to the database.

Using phpMyAdmin to create a database:

1. Access the phpMyAdmin instance running on your server.
2. Click Databases (in the right frame) and then create a database. You can give it any name you want (for example comments).
3. Create a user with connection privileges for this database.
4. Under localhost, in the right frame, click Privileges and then at the bottom of the page click the reload the privileges link.
Deploying the WebHelp with Feedback Output

If you have a web server configured with PHP and MySQL, you can deploy the WebHelp with Feedback output by following these steps:

1. Connect to your server using an FTP client.
2. Locate the home directory (from now on, referred to as DOCUMENT_ROOT) of your server.
3. Copy the transformation output folder into the DOCUMENT_ROOT folder.
4. Rename it to something relevant (for example, myProductWebHelp).
5. Open the output folder (for example, http://[YOUR_SERVER]/myProductWebHelp/). You are redirected to the installation wizard. Proceed with the installation as follows:
   a. Verify that the prerequisites are met.
   b. Press Start Installation.
   c. Configure the Deployment Settings section. Default values are provided, but you should adjust them as needed.

   Tip: You can change some of the options later. The installation creates a config.php file in [OXYGEN_WEBHELP_INSTALL_DIR]/feedback/resources/php/config/config.php where all your configuration options are stored.

d. Configure the MySql Database Connection Settings section. Use the information (database name, username, password) from the Create WebHelp with Feedback Database section (page 1614) to fill-in the appropriate text boxes.

   Warning: Selecting the Create new database structure option will overwrite any existing data in the selected database, if it already exists. Therefore, it is useful the first time you install the WebHelp with Feedback system, but you do not want to select this option on subsequent deployments.

e. If you are using a domain (such as OpenLDAP or Active Directory) to manage users in your organization, select the Enable LDAP Authentication option. This will allow you to configure the LDAP server, which will provide information and credentials for users who will access the WebHelp system. Also, this will allow you to choose which of the domain users will have administrator privileges.

f. If the Create new database structure option is selected, the Create WebHelp Administrator Account section becomes available. Here you can set the administrator account data. The administrator is able to moderate new posts and manage WebHelp users.

The same database can be used to store comments for multiple WebHelp with Feedback deployments. If a topic is available in multiple deployments and there are comments associated with it, you can choose to display the comments in all deployments that share the database. To do this, select the Display comments from other products option. In the Display
comments from section, a list with the deployments sharing the same database is displayed. Select the deployments allowed to share common feedback.

Note: You can restrict the displayed comments of a product depending on its version. If you have two products that use the same database and you restrict one of them to display comments starting from a certain version, the comments of the other product are also displayed from the specified version onwards.

g. Press Next Step.
h. Remove the installation folder from your web server.

Important: When you publish subsequent iterations of your WebHelp with Feedback system, you will not upload the /install folder in the output, as you only need it uploaded the first time you create the installation. On subsequent uploads, you will just upload the other output files.

i. In your Web browser, go to your WebHelp with Feedback system main page.

Testing Your WebHelp with Feedback System

To test your system, create a user and post a comment. Check to see if the notification emails are delivered to your email inbox.

Note: To read debug messages generated by the system:

1. Enable JavaScript logging by doing one of the following:
   • Open the log.js file, locate the var log = new Log(Level.NONE); line, and change the logging level to: Level.INFO, Level.DEBUG, Level.WARN, or Level.ERROR.
   • Append ?log=true to the WebHelp URL.

2. Inspect the PHP and Apache server log files.

Documentation Product ID and Version

When you run a WebHelp with Feedback transformation scenario, by default you are prompted for a documentation product ID and version number. This is needed when multiple WebHelp systems are deployed on the same server. Think of your WebHelp output as a product. If you have three different WebHelp outputs, you have three different products (each with their own unique documentation product ID). This identifier is included in a configuration file so that comments are tied to a particular output (product ID and version number).
Note: The WebHelp with Feedback installation includes a configuration option (Display comments from other products) that allows you to choose to have comments visible in other specified products.

Related Information:

• Managing Users and Comments in a Feedback-Enabled System (page 1617)

Refreshing the Content of a Feedback-Enabled System

It is common to update the content of an existing installation of a WebHelp with Feedback system on a regular basis. In this case, reinstalling the whole system is not a viable option since it might result in the loss of the comments associated with your topics. Also, reconfiguring the system every time you want to refresh it may be time consuming.

Fortunately, you can refresh just the content without losing the comments or the initial system configuration. To do so, follow these steps:

1. Execute the transformation scenario that produces the WebHelp with Feedback output directory.
2. Go to the output directory (specified in the Output tab of the transformation scenario), locate the \feedback\resources\php\config\config.php file, and delete it.
3. Locate the \feedback\install directory and delete it.
4. Copy the remaining structure of the output folder and paste it into your WebHelp with Feedback system installation directory, overwriting the existing content.

Managing Users and Comments in a Feedback-Enabled System

When you installed the WebHelp with Feedback system the first time (assuming the Create new database structure option (page 1615) was selected), you should have been prompted to create an administrator account (or a user named administrator was created by default). As an administrator, you have access to manage comments posted in your feedback-enabled WebHelp system. You can also manage the user information (such as role, status, or notification options).

To manage comments and user information, follow these steps:

1. At the bottom of each specific topic there is a Comments navigation bar and on the right side there is a Log in button. Click this button and log in with your administrator credentials. This gives you access to an Admin Panel button.
2. Click the Admin Panel button to display an administration page.
3. Use this page to manage the following options:

**Delete Orphaned Comments**

Allows you to delete comments that are no longer associated with a topic in your WebHelp system.

**Delete Pending Users**

Allows you to delete user accounts that you do not wish to activate.

**View All Posts**

Allows you to view all the comments that are associated with topics in your WebHelp system.

**Export Comments**

Allows you to export all posts associated with topics in your WebHelp system into an XML file.

**Set Version**

Use this action to display comments starting with a particular version.

**Manage User Information**

To edit the details for a user, click on the corresponding row. This opens a window that allows you to customize the following information associated with the user:

**Name**

The full name of the user.

**Level**

Use this field to modify the privilege level (role) for the selected user. You can choose from the following:

- **User** - Regular user, able to post comments and receive e-mail notifications.
- **Moderator** - In addition to the regular User rights, this type of user has access to the Admin Panel where a moderator can view,
delete, export comments, and set the version of the feedback-enabled WebHelp system.
• **Admin** - Full administrative privileges. Can manage WebHelp-specific settings, users, and their comments.

**Company**

The name of the organization associated with the user.

**E-Mail**

The contact email address for the user. This is also the address where the WebHelp system sends notifications.

**WebHelp Notification**

When selected, the user receives notifications when comments are posted anywhere in your feedback-enabled WebHelp system.

**Reply Notification**

When selected, the user receives notifications when comments are posted as a reply to one of their comments.

**Page Notification**

When selected, the user receives notifications when comments are posted on a topic where they previously posted a comment.

**Date**

The date the user registered is displayed.

**Status**

Use this drop-down list to change the status of the user. You can choose from the following:
• **Created** - The user is created but does not yet have any rights for the feedback-enabled WebHelp system.
• **Validated** - The user is able to use the feedback-enabled WebHelp system.
• **Suspended** - The user has no rights for the feedback-enabled WebHelp system.

**Warning:** The key used for identifying the page a comment is attached to is the relative file path to the output page. Since the output file and folder names mirror the source, any change to the file name (or its folder) in the source will affect the comments associated with that WebHelp page. If you change the file name or path, the comment history for that topic will become orphaned (a change to the topic ID does not affect the comment history).
Context-Sensitive WebHelp Responsive System

Context-sensitive help systems assist users by providing specific informational topics for certain components of a user interface, such as a button or window. This mechanism works based on mappings between a unique ID defined in the topic and a corresponding HTML page.

Generating Context-Sensitive Help

When WebHelp Responsive output is generated, the transformation process produces an XML mapping file called `context-help-map.xml` and copies it in the output folder of the transformation. This XML file maps an ID to a corresponding HTML page through an `appContext` element, as in the following example:

```xml
<map productID="oxy-webhelp" productVersion="1.1">
  <appContext helpID="myapp-functionid1" path="tasks/app-help1.html"/>
  <appContext helpID="myapp-functionid2" path="tasks/app-help1.html"/>
  ...
</map>
```

The possible attributes are as follows:

**helpID**

A Unique ID provided by a topic from two possible sources (resourceid element or id attribute):

**resourceid**

The `resourceid` element is mapped into the appContext element and can be specified in either the `topicref` within a `DITA map` or in a `prolog` within a DITA topic. The `resourceid` element accepts the following attributes:

- **appname** - A name for the external application that references the topic. If this attribute is not specified, its value is considered to be empty ("").
- **appid** - An ID used by an application to identify the topic.
- **id** - Specifies a value that is used by a specific application to identify the topic, but this attribute is ignored if an **appid** attribute is used.

**Note:** Multiple **appid** values can be associated with a single **appname** value (and multiple **appname** values can be associated with a single **appid** value), but the values for both attributes work in combination.
to specify a specific ID for a specific application, and therefore each combination of values for the `appid` and `appname` attributes should be unique within the context of a single root map (page 2711). For example, suppose that you need two different functions of an application to both open the same WebHelp page.

**Example: `resourceid` Specified in a DITA Map**

The `resourceid` element can be specified in a `topicmeta` element within a `topicref`.

```xml
<map title="App Help">
  <topicref href="app-help1.dita" type="task">
    <topicmeta>
      <resourceid appname="myapp" appid="functionid1"/>
      <resourceid appname="myapp" appid="functionid2"/>
    </topicmeta>
  </topicref>
</map>
```

**Example: `resourceid` Specified in a DITA Topic**

The `resourceid` element can be specified in a `prolog` element within a DITA topic.

```xml
<task id="app-help1">
  <title>My App Help</title>
  <prolog>
    <resourceid appname="myapp" appid="functionid1"/>
    <resourceid appname="myapp" appid="functionid2"/>
  </prolog>
  ...
</task>
```

For more information about the `resourceid` element, see DITA Specifications: `<resourceid>`.

**id**

If a `resourceid` element is not declared in the DITA map or DITA topic (as described above), the `id` attribute that is set on the topic root element is mapped into the `appContext` element.

⚠️ **Important:** You should ensure that these defined IDs are unique in the context of the entire DITA project. If the IDs are not unique,
the transformation scenario will display warning messages in the transformation console output and the help system will not work properly.

**path**

The path to a corresponding WebHelp page. This path is relative to the location of the `context-help-map.xml` mapping file.

**productID** *(Applicable only if you are using the WebHelp Responsive with Feedback transformation scenario)*

The ID of the product for your documentation project.

**productVersion** *(Applicable only if you are using the WebHelp Responsive with Feedback transformation scenario)*

The version of the product for your documentation project.

There are two ways of implementing context-sensitive help in your system:

- The XML mapping file can be loaded by a PHP script on the server side. The script receives the `contextId` value and will look it up in the XML file.
- Invoke the `index.html` WebHelp system file and pass the `contextId` parameter with a specific value. The WebHelp system will automatically open the help page associated with the value of the `contextId` parameter.

```
index.html?contextId=myDITATopic
```

**Note:** The `contextId` parameter is not case-sensitive.

**Context-Sensitive Queries**

You can use the URL field in your browser to search for topics in a context-sensitive WebHelp system with the assistance of the following parameters:

**contextId**

The WebHelp JavaScript engine will look for this value in the `context-help-map.xml` mapping file and load the corresponding help page.

**Note:** You can use an anchor (page 2703) in the `contextId` parameter to jump to a specific section in a document. For example, `contextId=topicID#anchor`.

**appname**

You can use this parameter in conjunction with `contextId` to search for this value in the corresponding `appname` attribute value in the mapping file.
Another parameter indicates the search query:

`searchQuery`

You can use this parameter to perform a search operation when WebHelp is loaded. For example, if you want to open WebHelp showing all search results for *growing flowers*, the URL should look like this: `http://localhost/webhelp/index.html?searchQuery=growing%20flowers`.

**Accessibility**

**Oxygen XML WebHelp Responsive** output is compliant with the [Section 508 accessibility standard](http://www.section508.gov), making the output accessible for people with visual impairment and other disabilities. Documentation and interface components are considered accessible when they have support in place that allows those with disabilities to use assistive technologies to understand the content.

Generally speaking, the WebHelp Responsive output has two major parts: topic content and WebHelp Responsive-related components (publication TOC, breadcrumb, menu). While the WebHelp Responsive components are designed to comply with the accessibility rules, it is important to adhere to some rules when you write DITA topics so that the content is also accessible.

**Related Information:**
- DITA-OT Day 2017 Presentation: Accessibility in DITA-OT

**Writing Guidelines for Accessible Documentation**

To create accessible content, good authoring practices involve following guidelines, such as marking table headers, using semantic elements where available, and using alternative text for images.

**Accessible Images**

Images must have text alternatives that describe the information or function represented by them.

**Short Text Equivalents for Images**

When using the `<image>` element, specify a short alternative text with the `<alt>` element.

```html
<image href="puffin.jpg">
  <alt>Puffin figure</alt>
</image>
```
Long Descriptions of Images

For complex images, when a short text equivalent does not suffice to adequately convey the function or role of an image, provide additional information in a file designated by the `<longdesc>` element.

```xml
<image href="puffin.jpg">
  <alt>Puffin figure</alt>
  <longdesc href="http://www.example.org/birds/puffin.html" scope="external" format="html"/>
</image>
```

Related Information:

- Darwin Information Typing Architecture (DITA) Specification `<image>` element
- Web Accessibility Tutorials: Alt Decision Tree

Accessible Image Maps

For image maps, text alternatives are needed on both the `<image>` element itself (to describe the informative context) and on each of the `<area>` elements (to convey the link destination or the action that will be initiated if the link is followed). The `<xref>` content within the `<area>` element contains the intended alternative text or hover text for that image map area.

```xml
<imagemap id="gear_pump_map">
  <image href="../images/Gear_pump_exploded.png" id="gear_pump_exploded">
    <alt>Gear Pump</alt>
  </image>
  <area shape="circle">
    <coords>172, 265, 14</coords>
    <xref href="parts/bushings.dita#bushings_topic/bushings" format="dita">Bushings</xref>
  </area>
  <area shape="circle">
    <coords>324, 210, 14</coords>
  </area>
</imagemap>
```
Accessible Tables

Accessible HTML tables need markup that indicates header cells and data cells and defines their relationship. Header cells must be marked with `<th>`, and data cells with `<td>`, to make tables accessible. For more complex tables, explicit associations may be needed using `@scope`, `@id`, and `@headers` attributes.

When you implement the table, it is best to use the `<table>` element (CALS table or OASIS Table Exchange Model). The `<table>` element includes all that you need to make a fully accessible table.

### Related Information:
- Darwin Information Typing Architecture (DITA) Specification `<table>` element

---

Table with Header Cells in the Top Row Only

For this type of table, you have to embed the table rows in the `<thead>` element.

#### Table 66. Example: Oxygen Events

<table>
<thead>
<tr>
<th>Event</th>
<th>Date</th>
<th>Location</th>
</tr>
</thead>
<tbody>
<tr>
<td>Evolution of TC 2018</td>
<td>May 31 - June 1, 2018</td>
<td>Sofia, Bulgaria</td>
</tr>
<tr>
<td>Markup UK</td>
<td>June 9 - 10, 2018</td>
<td>London, United Kingdom</td>
</tr>
<tr>
<td>Balisage 2018 - The Markup Conference</td>
<td>July 31 - August 3, 2018</td>
<td>Rockville, Maryland, USA</td>
</tr>
</tbody>
</table>

```
<table>
  <title><b>Oxygen Events</b></title>
  <thead>
    <th>Event</th>
    <th>Date</th>
    <th>Location</th>
  </thead>
  <tgroup cols="3">
    <row>
      <cell>Evolution of TC 2018</cell>
      <cell>May 31 - June 1, 2018</cell>
      <cell>Sofia, Bulgaria</cell>
    </row>
    <row>
      <cell>Markup UK</cell>
      <cell>June 9 - 10, 2018</cell>
      <cell>London, United Kingdom</cell>
    </row>
    <row>
      <cell>Balisage 2018 - The Markup Conference</cell>
      <cell>July 31 - August 3, 2018</cell>
      <cell>Rockville, Maryland, USA</cell>
    </row>
  </tgroup>
</table>
```
For this type of table, you have to set the `@rowheader="firstcol"` attribute on the `<table>` element to identify the header column.

**Table 67. Example: Oxygen Events**

<table>
<thead>
<tr>
<th>Event</th>
<th>Evolution of TC 2018</th>
<th>Markup UK</th>
<th>Balisage 2018 - The Markup Conference</th>
</tr>

WebHelp Responsive 508 VPAT

WebHelp Responsive was designed to adhere to the U.S. Government Section 508 accessibility standards. This document describes the accessibility features that address the Section 508 Standards. This VPAT (Voluntary Product Accessibility Template) is an informational tool developed by industry and government to help facilitate the understanding of compatibility issues under Section 508.

Table 69. 1194.22 Web-based intranet and internet information and applications.

<table>
<thead>
<tr>
<th>Criteria</th>
<th>Supporting Features</th>
<th>Remarks and Explanations</th>
</tr>
</thead>
<tbody>
<tr>
<td>(a) A text equivalent for every non-text element shall be provided (e.g., via “alt”, “longdesc”, or in element content).</td>
<td>Supported with exceptions</td>
<td>- The process that produces the WebHelp Responsive accessible output uses information extracted from the DITA topics. It is the technical writer's responsibility to write accessible-friendly DITA topics (page 1623).</td>
</tr>
<tr>
<td>Criteria</td>
<td>Supporting Features</td>
<td>Remarks and Explanations</td>
</tr>
<tr>
<td>-------------------------------------------------------------------------</td>
<td>---------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>(b) Equivalent alternatives for any multimedia presentation shall be synchronized with the presentation.</td>
<td>Supported with exceptions</td>
<td>WebHelp Responsive plugin offers support to transfer multimedia objects (video, audio) from DITA topics to the generated HTML pages. Technical writers are responsible for ensuring that they use multimedia objects that conform to this criterion.</td>
</tr>
</tbody>
</table>
| (c) Web pages shall be designed so that all information conveyed with color is also available without color, for example from context or markup. | Supported with exceptions | • The built-in Cobalt theme was specially designed to help visually impaired users.  
• The developers who customize the WebHelp output are responsible for ensuring that the template they customize conforms to this criterion. |
<p>| (d) Documents shall be organized so they are readable without requiring an associated stylesheet. | Supported | The WebHelp Responsive output is readable without requiring any stylesheet. |
| (e) Redundant text links shall be provided for each active region of a server-side image map. | Not applicable | The product contains no server-side image maps. |
| (f) Client-side image maps shall be provided instead of server-side image maps except where the regions cannot be defined with an available geometric shape. | Supported with exceptions | Technical writers can insert image maps in DITA topics. They are responsible for specifying the information required to generate accessible image maps (page 1624). |
| (g) Row and column headers shall be identified for data tables. | Supported with exceptions | Technical writers can insert tables in DITA topics. They are responsible for inputting the information required to generate accessible tables (page 1625). |</p>
<table>
<thead>
<tr>
<th>Criteria</th>
<th>Supporting Features</th>
<th>Remarks and Explanations</th>
</tr>
</thead>
<tbody>
<tr>
<td>(h) Markup shall be used to associate data cells and header cells for data tables that have two or more logical levels of row or column headers.</td>
<td>Supported with exceptions</td>
<td>Technical writers can insert tables in DITA topics. They are responsible for inputting the information required to generate accessible tables (page 1625).</td>
</tr>
<tr>
<td>(i) Frames shall be titled with text that facilitates frame identification and navigation.</td>
<td>Not applicable</td>
<td>The WebHelp Responsive output does not use frames.</td>
</tr>
<tr>
<td>(j) Pages shall be designed to avoid causing the screen to flicker with a frequency greater than 2 Hz and lower than 55 Hz.</td>
<td>Not applicable</td>
<td>The screen does not flicker with frequencies greater than 2 Hz and lower than 55 Hz.</td>
</tr>
<tr>
<td>(k) A text-only page, with equivalent information or functionality, shall be provided to make a website comply with the provisions of this part, when compliance cannot be accomplished in any other way. The content of the text-only page shall be updated whenever the primary page changes.</td>
<td>Not applicable</td>
<td>Accessibility provisions in WebHelp Responsive output can be provided without requiring a separate text-only version.</td>
</tr>
<tr>
<td>(l) When pages utilize scripting languages to display content, or to create interface elements, the information provided by the script shall be identified with functional text that can be read by assistive technology.</td>
<td>Supported with exceptions</td>
<td>The developers who customize the WebHelp output are responsible for ensuring that the template they customize conforms to this criterion.</td>
</tr>
<tr>
<td>(m) When a web page requires that an applet, plug-in or other application be present on the client system to interpret page content, the page must provide a link to a plug-in or applet that complies with 1194.21(a) through (l).</td>
<td>Not Applicable</td>
<td>This product does not use any plugins or applets.</td>
</tr>
<tr>
<td>(n) When electronic forms are designed to be completed on-line, the form shall allow people using assistive technology to access the information, field elements, and functionality required for completion and submission of the form, including all directions and cues.</td>
<td>Supported with exceptions</td>
<td>The developers who customize the WebHelp output are responsible for ensuring that the template they customize conforms to this criterion.</td>
</tr>
<tr>
<td>(o) A method shall be provided that permits users to skip repetitive navigation links.</td>
<td>Supported</td>
<td></td>
</tr>
<tr>
<td>(p) When a timed response is required, the user shall be alerted and given sufficient time to indicate more time is required.</td>
<td>Not applicable</td>
<td>WebHelp Responsive output does not require a timed response as part of its core functionality.</td>
</tr>
</tbody>
</table>
Note: This VPAT pertains only to the HTML output generated by the WebHelp Responsive plugin as shipped and not to any customization. It specifically applies to version 20.1 or above and it does not apply to any versions prior to this.

Supported Platforms

All accessibility tests have been carried out in the following environment:

- NVDA (Non Visual Desktop Access) version 2018.1.1 with Firefox version 60.0.1 and Chrome version 66.0.3359.181.
- Windows 10 Narrator with Microsoft Edge browser.

However, this does not mean that WebHelp Responsive-generated output has any issue with other modern, standards-compliant browsers and alternative screen reader solutions. In any case, if you encounter any accessibility-related issue while using WebHelp Responsive generated output, contact the Oxygen support team. All accessibility issues are treated with utmost attention.

Publishing Templates

An Oxygen Publishing Template defines all aspects of the layout and styles for output obtained from the following transformation scenarios:

- WebHelp Responsive
- WebHelp Responsive with Feedback
- DITA Map PDF - based on HTML5 & CSS

It is a self-contained customization package stored as a ZIP archive or folder that can easily be shared with others. It provides the primary method for customizing the output.

Some possible customization methods include:

- Add additional template resources to customize the output (such as logos, Favicons, or CSS files).
- Extend the default processing by specifying one or more XSLT extension points.
- Specify one or more transformation parameters to customize the output.
- Customize various aspects of the output through simple CSS styling.
For **WebHelp Responsive** output, change the layout of the main page or topic pages by customizing which components will be displayed and where they will be positioned in the page.

The following graphics are possible sample structure for **Oxygen Publishing Template** packages:

**Figure 569: Oxygen Publishing Template Package (WebHelp Responsive)**

- How to Edit a Packed Publishing Template (*page 1678*)
- How to Add a Publishing Template to the Publishing Templates Gallery (*page 1678*)
Publishing Templates Gallery

Oxygen XML Editor plugin comes bundled with a variety of built-in templates. You can use one of them to publish your documentation or as a starting point for a new publishing template.

Built-in Templates

There are two categories of templates, *Tiles* and *Tree*. You can see the built-in templates in the Templates tab when editing a WebHelp Responsive transformation scenario in Oxygen XML Editor/Author. Each one also includes an Online preview icon in the bottom-right corner that opens a webpage in your default browser that provides a sample of how the main page will look when that particular template is used to generate the output.

Tiles Templates

The main page in the WebHelp output presents a tile for each main topic (chapter) of the documentation.

Tree Templates

The main page in the WebHelp output presents a tree-like table of contents.
Built-in Templates Location

All built-in templates are stored in the following directory: `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/templates`.

Custom Templates

You can use a built-in template as a starting point for creating your own custom template (page 1770). You can store all of your custom templates in a particular directory. Then, go to Options > Preferences > DITA > Publishing and add your directory to the list, and all the templates stored in that directory will be displayed in the preview pane in the transformation scenario’s Template tab along with all the built-in templates.

Sharing Publishing Template

To share a publishing template with others, following these steps:

1. Copy your template in a new folder.
2. Go to Options > Preferences > DITA > Publishing and add that new folder to the list.
3. Switch the option as the bottom of that preferences page to Project Options.
4. Share your project file (.xpr).

Publishing Template Package Contents for WebHelp Responsive Customizations

An Oxygen Publishing Template package for WebHelp output must contain a template descriptor file and at least one CSS file, and may contain other resources (such as graphics, XHTML files, XSLT files, etc.). All the template resources can be stored in either a ZIP archive or in a folder. It is recommended to use a ZIP archive because it is easier to share with others.
Template Descriptor File

Each publishing template includes a descriptor file that defines the meta-data associated with template. It is an XML file with certain elements that defines all the resources included in a template (such as CSS files, images, JS files, and transformation parameters).

The template descriptor file must have the .opt file extension and must be located in the template's root folder.

A template descriptor might look like this:

```xml
<publishing-template>
  <name>Flowers</name>

  <webhelp>
    <tags>
      <tag>tree</tag>
      <tag>light</tag>
    </tags>
    <preview-image file="flowers-tree.png"/>

    <!-- Resources (CSS, favicon, logo and others) -->
    <resources>
      <!-- Main CSS file -->
      <css file="flowers.css"/>

      <!-- Resources to copy to the output folder -->
      <fileset>
        <include name="resources/**/*"/>
        <exclude name="resources/**/.svn"/>
        <exclude name="resources/**/.git"/>
      </fileset>
    </resources>

    <parameters>
      <!-- Parameters for the publishing process -->
      <parameter name="webhelp.show.main.page.tiles" value="no"/>
      <parameter name="webhelp.show.main.page.toc" value="yes"/>
      <parameter name="webhelp.top.menu.depth" value="3"/>
    </parameters>
  </webhelp>
</publishing-template>
```
Tip: It is recommended to edit the template descriptor in Oxygen XML Editor/Author because it provides content completion and validation support.

Template Name and Description

Each template descriptor file requires a name element. This information is displayed as the name of the template in the transformation scenario dialog box.

Optionally, you can include a description and it displayed when the user hovers over the template in the transformation scenario dialog box.

```xml
<publishing-template>
  <name>Lorem Ipsum</name>
  <description>Lorem ipsum dolor sit amet, consectetur adipiscing elit</description>
  ...
</publishing-template>
```

Template Author

Optionally, you can include author information in the descriptor file and it displayed when the user hovers over the template in the transformation scenario dialog box. This information might be useful if users run into an issue or have questions about a certain template.

If you include the author element, a name is required and optionally you can include email, organization, and organizationUrl information.

```
<publishing-template>
  ...
  <author>
    <name>John Doe</name>
    <email>jdoe@example.com</email>
    <organization>ACME</organization>
    <organizationUrl>http://www.example.com/jdoe</organizationUrl>
  </author>
  ...
</publishing-template>
```

Webhelp Element

The webhelp element contains various details that define the WebHelp Responsive output. It is a required element if you intend on using a WebHelp Responsive transformation scenario. The elements that are allowed in this webhelp section specify the template tags (page 1638), template preview image (page 1638), resources (page 1639) (such as CSS, JS, fonts, logos), transformation
parameters (page 1641), HTML fragment extensions (page 1643) (used to add fragments to placeholders), XSLT extensions (page 1642), or HTML page layout files (page 1649).

```xml
<webhelp>
  <tags>
    ...
  </tags>
  <preview-image file="MyPreview.png"/>
</webhelp>

<preview-image file="MyPreview.png"/>

<resources>
  ...
</resources>

<html-page-layouts>
  ...
</html-page-layouts>

<parameters>
  ...
</parameters>
</webhelp>

Template Tags

The tags section provides meta information about the template (such as layout type or color theme). Each tag is displayed at the top of the Templates tab window in the transformation scenario dialog box and they help the user filter and find particular templates.

```xml
<publishing-template>
  ...
  <webhelp>
    <tags>
      <tag>tree</tag>
      <tag>dark</tag>
    </tags>
  </webhelp>
</publishing-template>
```

Template Preview Image

The preview-image element is used to specify an image that will be displayed in the transformation scenario dialog box. It provides a visual representation of the template to help the user select the right
You can also include an `online-preview-url` element to specify the URL of a published sample of your template. This will display an Online preview icon in the bottom-right corner the image in the transformation scenario dialog box and if the user clicks that icon, it will open the specified URL in their default browser.

```
<publishing-template>
  ...
  <webhelp>
    ...
    <preview-image file="ashes/ashes-tree.png"/>
    <online-preview-url>https://www.example.com/samples/tiles/ashes</online-preview-url>
  </webhelp>
</publishing-template>
```

### Template Resources

The `resources` section of the descriptor file specifies a set of resources (CSS, JS, fonts, logos, graphics, etc.) that are used to customize various components in generated output. These resources will be copied to the output folder during the transformation process. At least one CSS file must be included, while the other types of resources are optional.

This section is defined using the `resources` element and the types of resources that can be specified include:

- **CSS files** - One or more CSS files that will define the styles of all generated HTML pages. They are referenced using the `css` element.
- **Favicon** - You can specify the path to an image for the favicon associated with your website. It is referenced using the `favicon` element.
- **Logo** - You can specify the path to a logo image that will be displayed in the left side of the output header. It is referenced using the `logo` element. Optionally, you can also specify:
  - `target-url` - will redirect the user to the specified URL if they click the logo in the output.
  - `alt` - provides an alternate text for the logo image.
- **JavaScript AMD module** - The path to a JavaScript module that uses the AMD (Asynchronous Module Definition) format. This module will be loaded in the output HTML pages using the RequireJS library. It can be referenced using the `js-amd-module` element. For more information, see How to Insert JavaScript AMD Modules in WebHelp Responsive Output (page 1689).
- **Additional Resources (graphics, JS, fonts)** - For other resources (such as images referenced in CSS, JS, fonts, etc.) that need to be included in the output, you need to instruct the transformation to include them in the output folder. You can specify one or more sets of additional resources to
be copied to the output folder by using the `fileset` element and you can use one or more `include` and `exclude` elements. This semantic is similar to the ANT FileSet.

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <resources>
      <css file="css/custom_styles.css"/>
      <css file="css/custom_fonts.css"/>
      <favicon file="images/favicon.png"/>
      <logo file="images/logo.png"
        target-url="http://www.example.com"
        alt="Alternate text for the logo image"/>
      <js-amd-module file="js/template-main.js"/>
      <fileset>
        <include name="common/**/*"/>
        <include name="JS/**/*"/>
        <exclude name="**/*.svn"/>
        <exclude name="**/*.git"/>
    </fileset>
  </resources>
</webhelp>
</publishing-template>
```

**Note:** All relative paths specified in the descriptor file are relative to the template root folder.

The resources specified in the template descriptor are copied to the following output folder: `[WebHelp_OUTPUT_DIR]/oxygen-webhelp/template`. The following graphic illustrates the mapping between the template resources and the location where they will be copied to the output folder:

*Figure 571: Template Resources Mapping*
Transformation Parameters

You can also set one or more WebHelp transformation parameters in the descriptor file.

```xml
<resources>
  <css file="CSS/oxygen-skin.css"/>
  <css file="CSS/oxygen-fonts.css"/>
  <logo file="images/logo.png"/>
  <favicon file="images/favicon.ico"/>
  <fileset>
    <include name="js/*"/>
    <include name="fonts/*"/>
    <exclude name="/**"/>
    <exclude name="/\*.git"/>
  </fileset>
</resources>

<parameters>
  <parameter
    name="webhelp.show.main.page.toc"
    value="yes"/>
  <parameter
    name="webhelp.top.menu.depth"
    value="3"/>
  <parameter
    name="webhelp.fragment.welcome"
    value="html-fragment/webhelp.fragment.welcome.html"
    type="filePath"/>
</parameters>
</webhelp>
```

The following information can be specified in the `parameter` element:

Parameter name

The name of the parameter. It may be one of the WebHelp Responsive transformation parameters (page 1745) or a DITA-OT HTML-based output parameter.
Note: It is not recommended to specify an input/output parameter in the descriptor file (such as the input Map, DITAVAL file, or temporary directory).

Attention: JVM arguments like -Xmx cannot be specified as a transformation parameter.

**Parameter Value**

The value of the parameter. It should be a relative path to the template root folder for file paths parameters.

**Parameter Type**

The type of the parameter: string or filepath. The string value is default.

After creating a publishing template (page 1770) and adding it to the templates gallery (page 1678), when you select the template in the transformation scenario dialog box, the Parameters tab will automatically be updated to include the parameters defined in the descriptor file. These parameters are displayed in italics.

**XSLT Extension Points**

The publishing templates support one or more XSLT extension points. They are helpful when you want to change the structure of the HTML pages that are primarily generated from XSLT processing. They can be specified in the descriptor file using the following structure:

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <xslt>
      <extension
        id="com.oxygenxml.webhelp.xsl.dita2webhelp"
        file="xsl/customDita2webhelp.xsl"/>
      <extension
        id="com.oxygenxml.webhelp.xsl.createMainPage"
        file="xsl/customMainPage.xsl"/>
    </xslt>
  </webhelp>
  ...
</publishing-template>
```

For more information, and a full list of the available extension points, see: XSLT-Import and XSLT-Parameter Extension Points (page 1752).
Note: You can read the value of a WebHelp transformation parameter from your XSLT extension stylesheets by using the `getParameter(param.name)` function from the `http://www.oxygenxml.com/functions` namespace.

**HTML Fragment Extension Points**

The HTML pages contain component placeholders that can be used to insert custom HTML fragments (either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment).

You can specify one or more HTML fragment extension points in the descriptor file using the following structure:

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <html-fragments>
      <fragment
        file="html-fragments/webhelp_fragment_welcome.html"
        placeholder="webhelp.fragment.welcome"/>
      <fragment
        file="html-fragments/webhelp_fragment_footer.html"
        placeholder="webhelp.fragment.footer"/>
      </html-fragments>
    </webhelp>
  ...
</publishing-template>
```

Some of these placeholders are left empty in the default output configurations, but you can use them to insert custom content.

Each placeholder has an associated parameter value in the transformation. These predefined placeholders are illustrated and described below.

*Figure 572: Predefined Placeholders Diagram*
Each of these placeholders can hold either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment:

1- **webhelp.fragment.head**

   In the generated output it inserts a given XHTML fragment in the `<head>` element. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

2- **webhelp.fragment.before.body**
In the generated output it displays a given XHTML fragment before the page body. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

3- webhelp.fragment.before.logo_and_title

In the generated output it displays a given XHTML fragment before the logo and title. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

4- webhelp.fragment.after.logo_and_title

In the generated output it displays a given XHTML fragment after the logo and title. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

5- webhelp.fragment.before.top_menu

In the generated output it displays a given XHTML fragment before the top menu. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

6- webhelp.fragment.after.top_menu

In the generated output it displays a given XHTML fragment after the top menu. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

7- webhelp.fragment.before.main.page.search

In the generated output it displays a given XHTML fragment before the search field. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

8- webhelp.fragment.welcome

In the generated output it displays a given XHTML fragment as a welcome message (or title). The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

9- webhelp.fragment.after.main.page.search

In the generated output it displays a given XHTML fragment after the search field. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

10- webhelp.fragment.before.toc_or_tiles

In the generated output it displays a given XHTML fragment before the table of contents or tiles in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.
11- webhelp.fragment.after.toc_or_tiles

In the generated output it displays a given XHTML fragment after the table of contents or tiles in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

12- webhelp.fragment.footer

In the generated output it displays a given XHTML fragment as the page footer. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

13- webhelp.fragment.after.body

In the generated output it displays a given XHTML fragment after the page body. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

- How to Insert HTML Content in WebHelp Responsive Output (page 1684)

WebHelp Responsive Macros

You can use the whc:macro layout component to specify a macro value (a variable that will be expanded when the output files are generated).

A macro has the following syntax:

```
${macro-name}
```

or

```
${macro-name(macro-parameter)}
```

A macro name can accept any alphanumeric characters, as well as the following characters: - (minus), _ (underscore), . (dot), : (colon). The value of a parameter may contain any character except the } (close curly bracket) character.

Implementations

The following macros are supported:

```
i18n
```

For localizing a string.
param

Returns the value of a transformation parameter.

${param(webhelp.show.main.page.tiles)}

env

Returns the value of an environment variable.

${env(JAVA_HOME)}

system-property

Returns the value of a system property.

${system-property(os.name)}

timestamp

Can be used to format the current date and time. Accepts a string (as a parameter) that determines how the date and time will be formatted (format string or picture string as it is known in the XSLT specification). The format string must comply with the rules of the XSLT \texttt{format-dateTime} function specification.

${timestamp([h1]:[m01] [P] [M01]/[D01]/[Y0001])}

path

Returns the path associated with the specified path ID. The following paths IDs are supported:

- \texttt{oxygen-webhelp-output-dir} - The path to the output directory. The path is relative to the current HTML file.
- \texttt{oxygen-webhelp-assets-dir} - The path to the oxygen-webhelp subdirectory from the output directory. The path is relative to the current HTML file.
- \texttt{oxygen-webhelp-template-dir} - The path to the template directory. The path is relative to the current HTML file.

${path(oxygen-webhelp-template-dir)}

\textbf{Note:} New paths IDs can be added by overriding the \texttt{wh-macro-custom-path} template from \texttt{com.oxygenxml.webhelp.responsive\xsl\template\macroExpander.xsl}: 
map-xpath

Can be used to execute an XPath expression over the DITA map file from the temporary directory.

ℹ️ Tip: Available in all template layout HTML pages.

${map-xpath(/map/title)}

topic-xpath

Can be used to execute an XPath expression over the current topic.

ℹ️ Tip: Available only in the topic HTML page template (wt_topic.html).

${topic-xpath(string-join(//shortdesc//text(), ' '))}

oxygen-webhelp-build-number

Returns the current WebHelp distribution ID (build number).

${oxygen-webhelp-build-number}

Extensibility

To add new macros, you can add an XSLT extension to overwrite the wh-macro-extension template from the com.oxygenxml.webhelp.responsive\xsl\template\macroExpander.xsl file.
The `wh-macro-extension` template has the following parameters:

- **name** - The name of the current *macro*.
- **params** - List of parameters of the current *macro* as *string* sequence. The current *macros* parsing mechanism only allows *macros* with a maximum of one parameter. Consequently, this list will contain at most one element.
- **contextNode** - The current element or attribute where the *macro* was declared.
- **matchedString** - The entire value of the matched *macro* as specified in the HTML template page.

### HTML Page Layout Files

The HTML page layout files define the default layout of the generated pages in the output for the built-in template. There are four types of pages (`main`, `search`, `topic`, `index`) and each type of page is a simple HTML file. Each page type has various components that appear by default and each component has a corresponding element and when that element is included in the HTML file, the corresponding components will appear in the output.

⚠️ **Warning**: It is no longer recommended for you to customize these files because if you upgrade to a newer version of Oxygen, those files may no longer produce the desired results and if new components have been added, you won't have access to them.

If you do choose to customize these HTML files, each type of page is defined inside an `html-page-layout-files` element in the descriptor file.

```xml
<publishing-template>
  ...  
  <webhelp>  
    ...  
  </webhelp>
  <!-- HTML page layout files -->
  <html-page-layout-files>
    <page-layout-file page="main" file="page-templates/wt_index.html"/>
    <page-layout-file page="search" file="page-templates/wt_search.html"/>
    <page-layout-file page="topic" file="page-templates/wt_topic.html"/>
    <page-layout-file page="index-terms" file="page-templates/wt_terms.html"/>
  </html-page-layout-files>
</publishing-template>
```
If you do use the `html-page-layout-files` element, you must specify all four types of pages (`main`, `search`, `topic`, `index`). When not specified, the files from the `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/page-templates` folder will be used to define the layout of each type of page.

**HTML Page Components**

Each type of page contains various components that control the layout of that page. The rendering of each component depends on the context where it is placed and its content depends on the transformed `DITA map (page 2705)`.

Some of the components can be used in all four types of pages, while some are only available for certain pages. For instance, the `Publication Title` component can be used in all pages, but the `Navigation Breadcrumb` component can only be used in the `Topic Page`.

To include a component in the output of a particular type of page, you have to reference a specific element in that particular HTML file. All the elements associated with a component should belong to the `http://www.oxygenxml.com/webhelp/components` namespace.

Every component can contain custom content or reference another component. To specify where the component content will be located in the output, you can use the `whc:component_content` element as a descendant of the component element. It can specify the location as before, after, or it can wrap the component content. The following snippet contains an example of each:

```html
<whc:webhelp_search_input class="navbar-form wh_main_page_search" role="form">
    <div class="custom-content-before">Enter search terms here:</div>
    <div class="custom-wrapper">
        <whc:component_content/>
    </div>
    <div class="custom-content-after">Results will be displayed in a new window.</div>
</whc:webhelp_search_input>
```

**Main Page**

The *Main Page* is the home page generated in the WebHelp Responsive output. The name of the HTML file that defines this page is `wt_index.html` and it is located in the following directory: `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/page-templates`. 
The main function of the home page is to display top-level information and provide links that help you easily navigate to any of the top-level topics of the publication. These links can be rendered in either a Tiles or Tree style of layout. The HTML page produced for the home page also consists of various other components, such as a logo, title, menu, search field, or index link.

*Figure 573: Examples of Main Page Components for a Tiles Style of Layout*
The following components can be referenced in the Main Page (wt_index.html) file:

**Publication Title** (webhelp_publication_title)

This component generates the publication title in the output. To generate this component, the webhelp_publication_title element must be specified in the HTML file as in the following example:

```html
<whc:webhelp_publication_title
```

In the output, you will find an element with the class: wh_publication_title.

**Publication Logo** (webhelp_logo)
This component generates a logo image in the output. To generate this component, the `webhelp_logo` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_logo
```

In addition, you must also specify the path of the logo image in the `webhelp.logo.image` transformation parameter (in the Parameters tab in the transformation scenario). You can set the `webhelp.logo.image.target.url` parameter to generate a link to a URL when you click the logo image.

In the output, you will find an element with the class: `wh_logo`.

**Search Input (webhelp_search_input)**

This component is used to generate the input widget associated with search function in the output. To generate this component, the `webhelp_search_input` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_search_input
```

In the output, you will find an element with the class: `wh_search_input`.

**Print Link (webhelp_print_link)**

This component is used to generate a print icon that opens the print dialog box for your particular browser. To generate this component, the `webhelp_print_link` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_print_link
```

In the output, you will find an element with the class: `wh_print_link`.

**Main Menu (webhelp_top_menu)**

This component generates a menu with all the documentation topics. To generate this component, the `webhelp_top_menu` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_top_menu
```

In the output, you will find an element with the class: `wh_top_menu`.
You can control the maximum level of topics that will be included in the menu using the `webhelp.top.menu.depth` transformation parameter (in the Parameters tab of the transformation scenario).

For information about customizing the menu, see How to Customize the Menu (page 1695).

**Main Page Topic Tiles (webhelp_tiles)**

This component generates the tiles section in the main page. This section will contain a tile for each root topic of the published documentation. Each topic tile has three sections that correspond to the topic title, short description, and image. To generate this component, the `webhelp_tiles` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_tiles
```

In the output, you will find an element with the class: `wh_tiles`.

If you want to control the HTML structure that is generated for a WebHelp tile you can also specify the template for a tile by using the `whc:webhelp_tile` component, as in the following example:

```xml
<whc:webhelp_tile class="col-md-4">
    <!-- Place holder for tile's image -->
    <whc:webhelp_tile_image/>

    <div class="wh_tile_text">
        <!-- Place holder for tile's title -->
        <whc:webhelp_tile_title/>

        <!-- Place holder for tile's shortdesc -->
        <whc:webhelp_tile_shortdesc/>
    </div>
</whc:webhelp_tile>
```

For information about customizing the tiles, see How to Configure the Tiles on the WebHelp Responsive Main Page (page 1700).

**Main Page Table of Contents (webhelp_main_page_toc)**

This component generates a simplified Table of Contents. It is simplified because it contains only two levels from the documentation hierarchy. To generate this component,
the `webhelp_main_page_toc` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_main_page_toc
```

In the output, you will find an element with the class: `wh_main_page_toc`.

**Index Terms Link (webhelp_indexterms_link)**

This component can be used to generate a link to the index terms page (`indexterms.html`). If the published documentation does not contain any index terms, then the link will not be generated. To generate this component, the `webhelp_indexterms_link` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_indexterms_link
```

In the output, you will find an element with the class: `wh_indexterms_link`. This element will contain a link to the `indexterms.html` page.

**Link to Skins Resources (webhelp_skin_resources)**

This component can be used to add a link to resources for the current WebHelp skin (such as the CSS file). To generate this component, the `webhelp_skin_resources` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_skin_resources/>
```

In the output, you will find a link to the skin resources.

**Topic Page**

The *Topic Page* is the page generated for each DITA topic in the WebHelp Responsive output. The name of the HTML file that defines this page is `wt_topic.html` and it is located in the following directory: `/DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/page-templates`.

The HTML pages produced for each topic consist of the topic content along with various other additional components, such as a title, menu, navigation breadcrumb, print icon, or side table of contents.

*Figure 575: Examples of Topic Page Components*
poly 74, 13, 18, 58, 17, 123, 73, 124, 72, 50, 149, 49, 148, 13 Publication Logo (page 1657)
poly 211, 13, 144, 82, 80, 82, 80, 103, 206, 103, 205, 82, 171, 82, 211, 50, 286, 48, 284, 12 Publication Title (page 1657)
poly 232, 73, 232, 110, 184, 157, 144, 157, 144, 188, 654, 186, 654, 158, 210, 156, 256, 109, 331, 108, 331, 72 Search Input (page 1657)
poly 418, 13, 417, 50, 348, 83, 349, 101, 738, 102, 736, 81, 586, 80, 516, 13 Main Menu (page 1659)
poly 601, 11, 601, 50, 701, 50, 748, 81, 741, 85, 742, 101, 771, 101, 772, 82, 702, 13 Index Terms Link (page 1660)

poly 640, 114, 643, 151, 672, 152, 742, 220, 742, 235, 757, 235, 757, 221, 721, 158, 736, 145, 736, 115 Expand/Collapse All Sections (page 1659)
poly 738, 157, 738, 179, 764, 182, 764, 221, 761, 235, 781, 235, 781, 220, 776, 182, 798, 182, 796, 155 Print Link (page 1658)
poly 382, 249, 409, 234, 704, 235, 704, 220, 16, 220, 16, 238, 324, 237, 381, 288, 480, 287, 479, 249 Breadcrumb (page 1657)
poly 34, 480, 34, 518, 150, 518, 149, 479, 95, 479, 96, 429, 171, 428, 171, 261, 18, 262, 20, 427, 84, 430, 85, 480 Publication Table of Contents (page 1658)
poly 362, 480, 362, 516, 459, 515, 459, 480, 415, 479, 415, 443, 679, 442, 676, 244, 476, 290, 372, 290, 322, 245, 185, 246, 185, 442, 368, 444 Topic Content (page 1658)
The following components can be referenced in the Topic Page (wt_topic.html) file:

**Publication Title (webhelp_publication_title)**

This component generates the publication title in the output. To generate this component, the `webhelp_publication_title` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_publication_title
```

In the output, you will find an element with the class: `wh_publication_title`.

**Publication Logo (webhelp_logo)**

This component generates a logo image in the output. To generate this component, the `webhelp_logo` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_logo
```

In addition, you must also specify the path of the logo image in the `webhelp.logo.image` transformation parameter (in the Parameters tab in the transformation scenario). You can set the `webhelp.logo.image.target.url` parameter to generate a link to a URL when you click the logo image.

In the output, you will find an element with the class: `wh_logo`.

**Search Input (webhelp_search_input)**

This component is used to generate the input widget associated with search function in the output. To generate this component, the `webhelp_search_input` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_search_input
```

In the output, you will find an element with the class: `wh_search_input`.

**Topic Breadcrumb (webhelp_breadcrumb)**

This component generates a breadcrumb that displays the path of the current topic. To generate this component, the `webhelp_breadcrumb` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_breadcrumb
```
In the output, you will find an element with the class: wh_breadcrumb. This element will contain a list with items that correspond to the topics in the path. The first item in the list has a link to the main page with the home class. The last item in the list corresponds to the current topic and has the active class set.

**Navigation Links (webhelp_navigation_links)**

This component generates navigation links to the next and previous topics. To generate this component, the webhelp_navigation_links element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_navigation_links
```

In the output, you will find an element with the class: wh_navigation_links. This element will contain the links to the next and previous topics.

**Print Link (webhelp_print_link)**

This component is used to generate a print icon that opens the print dialog box for your particular browser. To generate this component, the webhelp_print_link element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_print_link
```

In the output, you will find an element with the class: wh_print_link.

**Topic Content (webhelp_topic_content)**

This component generates the content of a topic and it represent the content of the HTML files as they are produced by the DITA-OT processor. To generate this component, the webhelp_topic_content element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_topic_content
```

In the output, you will find an element with the class: wh_topic_content.

**Publication TOC (webhelp_publication_toc)**

This component generates a mini table of contents for the current topic (on the left side). It will contain links to the children of current topic, its siblings, and all of its ancestors. To generate this component, the webhelp_publication_toc element must be specified in the HTML file as in the following example:
In the output, you will find an element with the class: `whPublicationToc`. This element will contain links to the topics that are close to the current topic.

**Topic TOC (webhelp_topic_toc)**

This component generates a topic table of contents for the current topic (on the right side) with a heading named **On this page**. It contains links to each section within the current topic and the section corresponding to the current scroll position is highlighted. The topic must contain at least two `<section>` elements and each `<section>` must have an `@id` attribute. To generate this component, the `webhelp_topic_toc` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_topic_toc
```

In the output, you will find an element with the class: `wh_topic_toc`. This element will contain links to the topics that are close to the current topic.

**Expand/Collapse Sections (webhelp_expandCollapseSections)**

This component is used to generate an icon that expands or collapses sections listed in the side table of contents within a topic. To generate this component, the `webhelp_expandCollapseSections` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_expandCollapseSections
```

In the output, you will find an element with the class: `webhelp_expandCollapseSections`.

**Topic Feedback (webhelpFeedback)**

This component generates a placeholder for where the comments section will be presented. To generate this component, the `webhelpFeedback` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelpFeedback
```

**Main Menu (webhelpTopMenu)**
This component generates a menu with all the documentation topics. To generate this component, the `webhelp_top_menu` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_top_menu
```

In the output, you will find an element with the class: `wh_top_menu`.

You can control the maximum level of topics that will be included in the menu using the `webhelp.top.menu.depth` transformation parameter (in the Parameters tab of the transformation scenario).

For information about customizing the menu, see How to Customize the Menu (page 1695).

**Index Terms Link (webhelp_indexterms_link)**

This component can be used to generate a link to the index terms page (`indexterms.html`). If the published documentation does not contain any index terms, then the link will not be generated. To generate this component, the `webhelp_indexterms_link` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_indexterms_link
```

In the output, you will find an element with the class: `wh_indexterms_link`. This element will contain a link to the `indexterms.html` page.

**Child Links (webhelp_child_links)**

For all topics with subtopics (child topics), this component generates a list of links to each child topic. To generate this component, the `webhelp_child_links` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_child_links
```

**Related Links (webhelp_related_links)**

For all topics that contain related links, this component generates a list of related links that will appear in the output. To generate this component, the `webhelp_related_links` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_related_links
```
Link to Skins Resources (webhelp_skin_resources)

This component can be used to add a link to resources for the current WebHelp skin (such as the CSS file). To generate this component, the `webhelp_skin_resources` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_skin_resources/>
```

In the output, you will find a link to the skin resources.

Search Results Page

The Search Results Page is the page generated that present search results in the WebHelp Responsive output. The name of the HTML file that defines this page is `wt_search.html` and it is located in the following directory: `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/page-templates`.

The HTML page that is produced consists of a search results component along with various other additional components, such as a title, menu, or index link.

Figure 576: Examples of Search Results Page Components

poly 72, 12, 17, 59, 17, 125, 73, 124, 72, 60, 148, 51, 148, 12 Publication Logo (page 1662)
poly 211, 13, 135, 83, 80, 83, 80, 101, 206, 102, 206, 82, 172, 82, 211, 49, 286, 49, 286, 12 Publication Title (page 1662)
poly 232, 72, 232, 109, 181, 156, 144, 157, 145, 184, 651, 183, 651, 157, 214, 156, 255, 109, 331, 107, 329, 72 Search Input (page 1662)
poly 400, 13, 400, 52, 355, 83, 355, 108, 353, 104, 716, 102, 717, 82, 592, 82, 500, 11 Main Menu (page 1663)
poly 582, 12, 582, 52, 685, 52, 722, 81, 724, 100, 750, 101, 750, 81, 683, 12 Index Terms Link (page 1663)
poly 737, 22, 739, 46, 763, 46, 759, 103, 778, 101, 777, 45, 793, 45, 792, 20 Print Link (page 1663)

The following components can be referenced in the Search Results Page (wt_search.html) file:

**Publication Title** (webhelp_publication_title)
This component generates the publication title in the output. To generate this component, the `webhelp_publication_title` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_publication_title
```

In the output, you will find an element with the class: `wh_publication_title`.

**Publication Logo** (webhelp_logo)
This component generates a logo image in the output. To generate this component, the `webhelp_logo` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_logo
```

In addition, you must also specify the path of the logo image in the `webhelp.logo.image` transformation parameter (in the Parameters tab in the transformation scenario). You can set the `webhelp.logo.image.target.url` parameter to generate a link to a URL when you click the logo image.

In the output, you will find an element with the class: `wh_logo`.

**Search Input** (webhelp_search_input)
This component is used to generate the input widget associated with search function in the output. To generate this component, the `webhelp_search_input` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_search_input
```
Search Results (webhelp_search_results)

This component is used to generate a placeholder to signal where the search results will be presented in the output. To generate this component, the webhelp_search_results element must be specified in the HTML file as in the following example:

```
<whc:webhelp_search_results
```

In the output, you will find an element with the class: wh_search_input.

Print Link (webhelp_print_link)

This component is used to generate a print icon that opens the print dialog box for your particular browser. To generate this component, the webhelp_print_link element must be specified in the HTML file as in the following example:

```
<whc:webhelp_print_link
```

In the output, you will find an element with the class: wh_print_link.

Main Menu (webhelp_top_menu)

This component generates a menu with all the documentation topics. To generate this component, the webhelp_top_menu element must be specified in the HTML file as in the following example:

```
<whc:webhelp_top_menu
```

In the output, you will find an element with the class: wh_top_menu.

You can control the maximum level of topics that will be included in the menu using the webhelp.top.menu.depth transformation parameter (in the Parameters tab of the transformation scenario).

For information about customizing the menu, see How to Customize the Menu (page 1695).

Index Terms Link (webhelp_indexterms_link)

This component can be used to generate a link to the index terms page (indexterms.html). If the published documentation does not contain any index terms, then the link will not be generated. To generate this component, the
webhelp_indexterms_link element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_indexterms_link
```

In the output, you will find an element with the class: wh_indexterms_link. This element will contain a link to the indexterms.html page.

**Link to Skins Resources (webhelp_skin_resources)**

This component can be used to add a link to resources for the current WebHelp skin (such as the CSS file). To generate this component, the webhelp_skin_resources element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_skin_resources/>
```

In the output, you will find a link to the skin resources.

**Index Terms Page**

The Index Terms Page is the page generated that presents index terms in the WebHelp Responsive output. The name of the HTML file that defines this page is wt_terms.html and it is located in the following directory: DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/page-templates.

The HTML page that is produced consists of an index terms section along with various other additional components, such as a title, menu, or search field.

An alphabet that contains the first letter of the documentation index terms is generated at the top of the index page. Each letter represents a link to a specific indices section.

*Figure 577: Example of Index Terms Page Components*
The following components can be referenced in the `Index Terms Page` file:

**Publication Title** (`webhelp_publication_title`)

This component generates the publication title in the output. To generate this component, the `webhelp_publication_title` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_publication_title
```

In the output, you will find an element with the class: `wh_publication_title`.

**Publication Logo** (`webhelp_logo`)

This component generates a logo image in the output. To generate this component, the `webhelp_logo` element must be specified in the HTML file as in the following example:
In addition, you must also specify the path of the logo image in the `webhelp.logo.image` transformation parameter (in the Parameters tab in the transformation scenario). You can set the `webhelp.logo.image.target.url` parameter to generate a link to a URL when you click the logo image.

In the output, you will find an element with the class: `wh_logo`.

**Search Input** (`webhelp_search_input`)

This component is used to generate the input widget associated with search function in the output. To generate this component, the `webhelp_search_input` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_search_input
```

In the output, you will find an element with the class: `wh_search_input`.

**Print Link** (`webhelp_print_link`)

This component is used to generate a print icon that opens the print dialog box for your particular browser. To generate this component, the `webhelp_print_link` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_print_link
```

In the output, you will find an element with the class: `wh_print_link`.

**Main Menu** (`webhelp_top_menu`)

This component generates a menu with all the documentation topics. To generate this component, the `webhelp_top_menu` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_top_menu
```

In the output, you will find an element with the class: `wh_top_menu`.

You can control the maximum level of topics that will be included in the menu using the `webhelp.top.menu.depth` transformation parameter (in the Parameters tab of the transformation scenario).
For information about customizing the menu, see How to Customize the Menu (page 1695).

**Index Terms Link (webhelp_indexterms_link)**

This component can be used to generate a link to the index terms page (indexterms.html). If the published documentation does not contain any index terms, then the link will not be generated. To generate this component, the webhelp_indexterms_link element must be specified in the HTML file as in the following example:

```xml
<wch:webhelp_indexterms_link
    xmlns:wch="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: wh_indexterms_link. This element will contain a link to the indexterms.html page.

**Link to Skins Resources (webhelp_skin_resources)**

This component can be used to add a link to resources for the current WebHelp skin (such as the CSS file). To generate this component, the webhelp_skin_resources element must be specified in the HTML file as in the following example:

```xml
<wch:webhelp_skin_resources/>
```

In the output, you will find a link to the skin resources.

**Combining WebHelp Responsive and PDF Customizations in a Template Package**

An Oxygen Publishing Template package can contain both a WebHelp Responsive and PDF customization in the same template package and you can use that same template in both types of transformations. The template descriptor file can define the customization for both types by including both a `webhelp` and `pdf` element and some of the resources can be reused. Resources referenced in elements in the `webhelp` element will only be used for WebHelp transformations, and resources referenced in the elements in the `pdf` element will only be used in PDF transformations.

```xml
<publishing-template>
    <name>Flowers</name>
    <description>Flowers themed light-colored template</description>
    <webhelp>
        <tags>
            <tag>purple</tag>
            <tag>light</tag>
        </tags>
    </webhelp>
</publishing-template>
```
Generating WebHelp Responsive Output

The publishing process can be initiated from a transformation scenario within Oxygen XML Editor/Author, from a command line outside Oxygen XML Editor/Author, or from an integration server.

Related Information:

- Publishing Template Package Contents for PDF Customizations (page 1764)
Running from Oxygen XML Editor/Author

To publish to the WebHelp Responsive output from a transformation scenario inside Oxygen XML Editor/Author, use one of the following procedures, depending on whether or not you want a feedback section in your output.

**WebHelp Responsive Output**

To publish a DITA map (page 2705) as WebHelp Responsive output, follow these steps:

1. Select the 
   Configure Transformation Scenario(s) action from the DITA Maps Manager toolbar.
2. Select the DITA Map WebHelp Responsive scenario from the DITA Map section.
3. If you want to configure the transformation, click the Edit button.

**Step Result:** This opens an Edit scenario configuration dialog box that allows you to configure various options in the following tabs:

- **Templates Tab** - This tab contains a set of built-in skins that you can use for the layout of your WebHelp system output.
- **Parameters Tab** - This tab includes numerous transformation parameters that can be set to customize your WebHelp system output.
- **Filters Tab** - This tab allows you to filter certain content elements from the generated output.
- **Advanced Tab** - This tab allows you to specify some advanced options for the transformation scenario.
- **Output Tab** - This tab allows you to configure options that are related to the location where the output is generated.

4. Click Apply associated to process the transformation.

When the DITA Map WebHelp Responsive transformation is complete, the output is automatically opened in your default browser.

**WebHelp Responsive with Feedback Output**

To publish a DITA map (page 2705) as a WebHelp Responsive with Feedback system, follow these steps:

1. Select the 
   Configure Transformation Scenario(s) action from the DITA Maps Manager toolbar.
2. Select the DITA Map WebHelp Responsive with Feedback scenario from the DITA Map section.
3. If you want to configure the transformation, click the Edit button.

**Step Result:** This opens an Edit scenario configuration dialog box that allows you to configure various options in the following tabs:
• **Templates Tab** - This tab contains a set of built-in skins that you can use for the layout of your WebHelp system output.

• **Parameters Tab** - This tab includes numerous transformation parameters that can be set to customize your WebHelp system output.

• **Filters Tab** - This tab allows you to filter certain content elements from the generated output.

• **Advanced Tab** - This tab allows you to specify some advanced options for the transformation scenario.

• **Output Tab** - This tab allows you to configure options that are related to the location where the output is generated.

4. Click **Apply associated** to begin the transformation.

5. Enter the documentation product ID (value for the `webhelp.product.id` parameter) and the documentation version (value for the `webhelp.product.version` parameter).

When the **DITA Map WebHelp Responsive with Feedback** transformation is complete, your default browser opens the `installation.html` file. This file contains information about the output location, system requirements, installation instructions, and deployment of the output. Follow the instructions to complete the system deployment *(page 1614)*.

### Running from Command Line

To publish to the WebHelp Responsive output from a command line outside of Oxygen XML Editor/Author, you can use the `dita` startup script that comes bundled with **DITA-OT** distribution.

**dita Command Format**

**DITA-OT** `dita` command has the following format:

```
DITA-OT-DIR/bin/dita --format=webhelp-responsive --input=input-file options
```

where the arguments are as follows:

**dita**

**Windows** - The `dita.bat` script located in: `DITA-OT-DIR` *(page 2706)*\`bin\`.  

**Linux/Mac OS X** - The `dita` script file located in: `DITA-OT-DIR` *(page 2706)*\`bin\`.  

**--format = webhelp-responsive**

Specifies the output format (transformation type) for WebHelp Responsive transformation.

**--input = input-file**

The `input-file` represents the path to the DITA map that you want to process.
options

options include the following optional build parameters:

--output =dir

-o dir

Specifies the path of the output directory; the path can be absolute or relative to the current directory. By default, the output is written to the `out` subdirectory of the current directory.

--filter =file

Specifies filter file(s) used to include, exclude, or flag content.

Relative paths are resolved against the current directory and internally converted to absolute paths.

--temp =dir

-t dir

Specifies the location of the temporary directory.

--verbose

-v

Verbose logging.

--debug

-d

Debug logging.

--logfile =file

-l file

Write logging messages to a file.

--parameter =value

-D parameter=value

Specify a value for a DITA-OT or Ant build parameter.

--propertyfile =file

Use build parameters defined in the referenced `.properties` file.

Build parameters specified on the command line override those set in the `.properties` file.
WebHelp and DITA-OT parameters

In addition to the transformation parameters that are specific to WebHelp Responsive (page 1745), you can use the common DITA-OT transformation parameters and the HTML-based Output Parameters.

Command-Line Example

• Windows:

```bash
        dita.bat
            --format=webhelp-responsive
            --input=c:\path\to\mySample.ditamap
            --output=c:\path\to\output
            -Dwebhelp.logo.image=myLogo.jpg
```

• Linux/Mac OS X:

```bash
        dita
            --format=webhelp-responsive
            --input=/path/to/mySample.ditamap
            --output=/path/to/output
            -Dwebhelp.logo.image=myLogo.jpg
```

• DITA-OT Documentation: HTML-based output parameters

• WebHelp Responsive Output Parameters (page 1745)

Running from an Integration Server

Oxygen XML Editor plugin can be processed from an automatic publishing system, such as Jenkins or Travis.
Automating DITA to WebHelp Output with Jenkins

To integrate WebHelp output with the Jenkins continuous integration tool, follow these steps:

1. Create a Maven project to incorporate the DITA-OT that already integrates Oxygen XML Editor plugin.
2. Go to the root of your Maven project and edit the `pom.xml` file to include the following fragment:

   ```xml
   <properties>
     <oxygen-webhelp>${basedir}/tools/plugins/com.oxygenxml.webhelp.responsive</oxygen-webhelp>
   </properties>
   
   <plugin>
     <artifactId>exec-maven-plugin</artifactId>
     <groupId>org.codehaus.mojo</groupId>
     <executions>
       <execution><!-- Run our version calculation script -->
         <id>Version Calculation</id>
         <phase>generate-sources</phase>
         <goals>
           <goal>exec</goal>
         </goals>
         <configuration>
           <executable>${oxygen-webhelp}/ditaWebhelp.bat</executable>
         </configuration>
       </execution>
     </executions>
   </plugin>
   
3. Go to the Jenkins top page and create a new Jenkins job. Configure this job to suit your particular requirements, such as the build frequency and location of the Maven project.

Automating DITA to WebHelp Output with Travis CI

This topic assumes you have a DITA project hosted on a GitHub public or private repository.

The goal of this tutorial is to help you set up a Travis continuous integration job that automatically publishes your DITA project to GitHub pages after every commit. The published website will contain a feedback link on each page that would allow a contributor to easily suggest changes to the documentation by creating a pull request on GitHub with just a few clicks.
Enable the Travis CI Build

1. Sign in to Travis CI with your GitHub account, accepting the GitHub access permissions confirmation.
2. Once you are signed in, and you have synchronized your GitHub repositories, go to your profile page and enable Travis CI for the repository you want to build.

Configure the Travis CI Build in your GitHub Project

1. Checkout your GitHub project locally.
2. Copy the .travis folder from here to the root directory of your project.
3. In the root of your GitHub project, add a file called .travis.yml with the following content:

```yaml
language: dita
install:
  - echo "Installed"
script:
  - sh .travis/publish.sh
after_success:
  - sh .travis/deploy.sh
env:
  global:
    - DITAMAP=/path/to/your/ditamap/file
    - DITAVAL=/path/to/your/ditaval/file
    - ANT_OPTS=-Xmx1024M

Note: Replace /path/to/your/ditamap/file and /path/to/your/ditaval/file with the appropriate paths to your DITA map and ditaval files.
4. Create a GitHub personal access token by following this procedure.
5. Define an environment variable in the repository settings that has the name GH_TOKEN and the value equal with the GitHub personal access token created earlier.

Register Your License Key

1. Edit your .gitignore file (or create it if it does not already exist) and add the following line:

   licenseKey.txt

2. Copy your WebHelp license to the root of your GitHub project in a file called licenseKey.txt.
**Important:** The licenseKey.txt file should not be committed to GitHub as it contains a license key that is issued only to you.

3. **Encrypt the license key file** and **add** it to the `.travis.yml` configuration file. This way only the Travis CI server will be able to decrypt it during the build process.

**Commit to GitHub**

1. Commit the following files and folders and push the commit to GitHub:

```bash
    git add .gitignore licenseKey.txt.enc .travis.yml .travis/
    git commit -m "Set up the Travis CI publishing system"
    git push
```

2. Create a `gh-pages` branch in your GitHub project where the WebHelp output will be published. You can follow the procedure [here](#).

**Customizing the WebHelp Responsive Output**

Oxygen XML Editor plugin provides support for customizing the **WebHelp Responsive** output to suit your specific needs. The **WebHelp Responsive** output is based upon the **Bootstrap** responsive front-end framework and is available for DITA document types. The **WebHelp Responsive with Feedback** variant allows your users to add comments to your output.

To change the overall appearance of your **WebHelp Responsive** output, you can use several different customization methods or a combination of methods. If you are familiar with CSS and coding, you can style your WebHelp output through your own custom stylesheets. You can also customize your output by modifying existing templates, create your own layout pages, or by configuring certain options and parameters in the transformation scenario.

This section includes topics that explain various ways to customize your WebHelp Responsive system output, such as how to configure the tiles on the main page, add logos in the title area, integrate with social media, localizing the interface, and much more.

**Working with Publishing Templates**

An **Oxygen Publishing Template** (page 2708) defines all aspects of the layout and styles of the **WebHelp Responsive** output. It is a self-contained customization package stored as a ZIP archive or folder that can easily be shared with others. It provides the primary method for customizing the output. The recommended method for customizing the **WebHelp Responsive** output is to use a custom publishing template.
This section contains topics about how to create, edit, publish, and share publishing templates.

Related Information:

- Publishing Template Package Contents for WebHelp Responsive Customizations (page 1635)

How to Create a Publishing Template

To create a customization, you can start from scratch or from an existing template, and then adapt it according to your needs.

Creating a Template Starting from Scratch

To create a new Oxygen Publishing Template, follow these steps:

1. Create a folder that will contain all the template files.
2. In Oxygen XML Editor/Author, open the new document wizard (use File > New or the New toolbar button), then choose the Publishing Template Descriptor template.

   Figure 578: Choosing the Publishing Template Descriptor Document Template

3. Save the .opt file into your customization directory.
4. Open the .opt file in the editor and customize it to suit your needs.
Creating a Template Starting from an Existing Template

If you are using a WebHelp Responsive or DITA Map PDF - based on HTML5 & CSS transformation, the easiest way to create a new Oxygen Publishing Template (page 2708) is to select an existing template in the transformation scenario dialog box and use the Save template as button to save that template into a new template package that can be used as a starting point.

To create a new Oxygen Publishing Template, follow these steps:

1. Open the transformation scenario dialog box and select the publishing template you want to export and use as a starting point.
2. Optional: You can set one or more transformation parameters from the Parameters tab and the edited parameters will be exported along with the selected template. You will see which parameters will be exported in the dialog box that is displayed after the next step.
3. Click the Save template as button.

   **Step Result:** This opens a template package configuration dialog box that contains some options and displays the parameters that will be exported to your template package.

4. Specify a name for the new template.
5. Optional: Specify a template description.
6. Optional: The same publishing template package can contain both a WebHelp Responsive and PDF customization and you can use the same template in both types of transformations (DITA Map WebHelp Responsive or DITA Map to PDF - based on HTML5 & CSS). You can use the Include WebHelp customization and Include PDF customization options to specify whether your custom template will include both types of customizations.
7. Optional: For WebHelp Responsive customizations, you can select the Include HTML Page Layout Files option if you want to copy the default HTML Page Layout Files (page 1649) in your template package. They are helpful if you want to change the structure of the generated HTML pages.
8. In the Save as field, specify the name and path of the ZIP file where the template will be saved.

   **Step Result:** A new ZIP archive will be created on disk in the specified location with the specified name.
9. Open the .opt file in the editor and customize it to suit your needs.

For more information about creating and customizing publishing templates, watch our video demonstration:

[https://www.youtube.com/embed/zNmXfKWXwO8](https://www.youtube.com/embed/zNmXfKWXwO8)

**Related Information:**
How to Edit a Packed Publishing Template

To edit an existing Oxygen Publishing Template package, follow these steps:

1. Unzip the ZIP archive associated with the Oxygen Publishing Template in a separate folder.
2. Link the folder associated with the template in the Navigator view.
3. Using the Navigator view, you can modify the resources (CSS, JS, fonts) within the Oxygen Publishing Template folder to fit your needs.
4. Open the publishing template descriptor file (.opt extension) in the editor and modify to suit your needs.
5. Optional: Once you finish your customization, you can archive the folder as a ZIP file.

Related Information:

- Publishing Template Package Contents for PDF Customizations (page 1764)
- Publishing Template Package Contents for WebHelp Responsive Customizations (page 1635)

How to Add a Publishing Template to the Publishing Templates Gallery

To add the publishing template to your templates gallery, follow these steps:

1. Open the transformation scenario dialog box by editing a WebHelp Responsive transformation.

2. In the Templates tab, click the Configure Publishing Templates Gallery link to.
   This will open the preferences page.

3. Click the Add button and specify the location of your template directory.
   Your template directory is now added to the Additional Publishing Templates Galleries list.

4. Click OK to return to the transformation scenario dialog box.
All the templates contained in your template directory will be displayed in the preview pane along with all the built-in templates.

How to Use a Publishing Template from a Command Line

Before you run the transformation, you need to know if the publishing template has a single or multiple template descriptor files (page 1636). If you don't know, open the ZIP archive or folder and check for files with the .opt extension.

Using a Publishing Template with a Single Descriptor

A template with a single descriptor is used for a single customization.

To run from a command line, you need to use the webhelp.publishing.template parameter (page 1745). This parameter specifies the path to the ZIP archive (or root folder) that contains your custom WebHelp Responsive template.

**Command-Line Example:**

- **Windows:**
  ```
dita.bat
  --format=webhelp-responsive
  --input=c:\path\to\mySample.ditamap
  --output=c:\path\to\output
  -Dwebhelp.publishing.template=custom-template
  ```

- **Linux/Mac OS X:**
  ```
dita
  --format=webhelp-responsive
  --input=/path/to/mySample.ditamap
  --output=/path/to/output
  -Dwebhelp.publishing.template=custom-template
  ```

Using a Publishing Template with Multiple Descriptors

A template with multiple descriptors contains multiple customizations.

Because the publishing template is self-contained, it is used to reuse resources that are common to multiple publications.
To run from a command line, you need to use the `webhelp.publishing.template` (page 1745) and `webhelp.publishing.template.descriptor` (page 1745) parameters.

The `webhelp.publishing.template` (page 1745) parameter specifies the path to the ZIP archive (or root folder) while the `webhelp.publishing.template.descriptor` (page 1745) parameter specifies the name of the descriptor you want to use.

**Command-Line Example:**

- **Windows:**

  ```bash
dita.bat
  --format=webhelp-responsive
  --input=c:\path\to\mySample.ditamap
  --output=c:\path\to\output
  -Dwebhelp.publishing.template=custom-template
  -Dwebhelp.publishing.template.descriptor=flowers.opt
  ```

- **Linux/Mac OS X:**

  ```bash
dita
  --format=webhelp-responsive
  --input=/path/to/mySample.ditamap
  --output=/path/to/output
  -Dwebhelp.publishing.template=custom-template
  -Dwebhelp.publishing.template.descriptor=flowers.opt
  ```

**How to Share a Publishing Template**

To share a publishing template with others, following these steps:

1. Copy your template in a new folder in your project.
2. Go to **Options > Preferences > DITA > Publishing** and add that new folder to the list.
3. Switch the option as the bottom of that preferences page to **Project Options**.
4. Share your project file (`.xpr`).

**Converting Old Templates to Version 20.0 and Newer**

With the introduction of the Publishing Template concept in Oxygen XML Editor plugin version 20.0, the old WebHelp output template formats (version 19.1 and older) are no longer supported. However, they can be easily converted to the new format by following this procedure:
1. Set Oxygen XML Editor plugin to point to the DITA-OT distribution that contains your old template:
   a. Go to Options > Preferences > DITA.
   b. Select Custom in the DITA Open Toolkit section and specify the DITA-OT directory that contains your old template.
2. Edit a WebHelp Responsive transformation scenario.
3. Select your old custom template in the Templates tab.
4. Click on the Save Template as button, complete the required fields, and save the template.
5. Edit the WebHelp Responsive transformation scenario again.
6. This time, use the Choose custom template button to select your old template.
7. Save the scenario and use it to generate the WebHelp Responsive output.

Related Information:

- Converting Old Templates with Custom HTML Page Layout Files to Version 21 (page 1681)

Converting Old Templates with Custom HTML Page Layout Files to Version 21

If you have a custom Publishing Template that was created in Oxygen XML Editor plugin version 20.0 or 20.1 and it includes custom HTML page layout files (page 1649), the following conversion procedure is required for the template to be compatible with Oxygen XML Editor plugin version 21.0:

1. In the Navigator view, add the root directory of your custom Publishing Template (you can use a linked folder (page 19) and the easiest way to do this is to drag and drop the folder).

   ![Note:](image)

   If your template is stored as a ZIP archive, you first need to unzip it.

2. Expand your template directory, right-click the page-templates subfolder, and select Refactoring > XML Refactoring.
3. In the XML Refactoring dialog box, scroll to the Publishing Template section and select Migrate HTML Page Layout Files to v21, then click Next.
4. The Scope should be left as Selected project resources.
5. You can use the Preview button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.
6. Click Finish to perform the conversion.

Related Information:
Troubleshooting: Errors Encountered when Loading Templates

When the Templates tab of a WebHelp Responsive transformation scenario dialog box is opened, all templates (built-in and custom) are loaded and validated. Specifically, certain elements in the template descriptor file (page 1636) are checked for validity. If errors are encountered that prevents the template from loading, the following message will be displayed toward the bottom of the dialog box:

![Some templates could not be loaded. More details](image)

If you click the More details link, a window will open with more information about the encountered error. For example, it might offer a hint for which element is missing from the expected descriptor file structure (page 1636).

Also, if a template could be loaded, but certain elements could not be found in the descriptor file (page 1636), a warning icon (⚠️) will be displayed on the template's image (in the Templates tab of the transformation dialog box). For example, this happens if a valid preview-image element (page 1638) cannot be found.

Changing the Layout and Styles

This section contains topics that explain how to customize the output using CSS, inserting HTML fragments, changing the layout of the main page, and more.

How to Use CSS Styling to Customize the Output

The most common way to customize WebHelp Responsive output is to use custom CSS styling. This method can be used to make small, simple styling changes or more advanced, precise changes. To implement the styling in your WebHelp output, you simply need to create the custom CSS file and reference it in your transformation scenario (using a Oxygen Publishing Templater (page 2708) or a transformation parameter). This custom file will be the final CSS to be applied so its content will override the styles in the other pre-existing CSS files.

Using CSS Inspector to Identify Content for Custom CSS File

You can use your browser's CSS inspector to identify the pertinent code in the current CSS files and you can even make changes directly in the CSS inspector to test the results so that you know exactly what content to use in your custom CSS file.
In most popular browsers (such as Chrome, Firefox, and Edge), you can access the CSS inspector by using **F12** or by selecting **Inspect Element** (or simply **Inspect**) from the contextual menu.

**Tip:** When using Safari on Mac OS X, you must first enable the Develop menu by going to the Advanced settings and selecting **Show Develop menu in menu bar**. Then you can select **Show Web Inspector** from the Develop menu or click **Command + Option + I**.

Create the Custom CSS

As a practical example, the following procedure would change the background color of the footer bar in the WebHelp output:

1. Use the browser's CSS inspector to identify the current CSS code that styles the footer bar. In this particular case, the pertinent code that would be identified is:

   ```css
   .wh_footer {
     font-size: 15px;
     line-height: 1.7em;
     background-color: #000;
   }
   ```

2. If you want to test the color you want to apply as the background of this particular element, use the browser's CSS inspector to change the value of the `background-color` attribute. After you find a suitable color, copy that new code.

3. Create a custom CSS file and paste or enter the copied code. For example:

   ```css
   .wh_footer {
     background-color: #255890;
   }
   ```

4. Save the custom CSS file at a location of your convenience.

5. Reference the CSS file in a **WebHelp Responsive** transformation using an **Oxygen Publishing Template (page 1683)** or the **args.css** parameter (page 1684).

Referencing the CSS Using a Publishing Template

1. If you haven't already created a Publishing Template, see **Working with Publishing Templates (page 1675)**.

2. Using the **Navigator** view, copy your custom CSS in a folder inside the publishing template root folder (for example, in the `custom_footer_template/resources` folder).

3. Open the **template descriptor file (page 1636)** associated with your publishing template and add your custom CSS in the `resources` section.
<publishing-template>
  ...
  <webhelp>
    ...
    <resources>
      ...
      <css file="resources/MyCustom.css"/>
  </webhelp>
</publishing-template>

4. Open the *DITA Map WebHelp Responsive* transformation scenario.
5. Click the *Choose Custom Publishing Template* link and select your template.
6. Click **OK** to save the changes to the transformation scenario.
7. Run the transformation scenario.

**Result:** Your custom CSS will be applied as a final layer on top of any existing CSS rules and the output will reflect the changes you made.

**Referencing the CSS Using the *args.css* Parameter**

1. Edit the *DITA Map WebHelp Responsive* transformation scenario and open the **Parameters** tab.
2. Set the **args.css** parameter to the path of your custom CSS file.
3. Set the **args.copycss** parameter to **yes** to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
4. Click **OK** to save the changes to the transformation scenario.
5. Run the transformation scenario.

**Result:** Your custom CSS will be applied as a final layer on top of any existing CSS rules and the output will reflect the changes you made.

**How to Insert HTML Content in WebHelp Responsive Output**

You can add custom HTML content in the WebHelp Responsive output by inserting it in a well-formed XML file that will be referenced in the transformation (either from an *Oxygen Publishing Template* (page 2708) or using one of the *HTML fragment parameters* (page 1746)). This content may include references to additional JavaScript, CSS, and other types of resources, or such resources can be inserted inline within the HTML content that is inserted in the XML file.

**The XML File**

There are several things to consider regarding this XML file:

- **Well-Formedness** - If the file is not a *Well-formed XML document* (page 854) (or fragments are not well-formed), the transformation will fail.
A common use case is if you want to include several script or link elements. In this case, the XML fragment has multiple root elements and to make it well-formed, you can wrap it in an html element. This element tag will be filtered out and only its children will be copied to the output documents. Similarly, you can wrap your content in head, body, html/head, or html/body elements.

• **Referencing Resources in the XML File** - You can include references to local resources (such as JavaScript or CSS files) by using the built-in `$oxygen-webhelp-output-dir` macro to specify their paths relative to the output directory:

```html
<html>
  <script type="text/javascript" src="${oxygen-webhelp-output-dir}/js/test.js"/>
  <link rel="stylesheet" type="text/css" href="${oxygen-webhelp-output-dir}/css/test.css"/>
</html>
```

If you want that the path of your resource to be relative to the templates directory (page 1632), you can use the `$oxygen-webhelp-template-dir` macro.

To copy the referenced resources to the output directory, follow the procedure in: How to Copy Additional Resources to Output Directory (page 1702).

• **Inline JavaScript or CSS Content**:

JavaScript:

```html
<script type="text/javascript">
  /* Include JavaScript code here. */

  function myFunction() {
    return true;
  }

</script>
```

CSS:

```html
<style>
  /* Include CSS style rules here. */

  *
  color:red

</style>
```
**Note:** If you have special characters (for example, &, <) that break the well-formedness of the XML fragment, it is important to place this content inside an XML comment:

```html
<script type="text/javascript">
<!--
 /* Include JavaScript code here. */

 function myFunction() {
     return true;
 }
 --/>
</script>
```

### Using WebHelp Macros Inside an HTML Fragment File

The XML file can use WebHelp macros, which are variables that will be expanded when the content of the HTML fragment file will be copied in the final output.

There are two possibilities for using macros:

- **Directly in attribute values** - For example, if you want to reference a JavaScript file from the Publishing Template directory, you can use the following construct:

  ```html
  <script type="text/javascript" src="${path(oxygen-webhelp-template-dir)}/">
  </script>
  ```

- **In text content** - Using the `<whc:macro/>` template component:

  ```html
  <script type="text/javascript" xmlns:whc="http://www.oxygenxml.com/webhelp/components">
  var outDirPath = '<whc:macro value="${path(oxygen-webhelp-output-dir)}"/>';
  console.log("The output directory path is:", outDirPath);
  </script>
  ```

The following *macros* are supported:

- `i18n`
  
  For localizing a string.

  ```html
  ${i18n(string.id)}
  ```

- `param`
Returns the value of a transformation parameter.

```text
${param(webhelp.show.main.page.tiles)}
```

`env`

Returns the value of an environment variable.

```text
${env(JAVA_HOME)}
```

`system-property`

Returns the value of a system property.

```text
${system-property(os.name)}
```

`timestamp`

Can be used to format the current date and time. Accepts a string (as a parameter) that determines how the date and time will be formatted (format string or picture string as it is known in the XSLT specification). The format string must comply with the rules of the XSLT `format-dateTime` function specification.

```text
${timestamp([h1]:[m01] [P] [M01]/[D01]/[Y0001])}
```

`path`

Returns the path associated with the specified path ID. The following paths IDs are supported:

- `oxygen-webhelp-output-dir` - The path to the output directory. The path is relative to the current HTML file.
- `oxygen-webhelp-assets-dir` - The path to the `oxygen-webhelp` subdirectory from the output directory. The path is relative to the current HTML file.
- `oxygen-webhelp-template-dir` - The path to the template directory. The path is relative to the current HTML file.

```text
${path(oxygen-webhelp-template-dir)}
```

**Note:** New paths IDs can be added by overriding the `wh-macro-custom-path` template from `com.oxygenxml.webhelp.responsive\xsl\template\macroExpander.xsl`:

```xml
<!-- Extension template for expanding a custom path macro. -->
<xsl:template name="wh-macro-custom-path">
  <xsl:param name="pathId"/>
```
map-xpath

Can be used to execute an XPath expression over the DITA map file from the temporary directory.

Tip: Available in all template layout HTML pages.

${map-xpath(/map/title)}

topic-xpath

Can be used to execute an XPath expression over the current topic.

Tip: Available only in the topic HTML page template (wt_topic.html).

${topic-xpath(string-join(//shortdesc//text(), ' '))}

oxygen-webhelp-build-number

Returns the current WebHelp distribution ID (build number).

${oxygen-webhelp-build-number}

Referencing the HTML fragment using a Publishing Template

1. If you have not already created a Publishing Template, see Working with Publishing Templates (page 1675).
2. Insert the HTML content in a well-formed XML file (for example, custom-html.html).
3. Using the Navigator view, copy your custom HTML fragment in a folder inside publishing the template root folder (for example, in the custom_footer_template/html-fragments folder).
4. Open the template descriptor file (page 1636) associated with your publishing template and add a reference to the custom HTML fragment in the html-fragments section.

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <html-fragments>
      <fragment
        file="html-fragments/custom-html.html"
        placeholder="webhelp.fragment.head"/>
    </html-fragments>
  </webhelp>
  ...
</publishing-template>
```
Note: If you want to insert the content in another location within the output document, you can reference the XML file from any other HTML Fragment extension points (page 1643).

5. Open the DITA Map WebHelp Responsive transformation scenario.
6. Click the Choose Custom Publishing Template link and select your template.
7. Click OK to save the changes to the transformation scenario.
8. Run the transformation scenario.

Results: Your additional content will be included at the end of the head element of your output document.

Referencing the HTML Fragment using a Transformation Parameter

1. Insert the HTML content in a well-formed XML file.
2. Edit the DITA Map WebHelp Responsive transformation scenario and open the Parameters tab.
3. Edit the value of the webhelp.fragment.head parameter and set it to the absolute path of your XML file.

Note: If you want to insert the content in another location within the output document, you can reference the XML file from any other HTML Fragment extension points (page 1643).

4. Click OK to save the changes to the transformation scenario.
5. Run the transformation scenario.

Results: Your additional content will be included at the end of the head element of your output document.

How to Insert JavaScript AMD Modules in WebHelp Responsive Output

In the WebHelp Responsive output, you may want to include a JavaScript module that uses the Asynchronous Module Definition (AMD) format. Unlike the traditional JavaScript resources that are loaded using <script> tags, these modules are loaded using the RequireJS library. For the traditional
JavaScript libraries, the standard procedure to contribute your script to the output would be to use an HTML fragment file as described here (page 1684).

Although following the procedure that uses HTML fragments (page 1684) would result in having your JS file included in the output, loading the JS code in the browser will result in an error. Since your JS module uses the AMD API, it cannot be loaded using a `<script>` element. For example, because many jQuery plugins use the AMD format, it will be difficult for you to use those libraries in your custom WebHelp output.

Normally, a JavaScript AMD module can be loaded in one of the following ways:

- **As a top-level script**, using the `data-main` attribute of the `<script>` element used to load the RequireJS library.

  ```html
  <script data-main="js/template-main.js" src="js/require.js"></script>
  ```

  However, since WebHelp already loads its internal JS modules using RequireJS, a top level script is already specified and you cannot specify another top level script in the same page. Therefore, this approach can not be used to load your custom JS module in Oxygen XML WebHelp, leaving you with only the following option.

- **As a dependency module**, using a `require()` call from the top level (main) script or from one of its dependency modules. This means that you would have to alter one of the WebHelp core JS libraries and inject a `require()` call to load your custom module:

  ```javascript
  require(['js/template-main.js']);
  ```

  **Note:** Altering the WebHelp core libraries is not recommended because when you will upgrade the WebHelp plugin to a newer version, those modifications will be lost.

### Contributing JavaScript AMD Modules Using a Publishing Template

**Oxygen XML WebHelp** provides the ability to contribute a custom JavaScript Asynchronous Module Definition (AMD) resource in the output by referencing it in the Publishing Template descriptor file (page 1636). This module is automatically copied to the output directory and it is automatically loaded in the output HTML pages using a `require()` call. Thus, you can include your scripts in the output without altering WebHelp's core JavaScript libraries.

This module may contain all of your custom functionality or can be used to load other AMD JavaScript modules. The additional sub-modules can be stored either locally in your custom Publishing Template or on a remote web server.
Important: To enable loading of a JS module you should set the webhelp.enable.template.js.module.loading parameter to yes (the default value is no) in the Publishing Template descriptor file or in the transformation scenario.

The JavaScript Modules

The JS Modules sample template contains a main JavaScript module (template-main.js) that loads other modules stored in the template package or in a remote location on the Internet.

```javascript
define(['require'], function (require) {
    require(['./red', './italic', './tables']);
});
```

Besides the main JavaScript example, the template contains 3 other sub-modules:

- **red.js** - Changes the font color of the publication title.

```javascript
define(['jquery'], function ($) {
    $(document).ready(function () {
        // Make the title red
        $('.wh_publication_title a').attr('style', 'color:red');
    });
});
```

- **italic.js** - Changes the font style of your publication title.

```javascript
define(['jquery'], function ($) {
    $(document).ready(function () {
        // Make the title italic
        $('.wh_publication_title a').wrapInner('<i></i>');
    });
});
```

- **tables.js** - Loads the DataTables jQuery plugin from a CDN.

```javascript
define(['jquery',
    'https://cdn.datatables.net/1.10.16/js/jquery.dataTables.min.js'], function ($) {
    $(document).ready(function () {
        $('.table').DataTable();
    });
});
```
The JavaScript modules are stored in the Publishing Template package as follows:

```javascript
[template-dir]
    [js]
        template-main.js
        italic.js
        red.js
        tables.js
```

**Note:**

- The main module should be referenced in the Publishing Template descriptor file (page 1636) by specifying its path relative to the base directory of the template.

```xml
<js-amd-module file="js/template-main.js"/>
```

- The main JS module is copied automatically to the output directory, but the sub-modules are not. To instruct the Publishing Template engine to copy those modules to the output directory you should include a `<fileset>` section in the Publishing Template descriptor file (page 1636).

```xml
<fileset>
    <include name="js/*.js"/>
</fileset>
```

- The main module can reference other modules bundled in the publishing template package as follows:
  - **Relative to template directory** - Prefix their paths with the ID of the template directory:
    template-base-dir (for example: template-base-dir/js/italic).
  - **Relative to the name of the current JS module** - Use `./` to prefix the paths of the referenced modules.
  - The `.js` extension should be omitted for local modules, because the RequireJS library will add it automatically.

**Related Information:**

- How to Insert HTML Content in WebHelp Responsive Output (page 1684)

How to Change Numbering Styles for Ordered Lists
Ordered lists (ol) are usually numbered in XHTML output using numerals. If you want to change the numbering to alphabetical, follow these steps:

1. Define a custom outputclass value and set it as an attribute of the ordered list, as in the following example:

   ```html
   <ol outputclass="number-alpha">
     <li>A</li>
     <li>B</li>
     <li>C</li>
   </ol>
   ```

2. Add the following code snippet in a custom CSS file:

   ```css
   ol.number-alpha{
     list-style-type:lower-alpha;
   }
   ```

3. Reference the CSS file in a WebHelp Responsive transformation using an Oxygen Publishing Template (page 1693) or the args.css parameter (page 1694).

### Referencing the Custom CSS from a Publishing Template

1. If you haven't already created a Publishing Template, see Working with Publishing Templates (page 1675).
2. Using the Navigator view, copy your custom CSS in a folder inside the publishing template root folder (for example, in the custom_footer_template/resources folder).
3. Open the template descriptor file (page 1636) associated with your publishing template and add your custom CSS in the resources section.

   ```xml
   <publishing-template>
     ...
     <webhelp>
       ...
       <resources>
         ...
         <css file="resources/MyCustom.css"/>
       </resources>
     </webhelp>
   </publishing-template>
   ```

4. Open the DITA Map WebHelp Responsive transformation scenario.
5. Click the Choose Custom Publishing Template link and select your template.
6. Click OK to save the changes to the transformation scenario.
7. Run the transformation scenario.

**Result:** Your custom CSS will be applied as a final layer on top of any existing CSS rules and the output will reflect the changes you made.

### Referencing the CSS Using the `args.css` Parameter

1. Edit the DITA Map WebHelp Responsive transformation scenario and open the **Parameters** tab.
2. Set the `args.css` parameter to the path of your custom CSS file.
3. Set the `args.copycss` parameter to `yes` to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
4. Click **OK** to save the changes to the transformation scenario.
5. Run the transformation scenario.

**Result:** Your custom CSS will be applied as a final layer on top of any existing CSS rules and the output will reflect the changes you made.

### How to Show or Hide Navigation Links in Topic Pages

The topic pages (page 1602) in WebHelp Responsive output can contain navigation links (← Previous / → Next arrows) that can be used to navigate to the previous or next topic.

### How to Control Which Topic Pages Include Navigation Links

The navigation links are controlled by the `collection-type` attribute. For example, if you set `collection-type="sequence"` on a parent topic reference in your DITA map, navigation links will be generated in the output for all of its child topics (from children to parent, and from child to previous sibling and next sibling).

```
<map id="example_map" title="Example Map">
  <topicref href="/topics/ParentTopic.dita" collection-type="sequence">
    <topicref href="/topics/Childtopic.dita"/>
  </topicref>
</map>
```

### How to Generate Navigation Links for All Topics (Ignoring the Collection Type Attribute)

You can use the `webhelp.default.collection.type.sequence` parameter in the transformation and set its value to `yes` to generate navigation links for all topics, regardless of whether or not the `collection-type` attribute is present.
How to Hide All Navigation Links

To hide all navigation links, use the \texttt{webhelp.show.navigation.links} parameter in the transformation and set its value to \texttt{no}.

How to Change the Main Page Layout

This section contains topics that explain how to customize the layout of the main page in the WebHelp Responsive output.

How to Customize the Menu

By default, the menu component is displayed in all WebHelp Responsive pages. However, you might want to hide it completely, or only display some of its menu entries.

How to Hide Some of the Menu Entries

There are two methods for doing this. One of them involves editing the \textit{DITA map (page 2705)} and marking the topics that do not need to be included in the menu, and another one that uses a small CSS customization.

Editing the DITA Map

To edit the metadata in the \textit{DITA map} to control which topics will not be displayed in the menu, follow these steps:

1. Open the \textit{DITA map} in the \textbf{Text} editing mode of Oxygen XML Editor plugin.
2. Add the following metadata information in the \texttt{topicref} element (or any of its specializations) for each topic you do not want to be displayed in the menu:

   \begin{verbatim}
   <topicmeta>
     <data name="wh-menu">
       <data name="hide" value="yes"/>
     </data>
   </topicmeta>
   \end{verbatim}

Customizing the CSS

To customize the CSS to control which topics will not be displayed in the menu, follow these steps:

1. Make sure you set an ID on the topic that you do not want to include in the menu.
2. Create a new CSS file that contains a rule that hides the menu entry generated for the topic (identified by the topic ID `growing-flowers` in the following example). The CSS file should have content that is similar to this:

```css
.wh_top_menu *[data-id='growing-flowers'] {
  display:none;
}
```

3. Reference the CSS file in a WebHelp Responsive transformation using an Oxygen Publishing Template (page 1683) or the `args.css` parameter (page 1684).

How to Hide the Entire Menu

If you do not want to include a main menu in the pages of the WebHelp Responsive output, you can instruct the transformation scenario to skip the menu generation completely.

Using a Publishing Template

To hide the menu using an Oxygen Publishing Template (page 1632), follow this procedure:

1. If you haven't already created a Publishing Template, see Working with Publishing Templates (page 1675).
2. Open the template descriptor file (page 1636) associated with your publishing template and add the `webhelp.show.top.menu` parameter in the `parameters` section with its value set to `no`.

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <parameters>
      <parameter name="webhelp.show.top.menu" value="no"/>
    </parameters>
  </webhelp>
</publishing-template>
```

3. Open the DITA Map WebHelp Responsive transformation scenario.
4. Click the Choose Custom Publishing Template link and select your template.
5. Click OK to save the changes to the transformation scenario.
6. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To hide the menu using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:
1. Edit the DITA Map WebHelp Responsive transformation scenario and choose a template.
2. Open the Parameters tab and set the webhelp.show.top.menu parameter to no.
3. Click OK to save the changes to the transformation scenario.
4. Run the transformation scenario.

How to Add a Welcome Message in the WebHelp Responsive Main Page

The main page of the WebHelp Responsive output contains a set of empty placeholders (page 1643) that can be used to display customized text fragments. These placeholders are available to you through WebHelp Responsive transformation scenario parameters. For example, the placeholder identified through the webhelp.fragment.welcome parameter displays text content above the search box in the main page.

Using a Publishing Template

To add a customized welcome message in the main page of the WebHelp Responsive output using an Oxygen Publishing Template (page 1632), follow this procedure:

1. If you haven't already created a Publishing Template, see Working with Publishing Templates (page 1675).
2. Open the template descriptor file (page 1636) associated with your publishing template and add the webhelp.fragment.welcome parameter in the parameters section with its value set to one of the following:
   • A small well-formed XHTML fragment (such as: <i>Welcome to the User Guide</i>).
   • A path to a file that contains well-formed XHTML content.

   ```xml
   <publishing-template>
     ...
     <webhelp>
       ...
       <parameters>
         <parameter name="webhelp.fragment.welcome" value="c:\myMessage.xhtml"/>
       </parameters>
     </webhelp>
   </publishing-template>
   ```
3. Open the DITA Map WebHelp Responsive transformation scenario.
4. Click the Choose Custom Publishing Template link and select your template.
5. Click OK to save the changes to the transformation scenario.
6. Run the transformation scenario.
Result: In the WebHelp output, your custom message will be displayed above the search box in the main page.

Using a Transformation Scenario in Oxygen XML Editor/Author

⚠ Important: Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

• You must have a valid license for the Oxygen XML WebHelp Plugin (https://www.oxygenxml.com/buy_webhelp.html).
• The Oxygen XML WebHelp Plugin must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To add a customized welcome message in the main page of the WebHelp Responsive output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Edit the DITA Map WebHelp Responsive transformation scenario and choose a template.
2. Open the Parameters tab and set the webhelp.fragment.welcome parameter with its value set to one of the following:
   • A small well-formed XHTML fragment (such as: `<i>Welcome to the User Guide</i>`).
   • A path to a file that contains well-formed XHTML content.
3. Click OK to save the changes to the transformation scenario.
4. Run the transformation scenario.

Result: In the WebHelp output, your custom message will be displayed above the search box in the main page.

How to Create a Custom Footer

The main page of the WebHelp Responsive output contains a set of empty placeholders (page 1643) that can be used to display customized text fragments. These placeholders are available to you through WebHelp Responsive transformation scenario parameters. For example, the placeholder identified through the webhelp.fragment.footer parameter displays the custom content at the bottom of the page.

Using a Publishing Template

To create a custom footer in the WebHelp Responsive output using an Oxygen Publishing Template (page 1632), follow this procedure:
1. If you haven’t already created a Publishing Template, see Working with Publishing Templates (page 1675).

2. Open the template descriptor file (page 1636) associated with your publishing template and add the `webhelp.fragment.footer` parameter in the `parameters` section with its value set to one of the following:
   - A small well-formed XHTML fragment.
   - A path to a file that contains well-formed XHTML content.

   ```xml
   <publishing-template>
       ...
       <webhelp>
           ...
           <parameters>
               <parameter name="webhelp.fragment.footer" value="c:\myFooter.xhtml="/>
           </parameters>
       </webhelp>
   </publishing-template>
   ``

3. Open the DITA Map WebHelp Responsive transformation scenario.

4. Click the Choose Custom Publishing Template link and select your template.

5. Click OK to save the changes to the transformation scenario.

6. Run the transformation scenario.

   **Result:** In the WebHelp output, your custom footer will be displayed at the bottom of the page.

**Using a Transformation Scenario in Oxygen XML Editor/Author**

⚠️ **Important:** Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin (https://www.oxygenxml.com/buy_webhelp.html).
- The Oxygen XML WebHelp Plugin must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To create a custom footer in the WebHelp Responsive output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Edit the DITA Map WebHelp Responsive transformation scenario and choose a template.
2. Open the Parameters tab and set the `webhelp.fragment.footer` parameter with its value set to one of the following:
   - A small well-formed XHTML fragment.
3. Click OK to save the changes to the transformation scenario.
4. Run the transformation scenario.

**Result:** In the WebHelp output, your custom footer will be displayed at the bottom of the page.

How to Configure the Tiles on the WebHelp Responsive Main Page

The tiles version of the main page of the WebHelp Responsive output displays a tile for each topic found on the first level of the [DITA map](page 2705). However, you might want to customize the way they look or even to hide some of them.

Depending on your particular setup, you can choose to customize the these tiles either by setting metadata information in the [DITA map](page 2705) or by customizing the CSS that is associated with the [DITA map](page 2705).

How to Hide Some of the Tiles

If your documentation is very large or there is a large number of topics on the first level, you might want to hide some of the tiles. Also, this might be useful if you only want to display the topics in the first page that are most relevant to your intended audience.

There are two methods for doing this. One of them involves editing the [DITA map](page 2705) and marking the topics that do not need to be displayed as tiles, and another one that uses a small CSS customization level to hide some tiles identified by the ID of the topic.

**Editing the DITA Map**

To edit the metadata in the [DITA map](page 2705) to control which topics on the first level of the [DITA map](page 2705) will not be displayed as a tile, follow these steps:

1. Open the [DITA map](page 2705) in the **Text** editing mode of Oxygen XML Editor plugin.
2. Add the following metadata information in the `topicref` element (or any of its specializations) for each first-level topic that you do not want to be displayed as a tile:

   ```xml
   <topicmeta>
     <data name="wh-tile">
       <data name="hide" value="yes"/>
     </data>
   </topicmeta>
   ```

**Customizing the CSS**
To customize the CSS to control which topics on the first level of the DITA map will not be displayed as a tile, follow these steps:

1. Make sure you set an ID on the topic you want to hide.
2. Create a new CSS file that contains a rule that hides the tile generated for the topic (identified in the following example by the topic ID `growing-flowers`). The CSS file should have content that is similar to this:

```css
.wh_tile [data-id='growing-flowers'] { display:none; }
```
3. Reference the CSS file in a WebHelp Responsive transformation using an Oxygen Publishing Template (page 1683) or the `args.css` parameter (page 1684).

**How to Add an Image to the Tiles**

There are two methods that you can use to add an image to a tile. One of them involves editing the DITA map, and the other uses a CSS customization.

**Editing the DITA Map**

To edit the metadata in the DITA map to set an image to be displayed in a tile, follow these steps:

1. Open the DITA map in the Text editing mode of Oxygen XML Editor plugin.
2. Add the following metadata information in the `topicref` element (or any of its specializations) for each first-level topic that will have an image displayed in the corresponding tile:

```xml
<topicmeta>
  <data name="wh-tile"/>
  <data name="image" href="img/tile-image.png" format="png">
    <data name="attr-width" value="64"/>
    <data name="attr-height" value="64"/>
  </data>
</topicmeta>
```

**Note:** The `attr-width` and `attr-height` attributes can be used to control the size of the image, but they are optional.

**Customizing the CSS**

To customize the CSS to set an image to be displayed in a tile, follow these steps:
1. Make sure you set an ID on the topic that you want the tile include an image.

2. Create a new CSS file that contains a rule that associates an image with a specific tile. The CSS file should have content that is similar to this:

```css
.wh_tile[data-id='growing-flowers'] > div {
    background-image: url('resources/flower.png');
}
```

3. Reference the CSS file in a **WebHelp Responsive** transformation using an **Oxygen Publishing Template** (page 1683) or the **args.css** parameter (page 1684).

## Adding Graphics and Media Resources

This section contains topics that explain how to add media resources to the published output or the output directory.

### How to Copy Additional Resources to Output Directory

You can copy additional resources (such as JavaScript, CSS, or other resources) to the output directory either by using an **Oxygen Publishing Template** (page 2708) or the **webhelp.custom.resources** parameter.

### Copying Additional Resources to the Output Directory using a Publishing Template

1. If you haven't already created a Publishing Template, see **Working with Publishing Templates** (page 1675).

2. Add a new `<fileset>` element in the `resources` section of the template descriptor file (page 1639).

   ```xml
   <publishing-template>
   ...
   <webhelp>
   ...
   <resources>
   <fileset>
   <include name="custom-resources/**/*"/>
   <exclude name="**/*.git"/>
   </fileset>
   </resources>
   </webhelp>
   ...
   </publishing-template>
   
3. Open the **DITA Map WebHelp Responsive** transformation scenario.

4. Click the **Choose Custom Publishing Template** link and select your template.

5. Click **OK** to save the changes to the transformation scenario.
6. Run the transformation scenario.

**Results:** All files from the custom resources directory will be copied to the [WebHelp Output Directory](#)/oxygen-webhelp/template folder.

### Copying Additional Resources to the Output Directory using a Transformation Parameter

1. Place all your resources in the same directory.
2. Edit the *DITA Map WebHelp Responsive* transformation scenario and open the Parameters tab.
3. Edit the value of the `webhelp.custom.resources` parameter and set it to the absolute path of the directory in step 1.
4. Click **OK** to save the changes to the transformation scenario.
5. Run the transformation scenario.

**Results:** All files from the new directory will be copied to the root of the WebHelp output directory.

### How to Add a Logo Image in the Title Area

You can customize *WebHelp Responsive* output to include a logo in the title area. It will be displayed before the publication title. You can also specify a URL that can be used to send users to a specific website when they click the logo image.

This customization can be done using an *Oxygen Publishing Template* or using a transformation scenario from within *Oxygen XML Editor/Author*.

### Using a Publishing Template

To add a logo in the title area of your WebHelp output using an *Oxygen Publishing Template (page 1632)*, follow this procedure:

1. If you haven't already created a Publishing Template, see *Working with Publishing Templates (page 1675)*.
2. Open the *template descriptor file (page 1636)* associated with your publishing template and add the `webhelp.logo.image` parameter in the `parameters` section with its value set to path of your logo.
3. If you also want to add a link to your website when you click the logo image, set its URL in the `webhelp.logo.image.target.url` parameter.

```xml
<publishing-template>
  ...
  <webhelp>
```

...<parameters>
    <parameter name="webhelp.logo.image" value="c:\myLogo.jpg"/>
    <parameter name="webhelp.logo.image.target.url" value="http://sample.com"/>
</parameters>
</webhelp>

4. Open the DITA Map WebHelp Responsive transformation scenario.
5. Click the Choose Custom Publishing Template link and select your template.
6. Click OK to save the changes to the transformation scenario.
7. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To add a logo in the title area of your WebHelp output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Edit the DITA Map WebHelp Responsive transformation scenario and choose a template.
2. Open the Parameters tab and set the webhelp.logo.image parameter to the path of your logo.
3. If you also want to add a link to your website when you click the logo image, set its URL in the webhelp.logo.image.target.url parameter.
4. Click OK to save the changes to the transformation scenario.
5. Run the transformation scenario.

How to Add a Favicon in WebHelp Systems

You can add a custom favicon to your WebHelp output by simply using a parameter in the transformation scenario to point to your favicon image.

This customization can be done using an Oxygen Publishing Template or using a transformation scenario from within Oxygen XML Editor/Author.

Using a Publishing Template

To add a favicon to your WebHelp output using an Oxygen Publishing Template (page 1632), follow this procedure:

1. If you haven't already created a Publishing Template, see Working with Publishing Templates (page 1675).
2. Open the **template descriptor file** *(page 1636)* associated with your publishing template and add the `webhelp.favicon` parameter in the `parameters` section with its value set to path of your image.

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <parameters>
      <parameter name="webhelp.favicon" value="c:\myFavicon.jpg"/>
    </parameters>
  </webhelp>
</publishing-template>
```

3. Open the **DITA Map WebHelp Responsive** transformation scenario.
4. Click the **Choose Custom Publishing Template** link and select your template.
5. Click **OK** to save the changes to the transformation scenario.
6. Run the transformation scenario.

**Result:** Browsers that provide `favicon` support will display the favicon (typically in the browser's address bar, in the list of bookmarks, and in the history).

### Using a Transformation Scenario in Oxygen XML Editor/Author

To add a favicon to your WebHelp output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Edit the **DITA Map WebHelp Responsive** transformation scenario and choose a `template`.
2. Open the **Parameters** tab and set the `webhelp.favicon` parameter to the path of your image.
3. Click **OK** to save the changes to the transformation scenario.
4. Run the transformation scenario.

### How to Add Video and Audio Objects in DITA WebHelp Output

You can insert references to video and audio media resources (such as videos, audio clips, or embedded HTML frames) in your DITA topics and then publish them to WebHelp output. The media objects can be played directly in all HTML5-based outputs, including WebHelp systems.

To add media objects in the WebHelp output generated from DITA documents, follow the procedures below.

### Adding Videos to DITA WebHelp Output
1. Edit the DITA topic and insert a reference to the video through one of the following methods:
   - Use the **Insert Media Object** toolbar action (page 2475).
   - Drag (or copy) the video file from your system explorer or the Navigator view (page 250) and drop (or paste) it into your document.
   - Manually add an `object` element, as in one of the following examples:
     ```xml
     <object outputclass="video" type="video/mp4" data="MyVideo.mp4"/>
     ```
     or, instead of the `data` attribute, you can specify the video using a parameter like this:
     ```xml
     <object outputclass="video">
       <param name="src" value="videos/MyVideo.mp4"/>
     </object>
     ```

2. Apply a DITA to WebHelp transformation to obtain the output.

   **Result:** The transformation converts the `object` element to an HTML5 `video` element.
   ```html
   <video controls="controls">
     <source type="video/mp4" src="MyVideo.mp4"/>
   </video>
   ```

### Adding Audio Clips to DITA WebHelp Output

1. Edit the DITA topic and insert a reference to the audio clip through one of the following methods:
   - Use the **Insert Media Object** toolbar action (page 2475).
   - Drag (or copy) the audio file from your system explorer or the Navigator view (page 250) and drop (or paste) it into your document.
   - Manually add an `object` element, as in one of the following examples:
     ```xml
     <object outputclass="audio" type="audio/mpeg" data="MyClip.mp3"/>
     ```
     or, instead of the `data` attribute, you can specify the video using a parameter like this:
     ```xml
     <object outputclass="audio">
       <param name="src" value="audio/MyClip.mp3"/>
     </object>
     ```

2. Apply a DITA to WebHelp transformation to obtain the output.

   **Result:** The transformation converts the `object` element to an HTML5 `audio` element.
   ```html
   <audio controls="controls">
     <source type="audio/mpeg" src="MyClip.mp3"/>
   </audio>
   ```
Adding Embedded HTML Frames (such as YouTube videos) to DITA WebHelp Output

1. Edit the DITA topic and insert a reference to the embedded object by using the Insert Media Object toolbar action (page 2475) or by manually adding an object element, as in one of the following examples:

   `<object outputclass="iframe" data="https://www.youtube.com/embed/m_vv2s5Trn4"/>
   or, instead of the data attribute, you can specify the object using a parameter like this:

   `<object outputclass="iframe">
       <param name="src" value="http://www.youtube.com/embed/m_vv2s5Trn4"/>
   </object>`

2. If you want the video to be allowed to play in full screen mode once the document is converted to XHTML output, also add an allowfullscreen parameter and set its value to true:

   `<object outputclass="iframe" data="https://www.youtube.com/embed/m_vv2s5Trn4"/>
   <param name="allowfullscreen" value="true"/>
   </object>`

   Tip: If you copy the embed code from the source and paste it into the Insert Media dialog box (see the specific instructions: here (page 2477)), the allowfullscreen parameter will automatically be added and all you have to do is set the value to true.

3. Apply a DITA to WebHelp transformation to obtain the output.

   Result: The transformation converts the object element to an HTML5 iframe element.

   `<iframe controls="controls" src="https://www.youtube.com/embed/m_vv2s5Trn4"/>
   </iframe>`

For more information, see the following video demonstration:

[https://www.youtube.com/embed/lfX11gS4WaU](https://www.youtube.com/embed/lfX11gS4WaU)

- Adding Video, Audio, and Embedded HTML Resources in DITA Topics (page 2475)
How to Publish MathML Formulas when Generating WebHelp from a Command Line

The DITA-OT distribution that comes bundled with Oxygen includes some additional pre-installed DITA-OT plugins that add support for properly displaying MathML formulas in the WebHelp output. However, if you are generating your WebHelp output from a command line, MathML formulas will not be displayed properly unless you install these plugins manually.

These plugins can be downloaded and installed from DITA 1.3 Support for Open Toolkit (https://github.com/dita-community/dita13-dita-ot-1.x-support). This plugin package adds DITA 1.3 support, including MathML.

How to Add Support for MathML when Generating WebHelp from a Command Line

1. Download and unzip the DITA 1.3 Support for Open Toolkit 1.x distribution package. It includes 4 DITA-OT plugins.
2. Copy the four plugin directories to your DITA-OT-DIR/plugins directory.
3. In the home directory of your DITA-OT installation, run the ant -f integrator.xml command.

Searching the Output

This section contains topics that explain how to use some of the search features in WebHelp Responsive output.

How to Change Element Scoring in Search Results

The WebHelp Search feature is enhanced with a rating mechanism that computes scores for every page that matches the search criteria. HTML tag elements are assigned a scoring value and these values are evaluated for the search results. The WebHelp directory includes a properties file that defines the scoring values for tag elements and this file can be edited to customize the values according to your needs.

To edit the scoring values of HTML tag element for enhancing WebHelp search results, follow these steps:

1. Edit the scoring properties file for DITA. The properties file includes instructions and examples to help you with your customization. The file is located in: DITA-OT-DIR/plugins\com.oxygenxml.webhelp.responsive\indexer\scoring.properties.

The values that can be edited in the scoring.properties file:

```
h1 = 10
h2 = 9
h3 = 8
```
2. Save your changes to the file.

3. Re-run your WebHelp transformation.

How to Exclude Certain DITA Topics from Search Results

There are several ways to exclude certain DITA resources from your WebHelp system's search results. This is useful if you have topics in your DITA map (page 2705) structure that you do not want to be included in search results for your WebHelp system. The first method involves setting a parameter in the WebHelp transformation scenario and the second involves setting an attribute for each DITA topic reference that you want to exclude.

Transformation Parameter Method

To exclude DITA topics from WebHelp search results using a transformation parameter, follow these steps:

1. Create a simple text file that will contain your excluded file patterns. Each pattern must be on a new line. The patterns are considered to be relative to the output directory and they accept wildcards such as `*` (matches zero or more characters) or `?` (matches one character). For more information about the patterns, see https://ant.apache.org/manual/dirtasks.html#patterns.

   **Example:** Suppose that in your project, you want to exclude all files located in the resources directory and all files located in the topics directory that have a `.bak` file extension. You could

2. Save your changes to the file.

3. Re-run your WebHelp transformation.
create a simple text file (for example, named `exclude.properties`), and add the following lines:

```
resources/*
topics/*.bak
```

2. Set the `webhelp.search.custom.excludes.file` parameter to specify the path to the file that contains the excluded file patterns (for example, `exclude.properties` in step 1). The parameter can be specified in the `parameters` section of the template descriptor file (page 1641) associated with your publishing template or in the Parameters tab of the transformation scenario dialog box in Oxygen XML Editor/Author.

3. Run the transformation.

### Search Attribute Method

The WebHelp Search engine does not index DITA topics that have the `@search` attribute set to `no`.

To exclude DITA topics from WebHelp search results using this attribute, follow these steps:

1. Edit the DITA map and for any `topicref` that you want to exclude from search results, set the `search` attribute to `no`. For example:

   ```
   <topicref href="../topics/internal-topic1.dita" search="no"/>
   ```

2. Save your changes to the DITA map.

3. Run your WebHelp system transformation.

### How to Optimize Search Results

A DITA Map WebHelp transformation scenario can be configured to produce a `sitemap.xml` file that is used by search engines to aid crawling and indexing mechanisms. A sitemap lists all pages of a WebHelp system and allows webmasters to provide additional information about each page, such as the date it was last updated, change frequency, and importance of each page in relation to other pages in your WebHelp deployment.

The structure of the `sitemap.xml` file looks like this:

```xml
<urlset xmlns="http://www.sitemaps.org/schemas/sitemap/0.9">
  <url>
    <loc>http://www.example.com/topics/introduction.html</loc>
    <lastmod>2014-10-24</lastmod>
    <changefreq>weekly</changefreq>
    <priority>0.5</priority>
  </url>
</urlset>
```
Each page has a `<url>` element structure containing additional information, such as:

- **loc** - the URL of the page. This URL must begin with the protocol (such as `http`), if required by your web server. It is constructed from the value of the `webhelp.sitemap.base.url` parameter from the transformation scenario and the relative path to the page (collected from the `href` attribute of a `topicref` element in the DITA map).

  Note: The value must have fewer than 2,048 characters.

- **lastmod** (optional) - the date when the page was last modified. The date format is `YYYY-MM-DD`.

- **changefreq** (optional) - indicates how frequently the page is likely to change. This value provides general information to assist search engines, but may not correlate exactly to how often they crawl the page. Valid values are: `always`, `hourly`, `daily`, `weekly`, `monthly`, `yearly`, and `never`. The first time the `sitemap.xml` file is generated, the value is set based upon the value of the `webhelp.sitemap.change.frequency` parameter in the DITA WebHelp transformation scenario. You can change the value in each `url` element by editing the `sitemap.xml` file.

  Note: The value `always` should be used to describe documents that change each time they are accessed. The value `never` should be used to describe archived URLs.

- **priority** (optional) - the priority of this page relative to other pages on your site. Valid values range from 0.0 to 1.0. This value does not affect how your pages are compared to pages on other sites. It only lets the search engines know which pages you deem most important for the crawlers.

  The first time the `sitemap.xml` file is generated, the value is set based upon the value of the `webhelp.sitemap.priority` parameter in the DITA WebHelp transformation scenario. You can change the value in each `url` element by editing the `sitemap.xml` file.

### Creating and Editing the `sitemap.xml` File

Follow these steps to produce a `sitemap.xml` file for your WebHelp system, which can then be edited to fine-tune search engine optimization:
1. **Edit** the transformation scenario you currently use for obtaining your WebHelp output. This opens the **Edit DITA Scenario** dialog box.

2. Open the **Parameters** tab and set a value for the following parameters:
   - **webhelp.sitemap.base.url** - the URL of the location where your WebHelp system is deployed
     
     **Note:** This parameter is required for Oxygen XML Editor plugin to generate the sitemap.xml file.
   - **webhelp.sitemap.change.frequency** - how frequently the WebHelp pages are likely to change (accepted values are: always, hourly, daily, weekly, monthly, yearly, and never)
   - **webhelp.sitemap.priority** - the priority of each page (value ranging from 0.0 to 1.0)

3. Run the transformation scenario.

4. Look for the sitemap.xml file in the transformation's output folder. Edit the file to fine-tune the parameters of each page, according to your needs.

**How to Index Japanese Content**

To optimize the indexing of Japanese content in WebHelp pages, the Lucene Kuromoji Japanese analyzer can be used. This analyzer is included in the **Oxygen XML Editor/Author** installation kit.

**Using a Publishing Template**

To add a logo in the title area of your WebHelp output using an **Oxygen Publishing Template** (page 1632), follow this procedure:

1. If you haven't already created a Publishing Template, see Working with Publishing Templates (page 1675).

2. Open the template descriptor file (page 1636) associated with your publishing template and add the **default.language** parameter in the **parameters** section with its value set to **ja-jp**.

   ```xml
   <publishing-template>
     ...
     <webhelp>
       ...
       <parameters>
         <parameter name="default.language" value="ja-jp"/>
       </parameters>
     </webhelp>
   </publishing-template>
   ``

3. Open the **DITA Map WebHelp Responsive** transformation scenario.

4. Click the **Choose Custom Publishing Template** link and select your template.
5. Click OK to save the changes to the transformation scenario.
6. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To activate the Japanese indexing in your WebHelp output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Edit a DITA to WebHelp transformation scenario and in the Parameters tab, set the value of the default.language parameter to ja-jp.

   Note: Alternatively, you could set the xml:lang attribute on the root of the DITA map (page 2705) and the referenced topics to ja-jp. Another alternative for DITA output is to use the webhelp.search.japanese.dictionary parameter to specify a path to a Japanese dictionary that will be used by the Kuromoji morphological engine (note that the encoding for the dictionary must be UTF8).

2. Run the WebHelp transformation scenario to generate the output.

Localization

This section contains topics that explain how to use the localization support in WebHelp Responsive output.

How to Localize Email Notifications of Feedback System

The feedback-enabled WebHelp Responsive systems use emails to notify users when comments are posted. These emails are based on templates stored in the WebHelp directory. The default messages are in English, French, German, and Japanese. These messages are copied into the WebHelp system deployment directory during the execution of the corresponding transformation scenario.

Using a Publishing Template

To change the language of the emails for DITA Map WebHelp Responsive with Feedback output using an Oxygen Publishing Template (page 1632), follow this procedure:

1. Create the following directory:

   DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\oxygen-webhelp\resources\php\templates\nl
2. Copy all English template files from \DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\oxygen-webhelp\resources\php\templates\en and paste them into the directory you just created.

3. Edit the HTML files from the \DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\oxygen-webhelp\resources\php\templates\nl directory and translate the content into your language.

4. Open the template descriptor file (page 1636) associated with your publishing template and add the `default.language` parameter in the `parameters` section with its value set to the appropriate language code (for example, `nl` for Dutch).

   **Note:** If you set the parameter to a value such as `LanguageCode-CountryCode` (for example, `en-us`), the transformation scenario will only use the language code.

   ```xml
   <publishing-template>
       ...
       <webhelp>
           ...
           <parameters>
               <parameter name="default.language" value="nl"/>
           </parameters>
       </webhelp>
   </publishing-template>

5. Open the DITA Map WebHelp Responsive transformation scenario.

6. Click the Choose Custom Publishing Template link and select your template.

7. Click OK to save the changes to the transformation scenario.

8. Run the transformation scenario.

---

Using a Transformation Scenario in Oxygen XML Editor/Author

To change the language of the emails for DITA Map WebHelp Responsive with Feedback output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Create the following directory:

   \DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\oxygen-webhelp\resources\php\templates\nl

2. Copy all English template files from \DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\oxygen-webhelp\resources\php\templates\en and paste them into the directory you just created.

3. Edit the HTML files from the \DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\oxygen-webhelp\resources\php\templates\nl directory and translate the content into your language.
4. Edit a DITA Map WebHelp Responsive transformation scenario and open the Parameters tab.
5. In the Parameters tab, look for the default.language parameter and set its value to the appropriate language code (for example, `nl` for Dutch).

**Note:** If you set the parameter to a value such as LanguageCode-CountryCode (for example, `en-us`), the transformation scenario will only use the language code.

6. Run the transformation scenario.

**Related Information:**

### How to Localize the Interface of WebHelp Responsive Output

Static labels used in the WebHelp output are stored in translation files that have the `strings-lang1-lang2.xml` name format, where `lang1` and `lang2` are ISO language codes. For example, the US English labels are kept in the `strings-en-us.xml` file.

These translation files are collected from two locations:

- **DITA-OT-DIR/xsl/common** folder - DITA-OT's default translations (generated text for `note`, `fig`, and `table` elements).
- **DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/resources/localization** folder - These translations are contributed by the WebHelp plugin and extend the default ones provided by DITA-OT. The labels defined in this folder take precedence over the DITA-OT defaults.

There are two major reasons you may want to use modify the translation files: to modify the existing strings or to translate to a new language.

**Related Information:**
- How to Index Japanese Content (page 1712)
- Customizing Generated Text
Modifying the Existing Strings

To modify the generated text for WebHelp transformations, you need to create a DITA-OT extension plugin that uses the `dita.xsl.messages` extension point. The following procedure is for changing English labels, but you can adapt it for any language:

1. Create a `com.oxygenxml.webhelp.localization` plugin directory inside the `DITA-OT-DIR/plugins/` location.
2. Create a `plugin.xml` file inside that `com.oxygenxml.webhelp.localization` directory with the following content:

   ```xml
   <plugin id="com.oxygenxml.webhelp.localization">
     <require plugin="com.oxygenxml.webhelp.classic"/>
     <require plugin="com.oxygenxml.webhelp.responsive"/>
     <feature extension="dita.xsl.strings" file="webhelp-extension-strings.xml"/>
   </plugin>
   ```

3. Create a `webhelp-extension-strings.xml` file with the following content:

   ```xml
   <langlist>
     <lang xml:lang="en" filename="strings-en-us.xml"/>
     <lang xml:lang="en-us" filename="strings-en-us.xml"/>
   </langlist>
   ```

4. Copy the strings you want to change from the translation files (page 1715) to the `strings-en-us.xml` file. Make sure you leave the name attribute unchanged because this is the key used to look up the string. A sample content might be:

   ```xml
   <strings xml:lang="en-US">
     <str name="Figure">Fig</str>
     <str name="Draft comment">ADDRESS THIS DRAFT COMMENT</str>
   </strings>
   ```

5. Use the Run DITA-OT Integrator transformation scenario (page 1407) found in the DITA Map section in the Configure Transformation Scenario(s) dialog box (page 1502).

Adding a New Language

To add a new language for WebHelp transformations, you need to create a DITA-OT extension plugin that uses the `dita.xsl.messages` extension point. The following sample procedure is for adding translation files for the Polish language, but you can adapt it for any language:
1. Create a `com.oxygenxml.webhelp.localization` plugin directory inside the `DITA-OT-DIR/plugins/` location.

2. Create a `plugin.xml` file inside that `com.oxygenxml.webhelp.localization` directory with the following content:

   ```xml
   <plugin id="com.oxygenxml.webhelp.localization">
     <require plugin="com.oxygenxml.webhelp.classic"/>
     <require plugin="com.oxygenxml.webhelp.responsive"/>
     <feature extension="dita.xsl.strings" file="webhelp-extension-strings.xml"/>
   </plugin>
   ```

3. Create a `webhelp-extension-strings.xml` file with the following content:

   ```xml
   <langlist>
     <lang xml:lang="pl" filename="strings-pl-pl.xml"/>
     <lang xml:lang="pl-PL" filename="strings-pl-pl.xml"/>
   </langlist>
   ```

5. In the `strings-pl-pl.xml` file, change the `@xml:lang` attribute on the root element that conforms with the new language.

   ```xml
   <strings xml:lang="pl-PL">
     ...
   </strings>
   ```

6. Translate the content of each `<str>` element (make sure to leave the `name` attribute unchanged).

   ```xml
   <strings xml:lang="pl-PL">
     ...
     <str name="webhelp.content" js="true" php="false">Polish translation for "Content".</str>
     <str name="webhelp.search" js="true" php="false">Polish translation for "Search"</str>
     ...
   </strings>
   ```

7. Copy the common DITA-OT strings defined in the `DITA-OT-DIR/xsl/common/strings-en-us.xml` file. It defines a set generated text available for HTML based transformations (such as `note`, `fig`, and `table` elements). Translate the content of each `<str>` element.
<strings xml:lang="pl-PL">
  ...
  <str name="webhelp.content" js="true" php="false">Polish translation for "Content".</str>
  <str name="webhelp.search" js="true" php="false">Polish translation for "Search"</str>
  ...
  <str name="Figure">Polish translation for "Figure"</str>
  <str name="Table">Polish translation for "Table"</str>
  ...
</strings>

8. Use the Run DITA-OT Integrator transformation scenario (page 1407) found in the DITA Map section in the Configure Transformation Scenario(s) dialog box (page 1502).

How to Activate Support for Right-to-Left (RTL) Languages

To activate support for RTL (right-to-left) languages in WebHelp output, edit the DITA map (page 2705) and set the xml:lang attribute on its root element (map). The corresponding attribute value can be set for following RTL languages:

- ar-eg - Arabic
- he-il - Hebrew
- ur-pk - Urdu

Integrating Social Media and Google Tools in the WebHelp Output

This section contains topics that explain how to integrate some of the most popular social media sites in WebHelp output.

How to Add a Facebook Like Button in WebHelp Responsive Output

It is possible to integrate Facebook into your WebHelp Responsive output and you can specify where you want the widget to appear in your WebHelp page.

Using a Publishing Template

To add a Facebook Like widget to your WebHelp output using an Oxygen Publishing Template (page 1632), follow this procedure:

1. Go to the Facebook Developers website.
2. Fill in the displayed form, then click the **Get Code** button.

3. Copy the two code snippets and paste them into a `<div>` element inside an XML file called `facebook-widget.xml`. Make sure you follow these rules:

   - The file must be well-formed.
   - The code for each `script` element must be included in an XML comment.
   - The start and end tags for the XML comment must be on a separate line.

   The content of the XML file should look like this:

   ```xml
   <div id="facebook">
       <div id="fb-root"/>
       <script>
         <!--
           (function(d, s, id) {
             var js, fjs = d.getElementsByTagName(s)[0];
             if (d.getElementById(id)) return;
             js = d.createElement(s); js.id = id;
             js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
             fjs.parentNode.insertBefore(js, fjs);
           })(document, 'script', 'facebook-jssdk');
         -->
       </script>
       <div class="fb-like" data-layout="standard" data-action="like"
            data-show-faces="true" data-share="true"/>
   </div>
   ```

4. Open the **template descriptor file** (page 1636) associated with your publishing template.

5. Use one of the parameters that begin with `webhelp.fragment` (page 1643) in the `html-fragments` section of the descriptor file. Set the value of that parameter to reference the `facebook-widget.xml` file that you created earlier.

   ```xml
   <publishing-template>
       ...
   </publishing-template>
   <webhelp>
       ...
   </webhelp>
   <html-fragments>
       <fragment
           file="HTML-fragments/facebook-widget.xml"
           placeholder="webhelp.fragment.after.toc_or_tiles"/>
   </html-fragments>
   </publishing-template>
   ```

6. Open the **DITA Map WebHelp Responsive** transformation scenario.
7. Click the **Choose Custom Publishing Template** link and select your template.
8. Click **OK** to save the changes to the transformation scenario.
9. Run the transformation scenario.

### Using a Transformation Scenario in Oxygen XML Editor/Author

To add a Facebook *Like* widget to your WebHelp output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Go to the **Facebook Developers** website.
2. Fill in the displayed form, then click the **Get Code** button.
3. Copy the two code snippets and paste them into a `<div>` element inside an XML file called `facebook-widget.xml`. Make sure you follow these rules:
   - The file must be well-formed.
   - The code for each `script` element must be included in an XML comment.
   - The start and end tags for the XML comment must be on a separate line.

   The content of the XML file should look like this:

   ```xml
   <div id="facebook">
   <div id="fb-root"/>
   <script>
   <!--
   (function(d, s, id) {
   var js, fjs = d.getElementsByTagName(s)[0];
   if (d.getElementById(id)) return;
   js = d.createElement(s); js.id = id;
   js.src = '//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0';
   fjs.parentNode.insertBefore(js, fjs);
   }(document, 'script', 'facebook-jssdk'));
   -->
   </script>
   <div class="fb-like" data-layout="standard" data-action="like"
    data-show-faces="true" data-share="true"/>
   </div>
   
   </div>
   
   4. Edit the **DITA Map WebHelp Responsive** transformation scenario and choose a template.
5. Switch to the **Parameters** tab. Depending on where you want to display the button, edit one of the parameters that begin with `webhelp.fragment` (page 1643). Set that parameter to reference the `facebook-widget.xml` file that you created earlier.
6. Click **Ok** and run the transformation scenario.
How to Add a Google+ Button in WebHelp Responsive Output

It is possible to integrate Google into your WebHelp Responsive output and you can specify where you want the widget to appear in your WebHelp page.

Using a Publishing Template

To add a Google+ widget to your WebHelp Responsive output using an Oxygen Publishing Template (page 1632), follow this procedure:

1. Go to the Google Developers website.
2. Fill in the displayed form. The preview area on the right side displays the code and a preview of the widget.
3. Copy the code snippet displayed in the preview area and paste it into a div element inside an XML file called google-plus-button.xml. Make sure that the content of the file is well-formed. The content of the XML file should look like this:

   ```xml
   <div id="google-plus">
     <!-- Place this tag in your head or just before your close body tag. -->
     <script src="https://apis.google.com/js/platform.js" async defer></script>

     <!-- Place this tag where you want the +1 button to render. -->
     <div class="g-plusone" data-annotation="inline" data-width="300"></div>
   </div>
   ```

4. Open the template descriptor file (page 1636) associated with your publishing template.
5. Use one of the parameters that begin with webhelp.fragment (page 1643) in the html-fragments section of the descriptor file. Set the value of that parameter to reference the google-plus-button.xml file that you created earlier.

   ```xml
   <publishing-template>
     ...
     <webhelp>
       ...
       <html-fragments>
         <fragment file="HTML-fragments/google-plus-button.xml"
                   placeholder="webhelp.fragment.after.toc_or_tiles"/>
       </html-fragments>
     </webhelp>
   </publishing-template>
   ```

6. Open the DITA Map WebHelp Responsive transformation scenario.
7. Click the **Choose Custom Publishing Template** link and select your template.
8. Click **OK** to save the changes to the transformation scenario.
9. Run the transformation scenario.

**Using a Transformation Scenario in Oxygen XML Editor/Author**

To add a *Google+* widget to your WebHelp Responsive output using a transformation scenario from within *Oxygen XML Editor/Author*, follow this procedure:

1. Go to the *Google Developers* website.
2. Fill in the displayed form. The preview area on the right side displays the code and a preview of the widget.
3. Copy the code snippet displayed in the preview area and paste it into a `div` element inside an XML file called `google-plus-button.xml`. Make sure that the content of the file is well-formed. The content of the XML file should look like this:

   ```xml
   <div id="google-plus">
     <!-- Place this tag in your head or just before your close body tag. -->
     <script src="https://apis.google.com/js/platform.js" async defer></script>
     <!-- Place this tag where you want the +1 button to render. -->
     <div class="g-plusone" data-annotation="inline" data-width="300"></div>
   </div>
   ```

4. Edit the *DITA Map WebHelp Responsive* transformation scenario and choose a template.
5. Switch to the **Parameters** tab. Depending on where you want to display the button, edit one of the parameters that begin with `webhelp.fragment` (page 1643). Set that parameter to reference the `google-plus-button.xml` file that you created earlier.
6. Click **Ok** and run the transformation scenario.

**How to Add Tweet Button in WebHelp Responsive Output**

It is possible to integrate *Twitter* into your *WebHelp Responsive* output and you can specify where you want the widget to appear in your WebHelp page.

**Using a Publishing Template**

To add a Twitter *Tweet* widget to your WebHelp Responsive output using an *Oxygen Publishing Template* (page 1632), follow this procedure:

1. Go to the Tweet button generator page.
2. Fill in the displayed form. The **Preview and code** area displays the code that you will need.
3. Copy the code snippet displayed in the **Preview and code** area and paste it into a **div** element inside an XML file called `tweet-button.xml`. Make sure you follow these rules:

- The file must be well-formed.
- The code for each **script** element must be included in an XML comment.
- The start and end tags for the XML comment must be on a separate line.

The content of the XML file should look like this:

```
<div id="twitter">
  <a href="https://twitter.com/share" class="twitter-share-button">Tweet</a>
  <script>
    function (d, s, id) {
      var js, fjs = d.getElementsByTagName(s)[0], p = /^http:/
        ? 'http': 'https';
      if (! d.getElementById(id)) {
        js = d.createElement(s);
        js.id = id;
        js.src = p + '://platform.twitter.com/widgets.js';
        fjs.parentNode.insertBefore(js, fjs);
      }
    }
    (document, 'script', 'twitter-wjs');
  </script>
</div>
```

4. Open the **template descriptor file** *(page 1636)* associated with your publishing template.

5. Use **one of the parameters that begin with webhelp.fragment** *(page 1643)* in the **html-fragments** section of the descriptor file. Set the value of that parameter to reference the `tweet-button.xml` file that you created earlier.

```
<publishing-template>
  ...
  <webhelp>
    ...
    <html-fragments>
      <fragment
        file="HTML-fragments/tweet-button.xml"
        placeholder="webhelp.fragment.after.toc_or_tiles"/>
    </html-fragments>
  </webhelp>
  ...
</publishing-template>
```
6. Open the DITA Map WebHelp Responsive transformation scenario.
7. Click the Choose Custom Publishing Template link and select your template.
8. Click OK to save the changes to the transformation scenario.
9. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To add a Twitter Tweet widget to your WebHelp Responsive output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Go to the Tweet button generator page.
2. Fill in the displayed form. The Preview and code area displays the code that you will need.
3. Copy the code snippet displayed in the Preview and code area and paste it into a div element inside an XML file called tweet-button.xml. Make sure you follow these rules:
   • The file must be well-formed.
   • The code for each script element must be included in an XML comment.
   • The start and end tags for the XML comment must be on a separate line.

The content of the XML file should look like this:

```xml
<div id="twitter">
  <a href="https://twitter.com/share" class="twitter-share-button">Tweet</a>
  <script>
    <!--
    !function (d, s, id) {
      var js, fjs = d.getElementsByTagName(s)[0], p = /^http:/test(d.location) ? 'http': 'https';
      if (! d.getElementById(id)) {
        js = d.createElement(s);
        js.id = id;
        js.src = p + '://platform.twitter.com/widgets.js';
        fjs.parentNode.insertBefore(js, fjs);
      }
    }
    (document, 'script', 'twitter-wjs');
    -->
  </script>
</div>
```
4. Edit the DITA Map WebHelp Responsive transformation scenario and choose a template.
5. Switch to the Parameters tab. Depending on where you want to display the button, edit one of the parameters that begin with webhelp.fragment (page 1643). Set that parameter to reference the tweet-button.xml file that you created earlier.
6. Click Ok and run the transformation scenario.

How to Integrate Google Analytics in WebHelp Responsive Output

You can use Google Analytics to track and report site data for your WebHelp Responsive output.

Using a Publishing Template

To integrate Google Analytics into your WebHelp Responsive output using an Oxygen Publishing Template (page 1632), follow this procedure:

1. Create a new Google Analytics account (if you do not already have one) and log on.
2. Choose the Analytics solution that best fits the needs of your website.
3. Follow the on-screen instructions to obtain a Tracking Code that contains your Tracking ID. A Tracking Code looks like this:

```xml
<script>
(function(i,s,o,g,r,a,m){i['GoogleAnalyticsObject']=r;i[r]=i[r]||function()
(i[r].q=i[r].q||[]).push(arguments)},i[r].l=1*new Date();a=s.createElement(o),
m=s.getElementsByTagName(o)[0];a.async=1;a.src=g;m.parentNode.insertBefore(a,m)
}(window,document,'script','//www.google-analytics.com/analytics.js','ga'));

ga('create', 'UA-XXXXXXXX-X', 'auto');
ga('send', 'pageview');
</script>
```

4. Save the Tracking Code (obtained in the previous step) in a new XML file called googleAnalytics.xml. Note that the file should only contain the tracking code.
5. Open the template descriptor file (page 1636) associated with your publishing template.
6. Use the webhelp.fragment.after.body parameter (page 1746) in the html-fragments section of the descriptor file. Set the value of that parameter to reference the googleAnalytics.xml file that you created earlier. The content of this file will be copied at the end of all generated output pages, right before the ending <body> element. This ensures that the page is loaded before the Google Analytics servers are contacted, thus reducing page loading time.
7. Open the DITA Map WebHelp Responsive transformation scenario.
8. Click the Choose Custom Publishing Template link and select your template.
9. Click OK to save the changes to the transformation scenario.
10. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To integrate Google Analytics into your WebHelp Responsive output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Create a new Google Analytics account (if you do not already have one) and log on.
2. Choose the Analytics solution that best fits the needs of your website.
3. Follow the on-screen instructions to obtain a Tracking Code that contains your Tracking ID. A Tracking Code looks like this:

```html
<script>
(function(i,s,o,g,r,a,m){i['GoogleAnalyticsObject']=r;i[r]=i[r]||function()
(i[r].q=i[r].q||[]).push(arguments)},i[r].l=1*new Date();a=s.createElement(o),
m=s.getElementsByTagName(o)[0];a.async=1;a.src=g;m.parentNode.insertBefore(a,m)
)(window,document,'script','//www.google-analytics.com/analytics.js','ga');

ga('create', 'UA-XXXXXXXX-X', 'auto');
ga('send', 'pageview');
</script>
```

4. Save the Tracking Code (obtained in the previous step) in a new XML file called googleAnalytics.xml. Note that the file should only contain the tracking code.
5. Edit the DITA Map WebHelp Responsive transformation scenario and choose a template.
6. Switch to the Parameters tab. Edit the webhelp.fragment.after.body parameter (page 1746) and set it to reference the googleAnalytics.xml file that you created earlier. The content of this file will be copied at the end of all generated output pages, right before the ending <body> element. This ensures that the page is loaded before the Google Analytics servers are contacted, thus reducing page loading time.
7. Click Ok and run the transformation scenario.

How to Integrate Google Search in WebHelp Responsive Output

It is possible to integrate the Google Search Engine into your WebHelp Responsive output and you can specify where you want the results to appear in your WebHelp page.

Using a Publishing Template

To integrate the Google Search Engine into your WebHelp Responsive output using an Oxygen Publishing Template (page 1632), follow this procedure:

1. Go to the Google Custom Search Engine page using your Google account.
2. Select the Create a custom search engine button.
3. Follow the on-screen instructions to create a search engine for your site. At the end of this process you should obtain a code snippet that looks like this:

   ```html
   <script>
   (function() {
     var cx = '00088821088977588983:8mn4x_mf-yg';
     var gcse = document.createElement('script');
     gcse.type = 'text/javascript';
     gcse.async = true;
     var s = document.getElementsByTagName('script')[0];
     s.parentNode.insertBefore(gcse, s);
   })();
   </script>
   
   4. Save the script into a well-formed HTML file called googlecse.html.
5. Open the template descriptor file (page 1636) associated with your publishing template and add the webhelp.google.search.script parameter in the parameters section with its value set to reference the googlecse.html file that you created earlier.
6. You can also use the `webhelp.google.search.results` parameter to choose where to display the search results.
   
a. Create an HTML file with the following content: `<div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>` (you must use the HTML5 version for the GCSE). For more information about other supported attributes, see Google Custom Search: Supported Attributes.
   
b. Set the value of the `webhelp.google.search.results` parameter to the file path of the file you just created. If this parameter is not specified, the following code is used:

   ```html
   <div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>
   ```

7. Open the DITA Map WebHelp Responsive transformation scenario.
8. Click the Choose Custom Publishing Template link and select your template.
9. Click OK to save the changes to the transformation scenario.
10. Run the transformation scenario.

### Using a Transformation Scenario in Oxygen XML Editor/Author

To integrate the Google Search Engine into your WebHelp Responsive output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Go to the Google Custom Search Engine page using your Google account.
2. Select the Create a custom search engine button.
3. Follow the on-screen instructions to create a search engine for your site. At the end of this process you should obtain a code snippet that looks like this:

   ```javascript
   (function() {
     var cx = '
       000888210889775888983:8mn4x_mf-yy';
     var gcse = document.createElement('script');
     gcse.type = 'text/javascript';
     gcse.async = true;
     var s = document.getElementsByTagName('script')[0];
     s.parentNode.insertBefore(gcse, s);
   }());
   ```
4. Save the script into a well-formed HTML file called `googlecse.html`.

5. Edit the **DITA Map WebHelp Responsive** transformation scenario and choose a **template**.

6. Switch to the **Parameters** tab and edit the `webhelp.google.search.script` parameter to reference the `googlecse.html` file that you created earlier.

7. You can also use the `webhelp.google.search.results` parameter to choose where to display the search results.
   
   a. Create an HTML file with the following content:

   ```html
   <div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>
   ```

   (you must use the HTML5 version for the GCSE). For more information about other supported attributes, see [Google Custom Search: Supported Attributes](#).

   b. Set the value of the `webhelp.google.search.results` parameter to the file path of the file you just created. If this parameter is not specified, the following code is used:

   ```html
   <div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>
   ```

8. Click **Ok** and run the transformation scenario.

### XSLT Extensions for WebHelp Responsive Transformations

Since WebHelp Responsive output is primarily obtained by running XSLT transformations over the DITA input files, one customization method would be to override the default XSLT templates that are used by the WebHelp Responsive transformations.

There are two methods available to override the XSLT stylesheets implied by the WebHelp Responsive transformation.

- Use **XSLT-import extension points** from an *Oxygen Publishing Template* (page 2708).

  ![Note](image) **Note:** Use this method if you want to affect only the transformations that use this *publishing template*.

- Use **XSLT-import extension points** from a DITA-OT extension plugin.

  ![Note](image) **Note:** This method will affect all the outputs generated with the WebHelp system.

---

Related Information:
How to Use XSLT Extension Points from a Publishing Template

This example demonstrates how to use WebHelp XSLT-import Extension Points from an Oxygen Publishing Template (page 1762).

Use Case 1: Add Copyright Information Extracted from a DITA Bookmap

Suppose you want to customize the WebHelp Responsive main page by adding information about the legal rights associated with the book in the footer (for example, copyright dates and owner). This information is specified in the bookmap:

```xml
<bookrights>
  <copyrfirst>
    <year>2002</year>
  </copyrfirst>
  <copyrlast>
    <year>2017</year>
  </copyrlast>
  <bookowner>
    <organization>SyncRO Soft SRL</organization>
  </bookowner>
</bookrights>
```

![Figure 579: Example: Copyright information added in the WebHelp footer](image)

The XSLT stylesheet that generates the main page is located in: DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\mainFiles\createMainPage.xsl. This XSLT stylesheet declares the copy_template mode that processes the main page template (page 1650) to expand its components. The main page template declares a component for the footer section that looks like this:

```html
<div class="footer-container text-center">
```

```xml
<bookrights>
  <copyrfirst>
    <year>2002</year>
  </copyrfirst>
  <copyrlast>
    <year>2017</year>
  </copyrlast>
  <bookowner>
    <organization>SyncRO Soft SRL</organization>
  </bookowner>
</bookrights>
```
In the following example, the extension stylesheet will add a template that matches this component. It applies the default processing and adds the copyright information at the end.

```xml
<xsl:template match="*:div[contains(@class, 'footer-container')]" mode="copy_template">
  <!-- Apply the default processing -->
  <xsl:next-match/>

  <!-- Add a div containing the copyright information -->
  <div class="copyright_info">
    <xsl:choose>
      <!-- Adds the start-end years if they are defined -->
      <xsl:when test="exists($toc/*:topicmeta/*:bookrights/*:copyrfirst) and exists($toc/*:topicmeta/*:bookrights/*:copyrlast)">
        <span class="copyright_years">
          ©<xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrfirst"/>
          -<xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrlast"/>
        </span>
      </xsl:when>
      <!-- Adds only the first year if last is not defined. -->
      <xsl:when test="exists($toc/*:topicmeta/*:bookrights/*:copyrfirst)">
        <span class="copyright_years">
          ©<xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrfirst"/>
        </span>
      </xsl:when>
    </xsl:choose>

    <!-- Adds the organization if defined -->
    <xsl:if test="exists($toc/*:topicmeta/*:bookrights/*:bookowner/*:organization)">
      <span class="organization">
        <xsl:if test="$toc/*:topicmeta/*:bookrights/*:bookowner/*:organization">
          <xsl:text>©</xsl:text>
          <xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:bookowner/*:organization"/>
        </xsl:if>
      </span>
    </xsl:if>
  </div>
</xsl:template>
```
To add this functionality using an Oxygen Publishing Template, follow these steps:

1. If you haven't already created a Publishing Template, see Working with Publishing Templates (page 1675).

2. Link the folder associated with the publishing template to your current project in the Navigator view.
   You should have the custom_footer_template folder linked in your project.

3. Using the Navigator view, create an xslt folder inside the project root folder.
   You should have the custom_footer_template/xsl folder in your project.

4. Create your customization stylesheet (for example, custom_mainpage.xsl) in the custom_footer_template/xsl folder. Edit it to override the template that produces the footer section:

```xml
<xsl:template match="*:div[contains(@class, 'footer-container')]" mode="copy_template">
   <!-- Apply the default processing -->
   <xsl:next-match/>

   <!-- Add a div containing the copyright information -->
   <div class="copyright_info">
     <xsl:choose>
       <!-- Adds the start-end years if they are defined -->
       <xsl:when test="exists($toc/*:topicmeta/*:bookrights/*:copyrfirst) and
                     exists($toc/*:topicmeta/*:bookrights/*:copyrlast)">
         <span class="copyright_years">
           ©<xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrfirst"/>
           -<xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrlast"/>
         </span>
       </xsl:when>

       <!-- Adds only the first year if last is not defined. -->
       <xsl:when test="exists($toc/*:topicmeta/*:bookrights/*:copyrfirst)">
         <span class="copyright_years">
           ©<xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrfirst"/>
         </span>
       </xsl:when>
     </xsl:choose>
   </div>
</xsl:template>
```
5. Open the template descriptor file (page 1636) associated with your publishing template and set the XSLT stylesheet created in previous step with the `com.oxygenxml.webhelp.xsl.createMainPage` XSLT extension point.

6. Open the **DITA Map WebHelp Responsive** transformation scenario.

7. Click the **Choose Custom Publishing Template** link and select your template.

8. Click **OK** to save the changes to the transformation scenario.

9. Run the transformation scenario.
Use Case 2: Add generation time in the output footer

Another possible customization for the main page is to add the generation time in its footer. A transformation parameter is used to control whether or not this customization is active.

Figure 580: Generation time added in the WebHelp footer

To add this functionality, follow these steps:

1. In the customization stylesheet that you just created (for example, custom_mainpage.xsl), modify the template by adding the following XSLT code at the end.

   ```xml
   <xsl:if test="oxyf:getParameter('webhelp.footer.add.generation.time') = 'yes'">
     <div class="generation_time">
       Generation date: <xsl:value-of select="format-dateTime(current-dateTime(), '[h1]:[m01] [P] on [M01]/[D01]/[Y0001].')"/>
     </div>
   </xsl:if>
   ```

   **Note:** You can read the value of a WebHelp transformation parameter from your XSLT extension stylesheets by using the `getParameter(param.name)` function from the `http://www.oxygenxml.com/functions` namespace.

2. Open the template descriptor file (page 1636) associated with your publishing template and set the `webhelp.footer.add.generation.time` parameter to the default value.
3. Open the DITA Map WebHelp Responsive transformation scenario.

4. In the Parameters tab, you can change the value of the webhelp.footer.add.generation.time parameter.

5. Click OK to save the changes to the transformation scenario.

6. Run the transformation scenario.

How to Use XSLT Extension Points from a DITA-OT Plugin

In this example, the main page footer is modified by adding copyright information extracted from the DITA bookmap or by adding the output generation time. The first use-case uses an XSLT-Import extension point while the second uses an XSLT-Parameter extension point.

Note: This customization is available as a GitHub project at: https://github.com/oxygenxml/com.oxygenxml.webhelp.responsive.custom.footer.

Use Case 1: WebHelp XSLT-Import extension point to add copyright information extracted from a DITA Bookmap

Suppose you want to customize the WebHelp Responsive main page by adding information about the legal rights associated with the book in the footer (for example, copyright dates and owner). This information is specified in the bookmap:

```xml
<bookrights>
  <copyrfirst>
    <year>2002</year>
  </copyrfirst>
  <copyrlast>
    <year>2017</year>
  </copyrlast>
  <bookowner>
    <organization>SyncRO Soft SRL</organization>
  </bookowner>
</bookrights>
```

Figure 581: Example: Copyright information added in the WebHelp footer
The XSLT stylesheet that generates the main page is located in: `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\mainFiles\createMainPage.xsl`. This XSLT stylesheet declares the `copy_template` mode that processes the main page template to expand its components. The main page template *(page 1650)* declares a component for the footer section that looks like this:

```
<div class="footer-container text-center">
    <whc:include_html href="${webhelp.fragment.footer}"/>
</div>
```

In the following example, the extension stylesheet will add a template that matches this component. It applies the default processing and adds the copyright information at the end.

```
<xsl:template match="*:div[contains(@class, 'footer-container')]" mode="copy_template">
    <!-- Apply the default processing -->
    <xsl:next-match/>
    <!-- Add a div containing the copyright information -->
    <div class="copyright_info">
        <xsl:choose>
            <!-- Adds the start-end years if they are defined -->
            <xsl:when test="exists($toc/*:topicmeta/*:bookrights/*:copyrfirst) and exists($toc/*:topicmeta/*:bookrights/*:copyrlast)">
                <span class="copyright_years">
                    © <xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrfirst"/>
                    - <xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrlast"/>
                </span>
            </xsl:when>
            <!-- Adds only the first year if last is not defined. -->
            <xsl:when test="exists($toc/*:topicmeta/*:bookrights/*:copyrfirst)">
                <span class="copyright_years">
                    © <xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrfirst"/>
                </span>
            </xsl:when>
        </xsl:choose>
    </div>
</xsl:template>
```
You can implement this functionality with a WebHelp extension plugin that uses the `com.oxygenxml.webhelp.xsl.createMainPage` extension point. This extension point allows you to specify a customization stylesheet that will override the template described above.

To add this functionality as a DITA-OT plugin, follow these steps:

1. In the `DITA-OT-DIR\plugins\` folder, create a folder for this plugin (for example, `com.oxygenxml.webhelp.responsive.custom.footer`).
2. Create a `plugin.xml` file (in the folder you created in step 1) that specifies the extension point and your customization stylesheet. For example:

   ```xml
   <plugin id="com.oxygenxml.webhelp.responsive.custom.footer">
     <feature extension="com.oxygenxml.webhelp.xsl.createMainPage"
       file="custom_mainpage.xsl"/>
   </plugin>
   ```

3. Create your customization stylesheet (for example, `custom_mainpage.xsl`), and edit it to override the template that produces the footer section:

   ```xml
   <xsl:template match="*:div[contains(@class, 'footer-container')]
   mode="copy_template">
   <!-- Apply the default processing -->
   <xsl:next-match/>
   <!-- Add a div containing the copyright information -->
   <div class="copyright_info">
     \&amp;#xa9;<xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrfirst"/>
     </div>
   </xsl:template>
   ```
4. Use the **Run DITA-OT Integrator** transformation scenario *(page 1407)* found in the **DITA Map** section in the **Configure Transformation Scenario(s)** dialog box *(page 1502)*.

5. Run a **DITA Map WebHelp Responsive** transformation scenario to obtain the customized side TOC.
Use-Case 2: WebHelp XSLT-Parameter extension point to control if generation time is displayed in the output

Another possible customization for the main page is to add the generation time in its footer. You can use an XSLT-Parameter extension point to control whether or not this customization is active. In this case, you can use the `com.oxygenxml.webhelp.xsl.createMainPage.param` extension point (page 1754).

Figure 582: Generation time added in the WebHelp footer

To add this functionality, follow these steps:

1. Create a DITA-OT plugin structure by following the first 3 steps in the procedure above (page 1735).
2. In the customization stylesheet that you just created (for example, `custom_mainpage.xsl`), declare `webhelp.footer.add.generation.time` as a global parameter and modify the template by adding the following XSLT code at the end.

   ```xsl
   <xsl:if test='webhelp.footer.add.generation.time = 'yes''>
     <div class="generation_time">
       Generation date: <xsl:value-of select='format-dateTime(
         current-dateTime(), '[h1]:[m01] [P] on [M01]/[D01]/[Y0001].')'/>
     </div>
   </xsl:if>
   ```

3. Edit the `plugin.xml` file to specify the `com.oxygenxml.webhelp.xsl.createMainPage.param` extension point and a custom parameter file by adding the following line:

   ```xml
   <feature extension="com.oxygenxml.webhelp.xsl.createMainPage.param" file="params.xml"/>
   ```

4. Create a custom parameter file (for example, `params.xml`). It should look like this:

   ```xml
   <dummy>
     <param name="webhelp.footer.add.generation.time"
           expression="${webhelp.footer.add.generation.time}"
           if="webhelp.footer.add.generation.time"/>
   </dummy>
   ```

5. Use the Run DITA-OT Integrator transformation scenario (page 1407) found in the DITA Map section in the Configure Transformation Scenario(s) dialog box (page 1502).
6. Edit a DITA Map WebHelp Responsive transformation scenario and in the Parameters tab (page 2614), specify the desired value (yes or no) for your custom parameter (webhelp.footer.add.generation.time).

7. Run the transformation scenario.

Miscellaneous Customization Topics

This section contains miscellaneous topics about how to customize the WebHelp Responsive output.

How to Add an Edit Link to Launch Oxygen XML Web Author

You can embed Edit links in the DITA WebHelp Responsive output that will automatically launch a particular document in Oxygen XML Web Author. A reviewer can then simply click the link and they will be redirected to the Oxygen XML Web Author editing page with that particular file open and editable.

Using a Publishing Template

To embed an Edit link in the DITA Map WebHelp Responsive output using an Oxygen Publishing Template (page 1632), follow this procedure:

1. If you haven't already created a Publishing Template, see Working with Publishing Templates (page 1675).

2. Open the template descriptor file (page 1636) associated with your publishing template and add the following parameters with their values set to the URLs:

   - **editlink.remote.ditamap.url** - The URL of the DITA Map suitable for opening in Oxygen XML Web Author.
   - **editlink.web.author.url** - The URL of the Oxygen XML Web Author installation.

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <parameters>
      <parameter name="editlink.remote.ditamap.url"/>
    </parameters>
  </webhelp>
</publishing-template>
```
3. Open the DITA Map WebHelp Responsive transformation scenario.
4. Click the Choose Custom Publishing Template link and select your template.
5. Click OK to save the changes to the transformation scenario.
6. Run the transformation scenario.

**Result:** In the WebHelp output, all topics will have an *Edit* link to the right side of the title and clicking the link will launch that particular document in Oxygen XML Web Author.

For example:

- **Windows:**

  dita.bat -i c:\mySample.ditamap -f webhelp-responsive -
  Deditlink.remote.ditamap.url=webdav-https://dav.box.com/dav/my.ditamap -

- **Mac OS X/ Linux:**

  www.oxygenxml.com/webauthor.html

**Using a Transformation Scenario in Oxygen XML Editor/Author**

To embed an *Edit* link in the DITA Map WebHelp Responsive output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Edit a DITA Map WebHelp Responsive transformation scenario and open the Parameters tab.
2. Set values for the following parameters:
   - *editlink.remote.ditamap.url* - The URL of the DITA Map suitable for opening in Oxygen XML Web Author.
   - *editlink.web.author.url* - The URL of the Oxygen XML Web Author installation.
3. Run the transformation scenario.

**Result:** In the WebHelp output, all topics will have an *Edit* link to the right side of the title and clicking the link will launch that particular document in Oxygen XML Web Author.
How to Flag DITA Content in WebHelp Output

Flagging content in WebHelp output involves defining a set of images that will be used for marking content across your information set.

To flag DITA content, you need to create a filter file that defines properties that will be applied on elements to be flagged. Generally, flagging is supported for block elements (page 2703) (such as paragraphs), but not for phrase-level elements within a paragraph. This ensures that the images that will flag the content are easily scanned by the reader, instead of being buried in the text.

Using a Publishing Template

To flag content in DITA Map to WebHelp output using an Oxygen Publishing Template (page 1632), follow this procedure:

1. Create a DITA filter file (DITAVAL) and add it in a directory of your choice (for example, named myFile.ditaval).
2. Define the property for the elements you want to be flagged. For example, if you want to flag any element that has the audience attribute set to programmer, the content of the DITAVAL file should look like this:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<val>
  <prop att="audience" val="programmer" action="flag"
    img="D:\resource\delta.gif" alt="sample alt text"/>
</val>
```

Note that for an element to be flagged, at least one attribute-value pair needs to have a property declared in the DITAVAL file.

3. Open the template descriptor file (page 1636) associated with your publishing template and add the args.filter parameter in the parameters section with its value set to the path of the DITAVAL file you created.
Using a Transformation Scenario in Oxygen XML Editor/Author

To flag content in the DITA Map to WebHelp output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Create a DITA filter file (DITAVAL) and add it in a directory of your choice (for example, named myFile.ditaval).

2. Define the property for the elements you want to be flagged. For example, if you want to flag any element that has the audience attribute set to programmer, the content of the DITAVAL file should look like this:

   ```xml
   <?xml version="1.0" encoding="UTF-8"?>
   <val>
     <prop att="audience" val="programmer" action="flag"
     img="D:\resource\delta.gif" alt="sample alt text"/>
   </val>
   
   Note that for an element to be flagged, at least one attribute-value pair needs to have a property declared in the DITAVAL file.

3. Edit a DITA Map to WebHelp transformation scenario.

4. Specify the DITAVAL file in the Filters tab (with the Use DITAVAL File option).

5. Run the transformation scenario.

Related Information:
How to Deploy the Output on a SharePoint Site

Since WebHelp output must be published locally, on the same machine where the WebHelp process is running, to publish your files directly to a SharePoint library you need to map a network drive to connect to SharePoint and change your file extensions to .aspx, as described in the steps below.

Using a Script Outside of Oxygen XML Editor/Author

To publish WebHelp Responsive output on a SharePoint site using an Oxygen Publishing Template (page 1632), follow this procedure:

1. Map a network drive to connect to your SharePoint library. For more information, see: https://support.microsoft.com/en-us/kb/2616712.
2. To allow browsers to open your published files (rather than downloading them), you need to change the file extensions from .html to .aspx.
3. Open the template descriptor file (page 1636) associated with your publishing template and add the args.outext parameter in the parameters section with its value set to .aspx.

```
<publishing-template>
   ...
   <webhelp>
      ...
      <parameters>
         <parameter name="args.outext" value=".aspx"/>
      </parameters>
   </webhelp>
</publishing-template>
```

4. Open the DITA Map WebHelp Responsive transformation scenario.
5. Click the Choose Custom Publishing Template link and select your template.
6. Click OK to save the changes to the transformation scenario.
7. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To publish WebHelp Responsive output on a SharePoint site using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:
1. Map a network drive to connect to your SharePoint library. For more information, see: https://support.microsoft.com/en-us/kb/2616712.

2. To allow browsers to open your published files (rather than downloading them), you need to change the file extensions from .html to .aspx. Fortunately, this can be done in the transformation.
   a. Edit the WebHelp transformation scenario and open the Parameters tab.
   b. Set the args.outext parameter to .aspx.
   c. Run the transformation scenario.

WebHelp Responsive Transformation Parameters

In addition to the common DITA-OT transformation parameters and the HTML-based Output Parameters, there are numerous other supported parameters that are specific to the WebHelp Responsive output.

Publishing Template Parameters

webhelp.publishing.template

Specifies the path to the ZIP archive (or root folder) that contains your custom WebHelp Responsive template.

Note: The built-in templates are stored in the DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/templates folder.

Note: Relative paths are resolved based on the current working directory.

webhelp.publishing.template.descriptor

Specifies the name of the descriptor to be loaded from the WebHelp Responsive template package. If it is not specified, the first encountered descriptor will be automatically loaded.

Custom Resource Parameters

webhelp.custom.resources

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

webhelp.favicon

The file path that points to an image to be used as a favicon in the WebHelp output.

webhelp.logo.image.target.url
Specifies a target URL that is set on the logo image. When you click the logo image, you will be redirected to this address.

**webhelp.logo.image**

Specifies a path to an image displayed as a logo in the left side of the output header.

**webhelp.logo.image.alt**

Specifies a value that will be set in the `alt` attribute of the logo image. If the parameter is not specified, the `alt` attribute will contain the publication title. Note that this parameter makes sense only in conjunction with the `webhelp.logo.image` parameter.

### Feedback-Enabled Parameters

**webhelp.product.id** *(available only for Feedback-enabled systems)*

This parameter specifies a short name for the documentation target, or product (for example, `mobile-phone-user-guide, hvac-installation-guide`).

**Note:** You can deploy documentation for multiple products on the same server.

**Restriction:** The following characters are not allowed in the value of this parameter: `<>\'\{\}{};*%+&.`

**webhelp.product.version** *(available only for Feedback-enabled systems)*

Specifies the documentation version number (for example, 1.0, 2.5, etc.). New user comments are bound to this version.

**Note:** Multiple documentation versions can be deployed on the same server.

**Restriction:** The following characters are not allowed in the value of this parameter: `<>\'\{\}{};*%+&.`

### HTML Fragment Extension Parameters

**webhelp.fragment.after.body**

In the generated output it displays a given XHTML fragment after the page body. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.logo_and_title**
In the generated output it displays a given XHTML fragment after the logo and title. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.after.main.page.search**

In the generated output it displays a given XHTML fragment after the search field. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.after.toc_or_tiles**

In the generated output it displays a given XHTML fragment after the table of contents or tiles in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.after.top_menu**

In the generated output it displays a given XHTML fragment after the top menu. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.before.body**

In the generated output it displays a given XHTML fragment before the page body. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.before.logo_and_title**

In the generated output it displays a given XHTML fragment before the logo and title. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.before.main.page.search**

In the generated output it displays a given XHTML fragment before the search field. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.before.toc_or_tiles**

In the generated output it displays a given XHTML fragment before the table of contents or tiles in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.before.top_menu**

In the generated output it displays a given XHTML fragment before the top menu. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.
webhelp.fragment.footer

In the generated output it displays a given XHTML fragment as the page footer. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.head

In the generated output it inserts a given XHTML fragment in the <head> element. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.welcome

In the generated output it displays a given XHTML fragment as a welcome message (or title). The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

Output Component Parameters

webhelp.default.collection.type.sequence

Specifies if the sequence value will be used by default when the collection-type attribute is not specified. This option is helpful if you want to have Next and Previous navigational buttons generated for all HTML pages. Allowed values are no (default) and yes.

webhelp.merge.nested.topics.related.links

Specifies if the related links from nested topics will be merged with the links in the parent topic. Thus the links will be moved from the topic content to the related links component and all of the links from the same group (for example, Related Tasks, Related References, Related Information) are merged into a single group. The default value is yes.

webhelp.show.breadcrumb

Specifies if the breadcrumb component will be presented in the output. The default value is yes.

webhelp.show.changes.and.comments

When set to yes, user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is no.

webhelp.show.child.links

Specifies if child links will be generated in the output for all topics that have subtopics. The default value is no.

webhelp.show.full.size.image
Specifies if responsive images that are displayed with a smaller dimension than their original size can be clicked to see an enlarged version of the image. The default value is **yes**.

**webhelp.show.indexterms.link**

Specifies if an icon that links to the index will be presented in the output. The default value is **yes**.

**webhelp.show.main.page.tiles**

Specifies if the tiles component will be presented in the main page of the output. For a *tree* style layout, this parameter should be set to **no**.

**webhelp.show.main.page.toc**

Specifies if the table of contents will be presented in the main page of the output. The default value is **yes**.

**webhelp.show.navigation.links**

Specifies if navigation links will be presented in the output. The default value is **yes**.

**webhelp.show.print.link**

Specifies if a print link or icon will be presented within each topic in the output. The default value is **yes**.

**webhelp.show.publication.toc**

Specifies if a table of contents will be presented on the left side of each topic in the output. The default value is **yes**.

**webhelp.show.topic.toc**

Specifies if a topic table of contents will be presented on the right side of each topic in the output. This table of contents contains links to each `<section>` within the current topic that contains an `@id` attribute and the section corresponding to the current scroll position is highlighted. The default value is **yes**.

**webhelp.show.top.menu**

Specifies if a menu will be presented at the topic of the main page in the output. The default value is **yes**.

**webhelp.publication.toc.hide.chunked.topics**

Specifies if the table of contents will contain links for *chunked* topics. The default value is **yes**.

**webhelp.publication.toc.links**

Specifies which links will be included in the table of contents. The possible values are:
**chapter** (default) - The TOC will include links for the current topic, its children, its siblings, and its direct ancestor (including the direct ancestor's siblings), and the parent chapter.

**topic** - The TOC will only include links for the current topic and its direct children.

**all** - The TOC will include all links.

---

**webhelp.publication.toc.tooltip.position**

By default, if a topic contains a `shortdesc` element, its content is displayed in a tooltip when the user hovers over its link in the table of contents. This parameter controls whether or not this tooltip is displayed and its position relative to the link. The possible values are:

- **left** (default)
- **right**
- **top**
- **bottom**
- **hidden** - The tooltip will not be displayed.

---

**webhelp.top.menu.depth**

Specifies the maximum depth level of the topics that will be included in the top menu. The default value is 3. A value of 0 means that the menu has unlimited depth.

**webhelp.topic.collapsible.elements.initial.state**

Specifies the initial state of collapsible elements (tables with titles, nested topics with titles, sections with titles, index term groups). The possible values are **collapsed** or **expanded** (default value).

---

**Search-Related Parameters**

**webhelp.search.japanese.dictionary**

The file path of the dictionary that will be used by the *Kuromoji* morphological engine for indexing Japanese content in the WebHelp pages. The encoding for the dictionary must be **UTF8**.

**webhelp.search.ranking**

If this parameter is set to **false** then the 5-star rating mechanism is no longer included in the search results that are displayed on the **Search** tab (default setting is **true**).

**webhelp.search.stop.words.exclude**
Specifies a list of words that will be excluded from the default list of *stop words* that are filtered out before the search processing. Use comma separators to specify more than one word (for example: *if, for, is*).

**webhelp.sitemap.base.url**

Base URL for all the *loc* elements in the generated *sitemap.xml* file. The value of a *loc* element is computed as the relative file path from the *href* attribute of a *topicref* element from the *DITA map*, appended to this base URL value. The *loc* element is mandatory in *sitemap.xml*. If you leave this parameter set to its default empty value, then the *sitemap.xml* file is not generated.

**webhelp.enable.search.autocomplete**

Specifies if the *Autocomplete* feature is enabled in the WebHelp search text field. The default value is *yes*.

**webhelp.search.enable.pagination**

Specifies whether or not search results will be displayed on multiple pages. Allowed values are *yes* or *no*.

**webhelp.search.page.numberOfItems**

Specifies the number of search results items displayed on each page. This parameter is only used when the *webhelp.search.enable.pagination* parameter is enabled.

**webhelp.sitemap.change.frequency**

The value of the *changefreq* element in the generated *sitemap.xml* file. The *changefreq* element is optional in *sitemap.xml*. If you leave this parameter set to its default empty value, then the *changefreq* element is not added in *sitemap.xml*. Allowed values: <empty string> (default), always, hourly, daily, weekly, monthly, yearly, never.

**webhelp.sitemap.priority**

The value of the *priority* element in the generated *sitemap.xml* file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The *priority* element is optional in *sitemap.xml*. If you leave this parameter set to its default empty value, then the *priority* element is not added in *sitemap.xml*.

**webhelp.google.search.results**

A file path that specifies the location of a well-formed XHTML file containing the Google Custom Search Engine element *gcse:searchresults-only*. You can use all supported attributes for this element. It is recommend to set the *linkTarget* attribute to *frm* for frameless (*iframe*) version of WebHelp or to *contentWin* for the frameset version of WebHelp. The default value for this attribute is *_blank* and the search results will be
loaded in a new window. If this parameter is not specified, the following code will be used:

```xml
<gcse:searchresults-only linkTarget="frm"></gcse:searchresults-only>
```

**webhelp.google.search.script**

A file path that specifies the location of a well-formed XHTML file containing the Custom Search Engine script from Google.

**Note:** The `fix.external.refs.com.oxygenxml` parameter is not supported when running the transformation from a command line. This parameter is normally used to specify whether or not the application tries to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references.

- Generating WebHelp Responsive Output ([page 1668](#))
- Setting DITA-OT Parameters

### WebHelp Responsive XSLT-Import and XSLT-Parameter Extension Points

XSLT extension points can be used from either from an *Oxygen Publishing Template* or from a DITA-OT extension plug-in.

#### Extension Points from an Oxygen Publishing Template

The publishing template allows you to specify one or more XSLT extension points. These extension points will affect only the transformations that use the particular template.

For an example of how to use these extension in a publishing template, see: [How to Use a XSLT Extension Point from a Publishing Template](#) topic.

**Example:**

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <xslt>
      <extension
        id="com.oxygenxml.webhelp.xsl.createMainPage"
        file="xsl/customMainPage.xsl"/>
    </xslt>
  </webhelp>
  ...
</publishing-template>
```
Extension Points from a DITA-OT Extension Plug-in

The DITA-OT plug-in installer adds an XSLT import statement in the default WebHelp XSLT so that the XSLT stylesheet referenced by the extension point becomes part of the normal build. You can use these extension points to override XSLT processing steps.

Example:

```xml
<plugin id="com.oxygenxml.webhelp.responsive.extension">
  <feature extension="com.oxygenxml.webhelp.responsive.xsl.dita2webhelp"
           file="xsl/fixup.xsl"/>
</plugin>
```

XSLT-Import Extension Points

The following extension points are available:

com.oxygenxml.webhelp.xsl.dita2webhelp

Extension point to override the XSLT stylesheet (dita2webhelp.xsl) that produces an HTML file for each DITA topic. The location of this file is `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\dita2webhelp\dita2webhelp.xsl`

com.oxygenxml.webhelp.xsl.createMainPage

Extension point to override the XSLT stylesheet (createMainPage.xsl) that produces the WebHelp Responsive main HTML page (index.html). The location of this file is `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\mainFiles\createMainPage.xsl`

com.oxygenxml.webhelp.xsl.createNavLinks

Extension point to override the XSLT stylesheets that are used to generate navigation links in the WebHelp Responsive pages. These stylesheets can be found in the navLinks folder: `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\navLinks`

com.oxygenxml.webhelp.xsl.createSearchPage

Extension point to override the XSLT stylesheet (createSearchPage.xsl) that produces the WebHelp Responsive search HTML page (search.html). The location of this file is `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\mainFiles\createSearchPage.xsl`
com.oxygenxml.webhelp.xsl.createIndexTermsPage

Extension point to override the XSLT stylesheet (createIndextermsPage.xsl) that produces the WebHelp Responsive index terms HTML page (indexterms.html). The location of this file is DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\mainFiles\createIndextermsPage.xsl

com.oxygenxml.webhelp.xsl.createTocXML

Extension point to override the XSLT stylesheet (tocDita.xsl) that produces the toc.xml file. This file contains information extracted from the DITA map (page 2705) and it is mainly used to construct the WebHelp Table of Contents and navigational links. The path to this stylesheet is: DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\toc\tocDita.xsl.

XSLT-Parameter Extension Points

If your customization stylesheet declares one or more XSLT parameters and you want to control their values from the transformation scenario, you can use one of the following XSLT parameter extension points:

com.oxygenxml.webhelp.xsl.dita2webhelp.param

Use this extension point to pass parameters to the stylesheet specified using the com.oxygenxml.webhelp.xsl.dita2webhelp extension point (page 1753).

com.oxygenxml.webhelp.xsl.createMainPage.param

Use this extension point to pass parameters to the stylesheet specified using the com.oxygenxml.webhelp.xsl.createMainPage extension point (page 1753).

com.oxygenxml.webhelp.xsl.createNavLinks.param

Use this extension point to pass parameters to the stylesheet specified using the com.oxygenxml.webhelp.xsl.createNavLinks extension point (page 1753).

com.oxygenxml.webhelp.xsl.createSearchPage.param

Use this extension point to pass parameters to the stylesheet specified using the com.oxygenxml.webhelp.xsl.createSearchPage extension point (page 1753).

com.oxygenxml.webhelp.xsl.createIndextermsPage.param

Use this extension point to pass parameters to the stylesheet specified using the com.oxygenxml.webhelp.xsl.createIndextermsPage extension point (page 1753).

com.oxygenxml.webhelp.xsl.createTocXML.param
Use this extension point to pass parameters to the stylesheet specified using the `com.oxygenxml.webhelp.xsl.createTocXML` extension point (page 1754).

**DITA to PDF Output Customization**

Oxygen XML Editor plugin provides support for generating PDF output using transformation scenarios for certain types of documents (for example, DITA, DocBook, TEI, and JATS) and Oxygen XML Editor plugin supports several different types of processors. There are numerous ways to customize the published output to fit your specific needs.

**CSS-based DITA to PDF Customization**

Oxygen XML Editor plugin comes bundled with a **DITA-OT CSS-based PDF Publishing Plugin** that combines all the topics from a map or bookmap and styles the resulting document using CSS. It is the base of the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.

**DITA Map PDF - based on HTML5 and CSS Transformation Type**

This transformation type uses a CSS-based processing engine and HTML5 as an intermediate format. For this transformation, the `pdf-cs-html5` transtype is used. Because the structure of the HTML5 intermediate format resembles the one used in WebHelp output, it is possible to reuse parts of your CSS file you developed for a WebHelp customization.

**DITA Map PDF - based on DITA and CSS (WYSIWYG) Transformation Type (Deprecated)**

This transformation type converts DITA maps to PDF using a CSS-based processing engine and a merged DITA map (one with all topics expanded inline) as an intermediate format. For this transformation, the `pdf-css` transtype is used. This transformation scenario was deprecated
starting with version 21.0. It is recommended to use the **DITA Map PDF - based on HTML5 & CSS transformation scenario** (page 1398) instead.

### Related Information:

- DITA Map to PDF - based on HTML5 and CSS Transformation (page 1398)

### Overview

This section contains topics that provide a basic overview of the **DITA-OT CSS-based PDF Publishing Plugin**, technical details, and some additional resources to help you with your customizations.

### Resources

Customizing the PDF output requires knowledge of CSS, Paged Media, and DITA. The following list provides some resources to help you:

- **CSS** - You can find a good tutorial here: [https://developer.mozilla.org/en-US/docs/Learn/CSS/Introduction_to_CSS](https://developer.mozilla.org/en-US/docs/Learn/CSS/Introduction_to_CSS). Also, the specification is available on the W3C website: [https://www.w3.org/Style/CSS/Overview.en.html](https://www.w3.org/Style/CSS/Overview.en.html).

- **CSS Paged Media** - This is a part of the CSS specification that shows how to organize your publication in pages, how to use headers/footers, page breaks, and other page-related issues. The specification is available here: [https://www.w3.org/TR/CSS2/page.html](https://www.w3.org/TR/CSS2/page.html). Also, there is a set of hands-on examples in the Oxygen PDF Chemistry user guide: [https://www.oxygenxml.com/doc/ug-chemistry/](https://www.oxygenxml.com/doc/ug-chemistry/).

- **DITA** - You will need a basic understanding of DITA elements, attributes, and structure. A good resource is The DITA Style Guide - Best Practices for Authors by Tony Self. It is available at: [www.ditastyle.com](http://www.ditastyle.com) and: [https://www.oxygenxml.com/dita/styleguide/webhelp-feedback/Artefact/c_DITA_Authoring_Concepts.html](https://www.oxygenxml.com/dita/styleguide/webhelp-feedback/Artefact/c_DITA_Authoring_Concepts.html).

- **HTML5** - For the **DITA Map PDF - based on HTML5 & CSS** transformation type, you will need a good knowledge of HTML5. You can find resources here: [https://developer.mozilla.org/en-US/docs/Web/Guide/HTML/HTML5](https://developer.mozilla.org/en-US/docs/Web/Guide/HTML/HTML5)

### Related Information:

- DITA-OT DAY 2017: Using CSS to Style PDF Output
Supported Processors

The DITA-OT CSS-based PDF Publishing Plugin supports the following CSS processors:

- **Oxygen PDF Chemistry** - This is recommended processor because the built-in CSS files were fine-tuned for this processor. For example, metadata extraction *(page 1794)* only functions with this processor. If the plugin is started from an Oxygen XML Editor/Author distribution, a Chemistry installation is not needed.

Technical Details

It has two transformation types:

- **pdf-css-html5** *(DITA Map PDF - based on HTML5 & CSS transformation)* - CSS styling applied over a merged HTML5 document (the merged DITA converted to HTML5).
- **pdf-css** *(DITA Map PDF - based on DITA & CSS - WYSIWYG transformation)* - CSS styling applied directly over a merged DITA document. This transformation type was deprecated started with version 21.

This is how it works:

1. It expands all the topic references into a temporary clone of the map, resolving keys and reused content. This is the standard DITA-OT pre-processing procedure.
2. It generates a structure for the table of contents and index. The result is a merged map with all the references resolved. This is a standard DITA-OT processing procedure, based on the PDF2 plugin.
3. Then it post-processes the merged map. It fixes some of the structure in the TOC and index, moves the frontmatter and backmatter to the correct places, transforms any change tracking and review processing instructions to elements that can be styled later, etc. The result is another merged map.

4. When using the DITA Map PDF - based on HTML5 & CSS transformation type, the merged DITA map is transformed to a single HTML5 file. The generated HTML elements copy the class attributes from the original DITA elements. In this way you can either use selectors that were designed for DITA structure, or ones for the HTML structure - see: Reusing the Styling for WebHelp and PDF Output (page 1866). This step can apply customization XSLT extension points (page 1774) that change the default processing.

5. In the last phase, it uses a collection of CSS files to style the merged map (or for the DITA Map PDF - based on HTML5 & CSS transformation type, the merged map in the HTML5 format with the help of the CSS processor).
**Note:** For the DITA Map PDF - based on DITA & CSS (WYSIWYG) transformation type, the used CSS files are those selected in the **Styles** drop-down menu from the toolbar in Oxygen XML Editor/Author, and they are processed along with the CSS files specified with the `args.css` parameter set in the transformation scenario.

**Note:** For the DITA Map PDF - based on HTML5 & CSS transformation type, references to the CSS files are collected from the **publishing template** (page 1764).

---

**Increasing Memory Allocation for Java**

If you are working with a large project with extensive metadata or key references, you may need to increase the amount of memory that is allocated for the Java process. You can do this by changing the value of the `ANT_OPTS` environment variable from a command line for a specific session.

**Example:** To increase the JVM memory allocation to 1024 MB for a specific session, issue the following command from a command prompt (depending on your operating system):

- **Windows**
  
  ```
  set ANT_OPTS=%ANT_OPTS% -Xmx1024M
  ```

- **Linux/Mac OS X**
  
  ```
  export ANT_OPTS=$ANT_OPTS -Xmx1024M
  ```

**Tip:** To persistently change the memory allocation, change the value allocated to the `ANT_OPTS` environment variable on your system.
Transformation Parameters

This list includes the most common customization parameters that are available in the DITA Map PDF - based on HTML5 & CSS transformation scenario. Other standard DITA-OT parameters were omitted for clarity, but they are still supported.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>args.css</td>
<td>You can use this to specify a list of CSS URLs to be used in addition to those specified in the dita.css.list parameter or publishing template. The files must have URL syntax and be separated using semicolons.</td>
</tr>
<tr>
<td>args.css.param.*</td>
<td>You can use this parameter pattern to set attributes on the root of the merged map. This means you can activate specific CSS rules from your custom CSS using custom attributes. For examples, see: Styling Through Custom Parameters (page 1883).</td>
</tr>
</tbody>
</table>
| args.css.param.numbering | You can use this parameter to change the numbering of the chapters and sections. Allowed values:  
  
  - shallow - Only the topics from the first level will be numbered (chapters).  
  - deep - All the topics from the map will be numbered (chapters and subsections). |
| args.figurelink.style    | Specifies how cross references to figures are styled in output. Allowed values:  
  
  - NUMBER - Only the number of the figures will be shown in links.  
  - TITLE - Only the title of the figures will be shown in links.  
  - NUMTITLE (default) - Both the title and number of the figures will be shown in links. |
<p>| args.gen.task.lbl        | Specifies whether or not to generate headings for sections within task topics. Allowed values: YES or NO (default). When set to yes, headings like &quot;About this task&quot;, &quot;Procedure&quot;, or &quot;What to do next&quot;, are shown in the task contents. |
| args.input               | Specifies the master DITA map file for your documentation project.                                                                           |
| args.output.base         | Specifies the name of the output file without a file extension. By default, the name of the PDF file is derived from the name of the DITA map file. This parameter allows you to override it. |</p>
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>args.tablelink.style</td>
<td>Specifies how cross references to tables are styled in output. Allowed values:</td>
</tr>
<tr>
<td></td>
<td>• NUMBER - Only the number of the tables will be shown in links.</td>
</tr>
<tr>
<td></td>
<td>• TITLE - Only the title of the tables will be shown in links.</td>
</tr>
<tr>
<td></td>
<td>• NUMTITLE (default) - Both the title and number of the tables will be shown in links.</td>
</tr>
<tr>
<td>clean.temp</td>
<td>Specifies whether the DITA-OT deletes the files in the temporary directory after it finishes a build. Allowed values: Yes (default) / no</td>
</tr>
<tr>
<td>css.processor.path.antenna-house</td>
<td>Path to the Antenna House executable file that needs to be run to generate the PDF (for example, C:\path\to\AHFCmd.exe on Windows).</td>
</tr>
<tr>
<td>css.processor.path.chemistry</td>
<td>Path to the Oxygen PDF Chemistry executable file that needs to be run to generate the PDF (for example, C:\path\to\chemistry.bat on Windows). If this parameter is not set, the plugin will use the system's PATH environment variable to locate and start Oxygen PDF Chemistry.</td>
</tr>
<tr>
<td>css.processor.path.prince</td>
<td>Path to the Prince executable file that needs to be run to generate the PDF (for example, C:\path\to\prince.exe on Windows).</td>
</tr>
<tr>
<td>css.processor.type</td>
<td>Specifies the processor to use for the transformation. Allowed values: chemistry (default) / antenna-house / prince.</td>
</tr>
<tr>
<td>editlink.remote.ditamap.url</td>
<td>Use this parameter in conjunction with editlink.web.author.url to add an Edit link next to the topic title in the PDF output. When a user clicks the link, the topic is opened in Oxygen XML Web Author where they can make changes that can be saved to a file server. The value should be set as the custom URL of the main DITA map. For example, a GitHub custom URL might look like this: <a href="https://getFileContent/oxyengxml/userguide/master/UserGuide.ditamap">https://getFileContent/oxyengxml/userguide/master/UserGuide.ditamap</a>.</td>
</tr>
<tr>
<td>editlink.web.author.url</td>
<td>This parameter needs to be used in conjunction with editlink.remote.ditamap.url to add an Edit link next to the topic title in the PDF output. When a user clicks the link, the topic is opened in Oxygen XML Web Author where they can make changes that can be saved to a file server. The value should be set as the URL of the Web Author installation. For example: <a href="https://www.oxygenxml.com/oxygen-xml-web-author/">https://www.oxygenxml.com/oxygen-xml-web-author/</a>.</td>
</tr>
<tr>
<td>figure.title.placement</td>
<td>Controls the title placement of the figures, relative to the image. Possible values include top (default) and bottom.</td>
</tr>
</tbody>
</table>
The following parameters can be used to specify a publishing template:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pdf.publishing.template</td>
<td>Specifies the path to the folder containing the custom PDF template.</td>
</tr>
<tr>
<td>pdf.publishing.template.descriptor</td>
<td>Specifies the name of the descriptor to be loaded from the PDF template folder or package. If it is not specified, the first encountered descriptor will be loaded.</td>
</tr>
</tbody>
</table>

Publishing Templates

An Oxygen Publishing Template defines all aspects of the layout and styles for output obtained from the following transformation scenarios:

- WebHelp Responsive
- WebHelp Responsive with Feedback
- DITA Map PDF - based on HTML5 & CSS

It is a self-contained customization package stored as a ZIP archive or folder that can easily be shared with others. It provides the primary method for customizing the output.

Some possible customization methods include:

- Add additional template resources to customize the output (such as logos, Favicons, or CSS files).
- Extend the default processing by specifying one or more XSLT extension points.
- Specify one or more transformation parameters to customize the output.
- Customize various aspects of the output through simple CSS styling.
For **WebHelp Responsive** output, change the layout of the main page or topic pages by customizing which components will be displayed and where they will be positioned in the page.

The following graphics are possible sample structure for **Oxygen Publishing Template** packages:

**Figure 583: Oxygen Publishing Template Package (WebHelp Responsive)**

- publishing template
  - CSS
    - oxygen-skin.css
  - JS
  - fonts
  - HTML-Fragments
    - webhelp.fragment.footer.html
    - webhelp.fragment.before.logo_and_title.html
  - XSLT-Extensions
    - topic_page_extension.xsl
  - page-templates
    - wt_index.html
    - wt_search.html
    - wt_topic.html
    - wt_terms.html
  - template_descriptor.opt

Template Descriptor

For information about creating and customizing publishing templates, and how to adjust the WebHelp and PDF output through CSS styling and other customization methods, watch our Webinar: **Creating Custom Publishing Templates for WebHelp and PDF Output**. The Webinar slides and sample project are also available from that webpage.

**Related Information:**

- How to Create a Publishing Template (page 1676)
- How to Edit a Packed Publishing Template (page 1678)
- How to Add a Publishing Template to the Publishing Templates Gallery (page 1678)
Publishing Template Package Contents for PDF Customizations

An Oxygen Publishing Template for PDF output must contain a template descriptor file and at least one CSS file, and may contain other resources (such as graphics, XSLT files, etc.). All the template resources can be stored in either a ZIP archive or in a folder. It is recommended to use a ZIP archive because it is easier to share with others.

Template Descriptor File

Each publishing template includes a descriptor file that defines the meta-data associated with template. It is an XML file with certain elements that defines all the resources included in a template (such as CSS files, images, and transformation parameters).

The template descriptor file must have the .opt file extension and must be located in the templates' root folder.

A PDF template descriptor might look like this:

```
<publishing-template>
  <name>Flowers</name>

  <pdf>
    <tags>
      <tag>purple</tag>
      <tag>light</tag>
    </tags>
    <preview-image file="flowers-preview.png"/>
    <resources>
      <css file="flowers.css"/>
    </resources>
    <parameters>
      <parameter name="figure.title.placement" value="top"/>
    </parameters>
  </pdf>
</publishing-template>
```
Tip: It is recommended to edit the template descriptor in Oxygen XML Editor/Author because it provides content completion and validation support.

Template Name and Description

Each template descriptor file requires a name element. This information is displayed as the name of the template in the transformation scenario dialog box.

Optionally, you can include a description and it displayed when the user hovers over the template in the transformation scenario dialog box.

```xml
<publishing-template>
  <name>Flowers</name>
  <description>Flowers themed light colored template</description>
  ...
</publishing-template>
```

Template Author

Optionally, you can include author information in the descriptor file and it displayed when the user hovers over the template in the transformation scenario dialog box. This information might be useful if users run into an issue or have questions about a certain template.

If you include the author element, a name is required and optionally you can include email, organization, and organizationUrl information.

```xml
<publishing-template>
  ...
  <author>
    <name>John Doe</name>
    <email>jdoe@example.com</email>
    <organization>ACME</organization>
    <organizationUrl>http://www.example.com/jdoe</organizationUrl>
  </author>
  ...
</publishing-template>
```

PDF Element

The pdf element contains various details about the template and its resources that define the PDF output. It is a required element if you intend on using a DITA Map to PDF transformation scenario. The elements that are allowed in this pdf section specify the template tags (page 1766), template preview
image (page 1766), resources (page 1767) (such as CSS files), transformation parameters (page 1767), or XSLT extensions (page 1768).

```
<pdf>
  <tags>
    ... 
  </tags>
  <preview-image file="MyPreview.png"/>

  <resources>
    ... 
  </resources>

  <parameters>
    ... 
  </parameters>
</pdf>
```

**Template Tags**

The `tags` section provides meta information about the template (such as color theme). Each `tag` is displayed at the top of the Templates tab window in the transformation scenario dialog box and they help the user filter and find particular templates.

```
<publishing-template>
  ... 
  <pdf>
    <tags>
      <tag>purple</tag>
      <tag>light</tag>
    </tags>
  </pdf>
</publishing-template>
```

**Template Preview Image**

The `preview-image` element is used to specify an image that will be displayed in the transformation scenario dialog box. It provides a visual representation of the template to help the user select the right template. The image dimensions should be 200 x 115 pixels and the supported image formats are: JPEG, PNG, or GIF.

You can also include an `online-preview-url` element to specify the URL of a published sample of your template. This will display an Online preview icon in the bottom-right corner of the image in the
transformation scenario dialog box and if the user clicks that icon, it will open the specified URL in their default browser.

```xml
<publishing-template>
  ... 
  <pdf>
    ...
    <preview-image file="ashes/ashes-tree.png"/>
    <online-preview-url>https://www.example.com/samples/tiles/ashes</online-preview-url>
  </pdf>
</publishing-template>
```

**Template Resources**

The `resources` section of the descriptor file specifies a set of resources (CSS files) that are used to customize various components in generated output. These resources will be copied to the output folder during the transformation process. At least one CSS file must be included, while the other types of resources are optional.

```xml
<publishing-template>
  ... 
  <pdf>
    ...
    <resources>
      <css file="css/custom_styles.css"/>
      <css file="css/custom_fonts.css"/>
    </resources>
  </pdf>
</publishing-template>
```

**Note:** All relative paths specified in the descriptor file are relative to the template root folder.

**Transformation Parameters**

You can also set one or more transformation parameters in the descriptor file.

```xml
<publishing-template>
  ... 
  <pdf>
    ...
    <parameters>
      <parameter name="show.changes.and.comments" value="yes"/>
    </parameters>
  </pdf>
</publishing-template>
```
The following information can be specified in the parameter element:

**Parameter name**

The name of the parameter. It may be one of the transformation parameters listed in the Parameters tab of the DITA Map to PDF - based on HTML5 & CSS transformation scenario or a DITA-OT PDF-based output parameter.

**Note:** It is not recommended to specify an input/output parameter in the descriptor file (such as the input Map, DITAVAL file, or temporary directory).

**Attention:** JVM arguments like -Xmx cannot be specified as a transformation parameter.

**Parameter Value**

The value of the parameter. It should be a relative path to the template root folder for file paths parameters.

**Parameter Type**

The type of the parameter: string or filepath. The string value is default.

After creating a publishing template (page 1770) and adding it to the templates gallery (page 1773), when you select the template in the transformation scenario dialog box, the Parameters tab will automatically be updated to include the parameters defined in the descriptor file. These parameters are displayed in italics.

**XSLT Extension Points**

The publishing templates support one or more XSLT extension points. They can be specified in the descriptor file using the following structure:

```
<publishing-template>
  ...
  <pdf>
    ...
    <xslt>
      <extension id="com.oxygenxml.pdf.css.xsl.merged2html5"
        file="xslt/merged2html5Extension.xsl"/>
      <extension id="com.oxygenxml.pdf.css.xsl.merged2merged"
        file="xslt/merged2mergedExtension.xsl"/>
    </xslt>
  </pdf>
</publishing-template>
```
For more information about the available extension points, see: XSLT Extensions for PDF Transformations (page 1774).

Combining PDF and WebHelp Responsive Customizations in a Template Package

An Oxygen Publishing Template package can contain both a PDF and WebHelp Responsive customization in the same template package and you can use that same template in both types of transformations. The template descriptor file can define the customization for both types by including both a webhelp and pdf element and some of the resources can be reused. Resources referenced in elements in the webhelp element will only be used for WebHelp transformations, and resources referenced in the elements in the pdf element will only be used in PDF transformations.

```xml
<publishing-template>
  <name>Flowers</name>
  <description>Flowers themed light-colored template</description>

  <webhelp>
    <tags>
      <tag>purple</tag>
      <tag>light</tag>
    </tags>
    <preview-image file="flowers-preview.png"/>

    <resources>
      <css file="flowers-wh.css"/>
      <css file="flowers-page-styling.css"/>
    </resources>

    <parameters>
      <parameter name="webhelp.show.main.page.tiles" value="no"/>
      <parameter name="webhelp.show.main.page.toc" value="yes"/>
    </parameters>
  </webhelp>

  <pdf>
    <tags>
      <tag>purple</tag>
      <tag>light</tag>
    </tags>
    <preview-image file="flowers-preview.png"/>

    <resources>
      <css file="flowers-pdf.css"/>
      <css file="flowers-page-styling.css"/>
    </resources>
  </pdf>
</publishing-template>
```
How to Create a Publishing Template

To create a customization, you can start from scratch or from an existing template, and then adapt it according to your needs.

Creating a Template Starting from Scratch

To create a new Oxygen Publishing Template, follow these steps:

1. Create a folder that will contain all the template files.
2. In Oxygen XML Editor/Author, open the new document wizard (use File > New or the New toolbar button), then choose the Publishing Template Descriptor template.

   Figure 585: Choosing the Publishing Template Descriptor Document Template
3. Save the .opt file into your customization directory.

4. Open the .opt file in the editor and customize it to suit your needs.

Creating a Template Starting from an Existing Template

If you are using a WebHelp Responsive or DITA Map PDF - based on HTML5 & CSS transformation, the easiest way to create a new Oxygen Publishing Template (page 2708) is to select an existing template in the transformation scenario dialog box and use the Save template as button to save that template into a new template package that can be used as a starting point.

To create a new Oxygen Publishing Template, follow these steps:

1. Open the transformation scenario dialog box and select the publishing template you want to export and use as a starting point.

2. Optional: You can set one or more transformation parameters from the Parameters tab and the edited parameters will be exported along with the selected template. You will see which parameters will be exported in the dialog box that is displayed after the next step.

3. Click the Save template as button.

   **Step Result:** This opens a template package configuration dialog box that contains some options and displays the parameters that will be exported to your template package.

4. Specify a name for the new template.

5. Optional: Specify a template description.

6. Optional: The same publishing template package can contain both a WebHelp Responsive and PDF customization and you can use the same template in both types of transformations (DITA
Map WebHelp Responsive or DITA Map to PDF - based on HTML5 & CSS). You can use the Include WebHelp customization and Include PDF customization options to specify whether your custom template will include both types of customizations.

7. **Optional:** For WebHelp Responsive customizations, you can select the Include HTML Page Layout Files option if you want to copy the default HTML Page Layout Files in your template package. They are helpful if you want to change the structure of the generated HTML pages.

8. In the **Save as** field, specify the name and path of the ZIP file where the template will be saved.

**Step Result:** A new ZIP archive will be created on disk in the specified location with the specified name.

9. Open the .opt file in the editor and customize it to suit your needs.

For more information about creating and customizing publishing templates, watch our video demonstration:

https://www.youtube.com/embed/zNmXfKWXwO8

**Related Information:**

- Publishing Template Package Contents for PDF Customizations (page 1764)
- Publishing Template Package Contents for WebHelp Responsive Customizations (page 1635)

**How to Edit a Packed Publishing Template**

To edit an existing Oxygen Publishing Template (page 2708) package, follow these steps:

1. Unzip the ZIP archive associated with the Oxygen Publishing Template in a separate folder.
2. Link the folder associated with the template in the Navigator view.
3. Using the Navigator view, you can modify the resources (CSS, JS, fonts) within the Oxygen Publishing Template folder to fit your needs.
4. Open the publishing template descriptor file (.opt extension) in the editor and modify to suit your needs.
5. **Optional:** Once you finish your customization, you can archive the folder as a ZIP file.

**Related Information:**
How to Use a Publishing Template in a PDF Transformation

A publishing template can be used for PDF output from the DITA Map PDF - based on HTML5 & CSS transformation scenario.

The Templates tab in the DITA Map PDF - based on HTML5 & CSS transformation scenario dialog displays all the templates that are available in your template gallery. To use a particular template in the transformation scenario, simply select it from this tab and then continue configuring the transformation using the other tabs to suit your needs.

To add the publishing template to your templates gallery, follow these steps:

1. Open the transformation scenario dialog box by editing a DITA Map PDF - based on HTML5 & CSS transformation.
2. In the Templates tab, click the Configure Publishing Templates Gallery link to.
   
   **Step Result:** This will open the preferences page.

3. Click the Add button and specify the location of your template directory.
   
   **Step Result:** Your template directory is now added to the Additional Publishing Templates Galleries list.

4. Click OK to return to the transformation scenario dialog box.
   
   **Step Result:** All the templates contained in your template directory will be displayed in the preview pane along with all the built-in templates.

How to Share a Publishing Template

To share a publishing template with others, following these steps:

1. Copy your template in a new folder in your project.
2. Go to Options > Preferences > DITA > Publishing and add that new folder to the list.
3. Switch the option as the bottom of that preferences page to Project Options.
4. Share your project file (.xpr).

XSLT Extensions for PDF Transformations

Since PDF output is primarily obtained by running XSLT transformations over the DITA input files, one customization method would be to override the default XSLT templates that are used by the PDF transformation.

The `pdf-css-html5` transformation type uses two stages to transform the merged DITA map (the one that aggregates all the topics) to HTML5:

1. **Stage 1**: Makes some changes on the merged map (page 1782) and the result is a modified merged map. This stage can be altered by implementing the `com.oxygenxml.pdf.css.xsl.merged2merged` XSLT extension point. This extension overrides the stylesheets found in the following folder: `DITA-OT-DIR\plugins\com.oxygenxml.pdf.css\xsl\merged2merged`.

   Note: Use this when you need to filter DITA content.

2. **Stage 2**: Transforms the merged map (page 1782) to HTML5 and the result is a single HTML document. This stage can be altered by implementing the `com.oxygenxml.pdf.css.xsl.merged2html5` XSLT extension point. This extension overrides the stylesheets found in the following folder: `DITA-OT-DIR\plugins\com.oxygenxml.pdf.css\xsl\merged2html5`.

   Note: Use this when you need to change the HTML structures generated for a specific DITA element.

These extension points can be used either from a Publishing Template or a DITA-OT extension plugin.

How to Use XSLT Extension Points for PDF Output from a Publishing Template

These examples demonstrate how to use XSLT extension points from an Oxygen Publishing Template.

Use Case 1: Styling Codeblocks with a Zebra Effect

Suppose you want your `codeblocks` to have a particular background color for one line, and another color for the next line. One advantage of this coloring technique is that you can clearly see when text from the `codeblock` is wrapped.

This effect can be done by altering the HTML5 output, creating a `div` for each line from the code block, then styling them.
To add this functionality using an *Oxygen Publishing Template*, follow these steps:

1. If you haven't already created a Publishing Template, see How to Create a Publishing Template (page 1770).
2. Link the folder associated with the publishing template to your current project in the **Navigator** view.
3. Using the **Navigator** view, create an `xslt` folder inside the project root folder.
4. In this folder, create an XSL file (for example, named `merged2html5Extension.xsl`) with the following content:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    exclude-result-prefixes="xs"
    version="2.0">

    <xsl:template match="*[contains(@class, ' pr-d/codeblock ')]">
        <div class='zebra'>
            <xsl:analyze-string regex="\n" select=".">
                <xsl:matching-substring/>
                <xsl:non-matching-substring>
                    <div><xsl:value-of select="."/></div>
                </xsl:non-matching-substring>
            </xsl:analyze-string>
        </div>
    </xsl:template>
</xsl:stylesheet>
```

5. Open the *template descriptor file* (page 1764) associated with your *publishing template* (the `.opt` file) and set the XSLT stylesheet created in previous step with the `com.oxygenxml.pdf.css.xsl.merged2html5` XSLT extension point:

```xml
<publishing-template>
    ...
    <pdf>
        ...
        <xslt>
            <extension
                id="com.oxygenxml.pdf.css.xsl.merged2html5"
                file="xslt/merged2html5Extension.xsl"/>
        </xslt>
    </pdf>
</publishing-template>
```
6. Create a **css** folder in the publishing template directory. In this directory, save a custom CSS file with rules that style the **codeblock** structure. For example:

```css
div.zebra {
    font-family: courier, fixed, monospace;
    white-space: pre-wrap;
}

div.zebra > *:nth-of-type(odd){
    background-color: silver;
}
```

7. Open the **template descriptor file (page 1764)** associated with your **publishing template** (the `.opt` file) and reference your custom CSS file in the **resources** element:

```xml
<publishing-template>
    ...
    <pdf>
        ...
        <resources>
            <css file="css/custom.css"/>
        </resources>
    </pdf>
</publishing-template>
```

8. Edit the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.

9. In the **Templates** tab, click the **Choose Custom Publishing Template** link and select your template.

10. Click **OK** to save the changes to the transformation scenario.

11. Run the transformation scenario.

**Use Case 2: Removing the Related Links Section**

Suppose you want the **related links** sections to be removed from the PDF output.

To add this functionality using an **Oxygen Publishing Template**, follow these steps:

1. If you haven't already created a Publishing Template, see [How to Create a Publishing Template (page 1770)](#).

2. Link the folder associated with the publishing template to your current project in the **Navigator** view.

3. Using the **Navigator** view, create an **xslt** folder inside the project root folder.

4. In this folder, create an XSL file (for example, named `merged2mergedExtension.xsl`) with the following content:
5. Open the **template descriptor file** *(page 1764)* associated with your *publishing template* (the .opt file) and set the XSLT stylesheet created in previous step with the `com.oxygenxml.pdf.css.xsl.merged2merged` XSLT extension point:

```
<publishing-template>
  ...
  <pdf>
    ...
    <xslt>
      <extension
        id="com.oxygenxml.pdf.css.xsl.merged2merged"
        file="xslt/merged2mergedExtension.xsl"/>
    </xslt>
  </pdf>
</publishing-template>
```

6. Edit the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.

7. In the Templates tab, click the **Choose Custom Publishing Template** link and select your template.

8. Click **OK** to save the changes to the transformation scenario.

9. Run the transformation scenario.

---

**How to Use XSLT Extension Points for PDF Output from a DITA-OT Plugin**

These examples demonstrate how to use XSLT extension points from a DITA-OT plugin.

**Use-Case 1: Styling Codeblocks with a Zebra Effect**

Suppose you want your **codeblocks** to have a particular background color for one line, and another color for the next line. One advantage of this coloring technique is that you can clearly see when text from the **codeblock** is wrapped.
This effect can be done by altering the HTML5 output, creating a `<div>` for each line from the code block, then styling them.

To add this functionality using a DITA-OT plugin, follow these steps:

1. In the `DITA-OT-DIR\plugins\` folder, create a folder for this plugin (for example, `com.oxygenxml.pdf.custom.codeblocks`).
2. Create a `plugin.xml` file (in the folder you created in step 1) that specifies the extension point and your customization stylesheet. For example:

   ```xml
   <plugin id="com.oxygenxml.pdf.custom.codeblocks">
     <feature extension="com.oxygenxml.pdf.css.xsl.merged2html5">
       file="custom_codeblocks.xsl"/>
   </plugin>
   ```

3. Create your customization stylesheet (for example, `custom_codeblocks.xsl`) with the following content:

   ```xml
   <?xml version="1.0" encoding="UTF-8"?>
   <xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
     xmlns:xs="http://www.w3.org/2001/XMLSchema"
     exclude-result-prefixes="xs"
     version="2.0">
     
     <xsl:template match="*[contains(@class, ' pr-d/codeblock ')]">
       <div class='zebra'>
         <xsl:analyze-string regex="\n" select=".">
           <xsl:matching-substring/>
           <xsl:non-matching-substring>
             <div><xsl:value-of select="."/></div>
           </xsl:non-matching-substring>
         </xsl:analyze-string>
       </div>
     </xsl:template>
   </xsl:stylesheet>
   ```

4. Use the Run DITA-OT Integrator transformation scenario (page 1407) found in the DITA Map section in the Configure Transformation Scenario(s) dialog box.
5. Create a custom CSS file with rules that style the `codeblock` structure. For example:

   ```css
   div.zebra {
     font-family: courier, fixed, monospace;
     white-space: pre-wrap;
   }
   ```
6. Edit a DITA Map PDF - based on HTML5 & CSS transformation scenario and reference your custom CSS file (using the args.css parameter).

7. Run the transformation scenario.

Use-Case 2: Removing the Related Links Section

Suppose you want the related links sections to be removed from the PDF output.

To add this functionality using a DITA-OT plugin, follow these steps:

1. In the DITA-OT-DIR\plugins\ folder, create a folder for this plugin (for example, com.oxygenxml.pdf.custom.codeblocks).

2. Create a plugin.xml file (in the folder you created in step 1) that specifies the extension point and your customization stylesheet. For example:

   ```xml
   <plugin id="com.oxygenxml.pdf.custom.related.links">
      <feature extension="com.oxygenxml.pdf.css.xsl.merged2merged" file="custom_related_links.xsl"/>
   </plugin>
   ```

3. Create your customization stylesheet (for example, custom_related_links.xsl) with the following content:

   ```xml
   <?xml version="1.0" encoding="UTF-8"?>
   <xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
                   xmlns:xs="http://www.w3.org/2001/XMLSchema"
                   exclude-result-prefixes="xs"
                   version="2.0">

   <xsl:template match="*[contains(@class, ' topic/related-links ')]">
      <!-- Remove. -->
   </xsl:template>

   </xsl:stylesheet>
   ```

4. Use the Run DITA-OT Integrator transformation scenario (page 1407) found in the DITA Map section in the Configure Transformation Scenario(s) dialog box.

5. Run the DITA Map PDF - based on HTML5 & CSS transformation scenario.
Sample Use-cases: Using XSLT and CSS for PDF Transformations

In this section, you will find a series of use-cases that can be used as starting points for other customizations.

How to Use a Bullet Instead of Numbers for Tasks Containing a Single Step

If a DITA Task only contains one step (<step> element), you probably want it to be rendered like an unordered list (displayed with a bullet instead of a number).

```
... 
<steps>
  <step>
    <cmd>The step</cmd>
  </step>
</steps>
...
```

Should be rendered as:

```
o The step
```

Instead of:

```
1. The step
```

To achieve this, you need to create an XSLT template that adds a special @outputclass attribute (with its value set to single) for the single step, then you need to match this attribute from the CSS and change its aspect.

1. In the customization XSL, add:

```
<xsl:template match="*[contains(@class, ' task/step ')]*[count(../*[contains(@class, ' task/step ')]) = 1]">
  <xsl:copy>
    <xsl:copy-of select="@*"/>
    <xsl:attribute name="outputclass" select="concat(@outputclass, ' single ')"/>
    <xsl:apply-templates/>
  </xsl:copy>
</xsl:template>
```
2. In your customization CSS (page 1782), add:

```
*{outputclass ~="single"] {  
  list-style-type:circle !important;  
  margin-left:2em; 
}
```

Related Information:

- How to Use XSLT Extension Points for PDF Output from a Publishing Template (page 1774)

DITA-OT Extension Points

The DITA-OT CSS-based PDF Publishing Plugin supports DITA-OT extension points that can be used to expand the functionality of the transformation. The extension points are defined in the plugin.xml file. For more information, see DITA Open Toolkit Extension Points.

Related Information:

- XSLT Extensions for PDF Transformations (page 1774)

How to Contribute a Custom CSS to the Transformation from a DITA-OT Plugin

This topic is intended for publishing architects/developers that need to deploy a customized DITA-OT.

Usually, the CSS styles can be passed to the transformation by referencing the CSS files using the args.css parameter. However, there are cases where you want to add some sort of "built-in" CSS that is applied in conjunction with the publishing template or CSS files referenced in the transformation.

For this, you need to use the com.oxygenxml.pdf.css.init extension point and set the value of the extension.css ANT property to the path of the custom CSS file:

1. In your plugin.xml file, add:

```xml
<feature extension="com.oxygenxml.pdf.css.init" file="init.xml"/>
```

2. Create a file named init.xml with the following ANT content:

```xml
<root>
  <property name="extension.css"
```
Customization CSS

The publishing process is driven by a customization CSS.

To change the styling of the output for the **DITA Map PDF - based on HTML5 & CSS** transformation scenario:

1. Create the CSS file that will contain all your customizations. It is recommended to create this file in your project directory so you can edit it easily.
2. Add the custom CSS rules. See the various topics in this section for assistance with specific types of customizations.
3. For linking the CSS file, you have two options:
   a. Create a publishing template, create the customization CSS file inside the template folder and link it into the publishing template descriptor. See *Publishing Templates* (page 1632).
   b. Choose an existing publishing template, then edit the scenario and set the full path to the custom CSS file as the value of the `args.css` parameter. The rules from custom CSS will override the rules from the template CSS files.
4. Run the transformation scenario.

**Debugging the CSS**

If you notice that some of the CSS properties were not applied as expected, some of the tips offered in this topic might help you with the debugging process.
Merged Map File

Depending on the type of transformation, one or more merged map files are created at some point during the transformation stages. These files could be used to help debug unexpected results.

1. The first thing you should try is to check the file structure of the merged map file. This can be found in the out/pdf-css directory and it has the .merged.xml file extension. For the DITA Map PDF - based on HTML5 & CSS transformation type, you will also find a .merged.html file.
   You can open these files in Oxygen XML Editor/Author to examine the structure. Optionally, you can use the pretty print feature (Format and Indent) to make the structure easier to read.
2. Check that the CSS selectors are written correctly against the document structure.
3. If you still cannot identify the problem, then inspect how the styles are applied (you can try any of the methods listed below).

Inspecting the Applied Styles Using the Chrome Browser

To inspect the applied CSS styles using Chrome:

1. In Chrome, open the file ending in .merged.xml or .merged.html (for the DITA Map PDF - based on HTML5 & CSS transformation type).
2. Click on the element you want to inspect.
3. Activate the Chrome Developer Tools by using 
   More Tools > Developer Tools, or press CTRL +SHIFT+I.
4. Activate the Rendering pane by using 
   More Tools > Rendering:
5. In the Rendering pane, select print from the Emulate CSS media section. This will activate the CSS selectors enclosed in @media print {..}.

Note: This allows you to debug the styling of elements, table of contents, and index, but not the styles of the page margin boxes (headers, footers) or page breaks.

Tip: In the left pane of the Developer Tools interface, you can inspect elements and their styles in the Elements tab. You can click on any of the links to display the applied CSS files in the Styles tab in the right pane. Editing the styles in that pane results in a live preview of how the change will affect the output.

CAUTION: Do not modify the built-in rules directly in the CSS files from the Oxygen XML Editor/Author installation. Instead, copy the rules to your own customization CSS.

Inspecting the Applied Styles Using Oxygen XML Editor/Author

To inspect styles:

1. In Oxygen XML Editor/Author, open the file ending in .merged.xml or .merged.html (for the DITA Map PDF - based on HTML5 & CSS transformation type).
2. [Optional] From the Styles toolbar, choose the + Print Ready entry. This will activate certain CSS selectors enclosed in @media print {..}.
3. Click on the element you want to style. Use the Inspect Styles action from the Contextual Menu. A specialized CSS Inspector view will show the built-in CSS rules.

Tip: With this file opened in Author mode, it might be helpful to switch the Tags Display Mode to Full Tags with Attributes. You might be able to identify the selector you need to style without using the CSS Inspector view.

Note: This allows you to debug styling of elements, but not of the page margin boxes (headers, footers) or page breaks.
**CAUTION:** Do not modify the built-in rules directly in the CSS files from the Oxygen XML Editor/Author installation. Instead, copy the rules to your own customization CSS.

### Other techniques

These are some other techniques you may find useful:

- Add background and borders properties to the specific CSS rule. If they do not appear in the output then there is a problem with the rule selector.
- Try to use the `!important` notation to the property that is not applied, or make the selector more specific (you can add more parent selectors).
- To figure out how the elements are mapped into PDF, you can use this fragment in the customization CSS:

```css
* {
    border: 1pt solid blue !important;
}

*:before(1000) {
    content: oxy_name() !important;
    color: orange;
}

*:before(999) {
    content: "[ class= " attr(class) " ] " !important;
    color: orange;
}
```

This will show the element name, its class attribute, and will paint a blue border around each of the elements in the output. It will not show the page margin boxes or some content elements that were hidden.

### How to Speed up CSS Development and Debugging

You can speed up your CSS development considerably by not invoking the entire pipeline of transforming your DITA maps to PDF. Instead, you can use the merged map (page 1782) and transform it directly to PDF.

1. Transform your DITA Map to PDF using the **DITA Map PDF - based on HTML5 & CSS** or **DITA Map PDF - based on DITA & CSS** transformation scenario.
2. Open the merged file (page 1782) (*.merged.html or *.merged.xml) that is located in the output directory in the editor.

3. Configure an XML to PDF transformation with CSS scenario. Do not set CSS files here since the merged file already contains pointers to the stylesheets. This scenario uses the Chemistry CSS processor.

4. **Optional:** Enable the output of the CSS processor using the following preferences page: Options > Preferences > XML > PDF Processors > CSS Processor.

Now you can make incremental changes to the CSS stylesheet and quickly see the results by transforming the merged file directly.

**Fastpath:** If your changes involve only element styling, with no specific paged media CSS rules and properties, you can simply open the merged file in a browser (such as Chrome or Firefox) and refresh at each CSS change, as shown in: Debugging the CSS (page 1782).

**How to Write XPath Expressions**

This topic contains some guidelines for writing XPath expressions. They are used to extract the content from the merged DITA map document.

This is an example where the product name meta-information is placed before the front page title:

```
*[class~="front-page/front-page-title"]:before {
  text-align: left;
  content: oxy_xpath("///*[contains(@class, 'topic/prodname')]/text()()[1]");
  display:block;
}
```

**Notes:**

- Do not use the DITA element names directly. You must use the DITA `@class` attribute instead, as these attributes are propagated to the merged elements (including HTML `<div>` elements) while the element names can be lost. By using the class selectors, you also cover DITA specializations.
- Use the `[1]` XPath predicate to select the first value from the document. For example, `oxy_xpath("///*[contains(@class, 'topic/prodname')]/text()()[1]")`. The meta-information might be copied multiple times in the output, inherited by the `<topicref>` elements, so you can get many more values than expected.
- Do not use strings as values for the pseudo elements content, as the string values are not supported for pseudo elements. Instead, use the XPath directly.
- Use the Oxygen XPath Builder view to test the XPath expressions.
How to Debug XPath Expressions

You can use the content extracted from the document using the `oxy_xpath` function in your pseudo elements (`:before`, `:after`) or in string-set variables.

For example, the following XPath finds the publication author, set in the DITA map:

```xml
<map>
  <title>The Art of Bike Repair</title>
  <topicmeta>
    <author>John Doe</author>
  </topicmeta>
...

:root {
  string-set: author oxy_xpath('//*[contains(@class, "front-page/front-page")]/*[contains(@class, "map/topicmeta")]/*[contains(@class, "topic/author")]/text()');
}
```

To debug an XPath expression:

1. Read the XPath Expressions Guidelines (page 1786).
2. Begin by transforming your document using your customization CSS.
3. In the output folder, you will find a `[MAP_NAME].merged.xml` file (or if you are using the DITA Map PDF - based on HTML5 & CSS transformation, a `[MAP_NAME].merged.html` file).
4. Open the merged file in the Oxygen XML Editor/Author.
5. Activate the XPath Builder view (Window > Show View > XPath/XQuery Builder).
6. Paste your XPath expression and press the Execute XPath button. Check if it returns the expected results.

The XPath builder has a function that allows it to display the document path of the current element from the editor (Settings drop-down menu > Update on cursor move). Alternatively, you can right-click the element in the merged document and select the Copy XPath action, then paste it in the XPath builder.

- How to Debug XPath Expressions (page 1787)
Default Page Definitions

All page definitions are found in: [PLUGIN_DIR]css/print/p-pages-and-headers.css.

Note: This is listed solely for illustration purposes, as the plugin might use something different.

There are pages for the default page, chapter page, front matter page, back matter page, blank pages, index page, and large tables page.

Default Page

The default page imposes a header that contains the publication title, chapter, and section title. They alternate on the left or right side of the page:

```xml
tip:
To override the default rules defined for named pages (such as chapter or table of contents), you need to use more specific page rules that contain the page name:

```xml```
Chapter Page

This is inherited from the default page. The chapter page is associated to the topics marked as chapters, usually direct children of the map. It clears the header from the first page of each chapter.

Front Matter and Back Matter page

The bookmark front matter and back matter page. It clears the headers.

```xml
@page chapter {
    /* Currently inherit from the default page. */
}

/* No headers on the chapter first page. */
@page chapter:first: left {
    @top-left {
        content: none;
    }
}
@page chapter:first: right {
    @top-right {
        content: none;
    }
}
```

```xml
@page matter-page {
    @top-left-corner { content: none }
    @top-left { content: none }
    @top-center { content: none }
    @top-right { content: none }
    @top-right-corner { content: none }
    @bottom-left-corner { content: none }
}```
Blank Pages

The following example clears the header for the blank pages that may be created by a page-break-before, page-break-after, or by using double side pagination (page 1816):

```xml
@page :blank{
    @top-left {
        content: none;
    }
    @top-right {
        content: none;
    }
}
```

Index Page

The page that contains the index terms (appears only if there are such items in your topics). It uses a lower roman page number in the footer:

```xml
@page index {
    @top-left-corner        { content: none; }
    @top-left               { content: none; }
    @top-center             { content: none; }
    @top-right              { content: none; }
    @top-right-corner       { content: none; }
    @bottom-left-corner     { content: none; }
    @bottom-left            { content: none; }
    @bottom-center          { content: none; }
    @bottom-right           { content: none; }
    @bottom-right-corner    { content: none; }
}
@media oxygen-chemistry {
    @page index {
        column-count: 2;
        column-fill: auto;
    }
}
```
When transformed, the page layout is spread on two columns.

**Large Tables Page**

The big tables are placed on a rotated page, with orientation landscape:

```xml
@page landscape-page :right {
  size: landscape;

  @top-left {
    content: none
  }
  @top-center {
    content: none
  }
  @top-right {
    content: none
  }

  @right-bottom {
    content: string(maptitle) string(parttitle) string(chaptertitle)
    string(sectiontitle) " | " counter(page);
    font-size: 8pt;
    transform: rotate(90);
    vertical-align: middle;
    text-align: right;
  }
}

@page landscape-page :left {
  size: landscape;

  @top-left {
    content: none
  }
  @top-center {
    content: none
  }
```
Page Size

This is where you can find information on how the page sizes are defined.

Page Size - Built-in CSS rules

The `[PLUGIN_DIR]/css/print/p-page-size.css` file contains the default page rules. It uses the US-LETTER size (8.5 X 11 inches). The content of this file is:

```css
@page {
    padding-top: 0.2em;
    padding-bottom: 0.2em;
    size: us-letter;
    margin: 1in;
}
```

⚠️ Note: This is listed solely for illustration purposes, as the plugin might use something different.

How to Change the Page Size

Suppose you want to publish using the standard A4 page size, with a margin of 2cm.

In your customization CSS (page 1782), use:

```css
@page {
    size: A4;
    margin: 2cm;
}
```
If you need different margins depending on the page side:

```css
@page {
    size: A4;
    margin: 2cm;
}
@page :left{
    margin-right:4cm;
}
@page :right{
    margin-left:4cm;
}
```

This would only increase the gutter margins or the inside margins needed for binding of the final book. The other margins would remain 2cm.

How to Change the Page Orientation

Suppose you want to publish on a landscape page. The default is portrait, so you need to change it by using the size property. This will contain both the physical measurements and the orientation. In your customization CSS (page 1782), use:

```css
@page {
    size: us-letter landscape;
}
```

How to Change the Page Settings for a Specific Element

Suppose your publication is mainly using a portrait page orientation, but there are some topics that have wide images. To avoid having the images bleeding outside of the page, you could use a wider page setting (landscape).

1. Mark the topic with an `@outputclass` attribute and give it a distinct value (for example, `wide`).
   You can set the attribute on the root element of the topic, or on the `<topicref>` element from the map.

   ![Note:](image)

   **Note:** The `outputclass` values from the `topicref` automatically propagate to the root of the topic from the **merged map (page 1782)**.
2. In your customization CSS (page 1782), match the output class and associate it with a named page. This page has landscape orientation and small margins. This technique works for any element (consider a table or a list) not necessarily a topic.

```css
*[outputclass = 'wide'] { 
    page: wide-page;
 }

@page wide-page { 
    size: letter landscape;
    margin: 0.5in;
}
```

**Metadata**

DITA has a solid vocabulary for specifying metadata. There are `<prolog>` elements in the topics, and `<topicmeta>`, `<bookmeta>` elements in the bookmaps. They can be used to define authors, dates, audiences, organizations, etc. See: https://www.oxygenxml.com/dita/1.3/specs/archSpec/base/metadata-in-maps-and-topics.html

It is up to you to decide where this information should be presented, in the PDF content or in the PDF document properties.

**Metadata - XML Fragment**

In the merged map file (page 1782), the metadata section is placed inside the `<oxy:front-page>` element. This is different from the original placement in the map or bookmap - after the title, but allows usage of information from it in the title page.

**Bookmaps**

This is an example of a section taken from a merged bookmark. It only contains some of the possible metadata elements. The `bookmeta` metadata section is inherited from `topicmeta`:

```xml
xmlns:opentopic-index="http://www.idiominc.com/opentopic/index" cascade="merge"
ditaarch:DITAArchVersion="1.3" > 
 <bookmeta xmlns:dita-ot="http://dita-ot.sourceforge.net/ns/201007/dita-ot"
```
For the **DITA Map PDF - based on HTML5 & CSS** transformation type, the merged map is further processed resulting in a collection of HTML5 `<div>` elements. These elements preserve the original DITA `@class` attribute values and add a new value derived from the DITA element name.
Maps

The maps have a more simple structure, they use the `<topicmeta>` element for metadata sections. This is also a simplified example, as there may be many more elements in the metadata section:

```xml
<map xmlns:ditaarch="http://dita.oasis-open.org/architecture/2005/"
     xmlns:opentopic-index="http://www.idiominc.com/opentopic/index"
     cascade="merge"
     ditaarch:DITAArchVersion="1.3">
  ...
</map>

  <topicmeta>
    <author>Dan C</author>
    <metadata>
      <prodinfo>
        <prodnam...
For the **DITA Map PDF - based on HTML5 & CSS** transformation type, the merged map is further processed resulting in a collection of HTML5 `<div>` elements:

```html
         xmlns:opentopic-index="http://www.idiominc.com/opentopic/index"
         cascade="merge" class="- map/map"
         ditaarch:DITAArchVersion="1.3">
  ...
</div>

<div class=" front-page/front-page front-page">
  ...
</div>

<div class="- map/topicmeta topicmeta">
  <div class="- topic/author author">Dan C</div>
  <div class="- topic/metadata metadata">
    <div class="- topic/prodinfo prodinfo">
      <div class="- topic/prodname prodname">oXygen PDF CSS DITA Plugin</div>
    </div>
  </div>
  <div class="- topic/audience audience"/>
</topicmeta>
```

### Metadata - Built-in CSS rules

The `[PLUGIN_DIR]/css/print/p-meta.css` file contains the rules that extract metadata.

### How to Add the Publication Audience to the Custom PDF Metadata

The audience element indicates the users the publication is addressing. This can be placed inside a `<topicmeta>` element in a `<map>` as in the following example:

```html
<map>
  ...
  <topicmeta>
    ...
    <audience type="programmer" job="programming" experiencelevel="expert"/>
  </topicmeta>
</map>
```

To collect the `@type` attribute, add the following in your customization CSS *(page 1782)*:

```css
* [class =~ "map/map"] > * [class =~ "map/topicmeta"] > * [class =~ "topic/audience"] {
  -oxy-pdf-meta-custom: "Audience" attr(type);
```
Note: It is best to use the class selector (such as `*[class =~ "map/topicmeta"]`) instead of `topicmeta` to cover cases where the elements are specialized (for instance, in a bookmap the `bookmeta` is a `topicmeta`, so your selector will also function for bookmaps, not only simple maps.

Note: The selector begins with `map >` to choose the `<topicmeta>` that is a direct child of the map, not other `<topicmeta>` elements from other `<topicref>` elements.

The metadata is displayed in the Custom tab of the Document Properties dialog box from Acrobat Reader:

![Document Properties dialog box with metadata fields](image)

How to Show Metadata in the Cover Page

Suppose you need to present the author and the ISBN just under the publication title. Your bookmap contains:

```xml
<bookmap id="taskbook">
  <booktitle>
    <booklibrary>Retro Tools</booklibrary>
    <mainbooktitle>Product tasks</mainbooktitle>
    <booktitlealt>Tasks and what they can do</booktitlealt>
  </booktitle>
</bookmap>
```
The entire `<booktitle>` element content is displayed on the first page of the PDF, so suppose you need to add the information after it.

In your customization CSS (page 1782), add the following CSS rules:

```css
*[class =~ "bookmap/booktitle"]:after {
  display: block;
  content: "by " oxy_xpath('//*[contains(@class, " bookmap/bookmeta ")]'/
    *[contains(@class, " topic/author ")]//text()')
  margin-top: 4em;
  text-align: center;
  color: gray;
}
*[class =~ "bookmap/booktitle"]:after(2) {
  display: block;
  content: "ISBN " oxy_xpath('//*[contains(@class, " bookmap/isbn ")]//text()')
  text-align: center;
  color: gray;
}
```

The following CSS extensions were used in this example:

- **oxy_xpath** - Executes an XPath expression and returns a string content. Use this whenever you need to extract data from elements other than the one matched by the CSS rule selector.
- **:after(N)** - Creates more than one after pseudo element. The argument value represents how far the generated content is from the real content. In the example above, the content of the :after is closer to the title (upper) than the content of the :after(2).
Note: The `attr()` CSS function can also be used but is limited to extracting attribute values from the matched element.

Generating Synthetic Pages for Metadata.

Suppose you need to show this information on a page that follows the title page, instead of on the title page. In this case, you need to prepare a named page and place the content on it. In your customization CSS (page 1782), add the following CSS rules:

```css
@page page-for-meta {
  background-color: yellow; /* Just to see it better*/
  @top-left-corner {
    content: ''; /* Remove the default header */
  }
  @top-right-corner {
    content: ''; /* Remove the default header */
  }
}
*[class ~="bookmap/booktitle"]:after {
  page: page-for-meta;
}
*[class ~="bookmap/booktitle"]:after(2) {
  page: page-for-meta;
}
```

How to Show Metadata in the Header or Footer

The header and footer are composed of page margin boxes that can be populated with static text by using `string-sets`.

If you need to add some of the map metadata to the header of the front page (for example, the `creation date`), add the following CSS rules in your customization CSS (page 1782):

```css
*[class ~="front-page/front-page"] >
*[class ~="map/topicmeta"] >
  *[class ~="topic/critdates"] >
    *[class ~="topic/created"]{string-set: mapcreated attr(date);}
```
Note: The *front-page* is the name of a page that used to present the element with the class "front-page/front-page". The above page rule is combined with the default styles.

Cover (Title) Page

Customizing the cover page is one of the most requested customization requests.

Cover Page - XML Fragment

The merged map file *(page 1782)* contains the `<oxy:front-page>` element, as a child of the root element. This contains the metadata and an `<oxy:front-page-title>` element with the title structure.

For the DITA Map PDF - based on HTML5 & CSS transformation type, the merged map is further processed resulting in a collection of HTML5 `<div>` elements. These elements preserve the original DITA `<class>` attribute values and add a new value derived from the DITA element name.
Cover Page - Built-in CSS rules

The element with the class `frontpage/frontpage` is associated with a page named `front-page` with no headers or footers. The front page title is styled with a bigger font. The built-in CSS rules are in

```
@media print {

  *[class~="front-page/front-page"] {
    page: front-page;
  }

  *[class~="front-page/front-page-title"] {
    display:block;
    text-align:center;
    margin-top:3in;
    font-size:2em;
    font-family:arial, helvetica, sans-serif;
    font-weight:bold;
  }

  @page front-page {
    @top-left-corner    { content:none } 
    @top-left           { content:none } 
    @top-center         { content:none } 
    @top-right          { content:none } 
    @top-right-corner   { content:none } 
    @bottom-left-corner { content:none } 
    @bottom-left        { content:none } 
    @bottom-center      { content:none } 
    @bottom-right       { content:none } 
}
```
How to Add a Background Image for the Cover

The simplest way is to create an SVG image as large as the entire physical page and set it as the background for the front-page. This makes it very easy to accomplish a good positioning of the graphical elements or artwork. In the foreground, you can place text fragments using a series of :after pseudo elements bound to the front page title.

Consider the following SVG document.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE svg PUBLIC "-//W3C//DTD SVG 1.1//EN"
"http://www.w3.org/Graphics/SVG/1.1/DTD/svg11.dtd">
<svg xmlns="http://www.w3.org/2000/svg" width="8.5in" height="11in">
  <desc>A gradient as big as a page.</desc>
  <defs>
    <linearGradient id="lc"
      x1="0%" y1="0%"
      x2="0%" y2="100%"
      spreadMethod="pad">
      <stop offset="0%" stop-color="#00DD00" stop-opacity="1"/>
      <stop offset="100%" stop-color="#00AA00" stop-opacity="1"/>
    </linearGradient>
  </defs>
  <rect x="0" y="0" width="100%" height="100%" rx="10" ry="10"
    style="fill:url(#lc);
    stroke: #005000;
    stroke-width: 3;"/>
  <text x="45%" y="95%" color="#FFFFAA" font-size="0.7cm">Sample</text>
</svg>
```

It shows a gradient, but it can be anything, and the "Sample" text. It is as large as a US-LETTER page and can be used in a publication using this page size.

**Note:** You can use raster image formats (such as PNG or JPEG), but it is best to use vector images (such as SVG or PDF). They scale very well and produce better results when printed. In
addition the text from these images is searchable and can be selected (if the glyphs have not been converted to shapes) in the PDF viewer.

In your customization CSS *(page 1782)*, add the following:

```css
@page front-page {
    background-image: url("us-letter.svg");
    background-position: center;
}
```

For smaller artworks, you can use `background-position` with percentage values to position and center the artwork (for example, a company logo):

```css
@page front-page {
    background-image: url("company-logo.svg");
    background-position: 50% 5%; /* The first is the alignment on the X axis, the second on the Y axis. */
    background-repeat: no-repeat;
}
```

**Note:** The text from the SVG or PDF background images are searchable in the PDF reader.

**Related Information:**

- Oxygen PDF Chemistry: Graphics

**How to Change Styling of the Cover Page Title**

Match the front page title element in your customization CSS *(page 1782)* based on its class attribute:

```css
*[class ~="front-page/front-page-title"] {
    margin-top: 1in;
    font-size: 3em;
}
```

**How to Add Text to the Cover Page**

If you need to add arbitrary text to the cover page, you can use the front page title element as an anchor and add as many blocks of text as you need after it, and style them differently.

In your customization CSS *(page 1782)*, add the following:
To use content from the document, you can use the `oxy_xpath` function in the `content` property. For a more complex example, including the generation of a new page for the synthetic `:after` elements, see: How to Show Metadata in the Cover Page (page 1798).

Related Information:

- How to Show Metadata in the Cover Page (page 1798)

How to Place Cover on the Right or Left Side

In your customization CSS (page 1782), add the following CSS rules:
Note: This will create an empty page at the beginning of the publication, moving the cover content on the needed side.

For more information, see: Oxygen PDF Chemistry: Controlling Page Breaks.

Related Information:

- Double Side Pagination (page 1816)

How to Add a Specific Number of Empty Pages After the Cover Page

In your customization CSS (page 1782), add the following CSS rules:

```css
@page my-blank-page {
   /* Hide the page numbers */
   @top-left {content: none;}
   @top-right {content: none;}
}

*[class ~="front-page/front-page"]:after(1){
   page:my-blank-page;
   display:block;
   content:'\2002';
   color:transparent;
   page-break-after:always;
}

*[class ~="front-page/front-page"]:after(2){
   page:my-blank-page;
   display:block;
   content:'\2002';
   page-break-after:always;
}

*[class ~="front-page/front-page"]:after(3){
   page:my-blank-page;
}
Note: The \2002 character is a space that is not shown on the pages, but gives a value for the content property.

Related Information:

- How to Force an Odd or Even Number of Pages in a Chapter (page 1818)

How to Add a Copyright Page after the Map Cover (Not for Bookmaps)

Regular DITA maps do not have the concept of a copyright notice. This is available only in the DITA bookmap structure.

If you are constrained to using a regular map and you need to add a copyright page between the front cover and the TOC, use the following technique:

In your customization CSS (page 1782), declare a new page layout:

```css
@page copyright-notice-page {
  @top-left {
    content: none; /* Clear the headers for the copyright page */
  }
  @top-right {
    content: none;
  }
}
```

The oxy:front-page element contains the title of the publication and generates the cover page. A synthetic :after element is created that follows this element and it is placed on a different page.

```css
front-page:after{
  display:block;

  page: copyright-notice-page; /* Moves the synthetic element on a new page */

  margin-top:90%; /* use margins to position the text in the page */
  margin-left: 5em;
```
If you need to add more content as blocks, use the :after(2), :after(3) pseudo elements:

```css
front-page:after(2){
    display:block;
    page: copyright-notice-page; /* Continue on the same page as the first ':after'. */
    content: "Some more styled text";
    color:red;
}
```

If you want to extract information from the document, use the oxy_xpath() function. For example, if the copyright info is stored in the map like this:

```xml
<map ...>
   <topicmeta>
      <copyright>
         <copyryear year="2018"/>
         <copyrholder>MyCorp Inc.</copyrholder>
      </copyright>
   </topicmeta>
   ...
</map>
```

Use:

```css
front-page:after(3){
    display:block;
    page: copyright-notice-page;
    content: "Year: " oxy_xpath('//*:front-page/topicmeta/copyright/copyryear/@year')
             "\A Holder: " oxy_xpath('//*:front-page/topicmeta/copyright/copyrholder/text()') ;
    color:green;
}
```
How to Remove the Cover Page and TOC

If you need to hide or remove the cover page, the table of contents or other structures, match the elements with a "front-page/front-page" and "toc/toc" classes in your customization CSS (page 1782):

```
*[^class~='map/map'] > *[^class~='toc/toc'] {  
display:none !important;
}
*[^class~='map/map'] > *[^class~='front-page/front-page']{
  display:none !important;
}
[^class~='topic/topic'][is-chapter] {
  oxy-page-group: auto;
}
```

Front Matter and Back Matter

The front matter is a series of topics that are usually placed after the cover page and before the TOC or the content.

The back matter is a series of topics that are usually placed after the content of the book.

Front Matter and Back Matter - XML Fragment

In the merged map file (page 1782), the frontmatter topics are wrapped in an `<oxy:front-matter>` element that has the class `bookmap/frontmatter` (it is a clone of the original `<frontmatter>` element from the map):

```
<bookmap xmlns:ditaarch="http://dita.oasis-open.org/architecture/2005/" ...>
                    class=" front-page/front-page ">
    ...
  </oxy:front-page>
                     class="- map/topicref bookmap/frontmatter ">
    <concept xmlns:dita-ot="http://dita-ot.sourceforge.net/ns/201007/dita-ot"
              class="- topic/topic concept/concept 

```

id="unique_1" oid="concept-1">
  ...
</oxy:front-matter>
```
For the DITA Map PDF - based on HTML5 & CSS transformation type, the merged map is further processed resulting in a collection of HTML5 `<div>` elements. These elements preserve the original DITA `@class` attribute values and add a new value derived from the DITA element name.

```xml
<div xmlns:ditaarch="http://dita.oasis-open.org/architecture/2005/" ...>
  <div class=" front-page/front-page front-page">
  ...
  </div>
  <div class="- map/topicref bookmap/frontmatter frontmatter">
    <div class="- topic/topic concept/concept " id="unique_1" oid="concept-1">
    ...
    </div>
  </div>
</div>
```

Front Matter and Back Matter - Built-in CSS

The built-in CSS rules are in `[PLUGIN_DIR]/css/print/p-bookmap-frontmatter-backmatter.css`. By default, it associates the top-level topics that do not represent chapters to a `matter-page` style of page layout. Each child topic starts on a new page.

Related Information:
- Page Headers and Footers (page 1829)

How to Remove Page Breaks Between Front Matter Child Topics

If you do not like the fact that all the topics that enter a bookmap frontmatter start on a new page, you can disable this by using the following rules in your customization CSS (page 1782):

```css
*[class ~= "map/map"] > *[class ~= "topic/topic"]:not([is-chapter]){
  page-break-before: auto;
}
```

How to Style the Front Matter and Back Matter Topics

Suppose you want the topics from the front matter and back matter to start at the middle of the page and use a smaller fine print.

In your customization CSS (page 1782), add the following:

```css
*[class ~= "map/map"] > *[class ~= "topic/topic"]:not([is-chapter]){
  margin-top: 50%;
```
Numbering

This section contains information about how to deal with shallow or deep chapter numbering.

How to Switch Between Shallow and Deep Numbering

By default, only the first-level topics (the chapters) are numbered. To have all of the map hierarchy numbered, you need to set the transformation parameter `args.css.param.numbering` to `deep`.

The topics in this section contain some technical details in case you need to fine-tune the way the numbering works.

Shallow Numbering for Chapters Only

The default numbering system is to only number the chapters in the TOC and in the content (shallow numbering).

Note: For a plain DITA map, the chapters are the `<topicref>` elements that are placed on the first level. For bookmaps, the chapters are the topics referenced by a `<chapter>` element.

Shallow Numbering - Input XML Fragments

The numbering affects three parts of your publication, the table of contents, headers/footers, and chapter titles:

The Table of Contents

The table of contents is a tree of `<topicref>` elements.
Note: The `<opentopic:map>` element contains the effective table of contents structure.

Note: The TOC items are the elements with the class: `- map/topicref`.

Note: The ones identified as chapters have the `@is-chapter` attribute set.

For the DITA Map PDF - based on HTML5 & CSS transformation type, the merged map is further processed resulting in a collection of HTML5 `<div>` elements. These elements preserve the original DITA `@class` attribute values and add a new value derived from the DITA element name.
The Header and Footers

These are based on string sets generated for the titles. The complete set of strings is defined in: 
[INSTALLATION_DIR]/css/print/p-pages-and-headers.css.

The CSS rules that build the string sets are matching the map title from the front page and the titles from the content.

For the DITA Map PDF - based on HTML5 & CSS transformations:

The main content is organized as follows:
For the **DITA Map PDF - based on HTML5 & CSS** transformations:

```xml
<opentopic:map>
  ...
</opentopic:map>
```

Note: The topic content comes after the `<opentopic:map>` element.

Note: The child topics are the elements that have the `topic/topic` included in the parents.

Note: The ones identified as chapters have the `@is-chapter` attribute set.

### The Titles of Chapters

The titles from the content are children of the topics:
For the DITA Map PDF - based on HTML5 & CSS transformations:

Note: The title elements have the class `- topic/title`. The actual element name can be different.

Shallow Numbering - Built-in CSS

There is a file located in `[PLUGIN_DIR]/css/print/p-numbering-shallow`. This contains all the rules for numbering only the topics on the first level (the chapters).

Deep Numbering for Chapters and Subsections

This section contains information about deep numbering for situation where you want to numbering for all levels within the map hierarchy.

Deep Numbering - Built-in CSS

The CSS file responsible for deep numbering is `[PLUGIN_DIR]/css/print/p-numbering-deep.css`. The rules from this CSS are active only when the `args.css.param.numbering` is set to `deep`, and they override the rules from the `p-numbering-shallow.css`.

How to Use a Deeper Numbering for Subsections

If you need a deeper numbering, that goes beyond the chapters to subsections, import the rules defined in the `[INSTALLATION_DIRECTORY]/css/print/p-optional-double-side-pagination.css` from your customization CSS (page 1782).

Related Information:

- Deep Numbering - Built-in CSS (page 1815)
How to Remove the 'chapter NN' Prefix from Table of Contents and Content.

If you are using the shallow numbering CSS (this is the default), and you want to hide the "Chapter" prefix, use the following rules in your customization CSS (page 1782):

For the TOC:

```css
*\[class \sim \"map/topicmeta\"] > *\[class \sim \"topic/navtitle\"]:before {
    display: none !important;
}
```

For the titles in the content, change the content of the title :before (this example just uses the chapter number):

```css
*\[class \sim \"topic/topic\"]\[is-chapter]:not([is-part]) > *\[class \sim \"topic/title\"]:before {
    content: counter(chapter) ". " !important;
}
```

How to Reset the Page Numbers after the TOC

In your customization CSS (page 1782), use the following rule:

```css
*\[class \sim \"map/map\"] > *\[class \sim \"toc/toc\"] + *\[class \sim \"topic/topic\"]{
    counter-reset: page 1 !important;
}
```

The effect is that it will reset the page number at the beginning of the first topic following the TOC.

How to Reset the Page Numbers at Each Chapter

To achieve this, you can reset the page counter at each of the topics marked as chapters:

```css
*\[class \sim \"topic/topic\"]\[is-chapter] {
    counter-reset: page 1 !important;
}
```

Double Side Pagination

By default, the processor generates pages that are mirror images (the right page has the header on the right side, the left pages have the header on the left side). The chapters follow one another with no constraint on the page side.
**Note:** For a plain DITA map, the chapters are the `<topicref>` elements that are placed on the first level. For bookmaps, the chapters are the topics referenced by a `<chapter>` element.

This section contains information about how to position the start of the chapters on an odd folio number. Some of the CSS rules given here as examples are already listed in:

`[INSTALLATION_DIRECTORY]/css/print/p-optional-double-side-pagination.css`.

You may choose to import this file from your customization CSS (page 1782).

### How to Start Chapters on Odd Pages

A common use case is to arrange the chapters of the publication to start on an odd page number.

In your customization CSS (page 1782), add the following:

```css
@page chapter {
  -oxy-initial-page-number: auto-odd;
}
@page table-of-contents {
  -oxy-initial-page-number: auto-odd;
}
```

*Supported values for* `-oxy-initial-page-number` *include: auto, auto-even, auto-odd, or a number.*

### How to Style the Empty (Blank) Pages

By making the chapters start on an odd page, the CSS processor might add blank pages to the previous page sequence as padding.

To style those blank pages add the following code in your customization CSS (page 1782):

```css
@page chapter:blank, table-of-contents:blank {
  @top-left    { content: none; }
  @top-center  { content: none; }
  @top-right   { content: none; }
  @bottom-left { content: none; }
  @bottom-center { content: none; }
  @bottom-right { content: none; }
}
```

**Note:** This just removes the headers and footers, but you can use a background image or a header with "Intentionally left blank" text.

**Related Information:**

How to Force an Odd or Even Number of Pages in a Chapter

Another use case is to specify a number of pages for a section. Suppose that you have a table of contents that follows the cover page and you need to have an even number of pages. Hence, the next chapter would start on an even page.

In your customization CSS (page 1782), use the -oxy-force-page-count property with an even value:

```css
@page table-of-contents {
  -oxy-force-page-count: even;
}
```

Supported values for -oxy-force-page-count include: even, odd, end-on-even, end-on-odd, auto, no-force.

How to Style the First page of a Chapter

You can use the :first page rule selector to control how the first page of a chapter looks. Suppose that you have defined the following layout for your default page and you want to put the publication title (the maptile string) on the header of the first page (instead of the chapter name that is displayed on this page):

In your customization CSS (page 1782), add the following:

```css
@page chapter:first {
  @top-right-corner { content: string(maptitle); }
  @top-left { content: none; }
}
```

Multiple Column Pages

This section contains information about how to deal with pages that have multiple columns.

How to Use a Two Column Layout
Change Layout for Predefined Pages.

First you need to identify which of the pages need to be changed. Pages are already defined for the cover page, table of contents, chapter content, and others. The complete list is here: Default Page Definitions (page 1788).

Next, add the column-count and column-gap properties to that page. For example:

```xml
@page chapter{
    column-count:2;
    column-gap:lin;
}
```

If you need some of the elements to expand on all the columns, use the column-span:all CSS property. The next snippet makes the chapter titles span both columns:

```xml
*[class =~ "topic/topic"] [is-chapter] > *[class =~ "topic/title"] {
    column-span:all;
}
```

Limitation: You cannot use multiple column configurations on the same page. Oxygen XML Editor plugin only takes the column-count and column-gap properties into account if they are set on @page rules, not on elements from the content.

Change Layout for a Specific Topic.

If you need to have a different column layout just for one topic, you can use the following technique:

1. Define an outputclass on the topic root element.

   ```xml
   <topic outputclass="two_columns" ...>
   ```

2. Define a CSS rule that changes the page property for the matching element.

   ```xml
   *[class =~ "two_columns"],
   *[outputclass =~ "two_columns"]{
    page: two_column_page !important;
   }
   ```

Tip: In the selector, use the class attribute for the HTML transformation, or outputclass for the direct transformation, or leave them both if you are not sure.
Note: The topics from the first level use the chapter page. You must use !important because the built-in rules are more specific and you need to override the page property.

3. Define a page layout.

```xml
@page two_column_page {
  column-count: 2;
}
```

Note that the topic will be separated from other sibling topics with different page layouts by page breaks.

Related Information:

- Page Formatting in oXygen PDF Chemistry

Table of Contents

The table of contents is a hierarchy of topic titles with links to the topic content.

Table of Contents - XML Fragment

In the merged map file (page 1782), the `<opentopic:map>` contains a hierarchy of `<topicref>` elements, or other elements (such as `<chapter>` or `<part>`) that are specializations of `<topicref>`.

Each of the `<topicref>` elements include a metadata section that includes the topic title.

```xml
<bookmap ...>

<oxy:front-page> ... </oxy:front-page>
<oxy:front-matter> ... </oxy:front-matter>

<opentopic:map xmlns:opentopic="http://www.idiominc.com/opentopic" class="- toc/toc">

  <oxy:toc-title xmlns:oxy="http://www.oxygenxml.com/extensions/author" empty="true" class="- toc/title />

<booktitle class="- topic/title bookmap/booktitle">
  <booklibrary class="- topic/ph bookmap/booklibrary">Retro Tools</booklibrary>
  <mainbooktitle class="- topic/ph bookmap/mainbooktitle">Tasks</mainbooktitle>
```
For the **DITA Map PDF - based on HTML5 & CSS** transformation type, the merged map is further processed resulting in a collection of HTML5 `<div>` elements. These elements preserve the original DITA `@class` attribute values and add a new value derived from the DITA element name.
Note: The `<oxy:toc-title>` element is used as a placeholder for the name of the TOC. For instance, you can use the string "Contents", specified on a pseudo element, in the CSS.

Table of Contents - Built-in CSS

The built-in CSS rules are in: `[PLUGIN_DIR]/css/print/p-toc.css`.

Related Information:

- Page Headers and Footers (page 1829)

How to Style the Table of Contents Entries

Note: Each of the items from the table of contents is an element that has the `map/topicref` class.

The following example uses the italic font for the label and changes the color and style of the connecting line between the title and the page number.

In your customization CSS (page 1782), add the following two selectors:
And if you need to alter the indent of the nested table of content items, use the following selector:

```css
*[class ~= "map/topicref"] *{class ~= "map/topicref"] { 
    margin-left: 1em;
}
```

The numbers can be styled like this:

```css
*[class ~= "map/topicref"] > *[class ~= "map/topicmeta"]:before,
*[class ~= "map/topicref"]
    > *[class ~= "map/topicmeta"] > *[class ~= "topic/navtitle"]:before{
    color:blue;
}
```

The following is an example of customizing the font size for the items representing chapters. The chapters are level one topics and are marked in the merged DITA document TOC with the attribute `@is-chapter`.

```css
*[class ~= "map/topicref"][@is-chapter = "true"] > *[class ~= "map/topicmeta"] > 
*[class ~= "topic/navtitle"]{
    font-size:2em;
}
```

How to Change the Header of the Table of Contents

In the built-in CSS, there is a page named `table-of-contents`. The default is to have the word 'Contents' in its header (this is localized, using the `toc-header` string defined in the `p-18n.css`) alternating in the left or right side of the header:

```css
@page table-of-contents: left { 
```
If you need to change this string, or change the color, you should use the following @page selectors as a starting point in your customization CSS (page 1782):

```css
@page table-of-contents:left { 
  @top-left { 
    content: "My publication table of contents | " counter(page, lower-roman); 
    color: red; 
  } 
}
@page table-of-contents:right { 
  @top-right { 
    content: "My publication table of contents | " counter(page, lower-roman); 
    color: red; 
  } 
}
```

Related Information:

- Localization (page 1856)

How to Make the Table of Contents Start on an Odd Page

In your customization CSS (page 1782), add the following snippet for the table-of-contents page:

```css
@page table-of-contents { 
  -oxy-initial-page-number: auto-odd; 
}
```
Related Information:

- Double Side Pagination (page 1816)

How to Display a Topic Before the Table of Contents

To display a topic before the `table-of-contents` page, follow these steps:

1. Make sure the topic is referenced on the first level in the DITA map.
2. Set the `@outputclass` to `before-toc` on the `<topicref>`.

```xml
<topicref href="pathToMyTopic" outputclass="before-toc"/>
```

Result: When the PDF is processed, the topic will automatically appear before the table of contents.

Related Information:

- Controlling the Publication Content (page 1884)

How to Display Short Descriptions in the TOC

To display the short descriptions from the topics in the table of contents, you need to make the `<shortdesc>` element visible.

The following examples only makes the short descriptions associated with the chapters visible. The chapters are level one topics and are marked in the merged DITA document TOC with the attribute `@is-chapter`.

In your customization CSS (page 1782), add the following CSS selector:

```css
*[class =~ "map/topicref"] [is-chapter = "true"] > *[class =~ "map/topicmeta"] > *[class =~ "map/shortdesc"] { 
  display: block; /* The default is none - the shortdesc is hidden. */
  color: gray;
}
```

Note: If you need all the TOC item short descriptions to be visible, remove the `[is-chapter]` condition.
How to Hide the TOC

To hide the TOC, you have multiple options:

• Use a DITA bookmap instead of a DITA map, and omit the `<toc>` element from the `<booklists>`.
  An example bookmap can be found in the DITA 1.3 Spec. This is the best approach.
• Use the transformation parameter: `hide.frontpage.toc.index.glossary (page 1762).`
• Use a `display:none` property to hide the element that contains the TOC structure, and also remove it from the PDF bookmarks tree:

```css
*[class =~ "map/map"] > *[class =~ "toc/toc"] {
  display: none;
}

*[class =~ "map/map"] > *[class =~ "toc/toc"] > *[class =~ "toc/title"]{
  bookmark-label: none;
  -ah-bookmark-label: none;
}
```

Related Information:

• Transformation Parameters *(page 1760)*

PDF Bookmarks

The PDF Bookmarks are used to generate a hierarchical structure similar to a table of contents in a specialized view of your PDF Reader.

By default, the titles defined in the topics are used as bookmark labels.

PDF Bookmarks - Built-in CSS

The PDF bookmarks are generated by matching the titles from the topics in the content. The built-in CSS rules are in: `{PLUGIN_DIR}/css/print/p-bookmarks.css`.

How to Change the Bookmark Labels using the Navigation Title

To change the bookmark labels, you can specify a navigation title in a DITA map or topic.

This will be used as the bookmark label instead of the topic title in the table of contents and the bookmark views. There are two possibilities to do specify it:
1. Place a `<navtitle>` element in the topic reference in the DITA map:

```xml
...<topicref href="topics/my_topic.dita" locktitle="yes">
  <topicmeta>
    <navtitle>Introduction</navtitle>
  </topicmeta>
</topicref>...
```

**Note**: As a best practice, a `@locktitle` attribute with the value 'yes' is needed to activate the navigation title. The plugin applies the navigation title even if the attribute is missing.

2. Place a `<navtitle>` element in the topic, as a title alternative.

```xml
<topic id="other_topic" xml:lang="en-us">
  <title>Normal Title</title>
  <titlealts>
    <navtitle>Navigation Title</navtitle>
  </titlealts>
  <body>...
```

How to Control the Depth of the Sections From the PDF Bookmarks.

By default, the PDF bookmarks are generated for up to 7 levels. If you need to limit them (for example to 2 levels), you can use the following CSS rules in your customization CSS *(page 1782)*:

```css
 *[class="topic/topic"] *[class="topic/topic"] *[class="topic/topic"] > *
 *[class="topic/title"],
 *[class="topic/topic"] *[class="topic/topic"] *[class="topic/topic"]
 *[class="topic/topic"] > *[class="topic/title"],
 *[class="topic/topic"] *[class="topic/topic"] *[class="topic/topic"]*[class="topic/title"] > *[class="topic/title"],
 *[class="topic/topic"] *[class="topic/topic"] *[class="topic/topic"]
 *[class="topic/topic"] *[class="topic/topic"] *[class="topic/topic"]
 *[class="topic/topic"] *[class="topic/title"] {bookmark-label:none;
```
These rules clear the labels generated by the titles starting with the depth 3 (the topic nesting level is given by the selectors *\[class~="topic/topic"\] ).

**How to Specify the Open/Closed PDF Bookmark State**

If you want to specify the initial state for the bookmarks (opened/expanded or closed/collapsed), you can use the `bookmark-state` property in your customization CSS (page 1782).

For example, to specify that all bookmarks for the first three levels are opened (expanded) in the initial state, use:

```css
*\[class~="topic/topic"\] > *\[class~="topic/title"\],
*\[class~="topic/topic"\] *\[class~="topic/topic"\] > *\[class~="topic/title"\],
*\[class~="topic/topic"\] *\[class~="topic/topic"\] *\[class~="topic/topic"\] >

  *\[class~="topic/title"\] {
    bookmark-state:open;
  }
```

**How to Remove the Numbering From the PDF Bookmarks**

By default, the PDF bookmark labels are generated while taking the text set before the chapters titles into account. Since this usually contains the part, chapter, or section numbers, the PDF Bookmarks will make use of them.

The solution is to remove the `content(before)` from the `bookmark-label`, leaving just the `content(text)`.

In your customization CSS (page 1782), add the following CSS rules:

```css
*\[class~="topic/topic"\] > *\[class~="topic/title"\] {
  bookmark-label: content(text);
  -ah-bookmark-label: content();
}
```

⚠️ **Important:** This is a simple example that does not use the possible navigation titles, just the content of the `<title>` element. Copy and modify the built-in CSS for the full CSS rule that matches the `<title>` and `<titlealts>` elements:

```css
*\[class~="topic/topic"\]:has(*\[class~="topic/titlealts"\]) > *\[class~="topic/title"\]
  {...}
```
Page Headers and Footers

The page headers and footers use the string sets defined for publication, chapter, and section titles. These string-sets are defined in the numbering CSS (page 1811). This section contains information about how they are used in the page definitions.

Page Headers and Footers - Built-in CSS

The headers and footers are part of the page definitions. To see how the default page layouts are defined, see: Default Page Definitions (page 1788).

How to Change the Font for the Headers and Footers

To change the font for all the headers and footers, in your customization CSS (page 1782) add a CSS rule similar to this:

```css
@page {
  font-size: 12pt;
  font-family: "Arial";
}
```

⚠️ Important: These settings apply to all page margin boxes, but not to the text inside the page.

If you want to change the settings only for a specific page type (for example, the table of contents), use the name of the page:

```css
@page table-of-contents {
  font-size: 12pt;
  font-family: "Arial";
}
```

Related Information:

- How to Change the Header of the Table of Contents (page 1823)

How to Add a Multi-line Copyright Notice to the Footer
Suppose you want to add a footer with the following two lines of text at the end of each page that is shown on the right side:

© 2017 - My Company Ltd
All rights reserved

For this, you need to specify a rule that matches all the right pages and adds that content in the bottom-center. In your customization CSS (page 1782), add the following CSS rule:

```css
@page :right {
    @bottom-center {
        content: "© 2017 - My Company Ltd \A All rights reserved";
        font-size: 0.5em;
        color: silver;
    }
}
```

**Note:** Other page rules (such as the table-of-contents) override the contents of the @bottom-center because they are more specific. If you need to also print the copyright in the TOC pages, then use this as the selector:

```css
@page :right, table-of-contents:right {
    ...
}
```

**Note:** To use new lines ( \n characters) in your headers or footers, use the \A notation, as in the example above.

How to Add a Group of Topics to the Footer

To create a footer that contains the content of several topic files, but only on the last page, there are two possible approaches:

**Method 1: Using the position:fixed CSS Property**

1. Group all the footer topics under a single parent topic, under the last topic from your DITA map. For example, you can have the following map structure:

```xml
...  
End topic  
    Footer container topic  
        Footer content topic
```

2. Add an `@outputclass = footer` on the `<topic>` root element of the footer container topic, or on its `<topicref>` in the map.

3. Use the CSS `position: fixed` property to position this topic to the bottom of the page:

   ```css
   *[outputclass ~= "footer"] {
     position: fixed;

     bottom: 0.5in;
     left: 0.5in;

     width: 5in;
     height: 200pt;
   }
   ```

   **Note:** Make sure the width and height are enough for the content of the footer to fit. Be careful because the content might bleed out of the page. Use bottom and left values to position the block in the page.

**Method 2: Using the float:footnote CSS Property**

The second approach would be to declare the footer block as a footnote. Assuming the same DITA Map structure as above, you can use the following CSS fragment:

   ```css
   *[outputclass ~= "footer"] {
     float: footnote;
   }

   *[outputclass ~= "footer"]:footnote-call{
     color: transparent;
     font-size: 0;
   }

   *[outputclass ~= "footer"]:footnote-marker{
     color: transparent;
     font-size: 0;
   }
   ```

   **Note:** Use transparent colors and/or zero size font to avoid the display of the footnote counters.
How to Add a Background Image to the Header

A common use-case is to add a background image to one of the page corners.

```css
@page :left {
    @bottom-left-corner {
        content: " ";
        background-image: url('https://www.oxygenxml.com/resellers/resources/OxygenXMLEditor_icon.svg');
        background-repeat: no-repeat;
        background-position: 50% 50%;
    }
}
```

⚠️ **Important:** Always specify a `content` property. If not, the page margin box will not be generated.

Another use-case is to use one of the `@top-left` or `@top-right` page margin boxes. These boxes have an automatic layout and they can be very small if they have no content. If there is no text to be placed over the image, use a series of non-breaking spaces (`\A0`) to increase the box width as in the following example (alternatively, you can use the technique described in How to Decorate the Header by Using a Background Image on the Entire Page (page 1833)):

```css
@page :left {
    @top-left {
        content: '\A0\A0\A0\A0\A0\A0\A0\A0\A0\A0\A0\A0\A0\A0';
        background-image: url('https://www.oxygenxml.com/resellers/resources/OxygenXMLEditor_icon.svg');
        background-repeat: no-repeat;
        background-position: 50% 50%;
    }
}
```

⚠️ **Note:** You can use raster image formats (such as PNG or JPEG), but it is best to use vector images (such as SVG or PDF). They scale very well and produce better results when printed. In addition the text from these images is searchable and can be selected (if the glyphs have not been converted to shapes) in the PDF viewer.

Related Information:

- Images and Figures (page 1871)
How to Decorate the Header by Using a Background Image on the Entire Page

If you want to precisely position artwork and the page margin boxes are not sufficient, it is possible to use a background image for the entire page.

This technique consists of creating an image (SVG is the best since it is a vector image) as wide as the page that would contain the logo and placing other decorations at the desired locations. This offers the best results and the position of the artwork does not depend on the page margin contents.

Example:

```xml
@page :left, chapter:left, chapter:first:left {
    background-image: url('img/page_background_image_with_logos_and_artwork_for_left_page.svg');
    background-repeat: no-repeat;
    background-position: 50% 50%;
}
```

For a list of all the possible page names, see: Default Page Definitions (page 1788).

Related Information:

• How to Add a Background Image for the Cover (page 1803)

How to Style a Part of the Text from the Header

If you need to style a fragment of text (for example, a company slogan) with certain colors or font styles, you have several options:

• Use an SVG image as background for a page margin box or for the entire page. See: How to Add a Background Image to the Header (page 1832).

• Use the `oxy_label` constructor. This is a function that creates a text label with a set of styles.

```xml
@page {
    @top-right {
        content: oxy_label(text, "My Company", styles, "color:red; font-size: larger;");
    }
}
```
You can combine the `oxy_label` with `oxy_xpath`, to extract and style a piece of text from the document:

```xml
content: oxy_label(text, oxy_xpath("/some/xpath"), styles, "color:blue; ");
```

**Note:** These functions work only with the Chemistry CSS processor.

- Use two adjacent page margin boxes, and style them differently:

```xml
@page {
  @top-center {
    content: "First part";
    color: red;
    text-align: right;
  }
  @top-left {
    content: "- Second part";
    color: blue;
    text-align: left;
  }
}
```

### How to Simplify the Header (Only Keep the Chapter Title)

The headers display information such as map title, part title, chapter title, and section title, ending in the page number.

```xml
content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " | " counter(page);
```

This might be too much if you have long titles. The solution is to override the default header content.

In your customization CSS (page 1782), add the following CSS rule:

```xml
@page :left {
  @top-left {
    content: string(chaptertitle) " | " counter(page);
  }
}
```
Important: Some of the CSS default page rules are more important. If you see that the content does not change, you should try to specify also the name of the page:

@page :left, table-of-contents:left, chapter:left{
  ...
}

@page :right, table-of-contents:right, chapter:right{
  ...
}

How to Change the Header Separators (Between Sections and Chapter Titles)

There are a number of strings defined for part, chapter, and sections. Each of these strings start with the " | " character as a separator. For example, in the header of a page, you may find a sequence of strings:

My Publication | Introduction | Getting Started

1. "My Publication" is the value of the maptitle string.
2. "Introduction" is the value of the chaptertitle string.
3. "Getting Started" is the value of the sectiontitle string.

There might be cases where you want to change this separator. You will need to recompose the header content using the above string sets. Suppose you want to use " - " as a separator. In your customization CSS (page 1782), add the following CSS rule:

*[class =~ "topic/topic"]{is-part} > *[class =~ "topic/title"] {
  string-set: parttitle " - " counter(part, upper-roman) " - " content(),
  chaptertitle ""; /* Avoid propagating a past chapter title on a new part */
}

*[class =~ "topic/topic"]{is-chapter}:not([is-part]) > *[class =~ "topic/title"] {
  string-set: chaptertitle " - " counter(chapter) " - " content();
}
If you enabled the Deep Numbering - Built-in CSS (page 1815), then use:

```css
/*
 * Alter the string sets that are shown in the header of the page.
 */
*{class =~ "topic/topic"}[is-part] > *[class =~ "topic/title"] {
    string-set: parttitle " - " counter(part, upper-roman) " - " content(),
    chaptittle ""; /* Avoid propagating a past chapter title on a new part */
}
*{class =~ "topic/topic"}[is-chapter]:not([is-part]) > *[class =~ "topic/title"] {
    string-set: chaptittle " - " counter(chapter) " - " content(), sectiontitle "":
}
*{class =~ "topic/topic"}[is-chapter]:not([is-part]) > *{class =~ "topic/topic"} >
*{class =~ "topic/title"} {
    string-set: sectiontitle " - " counter(chapter) "." counter(section1) " - " content();
}
```

How to Change the Header Styling Depending on Page Side

To modify the styling of the default page headers, add the following CSS rule in your customization CSS (page 1782):

```css
@page :left {
    @top-left {
        color:navy;
        font-style:italic;
    }
    @top-right {
        color:red;
    }
}
```

If you intend to modify just the headers of the table of contents, use the table-of-contents page rule selector:

```css
@page table-of-contents: left {
    @top-left {
        color:navy;
        font-style:italic;
    }
}
```
How to Use XPath Computed Data or Images in the Header or Footer

A very simple approach is to use the `oxy_xpath` directly in the `content` property:

```xml
@page front-page {
  @top-center {
    content: "Created: " oxy_xpath('//*[contains(@class, " topic/created ")[1]]');
  }
}
```

**Example 1: Compute the Number of Words**

The following example computes the number of words from the publication. It counts all the words, including the ones from the TOC, but does not take the static labels into account:

```xml
@page front-page {
  @bottom-center {
    content: "Number of words: "
    oxy_xpath("string-length(normalize-space(/)) - \ string-length(translate(normalize-space(/),',','')) +1");
  }
}
```

**Note:** The XPath expression from the page rules is evaluated in the context of the document root element, so you will need to use absolute expressions starting with `/` or `//`. This is different from the case when the `oxy_xpath` is used in CSS rules that match an element. In this case, the XPath expressions are evaluated in the context of the matched element and you can use relative paths.

**Tip:** XPath 2.0 is supported (not schema aware).

**Example 2: Retrieve Image from a Document and Insert it in the Header**

Another example is to use an image from the document in the publication header:

```xml
<bookmeta>
  <metadata>
    ...
    <data name="cover">
```

If the URL returned by `oxy_xpath` is not absolute, it is considered to be relative to the CSS file. To obtain an absolute URL from one relative to the XML document, you can use in the XPath expression functions like `resolve-uri` and `document-uri`:

```
@page {
  @top-center {
    content: url(oxy_xpath("//*[contains(@outputclass, 'cover-image')]/@href"), document-uri(/));
  }
}
```

**Example 3: Insert the Current Date in the Footer**

Another example is to use the `oxy_xpath` function to compute the current date and insert it in the publication footer:

```
@page {
  @bottom-left {
    content: oxy_xpath('current-date()');
  }
}
```

How to Change Header Images for Each Chapter

It is possible to dynamically change an image in the header depending on the chapter. For this, you need to define an image reference in the metadata section of each chapter. One way is to specify it in the DITA map by using the `<topicmeta>` element for the `<chapter>` topic reference:

```
...  
  <chapter href="topics/installing.dita">
    <topicmeta>
      <data name="header-image" value="img/installing.png"/>
    </topicmeta>
  ...
```

In the above example, there is set of key value pairs with the name `header-image`. The `img/installing.png` is an image reference relative to the DITA map URI. This information is automatically copied into the content in the merged map file (page 1782), like this:

```
<topic is-chapter="true" ... >
  
  <title class="- topic/title ">Installing</title>
  
  <shortdesc class="- topic/shortdesc ">You install components to make them available for your solution.</shortdesc>
  
  <prolog class="- topic/prolog ">
    ...
  ...
  <data class="- topic/data " name="header-image" value="img/installing.png"/>
  ...
```

This information can be picked up from CSS:

```css
/* Define the string set variable that contains an URL */
*[class ~="topic/topic"] *[class ~="topic/data"] [name="header-image"] { 
  string-set: imgst oxy_url(oxy_xpath('/*/xtrf'), attr(value));
}

/* Using the value='none' stops applying the image. */
*[class ~="topic/topic"] *[class ~="topic/data"] [name="header-image"] [value="none"] { 
  string-set: imgst "";
}
/* Use the string set variable in one of the page margin boxes. */
@page chapter {
  @top-left-corner {
    content: string(imgst);
    font-size: 0; /* remove the font ascent and descent */
  }
}

Details: The `@value` attribute is used to build a URL relative to the URI of the DITA map. To determine the base URI of the DITA map, the `@xtrf` attribute was used from the root element of the merged map document, extracted using the `oxy_xpath` function.

Notes:

• The image is always aligned vertically to the middle of available space from the page margin box.
• Make sure you use an image of the correct size. For example, if you want to place the image in the top-left corner of the page, assuming the top and left page margins are 1 in, then make sure the image is a square having a size of 1 in.
• The image is applied to all pages that follow the data element, until another data element changes it:

    ...
    <chapter href="topics/installing.dita">
      <topicmeta>
        <data name="header-image" value="img/installing.png"/>
      </topicmeta>
    </chapter>
    <chapter href="..."><!-- Uses the same installing.png image --></chapter>
    <chapter href="..."><!-- Uses the same installing.png image --></chapter>
    <chapter href="..."><!-- Uses the same installing.png image --></chapter>
    <chapter href="topics/change.dita">
      <topicmeta>
        <data name="header-image" value="img/change.png"/>
      </topicmeta>
    </chapter>
    <chapter href="..."><!-- Uses the same change.png image --></chapter>
    <chapter href="..."><!-- Uses the same change.png image --></chapter>
    <chapter href="..."><!-- Uses the same change.png image --></chapter>

To clear the image, use the `none` value:
How to Add a Line Under the Header

There are two ways to add a horizontal line under the header.

**Method 1: Add a Border in the Page Margin Boxes**

To add a horizontal line that would stretch across the width of the page, add a bottom border to each of the 5 margin boxes in the top side of the page (top-left-corner, top-left, top-center, top-right, top-right-corner).

If you consider that the space between the header and the bottom border is too large, you could also change the alignment by adding a `vertical-align: bottom;` declaration in the page margin boxes.

For example, if you need to set some text as a header in the top-left margin box and insert a horizontal line under it, the customization CSS would look something like this:

```
@page chapter, chapter:first:left:right, front-page{

  padding-top: 1em;

  @top-left {
    content: "Custom header";
    color: gray;
    border-bottom: 1px solid black;
    vertical-align: bottom;
  }

  @top-center{
    content: " ";
    border-bottom: 1px solid black;
    vertical-align: bottom;
  }

  @top-right{
    content: " ";
    border-bottom: 1px solid black;
    vertical-align: bottom;
  }
```
Note: The `padding-top: 1em;` is used to avoid the border at the bottom of the header that joins with the page content.

Method 2: Use a Background Image

An alternative method is to add a horizontal line/border under an existing header (or in any other part of the page) using an SVG image, as described in How to Add a Background Image to the Header (page 1832).

Index

The index section collects all the index terms from the publication and shows them in a sorted tree.

Index - XML Fragment

In the merged map file (page 1782), the structure that holds the index tree is the `<opentopic:index:index.groups>` element.

```xml
<map class="- map/map ">
  <oxy:front-page>
    ...
  </oxy:front-page>
  <opentopic:map xmlns:opentopic="http://www.idiominc.com/opentopic">
    ...
  </opentopic:map>
  <topic class="- topic/topic ">
    <title class="- topic/title">Request Support</title>
  </topic>
</map>
```
Each of the groups contain:

- A label, the starting letter ("T" in the following example).
- A tree of `<opentopic-index:index.entry>` elements.
Each of the entries contain:

- The formatted value (`<opentopic-index:formatted-value>`).
- A link to the publication content (`<opentopic-index:refID> / <oxy:index-link>`).
- Possibly other child entries.

For the **DITA Map PDF - based on HTML5 & CSS** transformation type, the merged map is further processed resulting in a collection of HTML5 `<div>` elements. These elements preserve the original DITA `@class` attribute values and add a new value derived from the DITA element name.

```xml
<div class="- map/map map">
  <div class="front-page/front-page">
    ...
  </div>
  <div class="toc/toc toc">
    ...
  </div>
  <div class="- topic/topic topic">
    <div class="- topic/title title">
      Request Support</title>
    ...
  </div>
  <div class=" index/groups groups">
    ...
  </div>
</map>
```

The index group content becomes:

```xml
<div class=" index/group group">
  <div class=" index/label label">
  </div>
  <div class=" index/entry entry">
    <div class=" index/formatted-value formatted-value">
      table of contents
    </div>
    <div class=" index/refid refid">
      [d16e3988]
    </div>
  </div>
</div>
```
Index - Built-in CSS

All index styling is found in: [PLUGIN_DIR]css/print/p-index.css.

How to Style the Index Page Title and the Grouping Letters

In your customization CSS (page 1782), add the following CSS rules:

```css
* [class ~="index/groups"] * [class ~="index/group"] * [class ~="index/label"] {  
  font-size: 1.5em;
  color: navy;
}

* [class ~="index/groups"]:before {  
  content: "- Index - ";
  color: navy;
  font-size: 4em;
}
```

The result is:
How to Style the Index Terms Labels

In your customization CSS (page 1782), add the following CSS rule:

```css
* [class ~='index/groups'] * [class ~='index/formatted-value'] {
  font-style: oblique;
  color: gray;
}
```

The result is:

How to Add Filling Dots Between the Index Labels and the Page Numbers

Suppose you want the leader CSS content to generate a row of dots. It is necessary that the parent entry have the text justified.

In your customization CSS (page 1782), add the following CSS rule:

```css
index\entry {
```
How to Change the Index Page Number Format and Reset its Value

The page number is reset at the beginning of the index page by the built-in CSS rule:

```css
* [class ~="index/groups"] {
    counter-reset: page 1;
}
```

If you want to start the page counter from a different initial number, just change the value of this counter. For example, to continue the normal page counting, use:

```css
* [class ~="index/groups"] {
    counter-reset: none;
}
```

If you need to style the page number differently (for example, using decimals), add the following CSS rule in your customization CSS (page 1782):

```css
@page index {
    @bottom-center { content: counter(page, decimal) }
}
```
Footnotes

Footnotes are pieces of information placed at the bottom of the page. A footnote has a number that is left in the content (the footnote call) and the same value placed before the footnote text (the footnote marker).

Footnotes - Built-in CSS

Footnote properties are defined in [PLUGIN_DIR]css/print/p-foot-notes.css.

How to Change Style of the Footnote Markers and Footnote Calls

To bold the footnotes numbers and use some colors, add the following rules to your customization CSS (page 1782):

```css
*[class =~ "topic/fn"]:footnote-call {
  font-weight: bold;
  color:red;
}

*[class =~ "topic/fn"]:footnote-marker {
  font-weight: bold;
  color:red;
}
```

Related Information:

How to Add a Separator Above the Footnotes

The @footnote part of a @page declaration controls the style of the separator between the page content and the footnotes. For the content, you should set a leader. The leader uses a letter or a line style to fill the entire width of the page.

```xml
@page {
  margin:0.5in;
  ....
}
@footnote {
  content: leader(solid);
  color:silver;
}
```
To create a dotted line, you can use the dot character: `leader('.')`. Other commonly used characters are: "-" (dash) and "_" (underscore).

### How to Reset the Footnotes Counter

There are cases where you want to reset the footnote counter.

For example, if you need to reset it at the beginning of each chapter, add the following rules to your customization CSS (page 1782):

```css
*[class ~="bookmap/chapter"],
*[class ~="topic/topic"]{is-chapter} { counter-reset: footnote 1; }
```

Or you can mark any element with an `@outputclass` value, match that value, and reset the counter at any point in your counter:

```xml
<p outputclass="reset-footnotes"/>
```

### Page Breaks

The page breaks can be controlled in multiple ways:

1. By creating an `@page` and assigning it to an element will create a page break between this element and the sibling elements that have a different page.
3. In your DITA topic, set the `@outputclass` attribute on the topic root (or any element) to contain one of the `page-break-before`, `page-break-after`, or `page-break-avoid` values. If you want to control the page breaking from the DITA map, use the `@outputclass` attribute on the `<topicref>` with any of the values mentioned above.
Page Breaks - Built-in CSS

Page break properties are used in: [PLUGIN_DIR]css/print/p-page-breaks.css.

How to Avoid Page Breaks in Lists and Tables

To avoid splitting elements over two pages, you can use the `page-break-inside` CSS property. For example, if you want to impose this on tables and lists, then add the following rules to your customization CSS (page 1782):

```css
* [class ~="topic/table"] {
    page-break-inside:avoid;
}
* [class ~="topic/ol"] {
    page-break-inside:avoid;
}
* [class ~="topic/ul"] {
    page-break-inside:avoid;
}
```

**Note:** Since the task steps are inherited from `topic/ol`, they will also not be split over two separate pages. However, if you want to allow this, add the following CSS rule:

```css
* [class ~="task/steps"] {
    page-break-inside:auto;
}
```

**Note:** Another way to do this is to mark the element with an `@outputclass` set to `page-break-avoid`.

How to Force a Page Break Before or After a Topic or Another Element

If you want to force a page break, mark the topic (or any other element you need to control page breaking for) with an `@outputclass` set to one of these values:

```text
page-break-before
```
Use this for a page break before the marked element.

**page-break-before**

Use this for a page break after the marked element.

**page-break-avoid**

Use this to avoid page breaks inside the marked element.

For example, to force a page break before a certain topic, you should use:

```
<topic outputclass="page-break-before" ... >
```

**Note:** You can set the output class on the `<topicref>` element from the DITA map instead of the `<topic>` element. In this way you can reuse the topic in another context where the page breaking is not necessary.

You can also control page breaking for lists, paragraphs, or any other block type elements. The following example avoids page breaks inside an ordered list:

```
<ol outputclass="page-break-avoid" ... >
```

How to Add a Blank Page After a Topic

If you want to add a new blank page after a topic, add the following rules to your customization CSS (page 1782).

Style the separating blank page:

```css
@page topic-separating-page{
  @top-left {
    content: "";
  }
  @top-right {
    content: "";
  }
  @top-center {
    content: "This page is blank";
  }
}
```

Associate this page to the :after pseudo element of the topic:

```css
*[class="topic/topic"]*[outputclass="add-separator-page"]:after {
  content: " ";
}
In the XML content, on the `<topic>` element, set the `@outputclass` to the `add-separator-page` value.

```xml
<topic outputclass="add-separator-page"> ...
</topic>
```

The `:after` pseudo element will be created next to the topic content and will be placed on the `topic-separating-page`.

Use the page margin box selectors to override the default content from the headers/footers.

**Note:** You can set the output class on the `<topicref>` element from the DITA map instead of the `<topic>` element. This allows you to reuse the topic in another context where the page breaking is not necessary.

**How to Enforce a Number of Lines from Paragraphs that Continue in Next Page**

In typography, an *orphan* is the first line of a paragraph that appears alone at the bottom of a page (the paragraph continues on a following page), while a *widow* is the last line of a paragraph that appears alone at the top of a page. The default is 2 for each of them. You can control this number by adding the following to your customization CSS (page 1782):

```css
:root {
  widows: 4;
  orphans: 4;
}
```

**Hyphenation**

Hyphenation specifies how words should be hyphenated when text wraps across multiple lines.

**How to Enable Hyphenation for Entire Map**

To enable hyphenation for your entire map:

1. Make sure you set an `@xml:lang` attribute on the root of your map.
2. In your customization CSS (page 1782), add:

```css
:root {
  hyphens: auto;
}
```
3. To except certain elements from being hyphenated, use `hyphens:none`. The following example excludes the `<keyword>` elements from being hyphenated:

```css
*[class =~ "topic/keyword"] {
    hyphens: none;
}
```

How to Enable/Disable Hyphenation for Tables

To enable hyphenation for your entire map:

1. Make sure you set an `@xml:lang` attribute on the root of your map or your table elements.
2. In your customization CSS (page 1782), add:

```css
*[class =~ "topic/table"] {
    hyphens: auto;
}
```
3. To except certain elements from being hyphenated, use `hyphens:none`. The following example excludes the `<keyword>` elements from being hyphenated:

```css
*[class =~ "topic/keyword"] {
    hyphens: none;
}
```

Accessibility

By default, the PDF documents produced using this plugin are partially accessible in the sense that most of the paragraphs, tables, lists, headers, and footers are tagged automatically so a PDF reader can use this information to present the content.

Related Information:

- Oxygen PDF Chemistry: Accessibility

Accessibility - Built-in CSS

Accessibility properties are defined in `[PLUGIN_DIR]css/print/p-accessibility.css`. How to Create Fully Accessible Documents
To make your documents fully accessible (PDF/UA1), do the following:

1. In your customization CSS (page 1782), specify fonts for all elements and for all page margin boxes. There should be no text that falls back to the basic provided fonts (Times, Courier, etc.). For instance, you can use:

```css
:root { font-family: Arial }
@page {
  @top-left { font-family: Arial }
  ...
}
```

2. Specify an `@alt` attribute with a description on any image, or better, use the `<alt>` DITA element.

3. Change the Chemistry invocation from the `build.xml` file, adding the argument `-pdf-ua`. There are two targets to change: `chemistry` and `chemistry.embedded`.

Fonts

Fonts are an important part of the publication. Your font selection should take into consideration both design and the targeted ranges of characters.

To use them in the customization CSS (page 1782):

- You can place the font files in the same folder as your CSS and use a `@font-face` definition to reference them.
- You can use web fonts (for example, Google Fonts), and import the CSS snippet into your CSS.
- You can use system fonts.

All these techniques are explained in: Oxygen PDF Chemistry User Manual: Fonts.

How to Avoid Characters Being Rendered as #

When the processor renders text with a font that does not include certain characters, those characters are replaced with the `#` symbol.

To prevent this, make sure you use the proper font.

As an example, suppose the right arrow character is used in a definition list like this:

```xml
<dlentry>
  <dt>&#8594;</dt>
  <dd><ph>This is the right arrow.</ph></dd>
</dlentry>
```
If the font does not include this character, the output will look something like this:

```
#
This is the right arrow.
```

To fix this, use a fallback font. For example, if you use *Times New Roman* for the entire publication, you could add *Symbol* as the fallback font. In your customization CSS (page 1782), add:

```css
*[class ~="topic/dlentry"] {
  font-family: "Times New Roman", Symbol;
}
```

**How to Set Fonts in Titles and Content**

Suppose that in your customization CSS (page 1782), you have defined your font (for example, *Roboto*) using a Google web font:

```css
@import url('https://fonts.googleapis.com/css?family=Roboto');
```

You can force a font on all elements, then style the ones that need to be different. The advantage of this method is that you do not need to trace all elements that have a font family defined in the built-in CSS files, you just reset them all.

In your customization CSS (page 1782), add an `!important` rule that associates a font to all the elements from the document:

```css
* {
  font-family:"Roboto" !important;
}
```

**Note:** If you want to use the `:root` selector instead of the `*` sector, without the `!important` qualifier, the elements that have a predefined font specified in the built-in CSS will keep that font. If your content uses non-Latin glyphs, it is possible that the built-in fonts do not render them.

Next, identify the selectors for the elements that need to be styled with a different font than the one associated above. For information on how to do this, see: Debugging the CSS (page 1782).

For example, if you want the titles or the pre-formatted text to have a different font from the rest, matched by the above `*` selector, you need to use more specific CSS selectors:

```css
*[class="front-page/front-page-title"],
*[class="topic/title"] {
  font-family: Arial !important;
}
```
How to Use Fonts for Asian Languages

For Asian languages, you must use a font or a sequence of fonts that cover the needed character ranges. If the characters are not found, the # symbol is used.

When you specify a sequence of fonts, if the glyphs are not found in the first font, the next font is selected until one that includes all the glyphs is found. A common font sequence for Asian languages is as follows:

```
font-family: Calibri, SimSun, "Malgun Gothic", "Microsoft JhengHei";
```

To apply this font sequence, see: How to Set Fonts in Titles and Content (page 1855).

Some of the Asian fonts do not have italic, bold, or bold-italic variants. In this case, you may use the regular font file with multiple font face definitions to simulate (synthesize) the missing variants. You need to use the -oxy-simulate-style:yes CSS property in the font face definition as explained in: Using Simulated/Synthetic Styles in Oxygen Chemistry

Localization

The default CSS contain rules and localized strings for English, French and German.

This topic applies to the DITA Map PDF - based on HTML5 & CSS transformation type.

In this type of transformation, the intermediary merged DITA map is transformed to HTML5 using the DITA-OT built-in support, so the customization of the internationalization (the labels for chapters, parts, figures, tables, notes, etc.) can be achieved by following the DITA-OT recommendations: Customizing Generated Text.

It is recommended that you do this customization on a DITA-OT distribution deployed outside of the Oxygen installation. Otherwise, you will lose the customization when upgrading Oxygen. You can contact the Oxygen support team to ask for the Oxygen Publishing Engine package.
Comments and Tracked Changes

The comments and tracked changes can be made visible in the PDF output by setting the `show.changes.and.comments` transformation parameter to `yes`.

Figure 586: Chemistry Annotations in Acrobat Reader

By default, they are shown as PDF text annotations (sticky notes). These are graphical markers in the document content and are also listed in the Comments section when opening the output file in Acrobat Reader.

**Note:** Comments with the Mark as Done flag selected appear with a checkmark in the Comments section and with a Completed label (_completed).

To avoid rendering the elements as PDF annotations and show them as footnotes instead, you can use the `show.changes.and.comments.as.pdf.sticky.notes` transformation parameter set to `no`.

The comments and changes are included in the merged map file (page 1782) either as XML elements (`<oxy-insert>`, `<oxy-delete>`, `<oxy-comment>`, `<oxy-attributes>`) in the case of the XML merged map, or as HTML elements with similar classes (`oxy-insert`, `oxy-delete`, `oxy-comment`, `oxy-attributes`) in the case of the HTML merged map. Sub-elements contain meta-information about each change.

**Tip:** These elements are automatically recognized and transformed in PDF annotations when using Chemistry as PDF processor.

**Note:** The inserted text, deleted text, and deleted markup are included in the sticky notes.

Related Information:

- Transformation Parameters (page 1760)
Comments and Tracked Changes - XML Fragment

This section contains information about how each type of tracked change is structured in the merged map XML file (page 1782).

Insertions

For an insertion type of tracked change, the structure that defines the insertion details is inside the range (<oxy-range-start> to <oxy-range-end>), the inserted text is highlighted by an <oxy-insert-hl> element, and the details are stored in the <oxy-insert> element.

```
<oxy:oxy-range-start id="sc_1" hr_id="1"/>

<oxy:oxy-insert href="#sc_1" hr_id="1">
  <oxy:oxy-author>dan</oxy:oxy-author>
  <oxy:oxy-content>insert</oxy:oxy-content>
  <oxy:oxy-date>2018/03/15</oxy:oxy-date>
  <oxy:oxy-hour>09:38:29</oxy:oxy-hour>
  <oxy:oxy-tz>+02:00</oxy:oxy-tz>
</oxy:oxy-insert>

<oxy:oxy-insert-hl>This is an insert!!</oxy:oxy-insert-hl>

<oxy:oxy-range-end hr_id="1"/>
```

Comments

Similar to insertions, comments are defined in a range (<oxy-range-start> to <oxy-range-end>), the comment details is in the <oxy-comment> element, and the highlighted content is wrapped in the <oxy-comment-hl> element.

```
<oxy:oxy-range-start id="sc_1" hr_id="1"/>

<oxy:oxy-comment href="#sc_1" hr_id="1">
  <oxy:oxy-author>dan</oxy:oxy-author>
  <oxy:oxy-comment-text>This is a comment.</oxy:oxy-comment-text>
  <oxy:oxy-date>2018/03/15</oxy:oxy-date>
  <oxy:oxy-hour>09:56:59</oxy:oxy-hour>
</oxy:oxy-comment>
```
Note: Comments that are marked as done have a `flag="done"` attribute:

```xml
<oxy:oxy-comment href="#sc_6" hr_id="6" flag="done">
```

### Attribute changes

The attribute changes are more complex. The `range` is empty, and is directly above the affected element (the one that has modified attributes). The `<oxy-attributes>` element contains details about multiple attribute changes, each stored in the `<oxy-attributed-change>` element.

```xml
<oxy:oxy-attributes href="#sc_3" hr_id="3">
  
  <oxy:oxy-attribute-change type="inserted" name="platform">
    <oxy:oxy-author>dan</oxy:oxy-author>
    <oxy:oxy-current-value>windows</oxy:oxy-current-value>
    <oxy:oxy-date>2018/03/15</oxy:oxy-date>
    <oxy:oxy-hour>10:05:04</oxy:oxy-hour>
    <oxy:oxy-tz>+02:00</oxy:oxy-tz>
  </oxy:oxy-attribute-change>

  ....

  <oxy:oxy-attribute-change type="removed" name="audience">
    ....
  </oxy:oxy-attribute-change>

</oxy:oxy-attributes>
```
Deletions

For a deletion, there are some elements that define the start and end of the deletion, and the highlighted text is wrapped in the `<oxy-delete-hl>` element.

```
<oxy:oxy-range-start id="sc_2" hr_id="2"/>
<oxy:oxy-delete-hl>This is a deleted text. </oxy:oxy-delete-hl>
<oxy:oxy-range-end hr_id="2"/>
```

There is a structure that offers details about the deletion change, using the `<oxy-delete>` element. This is linked to the above deletion range by the same ID value:

```
<oxy:oxy-delete href="#sc_2" hr_id="2">
  <oxy:oxy-author>dan</oxy:oxy-author>
  <oxy:oxy-content><img src="../img/ex.gif"></oxy:oxy-content>
  <oxy:oxy-date>2018/03/14</oxy:oxy-date>
  <oxy:oxy-hour>11:38:06</oxy:oxy-hour>
  <oxy:oxy-tz>+02:00</oxy:oxy-tz>
</oxy:oxy-delete>
```

Colored Highlights

To show some text as highlighted with a background color:

```
<oxy:oxy-color-hl color="rgba(140,255,140,50)">Some colored text.</oxy:oxy-color-hl>
```

Comments and Tracked Changes - HTML Fragment

This section contains information about how each type of tracked change is structured in the merged map HTML file (page 1782).

Insertions

For an insertion type of tracked change, the structure that defines the insertion details is inside a range (oxy-range-start to oxy-range-end), the inserted text is highlighted by a `<span>` element with the class oxy-insert-hl, and the details are stored in a `<span>` element with the oxy-insert class.

```
<span class="oxy-range-start" id="sc_1" hr_id="1"/>

<span class="oxy-insert" href="#sc_1" hr_id="1">
  <span class="oxy-author">dan</span>
</span>
```
Comments

Similar to insertions, comments are defined in a range (oxy-range-start to oxy-range-end), the comment details in an element with the class oxy-comment, and the highlighted content is wrapped in the oxy-comment-hl element.

Note: Comments that are marked as done have a flag="done" attribute:

Attribute changes

The attribute changes are more complex. The range is empty, and is directly above the affected element (the one that has modified attributes). The element with the class oxy-attributes contains details about multiple attribute changes, each stored in an element with the class oxy-attribute-change.
Deletions

For a deletion, there are some elements that define the start and end of the deletion, and the highlighted text is wrapped in an element with the class `oxy-delete-hl`.

There is a structure that offers details about the deletion change, using the element with the class `oxy-delete`. This is linked to the above deletion range by the same ID value.
Colored Highlights

To show some text as highlighted with a background color:

```html
<span class="oxy-color-hl" color="rgba(140,255,140,50)">Some colored text.</span>
```

Comments and Tracked Changes - Built-in CSS

The built-in CSS that controls the way tracked changes and comments are displayed is found in:

`[PLUGIN_DIR]css/print/p-side-notes.css`

How to Style Changed or Commented Text

To style the highlighted text from the document content, use the `<oxy-comment-hl>` element (or `<oxy-delete-hl>` , `<oxy-insert-hl>` , respectively, by local name or class name):

```css
oxy-comment-hl,
.oxy-comment-hl {
  color:magenta;
}
```

**Note**: The class name selector is useful when using the DITA Map PDF - based on HTML5 & CSS transformation scenario.

If you want to change the small labels that define the affected start and end ranges (they are a number formatted like: “[n] .. [/n]” where n is the number of the change), you can use the following selectors:

```css
oxy-range-start:before,
.oxy-range-start:before {
  display:inline;
  content:'[' attr(hr_id) ']';
  color:red;
}
 oxy-range-end:before,
.oxy-range-end:before {
  display:inline;
  content:'[/' attr(hr_id) ']';
  color:red;
}
```

Use `display:none` if you want to hide them.
If you want to change the background color of the comment footnote (assuming you set the `show.changes.and.comments.as.pdf.sticky.notes` transformation to `no`), add the following snippet in your customization CSS (page 1782):

```css
oxy-comment,
.oxy-comment {
  background-color: inherit;
  border: 2pt solid yellow;
}
```

Similarly, you can style the other footnotes for `<oxy-attributes>`, `<oxy-delete>`, and `<oxy-insert>` elements.

**How to Hide Tracked Change Footnotes**

This topic is relevant if you have set the `show.changes.and.comments.as.pdf.sticky.notes` transformation parameter to `no`, and therefore the changes are shown as footnotes instead of PDF annotations.

In some cases, when your document contains a lot of tracked changes, you may need to hide the footnotes associated with the insertions, deletions, or attribute changes. Using the following example, the deletions and insertions are hidden, but the comments remain visible. In your customization CSS (page 1782), add:

```css
oxy-attributes,
oxy-delete,
oxy-insert{
  float:none;
  display:none;
}
```

**Draft Watermarks**

A *watermark* is an image displayed as the background of a printed document and it is faded enough to keep the publication text readable. *Draft watermarks* are used to indicate that a document is under construction or has not yet been approved.

**How to Add a Draft Watermark on All Pages**

To add a draft watermark to all of your publication pages, you can use the following page selector in your customization CSS (page 1782):

```css
@page {
```

background-image: url("draft.svg");
background-position: center;
background-repeat: no-repeat;
background-color: inherit;
}

If you have already set a background image for other pages (for example, the \texttt{front-page} or \texttt{table-of-contents}) , the above selector won't change them, as they are more specific.

The best practice is to use a different \texttt{draft.css} CSS file that imports the customization CSS where the rest of the style changes reside. If you need to publish as draft, use the \texttt{draft.css} in your transformation scenario, otherwise directly reference the customization CSS (page 1782).

Related Information:

- Images and Figures (page 1871)

How to Add a Draft Watermark Depending on Metadata

Suppose you want to apply a Draft watermark until your DITA bookmap is approved and the map is approved when an \texttt{<approved>} element has been added to the metadata section (for example, in the \texttt{bookmeta/bookchangehistory} element).

\begin{verbatim}
<bookmeta>
  <author>John</author>
  <critdates>
    <created date="1/1/2015"/>
    <revised modified="3/4/2016"/>
    <revised modified="3/5/2016"/>
  </critdates>
  <bookchangehistory>
    <approved/>
  </bookchangehistory>
  ...
\end{verbatim}

Use \texttt{oxy_xpath} every time you need to probe the value from an element other than the one matched by the CSS selector, and test the expression on the merged HTML file using the \texttt{Oxygen XPath Builder} view.

You can either use a page selector that imposes the draft watermark on the entire page surface (recommended):
or use an element selector that restricts the watermark image only to the page area covered by that element:

```css
:root, body{
    /* same as properties above */
}
```

The `body` selector is used here in case you want to apply the DITA Map PDF - based on HTML5 & CSS transformation type. You can use another element selector to target a specific part of your publication (for example, marking only the tables as drafts).

**Related Information:**

- Metadata (page 1794)
- How to Debug XPath Expressions (page 1787)

**Styling the Content**

If you need to change the styles of the elements from the topic contents, you should create a customization CSS (page 1782) and then add CSS rules. To create the CSS rules, you can use the development tools described in Debugging the CSS (page 1782).

**Reusing the Styling for WebHelp and PDF Output**

If you are using the pdf-css-html5 transformation type, then the generated HTML5 document that is later converted to PDF is very similar to the generated HTML5 pages from the WebHelp Responsive.

This is an output example from the WebHelp transformation:

```html
<h1 class="title topictitle1" id="ariaid-title2">Care and Preparation</h1>
<div class="body">
```
And the same example from the PDF transformation (note the additional emphasized class values):

It makes sense to reuse the same CSS rules you developed for one transformation type to the other. The main rule is to use the short class names instead of the long ones. For example, to style the short descriptions with italic font, use:

```
.shortdesc {
  font-style: italic;
}
```

The rule of thumb is that if you have a CSS rule that successfully styles an element in WebHelp, it should apply without any modification in the PDF output.

Lists

You can style the list item markers, or other properties.

How to Style the List Markers

For the media print, the default CSS rules for the list items use the :marker pseudo-class.

```
@media print {
  *[class="topic/li"]:marker {
    text-align: center;
    font-weight: bold;
  }
  *[class="topic/li"] {
    margin-left: 0.25in;
  }
}
```

To eliminate the bold font weight for the items form ordered lists then add the following rules to your customization CSS (page 1782):

```
*[class="topic/ol"] > *[class="topic/li"]:marker {
```

<p class="shortdesc">When caring ...</p>
<p class="p">When caring for your flower garden you want ...</p>
How to Change the Numbering System of Ordered Lists

It is possible to change all lists to have a different numbering system and there are several methods that can be used to achieve this.

**Use the `list-style-type` CSS Property.**

The Chemistry engine supports the following types: decimal, decimal-leading-zero, lower-roman, upper-roman, lower-latin, upper-latin, lower-alpha, upper-alpha.

```css
*[class ~= "topic/ol"] {
  list-style-type: lower-roman;
}
```

**Change the Content of the `:marker` CSS Pseudo Element.**

The following example emulate the Cyrillic numbering for the list items for an ordered list that has the `@outputclass` attribute set to `cyrillic`:

⚠️ **Important:** This example will work only for lists up to 28 items. You will have to extend it for longer lists!

```css
*[class ~= "topic/ol"] [outputclass ~= "cyrillic"] > *[class ~= "topic/li"]:marker {
  width:3em;
}

*[class ~= "topic/ol"] [outputclass ~= "cyrillic"] > *[class ~= "topic/li"]:nth-of-type(1):marker{ content:"а" }
*[class ~= "topic/ol"] [outputclass ~= "cyrillic"] > *[class ~= "topic/li"]:nth-of-type(2):marker{ content:"б" }
*[class ~= "topic/ol"] [outputclass ~= "cyrillic"] > *[class ~= "topic/li"]:nth-of-type(3):marker{ content:"в" }
```

Links

Links allow the users to navigate through the documentation.

How to Remove 'on page NNN' Link Label

For printed material, it is usually desirable for the links to display a label after the text content (such as "on page 54"). This makes it easier the user to identify the target page. However, if the produced PDF is not printed and is intended only for electronic use, this label may create clutter and make the document harder to read. To eliminate this label, add the following in your customization CSS (page 1782):

```
*[class =~ "topic/xref"] [href]:after, *
[class =~ "topic/link"] [href]:after {
  content: none;
}
```

Another use-case is to remove the labels only from links shown in tables cells, and leave the others as they are. For this, you could use a more specific selector:

```
*[class =~ "topic/entry"] *[class =~ "topic/xref"] [href]:after{
  content: none;
}
```
How to Change Link Styles

Suppose you want the links to be bold and with an underline. In your customization CSS (page 1782), add this snippet:

```css
*[^class ~="topic/xref"][^href]:after,
[^class ~="topic/link"][^href]:after {
  font-weight: bold;
  text-decoration: underline;
}
```

How to Hide Descriptions in Related Links Sections

The link descriptions that come from DITA relationship tables or related link elements within topics, are structured in the merged map (page 1782) like this:

```xml
<related-links class="- topic/related-links ">
  <linkpool class="- topic/linkpool ">
    <link class="- topic/link "
      role="friend" scope="local" type="topic">
      <linktext class="- topic/linktext ">Salvia</linktext>
      <desc class="- topic/desc ">The salvia plant</desc>
    </link>
  </linkpool>
  ...
</related-links>
```

If you need to hide these descriptions, add the following code in your customization CSS (page 1782):

```css
[^class ~="topic/link"] >[^class ~="topic/desc"] {
  display: none;
}
```

Images and Figures

Images are an important part of a publication.

Note: You can use raster image formats (such as PNG or JPEG), but it is best to use vector images (such as SVG or PDF). They scale very well and produce better results when printed. In addition the text from these images is searchable and can be selected (if the glyphs have not been converted to shapes) in the PDF viewer.
Images - Built-in CSS

Image properties are defined in [PLUGIN_DIR]css/print/p-images.css.

```css
*[class =~ "topic/image"] {
    prince-image-resolution: 120dpi;
    -ah-image-resolution: 120dpi;
    image-resolution: 120dpi;
    /* The US-letter page size minus page margins. See p-page-size.css for the current page size. */
    max-width: 6.5in;
}
```

How to Fix Image Bleeding - Control Image Size

Sometimes the images may be too big for the page. The built-in CSS rules specify a maximum size for images, limiting to the width of the parent block. But if the parent block is itself too wide and bleeds out of page, you might consider specifying a length.

In your customization CSS (page 1782), add the following snippet:

```css
*[class =~ "topic/image"] {
    ...
    /* The US-letter page size minus page margins. See p-page-size.css for the current page size. */
    max-width: 6.5in;
}
```

How to Change Image Resolution

This is a good technique to change the size of all raster images from your documentation. This will not work for vector images, such as PDF or SVG. If the images (PNG, for example) contain the image resolution in their metadata, this will be taken into account. For all other images, the default resolution is 120dpi.

If the default resolution is not good (suppose you need a higher pixel density of 300dpi), you can change it by adding the following in your customization CSS (page 1782):

```css
*[class =~ "topic/image"] {
    prince-image-resolution: 300dpi;
    -ah-image-resolution: 300dpi;
    image-resolution: 300dpi;
}
```
How to Place Big Images on Rotated Pages

Very wide images may bleed out of the page. One solution for this is to use landscape pages for these wide images.

In your customization CSS (page 1782), add:

```css
*[class~="topic/image"][outputclass='land'] {
    page: landscape-page;
}
```

Setting the attribute `@outputclass = 'land'` on the table element will force the table on a new landscape page.

Another solution is to set an `@outputclass` attribute on the image, then create a rule that matches it, and associate a landscape page for it.

How to Place a Text and Image Side by Side

If you need to align text and an image side by side, you can use the following technique:

1. Organize your text and image under a `<div>` element like this:

   ```xml
   ...<div outputclass="side-by-side">
      <p> This will be in the left side, the next figure in the right. </p>
      <fig>
         <image href="cactus.jpeg"/>
      </fig>
   </div>...
   ```

   **Note:** You can use the `@outputclass` attribute to mark the `<div>` elements that have this special layout.

2. In your customization CSS (page 1782), add:

   ```css
   *[outputclass =~ "side-by-side"] > *[class =~ "topic/p"] {
      display: inline-block;
      width: 45%;
   }
   ```
The image should fill the entire width of the parent `<fig>` element:

```
*[outputclass =~ "side-by-side"] > *[class =~ "topic/fig"] {
  width: 100%;
}
```

By default, the bottom of the image is on the same line as the text baseline. If you want the text and the image to be aligned at the top, add these lines:

```
*[outputclass =~ "side-by-side"] > *[class =~ "topic/p"] {
  vertical-align: top;
}

*[outputclass =~ "side-by-side"] > *[class =~ "topic/fig"] {
  vertical-align: top;
  font-size: 0pt;
}
```

Note: The `font-size: 0pt` is needed to remove the font ascent and descent around the image rectangle.

---

**How to Center Images**

DITA defines a `@placement` attribute for the `<image>` elements. The implicit value is `inline`. Suppose that you need to center the images that have the placement set to `break` (for example, they are not on the same line with other content and the images from the `<fig>` element).

In your customization CSS (page 1782), add:

```
*[class =~ "topic/fig"] {
  text-align: center;
}

/* Other images, with break placement. */
*[class =~ "topic/image"]{placement='break'}{
  display:block;
}
```
How to Change/Reset the Figure Numbering

There are cases when you need to change the aspect of the figure counter that is shown before the figure titles. By default, the figure titles are formatted like this:

Figure NN. Lore Ipsum Title

NN is the number of the figure that starts being counted from the beginning of the publication.

One use-case is to have the NN counter be incremented only within one chapter (for example, the first chapter contains "Figure 1" and "Figure 2", and second chapter starts over with "Figure 1" instead of incrementing to "Figure 3").

You should reset the figure counter on each topic marked as chapter, then hide the label from the figure <figcaption> (this is an HTML element generated by the XSL transformation), and create another label using a :before selector on the <figcaption>.

/* Add more styling or change the content if needed */
content: "Figure " counter(figcount) ". ";
counter-increment: figcount;
Tables

Tables are widely used in technical documentation. This section contains information about the CSS rules that are used to style them and how to fix some problems.

Tables - Built-in CSS

There is a combination of CSS files that address tables: [PLUGIN_DIR]/css/core/-table-html-cals.css, [PLUGIN_DIR]/css/core/-table-cals.css.

How to Deal With Wide Tables - Page Rotation

Some of the tables can have a large number of columns. In this case, the table may bleed out of the page. One solution is to use landscape pages for these tables.

Setting the attribute `@orient` = 'land' on the table element will force the table on a new landscape page.

Another solution is to use automatic detection of wide tables (5 or more columns):

```
* [class~="topic/table"] > * [class~="topic/tgroup"] [cols='5'],
* [class~="topic/table"] > * [class~="topic/tgroup"] [cols='6'],
* [class~="topic/table"] > * [class~="topic/tgroup"] [cols='7'],
* [class~="topic/table"] > * [class~="topic/tgroup"] [cols='8'] {
    page: landscape-page;
    max-width: 100%;
    page-break-before: avoid;
}
```

Note: The landscape-page page layout is defined in the [PLUGIN_DIR]css/print/p-pages-and-headers.css.

If you want to rotate the entire topic that contains the big table, use:

```
* [class~="topic/table"] > * [class~="topic/tgroup"] [cols='5'],
* [class~="topic/table"] > * [class~="topic/tgroup"] [cols='6'],
* [class~="topic/table"] > * [class~="topic/tgroup"] [cols='7'],
* [class~="topic/table"] > * [class~="topic/tgroup"] [cols='8'] {
    max-width: 100%;
    table-layout:auto;
}
```
How to Fix Text Bleeding From Table Cells

Slim tables or tables that have many columns make the text from the cells to be confined to a small horizontal space. Long words would bleed outside the cell boundaries. To fix this, you should enable hyphenation in your tables, thus making the words spread on multiple lines. In your customization CSS (page 1782), add:

```css
*{class~="topic/table"} {
  hyphens: auto;
}
```
How to Enable the Automatic Table Layout

The DITA specification indicates that tables should have a fixed layout. However, you can get a more optimal arrangement of the cells using the automatic layout. In your customization CSS (page 1782), add:

```
*[class~="topic/tgroup"] {  
    table-layout:auto !important;
}
```

If you want to control which table you want this layout, you can set the `@outputclass` attribute on the `<table>` element:

```html
<table outputclass='auto_tbl'> ... </table>
```

Then, in the CSS, use a rule that matches the `@outputclass`:

```
*[class="topic/table"][outputclass='auto_tbl'] > *[class="topic/tgroup"] {  
    table-layout:auto !important;
}
```

⚠️ **Important:** Make sure the tables have no column width specified.

How to Change/Reset the Table Numbering

There are cases when you need to change the aspect of the table counter that is shown before the table titles. By default, the table titles are formatted like this:

```
Table NN. Lore Ipsum Title
```

`NN` is the number of the table that starts being counted from the beginning of the publication.

One use-case is to have the `NN` counter be incremented only within one chapter (for example, the first chapter contains "Table 1" and "Table 2", and the second chapter starts over with "Table 1" instead of incrementing to "Table 3").
You should reset the table counter on each chapter, then hide the label from the table `<caption>` (this is an HTML element generated by the XSL transformation), and create another label using a `:before` selector on the `<caption>`.

```css
*[class ~= "topic/topic"]{is-chapter} {
    counter-reset:tablecount;
}
.table--title-label{
    display:none;
}

*[class ~= "topic/table"] > caption:before{
    /* Add more styling or change the content if needed */
    content: "Table " counter(tablecount) ". ";
    counter-increment:tablecount;
}
```

**How to Rotate Content from a Table Cell**

There are cases where you want to style the first column as a kind of table header, with vertical text.

There is an important thing to remember: you can rotate an element from a table cell, but not the cell itself. So, your DITA table cell should contain a `<div>` or a `<p>` element that will be rotated. The cell has to be marked somehow so that it can be matched from the CSS. One way is to set an `@outputclass` attribute on it, another will be to mark the table and then match the first entries from it.

```xml
<row>
    ...
    <entry outputclass="rotated">
        <p>Rotated</p>
    </entry>
    ...
</row>
```

In your customization CSS *(page 1782)*, use the following rule that matches the child of the entry:

```css
*[outputclass =~ "rotated"] > * {
    display: block;
    transform: rotate(-90deg) !important;
    text-align: left !important;
}
```
The padding and margins are set to zero to clear any space that may come from other rules. The width is required - it will become the height of the cell. If this is not specified, the vertical rotated text will bleed out of the cell. The height is optional.

**Code Blocks**

Code blocks are used to render section of programming code.

**How to Enable Code Syntax Highlighting**

This topic refers only to the **DITA Map PDF - based on HTML5 & CSS** transformation type.

You can use syntax highlighting to make it easier to read your code snippets by displaying each type of code in different colors and fonts. In the DITA topics, set the `@outputclass` attribute on the `<codeblock>` elements to one of these values:

- language-bourne
- language-c
- language-cpp
- language-csharp
- language-css
- language-ini
- language-java
- language-javascript
- language-json
- language-lua
- language-perl
- language-php
- language-python
- language-ruby
- language-sql
- language-xml
For example, for a java snippet:

```
<codeblock outputclass="language-java">
    for (int i=0; i &lt; 100; i++) {
        // do something
    }
</codeblock>
```

The resulting HTML fragment in the merged HTML5 document is:

```
<pre class="+ topic/pre pr-d/codeblock pre codeblock language-java"
    xml:space="preserve">
    <strong class="hl-keyword" style="color:#7f0055">for</strong>
    <i class="hl-number">i=0</i>; i &lt; <i class="hl-number">100</i>; i++) {
        <em class="hl-comment" style="color:#006400">// do something</em>
    }
</pre>
```

And in the output, it will be rendered as:

```
for (int i=0; i &lt; 100; i++) {
    // do something
}
```

### Changing the Colors for the Syntax Highlighting

As you can see in the above example, the HTML elements `<span>` and `<strong>` are used to color the content. Since they have a `@style` attribute set, the overriding properties need to be marked with `!important`.

Suppose you want to color the keywords in red and the comments in blue. To do so, add the following to your customization CSS *(page 1782)*:

```css
.hl-keyword {
    color: red !important;
}
.hl-comment {
    color: blue !important;
}
```
How to Disable Line Wrapping in Code Blocks

By default, code blocks have the content wrapped to avoid the bleeding of long lines out of the page. To avoid wrapping, add the following in your customization CSS (page 1782):

```
*[class~="pr-d/codeblock"] {
    white-space: pre;
}
```

For the DITA Map PDF - based on HTML5 & CSS transformation type, the best solution to distinguish between lines is to leave them wrapped, but color each line with a different background (zebra coloring). An example is provided here: XSLT Extensions for PDF Transformations (page 1774).

Notes

Notes contain an additional piece of information that calls attention to particular content. They may have various types (tip, caution, danger, restriction, etc.)

How to Change Note Icons

The recommended icon format is SVG.

To change the default icons for notes that do not have a type attribute, add the following rule to your customization CSS (page 1782):

```
div.note > span.note__title{
    background-image:url("../img/note.svg") !important;
}
```

For a note with a type attribute set to warning, caution, or trouble, add the following corresponding CSS rule:

```
div.warning > span.note__title{
    background-image:url("../img/warning.svg") !important;
}
div.caution > span.note__title{
    background-image:url("../img/caution.svg") !important;
}
div.trouble > span.note__title{
    background-image:url("../img/troubleshooting.svg") !important;
}
```
Abbreviated Forms

When using the `<abbreviated-form>` element in your content, it is possible to style the subsequent occurrences differently than the first occurrence. To achieve this, add something similar to the following rule in your customization CSS (page 1782):

```css
a:has(dfn[class =~ "abbreviated-form"]) {
    color: oxy_xpath("let $cdf:= dfn return if (preceding::dfn[@keyref = $cdf/@keyref]) then 'black' else 'red'");
    text-decoration: oxy_xpath("let $cdf:= dfn return if (preceding::dfn[@keyref = $cdf/@keyref]) then 'none' else 'underline'");
}
```

This example would render the first occurrence with a red color and an underline, while the subsequent occurrences would be rendered with a black color and no underline.

Styling Through Custom Parameters

You can activate parts of your CSS by using custom transformation parameters that start with the `args.css.param` prefix.

These parameters are recognized by the publishing pipeline and are forwarded as synthetic attributes on the root element of the merged map. The last part of the parameter name will become the attribute name, while the value of the parameter will be become the attribute value. The namespace of these synthetic attributes is: http://www.oxygenxml.com/extensions/publishing/dita/css/params.

**Notes:**

- Use only Latin alphanumeric characters for parameter names.
- You can set multiple styling parameters at the same time.

How to Limit the Depth of the TOC Using a Parameter

In the following example, a custom parameter is used to switch from a full depth table of contents to a flat one that shows only the titles of the first-level topics (such as chapters, preface, notices).

The custom parameter is:

```xml
args.css.param.only-chapters-in-toc="yes"
```

The CSS that hides the `topicrefs` at level 2 or more:

```css
@namespace a "http://www.oxygenxml.com/extensions/publishing/dita/css/params";
```
The selector :root[a|only-chapters-in-toc='yes'] makes the rule activate only when the attribute is set.

How to Change the Page Size Using a Parameter

In the next example, a custom parameter is used to modify the page size. The parameter is defined in the transformation scenario:

```xml
args.css.param.page-size="A4"
```

Then in the CSS, the attribute value is extracted and used:

```css
@page {
  size: oxy_xpath(/*/@*[local-name()="page-size"]);
}
```

Controlling the Publication Content

Using a plain DITA map, the transformation will produce a publication with a front page, a table of contents, chapters with content, and an index at the end. This is appropriate for most cases, but there are use cases where some adjustments are necessary. For example, if you want to do one of the following:

- Remove the TOC or index.
- Add a glossary.
- Change the position of the TOC or the index relative to the sibling topics.
- Add a preface, frontmatter, or backmatter with copyright notices, abstracts, list of tables, list of figures, etc.

All of these can be achieved using a DITA bookmap.

A bookmap has a more elaborate structure than a regular map. You should start by defining the title structure, with a main title and alternative title:

```xml
<!DOCTYPE bookmap PUBLIC "-//OASIS//DTD DITA BookMap//EN" "bookmap.dtd">
<bookmap id="taskbook">
  <booktitle>
```
Then you may define a front matter. In this, you may link the topics that need to appear before the main content. You may also define the location where the table of contents will be placed. In the example below, it appears between the "abstract" and "foreword" topics:

```xml
<frontmatter>
  <topicref href="topics/abstract.dita"/>
  <booklists>
    <toc/>
  </booklists>
  <topicref href="topics/foreword.dita"/>
</frontmatter>
```

**Note:** To remove the TOC from the publication, just omit the `<toc>` element from the `<booklists>`.

Next, the topics are grouped into chapters:

```xml
...<chapter href="topics/installation.dita"/>
...```

At the end, you could define the structure of the backmatter. Just like for the frontmatter, you can include some topics and some generated content, such as the index. In the example below, it is defined that the glossary should come after the index, followed by a list of figures and list of tables. At the very end, there is a topic with some thank you notes.

```xml
<backmatter>
  <topicref href="topics/conclusion.dita"/>
  <booklists>
    <indexlist/>
    <glossarylist>
      <topicref href="topics/xp.dita" keys="xp" print="yes"/>
      <topicref href="topics/anti_lock_braking_system.dita" keys="abs" print="yes"/>
    </glossarylist>
    <figurelist/>
    <tablelist/>
  </booklists>
</backmatter>
```
As you can see, the bookmarks offers a much better control over the final content of the publication. It also offers more options in controlling the metadata that will go into the PDF (see the Metadata (page 1794) topic).

How to Omit the Front Page, TOC, Glossary, Index for a Plain DITA Map

For a plain DITA map, there are no elements that allow you to control if and where to place the generated content such as the title page, table of contents, list of tables, glossary, or index. For the most common use-case, when you want to hide them all and just keep the content, you can use the transformation parameter hide.frontpage.toc.index.glossary. See: Transformation Parameters (page 1760).

Troubleshooting

This section contains information about fixing various publishing problems.

Error Parsing CSS File - Caused by a Networking Problem

Problem

My custom styles are not applied and in the transformation results console, I get an error containing one of the following: I/O exception, Unknown host, Error parsing.

Cause

One of the CSS files contains references to resources from another website that is currently inaccessible. These resources may include:

- Fonts
- Images
- Other CSS files

Note: If you exported one of the built-in publishing templates from the transformation scenario dialog, it is possible that the associated CSS files use an imported Google Font.

Remedy

1. Check your proxy settings (ask the system administrator for help).
2. If the server is still inaccessible from the transformation process, download the remote resources using a web browser, save them in the customization CSS file folder, and refer them directly from your CSS.

Note: If the problem is caused by a remote font, see Using Local Fonts.

XSL FO-based DITA to PDF Customization

Oxygen XML Editor plugin comes bundled with the DITA Open Toolkit that provides a mechanism for converting DITA maps (page 2705) to PDF output. Oxygen XML Editor plugin includes a built-in DITA Map PDF - based on XSL-FO (page 1403) transformation scenario that converts DITA maps to PDF using an xsl:fo processor.

There are several methods that can be used to customize DITA to PDF output:

- Create a customization directory that contains your customized files and reference that directory in the PDF transformation scenario (using the customization.dir parameter).
- Creating a DITA Open Toolkit plugin that adds extensions to the PDF output. More details can be found in the DITA Open Toolkit Documentation.

Tip: Some sample plugins are available on GitHub that could help you to get started with creating a plugin:
  ◦ Sample Plugin: DITA-OT PDF Customization Plugin for Oxygen User Manual
  ◦ Sample Plugin: DITA-OT PDF2 - Generate Numbers Before Topic's Title

Using a Customization Directory

One way to customize the PDF output generated by the DITA Map to PDF - based on XSL-FO (page 1403) transformation scenario is to create a dedicated folder to store customized files. With this approach, you will copy the contents of the built-in customization directory to a new directory where you can customize the files according to your needs and reference the new directory using the customization.dir parameter in the transformation scenario. The biggest advantage of this method is that the contents of your customization directory will remain unaffected when the DITA-OT is upgraded.

How to Create a Customization Directory

Follow this procedure to create a customization directory:
1. Copy all the entire DITA-OT-DIR\plugins\org.dita.pdf2\Customization directory to another location where you have write access.

2. Modify any of the files in whatever way necessary to achieve your specific goal. For inspiration, see Embedding a Company Logo (page 1888) for a specific example of how you can modify contents of the directory to embed a logo in the output.

   **Tip:** For other specific examples, see DITA-OT Documentation - PDF Customization Plugin.

3. Edit the DITA Map to PDF - based on XSL-FO (page 1403) transformation scenario, go to the Parameters tab, and set the customization.dir parameter to point to the location of your customization directory.

**Related Information:**

- Automatic PDF plugin customization generator by Jarno Elovirta.
- DITA-OT Documentation - PDF Customization Plugin

---

**Embedding a Company Logo**

The following procedure explains how to embed a company logo image in the front matter of the book.

1. Create a customization directory (page 1887) (if you haven't already done so).
2. Create a cfg\common\artwork directory structure in your customization directory and copy your logo to that directory (for example, [C:\Customization\cfg\common\artwork \logo.png]).

   **Important:** Make sure that your logo image is named: logo.png.

3. Rename Customization\catalog.xml.orig to: Customization\catalog.xml.
4. Open the catalog.xml in Oxygen XML Editor plugin and *uncomment* this line:

   ```xml
   <!--uri name="cfg:fo/xsl/custom.xsl" uri="fo/xsl/custom.xsl"-->
   ``

   It now looks like this:

   ```xml
   <uri name="cfg:fo/xsl/custom.xsl" uri="fo/xsl/custom.xsl"/>
   ```

5. Rename the file Customization\fo\xsl\custom.xsl.orig to: C:\Customization\fo \xsl\custom.xsl
6. Open the `custom.xsl` file in Oxygen XML Editor plugin and create the template called `createFrontCoverContents` for DITA-OT 3.2.1.

Tip: You can copy the same template from `DITA-OT-DIR\plugins\org.dita.pdf2\xsl\fo\front-matter.xsl` and modify it in whatever way necessary to achieve your specific goal. This new template in the `custom.xsl` file will override the same template from `DITA-OT-DIR\plugins\org.dita.pdf2\xsl\fo\front-matter.xsl`.

Example:

For example, the `custom.xsl` could look like this:

```xml
<?xml version='1.0'?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:fo="http://www.w3.org/1999/XSL/Format"
    version="2.0">

<xsl:template name="createFrontCoverContents">
    <!-- set the title -->
    <fo:block xsl:use-attribute-sets="__frontmatter__title">
        <xsl:when test="$map/*[contains(@class,' topic/title ')][1]">
            <xsl:apply-templates select="$map/*[contains(@class,' topic/title ')][1]/@	itle"/>
        </xsl:when>
        <xsl:when test="$map/*[contains(@class, ' bookmap/mainbooktitle ')][1]">
            <xsl:apply-templates select="$map/*[contains(@class, ' bookmap/mainbooktitle ')][1]"/>
        </xsl:when>
        <xsl:when test="/*/[@class = ' map/map']/@title">
            <xsl:value-of select="/*/[@class = ' map/map']/@title"/>
        </xsl:when>
        <xsl:otherwise>
            <xsl:value-of select="/descendant::*[contains(@class, ' topic/topic ')][1]/*[contains(@class, ' topic/title ')]"/>
        </xsl:otherwise>
    </fo:block>

    <!-- set the subtitle -->
    <xsl:apply-templates select="$map/*[contains(@class, ' bookmap/booktitlealt ')]"/>
    <fo:block xsl:use-attribute-sets="__frontmatter__owner">
```
7. Edit the **DITA Map to PDF - based on XSL-FO** *(page 1403)* transformation scenario, go to the **Parameters** tab, and set the **customization.dir** parameter to point to the location of your customization directory.

**Tip:** For other specific examples, see [DITA-OT 3.x Documentation - Customizing PDF Output](#).

### Related Information:

- [Using a Customization Directory](#) *(page 1887)*

---

**Customizing the Header and Footer in PDF Output**

The XSLT stylesheet `DITA-OT-DIR/plugins/org.dita.pdf2/xsl/fo/static-content.xsl` contains templates that output the static header and footers for various parts of the PDF such as the prolog, table of contents, front matter, or body.

The templates for generating a footer for pages in the body are called `insertBodyOddFooter` or `insertBodyEvenFooter`.

These templates get the static content from resource files that depend on the language used for generating the PDF. The default resource file is `DITA-OT-DIR/plugins/org.dita.pdf2/cfg/common/vars/en.xml`. These resource files contain variables (such as `Body odd footer`) that can be set to specific user values.

Instead of modifying these resource files directly, they can be overwritten with modified versions of the resources in a PDF customization directory.
1. Create a customization directory (page 1887) (if you haven't already done so).
2. Locate the stylesheets and templates listed above in your customization directory and modify them in whatever way necessary to achieve your specific goal.

   **Tip:** For more information and examples, see the Oxygen PDF Customization Plugin project on GitHub.

3. Edit the DITA Map to PDF - based on XSL-FO (page 1403) transformation scenario, go to the Parameters tab, and set the customization.dir parameter to point to the location of your customization directory.

Related Information:
- Using a Customization Directory (page 1887)

Adding a Watermark to PDF Output

To add a watermark to the PDF output of a DITA Map PDF - based on XSL-FO (page 1403) transformation scenario, follow this procedure:

1. Create a customization directory (page 1887) (if you haven't already done so).
2. Create a cfg\common\artwork directory structure in your customization directory and copy your watermark image to that directory (for example, C:\Customization\cfg\common\artwork\watermark.png).
3. Rename the Customization\catalog.xml.orig file to: Customization\catalog.xml.
4. Open the catalog.xml in Oxygen XML Editor plugin and *uncomment* this line:
   
   ```xml
   <!--uri name="cfg:fo/xsl/custom.xsl" uri="fo/xsl/custom.xsl"/>-->
   ```
   
   The uncommented line should look like this:
   
   ```xml
   <uri name="cfg:fo/xsl/custom.xsl" url="fo/xsl/custom.xsl"/>
   ```
   
5. Rename the file: Customization\fo\xsl\custom.xsl.orig to: Customization\fo\xsl\custom.xsl.
6. Open the Customization\fo\xsl\custom.xsl file in Oxygen XML Editor plugin to overwrite two XSLT templates:
   - The first template is located in the XSLT stylesheet DITA-OT-DIR\plugins\org.dita.pdf2\xsl\fo\static-content.xsl. Override by copying the original...
template content in the custom.xsl and specifying a watermark image for every page in the PDF content, using a block-container element that references the watermark image file:

```xml
<fo:static-content flow-name="odd-body-header">
  <fo:block-container absolute-position="absolute"
                        top="-2cm" left="-3cm" width="21cm" height="29.7cm"
                        background-image="{concat($artworkPrefix,
                                      'Configuration/OpenTopic/cfg/common/artwork/watermark.png')}">
    <fo:block/>
  </fo:block-container>
  <fo:block xsl:use-attribute-sets="__body_odd__header">
    <xsl:call-template name="insertVariable">
      <xsl:with-param name="theVariableID" select="'Body odd header'"/>
      <xsl:with-param name="theParameters">
        <prodname>
          <xsl:value-of select="$productName"/>
        </prodname>
        <heading>
          <fo:inline xsl:use-attribute-sets="__body_odd__header__heading">
            <fo:retrieve-marker retrieve-class-name="current-header"/>
          </fo:inline>
        </heading>
        <pagenum>
          <fo:inline xsl:use-attribute-sets="__body_odd__header__pagenum">
            <fo:page-number/>
          </fo:inline>
        </pagenum>
      </xsl:with-param>
    </xsl:call-template>
  </fo:block>
</fo:static-content>
```

• The second template to override is located in the XSLT stylesheet DITA-OT-DIR\plugins\org.dita.pdf2\xsl\fo\commons.xsl and is used for styling the first page of the output. Override it by copying the original template content in the custom.xsl and adding the block-container element that references the watermark image file:

```xml
<xsl:template name="createFrontMatter_1.0"/>
```
7. Edit the DITA Map to PDF - XSL-FO (page 1403) transformation scenario, go to the Parameters tab, and set the customization.dir parameter to point to the location of your customization directory.

Related Information:

- Adding a Watermark in DITA Map to XHTML Output (page 2624)

Adding an Edit Link in PDF Output to Launch Oxygen XML Web Author

You can embed Edit links in the DITA Map PDF output that will automatically launch a particular document in Oxygen XML Web Author. A reviewer can then simply click the link and they will be redirected to the Oxygen XML Web Author editing page with that particular file open and editable.

To embed an Edit link in the DITA Map PDF output, follow these steps:

1. Edit a DITA Map to PDF - based on XSL-FO (page 1403) transformation scenario and open the Parameters tab.
2. Set values for the following parameters:
   - editlink.remote.ditamap.url - The URL of the DITA Map suitable for opening in Oxygen XML Web Author.
   - editlink.web.author.url - The URL of the Oxygen XML Web Author installation, for example https://www.oxygenxml.com/oxygen-xml-web-author/
3. Run the transformation scenario.

Result: In the PDF output, all topics will have an Edit link to the right side of the title and clicking the link will launch that particular document in Oxygen XML Web Author.
Force Page Breaks Between Two Block Elements in PDF Output

Suppose that in your DITA content you have two block elements (page 2703), such as two paragraphs:

```xml
<p>First para</p>
<p>Second para</p>
```

and you want to force a page break between them in the PDF output.

Here is how you can implement a DITA Open Toolkit plugin (page 2709) that would achieve this:

1. Define your custom processing instruction that marks the place where a page break should be inserted in the PDF, for example:

   ```xml
   <p>First para</p>
   <?pagebreak?>
   <p>Second para</p>
   ```

2. Locate the DITA Open Toolkit distribution and in the plugins directory create a new plugin folder (for example, DITA-OT-DIR/plugins/pdf-page-break).

3. In this new folder, create a new plugin.xml file with the following content:

   ```xml
   <plugin id="com.yourpackage.pagebreak">
     <feature extension="package.support.name" value="Force Page Break Plugin"/>
     <feature extension="package.support.email" value="support@youremail.com"/>
     <feature extension="package.version" value="1.0.0"/>
     <feature extension="dita.xsl.xslfo" value="pageBreak.xsl" type="file"/>
   </plugin>
   ```

   The most important feature in the plugin is that it will add a new XSLT stylesheet to the XSL processing that produces the PDF content.

4. In the same folder, create an XSLT stylesheet named pageBreak.xsl with the following content:

   ```xml
   <xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
                   xmlns:fo="http://www.w3.org/1999/XSL/Format" version="1.0">
     <xsl:template match="processing-instruction('pagebreak')">
       <fo:block break-after="page"/>
     </xsl:template>
   </xsl:stylesheet>
   ```

5. Install your plugin in the DITA Open Toolkit. (page 2665)
The source code for the plugin can be found on GitHub here: https://github.com/dita-community/org.dita-community.pdf-page-break.

Customizing note Images in PDF

To customize the images that appear next to each type of note in the PDF output, use a PDF customization folder (page 1887) with the following procedure:

1. Create a customization directory (page 1887) (if you haven't already done so).
2. Create a `cfg\common\vars` directory structure in your customization directory and copy the contents of `DITA-OT-DIR\plugins\org.dita.pdf2\cfg\common\vars` into that created directory.
3. Locate the `DITA-OT-DIR\plugins\org.dita.pdf2\cfg\common\vars\en.xml` file in your customization directory (for example, `custom_org.dita.pdf2\cfg\common\vars\en.xml`).
4. Create a `cfg\common\artwork` directory structure in your customization directory and add your custom notice image (for example, `Customization\cfg\common\artwork\notice.gif`).
5. Locate and edit the `Customization\cfg\common\vars\en.xml` file and modify the appropriate note element. For example, modify the path to the image for `<note>` element with the `type` attribute set to `notice` from:

   `<variable id="notice Note Image
   Path">Configuration/OpenTopic/cfg/common/artwork/important.png</variable>`

   to:

   `<variable id="notice Note Image
   Path">cfg/common/artwork/notice.gif</variable>`

6. Edit the DITA Map to PDF - based on XSL-FO (page 1403) transformation scenario, go to the Parameters tab, and set the path for the `customization.dir` property to point to the customization folder. Also, set the `com.oxygenxml.use.custom.note.images` parameter to `no`.

Show Comments and Tracked Changes in PDF Output

To include comments and tracked changes (stored within your DITA topics) in the PDF output, follow these steps:

1. Edit a DITA Map to PDF transformation scenario.
2. In the Parameters tab, set the value of the `show.changes.and.comments` parameter to `yes`.
3. Optionally, you can configure any of these other parameters to adjust the colors of the comments and tracked changes:
• **ct.insert.color** - Specifies the color for insertion type tracked changes, as a plain color (i.e. red, yellow, blue), or with a hexadecimal equivalent (i.e. #FFFFFF). The default value is 'blue'.

• **ct.delete.color** - Specifies the color for deletion type tracked changes, as a plain color (i.e. red, yellow, blue), or with a hexadecimal equivalent (i.e. #FFFFFF). The default value is 'red'.

• **ct.comment.bg.color** - Specifies the background color for comment type tracked changes, as a plain color (i.e. red, yellow, blue), or with a hexadecimal equivalent (i.e. #FFFFFF). The default value is 'yellow'.

4. Click **OK** and then the **Apply Associated** button to run the transformation scenario.

**Result:** Comment threads and tracked changes will now appear in the PDF output. Details about each comment or change will be available in the footer section for each page.

---

**Set a Font for PDF Output Generated with FO Processor**

When a **DITA map (page 2705)** is transformed to PDF using an FO processor and it contains some Unicode characters that cannot be rendered by the default PDF fonts, a font that is capable of rendering these characters must be configured and embedded in the PDF result.

The settings that must be modified for configuring a font for the built-in FO processor are detailed in **Add a Font to the Built-in FO Processor - Advanced Version (page 1481)**.

---

**DITA OT PDF Font Mapping**

The DITA OT contains a file **DITA-OT-DIR/plugins/org.dita.pdf2/cfg/fo/font-mappings.xml** that maps logical fonts used in the XSLT stylesheets to physical fonts that will be used by the FO processor to generate the PDF output.

The XSLT stylesheets used to generate the XSL-FO output contain code like this:

```xml
<xsl:attribute name="font-family">monospace</xsl:attribute>
```

The font-family is defined to be *monospace*, but *monospace* is just an alias. It is not a physical font name. Therefore, another stage in the PDF generation takes this *monospace* alias and looks in the font-mappings.xml.

If it finds a mapping like this:

```xml
<aliases>
  <alias name="monospace">Monospaced</alias>
</aliases>
```

then it looks to see if the *monospace* has a logical-font definition and if so, it will use the physical-font specified there:
### Important:

If no alias mapping is found for a font-family specified in the XSLT stylesheets, the processing defaults to **Helvetica**.

### Related Information:

---

#### Adding Libraries to the Built-in FO Processor (DITA-OT)

Starting with Oxygen XML Editor plugin version 20.0, both hyphenation and PDF image support are enabled by default in the built-in DITA-OT FO processor. For older version of Oxygen XML Editor plugin, use the following procedures to enable such support.

**Adding Hyphenation Support for DITA-OT Transformation Scenarios**

1. Download the pre-compiled **JAR (page 2707)** from OFFO.
2. Edit the DITA-OT transformation scenario and switch to the **Advanced** tab.
3. Click the **Libraries** button and add the path to the `fop-hyph.jar` library.

**Adding Support for PDF Images**

1. Download the **fop-pdf-images JAR libraries**.
2. Edit the DITA-OT transformation scenario and switch to the **Advanced** tab.
3. Click the **Libraries** button and add the path to the libraries.

**Adding Support for CGM Images**

1. Go to the **JCGM page** and download the `jcgm-image-0.1.1.jar` and `jcgm-core-0.2.0.jar` libraries.
2. Edit the DITA-OT transformation scenario and switch to the Advanced tab.
3. Click the Libraries button and add the path to the libraries.

### Debugging DITA PDF Transformations

To debug a DITA PDF transformation scenario using the XSLT Debugger follow these steps:

1. **Open the Preferences dialog box** *(page 55)*, go to XML > XML Catalog, click Add, and select the file located at `DITA-OT-DIR\plugins\org.dita.pdf2\cfg\catalog.xml`.
2. **Open the map in the DITA Maps Manager** *(page 2400)* and create a DITA Map PDF - XSL-FO transformation scenario.
3. **Edit the scenario**, go to the Parameters tab and change the value of the clean.temp parameter to no.
4. **Run the transformation scenario**.
5. **Open the stage1.xml file** located in the temporary directory and **format and indent** *(page 645)* it.
6. **Create a transformation scenario for this XML file** by associating the `topic2fo_shell_fop.xsl` stylesheet located at `DITA-OT-DIR\plugins\org.dita.pdf2\xsl\fo\topic2fo_shell_fop.xsl`. If you are specifically using the RenderX XEP or Antenna House FO processors to build the PDF output, you should use the XSL stylesheets `topic2fo_shell_xep.xsl` or `topic2fo_shell_axf.xsl` located in the same folder.
7. **In the transformation scenario** edit the XSLT Processor combo box choose the Saxon EE XSLT processor (the same processor used when the DITA OT transformation is executed).
8. **In the transformation scenario**, edit the Parameters list and set the parameter locale with the value en_GB and the parameter customizationDir.url to point either to your customization directory or to the default DITA OT customization directory. Its value should have a URL syntax like this: `file://c:/path/to/DITA-OT-DIR/plugins/org.dita.pdf2/config`. 
9. **Debug the transformation scenario**.

### Related Information:

- [Debugging XSLT Stylesheets and XQuery Documents](page 2007)
- [How to Enable Debugging for FO Processor Transformations](page 1482)

### DocBook to PDF Output Customization
When the default layout and output of the DocBook to PDF transformation needs to be customized, follow these steps:

   You should start from a copy of the file `[DocBook XSL directory]/fo/titlepage.templates.xml` and customize it. The instructions for the spec file can be found here.

   An example of spec file:

   ```xml
   <t:titlepage-content t:side="recto">
     <mediaobject/>
     <title t:named-template="book.verso.title"
           font-size="&hsize2;"
           font-weight="bold"
           font-family="{$title.font.family}"/>
     <corpauthor/>
     ...
   </t:titlepage-content>
   ```

2. Generate a new XSLT stylesheet from the title spec file from the previous step.

   Apply `[DocBook XSL directory]/template/titlepage.xsl` to the title spec file. The result is an XSLT stylesheet (for example, `mytitlepages.xsl`).

3. Import `mytitlepages.xsl` in a DocBook customization layer.

   The customization layer is the stylesheet that will be applied to the XML document. The `mytitlepages.xsl` should be imported with an element like this:

   ```xml
   <xsl:import href="dir-name/mytitlepages.xsl"/>
   ```

4. Insert a logo image in the XML document.

   The path to the logo image must be inserted in the `book/info/mediaobject` element of the XML document.

5. Apply the customization layer to the XML document.

   A quick way is to duplicate the transformation scenario `DocBook PDF` that is included with Oxygen XML Editor plugin and set the customization layer in the XSL URL property of the scenario (page 1416).

Related Information:

Video demonstration for creating a DocBook customization layer in Oxygen XML Editor plugin.
11. Working with XPath Expressions

XPath is a language for addressing specific parts of a document. XPath models an XML document as a tree of nodes. An XPath expression is a mechanism for navigating through and selecting nodes from the document. An XPath expression is, in a way, analogous to an SQL query used to select records from a database.

Note: If an XPath expression is run over a JSON document, it is converted to XML and the XPath is executed over the converted XML document.

There are various types of nodes, including element nodes, attribute nodes, and text nodes. XPath defines a way to compute a string-value for each type of node.

XPath defines a library of standard functions for working with strings, numbers and boolean expressions.

Examples:

- `child::*` - Selects all children of the root node.
- `./name` - Selects all elements having the name "name", descendants of the current node.
- `/catalog/cd[price>10.80]` - Selects all the `cd` elements that have a price element with a value larger than 10.80.

To find out more about XPath, see [http://www.w3.org/TR/xpath](http://www.w3.org/TR/xpath).

Related Information:

- Content Completion in XPath Expressions (page 966)

XPath Builder View

The XPath/XQuery Builder view allows you to compose complex XPath expressions and execute them over the currently edited XML document. For XPath 2.0 / 3.0, you can use the `doc()` function to specify the source file for which the expressions are executed. When you connect to a database, the expressions are executed over that database. If you are using the XPath/XQuery Builder view and the
current file is an XSLT document, Oxygen XML Editor plugin executes the expressions over the XML document in the associated scenario.

**Note:** If an XPath expression is run over a JSON document, it is converted to XML and the XPath is executed over the converted XML document.

If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

The upper part of the view contains the following actions:

### XPath version chooser drop-down menu
A drop-down menu that allows you to select the type of the expression you want to execute. You can choose between:

- XPath 1.0 (Xerces-driven)
- XPath 2.0, XPath 2.0SA, XPath 3.0, XPath 3.0SA, Saxon-HE XQuery, Saxon-PE XQuery, or Saxon-EE XQuery (all of them are Saxon-driven)
- Custom connection to XML databases that can execute XQuery expressions

**Note:** The results returned by XPath 2.0 SA and XPath 3.0 SA have a location limited to the line number of the start element (there are no column information and no end specified).

**Note:** Oxygen XML Editor plugin uses Saxon to execute XPath 3.0 expressions. Since Saxon implements a part of the 3.0 functions, when using a function that is not implemented, Oxygen XML Editor plugin returns a compilation error.

### Execute XPath button
Use this button to start the execution of the XPath or XQuery expression you are editing. The result of the execution is displayed in the **Results view** (page 267).

### Favorites button
Allows you to save certain expressions that you can later reuse. To add an expression as a favorite, press the star button and enter a name for it. The star turns yellow to confirm that the expression was saved. Expand the drop-down menu next to the star button to see all your favorites. Oxygen XML Editor plugin automatically groups favorites in folders named after the method of execution.

### History drop-down menu
Keeps a list of the last 15 executed XPath expressions. Use the **Clear history** action from the bottom of the list to remove them.

### Settings drop-down menu
Contains the following three options:

- **Update on cursor move**
  When selected and you navigate through a document, the XPath expression corresponding to the XML node at the current cursor position is displayed. For JSON documents, it displays the XPath expression for the current property.

- **Evaluate as you type**
  When you select this option, the XPath expression you are composing is evaluated in real time.

  **Note:** This option and the automatic validation are disabled when the scope is other than **Current file**.

- **Options**
  Opens the Preferences page of the currently selected processing engine.

**XPath scope menu**

Oxygen XML Editor plugin allows you to define a scope for which the XPath operation will be executed. You can choose where the XPath expression will be executed:

- **Current file** - Current selected file only.
- **Enclosing project** - All the files of the project that encloses the current edited file.
- **Workspace selected files** - The files selected in the workspace. The files are collected from the last selected resource provider view (Navigator (page 250), Project Explorer or Package Explorer).
- **All opened files** - All files opened in the application.
- **Current DITA Map hierarchy** - All resources referenced in the currently selected DITA map, opened in the DITA Maps Manager view (page 2400).
- **Opened archive** - Files open in the Archive Browser view (page 1910).
- **Working sets** - The selected working sets (page 2712).

At the bottom of the scope menu the following scope configuration actions are available:

- **Configure XPath working sets** - Allows you to configure and manage collections of files and folders, encapsulated in logical containers called working sets (page 2712).
- **XPath file filter** - You can filter the files from the selected scope for which the XPath expression will be executed. By default, the XPath expression will be
executed only on XML or JSON files, but you can also define a set of patterns that will filter out files from the current scope.

Figure 587: XPath/XQuery Builder View

When you hover your cursor over the version icon, a tooltip is displayed to let you know what engine Oxygen XML Editor plugin currently uses.

While you edit an XPath or XQuery expression, Oxygen XML Editor plugin assists you with the following features:

- **Content Completion Assistant (page 2704)** - It offers context-dependent proposals and takes into account the cursor position in the document you are editing. The set of functions proposed by the Content Completion Assistant also depends on the engine version. Select the engine version from the drop-down menu available in the toolbar.

- **Syntax Highlighting** - Allows you to identify the components of an expression. To customize the colors of the components of the expression, open the Preferences dialog box (page 55) and go to Editor > Syntax Highlight (page 149).

- Automatic validation of the expression as you type.
Note: When you type invalid syntax, a red serrated line underlines the invalid fragments.

- Function signature and documentation balloon, when the cursor is located inside a function.

Related Information:

- XPath Expression Results View (page 1906)

XPath Expression Results View

When you run an XPath expression, Oxygen XML Editor plugin displays the results of its execution in the XPath Results view.

This view contains the following columns:

- **Description** - The result that Oxygen XML Editor plugin displays when you run an XPath expression.
- **XPath location** - The path to the matched node.
- **Resource** - The name of the document that you run the XPath expression on.
- **System ID** - The path to the document itself.
- **Location** - The location of the result in the document.

To arrange the results depending on a column, click its header. If no information regarding location is available, Oxygen XML Editor plugin displays Not available in the Location column. Oxygen XML Editor plugin displays the results in a valid XPath expression format.

```
/node[value]/node[value]/node[value]
```

XPath Results View Contextual Menu Actions

The following actions are available when the contextual menu is invoked in this view:

- **Select All**
  
  Extends the selection to all the messages from the view.

- **Copy**
  
  Copies information associated with the selected messages in case you want to paste it elsewhere.

- **Save Results**
Saves the complete list of messages in a file in text format. For each message, the included details are the same as the ones for the Copy action (page 1906).

**Save Results as XML**

Saves the complete list of messages in a file in XML format. For each message, the included details are the same as the ones for the Copy action (page 1906).

**Save Results as HTML**

Saves the complete list of messages in a file in HTML format. For each message, the included details are the same as the ones for the Copy action (page 1906).

**Example:**

The following snippets are taken from a DocBook book based on the DocBook XML DTD. The book contains a number of chapters. To return all the chapter nodes of the book, enter `//chapter` in the XPath expression field and press (Enter). This action returns all the chapter nodes of the DocBook book in the Results View. Click a record in the Results View to locate and highlight its corresponding chapter element and all its children nodes in the document you are editing.

To find all example nodes contained in the sect2 nodes of a DocBook XML document, use the following XPath expression: `//chapter/sect1/sect2/example`. Oxygen XML Editor plugin adds a result in the Results View for each example node found in any sect2 node.

For example, if the result of the above XPath expression is:

```
- /chapter[1]/sect1[3]/sect2[7]/example[1]
```

it means that in the edited file, the example node is located in the first chapter, third section level one, seventh section level 2.

*Figure 588: XPath Results Highlighted in Editor Panel with Character Precision*
XPath and XML Catalogs

The evaluation of the XPath expression tries to resolve the locations of documents referenced in the expression through XML Catalogs (page 2712). These catalogs are configured in the XML Catalog preferences (page 171) pages and the XML Parser preferences (page 173).

Example:

As an example, consider the evaluation of the collection(URIofCollection) function (XPath 2.0). To resolve the references from the files returned by the collection() function with an XML catalog, specify the class name of the catalog-enabled parser for parsing these collection files. The class name is ro.sync.xml.parser.CatalogEnabledXMLReader. Specify it as it follows:

```xml
let $docs := collection(iri-to-uri("file:///D:/temp/test/XQuery-catalog/mydocsdir?recurse=yes;select=*.xml;parser=ro.sync.xml.parser.CatalogEnabledXMLReader"))
```

XPath Prefix Mapping

To define default mappings between prefixes and namespace URIs go to the XPath preferences page (page 184) and enter the mappings in the Default prefix-namespace mappings table. The same preferences panel allows you to configure the default namespace used in XPath 2.0 expressions.

⚠️ Important: If you define a default namespace, Oxygen XML Editor plugin binds this namespace to the first free prefix from the list: default, default1, default2, and so on. For example, if you define
the default namespace `xmlns="something"` and the prefix `default` is not associated with another namespace, you can match tags without prefix in an XPath expression typed in the XPath toolbar by using the prefix `default`. To find all the `level` elements when you define a default namespace in the root element, use this expression: `//default:level` in the XPath toolbar.
12. Working with Archives

Oxygen XML Editor plugin includes a useful Archive Browser view (page 1910) that offers the means to work with files directly from various types of archives (for example, opening and saving files directly in archives, or browsing and modifying archive structures). The archive support is available for all ZIP-type archives, including:

- ZIP archives
- EPUB books
- JAR archives (page 2707)
- Office Open XML (OOXML) files
- Open Document Format (ODF) files
- IDML files (page 2707)

You can transform, validate, and perform many other operations on files directly from an archive. For instance, you can transform, or validate files directly from OOXML or ODF packages, and the structure and content of the ZIP archives can be opened, edited, and saved, similar to any other ZIP archive browsing tool. Also, when browsing for a URL in various dialog boxes, you can use the Browse for archived file action to browse and select files from a particular archive.

For more information about working with an EPUB archive in Oxygen XML Editor plugin, watch our video demonstration:

https://www.youtube.com/embed/OIGTNQwOCl8

Browsing Archives

To view the contents and structure of an archive, use one of the following methods:

- Open an archive from the Navigator view (page 250). This will open the archive in the main editing pane. The archive will be unmounted when the editor is closed.
- Use the Eclipse File System (EFS) by right-clicking the archive in the Navigator view and choosing Expand Zip Archive. This will expand the archive in the Navigator view. All the standard Navigator actions are available on the mounted archive. To close the archive, you can use the Collapse ZIP
Archive action and any file opened from the expanded archive will be closed when the archive in unmounted.

**Tip:** If a file is not recognized by Oxygen XML Editor plugin as a supported archive type, you can add it from the Archive preferences page (page 57).

*Figure 589: Browsing an Archive*

### Archive Contextual Menu Actions

The following additional actions are available from the contextual menu for archives:

- **Open**
  
  Opens a resource from the archive in the editor.

- **Extract**
  
  Extracts a resource from the archive in a specified folder.

- **New folder**
  
  Creates a folder as child of the selected folder in the browsed archive.

- **New file**
  
  Creates a file as child of the selected folder in the browsed archive.

- **Add files**
  
  Adds existing files as children of the selected folder in the browsed archive.

  **Note:** On OS X, the *Add file* action is also available and it allows you to add one file at a time.

- **Rename**
  
  Renames a resource in the archive.
Cut
Cuts the selected archive resource.

Copy
Copies the selected archive resource.

Paste
Paste a file or folder into the archive.

Delete
Removes a file or folder from archive.

Copy location
Copies the URL location of the selected resource.

Refresh
Refreshes the selected resource.

Properties
Shows the properties of the selected resource.

For more information, watch our video demonstration about working with an EPUB in the Archive Browser view:

https://www.youtube.com/embed/OIGTNQw0Ci8

Working with Archive Files

Oxygen XML Editor plugin includes support for working with various types of archives, including the following:

- **EPUB** - An e-book file format that can be used on many types of devices, such as smart phones, tablets, e-readers, or computers.
- **OOXML** - An XML-based file format for representing spreadsheets, charts, presentations, and word processing documents.
- **ODF** - An free and open-source XML-based file format for electronic office documents, such as spreadsheets, charts, presentations, and word processing documents.

When these types of files are opened in the Navigator view or the main editing pane, their internal components are expanded:

- Document content (XHTML and image files).
• Packaging files.
• Container files.

![Figure 590: EPUB File Displayed in Eclipse]

When an archive is expanded, you can add or delete files that compose the archive structure. All changes made to the structure of an archive are saved immediately. You can open files from within the archive to edit them in the main editing pane and save changes (page 1914) back to the archive. You can also use the Open in System Application action to open the archive in the default system application that is associated with that type of file.

**EPUB-Specific Validation**

When working with EPUB archives, Eclipse includes a Validate action on the toolbar that checks the EPUB archive to make sure the structure and content are valid. Oxygen XML Editor plugin uses the open-source EpubCheck validator to perform the validation. This validator detects many types of errors, including OCF container structure, OPF and OPS mark-up, as well as internal reference consistency.

For more information about working with an EPUB archive in Oxygen XML Editor plugin, watch our video demonstration:
Creating an Archive

To create an archive from scratch, follow these steps:

1. Go to File > New > New from Templates.

2. Choose your particular type of archive template. For example, select one of the ODF, OOXML, or EPUB templates.

3. Click Next and choose the name and location of the file.

4. Click Finish.
   A skeleton archive is saved on disk and opened in Eclipse.

   Tip: Use toolbar and contextual menu actions to edit, add, and remove resources from the archive. For EPUB archives, you can use the Validate action to verify the integrity of the EPUB archive.

Editing and Saving Files Inside an Archive

You can open files directly from an archive and then edit them in the main editor pane. To open a file, simply double-click it or select Open from the contextual menu.

When saving the file back to the archive, you are prompted to choose if you want the application to make a backup copy of the archive before saving the new content. If you choose Never ask me again, you will not be asked again to make backup copies. You can re-enable the pop-up message from the Archive preferences page (page 57).

Migrating Archives to DITA or TEI
Certain types of archives can be converted to DITA or TEI. For example, OOXML (Office Open XML) archive files with the DOCX file extension can be migrated to DITA or TEI.

To migrate DOCX files to DITA or TEI, follow these steps:

1. Open and expand the archive in Eclipse.
2. Open the document.xml file contained in the archive.
3. Run one of the following built-in transformation scenarios:
   a. DOCX DITA to migrate to DITA.
   b. DOCX TEI P5 to migrate to TEI.
4. You may need to do some manual reconfiguring to map DOCX styles to DITA or TEI content.

**Tip:** Oxygen XML Editor plugin also includes a built-in transformation scenario called ODT TEI P5 for converting ODF archive files with the ODT file extension to TEI and a similar process can be used to migrate ODT files to TEI.
13.

Databases and SharePoint

Oxygen XML Editor plugin provides support for connecting and integrating with various databases and Microsoft SharePoint. This section includes information about the database-related features in Oxygen XML Editor plugin. It explains how to connect with the supported databases, presents the actions that are available for each type, and includes information about SharePoint integration.

Working with Databases

XML is a storage and interchange format for structured data and is supported by all major database systems. Oxygen XML Editor plugin offers the means for managing the interaction with some of the most commonly used databases (both Relational and Native XML databases). Through this interaction, Oxygen XML Editor plugin helps users with browsing, content editing, importing from databases, using XQuery with databases, SQL execution, and generating XML Schema from a database structure.

The types of connections that are supported in Oxygen XML Editor plugin include:

- IBM DB2 (page 1923)
- Microsoft SQL Server (page 1927)
- Oracle Database (page 1931)
- PostgreSQL (page 1937)
- Berkeley DB XML (page 1942)
- eXist (page 1948)
- MarkLogic (page 1953)
- MySQL (page 1963)
- Generic JDBC (page 1966)
- JDBC-ODBC (page 1968)
- BaseX (page 1969)
- WebDAV (page 1974)
- Microsoft SharePoint (page 1988)
Data Source Explorer View

The **Data Source Explorer** view displays your database connections. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

You can connect to a database simply by expanding the connection node (click the connection). The database structure can be expanded to resource level, or even all the way to column level for tables inside relational databases. Oxygen XML Editor plugin supports multiple simultaneous database connections and the connection tree in the **Data Source Explorer** view provides an easy method for browsing them.

![Data Source Explorer View](image)

The objects (nodes) that are displayed in the **Data Source Explorer** view depend on the connection type and structure of the database. Various contextual menu actions are available for each hierarchical level and for some connections you can add or move resources in a container by simply dragging them from the **Navigator view** (page 250), a file browsing application, or another database.

**Toolbar Actions**

The following actions are available in the toolbar of this view:

- **Filters**
Opens the **Data Sources / Table Filters** preferences page *(page 65)*, allowing you to decide which table types are displayed in the **Data Source Explorer** view.

**Configure Database Sources**

Opens the **Data Sources preferences page** *(page 60)* where you can configure both data sources and connections.

### Database-Specific Contextual Menu Actions

Each specific type of database will also include its own specific contextual menu actions in the **Data Source Explorer** view. The actions depend on the type of database, the type of node, or the hierarchical level of the node in which the contextual menu is invoked.

For more information on the specific actions that are available, see the topics in this section for each specific type of database.

**Related Information:**

- **Data Sources Preferences (page 60)**

### Table Explorer View

Relational databases tables in the **Data Source Explorer view** *(page 1917)* can be displayed and edited in the **Table Explorer** view by selecting the **Edit** action from the contextual menu of a **Table** node or by double-clicking one of its fields. To modify the content of a cell, double-click it and start typing. When editing is complete, Oxygen XML Editor plugin attempts to update the database with the new cell content.

*Figure 592: Table Explorer View*
You can sort the content of a table by one of its columns by clicking its column header.

Note the following:

- The first column is an index (not part of the table structure).
- Every column header contains the field name and its data type.
- The primary key columns are marked with this symbol: ⬤ .
- Multiple tables are presented in a tabbed manner.

For performance issues, you can set the maximum number of cells that are displayed in the Table Explorer view (using the Limit the number of cells option in the Data Sources Preferences page (page 64)). If a table that has more cells than the value set in the options is displayed in the Table Explorer view, a warning dialog box informs you that the table is only partially shown.

You are notified if the value you have entered in a cell is not valid (and thus cannot be updated).

- If the content of the edited cell does not belong to the data type of the column, an information dialog box appears, notifying you that the value you have inserted cannot be converted to the SQL type of that field. For example, if you have a column that contains LONG (numerical) values, and a character or string is inserted into one of its cells, you would get the error message that a string value cannot be converted to the requested SQL type (NUMBER).
- If the constraints of the database are not met (for instance, primary key constraints), an information dialog box will appear, notifying you of the reason the database has not been updated. For example, in the table below, trying to set the second record in the primary key propID column to 8, results in a duplicate entry error since that value has already been used in the first record:

![Figure 593: Duplicate Entry for Primary Key](image)
Table Explorer Contextual Menu Actions

Common editing actions (Cut, Copy, Paste, Select All, Undo, Redo) are available in the contextual menu of an edited cell.

The contextual menu, available on every cell in the Table Explorer view, also includes the following actions:

Set NULL

Sets the content of the cell to null. This action is not available for columns that cannot have a value of null.

Insert row

Inserts an empty row in the table.

Duplicate row

Makes a copy of the selected row and adds it in the Table Explorer view. Note that the new row will not be inserted in the database table until all conflicts are resolved.

Commit row

Commits the selected row.

Delete row

Deletes the selected row.

Copy

Copies the content of the cell.

Paste
Pastes copied content into the selected cell.

**Table Explorer Toolbar Actions**

The toolbar of the **Table Explorer** view also includes the following actions:

- **Export to XML**
  
  Opens the **Export Criteria** dialog box (a thorough description of this dialog box can be found in the [Import from database](page 1999) chapter).

- **Refresh**
  
  Performs a refresh for the sub-tree of the selected node.

- **Insert row**
  
  Inserts an empty row in the table.

- **Duplicate row**
  
  Makes a copy of the selected row and adds it in the **Table Explorer** view. Note that the new row will not be inserted in the database table until all conflicts are resolved.

- **Commit row**
  
  Commits the selected row.

- **Delete row**
  
  Deletes the selected row.

**Related Information:**

- Data Source Explorer View (page 1917)

**Database Connection Support**

Oxygen XML Editor plugin offers support for a variety of **Relational** and **Native XML** database connections. The database drivers and connections for various types of database are configured in the **Data Sources** preferences page (page 60) and once configured, the database connections can be viewed and managed in the **Data Source Explorer** view (page 1917). Oxygen XML Editor plugin also includes a **Database perspective** (page 220) that helps you to manage databases.

The database support in Oxygen XML Editor plugin offers a variety of capabilities, including:
• Browsing the structure of databases in the Data Source Explorer view (page 1917).
• Viewing relational tables in the Table Explorer view (page 1918).
• Executing SQL queries against databases.
• Calling stored procedures with input and output parameters.
• XQuery execution with databases.
• Exporting data from databases to XML.

Relational Database Support

Relational databases use a relational model and are based on tables linked by a common key. Oxygen XML Editor plugin offers support for the most commonly used relational databases, including:

• IBM DB2
• Oracle 11g
• Microsoft SQL Server
• PostgreSQL
• MySQL

Oxygen XML Editor plugin also offers generic support (table browsing and execution of SQL queries) for any JDBC-compliant database (for example, MariaDB).

Native XML Database Support

Native XML databases have an XML-based internal model and their fundamental unit of storage is XML. They use XML as an interface to specify documents as tree structured data that may contain unstructured text, but on disk the data is stored as optimized binary files. This makes query and retrieval processes faster. Oxygen XML Editor plugin offers support for the most commonly used native XML databases, including:

• Berkeley DB XML
• eXist
• MarkLogic
• Oracle XML DB
• Base X

Related Information:

• WebDAV Connections (page 1974)
IBM DB2 Database Connections

Oxygen XML Editor plugin includes support for IBM DB2 database connections. Oxygen XML Editor plugin allows you to browse the structure of an IBM DB2 database in the **Data Source Explorer view** (page 1917), open tables in the **Table Explorer view** (page 1918), and perform various operations on the resources in the repository.

**Figure 594: IBM DB2 Database Connection**

Configuring an IBM DB2 Database Connection

To configure the support for the IBM DB2 database, follow this procedure:

1. Go to the [IBM website](http://www.ibm.com) and in the **DB2 Clients and Development Tools** category select the **DB2 Driver for JDBC and SQLJ** download link. Fill out the download form and download the zip file. Unzip the zip file and use the `db2jcc.jar` and `db2jcc_license_cu.jar` files in Oxygen XML Editor plugin for configuring a DB2 data source (page 1924).
2. Configure IBM DB2 **Data Source drivers** (page 1924).
3. Configure an IBM DB2 Server **Connection** (page 1925).
4. To view your connection, go to the **Data Source Explorer view** (page 1917) (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database perspective** (page 2709).
How to Configure IBM DB2 Data Source Drivers

Available in the Enterprise edition only.

To configure a data source for connecting to an IBM DB2 server, follow these steps:

1. Go to the IBM website and in the DB2 Clients and Development Tools category select the DB2 Driver for JDBC and SQLJ download link. Fill out the download form and download the zip file.

2. Unzip the downloaded archive.

3. Open the Preferences dialog box (page 55) and go to Data Sources.

4. Click the New button in the Data Sources panel.

   The dialog box for configuring a data source is opened.

5. Enter a unique name for the data source.

6. Select DB2 in the driver Type drop-down menu.

7. Click the Add Files button and select the IBM DB2 driver files from the archive that you downloaded and unzipped.
The IBM DB2 driver files are:
- db2jcc.jar
- db2jcc_license_cisuz.jar
- db2jcc_license_cu.jar

8. Select the most appropriate **Driver class.**

9. Click the **OK** button to finish the data source configuration.

10. Continue on to configure your IBM DB2 connection (**page 1925**).

How to Configure an IBM DB2 Connection

The support to create an IBM DB2 connection is available in the Enterprise edition only.

To configure a connection to an IBM DB2 server, follow these steps:

1. Open the **Preferences** dialog box (**page 55**) and go to **Data Sources**.

2. Click the **New** button in the **Connections** panel.

   The dialog box for configuring a database connection is displayed.

   **Figure 596: Connection Configuration Dialog Box**

3. Enter a unique name for the connection.
4. Select an **IBM DB2** data source in the **Data Source** drop-down menu.

5. Enter the connection details.
   a. Enter the URL to the installed IBM DB2 engine.
   b. Enter the user name to access the IBM DB2 engine.
   c. Enter the password to access the IBM DB2 engine.

6. Click the **OK** button to finish the connection configuration.

7. To view your connection, go to the **Data Source Explorer view** *(page 1917)* (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database perspective** *(page 2709)*.

---

**IBM DB2 Contextual Menu Actions**

### General Contextual Menu Actions

For relational databases, the following general actions are available in the contextual menu of the **Data Source Explorer view** *(page 1917)*, depending on the node in which it is invoked:

- **Refresh**
  
  Performs a refresh on the selected node.

- **Disconnect (available on Connection nodes)**
  
  Closes the current database connection. If a table is already open, you are warned to close it before proceeding.

- **Configure Database Sources (available on Connection nodes)**
  
  Opens the **Data Sources preferences page** *(page 60)* where you can configure both data sources and connections.

- **Edit (available on Table nodes)**
  
  Opens the selected table in the **Table Explorer view** *(page 1918)*.

- **Export to XML (available on Table nodes)**
  
  Opens the **Export Criteria** dialog box *(a thorough description of this dialog box can be found in the **Import from Database** *(page 1999)* chapter)*.

### Database-Specific Contextual Menu Actions

In addition to the general contextual menu actions in the **Data Source Explorer view** *(page 1917)*, the various nodes in IBM DB2 connections include the following additional contextual menu actions:
**Oxygen XML Editor Eclipse Plugin 21.0 User Guide | 13 - Databases and SharePoint | 1927**

**XML Schema Repository Level Nodes**

**Register**
Opens a dialog box for adding a new schema file in the DB XML repository. In this dialog box, you enter a collection name and the necessary schema files. Schema dependencies management can be done by using the **Add** and **Remove** buttons.

**Schema Level Nodes**

**Unregister**
Removes the selected schema from the XML Schema Repository.

**View**
Opens the selected schema in Oxygen XML Editor plugin.

**Microsoft SQL Server Database Connections**

Oxygen XML Editor plugin includes support for Microsoft SQL Server database connections. Oxygen XML Editor plugin allows you to browse the structure of a SQL Server database in the **Data Source Explorer view** (page 1917), open tables in the **Table Explorer view** (page 1918), and perform various operations on the resources in the repository.

**Configuring a Microsoft SQL Server Connection**

To configure the support for a Microsoft SQL Server database, follow this procedure:

2. Configure MS SQL Server Data Source drivers (page 1927).
3. Configure a MS SQL Server Connection (page 1929).
4. To view your connection, go to the **Data Source Explorer view** (page 1917) (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database perspective** (page 2709).

**How to Configure Microsoft SQL Server Data Source Drivers**

Available in the Enterprise edition only.

To configure a data source for connecting to a Microsoft SQL server, follow these steps:

2. Open the Preferences dialog box (page 55) and go to Data Sources.

3. Click the + New button in the Data Sources panel.

   The dialog box for configuring a data source is opened.

   **Figure 597: Data Source Drivers Configuration Dialog Box**

4. Enter a unique name for the data source.

5. Select SQLServer in the driver Type drop-down menu.

6. Click the Add Files button and select the Microsoft SQL Server driver file that you downloaded.
   
   The SQL Server driver file is called sqljdbc.jar.

7. Select the most appropriate Driver class.

8. Click the OK button to finish the data source configuration.

9. Continue on to configure your Microsoft SQL Server connection (page 1929).
How to Configure a Microsoft SQL Server Connection

The support to configure a Microsoft SQL Server connection is available in the Enterprise edition only.

To configure a connection to a Microsoft SQL Server, follow these steps:

1. Open the Preferences dialog box (page 55) and go to Data Sources.

2. Click the New button in the Connections panel.

   The dialog box for configuring a database connection is displayed.

   ![Connection Configuration Dialog Box]

3. Enter a unique name for the connection.

4. Select the SQL Server data source in the Data Source drop-down menu.

5. Enter the connection details.

   a. Enter the URL of the SQL Server server.

      If you want to connect to the server using Windows integrated authentication, you must add ;integratedSecurity=true to the end of the URL. The URL will look like this:

      ```
      jdbc:sqlserver://localhost;instanceName=SQLEXPRESS;integratedSecurity=true;
      ```

   Note: For integrated authentication, leave the User and Password fields empty.
b. Enter the user name for the connection to the SQL Server.

c. Enter the password for the connection to the SQL Server.

6. Click the **OK** button to finish the connection configuration.

7. To view your connection, go to the **Data Source Explorer view** *(page 1917)* (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database perspective** *(page 2709)*.

**Microsoft SQL Server Contextual Menu Actions**

**General Contextual Menu Actions**

For relational databases, the following general actions are available in the contextual menu of the **Data Source Explorer view** *(page 1917)*, depending on the node in which it is invoked:

- **Refresh**
  
  Performs a refresh on the selected node.

- **Disconnect** *(available on Connection nodes)*
  
  Closes the current database connection. If a table is already open, you are warned to close it before proceeding.

- **Configure Database Sources** *(available on Connection nodes)*
  
  Opens the **Data Sources preferences page** *(page 60)* where you can configure both data sources and connections.

- **Edit** *(available on Table nodes)*
  
  Opens the selected table in the **Table Explorer view** *(page 1918)*.

- **Export to XML** *(available on Table nodes)*
  
  Opens the **Export Criteria** dialog box (a thorough description of this dialog box can be found in the **Import from Database** *(page 1999)* chapter).

**Database-Specific Contextual Menu Actions**

In addition to the general contextual menu actions in the **Data Source Explorer view** *(page 1917)*, the resource level nodes in Microsoft SQL Server connections include the following additional contextual menu action:

- **XML Schema Repository Level Nodes**
Register

Opens a dialog box for adding a new schema file in the DB XML repository. In this dialog box, you enter a collection name and the necessary schema files. Schema dependencies management can be done by using the Add and Remove buttons.

**Schema Level Nodes**

Add

Adds a new schema to the XML Schema files.

Unregister

Removes the selected schema from the XML Schema Repository.

View

Opens the selected schema in Oxygen XML Editor plugin.

Oracle Database Connections

The Oracle database is a common relational type of database system. Oxygen XML Editor plugin comes with built-in support for the 11g version of the database system. The Oracle database also includes a Oracle XML DB component that adds native XML support. Oxygen XML Editor plugin allows you to browse Oracle repositories in the Data Source Explorer view (page 1917), open tables in the Table Explorer view (page 1918), and perform various operations on the resources in the repository.

*Figure 599: Oracle Database Connection*
Configuring an Oracle 11g Database Connection

To configure the support for a Oracle 11g database, follow this procedure:

2. Configure Oracle 11g Data Source drivers (page 1932).
3. Configure an Oracle 11g Connection (page 1933).
4. To view your connection, go to the Data Source Explorer view (page 1917) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (page 2709).

How to Configure Oracle 11g Data Source Drivers

Available in the Enterprise edition only.

To configure a data source for connecting to an Oracle 11g server, follow these steps:

2. Open the Preferences dialog box (page 55) and go to Data Sources.
3. Click the New button in the Data Sources panel.

The dialog box for configuring a data source is opened.

*Figure 600: Data Source Drivers Configuration Dialog Box*
4. Enter a unique name for the data source.

5. Select Oracle in the driver Type drop-down menu.

6. Click the Add Files button and select the Oracle driver file that you downloaded. The Oracle driver file is called ojdbc5.jar.

7. Select the most appropriate Driver class.

8. Click the OK button to finish the data source configuration.

9. Continue on to configure your Oracle connection (page 1933).

How to Configure an Oracle 11g Connection

Available in the Enterprise edition only.

To configure a connection to an Oracle 11g server, follow these steps:

1. Open the Preferences dialog box (page 55) and go to Data Sources.

2. Click the + New button in the Connections panel.

   The dialog box for configuring a database connection is displayed.

   Figure 601: Connection Configuration Dialog Box
3. Enter a unique name for the connection.

4. Select the *Oracle 11g* data source in the *Data Source* drop-down menu.

5. Enter the connection details.
   a. Enter the URL of the Oracle server.
   b. Enter the user name for the connection to the Oracle server.
   c. Enter the password for the connection to the Oracle server.

6. Click the **OK** button to finish the connection configuration.

7. To view your connection, go to the *Data Source Explorer view* *(page 1917)* (if the view is not displayed, it can be opened by selecting it from the *Window > Show View* menu) or switch to the *Database perspective* *(page 2709).*

**Oracle Database Contextual Menu Actions**

**General Contextual Menu Actions**

For relational databases, the following general actions are available in the contextual menu of the *Data Source Explorer view* *(page 1917)*, depending on the node in which it is invoked:

- **Refresh**
  
  Performs a refresh on the selected node.

- **Disconnect** *(available on Connection nodes)*
Closes the current database connection. If a table is already open, you are warned to close it before proceeding.

Configure Database Sources (available on Connection nodes)

Opens the Data Sources preferences page (page 60) where you can configure both data sources and connections.

Edit (available on Table nodes)

Opens the selected table in the Table Explorer view (page 1918).

Export to XML (available on Table nodes)

Opens the Export Criteria dialog box (a thorough description of this dialog box can be found in the Import from Database (page 1999) chapter).

Database-Specific Contextual Menu Actions

In addition to the general contextual menu actions in the Data Source Explorer view (page 1917), the various nodes in Oracle database connections include the following additional contextual menu actions:

Register

Opens a dialog box for adding a new schema file in the XML repository. To add an XML Schema, enter the schema URI and location on your file system. Local scope means that the schema is visible only to the user who registers it. Global scope means that the schema is public.

Note: Registering a schema may involve dropping/creating types. Hence you need type-related privileges such as DROP TYPE, CREATE TYPE, and ALTER TYPE. You need privileges to delete and register the XML schemas involved in the registering process. You need all privileges on XMLType tables that conform to the registered schemas. For XMLType columns, the ALTER TABLE privilege is needed on corresponding tables. If there are schema-based XMLType tables or columns in other database schemas, you need privileges such as the following:

- CREATE ANY TABLE
- CREATE ANY INDEX
- SELECT ANY TABLE
- UPDATE ANY TABLE
- INSERT ANY TABLE
• DELETE ANY TABLE
• DROP ANY TABLE
• ALTER ANY TABLE
• DROP ANY INDEX

To avoid having to grant all these privileges to the schema owner, Oracle recommends that the registration be performed by a DBA if there are XML schema-based XMLType table or columns in other user database schemas.

XML Repository Level Nodes

Add container

Adds a new child container to the current one.

Add resource

Adds a new resource to the folder.

Container Level Nodes

Add container

Adds a new child container to the current one.

Add resource

Adds a new resource to the folder.

Delete

Deletes the current container.

Properties

Shows various properties of the current container.

Resource Level Nodes

Open

Opens the selected resource in the editor.

Open in System Application

When you use this action, Oxygen XML Editor plugin downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the Data Source
Explorer view, Oxygen XML Editor plugin will detect that there was a change and will ask if you want to upload the edited resource to the server.

**Rename**

Renames the current resource

**Move**

Moves the current resource to a new container (also available through drag and drop).

**Delete**

Deletes the current container.

**Copy location**

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

**Properties**

Shows various properties of the current container.

**Compare**

Compares two selected resources.

PostgreSQL Database Connections

Oxygen XML Editor plugin includes support for PostgreSQL database connections. Oxygen XML Editor plugin allows you to browse the structure of a PostgreSQL database in the Data Source Explorer view (page 1917), open tables in the Table Explorer view (page 1918), and perform various operations on the resources in the repository.

*Figure 602: PostgreSQL Database Connection*
Configuring a PostgreSQL Database Connection

To configure the support for a PostgreSQL database, follow this procedure:

1. Go to http://jdbc.postgresql.org/download.html and download the PostgreSQL 8.3 JDBC3 driver.
2. Configure PostgreSQL Data Source drivers (page 1938).
3. Configure a PostgreSQL Connection (page 1940).
4. To view your connection, go to the Data Source Explorer view (page 1917) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (page 2709).

How to Configure PostgreSQL 8.3 Data Source Drivers

To configure a data source for connecting to a PostgreSQL server, follow these steps:

1. Go to http://jdbc.postgresql.org/download.html and download the PostgreSQL 8.3 JDBC3 driver.
2. Open the Preferences dialog box (page 55) and go to Data Sources.
3. Click the New button in the Data Sources panel.

   The dialog box for configuring a data source is opened.

   *Figure 603: Data Source Drivers Configuration Dialog Box*
4. Enter a unique name for the data source.

5. Select *PostgreSQL* in the driver **Type** drop-down list.
6. Click the **Add Files** button and select the PostgreSQL driver file that you downloaded. The PostgreSQL driver file is called `postgresql-8.3-603.jdbc3.jar`.

7. Select the most appropriate **Driver class**.

8. Click the **OK** button to finish the data source configuration.

9. Continue on to configure your PostgreSQL connection (page 1940).

**How to Configure a PostgreSQL 8.3 Connection**

To configure a connection to a PostgreSQL 8.3 server, follow these steps:

1. Open the **Preferences** dialog box (page 55) and go to **Data Sources**.

2. Click the **+ New** button in the **Connections** panel.

   The dialog box for configuring a database connection is displayed.

   *Figure 605: Connection Configuration Dialog Box*

3. Enter a unique name for the connection.

4. Select the **PostgreSQL 8.3** data source in the **Data Source** drop-down menu.

5. Enter the connection details.
   a. Enter the URL of the PostgreSQL 8.3 server.
b. Enter the user name for the connection to the PostgreSQL 8.3 server.
c. Enter the password for the connection to the PostgreSQL 8.3 server.

6. Click the OK button to finish the connection configuration.

7. To view your connection, go to the Data Source Explorer view (page 1917) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (page 2709).

PostgreSQL Contextual Menu Actions

General Contextual Menu Actions

For relational databases, the following general actions are available in the contextual menu of the Data Source Explorer view (page 1917), depending on the node in which it is invoked:

- **Refresh**
  Performs a refresh on the selected node.

- **Disconnect (available on Connection nodes)**
  Closes the current database connection. If a table is already open, you are warned to close it before proceeding.

- **Configure Database Sources (available on Connection nodes)**
  Opens the Data Sources preferences page (page 60) where you can configure both data sources and connections.

- **Edit (available on Table nodes)**
  Opens the selected table in the Table Explorer view (page 1918).

- **Export to XML (available on Table nodes)**
  Opens the Export Criteria dialog box (a thorough description of this dialog box can be found in the Import from Database (page 1999) chapter).

Database-Specific Contextual Menu Actions

In addition to the general contextual menu actions in the Data Source Explorer view (page 1917), the resource level nodes in PostgreSQL connections include the following additional contextual menu action:

- **Resource Level Nodes**
  Compare
Compares two selected resources.

Berkeley DB XML Database Connections

Oxygen XML Editor plugin includes support for Berkeley DB XML database connections. Oxygen XML Editor plugin allows you to browse the structure of a Berkeley DB XML database in the Data Source Explorer view (page 1917) and perform various operations on the resources in the repository.

Oracle Berkeley DB XML is an open source, embeddable XML database with XQuery-based access to documents stored in containers and indexed based on their content. It is built on top of the Oracle Berkeley DB and inherits its features and attributes, along with native XML support. A detailed description can be found at: http://www.oracle.com/us/products/database/berkeley-db/xml/overview/index.html.

Figure 606: Berkeley DB XML Connection

Configuring a Berkeley DB XML Database Connection

Follow this procedure to configure the support for a Berkeley DB XML database:

2. Configure a Berkeley DB XML Connection (page 1943).
3. To view your connection, go to the Data Source Explorer view (page 1917) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (page 2709).

How to Configure Berkeley DB XML Data Source Drivers

For this procedure, you need to already have a Berkeley DB XML database installed on your system.
Oxygen XML Editor plugin supports Berkeley DB XML versions 2.3.10, 2.4.13, 2.4.16 & 2.5.16. To configure a data source for a Berkeley DB XML database, follow these steps:

1. **Open the Preferences dialog box (page 55)** and go to Data Sources.

2. Click the **New** button in the Data Sources panel.

3. Enter a unique name for the data source.

4. Select **Berkeley DBXML** from the driver **Type** drop-down menu.

5. Click the **Add Files** button to add the Berkeley DB driver files.

   The driver files for the Berkeley DB database (and their locations) are as follows:
   - db.jar (check for it in [DBXML_DIR]/lib or [DBXML_DIR]/jar)
   - dbxml.jar (check for it in [DBXML_DIR]/lib or [DBXML_DIR]/jar)

   Where [DBXML_DIR] is the Berkeley DB XML database root directory. For example, in Windows it is: C:\Program Files\Oracle\Berkeley DB XML <version>.

6. Click the **OK** button to finish the data source configuration.

7. Continue on to configure your Berkeley DB XML connection (page 1943).

How to Configure a Berkeley DB XML Connection

Oxygen XML Editor plugin supports Berkeley DB XML versions 2.3.10, 2.4.13, 2.4.16 & 2.5.16. To configure a connection to a Berkeley DB XML database, follow these steps:

1. **Open the Preferences dialog box (page 55)** and go to Data Sources.

2. Click the **New** button in the Connections panel.

3. Enter a unique name for the connection.

4. Select a previously configured Berkeley data source from the Data Source drop-down menu.

5. Enter the connection details.
   a. Set the path to the Berkeley DB XML database directory in the **Environment home directory** field. Use a directory with write access. DO NOT use the installation directory where Berkeley DB XML is installed if you do not have write access to that directory.
   b. Select the **Verbosity** level: **DEBUG**, **INFO**, **WARNING**, or **ERROR**.
   c. Optionally, you can select the **Join existing environment** checkbox.
If selected, an attempt is made to join an existing environment in the specified home
directory and all the original environment settings are preserved. If that fails, try reconfiguring
the connection with this option unchecked.

6. Click the OK button to finish the connection configuration.
7. To view your connection, go to the Data Source Explorer view (page 1917) (if the view is not
displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the
Database perspective (page 2709).

Berkeley DB XML Contextual Menu Actions

While browsing Berkeley DB XML connections in the Data Source Explorer view (page 1917), the
various nodes include the following contextual menu actions:

Connection Level Nodes

Configure Database Sources

Opens the Data Sources preferences page (page 60) where you can
configure both data sources and connections.

Disconnect

Stops the connection.

New Collection

Opens a Container configuration dialog box that allows you to adds a new
container in the repository.

Figure 607: Container Configuration Dialog Box

This dialog box allows you to configure the following:

- Name - The name of the new container.
- Container type - At creation time, every container must have a type
defined for it. This container type identifies how XML documents
are stored in the container. As such, the container type can only be
determined at container creation time. You cannot change it when
subsequent container opens. You can select one of the following
types:

- **Node container** - XML documents are stored as individual nodes
  in the container. Each record in the underlying database contains
  a single leaf node, its attributes and attribute values (if any),
  and its text nodes (if any). Berkeley DB XML also keeps the
  information it requires to reassemble the document from the
  individual nodes stored in the underlying databases. This is the
  default selection and is the preferred container type.

- **Whole document container** - The container contains entire
  documents. The documents are stored without any manipulation
  of line breaks or whitespace.

- **Allow validation** - If selected, documents will be validated when they
  are loaded into the container. The default behavior is to not validate
  documents.

- **Index nodes** - If selected, indices for the container will return nodes
  rather than documents. The default is to index at the document level.
  This property has no meaning if the container type is **Whole document
  container**.

**Refresh**

Performs a refresh on the selected node.

**Properties**

Shows various properties of the current container.

**Container Level Nodes**

**Import Files**

Allows you to add a new file on the connection, in the current folder.

**Export**

Allows you to export the folder on the remote connection to a local folder.

**Cut**

Removes the current selection and places it in the clipboard.

**Paste**

Pastes the copied selection.
**Rename**

Renames the current resource.

**Delete**

Deletes the current container.

**Edit indices**

Open a Container Indices dialog box that allows you to configure indices properties for the selected Berkeley container.

*Figure 608: Container Indices Dialog Box*

This dialog box allows you to configure the following properties:

- **Granularity** - A measure of the level of details of your data in the database. You can select one of the following:
  - **Document level** - Good option for retrieving large documents.
  - **Node level** - Good option for retrieving nodes from within documents.
- **Node** - The name of the node.
- **Namespace** - The index namespace.
- **Index type**:
  - **Uniqueness** - Indicates whether or not the indexed value must be unique within the container.
Path type - Drop-down menu that allows you to select from the following:
- node - Indicates that you want to index a single node in the path.
- edge - Indicates that you want to index the portion of the path where two nodes meet.

Node type - Drop-down menu that allows you to select from the following:
- element - An element node in the document content.
- attribute - An attribute node in the document content.
- metadata - A node found only in the metadata content of a document.

Key type - Drop-down menu that allows you to select from the following:
- equality - Improves the performances of tests that look for nodes with a specific value.
- presence - Improves the performances of tests that look for the existence of a node regardless of its value.
- substring - Improves the performance of tests that look for a node whose value contains a given sub-string.

Syntax - The syntax describes the type of data the index contains and is mostly used to determine how indexed values are compared. The default value is string.

Refresh
Perform a refresh on the selected node.

Properties
Shows various properties of the current container.

Resource Level Nodes
Open
Opens the selected resource in the editor.

Open in System Application
When you use this action, Oxygen XML Editor plugin downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the Data Source
Explorer view, Oxygen XML Editor plugin will detect that there was a change and will ask if you want to upload the edited resource to the server.

Cut
Removes the current selection and places it in the clipboard.

Copy location
Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

Rename
Renames the current resource

Delete
Deletes the current container.

Refresh
Performs a refresh on the selected node.

Properties
Shows various properties of the current container.

Compare
Compares two selected resources.

Debugging with Berkeley DB XML

The Berkeley DB XML database added a debugging interface starting with version 2.5. The current version is supported in the Oxygen XML Editor plugin XQuery Debugger. The same restrictions and peculiarities (page 1961) apply for the Berkeley debugger as for the MarkLogic debugger.

eXist Database Connections

Oxygen XML Editor plugin includes support for eXist database connections. Oxygen XML Editor plugin allows you to browse the structure of a eXist database in the Data Source Explorer view (page 1917) and perform various operations on the resources in the repository.

Figure 609: eXist Database Connection
Configuring an eXist Database Connection

There are two ways to configure the support for an eXist database:

- Use the dedicated Create eXist-db XML connection wizard.
- Use the Data Sources preferences page to manually configure your connection.

How to Configure an eXist Connection Using the Built-in Wizard

To configure a connection for an eXist database using the dedicated Create eXist-db XML connection wizard, follow these steps:

1. Open the Preferences dialog box (page 55), go to Data Sources and click the Create eXist-db XML connection link.
2. Enter your connection details in the connection wizard and click OK.

⚠️ Important: To create an eXist connection using this wizard, Oxygen XML Editor plugin expects the exist/webstart/exist.jnlp path to be accessible at the provided Host and Port.

3. To view your connection, go to the Data Source Explorer view (page 1917) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (page 2709).

How to Configure an eXist Connection Manually
Attention: For this manual procedure, you need to already have an eXist database server installed.

Tip: There is an easier way to configure an eXist database connection using a built-in wizard. For more information, see How to Configure an eXist Connection Using the Built-in Wizard (page 1949).

Step 1: Configure eXist Data Source Drivers

Oxygen XML Editor plugin supports eXist database server versions up to and including version 4.5. To configure a data source for an eXist database, follow these steps:

1. Open the Preferences dialog box (page 55) and go to Data Sources.
2. Click the + New button in the Data Sources panel.
3. Enter a unique name for the data source.
4. Select eXist from the driver Type drop-down menu.
5. Click the Add Files button to add the eXist driver files. The following driver files should be added and they are found in the installation directory of the eXist database server. Make sure you copy the files from the installation of the eXist server where you want to connect from Oxygen XML Editor plugin.

**eXist 3.x**

- exist.jar
- lib/core/xmlmdb.jar
- lib/core/xmlrpc-client-3.1.x.jar
- lib/core/xmlrpc-common-3.1.x.jar
- lib/core/ws-commons-util-1.0.x.jar
- lib/core/slf4j-api-1.x.x.jar (if available)
- lib/core/slf4j-log4j12-1.x.x.jar (if available)

**eXist 4.x**

- exist.jar
- lib/core/log4j-api-*.*.jar
- lib/core/log4j-jul-*.*.jar
- lib/core/log4j-slf4j-impl-*.*.jar
- lib/core/slf4j-api-*.*.jar
- lib/core/ws-commons-util-*.*.jar
- lib/core/xmlmdb-*.*.jar
- lib/core/xmlrpc-client-*.*.jar
- lib/core/xmlrpc-common-*.*.jar
- lib/core/j8fu-*.*.jar
Step 2: Configure an eXist Connection

To configure a connection to an eXist database, follow these steps:

1. Open the Preferences dialog box (page 55) and go to Data Sources.
2. Click the New button in the Connections panel.
3. Enter a unique name for the connection.
4. Select a previously configured eXist data source from the Data Source drop-down menu.
5. Enter the connection details:
   a. Set the URI to the installed eXist engine in the XML DB URI field.
   b. Set the user name in the User field.
   c. Set the password in the Password field.
   d. Enter the start collection in the Collection field.
   
   eXist organizes all documents in hierarchical collections. Collections are like directories. They are used to group related documents together. This text field allows the user to set the default collection name.

6. Click the OK button to finish the connection configuration.
7. To view your connection, go to the Data Source Explorer view (page 1917) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (page 2709).

For more information about running XQuery against an eXist XML database, watch our video demonstration:

https://www.youtube.com/embed/Yoc5h1zSddA

eXist Contextual Menu Actions

While browsing eXist database connections in the Data Source Explorer view (page 1917), the various nodes include the following contextual menu actions:

Connection Level Nodes

◆ Configure Database Sources
   
   Opens the Data Sources preferences page (page 60) where you can configure both data sources and connections.

Disconnect
Stops the connection.

- **Refresh**
  Performs a refresh on the selected node.

### Container Level Nodes

- **New File**
  Creates a new file on the connection, in the current folder.

- **New Collection**
  Creates a new collection on the connection.

- **Import Folders**
  Imports folders on the server.

- **Import Files**
  Allows you to add a new file on the connection, in the current folder.

- **Export**
  Allows you to export the folder on the remote connection to a local folder.

- **Cut**
  Removes the current selection and places it in the clipboard.

- **Paste**
  Pastes the copied selection.

- **Refresh**
  Performs a refresh on the selected node.

- **Properties**
  Shows various properties of the current container.

### Resource Level Nodes

- **Open**
  Opens the selected resource in the editor.

- **Open in System Application**
  When you use this action, Oxygen XML Editor plugin downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the Data Source...
Explorer view, Oxygen XML Editor plugin will detect that there was a change and will ask if you want to upload the edited resource to the server.

**Save As**

Allows you to save the selected resource as a file on disk.

**Cut**

Removes the current selection and places it in the clipboard.

**Copy**

Copies the current selection into the clipboard.

**Copy location**

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

**Rename**

Renames the current resource

**Delete**

Deletes the current container.

**Refresh**

Performs a refresh on the selected node.

**Properties**

Shows various properties of the current container.

**Compare**

Compares two selected resources.

MarkLogic Database Connections

Oxygen XML Editor plugin Enterprise edition includes support for MarkLogic database connections. Once you configure a MarkLogic connection *(page 1955)*, you can use the Data Source Explorer view *(page 1917)* to display all the application servers that are configured on the MarkLogic server.

You can expand each application server and view all of its configured modules, and the Data Source Explorer view *(page 1917)* allows you to open and edit these modules.

**Note:** To browse modules located in a database, directory properties must be associated with them. These directory properties are generated automatically if the directory creation property of the database is set to automatic. If this property is set to manual or manual-enforced, add the directory properties of the modules manually, using the XQuery function `xdmp:directory-create()`.
For example, for two documents with the `/code/modules/main.xqy` and `/code/modules/imports/import.xqy` IDs, run the following query:

```
{xdmp:directory-create('/code/modules/'), xdmp:directory-create('/code/modules/imports/')}
```

For more information about directory properties, go to: [http://blakeley.com/blogofile/2012/03/19/directory-assistance/](http://blakeley.com/blogofile/2012/03/19/directory-assistance/).

**MarkLogic and XQuery**

MarkLogic connections can be used in conjunction with XQuery scripts to debug and solve problems with XQuery transformations. XQuery modules can also be validated using a MarkLogic server to allow you to spot possible issues without the need of actually executing the XQuery script.

When debugging XQuery files with MarkLogic (page 1958), you can use the Data Source Explorer view (page 1917) to open the files from the application server that is involved in the debugging process. By using the Data Source Explorer view (page 1917), any imported modules are better identified by the MarkLogic server. You can also use step actions and breakpoints (page 1960) in the modules to help identify problems.

**Modules Container**

For each Application server (for example: Bill (HTTP port:8060)), you have access to the XQuery modules that are visible to that server. When editing, executing, or debugging XQuery it is recommended to open the XQuery files from this Modules container.

**Note:** You can also manage resources for a MarkLogic database through a WebDAV connection, although it is not recommended if you work with XQuery files since imported modules may not be resolved correctly.

**Requests Container**

Each MarkLogic application server includes a Requests container. In this container, Oxygen XML Editor plugin displays both queries that are stopped for debugging purposes and queries that are still running. To clean up the entire Requests container at the end of your session, right-click it and use the Cancel all requests action (page 1962).

*Figure 610: MarkLogic Connection in Data Source Explorer*
Configuring a MarkLogic Database Connection

Note that this feature is available in Oxygen XML Editor plugin Enterprise edition only.

Follow this procedure to configure the support for a MarkLogic database connection:

1. Download the MarkLogic driver from MarkLogic Community site.
2. Configure MarkLogic Data Source drivers (page 1955).
3. Configure a MarkLogic Connection (page 1956).
4. To view your connection, go to the Data Source Explorer view (page 1917) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (page 2709).

Related Information:

• MarkLogic Development in Oxygen XML Editor plugin (page 1957)

How to Configure MarkLogic Data Source Drivers

Available in the Enterprise edition only.

Note: Oxygen XML Editor plugin supports MarkLogic version 4.0 or later.

To configure a data source for MarkLogic, follow this procedure:

2. Unzip the downloaded archive.
3. Open the Preferences dialog box (page 55) and go to Data Sources.
4. Click the New button in the Data Sources panel.
5. Enter a unique name for the data source.
6. Select MarkLogic from the driver Type drop-down list.
7. Click the Add Files button and select the MarkLogic driver file from the lib folder of the archive that you downloaded and unzipped. The driver file name is marklogic-xcc-{server_version}.jar, where {server_version} is the MarkLogic server version.
8. Click the OK button to finish the data source configuration.
9. Continue on to configure your MarkLogic Connection (page 1956).

How to Configure a MarkLogic Connection

Available in the Enterprise edition only.

Note: Oxygen XML Editor plugin supports MarkLogic version 4.0 or later.

To configure a connection to a MarkLogic database, follow these steps:

1. Open the Preferences dialog box (page 55) and go to Data Sources.
2. Click the + New button in the Connections panel.
3. Enter a unique name for the connection.
4. Select a previously configured MarkLogic data source from the Data Source drop-down menu.
5. Enter the connection details.
   a. The host name or IP address of the installed MarkLogic engine in the XDBC Host field. Oxygen XML Editor plugin uses XCC connector to interact with MarkLogic XDBC server and requires the basic authentication schema to be set. Starting with version MarkLogic 4.0 the default authentication method when you create an HTTP or WebDAV Server is digest, so make sure to change it to basic.
   b. Set the port number of the MarkLogic engine in the Port field. A MarkLogic XDBC application server must be configured on the server on this port. This XDBC server will be used to process XQuery expressions against the server. Later, if you want to change the XDBC server, instead of editing the configuration just use the Use it to execute queries action (page 1962) from Data Source Explorer.
   c. Set the user name to access the MarkLogic engine in the User field.
   d. Set the password to access the MarkLogic engine in the Password field.
   e. Optionally, in the WebDAV URL field, set the URL used for browsing the MarkLogic database in the Data Source Explorer view (page 1917). The Database field specifies the database for which the XQuery expressions are executed. If you set this option to default, the database associated to the application server of the configured port is used.
6. Click the **OK** button to finish the connection configuration.
7. To view your connection, go to the Data Source Explorer view *(page 1917)* (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective *(page 2709)*.

**MarkLogic Development in Oxygen XML Editor plugin**

The Oxygen XML Editor plugin support for MarkLogic includes features designed for developers, such as debugging XQuery transformations, remote and collaborative debugging, XQuery editing and validation, and an XQuery builder *(page 1105)* that helps to improve productivity.

### Working with XQuery Files

MarkLogic supports working with XQuery files to create queries over stored XML content. You can open an XQuery file, configure a transformation scenario to match your MarkLogic connection, write the XQuery, and then execute it.

When editing XQuery modules stored on the MarkLogic server, the **Outline view* *(page 1103)* collects and displays all the functions from all imported modules. The **Content Completion Assistant* *(page 2704)* also presents all of these functions along with the latest built-in XQuery functions in accordance with the server version.

When developing queries for MarkLogic, it is best to open the resources from the **Data Source Explorer view* *(page 1917)*. When you execute or debug XQuery files opened from this view, imported modules can be resolved better by the MarkLogic server. Another advantage is that validation is automatically performed on the MarkLogic server, including any imported modules.

### XQuery Debugging

Oxygen XML Editor plugin allows you to use MarkLogic connections to debug real applications that use XQuery (for example, web applications that trigger XQuery executions). By setting the server in debug mode, you can intercept all the XQuery scripts that run on that server. Oxygen XML Editor plugin connects to the MarkLogic server, shows you the running XQuery scripts, and allows you to debug them. The remote debugging support also allows you to debug collaboratively. Multiple users can participate in the same debugging session. You can start a debugging session and another user can continue it, and vice versa.

### Working with Modules

MarkLogic has a concept of two types of XQuery modules, **library** and **main** modules. A **library** module is used to define functions. Library modules cannot be evaluated directly. They are imported, either
from other library modules or from main modules. A main module is used as an entry point that can be executed as an XQuery program. For more information on these types of modules, see XQuery Library Modules and Main Modules.

When working with library modules, you need to create a validation scenario and associate it with the module. In the validation scenario you need to specify a main module as the entry point for validation. The modules need to be deployed on a MarkLogic server because Oxygen XML Editor plugin will request the server to validate the modules.

To validate library modules stored on a MarkLogic server, follow these steps:

1. **Configure a MarkLogic database connection** *(page 1955).*
2. Expand the MarkLogic connection in the **Data Source Explorer view** *(page 1917)* and open the library modules. The main module must also be opened from the **Data Source Explorer view** *(page 1917).*
3. **Configure a validation scenario** *(page 869)* for each library module. Specify the main module in the **URL of the file to validate** field.

**Result:** Validation is done on the server that contains the main module. The main module and all other library modules involved in the validation must be saved. Otherwise, the server will validate what was saved on the server, without the uncommitted changes. Also, the **Content Completion Assistant** *(page 2704)* and the **Outline view** *(page 1103)* should now present the functions from all the modules.

**Related Information:**

- Debugging with MarkLogic *(page 1958)*
- Configuring a MarkLogic Database Connection *(page 1955)*

**Debugging with MarkLogic**

Oxygen XML Editor plugin includes support for debugging XQuery transformations that are executed against a MarkLogic database.

To use a debugging session against the MarkLogic engine, follow these steps:

1. Configure a **MarkLogic data source** *(page 1955)* and a **MarkLogic connection** *(page 1956).*
2. Make sure that the debugging support is enabled in the MarkLogic server that Oxygen XML Editor plugin accesses. On the server side, debugging must be activated in the XDBC server and in the
Task Server section of the server control console (the switch `debug allow`). If the debugging is not activated, the MarkLogic server reports a **DBG-TASKDEBUGALLOW** error.

**Note:** An XDBC application server must be running to connect to the MarkLogic server and this XDBC server will be used to process XQuery expressions against the server. You can change the XDBC application server that Oxygen XML Editor plugin uses to process XQuery expressions by selecting the **Use it to execute queries** action (page 1962) from the contextual menu in the **Data Source Explorer** view (page 1917).

3. Open the XQuery file and start the debugging process.
   - If you want to debug an XQuery file stored on the MarkLogic server, it is recommend to use the **Data Source Explorer** view (page 1917) and open the file from the application server that is involved in the debugging process. This improves the resolving of any imported modules.
   - The MarkLogic XQuery debugger integrates seamlessly into the **XQuery Debugger perspective** (page 219). If you have a MarkLogic validation scenario configured for the XQuery file, you can choose to debug the scenario (page 2025) directly.
   - Otherwise, switch to the **XQuery Debugger perspective** (page 2709), open the XQuery file in the editor, and select the MarkLogic connection in the XQuery engine selector from the debug control toolbar (page 2009).

For general information about how a debugging session is started and controlled, see the **Working with the Debugger** (page 2025) section.

**Note:** Before starting a debugging session, it is recommend that you link the MarkLogic connection with an Eclipse project. To do this, go to the **Data Source Explorer** view (page 1917) and select **Link to project** in the contextual menu of the MarkLogic connection. The major benefit of linking a debugging session with a project is that you can add breakpoints (page 2029) in the XQuery modules stored on the server. You are also able to access these modules from the Eclipse **Navigator** view and run debugging sessions from them.

In a MarkLogic debugging session, you can use step actions and **breakpoints** (page 2028) to help identify problems. When you add a breakpoint (page 2029) on a line where the debugger never stops, Oxygen XML Editor plugin displays a warning message. These warnings are displayed for **breakpoints** you add either in the main XQuery (which you can open locally or from the server) or for **breakpoints** you add in any XQuery that is opened from the connection that participates in the debugging session. For more information, see Using Breakpoints for Debugging Queries that Import Modules with MarkLogic (page 1960).

**Remote Debugging with MarkLogic**

Oxygen XML Editor plugin allows you to debug remote applications that use XQuery (for example, web applications that trigger XQuery executions). Oxygen XML Editor plugin connects to a MarkLogic
server, shows you the running XQuery scripts and allows you to debug them. You can even pause the scripts so that you can start the debugging queries in the exact context of the application. You can also switch a server to debug mode to intercept all XQuery scripts.

Oxygen XML Editor plugin also supports collaborative debugging. This feature allows multiple users to participate in the same debugging session. You can start a debugging session and at a certain point, another user can continue it.

⚠️ **Important:** When using the remote debugging feature, the HTTP and the XDBC servers involved in the debugging session must have the same module configuration.

For more information about the XQuery debugger for MarkLogic, watch our video demonstration:

https://www.youtube.com/embed/eQ4ThDZq1bk

**Related Information:**
- MarkLogic Development in Oxygen XML Editor plugin *(page 1957)*
- Configuring a MarkLogic Database Connection *(page 1955)*

**Using Breakpoints for Debugging Queries that Import Modules with MarkLogic**

When debugging queries that imports modules stored in the database, it is recommended to place breakpoints *(page 2028)* in the modules. When starting a new debugging session, make sure that the modules that you will debug are already opened in the editor. This is necessary so that the breakpoints in all the modules will be considered. Also, make sure that there are no other opened modules that are not involved in the current debugging session.

To place breakpoints in the modules, use the following procedure:

1. In the **Data Source Explorer view** *(page 1917)*, open all the modules from the **Modules** container of the **XDBC application server** *(page 1956)* that performs the debugging.
2. Set breakpoints *(page 2029)* in the module as needed.
3. Continue debugging *(page 2025)* the query.

If you get a warning that the breakpoints failed to initialize, try the following solutions:

- Check the **Breakpoints view** *(page 2013)* and make sure there are no older breakpoints (set on resources that are not part of the current debugging context).
• Make sure you open the modules from the context of the application server that does the debugging and place breakpoints there.

• MarkLogic Database Connections (page 1953)

• MarkLogic Development in Oxygen XML Editor plugin (page 1957)

Peculiarities and Limitations of the MarkLogic Debugger

MarkLogic debugger has the following peculiarities and limitations:

• Debugging support is only available for MarkLogic server versions 4.0 or newer.
• For MarkLogic server versions 4.0 or newer, there are three XQuery syntaxes that are supported: '0.9-ml' (inherited from MarkLogic 3.2), '1.0-ml', and '1.0'.
• All declared variables are presented as strings. The Value column of the Variables view contains the expression from the variable declaration. It can be evaluated by copying the expression with the Copy value action from the contextual menu of the Variables view (page 2023) and pasting it in the XWatch view (page 2015).
• There is no support for output to source mapping (page 2026).
• There is no support for showing the trace (page 2020).
• You can only set breakpoints (page 2013) in imported modules in one of the following cases:
  ◦ When you open the module from the context of the application server involved in the debugging, using the Data Source Explorer view (page 1917).
  ◦ When the debugger automatically opens the modules in the Editor.
• No breakpoints (page 2028) are set in modules from the same server that are not involved in the current debugging session.
• No support for profiling (page 2030) when an XQuery transformation is executed in the debugger.

MarkLogic Contextual Menu Actions

While browsing MarkLogic connections in the Data Source Explorer view (page 1917), the various nodes include the following contextual menu actions:

Connection Level Nodes

  ➤ Configure Database Sources
Opens the **Data Sources preferences page** *(page 60)* where you can configure both data sources and connections.

**Disconnect**

Stops the connection.

**Link to Project**

Links the connection to a project. This is helpful for **MarkLogic debugging sessions** *(page 1958)*.

**Refresh**

Performs a refresh on the selected node.

**Container Level Nodes**

**Enable Debug Mode**

Switches the server to a debugging mode. For more information, see **MarkLogic debugging sessions** *(page 1958)*.

**Use it to Execute Queries**

The server will be used to process XQuery expressions against it.

**Refresh**

Performs a refresh on the selected node.

**Module or Folder Level Nodes**

**Export**

Allows you to export the folder on the remote connection to a local folder.

**Refresh**

Performs a refresh on the selected node.

**Requests Level Nodes**

**Refresh**

Performs a refresh on the selected node.

**Cancel all requests**

Cancels all queries that are either running or stopped on the application server. You can use this action to clean up the entire **Requests** container at the end of your sessions.

**Resource Level Nodes**
Open

Opens the selected resource in the editor.

Open in System Application

When you use this action, Oxygen XML Editor plugin downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the Data Source Explorer view, Oxygen XML Editor plugin will detect that there was a change and will ask if you want to upload the edited resource to the server.

Copy location

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

Refresh

Performs a refresh on the selected node.

Compare

Compares two selected resources.

MySQL Database Connections

Oxygen XML Editor plugin includes support for MySQL database connections. Oxygen XML Editor plugin allows you to browse the structure of a SQL Server database in the Data Source Explorer view (page 1917), open tables in the Table Explorer view (page 1918), and perform various operations on the resources in the repository.
Configuring a MySQL Database Connection

To configure the support for a MySQL database, follow this procedure:

2. Configure a MySQL Connection. (page 1965)
3. To view your connection, go to the Data Source Explorer view (page 1917) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (page 2709).

How to Configure MySQL Data Source Drivers

To connect to a MySQL server, you need to create a generic JDBC type data source based on the MySQL JDBC driver available on the MySQL website.

To configure this data source, follow these steps:

1. Go to https://www.oxygenxml.com/database_drivers.html and download the appropriate MySQL driver.

2. Open the Preferences dialog box (page 55) and go to Data Sources.

3. Click the ★ New button in the Data Sources panel.

   The dialog box for configuring a data source is opened.

   Figure 611: Data Source Drivers Configuration Dialog Box
4. Enter a unique name for the data source.

5. Select *Generic JDBC* in the driver *Type* drop-down list.

6. Click the **Add Files** button and select the MySQL driver file that you downloaded.
   The driver file for the MySQL server is called *mysql-com.jar*.

7. Select the most appropriate *Driver class*.

8. Click the **OK** button to finish the data source configuration.

9. Continue on to configure your MySQL connection *(page 1965)*.

**How to Configure a MySQL Connection**

To configure a connection to a MySQL server, follow these steps:

1. Open the **Preferences** dialog box *(page 55)* and go to **Data Sources**.

2. Click the **+ New** button in the **Connections** panel.
   The dialog box for configuring a database connection is displayed.

*Figure 612: Connection Configuration Dialog Box*
3. Enter a unique name for the connection.

4. Select the **MySQL** data source in the **Data Source** drop-down list.

5. Enter the connection details.
   a. Enter the URL of the MySQL server.
   b. Enter the user name for the connection to the MySQL server.
   c. Enter the password for the connection to the MySQL server.

6. Click the **OK** button to finish the connection configuration.

7. To view your connection, go to the **Data Source Explorer view** (page 1917) (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database perspective** (page 2709).

Generic JDBC Database Connections

Oxygen XML Editor plugin includes support for Generic JDBC database connections.

**Configuring a Generic JDBC Database Connection**

To configure the support for a generic JDBC database, follow this procedure:

1. **Configure Generic JDBC Data Source drivers** (page 1967).
2. **Configure a Generic JDBC Connection** (page 1967).
3. To view your connection, go to the Data Source Explorer view (page 1917) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (page 2709).

How to Configure Generic JDBC Data Source Drivers

Starting with version 17, Oxygen XML Editor plugin comes bundled with Java 8, which does not provide built-in access to JDBC-ODBC data sources. To access such sources, you need to find an alternative JDBC-ODBC bridge or use a platform-independent distribution of Oxygen XML Editor plugin along with a Java VM version 7 or 6.

To configure a generic JDBC data source, follow these steps:

1. Open the Preferences dialog box (page 55) and go to Data Sources.
2. Click the ✪ New button in the Data Sources panel.
3. Enter a unique name for the data source.
4. Select Generic JDBC in the driver Type drop-down list.
5. Add the driver file(s) using the Add Files button.
6. Select the most appropriate Driver class.
7. Click the OK button to finish the data source configuration.
8. Continue on to configure a generic JDBC connection (page 1967).

How to Configure a Generic JDBC Connection

To configure a connection to a generic JDBC database, follow these steps:

1. Open the Preferences dialog box (page 55) and go to Data Sources.
2. Click the ✪ New button in the Connections panel.
3. Enter a unique name for the connection.
4. Select the Generic JDBC data source in the Data Source drop-down menu.
5. Enter the connection details.
   a. Enter the URL of the generic JDBC database, with the following format: jdbc: <subprotocol>: <subname>.
   b. Enter the user name for the connection to the generic JDBC database.
   c. Enter the password for the connection to the generic JDBC database.
6. Click the OK button to finish the connection configuration.
7. To view your connection, go to the Data Source Explorer view (page 1917) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (page 2709).
JDBC-ODBC Database Connections

Oxygen XML Editor plugin includes support for JDBC-ODBC database connections.

How to Configure a JDBC-ODBC Connection

Starting with version 17, Oxygen XML Editor plugin comes bundled with Java 8, which does not provide built-in access to JDBC-ODBC data sources. To access such sources, you need to find an alternative JDBC-ODBC bridge or use a platform-independent distribution of Oxygen XML Editor plugin along with a Java VM version 7 or 6.

To configure a connection to an ODBC data source, follow these steps:

1. **Open the Preferences dialog box** (page 55) and go to **Data Sources**.

2. Click the **New** button in the **Connections** panel.

   The dialog box for configuring a database connection is displayed.

   *Figure 613: Connection Configuration Dialog Box*

3. Enter a unique name for the connection.

4. **Select JDBC-ODBC Bridge** in the **Data Source** drop-down list.

5. Enter the connection details.
   
   a. Enter the URL of the ODBC source.
b. Enter the user name of the ODBC source.
c. Enter the password of the ODBC source.

6. Click the **OK** button to finish the connection configuration.

7. To view your connection, go to the **Data Source Explorer view** *(page 1917)* (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database perspective** *(page 2709)*.

BaseX Database Connections

Oxygen XML Editor plugin includes support for BaseX database connections using a WebDAV connection. BaseX is a light-weight XML database engine and XQuery processor. Oxygen XML Editor plugin allows you to browse the structure of a BaseX database in the **Data Source Explorer view** *(page 1917)* and perform XQuery executions.

**How to Configure a BaseX Connection**

To configure a BaseX connection, follow these steps:

1. First of all, make sure the BaseX HTTP Server is started. For details about starting the BaseX HTTP server, go to [http://docs.basex.org/wiki/Startup#BaseX_HTTP_Server](http://docs.basex.org/wiki/Startup#BaseX_HTTP_Server). The configuration file for the HTTP server is named `.basex` and is located in the BaseX installation directory. This file helps you to find out which port the HTTP server using. The default port for BaseX WebDAV is 8984.

2. To ensure that everything is functioning, open a WebDAV URL inside a browser and check to see if it works. For example, the following URL retrieves a document from a database named TEST: `http://localhost:8984/webdav/TEST/etc/factbook.xml`.

3. Once you are sure that the BaseX WebDAV service is working, you can configure the WebDAV connection in Oxygen XML Editor plugin as described in **How to Configure a WebDAV Connection** *(page 1974)*. The WebDAV URL should resemble this: `http://{hostname}:{port}/webdav/`. If the BaseX server is running on your own machine and it has the default configuration, the data required by the WebDAV connection is:
   - **WebDAV URL**: `http://localhost:8984/webdav`
   - **User**: `admin`
   - **Password**: `admin`

4. Once the WebDAV connection is created, to view your connection, go to the **Data Source Explorer view** *(page 1917)* (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database perspective** *(page 2709)*.

**BaseX Contextual Menu Actions**
While browsing BaseX connections in the Data Source Explorer view (page 1917), the various nodes include the following contextual menu actions:

### Connection Level Nodes

- **Configure Database Sources**
  
  Opens the Data Sources preferences page (page 60) where you can configure both data sources and connections.

- **Disconnect**
  
  Stops the connection.

- **New Folder**
  
  Creates a new folder on the connection.

- **Import Files**
  
  Allows you to add a new file on the connection, in the current folder.

- **Refresh**
  
  Performs a refresh on the selected node.

### Folder Level Nodes

- **New File**
  
  Creates a new file on the connection, in the current folder.

- **New Folder**
  
  Creates a new folder on the connection.

- **Import Folders**
  
  Imports folders on the server.

- **Import Files**
  
  Allows you to add a new file on the connection, in the current folder.

- **Export**
  
  Allows you to export the folder on the remote connection to a local folder.

- **Cut**
  
  Removes the current selection and places it in the clipboard.

- **Copy**
  
  Copies the current selection into the clipboard.

- **Paste**
Pastes the copied selection.

**Rename**

Renames the current resource

**Delete**

Deletes the current container.

**Refresh**

Performs a refresh on the selected node.

**Resource Level Nodes**

**Open**

Opens the selected resource in the editor.

**Open in System Application**

When you use this action, Oxygen XML Editor plugin downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the Data Source Explorer view, Oxygen XML Editor plugin will detect that there was a change and will ask if you want to upload the edited resource to the server.

**Cut**

Removes the current selection and places it in the clipboard.

**Copy**

Copies the current selection into the clipboard.

**Copy location**

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

**Rename**

Renames the current resource

**Delete**

Deletes the current container.

**Refresh**

Performs a refresh on the selected node.
Properties

Shows various properties of the current container.

Compare

Compares two selected resources.

Base X XQJ Connection

XQuery execution is possible in a BaseX connection through an XQJ connection.

⚠️ Important: The XQJ connector is only capable of running XQuery 1.0 scripts, therefore XQuery 3.0 and 3.1 scripts are not supported.

BaseX XQJ Data Source

First of all, create an XQJ data source as described in How to Configure an XQJ Data Source (page 1973). The BaseX XQJ API-specific files that must be added in the configuration dialog box are xqj-api-1.0.jar, xqj2-0.1.0.jar and basex-xqj-1.2.3.jar (the version names of the JAR file may differ). These libraries can be downloaded from xqj.net/basex/basex-xqj-1.2.3.zip. As an alternative, you can also find the libraries in the BaseX installation directory, in the lib sub-directory.

BaseX XQJ Connection

The next step is to create an XQJ connection (page 1973).

For a default BaseX configuration, the following connection details apply (you can modify them when necessary):

- **Port**: 1984
- **servername**: localhost
- **user**: admin
- **password**: admin

XQuery Execution

Now that the XQJ connection is configured, open the XQuery file you want to execute in Oxygen XML Editor plugin and create an XQuery Transformation (page 1489). In the Transformer drop-down menu, select the name of the XQJ connection you created. Apply the transformation scenario and the XQuery will be executed.
How to Configure an XQJ Data Source

Any transformer that offers an XQJ API implementation can be used when validating XQuery or transforming XML documents. An example of an XQuery engine that implements the XQJ API is Zorba.

1. If your XQJ Implementation is native, make sure the directory containing the native libraries of the engine is added to your system environment variables: to PATH - on Windows, to LD_LIBRARY_PATH - on Linux, or to DYLD_LIBRARY_PATH - on OS X. Restart Oxygen XML Editor plugin after configuring the environment variables.

2. Open the Preferences dialog box (page 55) and go to Data Sources.

3. Click the + New button in the Data Sources panel.

4. Enter a unique name for the data source.

5. Select XQuery API for Java (XQJ) in the Type combo box.

6. Press the Add button to add XQJ API-specific files. You can manage the driver files using the Add, Remove, Detect, and Stop buttons. Oxygen XML Editor plugin detects any implementation of javax.xml.xquery.XQDataSource and presents it in Driver class field.

7. Select the most suited driver in the Driver class combo box.

8. Click the OK button to finish the data source configuration.

9. Continue on to configure the XQJ connection (page 1973).

How to Configure an XQJ Connection

The steps for configuring an XQJ connection are the following:

1. Open the Preferences dialog box (page 55) and go to Data Sources.

2. Click the + New button in the Connections panel.

3. Enter a unique name for the connection.

4. Select one of the previously configured XQJ data sources (page 1973) in the Data Source combo box.

5. Fill-in the connection details.
The properties presented in the connection details table are automatically detected depending on the selected data source.

6. Click the **OK** button to finish the connection configuration.

### WebDAV Connections

Oxygen XML Editor plugin includes support for WebDAV server connections. Oxygen XML Editor plugin allows you to browse the structure of a WebDAV connection in the **Data Source Explorer view** *(page 1917)* and perform various operations on the resources in the repository.

#### How to Configure a WebDAV Connection

By default, Oxygen XML Editor plugin contains built-in data source drivers for **WebDAV** connections. Based on this data source, you can create a WebDAV connection for browsing and editing data from a database that provides a WebDAV interface. The connection is available in the **Data Source Explorer view** *(page 1917)*.

To configure a WebDAV connection, follow these steps:

1. Open the **Preferences dialog box** *(page 55)* and go to **Data Sources**.

2. Click the **New** button in the **Connections** panel.

3. Enter a unique name for the connection.

4. Select one of the WebDAV data sources in the **Data Source** drop-down menu.

5. Enter the connection details:
   a. Set the URL to the WebDAV repository in the field **WebDAV URL**.
   b. Set the user name that is used to access the WebDAV repository in the **User** field.
   c. Set the password that is used to access the WebDAV repository in the **Password** field.

6. Click the **OK** button to finish the connection configuration.

7. To view your connection, go to the **Data Source Explorer view** *(page 1917)* (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database perspective** *(page 2709)*.
   
   For more information about the WebDAV support in Oxygen XML Editor plugin, watch our video demonstration:

   https://www.youtube.com/embed/vDX036CqbvM
WebDAV Contextual Menu Actions

While browsing WebDAV connections in the Data Source Explorer view (page 1917), the various nodes include the following contextual menu actions:

Connection Level Nodes

Configure Database Sources
- Opens the Data Sources preferences page (page 60) where you can configure both data sources and connections.

Disconnect
- Stops the connection.

New Folder
- Creates a new folder on the connection.

Import Files
- Allows you to add a new file on the connection, in the current folder.

Refresh
- Performs a refresh on the selected node.

Folder Level Nodes

New File
- Creates a new file on the connection, in the current folder.

New Folder
- Creates a new folder on the connection.

Import Folders
- Imports folders on the server.

Import Files
- Allows you to add a new file on the connection, in the current folder.

Export
- Allows you to export the folder on the remote connection to a local folder.

Cut
- Removes the current selection and places it in the clipboard.

Copy
Copies the current selection into the clipboard.

Paste
Pastes the copied selection.

Rename
Renames the current resource.

Delete
Deletes the current container.

Refresh
Performs a refresh on the selected node.

Resource Level Nodes

Open
Opens the selected resource in the editor.

Open in System Application
When you use this action, Oxygen XML Editor plugin downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the Data Source Explorer view, Oxygen XML Editor plugin will detect that there was a change and will ask if you want to upload the edited resource to the server.

Cut
Removes the current selection and places it in the clipboard.

Copy
Copies the current selection into the clipboard.

Copy location
Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

Rename
Renames the current resource.

Delete
Deletes the current container.
### Refresh
Performs a refresh on the selected node.

### Properties
Shows various properties of the current container.

### Compare
Compares two selected resources.

## SQL Execution Support
The database support in Oxygen XML Editor plugin includes support for writing SQL statements, syntax highlighting, folding (page 2706), and dragging and dropping from the Data Source Explorer view (page 1917). It also includes transformation scenarios for executing the statements, and the results are displayed in the Table Explorer view (page 1918).

### Drag and Drop from Data Source Explorer View
Dragging operations from the Data Source Explorer view (page 1917) and dropping them in the SQL Editor allows you to create SQL statements quickly by inserting the names of tables and columns in the SQL statements.

1. Configure a database connection (see the specific procedure for your database server in the Database Connection Support (page 1921) section).

2. Browse to the table you will use in your statement.

3. Drag the table or a column of the table into the editor where a SQL file is open.

Drag and drop actions are available both on the table and on its fields. A pop-up menu is displayed in the SQL editor.

*Figure 614: SQL Statement Editing with Drag and Drop*
4. Select the type of statement from the pop-up menu.

Depending on your choice, dragging a table results in one of the following statements being inserted into the document:

- **SELECT `field1`, `field2`, ..., FROM `catalog`. `table`** (for example: SELECT `DEPT`, `DEPTNAME`, `LOCATION` FROM `camera`.`cameraDesc`)
- **UPDATE `catalog`. `table` SET `field1` = `field2`, ...** (for example: UPDATE `camera`.`cameraDesc` SET `DEPT` = `DEPTNAME` = `LOCATION` =)
- **INSERT INTO `catalog`. `table` (`field1`, `field2`, ...) VALUES (, ,)** (for example: INSERT INTO `camera`.`cameraDesc` (`DEPT`, `DEPTNAME`, `LOCATION`) VALUES (, , )
- **DELETE FROM `catalog`. `table`** (for example: DELETE FROM `camera`.`cameraDesc`)

Depending on your choice, dragging a column results in one of the following statements being inserted into the document:

- **SELECT `field` FROM `catalog`. `table`** (for example: SELECT `DEPT` FROM `camera`.`cameraDesc`)
- **UPDATE `catalog`. `table` SET `field` =** (for example: UPDATE `camera`.`cameraDesc` SET `DEPT` =)
- **INSERT INTO `catalog`. `table` (`field1`) VALUES ()** (for example: INSERT INTO `camera`.`cameraDesc` (`DEPT`) VALUES ()

• DELETE FROM `catalog` . `table` (for example: DELETE FROM `camera`. `cameraDesc` WHERE `DEPT` = )

SQL Validation

SQL validation support is offered for IBM DB2. Note that if you choose a connection that does not support SQL validation, you will receive a warning when trying to validate. The SQL document is validated using the connection from the associated transformation scenario.

Executing SQL Statements

The steps for executing an SQL statement on a relational database are as follows:

1. Configure a transformation scenario (page 1381) using the Configure Transformation Scenario(s) action from the toolbar or the XML menu.

   A SQL transformation scenario needs a database connection. You can configure a connection using the Preferences button from the SQL transformation dialog box.

   The dialog box contains the list of existing scenarios that apply to SQL documents.

2. Set parameter values for SQL placeholders using the Parameters button from the SQL transformation dialog box.

   For example, in SELECT * FROM `test`. `department` where DEPT = ? or DEPTNAME = ? the two parameters can be configured for the placeholders (?) in the transformation scenario.

   When the SQL statement is executed, the first placeholder is replaced with the value set for the first parameter in the scenario, the second placeholder is replaced by the second parameter value, and so on.

   **Restriction:** When a stored procedure is called in an SQL statement executed on an SQL Server database, mixing inline parameter values with values specified using the Parameters button of the scenario dialog box is not recommended. This is due to a limitation of the SQL Server driver for Java applications. An example of stored procedure that is not recommended:

   ```
   call dbo.Test(22, ?)
   ```

3. Execute the SQL scenario by clicking the OK or Apply associated button.

   The result of a SQL transformation is displayed in a view (page 267) at the bottom of the Oxygen XML Editor plugin window.

4. View more complex return values of the SQL transformation in a separate editor panel.

   A more complex value returned by the SQL query (for example, an XMLTYPE or CLOB value) cannot be displayed entirely in the result table.
a. Right-click the cell containing the complex value.

b. Select the action **Copy cell** from the contextual menu. The action copies the value in the clipboard.

c. Paste the value into an appropriate editor. For example, you can paste the value in an opened XQuery editor panel of Oxygen XML Editor plugin.

XQuery and Databases

XQuery is a native XML query language that is useful for querying XML views of relational data to create XML results. It also provides the mechanism to efficiently and easily extract information from Native XML Databases (NXD) and relational data. The following database systems supported in Oxygen XML Editor plugin offer XQuery support:

- **Native XML Databases**:
  - Berkeley DB XML
  - eXist
  - MarkLogic (validation support available starting with version 5)
- **Relational Databases**:
  - IBM DB2
  - Microsoft SQL Server (validation support not available)
  - Oracle (validation support not available)

**Related Information:**

- Editing XQuery Documents *(page 1099)*

Build Queries with Drag and Drop from the Data Source Explorer View

When a query is edited in the XQuery editor, the XPath expressions can be composed quickly by dragging them from the **Data Source Explorer view *(page 1917)* and dropping them into the editor panel.

1. Configure the data source drivers *(page 1921)* for the particular relational database in the **Data Sources preferences page *(page 60)*.
2. **Configure the connection** *(page 1921)* for the particular relational database in the **Data Sources preferences page** *(page 60).*

3. Browse the connection in the **Data Source Explorer view** *(page 1917)*, expanded to the table or column that you want to insert in the query.

4. Drag the table or column name to the XQuery editor panel.

5. Drop the table or column name where the XPath expression is needed.

An XPath expression that selects the dragged name is inserted in the XQuery document at the cursor position.

**XQuery Validation When Connected to a Database**

With Oxygen XML Editor plugin, you can validate your XQuery documents when connected to a database. When you open an XQuery document from a connection that supports validation (for example, MarkLogic, or eXist), by default Oxygen XML Editor plugin uses this connection for validation. If you open an XQuery file using a MarkLogic connection, the validation resolves imports better.

**Related Information:**

- **XQuery Validation** *(page 1100)*

**XQuery Transformation for Databases**

XQuery is designed to retrieve and interpret XML data from any source, whether it is a database or document. Data is stored in relational databases but it is often required that the data be extracted and transformed as XML when interfacing to other components and services. Also, it is an XPath-based querying language supported by most NXD vendors. To perform a query, you need an XQuery transformation scenario.

1. **Configure the data source drivers and the connection** *(page 1921)* for the particular database.

2. Configure an XQuery transformation scenario.

   a. Click the **Configure Transformation Scenario** toolbar button or go to menu **Document > Transformation > Configure Transformation Scenario**.

      *The **Configure Transformation Scenario** dialog box* *(page 1502)* is opened.

   b. Click the **New** button toward the bottom of the dialog box.
c. Select **XML Transformation with XQUERY** *(page 1433)*.

   The **New Scenario** dialog box for configuring an XQuery scenario is opened.

   **Figure 615: New Scenario Dialog Box**

   ![New Scenario Dialog Box](image)

   d. Insert the scenario name in the dialog box for editing the scenario.

   e. Choose the database connection in the **Transformer** drop-down list.

   f. Configure any other parameters as needed.

   For an XQuery transformation, the output tab has an option called **Sequence** that allows you to run an XQuery in lazy mode. The amount of data extracted from the database is controlled from the **Size limit on Sequence view** option *(page 185)* in the XQuery preferences page. If you choose **Perform FO Processing** in the FO Processor tab, the **Sequence** option is ignored.

   g. Click the **OK** button to finish editing the scenario.

Once the scenario is associated with the XQuery file, the query can include calls to specific XQuery functions that are implemented by that engine. The available functions depend on the target database engine selected in the scenario. For example, for eXist and Berkeley DB XML, the **Content Completion Assistant** *(page 2704)* lists the functions supported by that database engine. This is useful for only inserting calls to the supported functions (standard XQuery functions or extension ones) into the query.
Note: An XQuery transformation is executed against a Berkeley DB XML server as a transaction using the query transaction support of the server.

3. Run the transformation scenario.

To view a more complex value returned by the query that cannot be entirely displayed in the XQuery query result table at the bottom of the Oxygen XML Editor plug-in window (for example, an XMLTYPE or CLOB value), do the following:
- Right-click that table cell.
- Select the Copy cell action from the contextual menu to copy the value into the clipboard.
- Paste the value wherever you need it (for example, in an opened XQuery editor panel of Oxygen XML Editor plug-in).

Related Information:
- XML Transformation with XQuery (page 1433)
- XQuery XQJ Transformation (page 1983)

XQuery XQJ Transformation

XQuery API for Java (XQJ) refers to the common Java API for the XQuery 1.0 specification. The XQJ API enables you to execute XQuery against an XML data source.

Important: The XQJ connector is only capable of running XQuery 1.0 scripts, therefore XQuery 3.0 and 3.1 scripts are not supported.

Oxygen XML Editor plugin supports any transformer that offers an XQJ API implementation and it be used for validating XQuery or transforming XML documents.

To configure the support for XQJ, do the following:

3. To view your connection, go to the Data Source Explorer view (page 1917) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (page 2709).
How to Configure an XQJ Data Source

Any transformer that offers an XQJ API implementation can be used when validating XQuery or transforming XML documents. An example of an XQuery engine that implements the XQJ API is Zorba.

1. If your XQJ Implementation is native, make sure the directory containing the native libraries of the engine is added to your system environment variables: to PATH - on Windows, to LD_LIBRARY_PATH - on Linux, or to DYLD_LIBRARY_PATH - on OS X. Restart Oxygen XML Editor plugin after configuring the environment variables.

2. Open the Preferences dialog box (page 55) and go to Data Sources.

3. Click the + New button in the Data Sources panel.

4. Enter a unique name for the data source.

5. Select XQuery API for Java (XQJ) in the Type combo box.

6. Press the Add button to add XQJ API-specific files.
   You can manage the driver files using the Add, Remove, Detect, and Stop buttons.
   Oxygen XML Editor plugin detects any implementation of javax.xml.xquery.XQDataSource and presents it in Driver class field.

7. Select the most suited driver in the Driver class combo box.

8. Click the OK button to finish the data source configuration.

9. Continue on to configure the XQJ connection (page 1973).

How to Configure an XQJ Connection

The steps for configuring an XQJ connection are the following:

1. Open the Preferences dialog box (page 55) and go to Data Sources.

2. Click the + New button in the Connections panel.

3. Enter a unique name for the connection.

4. Select one of the previously configured XQJ data sources (page 1973) in the Data Source combo box.

5. Fill-in the connection details.
The properties presented in the connection details table are automatically detected depending on the selected data source.

6. Click the OK button to finish the connection configuration.

XQuery Database Debugging

Oxygen XML Editor plugin includes a debugging interface that helps you to detect and solve problems with XQuery transformations that are executed against MarkLogic and Berkeley DB XML databases.

For more information about the debugging support in Oxygen XML Editor plugin, see Debugging XSLT Stylesheets and XQuery Documents (page 2007).

Debugging with MarkLogic

Oxygen XML Editor plugin includes support for debugging XQuery transformations that are executed against a MarkLogic database.

To use a debugging session against the MarkLogic engine, follow these steps:

1. Configure a MarkLogic data source (page 1955) and a MarkLogic connection (page 1956).
2. Make sure that the debugging support is enabled in the MarkLogic server that Oxygen XML Editor plugin accesses. On the server side, debugging must be activated in the XDBC server and in the Task Server section of the server control console (the switch debug allow). If the debugging is not activated, the MarkLogic server reports a DBG-TASKDEBUGALLOW error.

   Note: An XDBC application server must be running to connect to the MarkLogic server and this XDBC server will be used to process XQuery expressions against the server. You can change the XDBC application server that Oxygen XML Editor plugin uses to process XQuery expressions by selecting the Use it to execute queries action (page 1962) from the contextual menu in the Data Source Explorer view (page 1917).

3. Open the XQuery file and start the debugging process.
   • If you want to debug an XQuery file stored on the MarkLogic server, it is recommend to use the Data Source Explorer view (page 1917) and open the file from the application server that is involved in the debugging process. This improves the resolving of any imported modules.
   • The MarkLogic XQuery debugger integrates seamlessly into the XQuery Debugger perspective (page 219). If you have a MarkLogic validation scenario configured for the XQuery file, you can choose to debug the scenario (page 2025) directly.
   • Otherwise, switch to the XQuery Debugger perspective (page 2709), open the XQuery file in the editor, and select the MarkLogic connection in the XQuery engine selector from the debug control toolbar (page 2009).
For general information about how a debugging session is started and controlled, see the Working with the Debugger (page 2025) section.

**Note:** Before starting a debugging session, it is recommend that you link the MarkLogic connection with an Eclipse project. To do this, go to the Data Source Explorer view (page 1917) and select Link to project in the contextual menu of the MarkLogic connection. The major benefit of linking a debugging session with a project is that you can add breakpoints (page 2029) in the XQuery modules stored on the server. You are also able to access these modules from the Eclipse Navigator view and run debugging sessions from them.

In a MarkLogic debugging session, you can use step actions and breakpoints (page 2028) to help identify problems. When you add a breakpoint (page 2029) on a line where the debugger never stops, Oxygen XML Editor plugin displays a warning message. These warnings are displayed for breakpoints you add either in the main XQuery (which you can open locally or from the server) or for breakpoints you add in any XQuery that is opened from the connection that participates in the debugging session. For more information, see Using Breakpoints for Debugging Queries that Import Modules with MarkLogic (page 1960).

### Remote Debugging with MarkLogic

Oxygen XML Editor plugin allows you to debug remote applications that use XQuery (for example, web applications that trigger XQuery executions). Oxygen XML Editor plugin connects to a MarkLogic server, shows you the running XQuery scripts and allows you to debug them. You can even pause the scripts so that you can start the debugging queries in the exact context of the application. You can also switch a server to debug mode to intercept all XQuery scripts.

Oxygen XML Editor plugin also supports collaborative debugging. This feature allows multiple users to participate in the same debugging session. You can start a debugging session and at a certain point, another user can continue it.

**Important:** When using the remote debugging feature, the HTTP and the XDBC servers involved in the debugging session must have the same module configuration.

For more information about the XQuery debugger for MarkLogic, watch our video demonstration:

[https://www.youtube.com/embed/eQ4ThDZq1bk](https://www.youtube.com/embed/eQ4ThDZq1bk)

**Related Information:**

- MarkLogic Development in Oxygen XML Editor plugin (page 1957)
Using Breakpoints for Debugging Queries that Import Modules with MarkLogic

When debugging queries that imports modules stored in the database, it is recommended to place breakpoints in the modules. When starting a new debugging session, make sure that the modules that you will debug are already opened in the editor. This is necessary so that the breakpoints in all the modules will be considered. Also, make sure that there are no other opened modules that are not involved in the current debugging session.

To place breakpoints in the modules, use the following procedure:

1. In the Data Source Explorer view, open all the modules from the Modules container of the XDBC application server that performs the debugging.
2. Set breakpoints in the module as needed.
3. Continue debugging the query.

If you get a warning that the breakpoints failed to initialize, try the following solutions:

- Check the Breakpoints view and make sure there are no older breakpoints (set on resources that are not part of the current debugging context).
- Make sure you open the modules from the context of the application server that does the debugging and place breakpoints there.

Related Information:

- MarkLogic Database Connections
- MarkLogic Development in Oxygen XML Editor plugin

Peculiarities and Limitations of the MarkLogic Debugger

MarkLogic debugger has the following peculiarities and limitations:

- Debugging support is only available for MarkLogic server versions 4.0 or newer.
- For MarkLogic server versions 4.0 or newer, there are three XQuery syntaxes that are supported: '0.9-ml' (inherited from MarkLogic 3.2), '1.0-ml', and '1.0'.
- All declared variables are presented as strings. The Value column of the Variables view contains the expression from the variable declaration. It can be evaluated by copying the expression with
the Copy value action from the contextual menu of the Variables view (page 2023) and pasting it in the XWatch view (page 2015).

- There is no support for output to source mapping (page 2026).
- There is no support for showing the trace (page 2020).
- You can only set breakpoints (page 2013) in imported modules in one of the following cases:
  - When you open the module from the context of the application server involved in the debugging, using the Data Source Explorer view (page 1917).
  - When the debugger automatically opens the modules in the Editor.
- No breakpoints (page 2028) are set in modules from the same server that are not involved in the current debugging session.
- No support for profiling (page 2030) when an XQuery transformation is executed in the debugger.

Debugging with Berkeley DB XML

The Berkeley DB XML database added a debugging interface starting with version 2.5. The current version is supported in the Oxygen XML Editor plugin XQuery Debugger. The same restrictions and peculiarities (page 1961) apply for the Berkeley debugger as for the MarkLogic debugger.

Integration with Microsoft SharePoint

Oxygen XML Editor plugin provides support for browsing and managing SharePoint connections in the Data Source Explorer view (page 1917). You can easily create new resources on the repository, copy and move them using contextual actions or the drag and drop support, or edit and transform the documents in the editor.

Note: You can access documents stored on SharePoint Online for Office 365 sites that use either Cloud identity (default) or Federated identity (ADFS) as the authentication method.

Restriction: The SharePoint connection is only available in the Enterprise edition of Oxygen XML Editor plugin.

Figure 616: SharePoint Connection
Related Information:

• Working with Databases (page 1916)

How to Configure a SharePoint Connection

By default, Oxygen XML Editor plugin contains built-in data source drivers for SharePoint. Use this data source to create a connection to a SharePoint server that will be available in the Data Source Explorer view (page 1917).

To configure a SharePoint connection, follow these steps:

1. Open the Preferences dialog box (page 55) and go to Data Sources.
2. In the Connections panel click the + New button.
3. Enter a unique name for the connection.
4. Select SharePoint in the Data Source combo box.
5. Fill-in the connection details:
   a. Set the URL to the SharePoint repository in the field SharePoint URL.
   b. Set the server domain in the Domain field. If you are using a SharePoint 365 account, leave this field empty.
   c. Set the user name to access the SharePoint repository in the User field.
d. Set the password to access the SharePoint repository in the **Password** field.

**SharePoint Contextual Menu Actions**

While browsing SharePoint connections in the [Data Source Explorer view](page 1917), the various nodes include the following contextual menu actions:

- **Connection Level Nodes**
  - **Configure Database Sources**
    - Opens the [Data Sources preferences page](page 60) where you can configure both data sources and connections.
  - **Disconnect**
    - Stops the connection.
  - **New Folder**
    - Creates a new folder on the connection.
  - **Import Files**
    - Allows you to add a new file on the connection, in the current folder.
  - **Refresh**
    - Performs a refresh on the selected node.

- **Folder Level Nodes**
  - **New File**
    - Creates a new file on the connection, in the current folder.
  - **New Folder**
    - Creates a new folder on the connection.
  - **Import Folders**
    - Imports folders on the server.
  - **Import Files**
    - Allows you to add a new file on the connection, in the current folder.
  - **Export**
    - Allows you to export the folder on the remote connection to a local folder.
  - **Cut**
    - Removes the current selection and places it in the clipboard.
Copy
Copies the current selection into the clipboard.

Paste
Pastes the copied selection.

Rename
Renames the current resource.

Delete
Deletes the current container.

Refresh
Performs a refresh on the selected node.

Resource Level Nodes

Open
Opens the selected resource in the editor.

Open in System Application
When you use this action, Oxygen XML Editor plugin downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the Data Source Explorer view, Oxygen XML Editor plugin will detect that there was a change and will ask if you want to upload the edited resource to the server.

Cut
Removes the current selection and places it in the clipboard.

Copy
Copies the current selection into the clipboard.

Copy location
Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

Check Out
Checks out the selected document on the server.

Check In
Checks in the selected document on the server. This action opens the **Check In** dialog box. In this dialog box, the following options are available:

- **Minor Version** - Increments the minor version of the file on the server.
- **Major Version** - Increments the major version of the file on the server.
- **Overwrite** - Overwrites the latest version of the file on the server.
- **Comment** - Allows you to comment on a file that you check in.

### Discard Check Out

Discards the previous checkout operation, making the file available for editing to other users.

### Rename

Renames the current resource

### Delete

Deletes the current container.

### Refresh

Performs a refresh on the selected node.

### Properties

Shows various properties of the current container.

### Compare

Compares two selected resources.
14.

Importing Data

Computer systems and databases contain data in incompatible formats and exchanging data between these systems can be very time consuming. Converting the data to XML can greatly reduce the complexity and create data that can be read by various types of applications.

Oxygen XML Editor plugin offers support for importing text files, MS Excel files, Database Data, and HTML files into XML documents. The XML documents can be further converted into other formats using the Transform features (page 1381).

Figure 617: Import Wizards of the Oxygen XML Editor plugin

Import from Text Files

To import a text file into an XML file, follow these steps:

1. Go to File > Import > Oxygen XML Editor plugin > Text File and click Next. A Select text file dialog box is displayed.
2. Select the URL of the text file.

3. Select the encoding of the text file.

4. Click the **Next** button.
   
The *Import from text file* dialog box is displayed.

   ![Import from Text File Dialog Box](image)

   **Figure 618: Import from Text File Dialog Box**

5. Configure the settings for the conversion.
   
   a. Select the **Field delimiter** for the import settings. You can choose between the following:
   
   Comma, Semicolon, Tab, Space, Or Pipe.
   
   b. The **Import settings** section presents the input data in a tabular form. By default, all data
   items are converted to element content ( symbol), but this can be overridden by clicking
   the individual column headers. Clicking a column header once causes the data from this
   column to be converted to attribute values ( symbol). Clicking a second time causes the
   column data to be ignored ( symbol) when generating the XML file. You can cycle through
   these three options by continuing to click the column header.
c. **First row contains field names** - If this option is selected, the default column headers are replaced (where such information is available) by the content of the first row. In other words, the first row is interpreted as containing the field names. The changes are also visible in the preview panel.

d. **Customize** - This button opens a Presentation Names dialog box that allows you to edit the name, XML name, and conversion criterion for the root and row elements. The XML names can be edited by double-clicking the desired item and entering the label. The conversion criteria can also be modified by selecting one of the following option in the drop-down menu: ELEMENT, ATTRIBUTE, or SKIPPED.

e. **Import Settings** - Clicking this button opens the Import preferences page (page 161) that allows you to configure more import options.

f. The XML Import Preview panel contains an example of what the generated XML document looks like.

g. **Save in file** - If selected, the new XML document is saved in the specified path.

6. Click **Finish** to generate the XML document.

## Import from MS Excel Files

Oxygen XML Editor plugin provides several methods for importing MS Excel files into an XML file. The first method is to use the Oxygen XML Editor plugin **Smart Paste mechanism** (page 696) by simply copying data from Excel and pasting it into a document in Author mode (note that this is only supported in DITA, DocBook, TEI, JATS, and XHTML documents). You can also copy data from Excel and paste it into inserted cells in Grid mode, but this is a more manual process. If you want to import an entire Excel file, Oxygen XML Editor plugin also offers a configurable import wizard that works with any type of XML document.

### Smart Paste Method in Author Mode

If you are importing data into DITA, DocBook, TEI, JATS, or XHTML documents, you can open the Excel spreadsheet in your office application, copy its content, and simply paste it into your document in Author mode.

The Oxygen XML Editor plugin **Smart Paste mechanism** (page 696) will convert the pasted content to the equivalent XML markup and considers various pasting solutions to keep the resulting document valid, while preserving the original text styling (such as bold, italics, underline) and formatting (such as lists, tables, paragraphs).
Grid Mode Method

The Grid mode in Oxygen XML Editor plugin displays all content in an XML document as a structured grid of nested tables and you can work with the cells in those tables much like you would with any spreadsheet application. When importing Excel data into Grid mode, you first need to insert new cells in the particular nested table and then you can paste data from Excel the same as you would in any table or spreadsheet.

1. Copy the particular cells from your Excel spreadsheet that you want to import into an XML file.
2. Switch to Grid mode in Oxygen XML Editor plugin.
3. Expand the particular nodes and locate the nested table where you want to insert the copied cells.
4. Right-click a particular row or column where you want to insert the data and select Insert row or Insert column, depending on the structure of the copied cells.
5. Paste the copied cells from the clipboard into the newly inserted cells in Grid mode.
6. You may need to make some manual adjustments. For example, if the selection of copied cells contained an empty cell, Oxygen XML Editor plugin might ignore that cell.

Import Wizard Method

By default, this method supports importing Excel 97/2000/XP/2003 formats out-of-the-box. To import spreadsheet data from Excel 2007 or newer, additional libraries are needed before using this procedure. See Import Data from MS Excel 2007 or Newer (page 1998) for instructions on adding more libraries.

To use the Import wizard to import an Excel file into an XML file, follow these steps:

1. Go to File > Import > Oxygen XML Editor plugin > MS Excel file.
2. Select the URL of the Excel file. The sheets of the document you are importing are presented in the Available Sheets section of this dialog box.
3. Click the Next button to proceed to the next stage of the wizard.

Figure 619: Import Wizard
4. Configure the settings for the conversion. This stage of the wizard offers the following options:

**Import settings section**

Presents the input data in a tabular form. By default, all data items are converted to element content (● symbol), but this can be overridden by clicking the individual column headers. Clicking a column header once causes the data from this column to be converted to attribute values (＝ symbol). Clicking a second time causes the column data to be ignored (× symbol) when generating the XML file. You can cycle through these three options by continuing to click the column header.

**First row contains field names**

If this option is selected, the default column headers are replaced (where such information is available) by the content of the first row. In other words, the first row is interpreted as containing the field names. The changes are also visible in the preview panel.

**Customize**
This button opens a **Presentation Names** dialog box that allows you to edit the name, XML name, and conversion criterion for the root and row elements. The XML names can be edited by double-clicking the desired item and entering the label. The conversion criteria can also be modified by selecting one of the following option in the drop-down menu: **ELEMENT, ATTRIBUTE, or SKIPPED**.

**Import Settings**

Clicking this button opens the **Import preferences page** *(page 161)* that allows you to configure more import options.

**Import formatted data (as displayed in Excel)**

If this option is selected, the imported data retains the Excel data formatting (such as the representation of numeric values or dates). If deselected, the data formatting is not imported.

**XML Import Preview panel**

Contains an example of what the generated XML document will look like.

**Save in file**

If selected, the new XML document is saved in the specified path.

5. Click **Finish** to generate the XML document.

For more information about exchanging data between Oxygen XML Editor plugin and spreadsheet applications, watch our video demonstration:

[https://www.youtube.com/embed/8VwsF58zLkU](https://www.youtube.com/embed/8VwsF58zLkU)

**Related Information:**

- **Exporting XML Content to Excel** *(page 671)*

---

**Import Data from MS Excel 2007 or Newer**

To import spreadsheet data from Excel 2007 or newer (.xlsx), Oxygen XML Editor plugin needs additional libraries from the release 3.10 of the Apache POI project.

**Manually Add the Libraries**

To manually add the libraries, follow these steps:

3. Copy the following .jar files into the plugin.xml file of the Oxygen XML Editor plugin Eclipse plugin (if you installed the plugin via the Eclipse update site, you will find it in the eclipse/plugins/com.oxygenxml... folder, and if you installed it via the dropins ZIP distribution, it is located in the eclipse/dropins/plugins/com.oxygenxml... folder):
   - dom4j-1.6.1.jar
   - poi-ooxml-3.10-FINAL-20140208.jar
   - poi-ooxml-schemas-3.10-FINAL-20140208.jar
   - xmlbeans-2.3.0.jar

   **Note:** The .jar files can be found in either the root folder where you unpacked the archive, or in the ooxml-lib subfolder.

**Result:** You can now use the Import wizard (page 1996) to import data from Excel 2007 or newer.

### Related Information:

- Exporting XML Content to Excel (page 671)

---

**Import Database Data as an XML Document**

To import the data from a relational database table as an XML document, follow these steps:

1. Go to `File > Import > Oxygen / Database Data` and click `Next` to start the `Import` wizard.

   This opens a `Select database table` dialog box that lists all the defined database connections:

   *Figure 620: Select Database Table Dialog Box*
2. Select the connection to the database that contains the appropriate data. Only connections configured in relational data sources can be used to import data.

3. If you want to edit, delete, or add a data source or connection, click the Configure Database Sources button. The Preferences/Data Sources option page is opened.

4. Click Connect.

5. In the list of sources, expand a schema and choose the required table.

6. Click the Next button.

   The Import Criteria dialog box is opened with a default query string in the SQL Query pane.

   *Figure 621: Import from Database Criteria Dialog Box*
7. Configure the settings for the conversion.

a. **SQL Preview** - If this button is pressed, the Import settings pane displays the labels that are used in the XML document and the first five lines from the database. By default, all data items are converted to element content (\(\star\) symbol), but this can be overridden by clicking the individual column headers. Clicking a column header once causes the data from this column to be converted to attribute values (= symbol). Clicking a second time causes the column data to be ignored (x symbol) when generating the XML file. You can cycle through these three options by continuing to click the column header.

b. **Customize** - This button opens a Presentation Names dialog box that allows you to edit the name, XML name, and conversion criterion for the root and row elements. The XML names can be edited by double-clicking the desired item and entering the label. The conversion criteria can also be modified by selecting one of the following option in the drop-down menu: ELEMENT, ATTRIBUTE, OF SKIPPED.
c. **Import Settings** - Clicking this button opens the Import preferences page (page 161) that allows you to configure more import options.

d. The **XML Import Preview** panel contains an example of what the generated XML document looks like.

e. **Save in file** - If selected, the new XML document is saved in the specified path.

f. **Generate XML Schema** - Allows you to specify the path of the generated XML Schema file.

8. Click **Finish** to generate the XML document.

### Import from HTML Files

Oxygen XML Editor plugin offers two methods for importing HTML files into an XML document. The first method is to simply copy data from an HTML document and paste it into a document in Author mode, but this is only supported in DITA, DocBook, TEI, JATS, and XHTML documents. Oxygen XML Editor plugin also offers a configurable import wizard that works with any type of XML document.

**Smart Paste Method**

If you are importing data into DITA, DocBook, TEI, JATS, or XHTML documents, you can open the HTML document in your web browser, copy its content, and paste it into your document in Author mode.

The Oxygen XML Editor plugin **Smart Paste mechanism** (page 696) will convert the pasted content to the equivalent XML markup and considers various pasting solutions to keep the resulting document valid, while preserving the original text styling (such as bold, italics, underline) and formatting (such as lists, tables, paragraphs).

**Import Wizard Method**

To use the **Import** wizard to import from HTML files, follow these steps:

1. Go to **File > Import > Oxygen XML Editor plugin > HTML File**. The Import HTML wizard is displayed.
2. Select a parent folder and file name for the resulting XHTML document.
3. Enter the URL of the HTML document.
4. Select the type of the resulting XHTML document:
   - XHTML5
   - XHTML 1.0 Transitional
   - XHTML 1.0 Strict
5. Click the **Finish** button.

**Result:** The resulting document is an XHTML file containing a DOCTYPE declaration that references the XHTML DTD definition on the Web. The parsed content of the imported file is transformed to XHTML5, XHTML Transitional, or XHTML Strict depending on the option you chose.

### Import Content Dynamically

Along with the built-in support for various useful URL protocols (such as HTTP or FTP), Oxygen XML Editor plugin also provides special support for a *convert* protocol that can be used to chain predefined processors to dynamically import content from various sources.

A *dynamic conversion URL* chains various processors that can be applied, in sequence, on a target resource and has the following general syntax:

```xml
class convert:/processor=xslt;ss=urn:processors:excel2d.xsl/processor=excel!/urn:files:my.xls
```

The previous example first applies a processor (`excel`) on a target identified by the identifier (`urn:files:sample.xls`) and converts the Excel™ resource to XML. The second applied processor (`xslt`) applies an XSLT stylesheet identified using the identifier (`urn:processors:excel2d.xsl`) over the resulting content from the first applied processor. These identifiers are all mapped to real resources on disk via an *XML catalog* that is configured in the application, as in the following example:

```xml
<catalog xmlns="urn:oasis:names:tc:entity:xmlns:xml:catalog">
  <rewriteURI uriStartString="urn:files:" rewritePrefix="/resources/"/>
  <rewriteURI uriStartString="urn:processors:" rewritePrefix="/processors/"/>
</catalog>
```

The target resource part of the conversion URL must always follow the `!/` pattern. It can be any of the following:

- An absolute URL that points to a resource.
- An identifier that will be resolved to an actual resource via the *XML Catalog (page 2712)* support in the application. In the example above, the `urn:files:sample.xls` target resource is resolved via the *XML catalog*.
- A relative location. This location can only be resolved to an actual resource URL when the application has enough information about the location where the URL is referenced.

*For example,* for a *DITA map (page 2705)* with a `topicref` such as:

```xml
<topicref href="convert://.../processor=excel!/resources/sample.xls"/>
```
the resources/sample.xls path will be resolved relative to the DITA map location.

This type of URL can be opened in the application by using the Open URL action from the File menu. It can also be referenced from existing XML resources via xi:include or as a topic reference from a DITA map.

A GitHub project that contains various dynamic conversion samples for producing DITA content from various sources (and then publishing it) can be found here: https://github.com/oxygenxml/dita-glass.

Conversion Processors

A set of predefined conversion processors is provided in Oxygen XML Editor plugin. Each processor has its own parameters that can be set to control the behavior of the conversion process. All parameters that are resolved to resources are passed through the XML catalog mapping.

The following predefined conversion processors are included:

- **xslt Processor** - Converts an XML input using the Saxon EE XSLT processor. The ss parameter indicates the stylesheet resource to be loaded. All other specified parameters will be set as parameters to the XSLT transformation.

  ```
  convert:/processor=xslt;ss=urn:processors:convert.xsl;pl=v1!/urn:files:sample.xml
  ```

- **xquery Processor** - Converts an XML input using the Saxon EE XQuery processor. The ss parameter indicates the XQuery script to be loaded. All other specified parameters will be set as parameters to the XSLT transformation.

  ```
  convert:/processor=xquery;ss=urn:processors:convert.xquery;pl=v1!/urn:files:sample.xml
  ```

- **excel Processor** - Converts an Excel™ input to an XML format that can later be converted by other piped processors. It has a single parameter sn, which indicates the name of the sheet that needs to be converted. If this parameter is missing, the XML will contain the combined content of all sheets included in the Excel™ document.

  ```
  convert:/processor=excel;sn=test!/urn:files:sample.xls
  ```

- **java Processor** - Converts an input to another format by applying a specific Java method. The jars parameter is a comma-separated list of JAR (page 2707) libraries, or folders that libraries will be loaded from. The ccn parameter is the fully qualified name of the conversion class that will be instantiated. The conversion class needs to have a method with the following signature:

  ```
  public void convert(String systemID, String originalSourceSystemID, InputStream is, OutputStream os, LinkedHashMap<String, String> properties) throws IOException
  ```
**js Processor** - Converts an input to another format by applying a JavaScript method. The `js` parameter indicates the script that will be used. The `fn` parameter is the name of the method that will be called from the script. The method must take a string as an argument and return a string. If any of the parameters are missing, an error is thrown and the conversion stops.

```
convert:/processor=js;js=urn:processors:md.js;fn=convertExternal!/urn:files:sample.md
```

**json Processor** - Converts a JSON input to XML. It has no parameters.

```
convert:/processor=json!/urn:files:personal.json
```

**xhtml Processor** - Converts HTML content to well-formed XHTML. It has no parameters.

```
convert:/processor=xhtml!/urn:files:test.html
```

**wrap Processor** - Wraps content in a tag name making it well-formed XML. The `rn` parameter indicates the name of the root tag to use. By default, it is `wrapper`. The `encoding` parameter specifies the encoding that should be used to read the content. By default, it is `UTF8`. As an example, this processor can be used if you want to process a comma-separated values file with an XSLT stylesheetsheet to produce XML content. The CSV file is first wrapped as well-formed XML, which is then processed with an `xslt` processor.

```
convert:/processor=wrap!/urn:files:test.csv
```

**cache Processor** - Caches the converted content obtained from the original document to a temporary file. The cache will be used on subsequent uses of the same URL, thus increasing the speed for the application returning the converted content. If the original URL points to the local disk, the cache will be automatically invalidated when the original file content gets modified. Otherwise, if the original URL points to a remote resource, the cache will need to be invalidated by reloading (File > C. Reload (F5)) the URL content that is opened in the editor.

```
convert:/processor=cache/processor=xslt/...!/urn:files:test.csv
```

### Reverse Conversion Processors

All processors defined above can also be used for saving content back to the target resource if they are defined in the URL as reverse processors. Reverse processors are evaluated right to left. These reverse processors allow *round-tripping* content to and from the target resource.
As an example, the following URL converts HTML to DITA when the URL is opened using the `h2d.xsl` stylesheet and converts DITA to HTML when the content is saved in the application using the `d2h.xsl` stylesheet.

```
<convert:processor=xslt;ss=h2d.xsl/rprocessor=xslt;ss=d2h.xsl!/urn:files:sample.html
```

⚠️ **Important**: If you are publishing a DITA map that has such conversion URL references inside, you need to edit the transformation scenario and set the value of the parameter `fix.external.refs.com.oxygenxml` to `true`. This will instruct Oxygen XML Editor plugin to resolve such references during a special pre-processing stage. Depending on the conversion, you may also require additional libraries to be added using the Libraries button in the Advanced tab of the transformation scenario.

**Related Information:**

15. Debugging XSLT Stylesheets and XQuery Documents

Oxygen XML Editor plugin includes a powerful debugging interface that helps you to detect and solve problems with XSLT and XQuery transformations.

XSLT Debugger Perspective

The **XSLT Debugger perspective** (page 2709) allows you to detect problems in an XSLT transformation by executing the process step by step. To switch the focus to this **perspective**, select **Window > Open Perspective > Other > Oxygen XSLT Debugger**.

XQuery Debugger Perspective

The **XQuery Debugger perspective** (page 2709) allows you to detect problems in an XQuery transformation process by executing the process step by step in a controlled environment and inspecting the information provided in the special views. To switch the focus to this **perspective**, select **Window > Open Perspective > Other > Oxygen XQuery Debugger**.

XSLT/XQuery Debugging Overview

The **XSLT Debugger** and **XQuery Debugger perspectives** (page 2709) allows you to test and debug XSLT 1.0 / 2.0 / 3.0 stylesheets and XQuery 1.0 / 3.0 documents including complex XPath 2.0 / 3.0 expressions. The interface presents simultaneous views of the source XML document, the XSLT/XQuery document and the result document. As you go step by step through the XSLT/XQuery document the corresponding output is generated step by step, and the corresponding position in the XML file is highlighted. At the same time, special views provide various types of debugging information and events useful to understand the transformation process.

The following set of features allow you to test and solve XSLT/XQuery problems:

- Support for XSLT 1.0 stylesheets (using Saxon 6.5.5 and Xalan XSLT engines), XSLT 2.0 / 3.0 stylesheets and XPath 2.0 / 3.0 expressions that are included in the stylesheets (using Saxon 9.8.0.12 XSLT engine) and XQuery 1.0 / 3.0 (using Saxon 9.8.0.12 XQuery engine).
- Stepping capabilities: step in, step over, step out, run, run to cursor, run to end, pause, stop.
• Output to source mapping between every line of output and the instruction element / source context that generated it.

• Breakpoints (page 2028) on both source and XSLT/XQuery documents.

• Call stack on both source and XSLT/XQuery documents.

• Trace history on both source and XSLT/XQuery documents.

• Support for XPath expression evaluation during debugging.

• Step into imported/included stylesheets as well as included source entities.

• Available templates and hits count.

• Variables view.

• Dynamic output generation.

For even more information, watch our video demonstration:

https://www.youtube.com/embed/m9d8c4V-LJw

Debugger Layout

The XML and XSL files are displayed in Text mode (page 614). The other modes (Author mode (page 303), Grid mode (page 292)) are available only in the Editor perspective (page 215).

The XSLT/XQuery Debugger perspective (page 2709) contains the following components:

• Source Document View (XML) - Displays and allows the editing of XML files (documents).

• XSLT/XQuery Document View (XSLT/XQuery) - Displays and allows the editing of XSL files (stylesheets) or XQuery documents.

• Output View - Displays the output that results from inputting a document (XML) and a stylesheet (XSL) or XQuery document in the transformer. The transformation result is written dynamically while the transformation is processed (using the Run button on the Control toolbar (page 2011)). Several actions are available in the contextual menu for this view, including Find/Replace, Copy, and Format and Indent. There are two types of output views: a text-based Output view (with XML syntax highlights) and HTML view.

• Control Toolbar (page 2009) - Contains a variety of actions to help you configure and control the debugging process.

• Information Views (page 2012) - The information views at the bottom of the editor display various types of information to help you understand the transformation process.

Tip: The Output view and the various other information views are dockable (page 2705) so that you can configure the workspace according to your preferences.

Figure 622: Debugger Interface
XML documents and XSL stylesheets or XQuery documents that were opened in the Editor perspective (page 2709) are automatically sorted into the first two panes. When multiple files of each type are opened, the individual documents and stylesheets are separated using the familiar tab management system that you are used to in the Editor perspective. Selecting a tab brings the document or stylesheet into focus and enables editing without the need to go back to the Editor perspective.

During debugging, the current execution node is highlighted in both document (XML) and XSLT/XQuery views.

Related Information:

- Steps in a Typical Debugging Process (page 2025)
- Identify the XSLT / XQuery Expression that Generated Particular Output (page 2026)
- Supported Processors for XSLT / XQuery Debugging (page 2035)
- Performance Profiling of XSLT Stylesheets and XQuery Documents (page 2030)
The **Control** toolbar contains all the actions that you need to configure and control the debugging process. The following actions are described as they appear in the toolbar from left to right.

**Figure 623: Control Toolbar**

![Control Toolbar](image)

**XML source selector**

The current selection represents the source document used as input by the transformation engine. The selection list contains all opened files (XML files being emphasized). This option allows you to use other file types also as source documents. In an XQuery debugging session this selection field can be set to the default value *NONE*, because usually XQuery documents do not require an input source.

**XSL / XQuery selector**

The current selection represents the stylesheet or XQuery document to be used by the transformation engine. The selection list contains all opened files (XSLT / XQuery files being emphasized).

**Link with editor**

When selected, the XML and XSLT/XQuery selectors display the names of the files opened in the central editor panels. This button is toggled off by default.

**Output selector**

The selection represents the output file specified in the associated transformation scenario. You can specify the path by using the text field, the ![Insert Editor Variables](page 201) button, or the ![Browse](button).

**Configure parameters**

Opens a dialog box that allows you to configure the XSLT / XQuery parameters to be used by the transformation.

**Edit extensions**

Allows you to add and remove the Java classes and **JARS** *(page 2707)* used as XSLT extensions.

**Turn on/off profiling**

Enables / Disables current transformation profiling.

**Enable XHTML output**
Enables the rendering of the output in the **HTML output view** (page 2008) during the transformation process. For performance issues, disable XHTML output when working with very large files. Note that only XHTML conformant documents can be rendered by this view. To view the output result of other formats, such as HTML, save the **Text output** area to a file and use an external browser for viewing.

When starting a debug session from the **Editor perspective** (page 2709) by using the **Debug Scenario** action, the state of this toolbar button reflects the state of the **Show as XHTML** output option from the scenario.

**Turn on/off output to source mapping**

Enables or disables the output to source mapping between every line of output and the instruction element / source context that generated it.

**Debugger preferences**

Quick link to Debugger preferences page (page 182).

**XSLT / XQuery engine selector**

Lists the processors available for debugging XSLT and XQuery transformations (page 2035).

**XSLT / XQuery engine advanced options**

If Saxon HE/PE/EE is selected, you can click this button to open the Advanced Saxon Transformation Options page (page 1420).

**Step into F7**

Starts the debugging process and runs until the next instruction is encountered.

**Step over F8 (Alt + F8 on OS X)**

Run until the current instruction and its sub-instructions are over. Usually this will advance to the next sibling instruction.

**Step out Shift + F7 (Command + F8 on OS X)**

Run until the parent of the current instruction is over. Usually this will advance to the next sibling of the parent instruction.

**Run Shift + F5**

Starts the debugging process. The execution of the process is paused when a breakpoint (page 2013) is encountered or the transformation ends.
Run to cursor **Ctrl + F5**

Starts the debugging process and runs until one of the following conditions occur: the line of cursor is reached, a valid breakpoint (page 2028) is reached or the execution ends.

Run to end **Alt + F5**

 Runs the transformation until the end, without taking into account enabled breakpoints (page 2028), if any.

Pause **Shift + F6**

Request to pause the current transformation as soon as possible.

Stop **F6**

Request to stop the current transformation without completing its execution.

Show current execution nodes

Reveals the current debugger context showing both the current instruction and the current node in the XML source. Possible displayed states:

- Entering (➡️) or leaving (⬅️) an XML execution node.
- Entering (➡️) or leaving (⬅️) an XSL execution node.
- Entering (➡️) or leaving (⬅️) an XPath execution node.

**Note:** When you set a MarkLogic server as a processor, the Show current execution nodes button is named Refresh current session context from server. Click this button to refresh the information in all the views.

**Note:** For some of the XSLT processors (Saxon-HE/PE/EE) the debugger could be configured to step into the XPath expressions affecting the behavior of the following debugger actions: Step into, Step over or Step Out.

Related Information:

- Advanced Saxon HE/PE/EE XQuery Transformation Options (page 1437)

Debugging Information Views

The information views at the bottom of the editor is comprised of two panes that are used to display various types of information used to understand the transformation process. For each information
type there is a corresponding tab. While running a transformation, relevant events are displayed in the various information views. This enables the developer to obtain a clear view of the transformation progress. By using the debug controls, developers can easily isolate parts of stylesheet. Therefore, they may be more easily understood and modified.

The information types include the following:

Left side information views

- **Breakpoints view** (page 2013)
- **XWatch view** (page 2015)
- **Context view** (page 2015)
- **Messages view** (page 2016) (XSLT only)
- **Variables view** (page 2023)
- **Invocation Tree view** (page 2032)

Right side information views

- **Stack view** (page 2017)
- **Output Mapping Stack view** (page 2018)
- **Trace view** (page 2020)
- **Templates view** (page 2021) (XSLT only)
- **Nodes/Values Set view** (page 2022)
- **Hotspots view** (page 2033)

**Tip:** The information views are dockable (page 2705) so that you can configure the workspace according to your preferences.

**Breakpoints View**

The **Breakpoints view** lists all breakpoints (page 2028) that are set on opened documents. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu. Breakpoints can be inserted (page 2029) in the XML source document or the XSLT/XQuery document in debugging sessions.

Once you insert a breakpoint, it is automatically added to the list in the **Breakpoints view** and you can edit its associated condition. A breakpoint can have an associated break condition that represents an XPath expression evaluated in the current debugger context. For them to be processed, their evaluation result should be a boolean value. A breakpoint with an associated condition only stops the execution of the Debugger if the breakpoint condition is evaluated as true.

**Figure 624: Breakpoints View**
The **Breakpoints** view contains the following columns:

- **Enabled** - If selected, the current condition is evaluated and taken into account.
- **Resource** - Resource file and number of the line where the breakpoint is set.
- **Condition** - XSLT/XQuery expression to be evaluated during debugging. The expression will be evaluated at every debug step.

Clicking a record highlights the breakpoint line in the document.

**Note:** The breakpoints list is not deleted at the end of a transformation (it is preserved between debugging sessions).

The following actions are available in the contextual menu of the table:

- **Go to**
  
  Moves the cursor to the source of the breakpoint.

- **Run to Breakpoint**
  
  Runs the debugger up to the point of this particular breakpoint and ignores the others (regardless of whether they were previously enabled or disabled).

- **Enable**
  
  Enables the breakpoint.

- **Disable**
  
  Disables the breakpoint. A disabled breakpoint will not be evaluated by the Debugger.

- **Add**
  
  Allows you to add a new breakpoint and breakpoint condition.

- **Edit**
  
  Allows you to edit an existing breakpoint.

- **Remove**
  
  Deletes the selected breakpoint.

- **Enable all**
Enables all breakpoints.

**Disable all**

Disables all breakpoints.

**Remove all**

Removes all breakpoints.

Related Information:

- Using Breakpoints (page 2028)

Context View

The context node is valid only for XSLT debugging sessions and is a source node corresponding to the XSL expression that is evaluated. It is also called the context of execution. The context node implicitly changes as the processor hits various steps (at the point where XPath expressions are evaluated). This node has the same value as evaluating '.' (dot) XPath expression in XWatch view (page 2015). The value of the context node is presented as a tree in the **Context** view. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

*Figure 625: Context node view*

The context nodes are presented in a tree-like fashion. Nodes from a defined namespace bound to a prefix are displayed using the qualified name. If the namespace is not bound to a prefix, the namespace URI is presented before the node name. The value of the selected attribute or node is displayed in the right side panel. The **Context** view also presents the current mode of the XSLT processor if this mode differs from the default one.

**XPath Watch (XWatch) View**
The XWatch view shows XPath expressions evaluated during the debugging process. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

Expressions are evaluated dynamically as the processor changes its source context. When you type an XPath expression in the Expression column, Oxygen XML Editor plugin supports you with syntax highlight and content completion assistance (page 966).

Figure 626: XPath Watch View

![Figure 626: XPath Watch View](image)

Table 70. XWatch columns

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Expression</td>
<td>XPath expression to be evaluated (XPath 1.0 or 2.0 / 3.0 compliant).</td>
</tr>
<tr>
<td>Value</td>
<td>Result of XPath expression evaluation. Value has a type (see the possible values (page 2023) in the section Variables View (page 2023)). For Node Set results, the number of nodes in the set is shown in parenthesis.</td>
</tr>
</tbody>
</table>

⚠️ Important: Notes about working with the XWatch view:

- Expressions that reference variable names are not evaluated.
- The expression list is not deleted at the end of the transformation (it is preserved between debugging sessions).
- To insert a new expression, click the first empty line of the Expression column and start typing.
- To delete an expression, click its Expression column and delete its content.
- If the expression result type is a Node Set, click it (Value column) and its value is displayed in the Nodes/Values Set view (page 2022).

Messages View

Using xsl:message instructions is one way to signal special situations encountered during transformation as well as a raw way of doing the debugging. The Messages view is available only for XSLT debugging sessions and shows all xsl:message calls executed by the XSLT processor during
transformation. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

*Figure 627: Messages View*

<table>
<thead>
<tr>
<th>Message</th>
<th>Terminate</th>
<th>Resource</th>
</tr>
</thead>
<tbody>
<tr>
<td>Message 1</td>
<td>no</td>
<td>personal.xsl [line 8]</td>
</tr>
<tr>
<td>Message 2</td>
<td>no</td>
<td>personal.xsl [line 12]</td>
</tr>
<tr>
<td>Message 3</td>
<td>no</td>
<td>personal.xsl [line 20]</td>
</tr>
</tbody>
</table>

**Table 71. Messages columns**

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Message</td>
<td>Message content.</td>
</tr>
<tr>
<td>Terminate</td>
<td>Signals whether or not the processor terminates the transformation once it encounters the message (yes/no respectively).</td>
</tr>
<tr>
<td>Resource</td>
<td>Resource file where <em>xsl:message</em> instruction is defined and the message line number.</td>
</tr>
</tbody>
</table>

The following actions are available in the contextual menu:

- **Go to**
  - Highlight the XSL fragment that generated the message.

- **Copy**
  - Copies to clipboard message details (system ID, severity info, description, start location, terminate state).

- **Clear all**
  - Removes all messages from the view.

**Important:**

- Clicking a record from the table highlights the *xsl:message* declaration line.
- Message table values can be sorted by clicking the corresponding column header. Clicking the column header switches the sorting order between: ascending, descending, no sort.

**Stack View**

The **Stack** view shows the current execution stack of both source and XSLT/XQuery nodes. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

During the transformation, two stacks are managed. One for source nodes being processed and the other for XSLT/XQuery nodes being processed. Oxygen XML Editor plugin shows both node types in one common stack. The source (XML) nodes are preceded by a red color icon while XSLT/XQuery nodes are preceded by a green color icon. The advantage of this approach is that you can always see
the source scope on which an XSLT/XQuery instruction is executed (the last red color node on the stack). The stack is oriented upside down.

**Figure 628: Stack View**

The contextual menu contains one action: **Go to**, which moves the selection in the editor panel to the line containing the XSLT element that is displayed on the selected line from the view.

**Table 72. Stack Columns**

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>#</td>
<td>Order number, represents the depth of the node (0 is the stack base).</td>
</tr>
<tr>
<td>XML/XSLT/XQuery Node</td>
<td>Node from source or stylesheet document currently being processed. One particular stack node is the document root, noted as <code>#document</code>.</td>
</tr>
<tr>
<td>Attributes</td>
<td>Attributes of the node (a list of <code>id=value</code> pairs).</td>
</tr>
<tr>
<td>Resource</td>
<td>Resource file where the node is located.</td>
</tr>
</tbody>
</table>

⚠️ **Important:** Remarks:

- Clicking a record from the stack highlights that node's location inside resource.
- Using Saxon, the stylesheet elements are qualified with XSL proxy, while using Xalan you only see their names. (example: `xsl:template` using Saxon and `template` using Xalan).
- Only the Saxon processor shows element attributes.
- The Xalan processor shows also the built-in rules.

Output Mapping Stack View

The **Output Mapping Stack** view displays context data (page 2026) and presents the XSLT templates/XQuery elements that generated specific areas of the output. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

**Figure 629: Output Mapping Stack view**
The Go to action of the contextual menu takes you to the line that contains the XSLT element displayed in the Output Mapping Stack view.

Table 73. Output Mapping Stack Columns

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>#</td>
<td>The order number in the stack of XSLT templates/XQuery elements. Number 0 corresponds to the bottom of the stack in the status of the XSLT/XQuery processor. The highest number corresponds to the top of the stack.</td>
</tr>
<tr>
<td>XSL/XQuery Node</td>
<td>The name of an XSLT template/XQuery element that participated in the generation of the selected output area.</td>
</tr>
<tr>
<td>Attributes</td>
<td>The attributes of the XSLT template/XQuery node.</td>
</tr>
<tr>
<td>Resource</td>
<td>The name of the file containing the XSLT template/XQuery element.</td>
</tr>
</tbody>
</table>

⚠️ **Important:** Remarks:

- Clicking a record highlights that XSLT template definition/XQuery element inside the resource (XSLT stylesheet file/XQuery file).
- Saxon only shows the applied XSLT templates having at least one hit from the processor. Xalan shows all defined XSLT templates, with or without hits.
- The table can be sorted by clicking the corresponding column header. When clicking a column header the sorting order switches between: ascending, descending, no sort.
- Xalan shows also the built-in XSLT rules.

Related Information:

- Identify the XSLT / XQuery Expression that Generated Particular Output (page 2026)
- Stack View (page 2017)
- Trace View (page 2020)
Trace View

Usually, the XSLT/XQuery processors signal the following events during transformation:

- Entering a source (XML) node.
- Leaving a source (XML) node.
- Entering an XSLT/XQuery node.
- Leaving an XSLT/XQuery node.

The Trace view catches all of these events, so you can see how the process evolved. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

The red icon lines denote source nodes while the green icon lines denote XSLT/XQuery nodes. It is possible to save the element trace in a structured XML document (using the Export to XML action in the contextual menu). Thus, you have the possibility of comparing the trace results from multiple debug sessions.

**Figure 630: Trace History View**

The contextual menu contains the following actions:

**Go to**

Moves the selection in the editor panel to the line containing the XSLT element or XML element that is displayed on the selected line from the view;

**Export to XML**

Saves the entire trace list in XML format.

**Table 74. Trace History Columns**

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Depth</td>
<td>Shows you how deep the node is nested in the XML or stylesheet structure. The bigger the number, the more nested the node is. A depth 0 node is the document root.</td>
</tr>
<tr>
<td>Column</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>XML/XSLT/XQuery Node</td>
<td>Represents the node from the processed source or stylesheet document. One particular node is the document root, noted as #document. Every node is preceded by an arrow that represents what action was performed on it (entering or leaving the node).</td>
</tr>
<tr>
<td>Attributes</td>
<td>Attributes of the node (a list of id=&quot;value&quot; pairs).</td>
</tr>
<tr>
<td>Resource</td>
<td>Resource file where the node is located.</td>
</tr>
</tbody>
</table>

**Important:** Remarks:

- Clicking a record highlights that node's location inside the resource.
- Only the Saxon processor shows the element attributes.
- The Xalan processor shows also the built-in rules.

**Templates View**

The `xsl:template` is the basic element for stylesheets transformation. The **Templates view** is only available during XSLT debugging sessions and shows all `xsl:template` instructions used by the transformation. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Being able to see the number of hits for each of the templates allows you to get an idea of the stylesheet coverage by template rules with respect to the input source.

**Figure 631: Templates view**

The contextual menu contains one action: **Go to**, which moves the selection in the editor panel to the line that contains the XSLT template displayed on the selected line from the view.

**Table 75. Templates columns**

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Match</td>
<td>The <code>match</code> attribute of the <code>xsl:template</code>.</td>
</tr>
<tr>
<td>Hits</td>
<td>The number of hits for the <code>xsl:template</code>. Shows how many times the XSLT processor used this particular template.</td>
</tr>
</tbody>
</table>
### Table:

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Priority</strong></td>
<td>The template priority as established by XSLT processor.</td>
</tr>
<tr>
<td><strong>Mode</strong></td>
<td>The <code>mode</code> attribute of the <code>xsl:template</code>.</td>
</tr>
<tr>
<td><strong>Name</strong></td>
<td>The <code>name</code> attribute of the <code>xsl:template</code>.</td>
</tr>
<tr>
<td><strong>Resource</strong></td>
<td>The resource file where the template is located.</td>
</tr>
</tbody>
</table>

**Important**: Remarks:

- Clicking a record highlights that template definition inside the resource.
- Saxon only shows the applied templates having at least one hit from the processor. Xalan shows all defined templates, with or without hits.
- Template table values can be sorted by clicking the corresponding column header. When clicking a column header the sorting order switches between: ascending, descending, no sort.
- Xalan shows also the built-in rules.

---

**Nodes/Values Set View**

The **Nodes/Values Set** view is always used in relation with the **Variables** view (page 2023) and **XWatch** view (page 2015). If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu. It shows an XSLT node set value in a tree form. This view is updated as a response to the following events:

- You click a variable that has a node set value in the **Variables** (page 2023) or **XWatch** view (page 2015).
- You click a tree fragment in the **Variables** (page 2023) or **XWatch** view (page 2015).
- You click an XPath expression evaluated to a node set in the **Variables** (page 2023) or **XWatch** view (page 2015).

**Figure 632: Node Set view**

The nodes / values set is presented in a tree-like fashion. Nodes from a defined namespace bound to a prefix are displayed using the qualified name. If the namespace is not bound to a prefix, the
namespace URI is presented before the node name. The value of the selected attribute or node is displayed in the right side panel.

**Important:** Remarks:

- For longer values in the right side panel, the interface displays it with an ellipsis (...) at the end. A more detailed value is available as a tooltip when hovering over it.
- Clicking a record highlights the location of that node in the source or stylesheet view.

Variables View

The **Variables** view displays variables and parameters (local and global), along with their values. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Variables and parameters play an important role during an XSLT/XQuery transformation. Oxygen XML Editor plugin uses the following icons to differentiate variables and parameters:

- **V** - Global variable.
- **{V}** - Local variable.
- **P** - Global parameter.
- **{P}** - Local parameter.

The following value types are available:

- **Boolean**
- **String**
- **Date** - XSLT 2.0 / 3.0 only.
- **Number**
- **Set**
- **Object**
- **Fragment** - Tree fragment.
- **Any**
- **Undefined** - The value was not yet set, or it is not accessible.

**Note:**

When Saxon 6.5 is used, if the value is unavailable, then the following message is displayed in the **Value** field: "The variable value is unavailable".

When Saxon 9 is used:

- If the variable is not used, the **Value** field displays "The variable is declared but never used".
If the variable value cannot be evaluated, the Value field displays "The variable value is unavailable".

- Document
- Element
- Attribute
- ProcessingInstruction
- Comment
- Text
- Namespace
- Evaluating - Value under evaluation.
- Not Known - Unknown types.

![Variables View](image.png)

**Figure 633: Variables View**

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of variable / parameter.</td>
</tr>
<tr>
<td>Value Type</td>
<td>Type of variable/parameter.</td>
</tr>
<tr>
<td>Value</td>
<td>Current value of variable / parameter.</td>
</tr>
</tbody>
</table>

The value of a variable (the Value column) can be copied to the clipboard for pasting it to other editor areas with the Copy value action from the contextual menu. This is useful if you have long and complex values that cannot be easily remembered just by looking at them once.

⚠️ **Important:** Remarks:

- Local variables and parameters are the first entries presented in the table.
- Clicking a record highlights the variable definition line.
- Variable values could differ depending on the transformation engine used or stylesheet version set.
- If the value of the variable is a node set or a tree fragment, clicking it causes the Node Set view (page 2022) to be shown with the corresponding set of values.
• Variable table values can be sorted by clicking the corresponding column header. Clicking the column header switches between the orders: ascending, descending, no sort.

Multiple Output Documents in XSLT 2.0 and XSLT 3.0

For XSLT 2.0 and XSLT 3.0 stylesheets that store the output in multiple files by using the `xsl:result-document` instruction, the content of the file created in this way is displayed dynamically while the transformation is running in an output view. There is one tab for each `xsl:result-document` instruction in the Result Documents view so that the output is not mixed while still being presented in multiple views.

Steps in a Typical Debugging Process

Depending on your situation and needs, the debugging process might be more complex, but the following procedure is an example of a typical debugging process:

1. Open the source XML document and the XSLT/XQuery document.

2. If you are in the Editor perspective (page 2709), switch to the XSLT Debugger or XQuery Debugger perspective (page 2709) with one of the following actions:
   - Select Window > Open Perspective > Other > Oxygen XSLT Debugger/XQuery Debugger.
   - Select the Debug scenario action on the toolbar. This action initializes the Debugger perspective (page 2709) with the parameters of the transformation scenario. Any modification applied to the scenario parameters (the transformer engine, XSLT parameters, transformer extensions, etc.) will be saved back in the scenario when exiting from the Debugger perspective.

3. Select the source XML document in the XML source selector of the Control toolbar (page 2010). In the case of XQuery debugging, if your XQuery document has no implicit source, set the source selector value to NONE.

4. Select the XSLT/XQuery document in the XSL/XQuery selector of the Control toolbar (page 2010).

5. Set XSLT/XQuery parameters using the Configure parameters button on the Control toolbar (page 2010).

6. Set one or more breakpoints (page 2028).

7. Step through the stylesheet using the following buttons available on the Control toolbar (page 2011):
8. Examine the data in the information views to find the bug in the transformation process. For more information about fixing bugs in the transformation, see: Identify the XSLT / XQuery Expression that Generated Particular Output (page 2026).

Related Information:

- Identify the XSLT / XQuery Expression that Generated Particular Output (page 2026)

### Identify the XSLT / XQuery Expression that Generated Particular Output

To quickly spot the XSLT templates or XQuery expressions with problems, it is important to know what XSLT template in the XSLT stylesheet (or XQuery expression in the XQuery document) and what element in the source XML document generated a specified area in the output.

Some of the debugging capabilities (for example, **Step in**) can be used for this purpose. Using **Step in**, you can see how output is generated and link it with the XSLT/XQuery element being executed in the current source context. However, this can become difficult on complex XSLT stylesheets or XQuery documents that generate a large output.

You can click particular text in the **Output** view and the editor will select the XML source context and the XSLT template/XQuery element that generated that text. Also, inspecting the whole stack of XSLT templates/XQuery elements that determined the state of the XSLT/XQuery processor at the moment of generating the specified output area speeds up the debugging process.

This is an example of a typical procedure for identifying an expression that generated particular output:
1. Switch to the **XSLT Debugger** or **XQuery Debugger** perspective *(page 2709)* with one of the following actions:
   - Select `Window > Open Perspective > Other > Oxygen XSLT Debugger/XQuery Debugger`.
   - Select the 🔄 **Debug scenario** action on the toolbar. This action initializes the Debugger perspective *(page 2709)* with the parameters of the transformation scenario. Any modification applied to the scenario parameters (the transformer engine, XSLT parameters, transformer extensions, etc.) will be saved back in the scenario when exiting from the Debugger perspective.

2. Select the source XML document in the **XML source selector** of the Control toolbar *(page 2010)*. In the case of XQuery debugging, if your XQuery document has no implicit source, set the source selector value to **NONE**.

3. Select the XSLT/XQuery document in the **XSL/XQuery selector** of the Control toolbar *(page 2010)*.

4. Select the appropriate engine in the **XSL/XQuery engine selector** of the Control toolbar *(page 2011)*.

5. Set XSLT/XQuery parameters using the **Configure parameters** button on the Control toolbar *(page 2010)*.

6. Apply the XSLT stylesheet or XQuery transformation using the ⬢ **Run to end** button that is available on the Control toolbar *(page 2012)*.

7. Inspect the mapping by clicking a section of the output in the **Output** view.

*Figure 634: Text Output to Source Mapping*
This action will highlight the XSLT / XQuery element and the XML source context. This XSLT template/XQuery element that is highlighted in the XSLT/XQuery editor represents only the top of the stack of XSLT templates/XQuery elements that determined the state of the XSLT/XQuery processor at the moment of generating the clicked output section. In the case of complex transformations, inspecting the whole stack of XSLT templates/XQuery elements speeds up the debugging process. This stack is available in the Output Mapping Stack view (page 2018).

Related Information:

- Output Mapping Stack View (page 2018)
- Trace View (page 2020)
- Templates View (page 2021)
The Oxygen XML Editor plugin XSLT/XQuery Debugger allows you to interrupt XSLT/XQuery processing to gather information about variables and processor execution at particular points. To ensure breakpoints are persistent between work sessions, they are saved at project level. You can set a maximum of 100 breakpoints per project.

**Inserting Breakpoints**

To insert a breakpoint, follow these steps:

1. Click the line where you want to insert the breakpoint in the XML source document or the XSLT/XQuery document. Breakpoints are automatically created on the ending line of a start tag, even if you click a different line.
2. Right-click the vertical stripe on the left side of the editor panel and select **Add breakpoint**.

**Result:**

Once you insert a breakpoint, it is automatically added to the list in the Breakpoints view and you can edit its associated condition. A breakpoint can have an associated break condition that represents an XPath expression evaluated in the current debugger context. For them to be processed, their evaluation result should be a boolean value. A breakpoint with an associated condition only stops the execution of the Debugger if the breakpoint condition is evaluated as true.

Figure 635: Example: Breakpoints

![Example Breakpoints](image)

**Tip:** You can configure the color and how breakpoints are shown from the Eclipse Annotations preferences page (Window ('Eclipse' on Mac OSX) > Preferences > General > Editors > Text Editors > Annotations).

**Removing Breakpoints**

To remove a breakpoint, Right-click the breakpoint icon (●) in the vertical stripe on the left side of the editor panel and select **Remove breakpoint**.

**Related Information:**

- [Breakpoints View (page 2013)](page)
Performance Profiling of XSLT Stylesheets and XQuery Documents

Whether you are trying to identify a performance issue that is causing your production XSLT/XQuery transformation to not meet customer expectations or you are trying to proactively identify issues prior to deploying your XSLT/XQuery transformation, using the XSLT/XQuery profiler feature is essential to helping you save time and ultimately ensure a better performing, more scalable XSLT/XQuery transformation.

The XSLT/XQuery profiling feature can use any available XSLT/XQuery processor that can be used for debugging and it is available from the debugging perspective (page 2709).

Enabling the Profiler

Enabling and disabling the profiler is controlled by the Profiler button from the debugger Control toolbar (page 2010). The XSLT/XQuery profiler is off by default. This option is not available during a debugger session so you need to set it before starting the transformation. For information about a common debugging procedure, see Steps in a Typical Debugging Process (page 2025).

Profiling Information Views

Immediately after enabling the profiler, two new information views are added to the current debugger information views (page 2012):

- Invocation tree view (page 2032) on left side
- Hotspots view (page 2033) on right side

Profiling data is available only after the transformation ends successfully.

On the left side (Invocation tree view (page 2032)), you can examine how style instructions are processed. This result view is also named call-tree, as it represents the order of style processing. The profiling result shows the duration time for each of the style-instruction including the time needed for its called children.

On the right side (Hotspots view (page 2033)), you can immediately spot the time the processor spent in each instruction. As an instruction usually calls other instructions, the used time of the called instruction is extracted from the duration time of the caller (the hotspot only presents the inherent time of the instruction).
Source Backmapping

In either the Invocation tree (page 2032) or Hotspots view (page 2033), you can use the backmapping feature to find the XSLT stylesheet or XQuery expression definition. Clicking the selected item causes Oxygen XML Editor plugin to highlight the XSLT stylesheet or XQuery expression source line where the instruction is defined.

Figure 636: Source Backmapping

Saving and Customizing Profiling Data

The profiling data can be saved (exported) into XML and HTML format. In either the Invocation tree (page 2032) or Hotspots view (page 2033), right-click anywhere in the view and select Export to XML or Export to HTML. The HTML report can be customized based upon the profiling raw data. When you select Export to HTML, Oxygen XML Editor plugin will save it as XML and apply an XSLT stylesheet to render the report as XML. You can customize these stylesheets to suit your needs. By default, they are located in: [OXYGEN_INSTALL_DIR]/frameworks/profiler/.

Other Profiling Notes

- If you want to change the XSLT/XQuery profiler settings (page 183), use the contextual menu and choose the corresponding View settings entry.
- Profiling exhaustive transformations may run into an OutOfMemory error due to the large amount of information being collected. If this is the case, you can close unused projects when running the profiling or use high values for Java VM options -Xms and -Xmx. If this does not help you can shorten your source XML file and try again.
- For more information about the XSLT/XQuery Profiler, watch our video demonstration:

  https://www.youtube.com/embed/4ftHschjLqA
Invocation Tree View

The Invocation Tree view shows a top-down call tree that represents how XSLT instructions or XQuery expressions are processed. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

Figure 637: Invocation Tree View

The entries in the invocation tree include a few possible icons that indicate the following:

- □ - Points to a call whose inherent time is insignificant compared to its total time.
- ○ - Points to a call whose inherent time is significant compared to its total time (greater than 1/3rd of its total time).

Every entry in the invocation tree includes textual information that depends on the XSLT/XQuery profiler settings (page 183):

- A percentage number of the total time that is calculated with respect to either the root of the tree or the calling instruction.
- A total time measurement in milliseconds or microseconds. This is the total execution time that includes calls into other instructions.
- A percentage number of the inherent time that is calculated with respect to either the root of the tree or the calling instruction.
- An inherent time measurement in milliseconds or microseconds. This is the inherent execution time of the instruction.
- An invocation count that shows how often the instruction has been invoked on this call-path.
- An instruction name that contains also the attributes description.

The Invocation Tree view also includes the following contextual menu actions:

Export to HTML

Selecting this option will save the profiling data as XML and then apply an XSLT stylesheet to render the report as HTML. These stylesheets are included in the
subfolder: \{OXYGEN_INSTALL_DIR\}/frameworks/profiler/. You can use them to customize your own report based on the profiling raw data.

**Export to XML**

Use this option to save the profiling data as an XML file in a specified location.

**View settings**

Opens the XSLT/XQuery Profiler preferences page (page 183) that allows you to configure various profiling settings.

**Hotspots View**

The Hotspots view displays a list of all instruction calls that lie above the threshold defined in the XSLT/XQuery profiler settings (page 183). If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

![Hotspots View](image)

By opening a hotspot instruction entry, the tree of back-traces leading to that instruction call are calculated and shown.

Every hotspot is described by the values from the following columns:

- **Instruction** - The name of the instruction.
- **Percentage** - The percentage number for this hotspot entry with respect to the total time.
- **Time** - The inherent time in milliseconds or microseconds of how much time has been spent in the hotspot. All calls into this instruction are summed up regardless of the particular call sequence.
- **Calls** - The invocation count of the hotspot entry.

If you click the ⚠️ handle on the left side of a hotspot, a tree of back-traces will be shown.
Every entry in the backtrace tree has textual information attached to it that depends on the XSLT/XQuery profiler settings (page 183):

- A percentage number that is calculated with respect to either the total time or the called instruction.
- A time measured in milliseconds or microseconds of how much time has been contributed to the parent hotspot on this call-path.
- An invocation count that shows how often the hotspot has been invoked on this call-path.

Note: This is not the number of invocations of this instruction.

- An instruction name that also contains its attributes.

The Hotspots view also includes the following contextual menu actions:

**Export to HTML**

Selecting this option will save the profiling data as XML and then apply an XSLT stylesheet to render the report as HTML. These stylesheets are included in the subfolder: \[OXYGEN_INSTALL_DIR\]/frameworks/profiler/. You can use them to customize your own report based on the profiling raw data.

**Export to XML**

Use this option to save the profiling data as an XML file in a specified location.

**View settings**

Opens the XSLT/XQuery Profiler preferences page (page 183) that allows you to configure various profiling settings.

### Debugging XSLT that Call Java Extensions

It is possible to debug XSLT that call Java extensions. This is achieved through a transformation scenario in which the Java extensions are specified, and the debugging can be done based upon the same scenario.

To debug XSLT with Java extensions, follow this procedure:

1. Create an XSLT transformation scenario (page 1463) for your XSLT document (select Configure Transformation Scenario(s) action from the toolbar, then click New, and select XSLT transformation).
2. In the New scenario dialog box, click the Extensions button (in the XSLT tab), specify the Java extensions (JAR libraries) that are needed, and click OK.
3. Once you are finished configuring the transformation scenario, click OK, then select Save and close.

4. Use the Debug scenario action on the toolbar and the debugging will be based upon the same transformation scenario you just configured and saved.

**Tip:** You could achieve this during a typical debugging process (page 2025) by specifying the Java extensions using the Edit extensions button on the debugger control toolbar (page 2010).

---

**Related Information:**
- Validating XSLT Stylesheets that Call Java Extensions (page 961)

---

**Debugging Java Extensions**

The XSLT/XQuery debugger does not step into Java classes that are configured as XSLT/XQuery extensions of the transformation. To step into Java classes, inspect variable values, and set breakpoints (page 2028) in Java methods, you can set up a Java debug configuration in an IDE (such as the Eclipse SDK) as described in the following steps:

1. Create a debug configuration.
   a. Set at least 256 MB as heap memory for the Java virtual machine (recommended 1024 MB) by setting the -Xmx parameter in the debug configuration (for example, `-Xmx1024m`).
   b. Make sure the `lib/oxygen.jar` file and your Java extension classes are on the Java classpath. The Java extension classes should be the same classes that were set as an extension (page 2010) of the XSLT/XQuery transformation in the debugging perspective (page 2709).
   c. Set the class `ro.sync.exml.Oxygen` as the main Java class of the configuration. The main Java class `ro.sync.exml.Oxygen` is located in the `oxygen.jar` file.

2. Start the debug configuration.
   Now you can set breakpoints and inspect Java variables as in any Java debugging process executed in the selected IDE (Eclipse SDK, and so on.).

---

**Supported Processors for XSLT / XQuery Debugging**
The following built-in XSLT processors are integrated in the debugger and can be selected in the Control Toolbar (page 2009):

- **Saxon 9.8.0.12 HE (Home Edition)** - a limited version of the Saxon 9 processor, capable of running XSLT 1.0, XSLT 2.0 / 3.0 basic and XQuery 1.0 transformations, available in both the XSLT debugger and the XQuery one,

- **Saxon 9.8.0.12 PE (Professional Edition)** - capable of running XSLT 1.0 transformations, XSLT 2.0 basic ones and XQuery 1.0 ones, available in both the XSLT debugger and the XQuery one,

- **Saxon 9.8.0.12 EE (Enterprise Edition)** - a schema aware processor, capable of running XSLT 1.0 transformations, XSLT 2.0 /3.0 basic ones, XSLT 2.0 / 3.0 schema aware ones and XQuery 1.0 / 3.0 ones, available in both the XSLT debugger and the XQuery debugger,

- **Saxon 6.5.5** - capable of running only XSLT 1.0 transformations, available only in the XSLT debugger,

- **Xalan 2.7.2** - capable of running only XSLT 1.0 transformations, available only in the XSLT debugger.
16.
Framework and Author Mode Customization

This section contains information and tutorials about customizing the authoring experience through custom frameworks and customizing the Author editing mode through CSS styling or API extensions.

Creating and Configuring Custom Frameworks

Oxygen XML Editor plugin includes built-in, configured frameworks for DocBook, DITA, TEI, XHTML, and JATS, but you can also create your own customization to handle other types of documents. A common use case is wanting to customize the interface to accommodate the needs of your authoring team.

Fully configuring a framework usually involves customizing CSS stylesheets, XML schemas, GUI components (menu actions, toolbars, inline components, content completion proposals, and more), configuring other more general settings, then bundling the framework to share with your team. The CSS and GUI components are used to customize the interface, while other general settings can be configured to accommodate custom document templates, XML catalogs, transformation scenarios, and more.

Advanced Framework Customization

Oxygen XML Editor plugin supports individual document types and classes of document types through frameworks. A framework associates a document type or a class of documents with CSS stylesheets, validation schemas, catalog files, new files templates, transformation scenarios, content completion proposals, custom actions, and more.

This section includes information about numerous possibilities for creating and customizing a framework, and how to share your customization with others.

Tip: A sample framework customization package is available that you can dabble with and use to help you get started. It can be downloaded from: https://www.oxygenxml.com/php/get_oxygen_sample_framework.php. The package includes a sample CSS file, XSL file, schema files, document templates, an XML catalog file, custom icons, and other resources.

Creating/Extending a Custom Framework
The easiest way to create a custom framework (page 2706) (document type) is by extending an existing built-in framework, such as DITA or DocBook, and then making modifications to it. You can then easily share the custom framework (page 2086) with your team.

To create a custom framework by extending an existing one, follow these steps:

1. In a location where you have full write access, create a folder structure similar to this: `custom_frameworks/dita-extension`.
2. Open the Preferences dialog box (page 55) and go to Document Type Association > Locations (page 71). Add the path to your `custom_frameworks` folder in the Additional frameworks directories list and click OK or Apply to save your changes.
3. Go to the Document Type Association preferences page (page 69) and select an existing framework configuration (for example, DITA) and use the Extend button to create an extension for it.

   **Step Result:** This opens the Document Type Configuration dialog box (page 72) where you can define the set of rules and settings for your custom framework.

4. Give the extension an appropriate name, select External for the Storage option, click the browsing button (changingdirectory) to specify the location of the custom directory you created in step 1.
5. Continue to configure the extension using the tabs on the bottom half of the dialog box. For details about each of those tabs, see the child topics in the Document Type Configuration dialog box (page 72) section. For even more information about customizing the extended framework, see the various topics and tutorials in the Creating and Configuring Custom Frameworks (page 2037) section. Make sure that you save any resources you reference in your framework configuration (CSS files, new document templates, schemas used for validation, catalogs, etc.) in your custom framework directory you created in step 1.
6. Click OK to close the configuration dialog box and then OK or Apply to save your changes.

   **Results:** You now have a fully functional framework that can be shared with others (page 2086).

**Related Information:**

- Sharing a Custom Framework (page 2086)

**Configuring Actions, Menus, Toolbars, Content Completion for a Framework**

You can configure actions, menus, toolbars, icons, and content completion proposals specifically for a particular framework (page 2706) (document type) to customize your editing experience in **Author** mode by using the Document Type configuration dialog box (page 72). Advanced users who
are familiar with API development can also create custom **Author** mode operations for a particular framework.

## Configuring Actions for a Framework

To add or configure actions for a *framework (page 2706)* (document type), follow this procedure:

1. **Open the Preferences dialog box** *(page 55)*, go to **Document Types Association**, and select the *framework* for which you want to create an action.
2. Click **Edit** and in the **Document Type configuration dialog box (page 72)** go to the **Author** tab, then go to the **Actions** subtab.
3. To create a new action, click the **New** button. To edit an existing action, select the action and click the **Edit** button.

**Result:** In either case, this opens the **Action configuration dialog box (page 79)** where you can configure numerous aspects of the action.

## Example: Configure the Insert Section Action for a Framework

This topic describes the procedure for defining the **Insert Section** action for a custom *framework (page 2706)*. It is assumed that the icon files, ![Section16.gif](Section16.gif) for the menu item and ![Section20.gif](Section20.gif) for the toolbar, are already available. Although you could use the same icon size for both the menu and toolbar, usually the icons from the toolbars are larger than the ones found in the menus. These files should be placed in your custom *framework* directory (`\[OXYGEN_INSTALL_DIR\]\frameworks\[CUSTOM_FRAMEWORK_DIR]\`).

*Figure 639: Action Dialog Box*
1. Set the **ID** field to **insert_section**. This is a unique action identifier.

2. Set the **Name** field to **Insert Section**. This will be the action's name, displayed as a tooltip when the action is placed in the toolbar, or as the menu item name.

3. Set the **Menu access key** to **i**. On Windows, the menu items can be accessed using **Alt+letter** keys combination, when the menu is visible. The **letter** is visually represented by underlining the first letter from the menu item name having the same value.

4. Add a **Description**.

5. Set the **Large icon (20x20)** field to **${frameworks}/sdf/Section20.gif**. A good practice is to store the image files inside the **framework directory** and use **editor variable (page 201)** **${framework}** to make the image relative to the **framework location**.

   If the images are bundled in a **JAR (page 2707)** archive together with some Java operations implementation, for instance, it might be convenient for you to reference the images not by the file name, but by their relative path location in the class-path.

   If the image file **Section20.gif** is located in the **images directory** inside the **JAR archive**, you can reference it by using **/images/Section20.gif**. The **JAR file** must be added into the **Classpath list**.

6. Set the **Small icon (16x16)** field to **${frameworks}/sdf/Section16.gif**.

7. Click the text field next to **Shortcut key** and set it to **Ctrl+Shift+S (Meta+Shift+S on Mac OS)**. This will be the key combination to trigger the action using the keyboard only.
The shortcut is enabled only by adding the action to the main menu of Author mode (page 2042), which contains all the actions that the author will have in a menu for the current document type.

8. At this time the action has no functionality added to it. Next you must define how this action operates. An action can have multiple operation modes. The first action mode enabled by the evaluation of its associated XPath expression will be executed when the action is triggered by the user. The XPath expression needs to be version 2.0 and its scope must be only element and attribute nodes of the edited document. Otherwise, the expression will not return a match and will not trigger the action. If the expression is left empty, the action will be enabled anywhere in the scope of the root element. For this example, suppose you want the action to add a section only if the current element is either a book, article, or another section.

   a. Set the XPath expression field to:

```
local-name()='section' or local-name()='book' or local-name()='article'
```

   b. Set the invoke operation field to InsertFragmentOperation built-in operation, designed to insert an XML fragment at cursor position. This belongs to a set of built-in operations, a complete list of which can be found in the Author Default Operations (page 2166) section. This set can be expanded with your own Java operation implementations.

   c. Configure the arguments section as follows:

```
<secti
xmlns="http://www.oxygenxml.com/sample/documentation"
>  
title/>
</secti
```

   insertLocation - leave it empty. This means the location will be at the cursor position.

   insertPosition - select "Inside".

Example: Configure the Insert Table Action for a Framework

This topic describes the procedure for defining the Insert Table action for a custom framework (page 2706). Suppose that you want to create an action that inserts a table with three rows and three columns into a document and the first row is the table header. As with the insert section action (page 2039), you will use the InsertFragmentOperation built-in operation.

Place the icon files for the menu item, and for the toolbar, in your custom framework directory (\OXYGEN_INSTALL_DIR\frameworks\{CUSTOM_FRAMEWORK_DIR\}).
1. Set **ID** field to `insert_table`.
2. Set **Name** field to **Insert table**.
3. Set **Menu access key** field to `t`.
4. Set **Description** field to **Adds a table element**.
5. Set **Toolbar icon** to `$\{framework\} / toolbarIcon.png`.
6. Set **Menu icon** to `$\{framework\} / menuIcon.png`.
7. Set **Shortcut key** to **Ctrl + Shift + T (Command + Shift + T on OS X)**.
8. Set up the action's functionality:
   a. Set **XPath expression** field to `true()`.
      `true()` is equivalent with leaving this field empty.
   b. Set **Invoke operation** to use **InsertFragmentOperation** built-in operation that inserts an XML fragment to the cursor position.
   c. Configure operation's arguments as follows:

      **fragment** - set it to:

      ```xml
      <table xmlns="http://www.oxygenxml.com/sample/documentation">
       <header>
        <td/> <td/> <td/>
       </header>
       <tr>
        <td/> <td/> <td/>
       </tr>
       <tr>
        <td/> <td/> <td/>
       </tr>
      </table>
      ```

      **insertLocation** - to add tables at the end of the section use the following code:

      ```xml
      ancestor::section/*[last()]
      ```

      **insertPosition** - **Select After**.

Configure the Main Menu for a Framework

Defined actions can be grouped into customized menus in the Oxygen XML Editor plugin menu bar.

1. Open the **Document Type** configuration dialog box (**page 72**), select your custom **framework** (**page 2706**), and go to the **Author** tab.

2. Go to the **Menu** subtab. In the left side you have the list of actions and some special entries:

   • **Submenu** - Creates a submenu. You can nest an unlimited number of menus.
3. The right side of the panel displays the current actions for that menu tree. To change its name, click this label to select it, then press the Edit button.

4. Select the Submenu label in the left panel section and the appropriate label in the right panel section, then press the Add as child button. Change the submenu name to Table, using the Edit button.

5. Select the Insert section action in the left panel section and the Table label in the right panel section, then press the Add as sibling button.

6. Now select the Insert table action in the left panel section and the Table in the right panel section. Press the Add as child button.

Figure 640: Configuring the Menu

When opening a test document for a custom framework in Author mode, the menu you created is displayed in the editor menu bar, between the Tools and the Document menus. The upper part of the menu contains generic Author mode actions (common to all document types) and the two actions created previously (with Insert table under the Table submenu).

Figure 641: Author Mode Menu
Configure the Contextual Menu for a Framework

The contextual menu is displayed when you right-click in the Author editing area. You can only configure the bottom part of the menu, since the top part is reserved for a list of generic actions (such as Copy, Paste, Undo, etc.)

1. Open the Document Type configuration dialog box (page 72) for the particular framework (page 2706) and go to the Author tab. Next, go to the Contextual Menu subtab.

2. Follow the same steps as explained in the Configuring the Main Menu (page 2042), except changing the menu name because the contextual menu does not have a name.

**Note:** You can choose to reuse a submenu that contains general authoring actions. In this case, all actions (both general and framework-specific ones) are grouped together under the same submenu.

![Fig 642: Configuring the Contextual Menu](image)

To test it, open the test file, and open the contextual menu. In the lower part there is shown the Table sub-menu and the Insert section action.

Configure the Toolbars for a Framework

This procedure describes how to add defined actions to a toolbar for a custom framework (page 2706). You can also create additional custom toolbars with existing or custom actions.

1. Open the Document Type configuration dialog box (page 72) for your custom framework and select the Author tab.
2. Next, go to the Toolbar subtab.

![Fig 643: Configuring the Toolbar](image)
The panel is divided in two sections. The left side contains a list of actions, while the right side contains an action tree, displaying the list of actions added in the toolbar. The special entry called Separator allows you to visually separate the actions in the toolbar.

3. To add an action, select it in the left panel and select the particular toolbar label where you want it added in the right panel section, then click the Add as child or Add as sibling button.

**Result:** When opening a document for the particular framework in Author mode, the toolbar with the new buttons will be displayed in the toolbar area.

**Tip:** If you have many custom toolbar actions, or want to group actions according to their category, add more toolbars with custom names and split the actions to better suit your purpose. If your toolbar is not displayed when switching to the Author mode, right-click the main toolbar, select Configure Toolbars, and make sure the appropriate toolbar (such as the Author Custom Actions toolbar) is selected.

**Note:** A maximum of 16 toolbars can be added. If you add more, all extra toolbars will be automatically converted to sub-toolbars for the last added toolbar.

**Configure Content Completion for a Framework**

You can customize the content of the following Author controls, adding items (which, when invoked, perform custom actions) or filtering the default contributed ones:

- **Content Completion Assistant** ([page 2704](#)) window
- **Elements** view ([page 325](#))
- **Insert Element** menus (from the **Outline** view ([page 316](#)) or **breadcrumb** ([page 684](#)) contextual menus)
You can use the content completion customization support in a custom framework by following this procedure:

1. Open the Document type configuration dialog box for your custom framework and select the Author tab. Next, go to the Content Completion tab.

   Figure 644: Customize Content Completion

   The top side of the Content Completion section contains the list with all the actions defined within the custom framework and the list of actions that you decided to include in the Content Completion Assistant list of proposals. The bottom side contains the list with all the items that you decided to remove from the Content Completion Assistant list of proposals.

2. If you want to add a custom action to the list of current Content Completion proposals, select the action item from the Available actions list and press the Add as child or Add as sibling button to include it in the Current actions list. An Insert Action dialog box appears, giving you the possibility to select where to provide the selected action.

   Figure 645: Insert Action Dialog Box

3. If you want to exclude a certain item from the Content Completion proposals, you can use the Add button from the Filter - Remove content completion items list. The Remove item dialog
box is displayed, allowing you to input the item name and to choose the controls that filter it. The Item name combo box accepts wildcards.

Figure 646: Remove Item Dialog Box

Adding Retina/HiDPI Icons in a Framework

Higher resolution icons can also be included in customized frameworks (page 2706) for rendering them in a Retina or HiDPI display. The icons can be referenced directly from the Document Type Configuration dialog box (page 72) (from the Action dialog box (page 79)) or from an API (ro.sync.exml.workspace.api.node.customizer.XMLNodeRendererCustomizer (page 2146)).

As with any image, the higher resolution icons are stored in the same images folder as the normal resolution images and they are identified by a scaling factor that is included in the name of the image files. For instance, icons with a Retina scaling factor of 2 will include @2x in the name (for example, myIcon@2x.png).

Developers should not specify the path of the alternate icons (@2x or @3x) in the Action dialog box (page 79) or the XMLNodeRendererCustomizer API (page 2146). When using a Retina or HiDPI display, Oxygen XML Editor plugin automatically searches the folder of the normal icon for a corresponding image file with a Retina scaling factor in the name. If the higher resolution icon file does not exist, the normal icon is scaled and used instead.

Related Information:

- Retina/HiDPI Images in Author Mode (page 803)

Localizing Frameworks
Oxygen XML Editor plugin supports *framework (page 2706)* localization (translating *framework* actions, buttons, and menu entries to various languages). This lets you develop and distribute a *framework* to users that speak other languages without changing the distributed *framework*.

To localize the content of a *framework*, create a *translation.xml* file that contains all the translation (key, value) mappings. The *translation.xml* has the following format:

```xml
<translation>
  <languageList>
    <language description="English" lang="en_US"/>
    <language description="German" lang="de_DE"/>
    <language description="French" lang="fr_FR"/>
  </languageList>
  <key value="list">
    <comment>List menu item name.</comment>
    <val lang="en_US">List</val>
    <val lang="de_DE">Liste</val>
    <val lang="fr_FR">Liste</val>
  </key>

  ......................
</translation>
```

Oxygen XML Editor plugin matches the GUI language with the language set in the *translation.xml* file. If this language is not found, the first available language declared in the *languageList* tag for the corresponding *framework* is used.

Add the directory where this file is located to the Classpath list corresponding to the edited document type.

After you create this file, you can use the keys defined in it to customize the name and description of the following:

- Actions
- Menu entries
- Contextual menus
- Toolbars
- Static CSS content

For example, if you want to localize the bold action, open the Preferences dialog box (page 55) and go to Document Type Association. Use the New or Edit button to open the Document type configuration dialog box (page 72), go to Author > Actions, and rename the bold action to
Actions with a name format other than \(i18n(\text{translation_key})\) are not localized. \textit{Translation_key} corresponds to the key from the translation.xml file.

Now open the \texttt{translation.xml} file and edit the translation entry if it exists or create one if it does not exist. This example presents an entry in the translation.xml file:

```xml
<key value="translation_key">
  <comment>Bold action name.</comment>
  <val lang="en_US">Bold</val>
  <val lang="de_DE">Bold</val>
  <val lang="fr_FR">Bold</val>
</key>
```

To use a description from the \texttt{translation.xml} file in the Java code used by your custom \texttt{framework}, use the new \texttt{ro.sync.ecss.extensions.api.AuthorAccess.getAuthorResourceBundle()} API method to request the associated value for a certain key. This allows all the dialog boxes that you present from your custom operations to have labels translated in multiple languages.

You can also reference a key directly in the CSS content:

```css
title:before{
  content:"${i18n(title.key)} : ";
}
```

\(\textbf{Note:}\) You can enter any language you want in the \texttt{languageList} tag and any number of keys.

The \texttt{translation.xml} file for the DocBook \texttt{framework} is located here: 
\texttt{[OXYGEN_INSTALL_DIR]/frameworks/docbook/i18n/translation.xml}. In the \texttt{Classpath} list corresponding to the DocBook document type the following entry was added: \texttt{${framework}/i18n/}.

To see how the DocBook actions are defined to use these keys for their name and description, open the \texttt{Preferences} dialog box (page \texttt{55}) and go to \texttt{Document Type Association \textgreater{} Author \textgreater{} Actions}. If you look in the Java class \texttt{ro.sync.ecss.extensions.docbook.table.SADocbookTableCustomizerDialog} available in the \texttt{oxygen-sample-framework} module of the Oxygen SDK Maven archetype, you can see how the new \texttt{ro.sync.ecss.extensions.api.AuthorResourceBundle} API is used to retrieve localized descriptions for various keys.

Creating New Document Templates for a Custom Framework

You can create your own custom document templates and attach them to a custom \texttt{framework} (page \texttt{2706}). You can then \texttt{share the custom framework} (page \texttt{2086}) so that all users will have access to the templates in the \texttt{New from templates} wizard (page \texttt{554}).
To create your own custom document template and have it appear in the new document wizard, follow these steps:

1. Create a new file and customize it to become a starting point for creating new files of this type.

   **Tip:** You can use editor variables (page 201) in the template file content and they will be expanded when the files are opened. Also, see Customizing Document Templates (page 557) for other template customization tips (for example, you could add placeholders or hints (page 559) to assist authors).

2. Save the new template in a directory (for example, called templates) within your custom framework directory.

   **Attention:** The name that you use to save the template will be the name that appears in the new document wizard, including capitalization, space, and characters (for example, My Custom Template1.xml will appear in the new file wizard as My Custom Template1). You can also configure the displayed name in a properties file by following the procedure found in the Configure the Displayed Names for Document Templates (page 559) section.

3. Open the Document Type configuration dialog box (page 72) for that specific framework, go to the Templates tab (page 94), and click the + button in the bottom-right corner to add your new directory to the list. It is recommended that the reference be made relative to the framework directory (for example, ${frameworkDir}/templates). Binding to an absolute file (e.g., C:\some_dir\templates) makes the association difficult to share between users.

4. Click OK for all of the dialog boxes to save your changes.

5. To test the template, open the new document wizard (New toolbar button or File > New > New from Templates) and you should see your custom template in the folder for your custom framework (in the Framework templates section).

Related Information:

- Customizing Document Templates (page 557)

Configuring XML Catalogs

For cases where you need to reference the location of a schema file from a remote web location and an Internet connection may not be available, an XML Catalog (page 2712) may be used to map the web location to a local file system entry. The following procedure presents an example of using an XML catalog in a custom framework (page 2706) by modifying an XML Schema file.
1. Create a catalog file that will help the parser locate the schema for validating the XML document. The file must map the location of the schema to a local version of the schema.

**Example:**

Create a new XML file called `catalog.xml` and save it in your custom framework directory (`{OXYGEN_INSTALL_DIR}\frameworks\{CUSTOM_FRAMEWORK_DIR}`). The content of the file should look like this:

```xml
<?xml version="1.0"?>
<catalog xmlns="urn:oasis:names:tc:entity:xmlns:xml:catalog">
    <uri name="http://www.oxygenxml.com/SDF/abs.xsd"
         uri="schema/abs.xsd"/>
    <uri name="http://www.oxygenxml.com/SDF/abs.xsd"
         uri="schema/abs.xsd"/>
</catalog>
```

2. Add catalog files to your custom framework using the Catalogs tab (page 95) from the Document Type configuration dialog box (page 72).

To test the catalog settings, restart Oxygen XML Editor plugin and try to validate a new sample document for your custom framework. There should be no errors.

**Example:**

The schema that validates the document refers the other file `abs.xsd` through an import element:

```xml
<xs:import namespace="http://www.oxygenxml.com/sample/documentation/abstracts"
              schemaLocation="http://www.oxygenxml.com/SDF/abs.xsd"/>
```

The `schemaLocation` attribute references the `abs.xsd` file:

```xml
xsi:schemaLocation="http://www.oxygenxml.com/sample/documentation/abstracts"
                  http://www.oxygenxml.com/SDF/abs.xsd"/>
```

The catalog mapping is:

```
http://www.oxygenxml.com/SDF/abs.xsd -> schema/abs.xsd
```

This means that all the references to http://www.oxygenxml.com/SDF/abs.xsd must be resolved to the `abs.xsd` file located in the schema directory (note that the schema directory needs to be in the same folder as the XML Catalog). The URI element is used by URI resolvers (for example, to resolve a URI reference used in an XSLT stylesheet).
Configuring Transformation Scenarios for a Framework

When distributing a framework (page 2706) to users, it is a good idea to have the transformation scenarios already configured. This helps the content authors publish their work in various formats. By being contained in the framework configuration, the scenarios can be distributed along with the actions, menus, toolbars, and catalogs.

These are the steps that allow you to create a transformation scenario for your framework.

1. Create an xsl folder inside your custom framework directory

   \( \{OXYGEN_INSTALL_DIR\}/frameworks/\{CUSTOM_FRAMEWORK_DIR\} \).

   The folder structure for the documentation framework should be:

   ```
   oxygen
   frameworks
   [CUSTOM_FRAMEWORK_DIR]
   schema
   css
   templates
   xsl
   ```

2. Create an xsl file and save it in the xsl folder. To help you get started, you can use the sample sdf.xsl file found in the sample framework customization package.

3. Open the Preferences dialog box (page 55) and go to Document Type Associations. Select the particular framework, click the Edit button to open Document Type Configuration dialog box (page 72), and choose the Transformation tab. Click the + New button and choose the appropriate type of transformation (for example, XML transformation with XSLT).

   In the New scenario dialog box, fill in the following fields:

   - Fill in the Name field with the name of your transformation scenario.
   - Set the XSL URL field to path of your custom stylesheet (for example, \$\{framework\}/xsl/mycustom.xsl).

```
Figure 647: Configuring a New XSLT Transformation Scenario
```
4. Change to the **Output** tab. Configure the fields as follows:

   • Set the **Save as** field to `${cfd}/${cfn}.html`. This means the transformation output file will have the name of the XML file and the `html` extension and will be stored in the same folder.

   • Select the **Open in Browser/System Application** option.

   **Note**: To set the browser or system application that will be used, go to **Window > Preferences > General > Web Browser** and specify it there. This will take precedence over the default system application settings.

   • Select the **Saved file** option.

5. Click the **OK** button to save the new scenario.

Now the scenario is listed in the **Transformation** tab:

*Figure 648: Transformation Tab*

<table>
<thead>
<tr>
<th>Type filter test</th>
<th>Default</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>SDF to HTML</td>
<td></td>
<td>XML with XSLT</td>
</tr>
</tbody>
</table>

To test the transformation scenario that you just created, you can use the sample `sdf.xml` file found in the sample framework customization package. Click the **Apply Transformation Scenario(s)**
button to display the Transform with dialog box. The scenario list contains the scenario you defined earlier. Select the SDF to HTML scenario that you just defined and click the Apply associated button. The HTML file is saved in the same folder as the XML file and displayed in the browser.

Configuring Validation Scenarios for a Framework

You can distribute a framework with a series of already configured validation scenarios. Also, this provides enhanced validation support that allows you to use multiple grammars to check the document. For example, you can use Schematron rules to impose guidelines that are otherwise impossible to enforce using conventional validation.

Note: If a master file is associated with the current file, the validation scenarios defined in the master file, along with any Schematron schema defined in the default scenarios for that particular framework, are used for the validation. These take precedence over other types of validation units defined in the default scenarios for the particular framework. For more information on master files, see Master Files Support or Working with Modular XML Files in the Master Files Context.

To associate a validation scenario with a specific framework, follow these steps:

1. Open the Preferences dialog box and go to Document Type Association.

2. Select the document type and click the Edit button to open the Document Type Configuration dialog box, then choose the Validation tab. This tab displays a list of document types in which you can define validation scenarios. To set one or more of the validation scenarios listed in this tab to be used as the default validation scenario (when another one is not specified in the validation process) for a specific document type, check the Default box for that specific document type.

3. To edit an existing scenario, select the scenario and click the Edit button. To add a new scenario, click the New button.

In either case, a scenario configuration dialog box is displayed. It lists all the validation units for the scenario.

Figure 649: Validation Scenario Configuration Dialog Box
This scenario configuration dialog box allows you to configure the following information and options:

**Name**

The name of the validation scenario.

**URL of the file to validate**

The URL of the main module that includes the current module. It is also the entry module of the validation process when the current one is validated. To edit the URL, click its cell and specify the URL of the main module by doing one of the following:

- Enter the URL in the text field or select it from the drop-down list.
- Use the **Browse** drop-down button to browse for a local, remote, or archived file.
- Use the **Insert Editor Variable** button to insert an editor variable (page 201) or a custom editor variable (page 208).

![Figure 650: Insert an Editor Variable](image)

### Supported Variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>$(start-dir)</td>
<td>Start directory of custom validator</td>
</tr>
<tr>
<td>$(standard-params)</td>
<td>List of standard parameters</td>
</tr>
<tr>
<td>$(finfo)</td>
<td>The current file name without extension</td>
</tr>
<tr>
<td>$(currentFileURL)</td>
<td>The path of the currently edited file (URL)</td>
</tr>
<tr>
<td>$(prefix)</td>
<td>The path of current file directory (URL)</td>
</tr>
<tr>
<td>$(frameworks)</td>
<td>Oxygen frameworks directory (URL)</td>
</tr>
<tr>
<td>$(proj-dir)</td>
<td>Project directory (URL)</td>
</tr>
<tr>
<td>$(appdirectory)</td>
<td>Oxygen installation directory (URL)</td>
</tr>
<tr>
<td>$(home)</td>
<td>The path to user home directory (URL)</td>
</tr>
<tr>
<td>$(pnc)</td>
<td>Project name</td>
</tr>
<tr>
<td>$(env(VAR_NAME))</td>
<td>Value of environment variable VAR_NAME</td>
</tr>
<tr>
<td>$(system(var.name)</td>
<td>Value of system variable var.name</td>
</tr>
</tbody>
</table>

**File type**

- XML Document
- DITA Validation
- Detected from input... <Default engine>
The type of the document that is validated in the current validation unit. Oxygen XML Editor plugin automatically selects the file type depending on the value of the URL of the file to validate field.

**Validation engine**

You can select one of the engines available in Oxygen XML Editor plugin for validation of the particular document type.

**Default engine** means that the default engine is used to run the validation for the current document type, as specified in the preferences page for that type of document (for example, XSLT preferences page (page 188), XQuery preferences page (page 185), XML Schema preferences page (page 176)).

The DITA Validation engine performs DITA-specific checks in the context of the specifications (it is similar to the checks done with the DITA Maps Manager Validate and Check for Completeness action (page 2446), but for a local file rather than an entire DITA map (page 2705)).

The Table Layout Validation engine looks for table layout problems (for more information, see Report table layout problems (page 2450)).

**Automatic validation**

If this option is selected, the validation operation defined by this row is also applied by the automatic validation feature (page 856). If the Automatic validation feature is disabled in the Document Checking preferences page (page 108), then this option is ignored, as the preference setting has a higher priority.

**Schema**

This option becomes active when you set the File type to XML Document and allows you to specify the schema used for the validation unit.

**Specify Schema**

Opens the Specify Schema dialog box that allows you to set a schema to be used for validating XML documents.

*Figure 651: Specify Schema Dialog Box*
The **Specify Schema** dialog box contains the following options:

**Use detected schema**

Uses the schema detected for the particular document *(page 887).*

**Use custom schema**

Allows you to specify the schema using the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S). You can specify the URL by using the text field, the history drop-down, the ![Insert Editor Variables](page 201) button, or the browsing actions in the ![Browse](page 201) drop-down list.

- **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the **URL** field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.

- **Embedded Schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, select this option.

- **Extensions** - Opens a dialog box that allows you to specify *Java extension JARs (page 2707)* to be used during the validation.

- **Public ID** - Allows you to specify a public ID if you have selected a DTD.

- **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you
want to use for validation. The listed phases are defined in the Schematron document.

**Move Up**

Moves the selected scenario up one spot in the list.

**Move Down**

Moves the selected scenario down one spot in the list.

**Add**

Adds a new validation unit to the list.

**Remove**

Removes an existing validation unit from the list.

4. Configure any of the existing validation units according to the information above, and you can use the buttons at the bottom of the table to add, remove, or move validation units. Note that if you add a Schematron validation unit, you can also select the validation phase.

5. Press **Ok**.

The newly created validation scenario is now included in the list of scenarios in the Validation tab (page 97). You can use the Default checkbox to specify that the new scenario be used as the default validation scenario when another specific scenario is not specified in the validation process.

Customizing Smart Paste Support

The Smart Paste feature (page 696) preserves certain style and structure information when copying content from some of the most common applications and pasting into frameworks (document types) that support Smart Paste (page 697) in Oxygen XML Editor plugin. For other document types, the default behavior of the paste operation is to keep only the text content without the styling.

The style of the pasted content can be customized by editing an XSLT stylesheet for a particular document type (framework (page 2706)). The XSLT stylesheet must accept an XHTML flavor of the copied content as input, and transform it to the equivalent XML markup that is appropriate for the target document type of the paste operation.

**How to Customize the Smart Paste Mapping**

To customize the mapping between the markup of the copied content and the markup of the pasted content for a particular document type, follow these steps:
1. Make sure the particular framework contains a folder named resources in the following path structure:

   /frameworks/[Document Type]/resources

2. Create an XSLT file named xhtml2content.xsl and save it in the resources folder for the particular framework.

   For example: /frameworks/[Document Type]/resources/xhtml2content.xsl

3. Add your customized styling in the XSLT file. A list of supported parameters can be found in the Supported Parameters for the Custom Smart Paste XSLT (page 2060) section below.

   **Tip:** The built-in DITA framework includes an xhtml2ditaDriver.xsl file (in [OXYGEN_INSTALL_DIR]/frameworks/dita/resources) that imports various other stylesheets that apply cleanup and handle the conversion from the pasted HTML content to DITA. If you are using a custom extension of the DITA framework, you can copy the entire contents of the built-in dita/resources folder and customize the stylesheets according to your needs.

4. You can test modifications done in the stylesheet by pasting content without having to restart Oxygen XML Editor plugin.

**Result:** When you paste content from external applications (such as a web browser or and Office document) to a document that is opened in Author mode, and that matches the particular framework, the styling from the xhtml2content.xsl stylesheet will be applied on the clipboard contents.

**Customized Smart Paste Stylesheet Sample:**

```xml
<xsl:stylesheet version="1.0"
 xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
 xmlns:xhtml="http://www.w3.org/1999/xhtml"
 xmlns="urn:hl7-org:v3"
 exclude-result-prefixes="xsl xhtml">

 <xsl:output method="xml" indent="no" omit-xml-declaration="yes"/>

 <xsl:template match="xhtml:b | xhtml:strong">
   <content styleCode="bold">
     <xsl:apply-templates select="@* | node()"/>
   </content>
 </xsl:template>

 <xsl:template match="*">
   <xsl:apply-templates select="@* | node()"/>
 </xsl:template>
</xsl:stylesheet>
```
Supported Parameters for the Custom Smart Paste XSLT

The following parameters can be used in your XSLT stylesheet for customizing the Smart Paste mechanism:

**inTableContext**

The custom XSLT stylesheet receives this parameter with a value of `true` if the end user is pasting content inside a table.

**folderOfPasteTargetXml**

A URL pointing to the folder where the current edited XML document is located. This is used to save images relative to the current XML document.

**context.path.names**

A sequence of element names showing the current context in the XML document where the paste occurred.

**context.path.uris**

A sequence of namespaces, one for each context path name.

**context.path.separator**

The separator between the path names. Its value can be used to split the context path names to a sequence.

By default, there is an extra check in place to ensure that the applied XSLT does not remove the original text from the pasted content. If there is a file called `externalPasteOptions.xml` in the `resources` folder, you can use it to specify the default behavior for checking if the XSLT stylesheet loses content during conversion:

```xml
<!-- Options that control external paste (automatic conversions when pasting HTML and URL flavors from the clipboard). -->
<pasteOptions>

<!--True to check if the entire sequence of words which get pasted are
```
Customizing Author Mode Using CSS Files Associated with a Framework

The easiest way to customize the main (page 2707) CSS stylesheet of a framework (page 2706) is to create a new stylesheet, save it as an alternate (page 2703) CSS file that will be applied as an additional layer to the main CSS, and then select it from the Styles drop-down menu in Author mode.

For example, suppose that you want to customize the main CSS for DITA documents. To do this, follow these steps:

1. First, create a new CSS stylesheet and save it in the /frameworks/dita/css/edit folder (where the default main stylesheet named style-basic.css is located).

2. Edit the DITA framework and go to the CSS subtab (page 77):
   a. Open the Preferences dialog box (page 55) and go to Document Type Association.
   b. Select the DITA document type and press the Edit button.

   Tip: If you do not have write permissions to modify the document type, use the Extend button to create an extension of the framework.

   a. Go to the CSS subtab of the Author tab.

Figure 652: CSS Subtab of the Document Type Association Author Tab
3. Add the new stylesheet as an *alternate* CSS stylesheet:
   a. Click the + Add button to open a dialog box that allows you to specify the URI and Title for your newly created stylesheet.
   b. Select the Alternate option to define it as an alternate stylesheet that will be applied as an additional layer to the main CSS.

   ![Add CSS Dialog Box](image)

4. Press OK in all the dialog boxes to validate the changes.

5. Select your newly created CSS stylesheet from the Styles drop-down menu on the toolbar in Author mode.
   You can now edit DITA documents based on the new CSS stylesheet. You can also edit the new CSS stylesheet itself and see its effects on rendering DITA documents in the Author mode by using the Refresh action that is available on the Author toolbar and in the DITA menu.

Related Information:

- Configuring and Managing Multiple CSS Styles for a Framework (page 2063)
Configuring and Managing Multiple CSS Styles for a Framework

Oxygen XML Editor plugin provides a Styles drop-down menu on the toolbar that allows you to select one main (non-alternate) CSS style (page 2707) and multiple alternate CSS styles (page 2703). This makes it easy to change the look of the document as it appears in Author mode and the output without having to continually edit the CSS stylesheets.

An example of a common use case is when content authors want to use custom styling within a document. You can select a main CSS stylesheet that styles the whole document and then apply alternate styles, as layers, to specific parts of the document.

Managing the CSS Styles

The main (page 2707) and alternate (page 2703) styles that are listed in the Styles drop-down menu can be controlled in the Document Type configuration dialog box (page 72). To access it, follow these steps:

1. Open the Preferences dialog box (page 55).
2. Go to Document Type Association.
3. Select the appropriate document type and press the Edit button.

⚠️ Important: If you do not have access rights to the folder where the framework (page 2706) files are stored, you can either elevate read/write permissions on that framework folder or you can extend the framework and customize the CSS stylesheets in the extension. If you want to share the customized extension with the rest of your team, see Sharing the Extended Framework (page 2086).

The CSS styles (CSS files) associated with the particular document type are listed in the CSS subtab (page 77) of the Author tab.

Figure 654: Main and Alternate CSS Styles in the Document Type Configuration Dialog Box
You can + Add, Edit, or × Delete styles from this dialog box to manage the main (page 2707) and alternate (page 2703) styles associated to the particular document type. You can also change the order of the styles by using the ✦ Move Up and ❯ Move Down buttons. This will also change the order that they appear in the Styles drop-down menu. The alternate styles are combined with the main CSS sequentially, in the order that they appear in this list. Therefore, if the same style rules are included in multiple CSS files, the rules that are defined in the last alternate style in this list will take precedence, since it is the last one to be combined (applied as a layer).

The URI column shows the path of each CSS file. The names listed in the Styles drop-down menu match the values in the Title column. The value in the Alternate column determines whether it is a main or alternate CSS. If the value is no it is a main CSS. If the value is yes it is an alternate CSS and the style can be combined with a main CSS or other alternate styles when using the Styles drop-down menu.

**Note:** To group alternate styles into categories (submenus), use a vertical bar character ( | ) in the Title column. You can use multiple vertical bars for multiple submenus. The text before each vertical bar will be rendered as the name of a submenu entry in the Styles drop-down menu, while the text after the final vertical bar will be rendered as the name of the style inside the submenu.
Example: Suppose that you want to add two alternate stylesheets in separate submenus, with the Title column set to My Styles|User Assistance|Hints and My Styles|User Actions|Inline Actions, respectively.

Oxygen XML Editor plugin will add a My Styles submenu with two submenus (User Assistance that contains the Hints style, and User Actions that contains the Inline Actions style) in the Styles drop-down menu.

The Enable multiple selection of alternate CSSs checkbox (page 78) at the bottom of the pane must be selected for the alternate CSS styles (page 2703) to be combined. They are applied like layers and you can activate any number of them. If this option is not selected, the alternate styles are treated like main CSS styles (page 2707) and you can only select one at a time. By default, this option is selected. There are also a few options that allow you to specify how to handle the CSS if there are CSS styles specified in the document. You can choose to ignore or merge them.

The following rules apply for merging CSS styles:

• CSS files with the same title will be merged.
• CSS files without a title will contribute to all others.
• They are merged sequentially, in the order that they appear in the list.

Using the Styles Drop-down Menu

You can use the Styles drop-down menu to select a main css style (page 2707) that applies to the whole document and then select one or more alternate css styles (page 2703) that behave like layers and are merged sequentially with the main style. Each of the styles that are listed in this drop-down menu have a corresponding CSS file that defines how your documents are rendered in Author mode and in the output. Also, the selections from this drop-down menu are persistent, meaning that Oxygen XML Editor plugin will remember them when subsequent documents are opened.

Main CSS Style

The main styles are listed in the top section and each of their corresponding CSS files are primarily used to render basic things such as the font and background of the document. You can only select one main style at a time.
Alternate CSS Styles

The alternate styles are listed in the bottom section and their corresponding CSS files are used to render numerous different types of things in the document as they are merged with the selected main styles. You can select as many alternate styles as you wish. If you are unsure about how each of the styles with change the look of your documents based solely upon their name, there is no harm in selecting them to see the difference. You can simply deselect them to revert to the previous look.

Note: If you deselect the Enable multiple selection of alternate CSSs option (page 78) in the CSS subtab of the Document Type configuration dialog box (page 72), the alternate styles are treated like main CSS styles and you can only select one at a time.

EXAMPLE: CSS Styles in DITA

Oxygen XML Editor plugin comes with a set of built-in CSS layer stylesheets for DITA documents (as well as some that are specifically for DITA maps (page 2705)). In the subsequent figure, a DITA document has the Century style selected for the main CSS style and the alternate styles Full width, Show table column specification, Hints, and Inline actions are combined for additive styling to specific parts of the document.

Tip: The Hints style displays tooltips throughout DITA documents that offer additional information to help you with the DITA structure. The Inline actions style displays possible elements that are allowed to be inserted at various locations throughout DITA documents.

Figure 655: Styles Drop-down Menu in a DITA Document
Customizing the Content Completion Assistant

Oxygen XML Editor plugin gathers information from the associated schemas (DTDs, XML Schema, RelaxNG) to determine the proposals that appear in the Content Completion Assistant (page 2704). Oxygen XML Editor plugin also includes support that allows you to customize the Content Completion Assistant to suit your specific needs.

There are two ways to customize the Content Completion Assistant in Oxygen XML Editor plugin:

- You can add, modify, or remove actions that are proposed for each particular document type (framework (page 2706)) by using the Content Completion subtab in the Document Type Association configuration dialog box (page 92). To access this subtab, open the Preferences dialog box (page 55), go to Document Type Association, use the New, Edit, Duplicate, or Extend button (page 69), click on the Author tab, and then the Content Completion subtab.
You can use a cc_config.xml configuration file that is specific to each document type (framework) to configure the values that are proposed in certain contexts, to customize the attributes or elements that are proposed, or to customize how certain aspects of the proposals are rendered in the interface. The rest of the topics in this section explain how you can use this configuration file to customize the content completion.

Configuring the Proposals for Elements and Attributes

There are many cases where elements have a relaxed content model and can accept a large number of child elements. For example, the DITA list item element (li) accepts more than 60 child elements. Oxygen XML Editor plugin includes support to allow the content architect to put some constraints on the possible elements or attributes, or to impose some best practices in the way content is edited.

For an example of a specific use-case, suppose that you want to restrict DITA list item elements (li) to only accept paragraph elements (p). In this case, the Content Completion Assistant (page 2704) should not offer any element other than a paragraph (p) when a list item (li) is inserted into a document. It would also be helpful if the required child element (p) was automatically inserted whenever a list item (li) is inserted.

One method of changing the content model is to alter the element definition in the associated schema (XML Schema, DTD, RelaxNG), but this may be quite complicated in some cases. Fortunately, Oxygen XML Editor plugin offers a simple, alternative method of using a configuration file to customize the content completion proposals for each element.

Setting up the Content Completion Configuration File

To customize the configuration file for the Content Completion Assistant (page 2704), follow these steps:

1. Create a new resources folder (if it does not already exist) in the frameworks directory for the particular document type (for example, OXYGEN_INSTALL_DIR/frameworks/dita/resources).
2. Open the Preferences dialog box (page 55) and go to Document Type Association. Select the particular document type, click the Edit button, and in the Classpath tab (page 76) add a link to that resources folder (if it does not already exist).
3. Create a new configuration file or edit an existing one.
   a. To easily create a new configuration file, you can use the Content Completion Configuration document template that is included in Oxygen XML Editor plugin (File > New > New from Templates > Framework templates > Oxygen Extensions > Content Completion Configuration). The document template includes details about how each element and attribute is used in the configuration file.
b. If a configuration file (cc_config.xml) already exists for the particular document type (in the resources folder), you can modify this existing file.

4. Make the appropriate changes to your custom configuration file.

5. Save the file in the resources folder for the particular document type, using the fixed name: cc_config.xml (for example, OXYGEN_INSTALL_DIR/frameworks/dita/resources/cc_config.xml).

6. Restart the application and open an XML document. In the Content Completion Assistant you should see your customizations.

**Tip:** In some cases, you can simply use the **Refresh (F5)** action to test your customizations, without having to restart the application.

### Configuring Elements or Attributes that are Proposed for Each Element

For the purposes of customizing the elements or attributes that are proposed for each individual element, the configuration file (cc_config.xml) uses `elementProposals` elements. This element allows you to customize or filter the child elements and attributes for an element.

**Warning:** Note that you can only choose elements or attributes that are already allowed by the schema in a particular context. For example, you cannot specify an element that is not allowed by the schema as a child of a particular node.

**Elements:**

To control the elements that are proposed for an element, you can use the following attributes for the `elementProposals` element:

- **path** - A path within the document that matches the element that will have its content completion proposals changed. For example, "title" matches all the `title` elements in the document, while "chapter/title" matches only the `title` elements that are direct children of the `chapter` element. You can use simplified forms of XPath in this attribute.

  The XPath expressions can accept multiple attribute conditions and inside each condition you can use **AND/OR** boolean operators and parentheses to override the priority.

You can use one or more of the following attribute conditions (default attribute values are not taken into account):

- `element[@attr]` - Matches all instances of the specified element that include the specified attribute.
- `element[not(@attr)]` - Matches all instances of the specified element that do not include the specified attribute.
- \texttt{element[@attr = "value"]} - Matches all instances of the specified element that include the specified attribute with the given value.
- \texttt{element[@attr != "value"]} - Matches all instances of the specified element that include the specified attribute and its value is different than the one given.

**Example:** The following are examples of how you could use multiple boolean operators and parentheses inside an attribute condition:

\[
*[@a and @b or @c and @d]
\]
\[
*[@a and (@b or @c) and @d]
\]

The following are just examples of how simplified XPath expressions might look like:

- \texttt{elementName}
- \texttt{//elementName}
- \texttt{/elementName1/elementName2/elementName3}
- \texttt{//xs:localName}

**Note:** Using a namespace prefix requires that you declare it in the configuration file. For example:

\[
<\text{elementProposals} xmlns:db5="http://docbook.org/ns/docbook" path="db5:listitem" insertElements="db5:para"/>
\]

- \texttt{//xs:documentation[@lang="en"]}

**Note:** If the \texttt{path} attribute is missing, the customization will apply to the proposals for all elements. You can intentionally omit this attribute and use \texttt{possibleElements} (page 2071) or \texttt{rejectElements} (page 2071) to specify or restrict particular elements for a framework (page 2706).

For example, suppose that in your DITA documents, you want to restrict your users from using \texttt{image} and \texttt{fig} elements because you do not want images to be included in your output. The configuration file should look like this:

\[
<\text{elementProposals} rejectElements="image fig"/>
\]

Since the \texttt{path} attribute is missing, the specified element will be filtered out from the proposals for the entire framework.

- \texttt{insertElements} - A space-separated sequence of child element names. Each time the element specified in the \texttt{path} attribute is inserted into the document, these child elements will also be inserted in the order that they are listed. For example, \texttt{insertElements="b i"} will insert exactly one \texttt{b} element, followed by an \texttt{i} element. An empty value ("") means that no child elements should be inserted.
Note: If this attribute is missing, the default required child elements will be inserted, as specified in the associated schema for the document.

- possibleElements - A space-separated list of element names that will be shown in the content completion list when invoked inside an element that is specified in the path attribute. For example, "b i codeph ph" means that the Content Completion Assistant will contain these four elements when invoked on the element specified in the path attribute. The following other possible values are also supported:
  - NONE - There will be no proposals in the content completion list.
  - ALL - All the possible elements specified in the associated schema will be presented in the content completion list. This is also the default behavior if this attribute is missing.
  - INSERTED - The proposals will be the same list of elements that are defined in the insertElements attribute.

When using this attribute to specify multiple elements, only use one entry with the element names separated by a space:

```xml
<elementProposals possibleElements="b i codeph ph"/>
```

- rejectElements - A space-separated list of element names that will be filtered out from the list of proposals that are presented in the content completion list. Each time the element specified in the path attribute is inserted into the document, the list of proposals in the Content Completion Assistant will include the entries that are defined in the associated schema, minus the elements specified in this attribute.

This setting also influences copy/paste and insertion behaviors. For example, if you reject the insertions of images in paragraphs and you try to paste an image inside a paragraph, by default the application will take your choice into account and try to insert the image in a place where it is allowed.

When using this attribute to specify multiple elements, only use one entry with the element names separated by a space:

```xml
<elementProposals rejectElements="image fig imagemap foreign"/>
```

Attributes:

To control the attributes that are proposed for an element, you can use the following attributes for the elementProposals element:

- path - A path within the document that matches the element that will have its attribute proposals changed. For example, "title" matches all the title elements in the document, while "chapter/title" matches only the title elements that are direct children of the
chapter element. You can use simplified forms of XPath in this attribute. For examples of such forms of XPath expressions, see the note in XML Preferences (page 141).

**Note:** If this attribute is missing, the customization will apply to the proposals for all elements. You can intentionally omit this attribute and use possibleAttributes (page 2072) or rejectAttributes (page 2072) to specify or restrict attributes for an entire framework.

For example, suppose that you only want to allow a limited set of attributes in a customized framework. The configuration file should look like this:

```xml
<elementProposals possibleAttributes="id domains href scope format type conref props keyref class"/>
```

Since the path attribute is missing, this applies to the entire framework and only the specified attributes will be proposed.

- **insertAttributes** - A space-separated sequence of attribute names that will be inserted along with the element.

  ```xml
  <elementProposals path="ol/li" insertAttributes="product platform"/>
  ```

- **insertAttribute** - This is similar to the preceding attribute, but this one also allows you to specify a value for the attribute that will be inserted. This attribute should be used like this:

  ```xml
  <elementProposals path="ol/li">
    <insertAttribute name="platform" value="test"/>
  </elementProposals>
  ```

- **possibleAttributes** - A space-separated list of attribute names that will be shown in the content completion list when invoked inside an element that is specified in the path attribute.

When using this attribute to specify multiple attributes, only use one entry with the attribute names separated by a space:

```xml
<elementProposals possibleAttributes="scope format type"/>
```

- **rejectAttributes** - A space-separated list of attribute names that will be filtered out from the list of proposals that are presented in the content completion list. Each time the element specified in the path attribute is inserted into the document, the list of proposals in the Content Completion Assistant will include the entries that are defined in the associated schema, minus the attributes specified in this attribute.

When using this attribute to specify multiple attributes, only use one entry with the attribute names separated by a space:
Other Important Notes About the Configuration File

⚠️ Important:

- By default, the element names that do not have a namespace prefix are considered from no-
  namespace. Consider declaring the namespace mapping on the root of the configuration file and
  prefixing the element names from the elementPath and model attributes.
- This configuration file only affects the content completion assistance. It has no effect on
  validation or operations invoked from other areas in the interface (such as the toolbar or menus).
- To test the effects of your changes, you should restart the application, although in some cases,
  you can simply use the **Refresh (F5)** action to test your customizations.
- When an XML element from the document is matched against a list of configured
  elementProposals, the first one in sequence takes precedence. Therefore, make sure you place
  the more specific elementProposals (those with a longer path) first in your configuration file.
- Regular expression patterns can be used in the following attributes: possibleElements,
  rejectElements, possibleAttributes, and rejectAttributes. For example, code*, *block,
  con*ref, _.
- Only simple recursion cases are detected and avoided by the editor, and logged to the console.
  Therefore, if complex elementProposals patterns are defined, you should avoid infinite
  recursions.

Examples: Configuring the Element Proposals

**Example 1: Automatically Insert Elements**

Suppose that you want to automatically insert a paragraph element (`p`) whenever a DITA
ordered list item element (`ol/li`) is inserted, and also to not allow any other element besides a
paragraph inside the ordered list items.

To achieve this, the configuration file should include the following:

```
<elementProposals path="ol/li" insertElements="p"
    possibleElements="_INSERTED_">

Tip: This particular example modifies an action that inserts a list in a DITA document. There
are several ways to invoke this action in the interface. For example, there is a toolbar button and
an action in the DITA menu that inserts a list. However, since the configuration file only affects
the Content Completion Assistant, this modification will have no effect on the behavior of the
toolbar or menu action. Those actions would need to be configured separately if you want the
result to be the same as the content completion proposal. For more information, see Configuring Actions, Menus, Toolbars, Content Completion for a Framework (page 2038).

- **Example 2: Insert Complex Element Structure**

For a more complex example, suppose that you want to insert a complex structure whenever a DITA prolog element is inserted.

For instance, if you need to insert the following structure inside prolog elements:

```xml
<prolog>
  <author></author>
  <metadata>
    <keywords>
      <keyword></keyword>
      <keyword></keyword>
    </keywords>
  </metadata>
</prolog>
```

The configuration file should include the following:

```xml
<elementProposals path="prolog" insertElements="author metadata"/>
<elementProposals path="prolog/metadata" insertElements="keywords"/>
<elementProposals path="prolog/metadata/keywords" insertElements="keyword, keyword"/>
```

- **Example 3: Limit Possible Elements**

Suppose that you also want to limit the proposals for the keywords element to only allow the user to insert audience or keyword elements. The configuration file should include the following:

```xml
<elementProposals path="prolog/metadata" insertElements="keywords"
  possibleElements="audience keywords"/>
```

Suppose that you want to simply restrict your users from inserting image elements inside DITA list item elements (li), but still propose all the other elements that are defined in the associated schema. The configuration file should look like this:

```xml
<elementProposals path="li" rejectElements="image"/>
```
Examples: Configuring the Attributes Proposals

- **Example 1: Automatically Insert Attributes**

  Suppose that you want to insert an `id` attribute (with an empty value) whenever a DITA list item element (`li`) is inserted. The configuration file should include the following:

  ```xml
  <elementProposals path="li" insertAttributes="id"/>
  ```

- **Example 2: Limit Possible Attributes**

  Suppose that you also want to limit the number of choices for attributes that are presented to the user whenever a DITA list item element (`li`) is inserted. The configuration file should look like this:

  ```xml
  <elementProposals path="li" insertAttributes="id"
                    possibleAttributes="id product platform audience"/>
  ```

Suppose that you want to simply restrict your users from inserting `conref` attributes inside DITA topics (`topic` element), but still propose all the other attributes that are defined in the associated schema. The configuration file should look like this:

```xml
<elementProposals path="topic" rejectAttributes="conref"/>
```

Related Information:

- Configuring the Proposals for Attribute and Element Values (*page 2075*)
- Customizing the Rendering of Elements (*page 2080*)

**Configuring the Proposals for Attribute and Element Values**

Oxygen XML Editor plugin includes support for configuring the proposed values that appear in the *Content Completion Assistant* (*page 2704*). To do so, a configuration file is used, along with the associated schema, to add or replace possible values for attributes or elements that are proposed in the *Content Completion Assistant*.

For an example of a specific use-case, suppose that you want the *Content Completion Assistant* to propose several possible values for the language code when you use an `xml:lang` attribute.
Setting up the Content Completion Configuration File

To customize the configuration file for the Content Completion Assistant (page 2704), follow these steps:

1. Create a new resources folder (if it does not already exist) in the frameworks directory for the particular document type (for example, OXYGEN_INSTALL_DIR/frameworks/dita/resources).

2. Open the Preferences dialog box (page 55) and go to Document Type Association. Select the particular document type, click the Edit button, and in the Classpath tab (page 76) add a link to that resources folder (if it does not already exist).

3. Create a new configuration file or edit an existing one.
   a. To easily create a new configuration file, you can use the Content Completion Configuration document template that is included in Oxygen XML Editor plugin (File > New > New from Templates > Framework templates > Oxygen Extensions > Content Completion Configuration). The document template includes details about how each element and attribute is used in the configuration file.
   b. If a configuration file (cc_config.xml) already exists for the particular document type (in the resources folder), you can modify this existing file.

4. Make the appropriate changes to your custom configuration file.

5. Save the file in the resources folder for the particular document type, using the fixed name: cc_config.xml (for example, OXYGEN_INSTALL_DIR/frameworks/dita/resources/cc_config.xml).

6. Restart the application and open an XML document. In the Content Completion Assistant you should see your customizations.

   Tip: In some cases, you can simply use the Refresh (F5) action to test your customizations, without having to restart the application.

Configuring Proposed Values

For the purposes of adding or replacing the values that are proposed, the configuration file (cc_config.xml) includes a series of match instructions that will match an element or attribute name. You also have the possibility of using an attribute called editable on the match element to specify the editable state of the attribute values, as reflected in the Attributes view (page 319) and the In-place Attributes Editor (page 322). The possible values for the editable attribute are:

- true - The attribute values can be edited by choosing from a combo box or manually providing a value.
- false - The attribute values cannot be edited.
• **onlyAllowedItems** - The attribute values can be edited, but only by choosing from a list of proposed values, in a non-editable combo box.

A new value is specified inside one or more **item** elements, which are grouped inside an **items** element. The behavior of the **items** element is specified with the help of the **action** attribute, which can have any of the following values:

- **append** - Adds new values to appear in the proposals list (default value).
- **addIfEmpty** - Adds new values to the proposals list only if no other values are contributed by the schema.
- **replace** - Replaces the values contributed by the schema with new values to appear in the proposals list.

The values in the configuration file can be specified either directly or by calling an external XSLT file that will extract data from an external source.

**Other Important Notes About the Configuration File**

⚠️ **Important:**

- This configuration file only affects the content completion assistance, not validation.
- To test the effects of your changes, you should restart the application.

**Example: Specifying Values Directly**

If you want to specify the values directly, the configuration file should look like this:

```xml
<!-- Replaces the values for an element with the local name "lg", from the given namespace -->
<match elementName="lg" elementNS="http://www.oxygenxml.com/ns/samples">
  <items action="replace">
    <item value="stanza"/>
    <item value="refrain"/>
  </items>
</match>

<!-- Adds two values for an attribute with the local name "type", from any namespace -->
<match attributeName="type" editable="onlyAllowedItems">
  <items>
    <item value="stanza"/>
  </items>
</match>
```
Example: Calling an External XSLT Script

If you want to collect values from an external XSLT script, the configuration file should include something like this:

```xml
<xslt href="../xsl/get_values_from_db.xsl" useCache="false" action="replace"/>
```

In this example, the `get_values_from_db.xsl` is executed to extract values from a database.

**Tip:** You can use `xsl:message` as a debugging mechanism. These messages are presented in the results area at the bottom of the application whenever the Content Completion Assistant is invoked.

**Note:** A comprehensive XSLT sample is included in the Content Completion Configuration document template (in the Framework Templates > Oxygen Extensions section of the New from templates wizard (page 554)).

Configuring Proposed Values in the Context Where the Content Completion was Invoked

**Web Author Customization Note:** This particular scenario is not supported for an Oxygen XML Web Author customization.

A more complex scenario is if you want to choose the possible values to propose, depending on the context of the element in which the content completion was invoked.

Suppose that you want to propose certain possible values for one property (for example, `color`) and other values for another property (for example, `shape`). If the property represents a color, then the values should represent applicable colors, while if the property represents a shape, then the values should represent applicable shapes. See the following code snippets:

Your main document:

```xml
<sampleArticle>
  <!-- The possible values for @value should be "red" and "blue" -->
  <property name="color" value=""/>
  <!-- The possible values for @value should be "square" and "rectangle" -->
  <property name="shape" value=""/>
</sampleArticle>
```
The content completion configuration file:

```xml
<config xmlns="http://www.oxygenxml.com/ns/ccfilter/config">
  <match elementName="property" attributeName="value">
    <xslt href="get_values.xsl" useCache="false" action="replace"/>
  </match>
</config>
```

The stylesheet that defines the possible values based on the context of the property on which the content completion was invoked:

```xml
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
                 xmlns:xs="http://www.w3.org/2001/XMLSchema"
                 xmlns:saxon="http://saxon.sf.net/"
                 exclude-result-prefixes="xs"
                 version="2.0">

  <xsl:param name="documentSystemID" as="xs:string"/>
  <xsl:param name="contextElementXPathExpression" as="xs:string"/>

  <xsl:template name="start">
    <xsl:apply-templates select="doc($documentSystemID)"/>
  </xsl:template>

  <xsl:template match="/">
    <xsl:variable name="propertyElement" select="saxon:eval(saxon:expression($contextElementXPathExpression, ./*))"/>

    <items>
      <xsl:if test="$propertyElement/@name = 'color'">
        <item value='red'/>
        <item value='blue'/>
      </xsl:if>
      <xsl:if test="$propertyElement/@name = 'shape'">
        <item value='rectangle'/>
        <item value='square'/>
      </xsl:if>
    </items>
  </xsl:template>
</xsl:stylesheet>
The `contextElementXPathExpression` parameter will be bound to an XPath expression that identifies the element in the context for which the content completion was invoked.

**Related Information:**

- Configuring the Proposals for Elements and Attributes *(page 2068)*
- Customizing the Rendering of Elements *(page 2080)*

**Customizing the Rendering of Elements**

In addition to the support for configuring the proposals that appear in the *Content Completion Assistant* *(page 2704)*, Oxygen XML Editor plugin also includes support for customizing how the elements are rendered. You can do this by using the *XMLNodeRendererCustomizer API* extension *(page 2146)*, but you can also use the same configuration file that is used to configure the content completion proposals.

For an example of a specific use-case, suppose that in DITA you want the names of paragraph elements (`p`) to be rendered as "Paragraph" instead of "p" in the various components in *Author* mode (such as in the *Outline view* *(page 316)*, *Elements view* *(page 325)*, *Attributes view* *(page 319)*, and the breadcrumb navigation bar). To achieve this, you can use the `elementRenderings` element in the configuration file.

**Setting up the Content Completion Configuration File**

To customize the configuration file for the *Content Completion Assistant* *(page 2704)*, follow these steps:

1. Create a new `resources` folder (if it does not already exist) in the `frameworks` directory for the particular document type (for example, `OXYGEN_INSTALL_DIR/frameworks/dita/resources`).
2. Open the *Preferences* dialog box *(page 55)* and go to *Document Type Association*. Select the particular document type, click the *Edit* button, and in the *Classpath* tab *(page 76)* add a link to that `resources` folder (if it does not already exist).
3. Create a new configuration file or edit an existing one.
   a. To easily create a new configuration file, you can use the *Content Completion Configuration* document template that is included in Oxygen XML Editor plugin *(File > New > New from Templates > Framework templates > Oxygen Extensions > Content Completion)*
Configuration). The document template includes details about how each element and attribute is used in the configuration file.

b. If a configuration file (cc_config.xml) already exists for the particular document type (in the resources folder), you can modify this existing file.

4. Make the appropriate changes to your custom configuration file.

5. Save the file in the resources folder for the particular document type, using the fixed name: cc_config.xml (for example, OXYGEN_INSTALL_DIR/frameworks/dita/resources/cc_config.xml).

6. Restart the application and open an XML document. In the Content Completion Assistant you should see your customizations.

   Tip: In some cases, you can simply use the Refresh (F5) action to test your customizations, without having to restart the application.

Changing the Rendering of Elements (Their Names, Annotations, and Icons)

For the purposes of customizing how the content completion elements are rendered, you can use the render element inside a elementRenderings element to specify how element names, their annotations, and their icons are rendered.

The elementRenderings element supports the platform attribute, which can have one of the following values:

- webapp
  The element renderings are only applied to Oxygen XML Web Author.

- standalone
  The element renderings are only applied to standalone distributions of Oxygen.

- eclipse
  The element renderings are only applied to Eclipse plugin distributions of Oxygen.

   Note: If the platform attribute is missing, the element renderings are applied to all types of distributions.

You can use the following attributes for the render element:

- element
  Identifies the element to be customized, in the form of a qualified name. If it does not have a prefix, it is considered to be from noNamespace.
Provides the name (label) that will be displayed for the element in various components in Author mode (the Content Completion Assistant, the breadcrumb navigation bar, the Full Tags display mode (page 331), and the Outline (page 316), Elements (page 325), and Attributes (page 319) views). This attribute is optional. If it is missing, the name of the element is used.

If you want to translate this label into another language, use the \$\{i18n(key_name)\} editor variable (page 206). The following code snippet shows how the DITA paragraph elements (p ) can be translated:

```xml
<elementRenderings>
  <render element="p" as="\$\{i18n(cc_p)\}"/>
</elementRenderings>

Note: The cc_p id is a key that identifies the translations available for the paragraph element.

iconPath

Optional attribute that specifies the icon for the element. This is shown in the Content Completion Assistant and the Outline view (page 316) in Author mode. If it is a relative path, the full path of the icon image file will be computed starting from the directory of the configuration file (for example, a value of "myImg.png" will cause Oxygen XML Editor plugin to load "frameworks/\$ \{framework\}/resources/myImg.png"). If you want to access a built-in resource, the value can begin with a forward slash "/", and the image file will be searched for in the Oxygen XML Editor plugin classpath resources (for example, "/images/OrderedList16.png" will load an icon from the built-in Oxygen XML Editor plugin JAR file resources.

xml:lang (Deprecated)

It is recommended to use the \$\{i18n(key_name)\} editor variable (page 206) instead. Optional attribute that could be used to render the same element differently, depending on the language. If there are multiple render elements for the same element attribute (element name) and the xml:lang attribute is missing on one of them, that one will be considered the default fallback value to be used if none of the others match the language specified in the interface.

Note: The default entry should be listed first, since the application tries to match them in sequence and the last match found is the one that is used.

For example, suppose that you want the name of DITA paragraph elements (p ) to be rendered as "Paragraphe" if the language is French, "Absatz" if the language is German,
and "Paragraph" if the language is English (or any other language). Your configuration file should look something like this:

```xml
<elementRenderings>
  <render element="p" as="Paragraph"/>
  <render element="p" as="Paragraphe" xml:lang="fr"/>
  <render element="p" as="Absatz" xml:lang="de"/>
</elementRenderings>
```

You can also use the configuration file to customize the annotations for elements. For this purpose, the `render` element also accepts the following element to change the tooltip annotations for an element (in both Author mode and Text mode):

```xml
annotation
  This element can be used within the `render` element to customize the tooltip annotations that are displayed for the element in various components in Author mode (such as tooltips shown in the Content Completion Assistant documentation window, the breadcrumb navigation bar, the Full Tags display mode (page 331), and the Outline (page 316), Elements (page 325), Attributes (page 319) views), as well as the tooltips that are displayed when you hover over elements in Text mode. You can use HTML content to style the annotations (see the example below (page 2084)).

Possible issue in the following sentence:

"Note: If this element is missing, the styling for the annotations for that element is collected from the associated schema (page 703)."

Other Important Notes About the Configuration File for Rendering Elements

⚠️ Important:

- This configuration file only affects the content completion assistance, not validation.
- To test the effects of your changes, you should restart the application, although in some cases, you can simply use the `<c>` Refresh (F5) action to test your customizations.
- If the framework (page 2706) has an associated style guide, then the annotations defined in the configuration file will take precedence over those defined in the style guide. To check to see if your framework uses a style guide, look for the following folder: `${oxygenInstallDir}frameworks/${framework}/styleguide/`. If that folder exists, it is recommended that you make your annotation changes directly in the style guide, rather than in the configuration file.
- If an `XMLNodeRendererCustomizer` API extension (page 2146) has been implemented for the framework and a configuration file is also used, the rendering customization for an element will be the result of merging the two. For example, if the `XMLNodeRendererCustomizer` implementation customizes the element name, while the configuration file specifies an icon
for the element, the properties of both customizations will be rendered. However, if both implementations define the same property (for example, both specify the rendering of an element name), the customizations defined in the configuration file take precedence.

• The rendering customizations defined in the configuration file also applies to aspects of the Oxygen XML Web Author interface.

Example: Changing the Rendering of an Element

Suppose that you want to render the name of the DITA title element to begin with a capital letter, use a custom icon for it, and provide specific documentation for that element in the various components in Author mode. The configuration file should look like this:

```xml
<elementRenderings>
  <render element="title" as="Title" iconPath="cimg/AcceptAll16.png">
    <annotation>
      <html xmlns="http://www.w3.org/1999/xhtml">
        <head>
          <title>Documentation for the Title Element</title>
        </head>
        <body>
          <p>A <i>heading</i> or <b>label</b> for the main parts of a topic</p>
        </body>
      </html>
    </annotation>
  </render>
</elementRenderings>
```

Related Information:

• Configuring the Proposals for Attribute and Element Values (page 2075)

• Configuring the Proposals for Elements and Attributes (page 2068)

• Customizing XML Node Rendering (page 2146)

• Schema Annotations in Author Mode (page 703)

• Customizing Annotations in the Content Completion Assistant (page 2085)
Customizing Annotations in the Content Completion Assistant

Oxygen XML Editor plugin gathers documentation from the associated schemas (DTD, XML Schema, RelaxNG) and presents it for each element or attribute. For example, if you open the Content Completion Assistant (page 2704) for a recognized XML vocabulary, documentation is displayed for each element provided by the associated schema. Similar information is displayed when you hover over tag names presented in the Elements view (page 325). If you hover over attributes in the Attributes view (page 319) you also see information about each attribute, gathered from the same schema.

If you have a framework configuration (page 72) set up for your XML vocabulary, there is a special XML configuration file that can be added to provide additional documentation information or links to additional information for certain elements and attributes.

To provide this additional information in the Content Completion Assistant, follow these steps:

1. Create a new folder in the configuration directory for the document type.

   **Example:** OXYGEN_INSTALL_DIR/frameworks/dita/styleguide

2. Use the New document wizard to create a file using the Content Completion Styleguide document template (in the Framework Templates > Oxygen Extensions section).

3. Save the file in the folder created in step 1, using the fixed name:

   contentCompletionElementsMap.xml.

4. Open the Preferences dialog box (page 55), go to Document Type Association, and edit the document type configuration for your XML vocabulary. Now you need to indicate where Oxygen XML Editor plugin will locate your mapping file by doing one of the following:

   • In the Classpath tab add a link to the newly created folder.

   • In the Catalogs tab add a new catalog file (page 897). The selected file needs to contain the following:

     ```xml
     <?xml version="1.0" encoding="UTF-8"?>
     <!DOCTYPE catalog PUBLIC "-//OASIS//DTD XML Catalogs V1.1//EN"
     "http://www.oasis-open.org/committees/entity/release/1.1/catalog.dtd">
     <catalog xmlns="urn:oasis:names:tc:entity:xmlns:xml:catalog">
       <uri name="http://www.oxygenxml.com/{processed_dt_name}/styleguide/contentCompletionElementsMap.xml" uri="contentCompletionElementsMap.xml"/>
     </catalog>
     ```

     where `{processed_dt_name}` is the name of the document type in lower case and with spaces replaced by underscores.
5. Make the appropriate changes to your custom mapping file.

   **Example:** You can look at how the DITA mapping file is configured: `OXYGEN_INSTALL_DIR/frameworks/dita/styleguide/contentCompletionElementsMap.xml`

   The associated XML Schema contains additional details about how each element and attribute is used in the mapping file.

6. Re-open the application and open an XML document.

   In the *Content Completion Assistant (page 2704)*, you should see the additional annotations for each element.

**Related Information:**

- Customizing the Rendering of Elements *(page 2080)*

### Sharing a Custom Framework

You can create a custom framework by extending a built-in document type *(page 2037)* (such as DITA or DocBook) using the Document Type Association preferences page *(page 69)*, make modifications to it, and then share the extension with your team.

### Sharing the Extended Framework

There are several ways that you can share the extended custom framework *(page 2037)* with others:

- Distribute the extended framework along with a project by following these steps:
  1. In a location where you have full write access, create a folder for your project.
  2. Go to the Navigator view *(page 250)* and create a project. Save it in the folder you created in step 1.
  3. Create a custom framework by extending an existing one *(page 2037)*, if you haven't already done so, and copy the custom framework directory to the folder you created in step 1. Make sure your custom framework directory includes any resources that are referenced in your framework (CSS files, new document templates, schemas used for validation, catalogs, etc.).
  4. Go to Options > Preferences > Document Type Association > Locations *(page 71)*.
  5. In the Additional frameworks directories list, add an entry using the `${pd}` editor variable *(page 207)* like this: `${pd}/custom_frameworks`. 
6. You can then share the new project directory with other users. For example, you can commit it to your version control system and have them update their working copy. When they open the customized project file in their Navigator view (page 250), the new framework becomes available in the list of document types.

- Distribute the directory of the extended framework (page 2037) to the other members of your team. They will simply copy that directory to their /frameworks directory. The new framework will be available in their list of document types when Oxygen XML Editor plugin starts.

To test the extended framework, the other members of your team can check the list of document types in the Document Type Association preferences page (page 69) to see if the framework is present and if it appears before the built-in frameworks (meaning that it has higher priority).

Framework Customization Tutorial

This section contains topics meant to provide a general tutorial for customizing a framework (page 2706). It includes information about creating a basic document type association, some basic customizations, testing the configuration, packaging and deploying the custom framework, and more.

Tip: A sample framework customization package is available that you can dabble with and use to help you get started. It can be downloaded from: https://www.oxygenxml.com/php/get_oxygen_sample_framework.php. The package includes a sample CSS file, XSL file, schema files, document templates, an XML catalog file, custom icons, and other resources.

Framework Customization Overview

The most important elements of a document type customization are represented by an XML Schema to define the XML structure, the CSS to render the information and the XML instance template that links the first two together.

XML Grammar

To provide as-you-type validation and to compute valid insertion proposals, Oxygen XML Editor plugin needs an XML grammar (XML Schema, DTD, or Relax NG) associated to the XML. The grammar specifies how the internal structure of the XML is defined. For information about associating a schema and how Oxygen XML Editor plugin detects the schema, see Associating a Schema to XML Documents (page 887).

Consider a use-case in which several users are testing a system and must send report results to a content management system. The customization should provide a visual editor for this type of document. The following XML Schema, test_report.xsd defines a report with results of a testing
session. The report consists of a title, few lines describing the test suite that was run, and a list of test results (each with a name and a boolean value indicating if the test passed or failed).

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema">
  <xs:element name="report">
    <xs:complexType>
      <xs:sequence>
        <xs:element ref="title"/>
        <xs:element ref="description"/>
        <xs:element ref="results"/>
      </xs:sequence>
    </xs:complexType>
  </xs:element>
  <xs:element name="title" type="xs:string"/>
  <xs:element name="description">
    <xs:complexType>
      <xs:sequence maxOccurs="unbounded">
        <xs:element name="line">
          <xs:complexType mixed="true">
            <xs:sequence minOccurs="0" maxOccurs="unbounded">
              <xs:element name="important" type="xs:string"/>
            </xs:sequence>
          </xs:complexType>
        </xs:element>
      </xs:sequence>
    </xs:complexType>
  </xs:element>
  <xs:element name="results">
    <xs:complexType>
      <xs:sequence maxOccurs="unbounded">
        <xs:element name="entry">
          <xs:complexType>
            <xs:sequence>
              <xs:element name="test_name" type="xs:string"/>
              <xs:element name="passed"/>
            </xs:sequence>
          </xs:complexType>
        </xs:element>
      </xs:sequence>
    </xs:complexType>
  </xs:element>
</xs:schema>
```
CSS Stylesheet

A set of rules must be defined for describing how the XML document is to be rendered in Author mode. This is done using Cascading Style Sheets (CSS). CSS is a language used to describe how an HTML or XML document should be formatted by a browser. CSS is widely used in the majority of websites.

The elements from an XML document are displayed in the layout as a series of boxes. Some of the boxes contain text and may flow one after the other, from left to right. These are called inline boxes. There are also other types of boxes that flow one below the other (such as paragraphs). These are called block boxes.

For example, consider the way a traditional text editor arranges the text. A paragraph is a block, because it contains a vertical list of lines. The lines are also blocks. However, blocks that contain inline boxes arrange its children in a horizontal flow. That is why the paragraph lines are also blocks, while the traditional "bold" and "italic" sections are represented as inline boxes.

The CSS allows us to specify that some elements are displayed as tables. In CSS, a table is a complex structure and consists of rows and cells. The `table` element must have children that have a `table-row` style. Similarly, the `row` elements must contain elements with a `table-cell` style.

To make it easy to understand, the following section describes how each element from a schema is formatted using a CSS file. Note that this is just one of infinite possibilities for formatting the content.

```
report

This element is the root element of a report document. It should be rendered as a box that contains all other elements. To achieve this the display type is set to block. Additionally, some margins are set for it. The CSS rule that matches this element is:
```

```css
report{
    display:block;
    margin:1em;
}
```
The title of the report. Usually titles have a large font. The block display is used so that the subsequent elements will be placed below it, and its font is changed to double the size of the normal text.

```
title {
    display:block;
    font-size:2em;
}
```

description

This element contains several lines of text describing the report. The lines of text are displayed one below the other, so the description has the block display. Also, the background color is changed to make it stand out.

```
description {
    display:block;
    background-color:#EEEEFF;
    color:black;
}
```

line

A line of text in the description. A specific aspect is not defined and it just indicates that the display should be block style.

```
line {
    display:block;
}
```

important

The important element defines important text from the description. Since it can be mixed with text, its display property must be set to inline. Also, the text is emphasized with bold to make it easier to spot.

```
important {
    display:inline;
    font-weight:bold;
}
```

results
The `results` element displays the list of `test_names` and the results for each one. To make it easier to read, it is displayed as a `table`, with a green border and margins.

```css
results{
    display:table;
    margin:2em;
    border:1px solid green;
}
```

**entry**

An item in the results element. The results are displayed as a table so the entry is a row in the table. Thus, the display is `table-row`.

```css
entry {
    display:table-row;
}
```

**test_name, passed**

The name of the individual test, and its result. They are cells in the results table with the display set to `table-cell`. Padding and a border are added to emphasize the table grid.

```css
test_name, passed{
    display:table-cell;
    border:1px solid green;
    padding:20px;
}

passed{
    font-weight:bold;
}
```

The full content of the CSS file `test_report.css` is:

```css
report {
    display:block;
    margin:1em;
}

description {
```
Figure 656: Report Rendered in Author Mode
XML Instance Template

Based on the XML Schema and CSS file Oxygen XML Editor plugin can help the content author in loading, editing, and validating the test reports. An XML document template must be created as a kind of skeleton that the users can use as a starting point for creating new test reports. The template must be generic enough and reference the XML Schema file and the CSS stylesheet.

This is an example:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<?xml-stylesheet type="text/css" href="test_report.css"?>
<report xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:noNamespaceSchemaLocation="test_report.xsd">
  <title>Automated test report</title>
  <description>
    This is the report of the test automatically ran. Each test suite is ran at 20:00h each day.
    Please <important>check</important> the failed ones!
  </description>
  <results>
    <entry>
      <test_name>Database connection test</test_name>
      <passed>true</passed>
    </entry>
    <entry>
      <test_name>XSLT Transformation test</test_name>
      <passed>true</passed>
    </entry>
    <entry>
      <test_name>DTD validation test</test_name>
      <passed>false</passed>
    </entry>
  </results>
</report>
```
The processing instruction \texttt{xml-stylesheet} associates the CSS stylesheet to the XML file. The \texttt{href} pseudo attribute contains the URI reference to the stylesheet file. In the example, the CSS is in the same directory as the XML file.

The next step is to place the XSD file and the CSS file on a web server and modify the template to use the HTTP URLs, like this:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<report xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:noNamespaceSchemaLocation="http://www.mysite.com/reports/test_report.xsd">
  <title>Test report title</title>
  <description>........
```

If you want to share the files with other team members, you could create an archive containing the \texttt{test_report.xml}, \texttt{test_report.css}, and \texttt{test_report.xsd} and send it to the other users.

Basic Tutorial: Creating and Configuring a Custom Framework

This basic tutorial is meant to provide an example of creating and configuring a custom document type (Framework \textit{(page 2706)}). This basic tutorial offers examples for creating a custom schema, adjusting the authoring experience through custom CSS styling, and creating a custom action. For more advanced and other types of customizations, see the Advanced Framework Customization \textit{(page 2037)} section.
Step 1: Organize Framework Files

First, create a new folder for your customized framework (page 2706). This folder will be used to store all files related to the documentation framework. The folder structure will look something like this:

```
  oxygen
  frameworks
    sdf
      schema
    css
```

The frameworks directory is the container where all the Oxygen XML Editor plugin framework customizations are located. Each subdirectory contains files related to a specific type of XML documents (schemas, catalogs, stylesheets, CSS stylesheets, etc.) Distributing a framework means delivering a framework directory.

It is assumed that you have the right to create files and folders inside the Oxygen XML Editor plugin installation directory. If you do not have this right, you will have to install another copy of the program in a folder you have access to, the home directory for instance, or your desktop.

To test your framework distribution, copy it in the frameworks directory of the newly installed application and start Oxygen XML Editor plugin by running the provided start-up script files.

You should copy the created schema files abs.xsd and sdf.xsd, sdf.xsd being the master schema, to the schema directory and the CSS file sdf.css to the css directory.

Step 2: Extend an Existing Framework

The easiest way to create a custom framework (page 2706) (document type) is by extending an existing built-in framework, such as DITA or DocBook, and then making modifications to it.

1. Open the Preferences dialog box (page 55) and go to Document Type Association > Locations (page 71). Add the path to your custom framework directory in the Additional frameworks directories list and click OK or Apply to save your changes.

2. Go to the Document Type Association preferences page (page 69) and select an existing framework configuration (for example, DocBook) and use the Extend button to create an extension for it.

   **Step Result:** This opens the Document Type Configuration dialog box (page 72) where you can define the set of rules and settings for your custom framework.
3. Give the extension an appropriate name, select **External** for the **Storage** option, click the browsing button (ֹ) to specify the location of your custom framework directory.

4. Click **OK** to close the configuration dialog box and then **OK** or **Apply** to save your changes.

**Results:** You now have a fully functional **framework** that you can continue to customize.

### Step 3: Create a Custom XML Schema

To illustrate an example of creating an XML Schema for a custom DocBook **framework** ([page 2706](#)), suppose the documents are either **articles** or **books**, both composed of **sections**. The sections may contain **titles**, **paragraphs**, **figures**, **tables**, and **other** sections. To complete the picture, each section includes a **def** element from another namespace.

The first schema file:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema"
  targetNamespace="http://www.oxygenxml.com/sample/documentation"
  xmlns:doc="http://www.oxygenxml.com/sample/documentation"
  xmlns:abs="http://www.oxygenxml.com/sample/documentation/abstracts"
  elementFormDefault="qualified">

  <xs:import namespace="http://www.oxygenxml.com/sample/documentation/abstracts"
              schemaLocation="abs.xsd"/>

  Next, the structure of the sections is defined. They all start with a title, then have the optional **def** element then either a sequence of other sections, or a mixture of paragraphs, images and tables.

```xml
<xs:element name="book" type="doc:sectionType"/>
<xs:element name="article" type="doc:sectionType"/>
<xs:element name="section" type="doc:sectionType"/>

<xs:complexType name="sectionType">
  <xs:sequence>
    <xs:element name="title" type="xs:string"/>
    <xs:element ref="abs:def" minOccurs="0"/>
  </xs:sequence>
</xs:complexType>
```
The paragraph contains text and other styling markup, such as bold (b) and italic (i) elements.

```
<xs:element name="para" type="doc:paragraphType"/>
```

The image element has an attribute with a reference to the file containing image data.

```
<xs:element name="image">
  <xs:complexType>
    <xs:attribute name="href" type="xs:anyURI" use="required"/>
  </xs:complexType>
</xs:element>
```

The table contains a header row and then a sequence of rows (tr elements) each of them containing the cells. Each cell has the same content as the paragraphs.

```
<xs:element name="table">
  <xs:complexType>
    <xs:sequence>
      <xs:element name="header">
        <xs:complexType>
          <xs:sequence>
            <xs:element name="td" maxOccurs="unbounded"/>
          </xs:sequence>
        </xs:complexType>
      </xs:element>
    </xs:sequence>
  </xs:complexType>
</xs:element>
```
The `<def>` element is defined as a text only element in the imported schema `abs.xsd`:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema"
    targetNamespace="http://www.oxygenxml.com/sample/documentation/abstracts">
    <xs:element name="def" type="xs:string"/>
</xs:schema>
```

Now the XML data structure will be styled.

**Step 4: Associate the Schema to the Framework**

In the bottom section of the Document Type configuration dialog box (page 72), there are a series of tabs. The Schema tab refers to the schema that is used for validation of the documents that match the defined association rules.
Important: If the document references a schema directly (for example, using a `DOCTYPE` declaration, `xsi:schemaLocation` attribute, or a Relax NG `xml-model` processing instruction), the schema defined in this Schema tab will not be used for validation or content completion.

**Schema Type**

Select from the combo box the value XML Schema.

**Schema URI**

Enter the value of the schema location (for example, `${frameworks}/sdf/schema/sdf.xsd`). Use the `$({frameworks})` editor variable (page 206) in the schema URI path instead of a full path to be valid for multiple Oxygen XML Editor plugin installations.

Important: The `$({frameworks})` variable is expanded at the time of validation into the absolute location of the directory containing the framework (page 2706).

**Step 5: Create a Custom CSS**

If you read the Framework Customization Overview (page 2087) then you already have some basic knowledge about creating simple styles. The example document contains elements from various namespaces, so you need to use CSS Level 3 extensions (supported by the Author mode layout engine) to associate specific properties with that element.

**Defining the General Layout**

Now the basic layout of the rendered documents is created.

Elements that are stacked one on top of the other are: book, article, section, title, figure, table, image. These elements are marked as having block style for display. Elements that are placed one after the other in a flowing sequence are: b, i. These will have inline display.

```css
/* Vertical flow */
book,
section,
para,
title,
image,
ref {
  display:block;
}

/* Horizontal flow */
```
Important: Having block display children in an inline display parent results in Oxygen XML Editor plugin changing the style of the parent to block display.

Styling an Element

The title of any section must be bold and smaller than the title of the parent section. To create this effect, a sequence of CSS rules must be created. The * operator matches any element, it can be used to match titles having progressive depths in the document.

It's useful to have before the title a constant text, indicating that it refers to a section. This text can include also the current section number. The :before and :after pseudo elements will be used, plus the CSS counters.

First declare a counter named sect for each book or article. The counter is set to zero at the beginning of each such element:
The `sect` counter is incremented with each `section`, that is a direct child of a `book` or an `article` element.

```html
book > section,  
article > section{  
    counter-increment:sect;  
}
```

The "static" text that will prefix the section title is composed of the constant "Section ", followed by the decimal value of the `sect` counter and a dot.

```html
book > section > title:before,  
article > section > title:before{  
    content: "Section " counter(sect) ". ";  
}
```

To make the documents easy to read, you add a margin to the sections. In this way the higher nesting level, the larger the left side indent. The margin is expressed relatively to the parent bounds:

```html
section{  
    margin-left:1em;  
    margin-top:1em;  
}
```

Figure 657: A sample of nested sections and their titles.
In the above screenshot you can see a sample XML document rendered by the CSS stylesheet. The selection "avoids" the text that is generated by the CSS "content" property. This happens because the CSS generated text is not present in the XML document and is just a visual aid.

### Styling Inline Elements

The "bold" style is obtained by using the `font-weight` CSS property with the value `bold`, while the "italic" style is specified by the `font-style` property:

```css
b {
    font-weight: bold;
}

i {
    font-style: italic;
}
```

### Styling Images

The CSS 2.1 does not specify how an element can be rendered as an image. To overpass this limitation, Oxygen XML Editor plugin supports a CSS Level 3 extension allowing to load image data from a URL. The URL of the image must be specified by one of the element attributes and it is resolved through the catalogs specified in Oxygen XML Editor plugin.

```css
image{
    display:block;
    content: attr(href, url);
    margin-left:2em;
}
```

The `image` element has the required attribute `href` of type `xs:anyURI`. The `href` attribute contains an image location so the rendered content is obtained by using the function:

```css
attr(href, url)
```

The first argument is the name of the attribute pointing to the image file. The second argument of the `attr` function specifies the type of the content. If the type has the `url` value, then Oxygen XML Editor plugin identifies the content as being an image. If the type is missing, then the content will be the text representing the attribute value.
Oxygen XML Editor plugin handles both absolute and relative specified URLs. If the image has an absolute URL location (for example: "http://www.oasis-open.org/images/standards/oasis_standard.jpg") then it is loaded directly from this location. If the image URL is relative specified to the XML document (for example: "images/my_screenshot.jpg") then the location is obtained by adding this value to the location of the edited XML document.

An image can also be referenced by the name of a DTD entity that specifies the location of the image file. For example, if the document declares an entity **graphic** that points to a JPEG image file:

```xml
<!ENTITY graphic SYSTEM "depo/keyboard_shortcut.jpg" NDATA JPEG>
```

and the image is referenced in the XML document by specifying the name of the entity as the value of an attribute:

```xml
<mediaobject>
  <imageobject>
    <imagedata entityref="graphic" scale="50"/>
  </imageobject>
</mediaobject>
```

The CSS should use the functions `url`, `attr` and `unparsed-entity-uri` for displaying the image in the Author mode:

```css
imagedata[entityref]{
  content: url(unparsed-entity-uri(attr(entityref)));
}
```

To take into account the value of the `width` attribute of the `imagedata` and use it for resizing the image, the CSS can define the following rule:

```css
imagedata[width]{
  width:attr(width, length);
}
```

*Figure 658: Samples of images in Author*
Step 6: Associate the Custom CSS to the Framework

Once you have customized your framework through CSS styling rules, you then need to associate the custom CSS file.

Step 7: Testing the Framework Customization

To test the new framework (page 2706) customization, create an XML instance that conforms with the association rules that you specified in your framework customization. You will not specify an XML Schema location directly in the document, using an xsi:schemaLocation attribute. Instead, Oxygen XML Editor plugin will detect its associated document type and use the specified schema.

```xml
<book xmlns="http://www.oxygenxml.com/sample/documentation"
      xmlns:abs="http://www.oxygenxml.com/sample/documentation/abstracts">
  <title>My Technical Book</title>
  <section>
    <title>XML</title>
    <abs:def>Extensible Markup Language</abs:def>
    <para>In this section of the book I will explain different XML applications.</para>
  </section>
</book>
```

When trying to validate the document there should be no errors. Now modify the title to title2. Validate again. This time there should be an error.
Undo the tag name change, go to **Author** mode, and Oxygen XML Editor plugin should load the CSS from the *document type association* (page 2705) and create a layout similar to this:

*Figure 659: Example: Testing a Framework Customization*

Customizing Frameworks and Author Mode Using Extensions, Plugins, SDK

Advanced users can extend the functionality of custom frameworks and **Author** mode by using plugins (page 2709), extensions, or the **Oxygen SDK**.

If you want to customize the Eclipse plugin you can look at the Eclipse IDE Integration Sample Project to see how an Eclipse plugin can interact with the **Oxygen** APIs.

Configuring Frameworks and Author Mode through Extensions

You can add extensions (page 2709) to your custom framework (page 2706) (document type) by using the Extensions tab from the **Document Type** configuration dialog box (page 72).

Configuring an Extensions Bundle

All extensions (page 2709) that are provided by Oxygen XML Editor plugin are included in a single bundle.

**Note:** The individual extensions can still be set (open the Preferences dialog box (page 55), go to **Document Type Association**, double-click a document type, and go to the extension tab), and if present, they take precedence over the single provider. However, this practice is discouraged and the single provider should be used instead.
The extensions bundle is represented by the \texttt{ro.sync.ecss.extensions.api.ExtensionsBundle} class. The provided implementation of the \texttt{ExtensionsBundle} is instantiated when the Document Type Association (page 2705) rules defined for the custom framework (page 2706) matches a document opened in the editor. Therefore, references to objects that need to be persistent throughout the application running session must not be kept in the bundle because the next detection event can result in creating another \texttt{ExtensionsBundle} instance.

To configure an extensions bundle, follow this procedure:

1. Create a new Java project in your IDE. Create a \texttt{lib} folder in the Java project folder and copy in it the \texttt{oxygen.jar} file from the \{OXYGEN\_INSTALL\_DIR\}/lib folder.

2. Create the class (for example, \texttt{simple.documentation.framework.SDFExtensionsBundle}) to extend the abstract class \texttt{ro.sync.ecss.extensions.api.ExtensionsBundle}.
   For example:
   ```java
   public class SDFExtensionsBundle extends ExtensionsBundle {
   }
   ```

3. A Document Type ID and a short description should be defined first by implementing the methods \texttt{getDocumentTypeID} and \texttt{getDescription}. The Document Type ID is used to uniquely identify the current framework. Such an ID must be provided especially if options related to the framework need to be persistently stored and retrieved between sessions.
   For example:
   ```java
   public String getDocumentTypeID() {
   }
   
   public String getDescription() {
       return "A custom extensions bundle used for the Simple Document" +
                 "Framework document type";
   }
   ```

4. To be notified about the activation of the custom Author Extension in relation with an opened document, \texttt{ro.sync.ecss.extensions.api.AuthorExtensionStateListener} should be implemented. The activation and deactivation events received by this listener should be used to perform custom initializations and to register or remove listeners such as \texttt{ro.sync.ecss.extensions.api.AuthorListener}, \texttt{ro.sync.ecss.extensions.api.AuthorMouseListener}, or \texttt{ro.sync.ecss.extensions.api.AuthorCaretListener}. The custom Author Extension state listener should be provided by implementing the \texttt{createAuthorExtensionStateListener} method.
   For example:
public AuthorExtensionStateListener createAuthorExtensionStateListener() {
    return new SDFAuthorExtensionStateListener();
}

The AuthorExtensionStateListener is instantiated and notified about the activation of the framework when the rules of the Document Type Association match a document opened in the Author editing mode. The listener is notified about the deactivation when another framework is activated for the same document, the user switches to another mode or the editor is closed. A complete description and implementation of ro.sync.ecss.extensions.api.AuthorExtensionStateListener can be found in Implementing an Author Extension State Listener (page 2120).

If Schema Aware mode (page 128) is active in Oxygen XML Editor plugin, all actions that can generate invalid content will be redirected toward the ro.sync.ecss.extensions.api.AuthorSchemaAwareEditingHandler. The handler can resolve a specific case, let the default implementation take place, or reject the edit entirely by throwing an ro.sync.ecss.extensions.api.InvalidEditException. The actions that are forwarded to this handler include typing, delete, or paste.

See Handling Schema-Aware Editing Events (page 2149) for more details about this handler.

5. Customizations of the content completion proposals are permitted by creating a schema manager filter extension. The interface that declares the methods used for content completion proposals filtering is ro.sync.contentcompletion.xml.SchemaManagerFilter. The filter can be applied on elements, attributes, or on their values. The createSchemaManagerFilter method is responsible for creating the content completion filter. A new SchemaManagerFilter will be created each time a document matches the rules defined by the Document Type Association that contains the filter declaration.

For example:

```java
public SchemaManagerFilter createSchemaManagerFilter() {
    return new SDFSchemaManagerFilter();
}
```

A detailed presentation of the schema manager filter can be found in the Configuring a Content Completion Handler (page 2113) section.

6. The Author mode supports link-based navigation between documents and document sections. Therefore, if the document contains elements defined as links to other elements (for example, links based on the id attributes), the extension should provide the means to find the referenced content. To do this, an implementation of the
ro.sync.ecss.extensions.api.link.ElementLocatorProvider interface should be returned by the createElementLocatorProvider method. Each time an element pointed by a link needs to be located, the method is invoked.

For example:

```java
public ElementLocatorProvider createElementLocatorProvider() {
    return new DefaultElementLocatorProvider();
}
```

For more information on how to implement an element locator provider, see the Configuring a Link Target Element Finder (page 2139) section.

7. The drag and drop functionality can be extended by implementing the ro.sync.exml.editor.xmleditor.pageauthor.AuthorDnDListener interface. Relevant methods from the listener are invoked when the mouse is dragged, moved over, or exits the Author editing mode, when the drop action changes, and when the drop occurs. Each method receives the DropTargetEvent containing information about the drag and drop operation. The drag and drop extensions are available in Author mode for both Oxygen XML Editor plugin Eclipse plugin and standalone application. The Text mode corresponding listener is available only for Oxygen XML Editor plugin Eclipse plugin. The methods corresponding to each implementation are: createAuthorAWTDndListener, createTextSWTDndListener, and createAuthorSWTDndListener.

```java
public AuthorDnDListener createAuthorAWTDndListener() {
    return new SDFAuthorDndListener();
}
```

For more details about the Author mode drag and drop listeners, see the Configuring a custom Drag and Drop Listener (page 2115) section.

8. Another extension that can be included in the bundle is the reference resolver. For example, the references represented by the ref element and the attribute indicating the referenced resource is location. To be able to obtain the content of the referenced resources you will have to implement a Java extension class that implements ro.sync.ecss.extensions.api.AuthorReferenceResolver. The method responsible for creating the custom references resolver is createAuthorReferenceResolver. The method is called each time a document opened in an Author editing mode matches the Document Type Association where the extensions bundle is defined. The instantiated references resolver object is kept and used until another extensions bundle corresponding to another document type is activated as result of the detection process.

For example:
9. To be able to dynamically customize the default CSS styles for a certain `ro.sync.ecss.extensions.api.node.AuthorNode`, an implementation of `ro.sync.ecss.extensions.api.StylesFilter` can be provided. The extensions bundle method responsible for creating the `StylesFilter` is `createAuthorStylesFilter`. The method is called each time a document opened in an Author editing mode matches the Document Type Association where the extensions bundle is defined. The instantiated filter object is kept and used until another extensions bundle corresponding to another document type is activated as a result of the detection process.

For example:

```java
public StylesFilter createAuthorStylesFilter() {
    return new SDFStylesFilter();
}
```

See the Configuring CSS Styles Filter (page 2138) section for more details about the styles filter extension.

10. To edit data in custom tabular format, implementations of the `ro.sync.ecss.extensions.api.AuthorTableCellSpanProvider` and the `ro.sync.ecss.extensions.api.AuthorTableColumnWidthProvider` interfaces should be provided. The two methods from the ExtensionsBundle specifying these two extension points are `createAuthorTableCellSpanProvider` and `createAuthorTableColumnWidthProvider`.

For example:

```java
public AuthorTableCellSpanProvider createAuthorTableCellSpanProvider() {
    return new TableCellSpanProvider();
}

public AuthorTableColumnWidthProvider createAuthorTableColumnWidthProvider() {
    return new TableColumnWidthProvider();
}
```
The two table information providers are not reused for different tables. The methods are called for each table in the document so new instances should be provided every time. Read more about the cell span and column width information providers in Configuring a Table Cell Span Provider (page 2130) and Configuring a Table Column Width Provider (page 2124) sections.

If the functionality related to one of the previous extension point does not need to be modified, then the developed ro.sync.ecss.extensions.api.ExtensionsBundle should not override the corresponding method and leave the default base implementation to return null.

11. An XML vocabulary can contain links to various areas of a document. If the document contains elements defined as links, you can choose to present a more relevant text description for each link. To do this, an implementation of the ro.sync.ecss.extensions.api.link.LinkTextResolver interface should be returned by the createLinkTextResolver method. This implementation is used each time the oxy_link-text() function (page 2246) is encountered in the CSS styles associated with an element.

For example:

```java
public LinkTextResolver createLinkTextResolver() {
    return new DitaLinkTextResolver();
}
```

12. Pack the compiled class into a JAR (page 2707) file.

13. Copy the JAR file into your custom framework directory (for example, frameworks/sdf).

14. Add the JAR file to the class path. To do this, open the Preferences dialog box (page 55), go to Document Type Association, select the document type (for example, SDF), press the Edit button, select the Classpath tab, and press the Add button. In the displayed dialog box, enter the location of the JAR file relative to the Oxygen XML Editor plugin frameworks folder.

15. Register the Java class by going to the Extensions tab. Press the Choose button and select the name of the class (for example, SDFExtensionsBundle).

Note: The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor plugin website.
Adding a Custom Image Decorator for Author Mode

The `AuthorImageDecorator` extension point allows you to add a custom decorator over images in Author mode. For example, you could use it to add a message over an image informing the user that they can double-click the image to edit it.

**How to Implement an `AuthorImageDecorator`**

To implement your own `AuthorImageDecorator`, follow this procedure:

1. Implement the `ro.sync.ecss.extensions.api.AuthorImageDecorator` interface.
2. To instruct Oxygen XML Editor plugin to use this newly created implementation, use either of the following methods:
   a. If you have configured an extensions bundle (page 2105), you can return the `AuthorImageDecorator` implementation using the `ro.sync.ecss.extensions.api.ExtensionsBundle.getAuthorImageDecorator()` method.
   b. Specify the `AuthorImageDecorator` in the Author image decorator individual extension in the Extensions tab (page 98) of the Document Type configuration dialog box (page 72) for your particular document type.

**Example**

The following example illustrates an implementation for presenting a simple message over an image that informs the user that they can double-click the image to edit it:

```java
/**
 * Custom Author image decorator for drawing string over images.
 */
public class CustomAuthorImageDecorator extends AuthorImageDecorator {

    /**
     * @see ro.sync.ecss.extensions.api.AuthorImageDecorator#paint
    * ro.sync.exml.view.graphics.Graphics, int, int, int, int,
    * ro.sync.exml.view.graphics.Rectangle,
```
Example result: In the top-left corner of the image, the following message will be displayed: [Double-click to edit image].

Adding Custom Persistent Highlights

The Author API includes a class that allows you to create or remove custom persistent highlights, set new properties for the highlights, and customize their appearance. An example of a possible use case would be if you want to implement your own way of editing review comments. The custom persistent highlights get serialized in the XML document as processing instructions, with the following format:

```xml
<?oxy_custom_start prop1="val1"....?> xml content <?oxy_custom_end?>
```

This functionality is available through the AuthorPersistentHighlighter class that is accessible through the AuthorEditorAccess#getPersistentHighlighter() method.

For more information, see the JavaDoc details for this class at [https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/ecss/extensions/api/highlights/AuthorPersistentHighlighter.html](https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/ecss/extensions/api/highlights/AuthorPersistentHighlighter.html).

Configuring the Automatic ID Generation and Unique Attributes Recognizer

The ro.sync.ecss.extensions.api.UniqueAttributesRecognizer interface can be implemented if you want to provide for your framework (page 2706) the following features:

- **Automatic ID generation** - You can automatically generate unique IDs for newly inserted elements. Implementations are already available for the DITA and DocBook frameworks (page...
The following methods can be implemented to accomplish this: `assignUniqueIDs(int startOffset, int endOffset), isAutoIDGenerationActive()`

- **Avoiding copying unique attributes when "Split" is called inside an element** - You can split the current block element (page 2703) by pressing the “Enter” key and then choosing “Split”. This is a very useful way to create new paragraphs, for example. All attributes are by default copied on the new element but if those attributes are IDs you sometimes want to avoid creating validation errors in the editor. Implementing the following method, you can decide whether or not an attribute should be copied during the split: `boolean copyAttributeOnSplit(String attrQName, AuthorElement element)`

**Tip:** The `ro.sync.ecss.extensions.commons.id.DefaultUniqueAttributesRecognizer` class is an implementation of the interface that can be extended by your customization to provide easy assignation of IDs in your framework (page 2706). You can also check out the DITA and DocBook implementations of `ro.sync.ecss.extensions.api.UniqueAttributesRecognizer` to see how they were implemented and connected to the extensions bundle.

**Note:** The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor plugin website.

### Configuring Content Completion Proposals

You can filter or contribute to proposals offered for content completion by implementing the `ro.sync.contentcompletion.xml.SchemaManagerFilter` interface.

```java
import java.util.List;
import ro.sync.contentcompletion.xml.CIAttribute;
import ro.sync.contentcompletion.xml.CIElement;
import ro.sync.contentcompletion.xml.CIValue;
import ro.sync.contentcompletion.xml.Context;
import ro.sync.contentcompletion.xml.SchemaManagerFilter;
import ro.sync.contentcompletion.xml.WhatAttributesCanGoHereContext;
import ro.sync.contentcompletion.xml.WhatElementsCanGoHereContext;
import ro.sync.contentcompletion.xml.WhatPossibleValuesHasAttributeContext;

public class SDFSchemaManagerFilter implements SchemaManagerFilter {

You can implement the various callbacks of the interface either by returning the default values given by Oxygen XML Editor plugin or by contributing to the list of proposals. The filter can be applied on elements, attributes or on their values. Attributes filtering can be
implemented using the `filterAttributes` method and changing the default content completion list of `ro.sync.contentcompletion.xml.CIAttribute` for the element provided by the current `ro.sync.contentcompletion.xml.WhatAttributesCanGoHereContext` context. For example, the `SDFSchemaManagerFilter` checks if the element from the current context is the `table` element and adds the `frame` attribute to the `table` list of attributes.

```java
/**
 * Filter attributes of the "table" element.
 */
public List<CIAttribute> filterAttributes(List<CIAttribute> attributes,
   WhatAttributesCanGoHereContext context) {
   // If the element from the current context is the 'table' element add the
   // attribute named 'frame' to the list of default content completion proposals
   if (context != null) {
      ContextElement contextElement = context.getParentElement();
      if ("table".equals(contextElement.getQName())) {
         CIAttribute frameAttribute = new CIAttribute();
         frameAttribute.setName("frame");
         frameAttribute.setRequired(false);
         frameAttribute.setFixed(false);
         frameAttribute.setDefaultValue("void");
         if (attributes == null) {
            attributes = new ArrayList<CIAttribute>();
         }
         attributes.add(frameAttribute);
      }
   }
   return attributes;
}
```

The elements that can be inserted in a specific context can be filtered using the `filterElements` method. The `SDFSchemaManagerFilter` uses this method to replace the `td` child element with the `th` element when `header` is the current context element.

```java
public List<CIElement> filterElements(List<CIElement> elements,
   WhatElementsCanGoHereContext context) {
   // If the element from the current context is the 'header' element remove the
   // 'td' element from the list of content completion proposals and add the
   // 'th' element.
   if (context != null) {
      Stack<ContextElement> elementStack = context getElementStack();
```
The elements or attributes values can be filtered using the `filterElementValues` or `filterAttributeValues` methods.

**Note:** The complete source code for framework customization examples can be found in the `oxygen-sample-framework` module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor plugin website.

Configuring a Custom Drag and Drop Listener

Sometimes it is useful to perform various operations when certain objects are dropped from outside sources in the editing area. You can choose from three interfaces to implement depending on whether
you are using the Eclipse plugin or the standalone version of the application, or if you want to add the handler for the **Text** or **Author** modes.

**Interfaces for the Drag and Drop Listener**

- **ro.sync.exml.editor.xmleditor.pageauthor.AuthorDnDListener**
  
  Receives callbacks from the standalone application for Drag And Drop in **Author** mode.

- **com.oxygenxml.editor.editors.author.AuthorDnDListener**
  
  Receives callbacks from the Eclipse plugin for Drag And Drop in **Author** mode.

- **com.oxygenxml.editor.editors.TextDnDListener**
  
  Receives callbacks from the Eclipse plugin for Drag And Drop in **Text** mode.

**Note:** The complete source code for framework customization examples can be found in the **oxygen-sample-framework** module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor plugin website.

To configure how dropped URLs or XHTML fragments are handled in documents, see Handling When URLs or XHTML Fragments are Dropped or Pasted in Author Mode (page 2151).

**Configuring a Reference Resolver**

This information is helpful if you need to provide a handler for resolving references and obtain the content they reference. For example, suppose the element that has references is `ref` and the attribute indicating the referenced resource is `location`. You need to implement a Java extension class for obtaining the referenced resources.

1. Create the class `simple.documentation.framework.ReferencesResolver`. This class must implement the `ro.sync.ecss.extensions.api.AuthorReferenceResolver` interface.

   ```java
   import ro.sync.ecss.extensions.api.AuthorReferenceResolver;
   import ro.sync.ecss.extensions.api.AuthorAccess;
   import ro.sync.ecss.extensions.api.node.AttrValue;
   import ro.sync.ecss.extensions.api.node.AuthorElement;
   import ro.sync.ecss.extensions.api.node.AuthorNode;

   public class ReferencesResolver
   ```
2. The `hasReferences` method verifies if the handler considers the node to have references. It takes `AuthorNode` as an argument that represents the node that will be verified. The method will return `true` if the node is considered to have references. In the following example, to be a reference, the node must be an element with the name `ref` and it must have an attribute named `location`.

```java
public boolean hasReferences(AuthorNode node) {
    boolean hasReferences = false;
    if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
        AuthorElement element = (AuthorElement) node;
        if ("ref".equals(element.getLocalName())) {
            AttrValue attrValue = element.getAttribute("location");
            hasReferences = attrValue != null;
        }
    }
    return hasReferences;
}
```

3. The method `getDisplayName` returns the display name of the node that contains the expanded referenced content. It takes `AuthorNode` as an argument that represents the node for which the display name is needed. The referenced content engine will ask this `AuthorReferenceResolver` implementation for the display name for each node that is considered a reference. In the following example, the display name is the value of the `location` attribute from the `ref` element.

```java
public String getDisplayName(AuthorNode node) {
    String displayName = "ref-fragment";
    if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
        AuthorElement element = (AuthorElement) node;
        if ("ref".equals(element.getLocalName())) {
            AttrValue attrValue = element.getAttribute("location");
            if (attrValue != null) {
                displayName = attrValue.getValue();
            }
        }
    }
    return displayName;
}
```

4. The method `resolveReference` resolves the reference of the node and returns a `SAXSource` with the parser and its input source. It takes `AuthorNode` as an argument that represents the node for
which the reference needs resolving, the `systemID` of the node, the `AuthorAccess` with access methods to the Author mode data model and a SAX `EntityResolver` that resolves resources that are already opened in another editor or resolve resources through the XML Catalog (page 2712). In the implementation, you need to resolve the reference relative to the `systemID`, and create a parser and an input source over the resolved reference.

```java
public SAXSource resolveReference(
    AuthorNode node,
    String systemID,
    AuthorAccess authorAccess,
    EntityResolver entityResolver) {
    SAXSource saxSource = null;

    if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
        AuthorElement element = (AuthorElement) node;
        if ("ref".equals(element.getLocalName())) {
            AttrValue attrValue = element.getAttribute("location");
            if (attrValue != null) {
                String attrStringVal = attrValue.getValue();
                try {
                    URL absoluteUrl = new URL(new URL(systemID),
                        authorAccess.getUtilAccess().correctURL(attrStringVal));
                    InputSource inputSource = entityResolver.resolveEntity(null,
                        absoluteUrl.toString());
                    if (inputSource == null) {
                        inputSource = new InputSource(absoluteUrl.toString());
                    }
                    XMLReader xmlReader = authorAccess.newNonValidatingXMLReader();
                    xmlReader.setEntityResolver(entityResolver);
                    saxSource = new SAXSource(xmlReader, inputSource);
                } catch (MalformedURLException e) {
                    logger.error(e, e);
                } catch (SAXException e) {
                    logger.error(e, e);
                } catch (IOException e) {
                    logger.error(e, e);
                }
            }
        }
    }
```
5. The method `getReferenceUniqueID` should return a unique identifier for the node reference. The unique identifier is used to avoid resolving the references recursively. The method takes `AuthorNode` as an argument that represents the node with the reference. In the following example, the unique identifier is the value of the `location` attribute from the `ref` element.

```java
public String getReferenceUniqueID(AuthorNode node) {
    String id = null;
    if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
        AuthorElement element = (AuthorElement) node;
        if ("ref".equals(element.getLocalName())) {
            AttrValue attrValue = element.getAttribute("location");
            if (attrValue != null) {
                id = attrValue.getValue();
            }
        }
    }
    return id;
}
```

6. The method `getReferenceSystemID` should return the `systemID` of the referenced content. It takes `AuthorNode` as an argument that represents the node with the reference and the `AuthorAccess` with access methods to the Author mode data model. For example, the value of the `location` attribute is used from the `ref` element and resolved relatively to the XML base URL of the node.

```java
public String getReferenceSystemID(AuthorNode node, AuthorAccess authorAccess) {
    String systemID = null;
    if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
        AuthorElement element = (AuthorElement) node;
        if ("ref".equals(element.getLocalName())) {
            AttrValue attrValue = element.getAttribute("location");
            if (attrValue != null) {
                String attrStringVal = attrValue.getValue();
                try {
```

```java
```
In the listing below, the XML document contains the `ref` element:

```xml
<ref location="referenced.xml">Reference</ref>
```

When no reference resolver is specified, the reference has the following layout:

**Figure 660: Reference with no specified reference resolver**

```
Reference without a reference resolver
†Referenced
```

When the above implementation is configured, the reference has the expected layout:

**Figure 661: Reference with reference resolver**

```
Reference with a reference resolver
Reference
†Referenced content
Refered paragraph
```

**Note:** The complete source code for framework customization examples can be found in the `oxygen-sample-framework` module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor plugin website.

Configuring a State Listener for Author Mode

The `ro.sync.ecss.extensions.api.AuthorExtensionStateListener` implementation is notified when the `Author` mode extension (where the listener is defined) is activated or deactivated in the document type detection process.

```java
import ro.sync.ecss.extensions.api.AuthorAccess;
```
import ro.sync.ecss.extensions.api.AuthorExtensionStateListener;

public class SDFAuthorExtensionStateListener implements AuthorExtensionStateListener {
    private AuthorListener sdfAuthorDocumentListener;
    private AuthorMouseListener sdfMouseListener;
    private AuthorCaretListener sdfCaretListener;
    private OptionListener sdfOptionListener;

    When the association rules of the framework (page 2706) (document type) configuration match that of a document opened in the Author editing mode, the activation event received by this listener should be used to perform custom initializations and to register listeners such as ro.sync.ecss.extensions.api.AuthorListener, ro.sync.ecss.extensions.api.AuthorMouseListener, or ro.sync.ecss.extensions.api.AuthorCaretListener.

    public void activated(AuthorAccess authorAccess) {
        // Get the value of the option.
        String option = authorAccess.getOptionsStorage().getOption("sdf.custom.option.key", "");
        // Use the option for some initializations...

        // Add an OptionListener.
        authorAccess.getOptionsStorage().addOptionListener(sdfOptionListener);

        // Add author DocumentListeners.
        sdfAuthorDocumentListener = new SDFAuthorListener();
        authorAccess.getDocumentController().addAuthorListener(sdfAuthorDocumentListener);

        // Add MouseListener.
        sdfMouseListener = new SDFAuthorMouseListener();
        authorAccess.getEditorAccess().addAuthorMouseListener(sdfMouseListener);

        // Add CaretListener.
        sdfCaretListener = new SDFAuthorCaretListener();
        authorAccess.getEditorAccess().addAuthorCaretListener(sdfCaretListener);

        // Other custom initializations...
    }
}
The `authorAccess` parameter received by the `activated` method can be used to gain access to specific Author mode actions and informations related to components such as the editor, document, workspace, tables, or the change tracking manager.

If options specific to the custom developed Author Extension need to be stored or retrieved, a reference to the `ro.sync.ecss.extensions.api.OptionsStorage` can be obtained by calling the `getOptionsStorage` method from the `authorAccess`. The same object can be used to register `ro.sync.ecss.extensions.api.OptionListener` listeners. An option listener is registered in relation with an option key and will be notified about the value changes of that option.

An `AuthorListener` can be used if events related to the Author mode document modifications are of interest. The listener can be added to the `ro.sync.ecss.extensions.api.AuthorDocumentController`. A reference to the document controller is returned by the `getDocumentController` method from the `authorAccess`. The document controller can also be used to perform operations involving document modifications.

To provide access to the Author mode component-related functionality and information, the `authorAccess` has a reference to the `ro.sync.ecss.extensions.api.access.AuthorEditorAccess` that can be obtained when calling the `getEditorAccess` method. At this level, `AuthorMouseListener` and `AuthorCaretListener` can be added to provide notification of mouse and cursor events that occur in the Author editor mode.

The deactivation event is received when another framework is activated for the same document, the user switches to another editor mode or the editor is closed. The `deactivate` method is typically used to unregister the listeners previously added on the `activate` method and to perform other actions. For example, options related to the deactivated Author Extension can be saved at this point.

```java
public void deactivated(AuthorAccess authorAccess) {
    // Store the option.
    authorAccess.getOptionsStorage().setOption(
        "sdf.custom.option.key", optionValue);

    // Remove the OptionListener.
    authorAccess.getOptionsStorage().removeOptionListener(sdfOptionListener);

    // Remove DocumentListeners.
    authorAccess.getDocumentController().removeAuthorListener(
        sdfAuthorDocumentListener);

    // Remove MouseListener.
    authorAccess.getEditorAccess().removeAuthorMouseListener(sdfMouseListener);
}
```
// Remove CaretListener.
authorAccess.getEditorAccess().removeAuthorCaretListener(sdfCaretListener);

// Other actions...
}

Note: The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor plugin website.

Configuring Tables

There are standard CSS properties used to indicate what elements are tables, table rows and table cells. What CSS is missing is the possibility to indicate the cell spanning, row separators or the column widths. Oxygen XML Editor plugin offers support for adding extensions to solve these problems.

The table in this example is a simple one. The header must be formatted in a different way than the ordinary rows, so it will have a background color.

table{
  display:table;
  border:1px solid navy;
  margin:1em;
  max-width:1000px;
  min-width:150px;
}

table[width]{
  width:attr(width, length);
}

tr, header{
  display:table-row;
}

header{
  background-color: silver;
  color:inherit
}
Suppose that in the schema, the `td` tag has the attributes `row_span` and `column_span` that are not automatically recognized by Oxygen XML Editor plugin, a Java extension will be implemented that will provide information about the cell spanning. See the section Configuring a Table Cell Span Provider (page 2130).

Suppose the column widths are specified by the `width` attribute of the `customcol` elements that are not automatically recognized by Oxygen XML Editor plugin. It is necessary to implement a Java extension that will provide information about the column widths. For more information, see Configuring a Table Column Width Provider (page 2124).

The table from the example does not make use of the attributes `colsep` and `rowsep` (which are automatically recognized) but if you want the rows to be separated by horizontal lines, it is necessary to implement a Java extension that will provide information about the row and column separators. For more information, see Configuring a Table Cell Row and Column Separator Provider (page 2134).

### Configuring a Table Column Width Provider

In a custom framework (page 2706), the `table` element as well as the table columns can have specified widths. For these widths to be considered by Author mode, you need to provide the means for determining them. As explained in Configuring Tables (page 2123), if you use the table element attribute `width` Oxygen XML Editor plugin can determine the table width automatically. In this example the table has `col` elements with `width` attributes that are not recognized by default. You will need to implement a Java extension class to determine the column widths.

1. Create the class `simple.documentation.framework.TableColumnWidthProvider`. This class must implement the `ro.sync.ecss.extensions.api.AuthorTableColumnWidthProvider` interface.

```java
import ro.sync.ecss.extensions.api.AuthorAccess;
import ro.sync.ecss.extensions.api.AuthorOperationException;
import ro.sync.ecss.extensions.api.AuthorTableColumnWidthProvider;
import ro.sync.ecss.extensions.api.WidthRepresentation;
import ro.sync.ecss.extensions.api.node.AuthorElement;

public class TableColumnWidthProvider
```
2. Method `init` is taking as argument an `AuthorElement` that represents the XML table element. In our case the column widths are specified in `col` elements from the table element. In such cases you must collect the span information by analyzing the table element.

```java
public void init(AuthorElement tableElement) {
    this.tableElement = tableElement;
    AuthorElement[] colChildren = tableElement.getElementsByLocalName("customcol");
    if (colChildren != null && colChildren.length > 0) {
        for (int i = 0; i < colChildren.length; i++) {
            AuthorElement colChild = colChildren[i];
            if (i == 0) {
                colsStartOffset = colChild.getStartOffset();
            } else if (i == colChildren.length - 1) {
                colsEndOffset = colEndChild.getStartOffset();
            }
        // Determine the 'width' for this col.
        AttrValue colWidthAttribute = colChild.getAttribute("width");
        String colWidth = null;
        if (colWidthAttribute != null) {
            colWidth = colWidthAttribute.getValue();
            // Add WidthRepresentation objects for the columns this 'customcol'
            // specification spans over.
            colWidthSpecs.add(new WidthRepresentation(colWidth, true));
        }
    }
}
```

3. The method `isTableAcceptingWidth` should check if the table cells are `td`.

```java
public boolean isTableAcceptingWidth(String tableCellsTagName) {
    return "td".equals(tableCellsTagName);
}
```

4. The method `isTableAndColumnsResizable` should check if the table cells are `td`. This method determines if the table and its columns can be resized by dragging the edge of a column.

```java
public boolean isTableAndColumnsResizable(String tableCellsTagName) {
```
5. Methods `getTableWidth` and `getCellWidth` are used to determine the table and column width. The table layout engine will ask this `ro.sync.ecss.extensions.api.AuthorTableColumnWidthProvider` implementation what is the table width for each table element and the cell width for each cell element from the table that was marked as cell in the CSS using the property `display:table-cell`. The implementation is simple and just parses the value of the `width` attribute. The methods must return `null` for the tables / cells that do not have a specified width.

```java
public WidthRepresentation getTableWidth(String tableCellsTagName) {
    WidthRepresentation toReturn = null;
    if (tableElement != null && "td".equals(tableCellsTagName)) {
        AttrValue widthAttr = tableElement.getAttribute("width");
        if (widthAttr != null) {
            String width = widthAttr.getValue();
            if (width != null) {
                toReturn = new WidthRepresentation(width, true);
            }
        }
    }
    return toReturn;
}

public List<WidthRepresentation> getCellWidth(AuthorElement cellElement, int colNumberStart, int colSpan) {
    List<WidthRepresentation> toReturn = null;
    int size = colWidthSpecs.size();
    if (size >= colNumberStart && size >= colNumberStart + colSpan) {
        toReturn = new ArrayList<WidthRepresentation>(colSpan);
        for (int i = colNumberStart; i < colNumberStart + colSpan; i ++) {
            // Add the column widths
            toReturn.add(colWidthSpecs.get(i));
        }
    }
    return toReturn;
}
```
6. Methods `commitTableWidthModification` and `commitColumnWidthModifications` are used to commit changes made to the width of the table or its columns when using the mouse drag gestures.

```java
public void commitTableWidthModification
(AuthorDocumentController authorDocumentController,
int newTableWidth, String tableCellsTagName) throws AuthorOperationException {
if ("td".equals(tableCellsTagName)) {
if (newTableWidth > 0) {
if (tableElement != null) {
    String newWidth = String.valueOf(newTableWidth);
    authorDocumentController.setAttribute("width",
        new AttrValue(newWidth),
        tableElement);
} else {
    throw new AuthorOperationException("Cannot find the table element.");
}
}
}

public void commitColumnWidthModifications
(AuthorDocumentController authorDocumentController,
WidthRepresentation[] colWidths, String tableCellsTagName)
throws AuthorOperationException {
if ("td".equals(tableCellsTagName)) {
    if (colWidths != null && tableElement != null) {
if (colsStartOffset >= 0 && colsEndOffset >= 0 && colsStartOffset < colsEndOffset) {
    authorDocumentController.delete(colsStartOffset, colsEndOffset);
}
String xmlFragment = createXMLFragment(colWidths);
int offset = -1;
AuthorElement[] header = tableElement.getElementsByTagName("header");
if (header != null && header.length > 0) {
    // Insert the cols elements before the 'header' element
    offset = header[0].getStartOffset();
```
}  
if (offset == -1) {
    throw new AuthorOperationException("No valid offset to insert column width");
}  
authorDocumentController.insertXMLFragment(xmlFragment, offset);
}
}

private String createXMLFragment(WidthRepresentation[] widthRepresentations) {
    StringBuffer fragment = new StringBuffer();
    String ns = tableElement.getNamespace();
    for (int i = 0; i < widthRepresentations.length; i++) {
        WidthRepresentation width = widthRepresentations[i];
        fragment.append("<customcol");
        String strRepresentation = width.getWidthRepresentation();
        if (strRepresentation != null) {
            fragment.append(" width=" + width.getWidthRepresentation() + """);
        }
        if (ns != null && ns.length() > 0) {
            fragment.append(" xmlns=" + ns + """);
        }
        fragment.append(">");
    }
    fragment.append("/>");
    return fragment.toString();
}

7. The following three methods are used to determine what type of column width specifications the table column width provider support. In our case all types of specifications are allowed:

    public boolean isAcceptingFixedColumnWidths(String tableCellsTagName) {
        return true;
    }

    public boolean isAcceptingPercentageColumnWidths(String tableCellsTagName) {
        return true;
    }

    public boolean isAcceptingProportionalColumnWidths(String tableCellsTagName) {
        return true;
Note: The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor plugin website.

In the listing below, the XML document contains the table element:

```
<table width="300">
  <customcol width="50.0px"/>
  <customcol width="1*"/>
  <customcol width="2*"/>
  <customcol width="20%"/>
  <header>
    <td>C1</td>
    <td>C2</td>
    <td>C3</td>
    <td>C4</td>
  </header>
  <tr>
    <td>cs=1, rs=1</td>
    <td>cs=1, rs=1</td>
    <td row_span="2">cs=1, rs=2</td>
    <td row_span="3">cs=1, rs=3</td>
  </tr>
  <tr>
    <td>cs=1, rs=1</td>
    <td>cs=1, rs=1</td>
  </tr>
  <tr>
    <td column_span="3">cs=3, rs=1</td>
  </tr>
</table>
```

When no table column width provider is specified, the table has the following layout:

*Figure 662: Table layout when no column width provider is specified*
When the above implementation is configured, the table has the correct layout:

![Columns with custom widths](image)

**Figure 663: Columns with custom widths**

---

**Note:** The complete source code for framework customization examples can be found in the `oxygen-sample-framework` module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor plugin website.

### Configuring a Table Cell Span Provider

In a custom framework (page 2706), the `table` element can have cells that span over multiple columns and rows. As explained in Configuring Tables (page 2123), you need to indicate Oxygen XML Editor plugin a method to determine the cell spanning. If you use the cell element attributes `rowspan` and `colspan` or `rows` and `cols`, Oxygen XML Editor plugin can determine the cell spanning automatically. In the following example, the `td` element uses the attributes `row_span` and `column_span` that are not recognized by default. You will need to implement a Java extension class for defining the cell spanning.

1. Create the class `simple.documentation.framework.TableCellSpanProvider`. This class must implement the `ro.sync.ecss.extensions.api.AuthorTableCellSpanProvider` interface.

   ```java
   import ro.sync.ecss.extensions.api.AuthorTableCellSpanProvider;
   ```
import ro.sync.ecss.extensions.api.node.AttrValue;
import ro.sync.ecss.extensions.api.node.AuthorElement;

public class TableCellSpanProvider
    implements AuthorTableCellSpanProvider {

    2. The `init` method takes `ro.sync.ecss.extensions.api.node.AuthorElement` that represents the XML table element as its argument. In this example, the cell span is specified for each of the cells so you leave this method empty. However, there are cases (such as the CALS table model) when the cell spanning is specified in the table element. In such cases, you must collect the span information by analyzing the table element.

        public void init(AuthorElement table) {
        }

    3. The `getColSpan` method is taking as argument the table cell. The table layout engine will ask this `AuthorTableSpanSupport` implementation what is the column span and the row span for each XML element from the table that was marked as cell in the CSS using the property `display:table-cell`. The implementation is simple and just parses the value of `column_span` attribute. The method must return null for all the cells that do not change the span specification.

        public Integer getColSpan(AuthorElement cell) {
            Integer colSpan = null;

            AttrValue attrValue = cell.getAttribute("column_span");
            if(attrValue != null) {
                // The attribute was found.
                String cs = attrValue.getValue();
                if(cs != null) {
                    try {
                        colSpan = new Integer(cs);
                    } catch (NumberFormatException ex) {
                        // The attribute value was not a number.
                    }
                }
            }
            return colSpan;
        }

    4. The row span is determined in a similar manner:
public Integer getRowSpan(AuthorElement cell) {
    Integer rowSpan = null;

    AttrValue attrValue = cell.getAttribute("row_span");
    if (attrValue != null) {
        // The attribute was found.
        String rs = attrValue.getValue();
        if (rs != null) {
            try {
                rowSpan = new Integer(rs);
            } catch (NumberFormatException ex) {
                // The attribute value was not a number.
            }
        }
    }
    return rowSpan;
}

5. The method `hasColumnSpecifications` always returns `true` considering column specifications always available.

    public boolean hasColumnSpecifications(AuthorElement tableElement) {
        return true;
    }

    Note: The complete source code for framework customization examples can be found in the `oxygen-sample-framework` module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor plugin website.

6. In the listing below, the XML document contains the table element:

    <table>
        <header>
            <td>C1</td>
            <td>C2</td>
            <td>C3</td>
            <td>C4</td>
        </header>
        <tr>
            <td>cs=1, rs=1</td>
        </tr>
    </table>
When no table cell span provider is specified, the table has the following layout:

**Figure 664: Table layout when no cell span provider is specified**

When the above implementation is configured, the table has the correct layout:

**Figure 665: Cells spanning multiple rows and columns.**
Configuring a Table Cell Row and Column Separator Provider

In a custom framework (page 2706), the table element has separators between rows. As explained in Configuring Tables (page 2123), you need to indicate a method to determine the way rows and columns are separated. If you use the rowsep and colsep cell element attributes, or your table is conforming to the CALS table model, Oxygen XML Editor plugin can determine the cell separators. Even if there are no attributes that define the separators, you can still force a separator between rows by implementing a Java extension.

1. Create the class simple.documentation.framework.TableCellSepProvider. This class must implement the ro.sync.ecss.extensions.api.AuthorTableCellSepProvider interface.

```java
import ro.sync.ecss.extensions.api.AuthorTableCellSepProvider;
import ro.sync.ecss.extensions.api.node.AuthorElement;

public class TableCellSepProvider implements AuthorTableCellSepProvider{
```

2. The init method takes the ro.sync.ecss.extensions.api.node.AuthorElement interface that represents the XML table element as its argument. If the separator information is implicit, it does not depend on the current table, so you leave this method empty. However, there are cases (such as the CALS table model) when the cell separators are specified in the table element. In such cases, you should initialize your provider based on the given argument.

```java
```

Note: The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor plugin website.
3. The `getColSep` method takes the table cell as its argument. The table layout engine will ask this `AuthorTableCellSepProvider` implementation if there is a column separator for each XML element from the table that was marked as cell in the CSS using the property `display:table-cell`. The following example returns `false`, meaning there will not be column separators.

```java
/**
 * @return false - No column separator at the right of the cell.
 */
@Override
public boolean getColSep(AuthorElement cellElement, int columnIndex) {
    return false;
}
```

4. The row separators are determined in a similar manner. This time the example returns `true`, forcing a separator between the rows.

```java
/**
 * @return true - A row separator below each cell.
 */
@Override
public boolean getRowSep(AuthorElement cellElement, int columnIndex) {
    return true;
}
```

Note: The complete source code for framework customization examples can be found in the `oxygen-sample-framework` module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor plugin website.

5. In the example below, the XML document contains the table element:

```xml
<table>
    <header>
        <td>1</td>
        <td>2</td>
        <td>3</td>
        <td>4</td>
    </header>
    <tr>
        <td>H1</td>
        <td>H2</td>
        <td>H3</td>
        <td>H4</td>
    </tr>
</table>
```
When the borders for the `td` element are removed from the CSS, the row separators become visible:

*Figure 666: Row separators provided by the Java implementation.*

<table>
<thead>
<tr>
<th>H1</th>
<th>H2</th>
<th>H3</th>
<th>H4</th>
</tr>
</thead>
<tbody>
<tr>
<td>C11</td>
<td>C12</td>
<td>C13</td>
<td>C14</td>
</tr>
<tr>
<td>C21</td>
<td>C22</td>
<td>C23</td>
<td>C24</td>
</tr>
<tr>
<td>C31</td>
<td>C32</td>
<td>C33</td>
<td>C34</td>
</tr>
</tbody>
</table>

**Note:** The complete source code for framework customization examples can be found in the `oxygen-sample-framework` module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor plugin website.

Customizing Attribute Value Editors

The `CustomAttributeValueEditor` extension point allows you to customize the attribute value editing mechanisms in Oxygen XML Editor plugin. It changes the `Browse` button found in the attribute
editors to an Edit button. When a user clicks that Edit button, your custom attribute value editor will be presented.

The Edit button can be accessed in the following attribute editors:

- The Attributes view in Author mode (page 319) (when the Expand button is used to reveal an expanded panel).
- The Attributes view in Text mode (page 261) (when the Expand button is used to reveal an expanded panel).
- The In-place Attributes Editor (page 322) when invoked in Author mode.
- The In-place Attributes Editor (page 318) invoked in the Outline view when editing in Author mode.
- The In-place Attributes Editor (page 260) invoked in the Outline view when editing in Text mode.

How to Implement a CustomAttributeValueEditor

To implement your own CustomAttributeValueEditor, follow this procedure:

1. Extend the ro.sync.ecss.extensions.api.CustomAttributeValueEditor abstract class.
2. To instruct Oxygen XML Editor plugin to use this newly created implementation, use either of the following methods:
   a. If you have configured an extensions bundle (page 2105), you can return the CustomAttributeValueEditor implementation using the ro.sync.ecss.extensions.api.ExtensionsBundle.createCustomAttributeValueEditor() method.
   b. Specify the CustomAttributeValueEditor in the Author custom attribute value editor individual extension in the Extensions tab (page 98) of the Document Type configuration dialog box (page 72) for your particular document type.

Example

The following example creates a very simple custom attribute value editor:

```java
/**
 * A custom attribute value editor.
 */
public class MyCustomAttributeValueEditor extends CustomAttributeValueEditor {

    /**
     * see ro.sync.ecss.extensions.api.Extension#getDescription()
     */
    @Override
```
Example result: If a user were to click the Edit button in any of the attribute editors, the following dialog box would be displayed that allows the user to insert a value for the particular attribute:

Customizing the CSS Styles Filter

You can modify the CSS styles for each ro.sync.ecss.extensions.api.node.AuthorNode rendered in the Author mode using an implementation of ro.sync.ecss.extensions.api.StylesFilter. You can implement the various callbacks of the interface either by returning the default value given by Oxygen
XML Editor plugin or by contributing to the value. The received styles \texttt{ro.sync.ecss.css.Styles} can be processed and values can be overwritten with your own. For example, you can override the \texttt{KEY\_BACKGROUND\_COLOR} style to return your own implementation of \texttt{ro.sync.exml.view.graphics.Color} or override the \texttt{KEY\_FONT} style to return your own implementation of \texttt{ro.sync.exml.view.graphics.Font}.

For instance, in this simple document example, the filter can change the value of the \texttt{KEY\_FONT} property for the \texttt{table} element:

```java
package simple.documentation.framework;

import ro.sync.ecss.css.Styles;
import ro.sync.ecss.extensions.api.StylesFilter;
import ro.sync.ecss.extensions.api.node.AuthorNode;
import ro.sync.exml.view.graphics.Font;

public class SDFStylesFilter implements StylesFilter {

    public Styles filter(Styles styles, AuthorNode authorNode) {
        if (AuthorNode.NODE\_TYPE\_ELEMENT == authorNode.getType() && "table".equals(authorNode.getName())) {
            styles.setProperty(Styles.KEY\_FONT, new Font(null, Font.\textbf{BOLD}, 12));
        }
        return styles;
    }
}
```

\textbf{Note:} The complete source code for \textit{framework} customization examples can be found in the \texttt{oxygen-sample-framework} module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor plugin website.

Customizing Elements that Wrap Profiled Content

For each \textit{framework} (page 2706) (document type), you can configure the phrase-type elements that wrap the profiled content by setting a custom \texttt{ro.sync.ecss.extensions.api.ProfilingConditionalTextProvider}. This configuration is set by default for DITA and DocBook \textit{frameworks}.

Customizing the Link Target Reference Finder
The link target reference finder represents the support for finding references from links that indicate specific elements inside an XML document. This support will only be available if a schema is associated with the document type.

If you do not define a custom link target reference finder, the DefaultElementLocatorProvider implementation (page 2140) will be used by default. The interface that should be implemented for a custom link target reference finder is ro.sync.ecss.extensions.api.link.ElementLocatorProvider. As an alternative, the ro.sync.ecss.extensions.commons.DefaultElementLocatorProvider implementation can also be extended.

The used ElementLocatorProvider will be queried for an ElementLocator when a link location must be determined (when a link is clicked). Then, to find the corresponding (linked) element, the obtained ElementLocator will be queried for each element from the document.

**Note:** The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor plugin website.

**Creating a Custom Link Target Reference Finder**

If you need to create a custom link target reference finder you can do so by creating the class that will implement the ro.sync.ecss.extensions.api.link.ElementLocatorProvider interface. As an alternative, your class could extend ro.sync.ecss.extensions.commons.DefaultElementLocatorProvider, the default implementation.

**Note:** The complete source code of the ro.sync.ecss.extensions.commons.DefaultElementLocatorProvider, ro.sync.ecss.extensions.commons.IDElementLocator or ro.sync.ecss.extensions.commons.XPointerElementLocator can be found in the oxygen-sample-framework project.

**Default Link Target Reference Finder**

The DefaultElementLocatorProvider implementation is used by default to find link target references. It offers support for the most common types of links:

- Links based on ID attribute values (page 2141).
- XPointer element() scheme (page 2142).

The method getElementLocator determines what ElementLocator should be used. In the default implementation, it checks if the link is an XPointer element() scheme. Otherwise, it assumes it is an
ID. A non-null IDTypeVerifier will always be provided if a schema is associated with the document type.

The link string argument is the anchor (page 2703) part of the URL that is composed from the value of the link property specified for the link element in the CSS.

```java
public ElementLocator getElementLocator(IDTypeVerifier idVerifier, String link) {
    ElementLocator elementLocator = null;
    try {
        if(link.startsWith("element(")){
            // xpointer element() scheme
            elementLocator = new XPointerElementLocator(idVerifier, link);
        } else {
            // Locate link element by ID
            elementLocator = new IDElementLocator(idVerifier, link);
        }
    } catch (ElementLocatorException e) {
        logger.warn("Exception when create element locator for link: "+ link + ". Cause: " + e, e);
    }
    return elementLocator;
}
```

ID Element Locator

The IDElementLocator is an implementation of the abstract class ro.sync.ecss.extensions.api.link.ElementLocator for links that use an ID.

The constructor only assigns field values and the method endElement is empty for this implementation.

The method startElement checks each of the element's attribute values and when one matches the link, it considers the element found if one of the following conditions is satisfied:

- The qualified name of the attribute is xml:id.
- The attribute type is ID.

The attribute type is checked with the help of the method IDTypeVerifier.hasIDType.

```java
public boolean startElement(String uri, String localName, String name, Attr[] atts) {
    boolean elementFound = false;
    // Code...
    return elementFound;
}
```
for (int i = 0; i < atts.length; i++) {
    if (link.equals(atts[i].getValue())) {
        if ("xml:id".equals(atts[i].getQName())) {
            // xml:id attribute
            elementFound = true;
        } else {
            // check if attribute has ID type
            String attrLocalName =
                ExtensionUtil.getLocalName(atts[i].getQName());
            String attrUri = atts[i].getNamespace();
            if (idVerifier.hasIDType(localName, uri, attrLocalName, attrUri)) {
                elementFound = true;
            }
        }
    }
}
return elementFound;

XPointer Element Locator

XPointerElementLocator is an implementation of the abstract class
ro.sync.ecss.extensions.api.link.ElementLocator for links that have one of the following XPointer
element() scheme patterns:

  element (elementID)

    Locate the element with the specified ID.

  element (/1/2/3)

    A child sequence appearing alone identifies an element by means of stepwise
    navigation, which is directed by a sequence of integers separated by slashes (/). Each
    integer n locates the nth child element of the previously located element.

  element (elementID/3/4)

    A child sequence appearing after a NCName identifies an element by means of stepwise
    navigation, starting from the element located by the given name.

The constructor separates the ID/integers, which are delimited by slashes(/) into a sequence of
identifiers (an XPointer path). It will also check that the link has one of the supported patterns of the
XPointer element() scheme.
public XPointerElementLocator(IDTypeVerifier idVerifier, String link) throws ElementLocatorException {
    super(link);
    this.idVerifier = idVerifier;

    link = link.substring("element(".length(), link.length() - 1);

    StringTokenizer stringTokenizer = new StringTokenizer(link, "/", false);
    xpointerPath = new String[stringTokenizer.countTokens()];
    int i = 0;
    while (stringTokenizer.hasMoreTokens()) {
        xpointerPath[i] = stringTokenizer.nextToken();
        boolean invalidFormat = false;

        // Empty xpointer component is not supported
        if (xpointerPath[i].length() == 0) {
            invalidFormat = true;
        }
        if (i > 0) {
            try {
                Integer.parseInt(xpointerPath[i]);
            } catch (NumberFormatException e) {
                invalidFormat = true;
            }
        }
    }

    if (invalidFormat) {
        throw new ElementLocatorException("Only the element() scheme is supported when locating XPointer links."
                + "Supported formats: element(elementID), element(/1/2/3),
                element(elemID/2/3/4).\"));
    }
    i++;
}

if (Character.isDigit(xpointerPath[0].charAt(0))) {
    // This is the case when xpointer have the following pattern /1/5/7
    xpointerPathDepth = xpointerPath.length;
} else {
The method `startElement` will be invoked at the beginning of every element in the XML document (even when the element is empty). The arguments it takes are:

- **uri**
  - The namespace URI, or the empty string if the element has no namespace URI or if namespace processing is disabled.

- **localName**
  - Local name of the element.

- **qName**
  - Qualified name of the element.

- **atts**
  - Attributes attached to the element. If there are no attributes, this argument will be empty.

The method returns `true` if the processed element is found to be the one indicated by the link.

The `XPointerElementLocator` implementation of the `startElement` will update the depth of the current element and keep the index of the element in its parent. If the `xpointerPath` starts with an element ID then the current element ID is verified to match the specified ID. If this is the case the depth of the XPointer is updated taking into account the depth of the current element.

If the XPointer path depth is the same as the current element depth then the kept indices of the current element path are compared to the indices in the XPointer path. If all of them match then the element has been found.

```java
public boolean startElement(String uri, String localName, String name, Attr[] atts) {
    boolean linkLocated = false;
    // Increase current element document depth
    startElementDepth ++;

    if (endElementDepth != startElementDepth) {
        // The current element is the first child of the parent
    }
    return linkLocated;
}
```
currentElementIndexStack.push(new Integer(1));
}
else {
    // Another element in the parent element
    currentElementIndexStack.push(new Integer(lastIndexInParent + 1));
}

if (startsWithElementID) {
    // This the case when xpointer path starts with an element ID.
    String xpointerElement = xpointerPath[0];
    for (int i = 0; i < atts.length; i++) {
        if (xpointerElement.equals(atts[i].getValue())){
            if (idVerifier.hasIDType(
                localName, uri, atts[i].getQName(), atts[i].getNamespace()){
                xpointerPathDepth = startElementDepth + xpointerPath.length - 1;
                break;
            }
        }
    }
}

if (xpointerPathDepth == startElementDepth){
    // check if xpointer path matches with the current element path
    linkLocated = true;
    try {
        int xpointerIdx = xpointerPath.length - 1;
        int stackIdx = currentElementIndexStack.size() - 1;
        int stopIdx = startWithElementID ? 1 : 0;
        while (xpointerIdx >= stopIdx && stackIdx >= 0) {
            int xpointerIndex = Integer.parseInt(xpointerPath[xpointerIdx]);
            int currentElementIndex = 
                {{(Integer)currentElementIndexStack.get(stackIdx)}.intValue();
            if (xpointerIndex != currentElementIndex) {
                linkLocated = false;
                break;
            }
        }
        xpointerIdx--;
        stackIdx--;
    }
The method `endElement` will be invoked at the end of every element in the XML document (even when the element is empty).

The `XPointerElementLocator` implementation of the `endElement` updates the depth of the current element path and the index of the element in its parent.

```java
public void endElement(String uri, String localName, String name) {
    endElementDepth = startElementDepth;
    startElementDepth --;
    lastIndexInParent = ((Integer)currentElementIndexStack.pop()).intValue();
}
```

Customizing XML Node Rendering

You can use this API extension to customize the way an XML node is rendered in the Outline view (page 316) in Author mode, breadcrumb navigation bar (page 684) in Author mode, Outline view (page 257) in Text mode, Content Completion Assistant (page 2704) window, or DITA Maps Manager view (page 2400).

**Note:** Oxygen XML Editor plugin uses `XMLNodeRendererCustomizer` implementations for the following frameworks (page 2706): DITA, DITA Map, DocBook 4, DocBook 5, TEI, XHTML, XSLT, and XML Schema.

There are two methods to provide an implementation of `ro.sync.exml.workspace.api.node.customizer.XMLNodeRendererCustomizer`:

- As a part of a bundle, returning it from the `createXMLNodeCustomizer()` method of the `ExtensionsBundle` associated with your document type in the Document type configuration dialog box (page 72) (Extensions bundle field in the Extensions tab).
- As an individual extension, associated with your document type in the Document type configuration dialog box (page 72) (XML node renderer customizer field in the Individual extensions section of the Extensions tab).
Support for Retina/HiDPI Displays

To support Retina or HiDPI displays, the icons provided by the XMLNodeRendererCustomizer should be backed up by a copy of larger size using the proper Retina/HiDPI naming convention (page 804).

For example, for the title element, if the XMLNodeRendererCustomizer returns the path ${framework}/images/myImg.png, then to support Retina images with a scaling factor of 2, an extra file (myImg@2x.png) should be added to the same images directory (${framework}/images/myImg@2x.png). If the higher resolution icon (the @2x file) does not exist, the normal icon is scaled and used instead.

For more information about using Retina/HiDPI images, refer to the Using Retina/HiDPI Images in Author Mode (page 803) section.

Note: The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor plugin website.

• Customizing the Rendering of Elements (page 2080)

Handling Author Mode Action Events

The AuthorActionEventHandler extension point allows you to handle certain Author mode actions in a special way. For example, a specific use-case would be if you want to insert new lines when you press Enter instead of it opening the Content Completion Assistant (page 2704).

How to Implement an AuthorActionEventHandler

To implement your own AuthorActionEventHandler, follow this procedure:

1. Implement the ro.sync.ecss.extensions.api.AuthorActionEventHandler interface.
2. To instruct Oxygen XML Editor plugin to use this newly created implementation, use either of the following methods:
   a. If you have configured an extensions bundle (page 2105), you can return the AuthorActionEventHandler implementation using the ro.sync.ecss.extensions.api.ExtensionsBundle.getAuthorActionEventHandler() method.
b. Specify the AuthorActionEventHandler in the Author action event handler individual extension in the Extensions tab (page 98) of the Document Type configuration dialog box (page 72) for your particular document type.

Example

The following example illustrates the use-case mentioned in the introduction, that is an implementation for inserting a new line when the user presses Enter in Author mode. It uses the canHandleEvent method to make sure the insertion will be performed in an element that will preserve the new-line character. Then the handleEvent method inserts the new line at the current cursor position.

```java
public class CustomAuthorActionEventHandler implements AuthorActionEventHandler {

    /**
     * @see ro.sync.ecss.extensions.api.AuthorActionEventHandler#canHandleEvent
     * (AuthorAccess, AuthorActionEventType)
     */
    @Override
    public boolean canHandleEvent(AuthorAccess authorAccess,
            AuthorActionEventType type) {
        boolean canHandle = false;

        if (type == AuthorActionEventType.ENTER) {
            AuthorDocumentController documentController = authorAccess.getDocumentController();
            int caretOffset = authorAccess.getEditorAccess().getCaretOffset();

            try {
                AuthorNode nodeAtOffset = documentController.getNodeAtOffset(caretOffset);
                if (nodeAtOffset instanceof AuthorElement) {
                    AuthorElement elementAtOffset = (AuthorElement) nodeAtOffset;
                    AttrValue xmlSpace = elementAtOffset.getAttribute("xml:space");
                    if (xmlSpace != null && xmlSpace.getValue().equals("preserve")) {
                        canHandle = true;
                    }
                }
            }
            catch (BadLocationException ex) {
                if (logger.isDebugEnabled()) {
                    logger.error(ex.getMessage(), ex);
                }
            }
        }
    }
}
```
Handling Schema-Aware Editing Events

The `AuthorSchemaAwareEditingHandlerAdapter` extension point allows you to handle certain `Author` mode actions in various ways. For example, implementing the `AuthorSchemaAwareEditingHandlerAdapter` makes it possible to handle events such as typing, the keyboard delete event at a given offset (using Delete or Backspace keys), delete element tags, delete selection, join elements, or paste fragment. It also makes it possible to improve solutions that are proposed by the paste mechanism in Oxygen XML Editor plugin when pasting content (through the use of some specific methods (page 2151)).
How to Implement an AuthorSchemaAwareEditingHandlerAdapter

For this handler to be called, the Schema Aware Editing option (page 128) must be set to On or Custom in the Schema-Aware preferences page (page 128). The handler can either resolve a specific case, let the default implementation take place, or reject the edit entirely by throwing an InvalidEditException.

To implement your own AuthorSchemaAwareEditingHandlerAdapter, follow this procedure:

1. Implement the ro.sync.ecss.extensions.api.AuthorSchemaAwareEditingHandlerAdapter extension.
2. To instruct Oxygen XML Editor plugin to use this newly created implementation, configure an extensions bundle (page 2105) and return the AuthorSchemaAwareEditingHandlerAdapter implementation using the ro.sync.ecss.extensions.api.ExtensionsBundle.getAuthorSchemaAwareEditingHandlerAdapter() method.

Example

Typing events can be handled using the handleTyping method. For example, the AuthorSchemaAwareEditingHandler checks if the schema is not a learned one, was loaded successfully, and if the Smart paste and drag and drop option (page 129) is selected. If these conditions are met, the event will be handled.

```java
public class AuthorSchemaAwareEditingHandlerAdapter extends AuthorSchemaAwareEditingHandler {

    /**
     * @see AuthorSchemaAwareEditingHandler#handleTyping
     * (int, char, ro.sync.ecss.extensions.api.AuthorAccess)
     */

    public boolean handleTyping(int offset, char ch, AuthorAccess authorAccess) throws InvalidEditException {
        boolean handleTyping = false;
        AuthorSchemaManager authorSchemaManager = authorAccess.getDocumentController().getAuthorSchemaManager();

        if (!authorSchemaManager.isLearnSchema() && !authorSchemaManager.hasLoadingErrors() &&
            authorSchemaManager.getAuthorSchemaAwareOptions().isEnableSmartTyping()) {
            try {
                AuthorDocumentFragment characterFragment =
            ```
authorAccess.getDocumentController().createNewDocumentTextFragment
    handleTyping = handleInsertionEvent
    new AuthorDocumentFragment[]{characterFragment}, authorAccess);  
    } catch (AuthorOperationException e) {
        throw new InvalidEditException
        e.getMessage(), ”Invalid typing event: ” + e.getMessage(), e, false);
    }  
    return handleTyping;

Note: The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor plugin website.

Methods for Improving the Paste Mechanism

getAncestorDetectionOptions

When pasting content in Author mode, if the result causes the document to become invalid, Oxygen XML Editor plugin will propose solutions to make it valid. As a possible solution, Oxygen XML Editor plugin might surround the pasted content in a sequence of ancestor elements. This getAncestorDetectionOptions method allows you to choose which parent elements might be a possible solution.

canBeReplaced

Allows you to improve solutions that might be proposed by the paste mechanism when pasting content in Oxygen XML Editor plugin. For example, when pasting an element inside an empty element with the same name, this canBeReplaced method allows Oxygen XML Editor plugin to replace the empty node rather than pasting it after or before the empty node. The callback could also reject this behavior if, for instance, the replacement node contains attributes.

Related Information:

• AuthorDocumentFragment Class

Handling When URLs or XHTML Fragments are Dropped or Pasted in Author Mode
The **AuthorExternalObjectInsertionHandler** extension can be used to configure how URLs or XHTML fragments from external applications are handled when they are dropped or pasted in Author mode.

**How to Implement an AuthorExternalObjectInsertionHandler**

To implement your own **AuthorExternalObjectInsertionHandler**, follow this procedure:

1. Implement the `ro.sync.ecss.extensions.api.AuthorExternalObjectInsertionHandler` interface.
2. To instruct Oxygen XML Editor plugin to use this newly created implementation, use either of the following methods:
   a. If your framework is an extension of DITA, DocBook, TEI, or XHTML, you can specify the **AuthorExternalObjectInsertionHandler** in the **Author external object Insertion handler** individual extension in the Extensions tab (page 98) of the Document Type configuration dialog box (page 72) for your particular document type.
   b. Otherwise, you can configured an extensions bundle (page 2105), then return the **AuthorExternalObjectInsertionHandler** implementation using the `ro.sync.ecss.extensions.api.ExtensionsBundle.createAuthorExternalObjectInsertionHandler()` method.
3. You can use a stylesheet to convert the pasted XHTML to your own XML vocabulary by overwriting the following method:

```java
ro.sync.ecss.extensions.api.AuthorExternalObjectInsertionHandler.getImporterStylesheetFileName(AuthorAccess)
```

and return the file name of the stylesheet that will be applied. The path to the importer stylesheet must also be added in the Classpath tab (page 76) in the Document Type configuration dialog box (page 72) for your particular document type.

**Example**

The following example illustrates an implementation for the DITA framework:

```java
/**
 * @see ro.sync.ecss.extensions.api.ExtensionsBundle#createExternalObjectInsertionHandler()
 * @Override
 public AuthorExternalObjectInsertionHandler createExternalObjectInsertionHandler() {
    return new DITAExternalObjectInsertionHandler();
 }
```
Tip: For XHTML fragments, there is another method that you could use to configure how they are handled when they are pasted in Author mode. For more information, see Customizing Smart Paste Support (page 2058).

Presenting an Edit Properties Dialog Box for Actions in Author Mode

The EditPropertiesHandler extension point allows you to present a specialized dialog box when the action of double-clicking an element tag is intercepted in Author mode. For example, you could use it to present a dialog box that allows the user to editing the properties of an image.

How to Implement an EditPropertiesHandler

To implement your own EditPropertiesHandler, follow this procedure:

1. Implement the ro.sync.ecss.extensions.api.EditPropertiesHandler interface.
2. To instruct Oxygen XML Editor plugin to use this newly created implementation, use either of the following methods:
   a. If you have configured an extensions bundle (page 2105), you can return the EditPropertiesHandler implementation using the ro.sync.ecss.extensions.api.ExtensionsBundle.createEditPropertiesHandler() method.
   b. Specify the EditPropertiesHandler in the Author edit properties handler individual extension in the Extensions tab (page 98) of the Document Type configuration dialog box (page 72) for your particular document type.

Example

The following example illustrates an implementation for presenting a simple properties editing dialog box when a user double-clicks an image tag in Author mode (with tags displayed from the Tags display mode drop-down menu):

```java
public class CustomEditPropertiesHandler implements EditPropertiesHandler {
```
public String getDescription() {
    return "Sample implementation that handles properties for a table element.";
}

public boolean canEditProperties(AuthorNode authorNode) {
    // If this node is an image element we can edit its properties.
    return "image".equals(authorNode.getDisplayName());
}

public void editProperties(AuthorNode authorNode, AuthorAccess authorAccess) {
    // If we receive this call then it surely an image.
    AuthorElement imageElement = (AuthorElement) authorNode;
    String currentValue = "";
    AttrValue altValue = imageElement.getAttribute("alt");
    if (altValue != null) {
        currentValue = altValue.getValue();
    }
    String newValue = JOptionPane.showInputDialog((Component) authorAccess.getWorkspaceAccess().getParentFrame(),
        "Alternate text",
        currentValue);
    if (newValue != null) {
        authorAccess.getDocumentController().setAttribute...
Example result: If a user were to double-click an `image` tag icon in `Author` mode, the following dialog box would be displayed that allows the user to edit the `alternate text` property for the image:

![Example dialog box showing input for alternate text](example-dialog-box.png)

Java API - Extending Author Functionality through Java

Oxygen XML Editor plugin `Author` mode has a built-in set of operations covering the insertion of text and XML fragments (see the Author Default Operations (page 2166)) and the execution of XPath expressions on the current document edited in `Author` mode. However, there are situations in which you need to extend this set. The following examples are just a few of the possible situations:

- You need to enter an element whose attributes will be edited by the user through a graphical user interface.
- The user must send selected element content (or the whole document) to a server for some kind of processing.
- Content authors need to extract pieces of information from a server and insert it directly into the edited XML document.
- You need to apply an XPath expression on the current document and process the nodes of the resulting node set.

To extend the Oxygen XML Editor plugin `Author` mode functionality through Java, you will need the Oxygen SDK available on the Oxygen XML Editor plugin website. It includes the source code of the `Author` mode operations in the built-in document types and the full documentation (in Javadoc format) of the public API available for `Author` mode custom actions.

The subsequent Java examples make use of AWT classes. If you are developing extensions for the Oxygen XML Editor plugin XML Editor plugin for Eclipse, you will have to use their SWT counterparts.

⚠️ **Attention:** Make sure the Java classes of your custom `Author` mode operations are compiled with the same Java version used by Oxygen XML Editor plugin. Otherwise, the classes may not be loaded by the Java virtual machine. For example, if you run Oxygen XML Editor plugin with a Java 1.8 virtual...
machine but the Java classes of your custom Author mode operations are compiled with a Java 9 or later virtual machine then the custom operations cannot be loaded and used by the Java 1.8 virtual machine.

Related Information:

Example 1- Simple Use of a Dialog Box from an Author Mode Operation

In this example, functionality is added for inserting images in a custom framework (page 2706). The images are represented by the `image` element. The location of the image file is represented by the value of the `href` attribute. In the Java implementation, a dialog box will be displayed with a text field, in which the user can enter a full URL or browse for a local file.

1. Set up a sample project following this set of instructions. The framework project is oxygen-sample-framework.

2. Modify the `simple.documentation.framework.InsertImageOperation` class that implements the `ro.sync.ecss.extensions.api.AuthorOperation` interface. This interface defines three methods: `doOperation`, `getArguments` and `getDescription`

   A short description of these methods follows:
   - The `doOperation` method is invoked when the action is performed either by pressing the toolbar button, by selecting the menu item or by pressing the shortcut key. The arguments taken by this method can be one of the following combinations:
     - An object of type `ro.sync.ecss.extensions.api.AuthorAccess` and a map.
     - Argument names and values.
   - The `getArguments` method is used by Oxygen XML Editor plugin when the action is configured. It returns the list of arguments (name and type) that are accepted by the operation.
   - The `getDescription` method is used by Oxygen XML Editor plugin when the operation is configured. It returns a description of the operation.

   **Example:**

   Here is the implementation of these three methods:

   ```java
   /**
   * Performs the operation.
   */
   ```
public void doOperation(
    AuthorAccess authorAccess,
    ArgumentsMap arguments)
    throws IllegalArgumentException,
    AuthorOperationException {

    JFrame oxygenFrame = (JFrame) authorAccess.getWorkspaceAccess().getParentFrame();
    String href = displayURLDialog(oxygenFrame);
    if (href.length() != 0) {
        // Creates the image XML fragment.
        String imageFragment =
            "<image xmlns='http://www.oxygenxml.com/sample/documentation' href='" + href + "] />

        // Inserts this fragment at the cursor position.
        int caretPosition = authorAccess.getEditorAccess().getCaretOffset();
        authorAccess.getDocumentController().insertXMLFragment(imageFragment, caretPosition);
    }
}

/**
 * Has no arguments.
 *
 * @return null.
 */
public ArgumentDescriptor[] getArguments() {
    return null;
}

/**
 * @return A description of the operation.
 */
public String getDescription() {
    return "Inserts an image element. Asks the user for a URL reference.";
}
Note: The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor plugin website.

Important:

Make sure you always specify the namespace of the inserted fragments.

3. Package the compiled class into a JAR file. An example of an Ant script that packages the classes folder content into a JAR archive named sdf.jar is listed below:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<project name="project" default="dist">
    <target name="dist">
        <jar destfile="sdf.jar" basedir="classes">
            <fileset dir="classes">
                <include name="**/*"/>
            </fileset>
        </jar>
    </target>
</project>
```

4. Copy the sdf.jar file into your custom framework directory

   ({OXYGEN_INSTALL_DIR}\frameworks\{CUSTOM_FRAMEWORK_DIR}).

5. Add the sdf.jar to the class path. To do this, open the Preferences dialog box (page 55), go to Document Type Association, select SDF, and press the Edit button.

6. Select the Classpath tab in the lower part of the Document Type configuration dialog box (page 72) and press the Add button. In the displayed dialog box, enter the location of the JAR file, relative to the Oxygen XML Editor plugin frameworks folder.

7. Next, create the action that will use the defined operation. Go to the Actions subtab. Copy the icon files for the menu item and for the toolbar in your custom framework directory

   ({OXYGEN_INSTALL_DIR}\frameworks\{CUSTOM_FRAMEWORK_DIR}).

8. Define the action's properties:
   • Set ID to insert_image.
   • Set Name to Insert image.
   • Set Menu access key to letter i.
• Set Toolbar action to `${framework}/toolbarImage.png`.
• Set Menu icon to `${framework}/menuImage.png`.
• Set Shortcut key to Ctrl (Meta on Mac OS)+Shift+i.

9. Next, set up the operation. You want to add images only if the current element is a section, book or article.

• Set the value of XPath expression to

\[
\text{local-name()}='section' \text{ or } \text{local-name()}='book' \\
\text{or } \text{local-name()}='article'
\]

• Set the Invoke operation field to `simple.documentation.framework.InsertImageOperation`.

**Figure 667: Selecting the Operation**

10. Add the action to the toolbar, using the Toolbar panel.

To test the action, open or create an xml file and place the cursor at a valid location. Then press the button associated with the action from the toolbar. In the dialog box, select an image URL and press OK. The image is inserted into the document.
Example 2- Operations with Arguments. Report from Database Operation

In this example you will create an operation that connects to a relational database and executes an SQL statement. The result should be inserted in the edited XML document as a table. To make the operation fully configurable, it will have arguments for the database connection string, the user name, the password and the SQL expression.

1. Set up a sample project following this set of instructions. The framework project is oxygen-sample-framework.

2. Create the class simple.documentation.framework.QueryDatabaseOperation. This class must implement the ro.sync.ecss.extensions.api.AuthorOperation interface.

```java
import ro.sync.ecss.extensions.api.ArgumentDescriptor;
import ro.sync.ecss.extensions.api.ArgumentsMap;
import ro.sync.ecss.extensions.api.AuthorAccess;
import ro.sync.ecss.extensions.api.AuthorOperation;
import ro.sync.ecss.extensions.api.AuthorOperationException;

public class QueryDatabaseOperation implements AuthorOperation {

```

3. Now define the operation's arguments. For each of them you will use a String constant representing the argument name:

```java
private static final String ARG_JDBC_DRIVER = "jdbc_driver";
private static final String ARG_USER = "user";
private static final String ARG_PASSWORD = "password";
private static final String ARG_SQL = "sql";
private static final String ARG_CONNECTION = "connection";
```

4. You must describe each of the argument name and type. To do this, implement the getArguments method that will return an array of argument descriptors:

```java
public ArgumentDescriptor[] getArguments() {
    ArgumentDescriptor args[] = new ArgumentDescriptor[] {
        new ArgumentDescriptor(
            ARG_JDBC_DRIVER,
            ArgumentDescriptor.TYPE_STRING,
            "The name of the Java class that is the JDBC driver."),
        new ArgumentDescriptor(
```
ARG_CONNECTION,
ArgumentDescriptor.TYPE_STRING,
"The database URL connection string.
),
new ArgumentDescriptor(
ARG_USER,
ArgumentDescriptor.TYPE_STRING,
"The name of the database user.
),
new ArgumentDescriptor(
ARG_PASSWORD,
ArgumentDescriptor.TYPE_STRING,
"The database password.
),
new ArgumentDescriptor(
ARG_SQL,
ArgumentDescriptor.TYPE_STRING,
"The SQL statement to be executed.

These names, types and descriptions will be listed in the Arguments table when the operation is configured.

5. When the operation is invoked, the implementation of the doOperation method extracts the arguments, forwards them to the method that connects to the database and generates the XML fragment. The XML fragment is then inserted at the cursor position.

```java
public void doOperation(AuthorAccess authorAccess, ArgumentsMap map)
throws IllegalArgumentException, AuthorOperationException {

   // Collects the arguments.
   String jdbcDriver =
   (String)map.getArgumentValue(ARG_JDBC_DRIVER);
   String connection =
   (String)map.getArgumentValue(ARG_CONNECTION);
   String user =
   (String)map.getArgumentValue(ARG_USER);
   String password =
   (String)map.getArgumentValue(ARG_PASSWORD);
   String sql =
   (String)map.getArgumentValue(ARG_SQL);
```
```java
int caretPosition = authorAccess.getCaretOffset();
try {
    authorAccess.getDocumentController().insertXMLFragment(
        getFragment(jdbcDriver, connection, user, password, sql),
        caretPosition);
} catch (SQLException e) {
    throw new AuthorOperationException("The operation failed due to the following database error: ", e);
} catch (ClassNotFoundException e) {
    throw new AuthorOperationException("The JDBC database driver was not found. Tried to load ' ", jdbcDriver + "'", e);
}
}
```

6. The `getFragment` method loads the JDBC driver, connects to the database and extracts the data. The result is a **table** element from the [http://www.oxygenxml.com/sample/documentation](http://www.oxygenxml.com/sample/documentation) namespace. The **header** element contains the names of the SQL columns. All the text from the XML fragment is escaped. This means that the '<' and '&' characters are replaced with the '&lt;' and '&amp;' character entities to ensure the fragment is well-formed.

```java
private String getFragment(
    String jdbcDriver,
    String connectionURL,
    String user,
    String password,
    String sql) throws
    SQLException,
    ClassNotFoundException {

    Properties pr = new Properties();
    pr.put("characterEncoding", "UTF8");
    pr.put("useUnicode", "TRUE");
    pr.put("user", user);
    pr.put("password", password);

    // Loads the database driver.
    Class.forName(jdbcDriver);
    // Opens the connection
    Connection connection =
```
DriverManager.getConnection(connectionURL, pr);
java.sql.Statement statement =
    connection.createStatement();
ResultSet resultSet =
    statement.executeQuery(sql);

StringBuilder fragmentBuffer = new StringBuilder();
fragmentBuffer.append("<table xmlns=" +
    "'http://www.oxygenxml.com/sample/documentation'>");

//
// Creates the table header.
//
fragmentBuffer.append("<header>");
ResultSetMetaData metaData = resultSet.getMetaData();
int columnCount = metaData.getColumnCount();
for (int i = 1; i <= columnCount; i++) {
    fragmentBuffer.append("<td>");
    fragmentBuffer.append(xmlEscape(metaData.getColumnName(i)));
    fragmentBuffer.append("</td>");
}
fragmentBuffer.append("</header>");

//
// Creates the table content.
//
while (resultSet.next()) {
    fragmentBuffer.append("<tr>");
    for (int i = 1; i <= columnCount; i++) {
        fragmentBuffer.append("<td>");
        fragmentBuffer.append(xmlEscape(resultSet.getObject(i)));
        fragmentBuffer.append("</td>");
    }
    fragmentBuffer.append("</tr>");
}
fragmentBuffer.append("</table>");
Note: The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor plugin website.

7. Package the compiled class into a JAR (page 2707) file.

8. Copy the JAR file and the JDBC driver files into your custom framework directory ({OXYGEN_INSTALL_DIR}\frameworks\[CUSTOM_FRAMEWORK_DIR]}).

9. Add the JARS to the class path. To do this, open the Document Type Association preferences page (page 69), select SDF and press the Edit button. Select the Classpath tab in the lower part of the Document Type configuration dialog box (page 72) and press the Add button. In the displayed dialog box, enter the location of the JAR file, relative to the Oxygen XML Editor plugin frameworks folder.

10. Go to the Actions subtab. The action properties are:
   
   - Set ID to clients_report.
   - Set Name to Clients Report.
   - Set Menu access key to letter r.
   - Set Description to Connects to the database and collects the list of clients.
   - Set Toolbar icon to ${framework}/TableDB20.png (image TableDB20.png is already stored in the frameworks / sdf folder).
   - Leave empty the Menu icon.
   - Set shortcut key to Ctrl + Shift + C (Command + Shift + C on OS X).

11. The action will work only if the current element is a section. Set up the operation as follows:

   - Set XPath expression to:

     ```xml
     local-name()='section'
     ```

   - Use the Java operation defined earlier to set the Invoke operation field. Press the Choose button, then select simple.documentation.framework.QueryDatabaseOperation. Once selected, the list of arguments is displayed. In the figure below the first argument,
jdbc_driver, represents the class name of the MySQL JDBC driver. The connection string has the URL syntax: `jdbc://<database_host>:<database_port>/<database_name>`.

The SQL expression used in the example follows, but it can be any valid SELECT expression that can be applied to the database:

```
SELECT userID, email FROM users
```

12. Add the action to the toolbar, using the **Toolbar** panel.

Figure 668: Java Operation Arguments Setup

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Type</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>jdbc_driver</td>
<td>The name of the Java driver</td>
<td>String</td>
<td>org.apache.mysql.Driver</td>
</tr>
<tr>
<td>connection</td>
<td>The database URL configuration</td>
<td>String</td>
<td>jdbc:mysql://10.0.0.16:3306/camera</td>
</tr>
<tr>
<td>user</td>
<td>The name of the database user</td>
<td>String</td>
<td>dbuser</td>
</tr>
<tr>
<td>password</td>
<td>The database password</td>
<td>String</td>
<td><em>password</em></td>
</tr>
<tr>
<td>sql</td>
<td>The SQL statement to execute</td>
<td>String</td>
<td>SELECT id, title, pageRank, status ...</td>
</tr>
</tbody>
</table>

To test the action, open or create an xml file and place the cursor at a valid location. Then press the **Create Report** button from the toolbar. You can see below the toolbar with the action button and sample table inserted by the **Clients Report** action.

Figure 669: Table Content Extracted from the Database
Author Mode Operations

This topic lists the default operations for the Author mode.

ChangeAttributeOperation

This operation allows you to add/modify/remove an attribute. You can use this operation in your own custom Author mode action to modify the value for a certain attribute on a specific XML element. The arguments of the operation are:

name

The attribute local name.

namespace

The attribute namespace.

elementLocation

The XPath location that identifies the element.

value

The new value for the attribute. If empty or null the attribute will be removed.

editAttribute

If an in-place editor exists for this attribute, it will automatically activate the in-place editor and start editing.

removeIfEmpty
The possible values are true and false. True means that the attribute should be removed if an empty value is provided. The default behavior is to remove it.

**ChangeAttributesOperation**

This operation allows you to add/modify/remove multiple attributes. You can use this operation in your own custom Author mode action to modify the value for one or more attributes for one or more XML elements. The arguments of the operation are:

- **elementLocations**
  
  The XPath location that identifies the elements whose attributes will be affected. If not defined, the element at the cursor location will be used.

- **attributeNames**
  
  The names of the attributes to add, modify, or remove. The values can be local names or Clark notations.

- **values**
  
  The new attributes values, each on a new line. An empty value will remove the attribute if removeIfEmpty is set to true.

- **removeIfEmpty**
  
  The possible values are true (default) and false. True means that the attribute will be removed if an empty value is provided.

**ChangePseudoClassesOperation**

Operation that sets a list of pseudo-class values to nodes identified by an XPath expression. It can also remove a list of values from nodes identified by an XPath expression. The operation accepts the following parameters:

- **setLocations**
  
  An XPath expression indicating a list of nodes for which the specified list of pseudo-classes will be set. If it is not defined, then the element at the cursor position will be used.

- **setPseudoClassNames**
  
  A space-separated list of pseudo-class names that will be set on the matched nodes.

- **removeLocations**
An XPath expression indicating a list of nodes from which the specified list of pseudo-
classes will be removed. If it is not defined, then the element at the cursor position will
be used.

**removePseudoClassNames**

A space-separated list of pseudo-class names that will be removed from the matched
nodes.

**includeAllNodes**
The possible values are *yes* and *no*. If set to *yes*, comments, CDATA, and text nodes
are included when evaluating XPath expressions. If set to *no*, they are ignored.

**DeleteElementOperation**

Deletes the node indicated by the `elementLocation` parameter XPath expression. If missing, the
operation will delete the node at the cursor location.

**DeleteElementsOperation**

Deletes the nodes indicated by the `elementLocations` parameter XPath expression. If missing, the
operation will delete the node at the cursor location.

**ExecuteCommandLineOperation**

This operation allows you to start a process executing a given command line. It has the following
arguments:

**name**

The name of the operation (or name of the console panel that corresponds to the
process run by an action built over this operation).

**workingDirectory**

The path to the directory where the command line is executed. The default value is "." (current directory).

**cmdLine**

The command line to be executed (accepts editor variables *(page 2183)*).

**showConsole**

If set to *true*, the console panel will be displayed in Oxygen XML Editor plugin. The
default value is *false*. 
ExecuteMultipleActionsOperation

This operation allows the execution of a sequence of actions, defined as a list of action IDs. The actions must be defined by the corresponding framework, or one of the common actions for all frameworks supplied by Oxygen XML Editor plugin.

actionIDs

The action IDs list that will be executed in sequence, the list must be a string sequence containing the IDs separated by commas or new lines.

ExecuteMultipleWebappCompatibleActionsOperation

An implementation of an operation that runs a sequence of Oxygen XML Web Author-compatible actions, defined as a list of IDs.

ExecuteTransformationScenariosOperation

This operation allows running one or more transformation scenarios defined in the current document type association (page 2705). It is useful to add to the toolbar buttons that trigger publishing to various output formats. The argument of the operation is:

scenarioNames

The list of scenario names that will be executed, separated by new lines.

InsertEquationOperation

Inserts a fragment containing a MathML equation at the cursor offset. The argument of this operation is:

fragment

The XML fragment containing the MathML content that should be inserted.

InsertFragmentOperation

Inserts an XML fragment at the current cursor position. The selection, if there is one, remains unchanged. The fragment will be inserted in the current context of the cursor position meaning that if the current XML document uses some namespace declarations then the inserted fragment must use the same declarations. The namespace declarations of the inserted fragment will be adapted to the existing namespace declarations of the XML document. For more details about its list of parameters, see Arguments of InsertFragmentOperation Operation (page 2188).
InsertOrReplaceFragmentOperation

Similar to InsertFragmentOperation (page 2169), except it removes the selected content before inserting the fragment. Also, the insertPosition parameter has another possible value: Replace. If this value is used, the operation deletes the node selected by the XPath expression denoted by the insertLocation parameter. For more details about its list of parameters, see Arguments of InsertFragmentOperation Operation (page 2188).

InsertOrReplaceTextOperation

Inserts a text at current position removing the selected content, if any. The argument of this operation is:

```
    text
    The text section to insert.
```

InsertXIncludeOperation

Insert an XInclude element at the cursor offset. Opens a dialog box that allows you to browse and select content to be included in your document and automatically generates the corresponding XInclude instruction.

JSOperation

Allows you to call the Java API from custom JavaScript content. For some sample JSOperation implementations, see https://github.com/oxygenxml/javascript-sample-operations.

Note: For the Oxygen XML Web Author, this operation cannot be invoked using the JavaScript API.

This operation accepts the following parameter:

```
    script
    The JavaScript content to execute. It must have a function called doOperation(), which can use the predefined authorAccess variable. The authorAccess variable has access to the entire ro.sync.ecss.extensions.api.AuthorAccess Java API.

    The following example is a script that retrieves the current value of the type attribute on the current element, allows the end user to edit its new value and sets the new value in the document:
```

```
    function doOperation(){
```
The current node is either entirely selected...

currentNode = authorAccess.getEditorAccess().getFullySelectedNode();

if(currentNode == null){
  //or the cursor is placed in it
  caretOffset = authorAccess.getEditorAccess().getCaretOffset();
  currentNode = authorAccess.getDocumentController().getNodeAtOffset
                 (caretOffset);
}

//Get current value of the @type attribute

currentTypeValue = "";

currentTypeValueAttr = currentNode.getAttribute("type");

if(currentTypeValueAttr != null){
  currentTypeValue = currentTypeValueAttr.getValue();
}

//Ask user for new value for attribute.

newTypeValue = javax.swing.JOptionPane.showInputDialog
                         ("Input @type value", currentTypeValue);

if(newTypeValue != null){
  //Create and set the new attribute value for the @type attribute.
  attrValue = new Packages.ro.sync.ecss.extensions.api.node.AttrValue
                (newTypeValue);
  authorAccess.getDocumentController().setAttribute
       ("type", attrValue, currentNode);
}

Tip: You can call functions defined inside a script called commons.js from your custom script content so that you can use that external script file as a library of functions. Note that this commons.js file must be placed in the root of the framework directory (for example, \{OXYGEN_INSTALL_DIR\}/frameworks/dita/commons.js) because that is the only location where Oxygen XML Editor plugin will look for it.

**MoveCaretOperation**

Flexible operation for moving the cursor within a document and it is also capable of performing a selection. The operation accepts the following arguments:

  xpathLocation
An XPath expression that identifies the node relative to where the cursor will be moved. If the expression identifies more than one node, only the first one will be taken into account.

**position**

The position relative to the node obtained from the XPath expression where the cursor will be moved. When also choosing to perform a selection, you can use the following possible values:

- Before - Places the cursor at the beginning of the selection.
- Inside, at the beginning - Places the cursor at the beginning of the selection.
- After - Places the cursor at the end of the selection.
- Inside, at the end - Places the cursor at the end of the selection.

**selection**

Specifies if the operation should select the element obtained from the XPath expression, its content, or nothing at all. The possible values of the argument are: None, Element, and Content.

**MoveElementOperation**

Flexible operation for moving an XML element to another location from the same document. XPath expressions are used to identify the source element and the target location. The operation takes the following parameters:

**sourceLocation**

XPath expression that identifies the content to be moved.

**deleteLocation**

XPath expression that identifies the node to be removed. This parameter is optional. If missing, the sourceLocation parameter will also identify the node to be deleted.

**surroundFragment**

A string representation of an XML fragment. The moved node will be wrapped in this string before moving it in the destination.

**targetLocation**

XPath expression that identifies the location where the node must be moved to.

**insertPosition**

Argument that indicates the insert position.
When `true`, only the content of the source element is moved.

**processTrackedChangesForXPathLocations**

When nodes are located via an XPath expression and the nodes are deleted with Change Tracking (page 2711) enabled, they are considered as being present by default (thus, the change tracking is ignored). If you set this argument to `true` and change tracking is enabled, deleted nodes will be ignored when the XPath locations are computed (thus, the change tracking is NOT ignored).

**OpenInSystemAppOperation**

Opens a resource in the system application that is associated with the resource in the operating system. The arguments of this operation are:

- **resourcePath**
  
  An XPath expression that, when executed, returns the path of the resource to be opened. Editor variables (page 201) are expanded in the value of this parameter, before the expression is executed.

- **isUnparsedEntity**
  
  Possible values are `true` or `false`. If the value is `true`, the value of the `resourcePath` argument is treated as the name of an unparsed entity.

**ReloadContentOperation**

Reloads the content of the editor by re-reading the information from the URL used to open it. It accepts the following argument:

- **markAsNotModified**
  
  The possible values are `true` and `false`. After reloading the editor, the content may appear as modified and in some cases where the content is already present on the file server, you would not want the user to save it again. You can set this flag to `true` to prevent the editor from showing the content as modified.

**RemovePseudoClassOperation**

An operation that removes a pseudo-class from an element. Accepts the following parameters:

- **name**
  
  Name of the pseudo-class to be removed.

- **includeAllNodes**
The possible values are \texttt{yes} and \texttt{no}. If set to \texttt{yes}, comments, CDATA, and text nodes are included when evaluating XPath expressions. If set to \texttt{no}, they are ignored.

\textbf{elementLocation}

The XPath location that identifies the element. Leave it empty for the current element. It can also identify multiple elements, in which case the pseudo class will be removed from all of them.

\textbf{Example:}

Suppose that there is a pseudo-class called \texttt{myClass} on the element \texttt{paragraph} and there are CSS styles matching the pseudo-class.

\begin{verbatim}
paragraph:myClass{
    font-size:2em;
    color:red;
}
paragraph{
    color:blue;
}
\end{verbatim}

In the previous example, by removing the pseudo-class, the layout of the \texttt{paragraph} is rebuilt by matching the other rules (in this case, the foreground color of the \texttt{paragraph} element will become blue.

\textbf{RenameElementOperation}

This operation allows you to rename all occurrences of the elements identified by an XPath expression. The operation requires two parameters:

\begin{itemize}
  \item \textbf{elementName}
    The new element name.
  \item \textbf{elementLocation}
    The XPath expression that identifies the element occurrences to be renamed. If this parameter is missing, the operation renames the element at current cursor position.
\end{itemize}

\textbf{SetPseudoClassOperation}

An operation that sets a pseudo-class to an element. The operation accepts the following parameters:

\begin{itemize}
  \item \textbf{elementLocation}
\end{itemize}
An XPath expression indicating the element for which the pseudo-class will be set. If it is not defined, then the element at cursor position will be used.

**name**

The pseudo-class local name.

**includeAllNodes**

The possible values are `yes` and `no`. If set to `yes`, comments, CDATA, and text nodes are included when evaluating XPath expressions. If set to `no`, they are ignored.

**ShowElementDocumentationOperation**

Opens the associated specification HTML page for the current element. The operation accepts as parameter a URL pattern that points to the HTML page containing the documentation.

**SurroundWithFragmentOperation**

Surrounds the selected content with a text fragment. Since the fragment can have multiple nodes, the surrounded content will be always placed in the first leaf element. If there is no selection, the operation will simply insert the fragment at the cursor position. For more details about the list of parameters go to: Arguments of SurroundWithFragmentOperation (page 2190).

**SurroundWithTextOperation**

This operation has two arguments (two text values) that will be inserted before and after the selected content. If there is no selected content, the two sections will be inserted at the cursor position. The arguments of the operation are:

- **header**
  
  The text that is placed before the selection.

- **footer**
  
  The text that is placed after the selection.

**TogglePseudoClassOperation**

An implementation of an operation to toggle on/off the pseudo-class of an element. Accepts the following parameters:

- **name**
  
  Name of the pseudo-class to be toggled on/off.
includeAllNodes

The possible values are yes and no. If set to yes, comments, CDATA, and text nodes are included when evaluating XPath expressions. If set to no, they are ignored.

elementLocation

The XPath location that identifies one or more elements for which the pseudo class will be toggled. Leave it empty for the current element.

Example:

```xml
paragraph:myClass{
    color:red;
}
paragraph{
    color:blue;
}
```

By default, the paragraph content is rendered in blue. Suppose that you have a TogglePseudoClassOperation configured for the myClass pseudo-class. Invoking it the first time will set the myClass pseudo-class and the paragraph will be rendered in red. Invoking the operation again, will remove the pseudo-class and the visible result will be a blue rendered paragraph element.

ToggleSurroundWithElementOperation

This operation allows wrapping and unwrapping content in a specific wrapper element that can have certain attributes specified on it. It is useful to implement toggle actions such as highlighting text as bold, italic, or underline. The operation supports processing multiple selection intervals, such as multiple cells within a table column selection. The arguments of the operation are:

element

The element to wrap or unwrap content.

schemaAware

This argument applies only on the surround with element operation and controls whether or not the insertion is valid, based upon the schema. If the insertion is not valid, then wrapping action will be broken up into smaller intervals until the wrapping action is valid. For example, if you try to wrap a paragraph element with a bold element, it would not be valid, so the operation will wrap the text inside the paragraph instead, since it would be valid at that position.
UnwrapTagsOperation

This operation allows removing the element tags either from the current element or for an element identified with an XPath location. The argument of the operation is:

unwrapElementLocation

An XPath expression indicating the element to unwrap. If it is not defined, the element at the cursor position is unwrapped.

XQueryUpdateOperation

Allows you to execute an XQuery Update script directly over content in Author mode.

Note: This operation is not applicable to the Oxygen XML Author Component or the Oxygen XML Web Author.

It supports the following arguments:

script

The XQuery Update script to be executed. The value can either be an XQuery script or a URL that points to the XQuery Update script. You can use the ${framework} (page 206) or ${frameworkDir} (page 206) editor variables to refer the scripts from the framework directory.

The script will be executed in the context of the node at the cursor position. If the script declares the following variable, it will also receive the selected nodes (assuming that entire nodes are selected):

```
declare variable $oxyxq:selection external;
```

In the example below (page 2178), you can see how this argument is used.

externalParams

A string that can assign multiple key-value pairs separated by a comma or a new line character.

For example, if an XQuery script declares two external parameters like this:

```
declare variable $param1 external;
declare variable $param2 external;
```

You can pass custom values for each parameter by setting the externalParams to `param1=value1,param2=value2`. 
expandXincludeReferences

Makes all Xinclude elements transparent to the XQuery transformer. When the Xinclude references are transparent, the XQueryUpdateOperation can use the referenced elements for further processing in the current document, but it cannot change their values in the original document. The default value is false, which means the Xinclude elements are not transparent.

An example of an XQuery Update Script that converts paragraphs to list items:

```xml
declare namespace oxyxq = "http://www.oxygenxml.com/ns/xqu";

(: This variable will be linked to the selected nodes assuming that there are actually fully selected nodes. For example this selection will return null: :
<p>{SEL_START}text{SEL_END} in para</p>
but this will give two "p" elements:
{SEL_END}<p>text</p><p>text2</p>{SEL_END}

If a multiple selection exists it will also be processed and forwarded.
Again, only fully selected nodes will be passed.
:)
declare variable $oxyxq:selection external;

(: We will process either the selection or the context node :) let $toProcess := if (empty($oxyxq:selection)) then
  (.)
else
  ($oxyxq:selection)
return if (not(empty($toProcess))) then
  (:
    (: Create the list :) let $ul :=
      <ul>
        for $sel in $toProcess
        return
          <li>{$sel}</li>
       </ul>
  )
</ul>

return
```
XSLTOperation and XQueryOperation

Applies an XSLT or XQuery script on a source element and then replaces or inserts the result in a specified target element.

**Note:** For the Oxygen XML Web Author, these operations cannot be invoked using the JavaScript API.

These operations accept the following parameters:

**sourceLocation**

An XPath expression indicating the element that the script will be applied on. If it is not defined, then the element at the cursor position will be used.

There may be situations in which you want to look at an ancestor of the current element and take decisions in the script based on this. To do this, you can set the sourceLocation to point to an ancestor node then use the oxy:current-element() function to access the current element, as in the following example:

```xml
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform" version="2.0"
    xpath-default-namespace="http://docbook.org/ns/docbook"
    xmlns:oxy="http://www.oxygenxml.com/ns/author/xpath-extension-functions"
    exclude-result-prefixes="oxy">

    <xsl:template match="/">
        <xsl:apply-templates select="oxy:current-element()"/>
    </xsl:template>

    <xsl:template match="para">
        <!-- And the context is again inside the current element, -->
    </xsl:template>

</xsl:stylesheet>
```
but we can use information from the entire XML -->

```xml
<xsl:variable
  name="keyImage" select="//imagedata[@fileref='images/lake.jpeg']
  /ancestor::inlinemediaobject/@xml:id/string()"/>

<xref linkend="{$keyImage}" role="key_include"
  xmlns="http://docbook.org/ns/docbook">
  <xsl:value-of
    select="$currentElementLocation"></xsl:value-of>
</xref>
```

**targetLocation**

An XPath expression indicating the insert location for the result of the transformation. If it is not defined then the insert location will be at the cursor location.

**script**

The script content (XSLT or XQuery). The base system ID for this will be the framework file, so any include/import reference will be resolved relative to the .framework file that contains this action definition.

For example, for the following script, the imported xslt_operation.xsl needs to be located in the current framework directory.

```xml
<xsl:stylesheet
  xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  version="1.0">
  <xsl:import href="xslt_operation.xsl"/>
</xsl:stylesheet>
```

You can also use a path for an included or imported reference. When using a path, the following apply:

- A relative path is resolved to the framework directory.
- The `${framework} editor variable (page 206)` can also be used to reference resources from the framework directory.
- The path is passed through the catalog mappings. It helps to use an absolute URL (for instance, `http://www.oxygenxml.com/fr/testy.xsl`) and map it in the catalog.xml file from the framework directory to a resource from the framework.

**action**
The insert action relative to the node determined by the target XPath expression. It can be: Replace, At cursor position, Before, After, Inside as first child or Inside as last child.

**caretPosition**

The position of the cursor after the action is executed. It can be: Preserve, Before, Start, First editable position, End, or After. If this parameter is not set, you can still indicate the position of the cursor by using the `${caret}` editor variable (page 205) in the inserted content.

**expandEditorVariables**

Parameter controlling the expansion of editor variables (page 201) returned by the script processing. Expansion is enabled by default.

**suspendTrackChanges**

It has 2 possible values (true and false). The default value is false. When set to true, the Track Changes (page 2711) feature is deactivated. When using this argument, after the action is finished, the state of the Track Changes feature is restored to its initial value.

**externalParams**

A string that can assign multiple key-value pairs separated by a comma or a new line character.

For example, if an XQuery script declares two external parameters like this:

```
declare variable $param1 external;
display variable $param2 external;
```

You can pass custom values for each parameter by setting the `externalParams` to `param1=value1,param2=value2`.

**XSLTOperation Example: Sort a list with respect to the language declared on the root element:**

Suppose you want an action that will sort a list with respect to the language declared on the root element and you have an XML file like this:

```
<article xml:lang="en">
  <ul>
    <li>B</li>
    <li>C</li>
    <li>A</li>
  </ul>
</article>
```
The XSLTOperation needs to be configured as follows:

- **sourceLocation** is set to /* so that the script has access to the root element and its children.
- **targetLocation** is left untouched (assuming that the action is active only when the cursor is inside the list).

The XSLT script would look like this:

```xml
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:oxygen="http://www.oxygenxml.com/ns/author/xpath-extension-functions"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    exclude-result-prefixes="xs oxy" version="2.0">

  <xsl:template match="/">
    <!-- sourceLocation parameter was set to /* to have a larger context. 
        We can pinpoint the element that contained the caret 
        using the oxy:current-element() function. 
    -->
    <xsl:apply-templates select="oxy:current-element()"/>
  </xsl:template>

  <xsl:template match="ul">
    <!-- Because the sourceLocation parameter was set to /* we now have access to the root element and its attributes. -->
    <xsl:variable name="lang" select="/*/@xml:lang"/>
    <xsl:variable name="collationURI">
      <xsl:value-of select="concat('http://www.w3.org/2013/collation/UCA?lang=',
          $lang)"/>
    </xsl:variable>

    <xsl:copy>
      <xsl:copy-of select="@*"/>
      <!-- Copy the list items, but sorted. -->
      <xsl:apply-templates select="li">
        <xsl:sort collation="{$collationURI}" select="text()"/>
      </xsl:apply-templates>
    </xsl:copy>
  </xsl:template>
</xsl:stylesheet>
```
Using Entities and Xincludes with the XSLTOperation

- **Entities** will be resolved in the result.
- **Xincludes** are also resolved in the result, and you can alter the XML obtained after the resolving using the XSLT/XQuery script of the operation, but you cannot alter the included document itself.

Editor Variables in Author Mode Operations

**Author** mode operations can include parameters that contain the following editor variables (page 201):

- **${caret}** - The position where the cursor is located. This variable can be used in a code template, in **Author** mode operations, or in a selection plugin.

  **Note:** The **${caret}** editor variable is available only for parameters that take XML content as values. It is replaced with the **${UNIQUE_CARET_MARKER_FOR_AUTHOR}** macro. The default Author operations process this macro and position the cursor at the designated offset.

- **${selection}** - The current selected text content in the current edited document. This variable can be used in a code template, in **Author** mode operations, or in a selection plugin.

- **${ask('message', type, ('real_value1':'rendered_value1'; 'real_value2':'rendered_value2'; ...), 'default_value'), @id}** - To prompt for values at runtime, use the **${ask('message', type, ('real_value1':'rendered_value1'; 'real_value2':'rendered_value2'; ...), 'default-value')}** editor variable. You can set the following parameters:
  - **message** - The displayed message. Note the quotes that enclose the message.
  - **default-value** - Optional parameter. Provides a default value.
  - **@id** - Optional parameter. Used for identifying the variable to reuse the answer using the **${answer(@id)}** editor variable.
  - **type** - Optional parameter, with one of the following values:

  **Note:** The title of the dialog box will be determined by the type of parameter and as follows:
For `url` and `relative_url` parameters, the title will be the name of the parameter and the value of the 'message'.

For the other parameters listed below, the title will be the name of that respective parameter.

If no parameter is used, the title will be "Input".

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Format: <code>${ask('message', parameter, 'default')}</code></th>
</tr>
</thead>
<tbody>
<tr>
<td><code>url</code></td>
<td>Description: Input is considered a URL. Oxygen XML Editor plugin checks that the provided URL is valid.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
</tr>
<tr>
<td></td>
<td>■ <code>{ask('Input URL', url)}</code> - The displayed dialog box has the name 'Input URL'. The expected input type is URL.</td>
</tr>
<tr>
<td></td>
<td>■ <code>{ask('Input URL', url, 'http://www.example.com')}</code> - The displayed dialog box has the name 'Input URL'. The expected input type is URL. The input field displays the default value <code>http://www.example.com</code>.</td>
</tr>
<tr>
<td><code>password</code></td>
<td>Description: The input is hidden with bullet characters.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
</tr>
<tr>
<td></td>
<td>■ <code>{ask('Input password', password)}</code> - The displayed dialog box has the name 'Input password' and the input is hidden with bullet symbols.</td>
</tr>
<tr>
<td></td>
<td>■ <code>{ask('Input password', password, 'abcd')}</code> - The displayed dialog box has the name 'Input password' and the input hidden with bullet symbols. The input field already contains the default <code>abcd</code> value.</td>
</tr>
<tr>
<td><code>generic</code></td>
<td>Description: The input is considered to be generic text that requires no special handling.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
</tr>
<tr>
<td></td>
<td>■ <code>{ask('Hello world!')}</code> - The dialog box has a <code>Hello world!</code> message displayed.</td>
</tr>
<tr>
<td></td>
<td>■ <code>{ask('Hello world!', generic, 'Hello again!')}</code> - The dialog box has a <code>Hello world!</code> message displayed and the value displayed in the input box is 'Hello again!'.</td>
</tr>
<tr>
<td><code>relative_url</code></td>
<td>Description: Input is considered a URL. Oxygen XML Editor plugin tries to make the URL relative to that of the document you are editing.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-------------</td>
</tr>
<tr>
<td>Note: If the $ask editor variable is expanded in content that is not yet saved (such as an <em>untitled</em> file, whose path cannot be determined), then Oxygen XML Editor plugin will transform it into an absolute URL.</td>
<td></td>
</tr>
</tbody>
</table>

Example:

```
${ask('File location', relative_url, 'C:/example.txt')} - The dialog box has the name 'File location'. The URL inserted in the input box is made relative to the current edited document location.
```

**combobox**

Format: ${ask('message', combobox, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'), 'default')}

Description: Displays a dialog box that offers a drop-down menu. The drop-down menu is populated with the given *rendered_value* values. Choosing such a value will return its associated value (*real_value*).

Note: The *default* parameter specifies the default selected value and can match either a key or a value.

Example:

```
${ask('Operating System', combobox, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'osx')} - The dialog box has the name 'Operating System'. The drop-down menu displays the three given operating systems. The associated value will be returned based upon your selection.
```

Note: In this example, the default value is indicated by the *osx* key. However, the same result could be obtained if the default value is indicated by *Mac OS X*, as in the following example: `${ask('Operating System', combobox, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'Mac OS X')}`

```
${ask('Mobile OS', combobox, ('win':'Windows Mobile';'ios':'iOS';'and':'Android'), 'Android')}
```

**editable_combobox**

Format: ${ask('message', editable_combobox, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'), 'default')}

Description: Displays a dialog box that offers a drop-down menu with editable elements. The drop-down menu is populated with the given...
Parameter | rendered_value values. Choosing such a value will return its associated real value (real_value) or the value inserted when you edit a list entry.

Note: The ‘default’ parameter specifies the default selected value and can match either a key or a value.

Example:

${ask('Operating System', editable_combobox, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'osx')} - The dialog box has the name ‘Operating System’. The drop-down menu displays the three given operating systems and also allows you to edit the entry. The associated value will be returned based upon your selection or the text you input.

radio | Format: ${ask('message', radio, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'), 'default')}

Description: Displays a dialog box that offers a series of radio buttons. Each radio button displays a ‘rendered_value’ and will return an associated real_value.

Note: The ‘default’ parameter specifies the default selected value and can match either a key or a value.

Example:

${ask('Operating System', radio, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'osx')} - The dialog box has the name ‘Operating System’. The radio button group allows you to choose between the three operating systems.

Note: In this example, Mac OS X is the default selected value and if selected, it would return osx for the output.

- ${timeStamp} - Time stamp, that is the current time in Unix format. For example, it can be used to save transformation results in multiple output files on each transformation.
- ${uuid} - Universally unique identifier, a unique sequence of 32 hexadecimal digits generated by the Java UUID class.
- ${id} - Application-level unique identifier. It is a short sequence of 10-12 letters and digits that is not guaranteed to be universally unique.
- ${cfn} - Current file name without extension and without parent folder. The current file is the one currently opened and selected.
- ${cfne} - Current file name with extension. The current file is the one currently opened and selected.
- ${cf} - Current file as file path, that is the absolute file path of the current edited document.
- ${cfd} - Current file folder as file path, that is the path of the current edited document up to the name of the parent folder.
- ${frameworksDir} - The path (as file path) of the frameworks directory.
- ${pd} - The file path to the folder that contains the current project file (.xpr).
- ${oxygenInstallDir} - Oxygen XML Editor plugin installation folder as file path.
- ${homeDir} - The path (as file path) of the user home folder.
- ${pn} - Current project name.
- ${env(VAR_NAME)} - Value of the VAR_NAME environment variable. The environment variables are managed by the operating system. If you are looking for Java System Properties, use the ${system(var.name)} editor variable.
- ${system(var.name)} - Value of the var.name Java System Property. The Java system properties can be specified in the command-line arguments of the Java runtime as -Dvar.name=var.value. If you are looking for operating system environment variables, use the ${env(VAR_NAME)} editor variable instead.
- ${date(pattern)} - Current date. The allowed patterns are equivalent to the ones in the Java SimpleDateFormat class. Example: yyyy-MM-dd.

Note: This editor variable supports both the xs:date and xs:dateTime parameters. For details about xs:date, go to: http://www.w3.org/TR/xmlschema-2/#date. For details about xs:dateTime, go to: http://www.w3.org/TR/xmlschema-2/#dateTime.

How to Find More Information About the Arguments of an Operation

If you need to find more information about the arguments of an operation, there are several places where this information is available:

- In the API documentation for the particular operation.
- By invoking the getArguments() method on the operation.
- In the source code of the operation.
- In Oxygen XML Editor plugin:
  1. Go to Options > Preferences > Document Type Association, select a document type and click the New, Edit, Duplicate, or Extend button (page 69).
  2. Go to the Author tab and then the Actions subtab. At the bottom of this subtab, click New to open the Action dialog box (page 79).
  3. Locate the Operation field and click the Choose button on the right side. This will open a dialog box that displays the default operations.
  4. Double-click the operation (or select it and click OK).
The arguments for the operation will now be displayed in the **Action** dialog box (page 79).

### Arguments of **InsertFragmentOperation** Operation

#### fragment

This argument has a textual value. This value is parsed by Oxygen XML Editor plugin as it was already in the document at the cursor position. You can use entity references declared in the document and it is namespace aware. The fragment may have multiple roots.

You can even use namespace prefixes that are not declared in the inserted fragment, if they are declared in the document where the insertion is done. For the sake of clarity, you should always prefix and declare namespaces in the inserted fragment!

If the fragment contains namespace declarations that are identical to those found in the document, the namespace declaration attributes will be removed from elements contained by the inserted fragment.

There are two possible scenarios:

1. **Prefixes that are not bound explicitly**

   For instance, the fragment:

   ```xml
   <x:item id="dty2"/>
   &ent;
   <x:item id="dty3"/>
   ```

   Can be correctly inserted in the document: (']' marks the insertion point):

   ```xml
   <?xml version="1.0" encoding="UTF-8"?>
   <!DOCTYPE x:root [ 
     <!ENTITY ent "entity">
   ]>
   
   <x:root xmlns:x="nsp">
   |  
   </x:root>
   ```

   Result:

   ```xml
   <?xml version="1.0" encoding="UTF-8"?>
   ```
2. Default namespaces

If there is a default namespace declared in the document and the document fragment (page 2705) does not declare a namespace, the elements from the fragment are considered to be in no namespace.

For instance, the fragment:

```xml
<item id="dty2"/>
<item id="dty3"/>
```

Inserted in the document:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<root xmlns="nsp">
  |
</root>
```

Gives the result document:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<root xmlns="nsp">
  <item xmlns="" id="dty2"/>
  <item xmlns="" id="dty3"/>
</root>
```

**insertLocation**

An XPath expression that is relative to the current node. It selects the reference node for the fragment insertion. When missing, the fragment will be inserted at the cursor position.

**insertPosition**

Specifies where the insertion is made relative to the reference node selected by the insertLocation. It can be one of the following constants:
- **Inside as first child** (default value) - The fragment is inserted as first child of the reference node.
- **Inside as last child** - The fragment is inserted as the last child of the reference node.
- **After** - The fragment is inserted after the reference node.
- **Before** - The fragment is inserted before the reference node.

**goToNextEditablePosition**

After inserting the fragment, the first editable position is detected and the cursor is placed at that location. It handles any in-place editors used to edit attributes. It will be ignored if the fragment specifies a cursor position using the ${caret} editor variable (page 205). The possible values of this action are `true` and `false`.

**schemaAware**

This argument applies only on the surround with element operation and controls whether or not the insertion is valid, based upon the schema. If the insertion is not valid, then wrapping action will be broken up into smaller intervals until the wrapping action is valid. For example, if you try to wrap a `paragraph` element with a `bold` element, it would not be valid, so the operation will wrap the text inside the paragraph instead, since it would be valid at that position.

**Arguments of SurroundWithFragmentOperation**

**fragment**

The XML fragment that will surround the selection. For example, consider the fragment:

```xml
<F>
  <A/>
  <B>
    <C/>
  </B>
</F>
```

and the document:

```xml
<doc>
  <X/>
  <Y/>
  <Z/>
</doc>
```
Considering the selected content to be surrounded is the sequence of elements $X$ and $Y$, then the result is:

```xml
<doc>
  <F>
    <A>
      <X></X>
      <Y></Y>
    </A>
    <B>
      <C></C>
    </B>
  </F>
  <Z></Z>
<doc>
```

Since the element $A$ was the first leaf in the fragment, it received the selected content. The fragment was then inserted in the place of the selection.

**schemaAware**

This argument applies only on the surround with element operation and controls whether or not the insertion is valid, based upon the schema. If the insertion is not valid, then wrapping action will be broken up into smaller intervals until the wrapping action is valid. For example, if you try to wrap a paragraph element with a bold element, it would not be valid, so the operation will wrap the text inside the paragraph instead, since it would be valid at that position.

Adding a Custom Operation to an Existing Framework

This task explains how to add a custom Author mode operation to an existing framework (page 2706) (document type).

1. Setup a sample project by following the instructions for installing the SDK.

   **Tip:** The SDK contains a sample framework project called oxygen-sample-framework.

2. A variety of classes in the `simple.documentation.framework.operations` package implement the `ro.sync.ecss.extensions.api.AuthorOperation` interface. Depending on your use-case, modify one of these classes.

3. Pack the operation class inside a Java JAR library.
4. Copy the JAR library to your framework directory (for example, \{OXYGEN_INSTALL_DIR\}/frameworks/\{FRAMEWORK_DIR\}).

5. Open the Preferences dialog box \(\text{\textbf{\textit{(page 55)}}}\), go to Document Type Association, and edit the document type (you need write access to the \{OXYGEN_INSTALL_DIR\}) to open the Document Type configuration dialog box \(\text{\textbf{\textit{(page 72)}}}\).
   a. In the Classpath tab, add a reference to your JAR library (for example, \$\{framework\}/customAction.jar).
   b. Go to the Author tab, then go to the Actions subtab.
   c. Click the \(\textbf{+ New}\) button and use the Action dialog box \(\text{\textbf{\textit{(page 79)}}}\) to create a new action that uses your custom operation.
   d. Mount the action to the toolbars or menus. You can also define a shortcut key.

6. Share the modifications \(\text{\textbf{\textit{(page 2086)}}}\) with your colleagues. The files that should be shared are your customAction.jar library and the .framework configuration file from the \{OXYGEN_INSTALL_DIR\}/frameworks/\{FRAMEWORK_DIR\} directory.

**Customizing Author Mode Through CSS**

The visual Author editing mode can be customized by creating CSS files to define styles for the XML elements and other components. The Author editing mode supports most CSS 2.1 selectors, numerous CSS 2.1 properties, and some CSS 3 selectors. Also, Oxygen XML Editor plugin has added some custom functions and properties that extend the W3C CSS specification and are useful for a wide range of use-cases for developers who customize Author mode through custom frameworks \(\text{\textbf{\textit{(page 2037)}}}\).

**Associating a CSS with an XML Document**

**Associating a Stylesheet with an XML Document**

The rendering of an XML document in the Author mode is driven by a CSS stylesheet that conforms to the version 2.1 of the CSS specification from the W3C consortium. Some CSS 3 features, such as namespaces and custom extensions, of the CSS specification are also supported.

There are several methods for associating a stylesheet (CSS) with an XML document:
1. Insert the `xml-stylesheet` processing instruction with the `type` attribute at the beginning of the XML document. If you do not want to alter your XML documents, you should create a new document type (framework) (page 2037).

CSS example:

```xml
<?xml-stylesheet type="text/css" href="test.css"?>
```

**Note:** XHTML documents need a `link` element, with the `href` and `type` attributes in the `head` child element, as specified in the W3C stylesheet specification. XHTML example:

```xml
<link href="/style/screen.css" rel="stylesheet" type="text/css"/>
```

**Tip:** You can also insert the `xml-stylesheet` processing instruction by using the Associate XSLT/CSS Stylesheet action that is available on the toolbar or in the XML menu.

2. Add a new CSS file to a framework (page 2706) (document type). To do so, open the Preferences dialog box (page 55) and go to Document Type Association. Edit the appropriate framework, open the Author tab, then the CSS subtab. Press the **New** button to add a new CSS file.

**Note:** The built-in frameworks are read-only, so you need to Extend (page 70) or Duplicate (page 70) them to configure them as custom frameworks.

If a document has no CSS association or the referenced stylesheet files cannot be loaded, a default one is used. A warning message is also displayed at the beginning of the document, presenting the reason why the CSS cannot be loaded.

*Figure 670: Document with no CSS association default rendering*
For information about associating a CSS to a framework (document type), see Customizing Author Mode Using CSS Files Associated with a Framework (page 2061).

Handling CSS Imports

When a CSS document contains imports to other CSS documents, the references are also passed through the XML Catalog (page 2712) URI mappings to determine an indirect CSS referenced location.

Example: CSS Import

For example, if you can have a CSS import, such as:

```
@import "http://host/path/to/location/custom.css";
```

and then add your own XML Catalog (page 2712) file that maps the location to a custom CSS in the XML Catalog preferences page (page 171):

```
<uri name="http://host/path/to/location/custom.css"
     url="path/to/custom.css"/>
```

Adding a Custom Default CSS for Every XML Document

To add a custom CSS that is applied to every XML document, add a mapping in your XML Catalog (page 2712) file that looks like this:

```
<uri name="http://www.oxygenxml.com/extensions/author/css/userCustom.css"
     url="path/to/custom.css"/>
```

This extra mapped CSS location will be parsed every time the application processes the CSS stylesheets used to render the opened XML document in the visual Author editing mode. This allows your custom CSS to be used without the need to modify all other CSS stylesheets contributed in the document type configuration.

Editor Variables in CSS Imports

You can use various editor variables (page 201) in CSS imports. When editing an XML document with an associated CSS in Author mode, the editor variables will be expanded and resolved.

Example: Editor Variable in a CSS Import

For example, the following editor variable:
@import "${framework(DITA)}/custom.css";

is resolved in the DITA framework (page 2706) folder where the custom.css is placed. In the Document Type Association preferences page (page 69), you can see a list of document type. The name for your particular document type needs to be passed as a parameter to the framework() function.

**Note:** If you use editor variables like $(cfdu) (Current File Directory URL), it will be expanded to the URL of the current CSS document that contains the imports rather than the XML document that references the CSS.

### Specifying Media Types in the CSS

The CSS stylesheets can specify how a document is presented on different types of media (on the screen, paper, etc.) You can specify that some of the selectors from your CSS should be taken into account only in the Oxygen XML Editor plugin Author mode and ignored in other media types. This can be accomplished by using the oxygen media type.

**Example: oxygen Media Type**

```css
b{
  font-weight:bold;
  display:inline;
}
@media oxygen{
  b{
    text-decoration:underline;
  }
}
```

This example results in the text being bold if the document is opened in a web browser that does not recognize @media oxygen, while the text is bold and underlined when opened in Oxygen XML Editor plugin Author mode.

You can also use the oxygen media type to specify CSS selectors to be applied in certain operating systems or platforms by using the os and platform properties. For example, you can specify one set of style rules for displaying Oxygen XML Editor plugin in Windows, and another set of style rules for Mac OS. The supported properties are as follows:

- **os** - The possible values are: win, linux, or mac.
• **platform** - The possible values are: standalone, eclipse, or webapp.

**Example: os and platform Properties**

```css
@media oxygen AND (os: "win") AND (platform: "standalone") {
  p{
    content: "PPP";
  }
}
```

Related Information:

• [@media Rule (page 2196)]

---

**CSS At-Rules**

Oxygen XML Editor plugin supports some of the standard at-rules specified by CSS Level 2.1 and 3. The **@media** rule also include support for some style rules that are specific to Oxygen XML Editor plugin.

**@font-face At-Rule**

Oxygen XML Editor plugin allows you to use custom fonts in the **Author** mode by specifying them in the CSS using the **@font-face** media type. Only the **src** and **font-family** CSS properties can be used for this media type.

**Example: **[@font-face Rule]

```css
@font-face{
    font-family: "Baroque Script";
    /*The location of the loaded TTF font must be relative to the CSS*/
    src:url("BaroqueScript.ttf");
}
```

The specified **font-family** must match the name of the font declared in the .ttf file.

**@media Rule**

The **@media** rule allows you to set different style rules for multiple types of media in the same stylesheet. For example, you can set the font size to be different on the screen than on paper. Oxygen
XML Editor plugin supports several media types, allowing you to set the style rules for presenting a document on various media (on screen, paper, etc.)

**Supported Media Types**

- **screen** - The styles marked with this media type are used only for rendering a document on screen.
- **print** - The styles marked with this media type are used only for printing a document.
- **all** - The styles marked with this media type are used for rendering a document in all supported types of media.
- **oxygen** - The styles marked with this media type are used only for rendering a document in the Oxygen XML Editor plugin **Author** mode. For more information, see *Specifying Media Types in the CSS* (page 2195).
- **oxygen-dark-theme** - The styles marked with this media type are used only for rendering a document in the Oxygen XML Editor plugin **Author** mode when a dark theme is used (for example, Graphite).
- **oxygen-high-contrast-black** - The styles marked with this media type are used only for rendering a document in the Oxygen XML Editor plugin **Author** mode on a Windows High Contrast Theme with a black background.
- **oxygen-high-contrast-white** - The styles marked with this media type are used only for rendering a document in the Oxygen XML Editor plugin **Author** mode on a Windows High Contrast Theme with a white background.

**Example: **@media** Rule**

```css
@media oxygen{
  b{
    text-decoration:underline;
  }
}
@media oxygen-high-contrast-white{
  b{
    font-weight:bold;
  }
}
```

**Supported Properties**

Oxygen XML Editor plugin also supports a few properties to set specific style rules that depend upon the size of the visible area in **Author** mode. These supported properties are as follows:
• **min-width** - The styles selected in this property are applied if the visible area in **Author** mode is equal to or greater than the specified value.
• **max-width** - The styles selected in this property are applied if the visible area in **Author** mode is less than or equal to the specified value.

**Example: min-width and max-width Properties**

```css
@media (min-width: 500px) {
    p {
        content: 'XXX';
    }
}
@media (max-width: 700px) {
    p:after {
        content: 'yyy';
    }
}
```

**Related Information:**

• [Specifying Media Types in the CSS](page 2195)

**Standard W3C CSS Supported Features**

Oxygen XML Editor plugin supports most of the CSS Level 3 selectors and most of the CSS Level 2.1 properties

**Supported CSS Selectors**

The following table lists the CSS selectors that are supported in Oxygen XML Editor plugin:

<table>
<thead>
<tr>
<th>Expression</th>
<th>Name</th>
<th>CSS Level</th>
<th>Description / Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>*</td>
<td>Universal selector</td>
<td>CSS Level 2</td>
<td>Matches any element</td>
</tr>
<tr>
<td>E</td>
<td>Type selector</td>
<td>CSS Level 2</td>
<td>Matches any E element (i.e. an element with the local name E)</td>
</tr>
<tr>
<td>E F</td>
<td>Descendant selector</td>
<td>CSS Level 2</td>
<td>Matches any F element that is a descendant of an E element.</td>
</tr>
<tr>
<td>E &gt; F</td>
<td>Child selectors</td>
<td>CSS Level 2</td>
<td>Matches any F element that is a child of an element E.</td>
</tr>
<tr>
<td>Expression</td>
<td>Name</td>
<td>CSS Level</td>
<td>Description / Example</td>
</tr>
<tr>
<td>------------</td>
<td>------</td>
<td>-----------</td>
<td>-----------------------</td>
</tr>
<tr>
<td>E:lang(c)</td>
<td>Language pseudo-class</td>
<td>CSS Level 2</td>
<td>Matches element of type (E) if it is in (human) language (c) (the document language specifies how language is determined).</td>
</tr>
<tr>
<td>E + F</td>
<td>Adjacent selector</td>
<td>CSS Level 2</td>
<td>Matches any (F) element immediately preceded by a sibling element (E).</td>
</tr>
<tr>
<td>E ~ F</td>
<td>General sibling selector</td>
<td>CSS Level 3</td>
<td>Matches any (F) element preceded by a sibling element (E).</td>
</tr>
<tr>
<td>E[foo]</td>
<td>Attribute selector</td>
<td>CSS Level 2</td>
<td>Matches any (E) element with the &quot;foo&quot; attribute set (whatever the value).</td>
</tr>
<tr>
<td>E[foo=&quot;warning&quot;]</td>
<td>Attribute selector with value</td>
<td>CSS Level 2</td>
<td>Matches any (E) element whose &quot;foo&quot; attribute value is exactly equal to &quot;warning&quot;.</td>
</tr>
<tr>
<td>E[foo~=&quot;warning&quot;]</td>
<td>Attribute selector containing value</td>
<td>CSS Level 2</td>
<td>Matches any (E) element whose &quot;foo&quot; attribute value is a list of space-separated values, one of which is exactly equal to &quot;warning&quot;.</td>
</tr>
<tr>
<td>E[lang</td>
<td>=&quot;en&quot;]</td>
<td>Attribute selector containing hyphen separated values</td>
<td>CSS Level 2</td>
</tr>
<tr>
<td>E:before and E:after</td>
<td>Pseudo elements</td>
<td>CSS Level 2</td>
<td>The ':before' and ':after' pseudo-elements can be used to insert generated content before or after an element's content.</td>
</tr>
<tr>
<td>E:before(n) and E:after(n)</td>
<td>Pseudo elements</td>
<td>CSS Level 3</td>
<td>Multiple ':before(n)' and ':after(n)' pseudo-elements can be used to insert content before or after the content of an element (or other pseudo-element). For more information, see the W3C CSS3 pseudo elements site.</td>
</tr>
<tr>
<td>E:first-child</td>
<td>The first-child pseudo-class</td>
<td>CSS Level 2</td>
<td>Matches element (E) when (E) is the first child of its parent.</td>
</tr>
<tr>
<td>Expression</td>
<td>Name</td>
<td>CSS Level</td>
<td>Description / Example</td>
</tr>
<tr>
<td>------------</td>
<td>------</td>
<td>-----------</td>
<td>-----------------------</td>
</tr>
<tr>
<td>E:not(s)</td>
<td>Negation pseudo-class</td>
<td>CSS Level 2</td>
<td>An E element that does not match simple selector s.</td>
</tr>
<tr>
<td>E:has</td>
<td>Relational pseudo-class</td>
<td>CSS Level 4</td>
<td>The :has() relational pseudo-class is a functional pseudo-class that takes a relative selector as an argument. For more information, see :has Relational Pseudo-Class (page 2205).</td>
</tr>
<tr>
<td>E:hover</td>
<td>The hover pseudo-class</td>
<td>CSS Level 2</td>
<td>The :hover pseudo-class applies while the user designates an element with a pointing device, but does not necessarily activate it. When moving the pointing device over an element, all the parent elements up to the root are taken into account.</td>
</tr>
<tr>
<td>E:focus</td>
<td>The focus pseudo-class</td>
<td>CSS Level 2</td>
<td>The :focus pseudo-class applies while an element has the focus (accepts keyboard input).</td>
</tr>
<tr>
<td>E:focus-within</td>
<td>The generalized input focus pseudo-class</td>
<td>CSS Level 4</td>
<td>The :focus-within pseudo-class applies to elements for which the :focus pseudo-class applies. Additionally, the ancestors of an element that matches :focus-within also match.</td>
</tr>
<tr>
<td>E#myid</td>
<td>The ID selector</td>
<td>CSS Level 2</td>
<td>Matches any E element with ID equal to &quot;myid&quot;.</td>
</tr>
</tbody>
</table>

**Important:** Limitation: In Oxygen XML Editor plugin the match is performed only taking
<table>
<thead>
<tr>
<th>Expression</th>
<th>Name</th>
<th>CSS Level</th>
<th>Description / Example</th>
</tr>
</thead>
</table>
| E[att^="val"] | Substring matching attribute selector | CSS Level 3 | An E element whose `att` attribute value begins exactly with the string `val`.
| E[att$="val"] | Substring matching attribute selector | CSS Level 3 | An E element whose `att` attribute value ends exactly with the string `val`.
| E[att*="val"] | Substring matching attribute selector | CSS Level 3 | An E element whose `att` attribute value contains the substring `val`.
| E:root | Root pseudo-class | CSS Level 3 | Matches the root element of the document. In HTML, the root element is always the HTML element.
| E:empty | Empty pseudo-class | CSS Level 3 | An E element that has no text or child elements.
| E:nth-child(n) | The nth-child pseudo-class | CSS Level 3 | An E element, the nth child of its parent.
| E:nth-last-child(n) | The nth-last-child pseudo-class | CSS Level 3 | An E element, the nth child of its parent, counting from the last one.
| E:nth-of-type(n) | The nth-of-type pseudo-class | CSS Level 3 | An E element, the nth sibling of its type.
| E:nth-last-of-type(n) | The nth-last-of-type pseudo-class | CSS Level 3 | An E element, the nth sibling of its type, counting from the last one.
| E:last-child | The last-child pseudo-class | CSS Level 3 | An E element, last child of its parent.
| E:first-of-type | The first-of-type pseudo-class | CSS Level 3 | An E element, first sibling of its type.
| E:last-of-type | The last-of-type pseudo-class | CSS Level 3 | An E element, last sibling of its type.
| E:only-child | The only-child pseudo-class | CSS Level 3 | An E element, only child of its parent.
### Expression | Name | CSS Level | Description / Example
--- | --- | --- | ---
E:only-of-type | The only-of-type pseudo-class | CSS Level 3 | An E element, only sibling of its type.
ns|E | Element namespace selector | CSS Level 3 | An element that has the local name E and the namespace given by the prefix ns. The namespace prefix can be bound to a URI by the at-rule:

```css
@namespace ns "http://some_namespace_uri";
```

See Namespace Selector (page 2202).

E!>F | The subject selector | CSS Level 4 (experimental) | An element that has the local name E and has a child F. See Subject Selector (page 2203).

#### Namespace Selector

In the CSS 2.1 standard, the element selectors ignore the namespaces of the elements they are matching. Only the local name of the elements are considered in the selector matching process.

Oxygen XML Editor plugin uses a different approach that is similar to the CSS Level 3 specification. If the element name from the CSS selector is not preceded by a namespace prefix it is considered to match an element with the same local name as the selector value and ANY namespace. Otherwise, the element must match both the local name and the namespace.

In CSS up to version 2.1, the name tokens from selectors match all elements from ANY namespace that have the same local name. Example:

```xml
<x:b xmlns:x="ns_x"/>
<y:b xmlns:y="ns_y"/>
```

Are both matched by the rule:

```css
b { font-weight: bold}
```

Starting with CSS Level 3, you can create selectors that are namespace aware.

**Example: Defining prefixed and default namespaces**
Given the namespace declarations:

```xml
@namespace sync "http://sync.example.org";
@namespace "http://example.com/foo";
```

Then:

```plaintext
sync|A
```

Represents the name A in the `http://sync.example.org` namespace.

```plaintext
*|B
```

Represents the name B in ANY namespace, including NO NAMESPACE.

```plaintext
C
```

Represents the name C in ANY namespace, including NO NAMESPACE.

**Example: Defining prefixed namespaces combined with pseudo-elements**

To match the `def` element its namespace declares, bind it to the `abs` prefix and then write a CSS rule:

```xml
@namespace abs "http://www.oxygenxml.com/sample/documentation/abstracts";
```

Then:

```plaintext
abs|def
```

Represents the name "def" in the `http://www.oxygenxml.com/sample/documentation/abstracts` namespace.

```plaintext
abs|def:before
```

Represents the :before pseudo-element of the "def" element from the `http://www.oxygenxml.com/sample/documentation/abstracts` namespace.

**Subject Selector**

Oxygen XML Editor plugin supports the subject selector described in CSS Level 4 (currently a working draft at W3C [http://www.w3.org/TR/selectors4/](http://www.w3.org/TR/selectors4/)). This selector matches a structure of the document, but unlike a compound selector, the styling properties are applied to the subject element (the one marked with "!") instead of the last element from the path.

*The subject of the selector can be explicitly identified by appending an exclamation mark (!) to one of the compound selectors in a selector. Although the element structure that the selector represents*
the same with or without the exclamation mark, indicating the subject in this way can change which compound selector represents the subject in that structure.

Example:

```css
table! > caption {
    border: 1px solid red;
}
```

A border will be drawn to the table elements that contain a caption, as direct child.

This is different from:

```css
table > caption {
    border: 1px solid red;
}
```

This draws a border around the caption.

**Taking Processing Instructions into Account in CSS Subject Selectors**

You can test for the existence of specific processing instructions (PI) in the child hierarchy of a subject selector.

For example:

```css
@namespace oxy "http://www.oxygenxml.com/extensions/author";

chapter! > oxy|processing-instruction[important][level="high"]{
    color:red;
}
```

This would change the color of a DocBook chapter to red if it contains the `important` processing instruction:

```xml
<chapter>
    <title>A title</title>
    <?important level='high'?>
</chapter>```
Descendant Selectors Limitation

⚠️ **Important:** The current implementation has a known limitation. The general descendant selectors are taken into account as direct child selectors. For example, the following two CSS selectors are considered equivalent:

```
.a:has(b c)
```

and:

```
.a:has(b>c)
```

**Related Information:**

- :has Relational Pseudo-Class (page 2205)

:has Relational Pseudo-Class

Oxygen XML Editor plugin supports the CSS Level 4 subject selector (currently a working draft at W3C [http://www.w3.org/TR/selectors4/]), as described in Subject Selector (page 2203). Oxygen XML Editor plugin also supports the :has relational pseudo-class that has similar functionality and it can match an element by taking its child elements into account. For more information, see [https://drafts.csswg.org/selectors-4/#relational](https://drafts.csswg.org/selectors-4/#relational).

You can create conditions that take into account the structure of the matching element.

**Example: has Pseudo Class**

```
table:has( tbody > thead){
    border: 1px solid red;
}
```

This example will result in a border being drawn for the table elements that contain at least a `thead` element in the `tbody` element.

Taking Processing Instructions into Account in CSS Subject Selectors

You can test for the existence of specific processing instructions (`PI`) in the child hierarchy of a subject selector.

For example:

```
@namespace oxy "http://www.oxygenxml.com/extensions/author";
```
This would change the color of a DocBook chapter to red if it contains the `important` processing instruction:

```xml
<chapter>
  <title>A title</title>
  <?important level='high'?>
</chapter>
```

**Descendant Selectors Limitation**

⚠️ **Important:** The current implementation has a known limitation. The general descendant selectors are taken into account as direct child selectors. For example, the following two CSS selectors are considered equivalent:

```
.a:has(b c)
```

and:

```
.a:has(b>c)
```

**Supported CSS Properties**

Oxygen XML Editor plugin validates all CSS 2.1 properties, but does not render `aural` and `paged` categories properties in **Author** mode, as well as some of the values of the `visual` category that are listed below under the **Ignored Values** column. For the Oxygen XML Editor plugin-specific (extension) CSS properties, see Oxygen CSS Extensions (page 2215).

- Oxygen CSS Extensions (page 2215)

**Transparent Colors**

CSS3 supports RGBA colors. The RGBA declaration allows you to set opacity (via the Alpha channel) as part of the color value. A value of 0 corresponds to a completely transparent color, while a value of 1 corresponds to a completely opaque color. To specify a value, you can use either a real number between 0 and 1, or a percent.

**Example: RGBA Color**

```css
personnel:before {
  display: block;
  padding: 1em;
  font-size: 1.8em;
  content: "Employees";
  font-weight: bold;
  color: #EEEEEE;
  background-color: rgba(50, 50, 50, 0.6);
}
```

**attr() Function: Properties Values Collected from the Edited Document**

In CSS Level 2.1 you may collect attribute values and use them as content only for the pseudo-elements. For instance, the :before pseudo-element can be used to insert some content before an element. This is valid in CSS 2.1:

```css
title:before{
  content: "[Audience Level: " attr(audience) "]";
}
```
If the `<title>` element from the XML document is:

```xml
<title audience="Expert">Changing the Timing Belt</title>
```

Then the title will be displayed as:

```
[Audience Level: Expert] Changing the Timing Belt
```

In Oxygen XML Editor plugin, the use of `attr()` function is available not only for the `content` property, but also for any other property. This is similar to the CSS Level 3 working draft: [http://www.w3.org/TR/2006/WD-css3-values-20060919/#functional](http://www.w3.org/TR/2006/WD-css3-values-20060919/#functional). The arguments of the function are:

`attr(attribute_name, attribute_type, default_value)`

- **attribute_name**
  - The attribute name. This argument is required.

- **attribute_type**
  - The attribute type. This argument is optional. If it is missing, argument's type is considered `string`. This argument indicates what is the meaning of the attribute value and helps to perform conversions of this value. Oxygen XML Editor plugin accepts one of the following types:
    - **color**
      - The value represents a color. The attribute may specify a color in various formats. Oxygen XML Editor plugin supports colors specified either by name (red, blue, green, etc.) or as an RGB hexadecimal value `#FFEEFF`.
    - **url**
      - The value is a URL pointing to a media object. Oxygen XML Editor plugin supports only images. The attribute value can be a complete URL, or a relative one to the XML document. Note that this URL is also resolved through the catalog resolver.
    - **integer**
      - The value must be interpreted as an integer.
    - **number**
      - The value must be interpreted as a float number.
    - **length**
The value must be interpreted as an integer.

**percentage**

The value must be interpreted relative to another value (length, size) expressed in percents.

**em**

The value must be interpreted as a size. 1 em is equal to the font-size of the relevant font.

**ex**

The value must be interpreted as a size. 1 ex is equal to the height of the x character of the relevant font.

**px**

The value must be interpreted as a size expressed in pixels relative to the viewing device.

**mm**

The value must be interpreted as a size expressed in millimeters.

**cm**

The value must be interpreted as a size expressed in centimeters.

**in**

The value must be interpreted as a size expressed in inches. 1 inch is equal to 2.54 centimeters.

**pt**

The value must be interpreted as a size expressed in points. The points used by CSS2 are equal to 1/72th of an inch.

**pc**

The value must be interpreted as a size expressed in picas. 1 pica is equal to 12 points.

**default_value**

This argument specifies a value that is used by default if the attribute value is missing. This argument is optional.

**Example: attr Function**
Consider the following XML instance:

```xml
<sample>
  <para bg_color="#AAAAFF">Blue paragraph.</para>
  <para bg_color="red">Red paragraph.</para>
  <para bg_color="red" font_size="2">Red paragraph with large font.</para>
  <para bg_color="#00AA00" font_size="0.8" space="4">Green paragraph with small font and margin.</para>
</sample>
```

The `para` elements have `bg_color` attributes with RGB color values (such as `#AAAAFF`). You can use the `attr()` function to change the elements appearance in the editor based on the value of this attribute:

```css
background-color: attr(bg_color, color);
```

The attribute `font_size` represents the font size in `em` units. You can use this value to change the style of the element:

```css
font-size: attr(font_size, em);
```

The complete CSS rule is:

```css
para{
  display: block;
  background-color: attr(bg_color, color);
  font-size: attr(font_size, em);
  margin: attr(space, em);
}
```

The document is rendered as:
Oxygen CSS Extensions

CSS stylesheets provide support for displaying documents. When editing non-standard documents, Oxygen XML Editor plugin CSS extensions are useful.

Examples of how they can be used:

- Property for marking foldable elements (page 2706) in large files.
- Enforcing a display mode for the XML tags, regardless of the current mode selected by the user.
- Constructing a URL from a relative path location.
- String processing functions.

Built-in CSS Selectors

When Oxygen XML Editor plugin renders content in the Author mode, it adds built-in CSS selectors (in addition to the CSS stylesheets linked in the XML or specified in the document type associated to the XML document). These built-in CSS selectors are processed before all other CSS content, but they can be overwritten if the CSS developer wants to modify a default behavior.

List of CSS Selector Contributed by Oxygen XML Editor plugin

```xml
@namespace oxy "http://www.oxygenxml.com/extensions/author";
@namespace xi "http://www.w3.org/2001/XInclude";
@namespace xlink "http://www.w3.org/1999/xlink";
@namespace svg "http://www.w3.org/2000/svg";
@namespace mml "http://www.w3.org/1998/Math/MathML";
```

    color: rgb(156, 156, 156) !important;
 }
/* ===================================================
* built-in oXygen elements
* */
oxy|comment {
    color: #a2a2a2 !important;
    background-color: transparent !important;
 }
oxy|reference,
oxy|entity {
    background-color: rgb(100, 100, 100) !important;
 }
}

**Example:**

To show all entities in the **Author** mode as transparent, without a gray background, first define in your CSS after all imports the namespace:

```css
@namespace oxy "http://www.oxygenxml.com/extensions/author";
```

and then add the following selector:

```css
oxy|entity {
    background-color: inherit !important;
}
```

**Additional CSS Selectors**
Oxygen XML Editor plugin provides support for selecting additional types of nodes. These custom selectors apply to: document, doctype sections, processing-instructions, comments, CDATA sections, reference sections, and entities. Processing-instructions are not displayed by default. To display them, open the Preferences dialog box (page 55), go to Editor > Author, and select Show processing instructions.

**Note:** The custom selectors are presented in the default CSS for Author mode and all of their properties are marked with an !important flag. For this reason, you have to set the !important flag on each property of the custom selectors from your CSS to be applicable.

For the custom selectors to work in your CSS stylesheets, declare the Author mode extensions namespace at the beginning of the stylesheet documents:

```css
@namespace oxy url('http://www.oxygenxml.com/extensions/author');
```

- The `oxy|document` selector matches the entire document:

```css
oxy|document {
  display:block !important;
}
```

- The following example changes the rendering of doctype sections:

```css
oxy|doctype {
  display:block !important;
  color:blue !important;
  background-color:transparent !important;
}
```

- To match the processing instructions, you can use the `oxy|processing-instruction` selector:

```css
oxy|processing-instruction {
  display:block !important;
  color:purple !important;
  background-color:transparent !important;
}
```

A processing instruction usually has a target and one or more pseudo attributes:

```xml
<?target_name data="b"?>
```

You can match a processing instruction with a particular target from the CSS using the construct:

```css
oxy|processing-instruction[target_name]
```
You can also match the processing instructions having a certain target and pseudo attribute value, such as:

```xml
oxy|processing-instruction[target_name][data="b"]
```

- The XML comments display in **Author** mode can be changed using the `oxy|comment` selector:

```css
oxy|comment {
    display:block !important;
    color:green !important;
    background-color:transparent !important;
}
```

- The `oxy|cdata` selector matches CDATA sections:

```css
oxy|cdata{
    display:block !important;
    color:gray !important;
    background-color:transparent !important;
}
```

- The `oxy|entity` selector matches the entities content:

```css
oxy|entity {
    display:morph !important;
    editable:false !important;
    color:orange !important;
    background-color:transparent !important;
}
```

To match particular entities, use the `oxy|entity` selector in expressions such as:

```css
oxy|entity[name='amp'],
oxy|entity[name='lt'],
oxy|entity[name='gt'],
oxy|entity[name='quot'],
oxy|entity[name='apos'],
oxy|entity[name='apos'][ -oxy-display-tags: none;
```

- The *references to entities, XInclude, and DITA conrefs and conkeyrefs* are expanded by default in **Author** mode and the referenced content is displayed. The referenced resources are displayed inside the element or entity that refers to them.
You can use the `reference` property to customize the way these references are rendered in **Author** mode:

```css
oxy|reference {
  border: 1px solid gray !important;
}
```

In the **Author** mode, content is highlighted when text contains comments ([page 719](page 719)) and changes (if **Track Changes** ([page 719](page 719)) was active when the content was modified).

If this content is referenced, the **Author** mode does not display the highlighted areas in the new context. If you want to mark the existence of this comments and changes you can use the `oxy|reference[comments]`, `oxy|reference[changeTracking]`, and `oxy|reference[changeTracking][comments]` selectors.

**Note:** Two artificial attributes (`comments` and `changeTracking`) are set on the reference node, containing information about the number of comments and tracked changes in the content.

- The following example represents the customization of the reference fragments that contain comments:

```css
oxy|reference[comments]:before {
  content: "Comments: " attr(comments) !important;
}
```

- To match reference fragments based on the fact that they contain tracked changes inside, use the `oxy|reference[changeTracking]` selector.

```css
oxy|reference[changeTracking]:before {
  content: "Change tracking: " attr(changeTracking) !important;
}
```

- Here is an example of how you can set a custom color to the reference containing both tracked changes and comments:

```css
oxy|reference[changeTracking][comments]:before {
  content: "Change tracking: " attr(changeTracking) " and comments: " attr(comments) !important;
}
```

*Figure 671: Example: A Document Rendered Using these Rules*
Additional CSS Properties

Oxygen XML Editor plugin provides various additional CSS properties to extend the standard CSS properties.

Append Content Properties: `-oxy-append-content / -oxy-prepend-content`

Used to append specified content.

**-oxy-append-content Property**

This property appends the specified content to the content generated by other matching CSS rules of lesser specificity. Unlike the `content` property, where only the value from the rule with the greatest specificity is taken into account, the `-oxy-append-content` property adds content to that generated by the lesser specificity rules into a new compound content.

**Example:**

```css
element:before{
    -oxy-append-content: "Hello";
}
```
The content shown before the `element` will be `Hello World!`.

**-oxy-prepend-content Property**

Prepends the specified content to the content generated by other matching CSS rules of lesser specificity. Unlike the `content` property, where only the value from the rule with the greatest specificity is taken into account, the `-oxy-prepend-content` prepends content to that generated by the lesser specificity rules into a new compound content.

**Example:**

```css
element:before{
  -oxy-prepend-content: "said: ";
}
element:before{
  -oxy-prepend-content: "I ";
}
element:before{
  -oxy-prepend-content: "I said: Hello! ";
}
```

The content shown before the `element` will be `I said: Hello!`.

**Collapse Text: -oxy-collapse-text Property Value**

Used to collapse the content of an element.

Oxygen XML Editor plugin allows you to set the value of the `visibility` property to `-oxy-collapse-text`, meaning that the content of that element is not rendered. If an element is marked as `-oxy-collapse-text` you are not able to position the cursor inside it and edit it. The purpose of `-oxy-collapse-text` is to make the text value of an element editable only through a form control.

**Example: visibility Property**

The text value of an XML element will be edited using a text field form control. In this case, the text content is not directly present in the Author visual editing mode:

```css
title{
  content: oxy_textfield(edit, '#text', columns, 40);
  visibility:-oxy-collapse-text;
}
Cyrillic Counters: -oxy-lower-cyrillic Property Values

Used to style lists with Cyrillic counters.

Oxygen XML Editor plugin allows you to set the value of the list-style-type property to Cyrillic counters. For example, -oxy-lower-cyrillic-ru, -oxy-lower-cyrillic-uk, -oxy-upper-cyrillic-ru or -oxy-upper-cyrillic-uk, meaning that you can have Russian and Ukrainian counters.

Example: Cyrillic Counters

Counting list items with Cyrillic symbols:

```html
li{
  display:list-item;
  list-style-type:-oxy-lower-cyrillic-ru;
}
```

Display Tag Markers: -oxy-display-tags Property

Used to specify whether or not tag markers are displayed.

Oxygen XML Editor plugin allows you to choose whether tag markers of an element should never be presented or the current display mode should be respected. This is especially useful when working with :before and :after pseudo-elements, in which case the element range is already visually defined so the tag markers are redundant.

The property is named -oxy-display-tags, with the following possible values:

- **none** - Tags markers will not be presented regardless of the current display mode. *(page 331)*.
- **default** - The tag markers will be created depending on the current display mode. *(page 331)*.
- **inherit** - The value of the property is inherited from an ancestor element.

-oxy-display-tags

  Value: none | default | inherit
  Initial: default
  Applies to: all nodes(comments, elements, CDATA, etc.)
  Inherited: false
  Media: all

Example: -oxy-display-tags Property
In this example, the `para` element from DocBook uses a `:before` and `:after` element and its tag markers will not be visible.

```css
para:before{
    content: "{";
}

para:after{
    content: "}";
}

para{
    -oxy-display-tags: none;
    display: block;
    margin: 0.5em 0;
}
```

**Editable: -oxy-editable Property**

Used to inhibit the content of a particular element.

If you want to inhibit editing a certain element’s content, you can set the `-oxy-editable` CSS property (deprecated property `editable` is also supported) to `false`.

**Folding Elements: -oxy-foldable Property**

Used to configure whether or not the content of an element can be expanded or collapsed.

Oxygen XML Editor plugin allows you to declare some elements to be foldable (page 2706). This is especially useful when working with large documents organized in logical blocks, editing a large DocBook article or book, for instance. Oxygen XML Editor plugin marks the foldable content with a small blue triangle. When you hover with your mouse pointer over this marker, a dotted line borders the collapsible content. The following actions are available in the Folding submenu of the contextual menu:

- **Toggle Fold**
  Toggles the state of the current fold.

- **Collapse Other Folds** (`Ctrl + NumPad/ (Command + NumPad/ on OS X)`)
  Folds all the elements except the current element.

- **Collapse Child Folds** (`Ctrl + NumPad- (Command + NumPad- on OS X)`)
  Folds the elements indented with one level inside the current element.
Expand Child Folds (Ctrl + NumPad+ (Command + NumPad+ on OS X))

Unfolds all child elements of the currently selected element.

Expand All (Ctrl + NumPad* (Command + NumPad* on OS X))

Unfolds all elements in the current document.

To define the element whose content can be folded by the user, you must use the property: `-oxy-foldable:true;`. To define the elements that are folded by default, use the `-oxy-folded:true` property.

**Note:** The `-oxy-folded` property works in conjunction with the `-oxy-foldable` property. Thus, the `folded` property is ignored if the `-oxy-foldable` property is not set on the same element.

When collapsing an element, it is useful to keep some of its content visible (for example, a short description of the collapsed region). The property `-oxy-not-foldable-child` is used to identify the child element that is kept visible. It accepts as value an element name or a list of comma-separated element names. The first child element from the XML document that appears in the list of element names will be identified as the not foldable child and displayed. If the element is marked as foldable (`-oxy-foldable:true;`) but it doesn't have the property `-oxy-not-foldable-child` or none of the specified non-foldable children exists, then the element is still foldable. In this case the element kept visible when folded will be the before pseudo-element.

**Note:** Deprecated properties `foldable`, `not-foldable-child`, and `folded` are also supported.

**Example: Folding DocBook Elements**

All the elements below can have a `title` child element and are considered to be logical sections. You mark them as being foldable leaving the `title` element visible.

```
set,
book,
part,
reference,
chapter,
preface,
article,
sect1,
sect2,
sect3,
sect4,
section,
appendix,
figure,
```
example,
table {
  -oxy-foldable:true;
  -oxy-not-foldable-child: title;
}

**Links: -oxy-link Property**

Used to specify that a particular element should be considered a link.

Oxygen XML Editor plugin allows you to declare some elements to be links. This is especially useful when working with many documents that reference each other. The links allow for an easy way to get from one document to another. Clicking the link marker will open the referenced resource in an editor.

To define the element that should be considered a link, you must use the link property on the before or after pseudo element. The value of the property indicates the location of the linked resource. Since links are usually indicated by the value of an attribute in most cases it will have a value similar to attr(href)

**Example: DocBook Link Elements**

The following elements are defined to be links on the before pseudo element and their values are defined by the value of an attribute.

```
*[href]:before{
  -oxy-link:attr(href);
  content: "Click " attr(href) " for opening" ;
}

ulink[url]:before{
  -oxy-link:attr(url);
  content: "Click to open: " attr(url);;
}

olink[targetdoc]:before{
  -oxy-link: attr(targetdoc);
  content: "Click to open: " attr(targetdoc);
}
```

**Morph Elements: -oxy-morph Property Value**

Used to specify that an element should be displayed inline.
Oxygen XML Editor plugin allows you to specify that an element has an `-oxy-morph` display type (deprecated `morph` property is also supported), meaning that the element is inline (page 2707) if all its children are inline.

**Example: `-oxy-morph` Property Value**

Suppose you have a wrapper XML element that allows users to set a number of attributes on all sub-elements. This element should have an inline (page 2707) or block (page 2703) behavior, depending on the behavior of its child elements:

```xml
wrapper{
    display: -oxy-morph;
}
```

**Placeholders for Empty Elements: `-oxy-placeholder-content` Property**

Used to configure placeholders for empty elements.

Oxygen XML Editor plugin displays the element name as pseudo-content for empty elements if the `Show placeholders for empty elements` option (page 110) is selected in the Author preferences page and there is no before or after content set in the CSS for this type of element. There are two CSS properties that can be used to control the placeholders (`-oxy-placeholder-content` and `-oxy-show-placeholder`).

**-oxy-placeholder-content CSS Property**

To control the displayed pseudo-content for empty elements, you can use the `-oxy-placeholder-content` CSS property.

The following example would change the `keyword` element to be displayed as `key`:

```xml
keyword{
    -oxy-placeholder-content: "key";
}
```

**Note:** This CSS property accepts the `$$i18n(key)$$` (page 206) localization editor variable, as in the following example:

```xml
-oxy-placeholder-content: "$$i18n(id)$$";
```
**-oxy-show-placeholder CSS Property**

The `-oxy-show-placeholder` property allows you to decide whether or not the placeholder will be shown. The possible values are:

- **always** - Always display placeholders.
- **default** - Always display placeholders if `before` or `after` content is not set in the CSS.
- **inherit** - The placeholders are displayed according to the Show placeholders for empty elements option (page 110) (if `before` and `after` content is not declared).
- **no** - Never display placeholders.

**Note:** Deprecated properties `show-placeholder` and `placeholder-content` are also supported.

**Related Information:**

- Using Placeholders in Document Templates (page 557)

**Style Elements: -oxy-style Property**

Used to configure the style of particular elements.

Oxygen XML Editor plugin allows you to specify the style for an XML element. This is helpful if you want to embed CSS styling to XML elements directly in the XML file you are editing without having to edit the CSS files that are normally attached to the XML files. The property should have an XPath function for the value.

**Example: -oxy-style Property**

The following code snippet should be added in the CSS file that renders the files for your framework customization:

```css
* { 
    -oxy-style: attr(style); 
} 
```

Suppose you want to display the `title` elements in your XML document in the color red. You could add the following snippet directly in the XML document:

```xml
<title style="color:red;">My Memoirs</title>
```

**Tip:** The `style` attribute is supported by default in HTML5 documents.
Tags Color: -oxy-tags-color Property

Used to configure the background or foreground colors of tags.

By default, Oxygen XML Editor plugin does not display element tags. You can use the Partial Tags button from the Author toolbar to control the amount of displayed markup. (page 331)

To configure the default background and foreground colors of the tags, open the Preferences dialog box (page 55), go to Editor > Edit modes > Author, and set the desired colors in the Tags background color (page 112) and Tags foreground color (page 112) options.

If you want to be more specific and configure the colors using a CSS, the -oxy-tags-background-color and -oxy-tags-color properties allow you to control the background and foreground colors for any particular XML element.

**Example:**

```css
para {
  -oxy-tags-color:white;
  -oxy-tags-background-color:green;
}
title {
  -oxy-tags-color:yellow;
  -oxy-tags-background-color:black;
}
```

Custom CSS Functions

Oxygen XML Editor plugin provides a wide range of custom CSS extension functions that can be used to customize the visual Author editing mode.

**Arithmetic Functions**

Arithmetic Functions that are supported.

You can use any of the arithmetic functions implemented in the java.lang.Math class (http://download.oracle.com/javase/6/docs/api/java/lang/Math.html).

In addition, the following functions are available:

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>oxy_add (param1, ..., paramN, 'returnType')</td>
<td>Adds the values of all parameters from param1 to paramN.</td>
</tr>
</tbody>
</table>
### Syntax

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>oxy_subtract(param1, param2, ..., paramN, 'returnType')</code></td>
<td>Subtracts the values of parameters <code>param2</code> to <code>paramN</code> from <code>param1</code>.</td>
</tr>
<tr>
<td><code>oxy_multiply(param1, ..., paramN, 'returnType')</code></td>
<td>Multiplies the values of parameters from <code>param1</code> to <code>paramN</code>.</td>
</tr>
<tr>
<td><code>oxy_divide(param1, param2, 'returnType')</code></td>
<td>Performs the division of <code>param1</code> to <code>param2</code>.</td>
</tr>
<tr>
<td><code>oxy_modulo(param1, param2, 'returnType')</code></td>
<td>Returns the reminder of the division of <code>param1</code> to <code>param2</code>.</td>
</tr>
</tbody>
</table>

**Note:** The `returnType` can be 'integer', 'number', or any of the supported CSS measuring types.

### Example: `oxy_multiply` Function

If you have an image with `width` and `height` specified on it, this will compute the number of pixels on it:

```css
image:before{
  content: "Number of pixels: " oxy_multiply(attr(width), attr(height), "px");
}
```

### Actions: `oxy_action()` Function

This function allows you to define actions directly in the CSS, rather than referencing them from the associated framework.

The `oxy_action()` function is frequently used from the `oxy_button()` function (page 2261) that provides a graphical button for invoking a custom action. The action is normally defined in the associated Document Type (`framework` configuration) but the `oxy_action()` function allows you to define it directly in the CSS instead of the `framework` configuration.

The arguments received by the `oxy_action()` function are a list of properties that define an action. The following properties are supported:

- **name** - The name of the action. It will be displayed as the label for the button or menu item.
- **description** (optional) - A short description with details about the result of the action.
- **icon** (optional) - A path relative to the CSS pointing to an image (the icon for the action). The path can point to resources that are packed in Oxygen XML Editor plugin (`oxygen.jar`) by starting its value with `/` (for example, `/images/Remove16.png`). It can also be expressed using an editor variable (page 201).
- **operation** - The name of the Java class implementing the `ro.sync.ecss.extensions.api.AuthorOperation` interface. There is also a variety of predefined operations (page 2166) that can be used.

**Note:** If the name of the operation specified in the CSS is not qualified (has no Java package name), then it is considered to be one of the built-in Oxygen XML Editor plugin operations from
ro.sync.ecss.extensions.commons.operations package. If the class is not found in this package, then it will be loaded using the specified name.

- arg-<string>- All arguments with the arg- prefix are passed to the operation (the string that follows the arg- prefix is passed).
- ID -(optional)- The ID of the action from the framework. If this is specified, all others parameters are disregarded.

Example: oxy_action function inside an oxy_button form control (page 2261):

```xml
oxy_button{
    action, oxy_action(
        name, 'Insert',
        description, 'Insert an element after the current one',
        icon, url('insert.png'),
        operation,
        'InsertFragmentOperation',
        arg-fragment, '<element>${caret}</element>',
        arg-insertLocation, '.',
        arg-insertPosition, 'After'),
    showIcon, true)
```

Example: oxy_action Function

You can also create a button form control directly from an oxy_action function:

```xml
oxy_action(
    name, 'Insert',
    description, 'Insert an element after the current one',
    operation, 'InsertFragmentOperation',
    arg-fragment, '<element>${caret}</element>',
    arg-insertLocation, '.',
    arg-insertPosition, 'After')
```

Tip: A code template is available to make it easy to add the oxy_action function with the Content Completion Assistant (page 2704) by pressing Ctrl + Space (Command + Space on OS X) and select the oxy_action code template.

Related Information:

- Button Form Control (page 2261)
Action Lists: oxy_action_list() Function

This function allows you to define a sequential list of actions directly in the CSS, rather than referencing them from the associated framework.

The oxy_action_list() function is used from the oxy_buttonGroup() function (page 2264) that provides a graphical group of buttons with multiple custom actions. These actions are normally defined in the associated Document Type (framework configuration) but the oxy_action_list() function allows you to define the actions directly in the CSS instead of the framework configuration.

The arguments received by the oxy_action_list() function are a list of actions (executed sequentially) that are defined with the oxy_action() function (page 2235). The following properties are supported in the oxy_action() function:

- `name` - The name of the action. The name of the first defined action will be displayed as the label for the button or menu item.
- `description` (optional) - A short description with details about the result of the action. The description of the first defined action will be displayed in a tooltip.
- `icon` (optional) - A path relative to the CSS pointing to an image (the icon for the action). The path can point to resources that are packed in Oxygen XML Editor plugin (oxygen.jar) by starting its value with / (for example, /images/Remove16.png). It can also be expressed using an editor variable (page 201).
- `operation` - The name of the Java class implementing the ro.sync.ecss.extensions.api.AuthorOperation interface. There is also a variety of predefined operations (page 2166) that can be used.

⚠️ **Note:** If the name of the operation specified in the CSS is not qualified (has no Java package name), then it is considered to be one of the built-in Oxygen XML Editor plugin operations from ro.sync.ecss.extensions.commons.operations package. If the class is not found in this package, then it will be loaded using the specified name.

- `arg-string` - All arguments with the arg- prefix are passed to the operation (the string that follows the arg- prefix is passed).
- `ID` - (optional) - The ID of the action from the framework. If this is specified, all others parameters are disregarded.

Example: oxy_action_list Function

```
p:after {
  content: oxy_buttonGroup(
  label, 'A group of actions',
  icon, url('http://www.oxygenxml.com/img/icn_oxy20.png'),
```
Tip: A code template is available to make it easy to add the oxy_action_list function with the Content Completion Assistant (page 2704) by pressing Ctrl + Space (Command + Space on OS X) and select the oxy_action_list code template.

Related Information:

- Actions: oxy_action() Function (page 2235)
- Button Group Form Control (page 2264)

Attributes Concatenation: oxy_attributes() Function

This function concatenates the attributes for an element and returns the serialization.

Syntax:

oxy_attributes()

Example: oxy_attributes Function

```
element{
    content: oxy_attributes();
```
For instance, if you have the following XML fragment:

```xml
[element att1="x" xmlns:a="2" x="&quot;"/>
```

the CSS function will display:

```
att1="x" xmlns:a="2" x=""
```

**Base URL: oxy_base-uri() Function**

This function evaluates the base URL in the context of the current node. It does not have any arguments and takes into account the `xml:base` context of the current node. See the XML Base specification for more details.

**Example: oxy_base-uri Function**

Suppose you have some image references but you want to see other thumbnail images that reside in the same folder (in Author mode):

```xml
image[href]{
  content:oxy_url(oxy_base-uri(), oxy_replace(attr(href), '.jpeg', 'Thumbnail.jpeg'));
}
```

**Capitalization: oxy_capitalize() Function**

This function capitalizes the first letter of the text received as argument.

**Syntax:**

```
oxy_capitalize(text)
```

The text in which the first letter will be capitalized.

**Example: oxy_capitalize Function**

```css
*:before{
  content: oxy_capitalize(oxy_name()) ": ";
}
```

This would insert the capitalized qualified name as static text content before the element.

**Compound Actions: oxy_compound_action() Function**
This function allows you to define multiple actions that will be executed sequentially.

The `oxy_compound_action()` function is used from the `oxy_button()` form control function (page 2261) or the `oxy_buttonGroup()` form control function (page 2264).

The arguments received by the `oxy_compound_action()` function are a list of actions (executed sequentially) that are defined with the `oxy_action()` function (page 2235).

You can use three optional properties (`name`, `description`, `icon`) in the `oxy_compound_action()` function to provide labels for the compound action. If you do not specify these three properties, those same properties defined in the first `oxy_action` function will be used for the labels.

- **name** - The name of the action. It will be displayed as the label for the action. If you want to reuse the name of an action already defined in your framework, you can use the `oxy_getActionName` function.
- **description** - A short description with details about the result of the action. It will be displayed in a tooltip when hovering over the button linked to this action. If you want to reuse the description of an action already defined in your framework, you can use the `oxy_getActionDescription` function.
- **icon** - A path relative to the CSS pointing to an image (the icon for the action). The path can point to resources that are packed in Oxygen XML Editor plugin (`oxygen.jar`) by starting its value with `/` (for example, `/images/Remove16.png`). It can also be expressed as an `editor variable` (page 201). If you want to reuse the icon of an action already defined in your framework, you can use the `oxy_getActionIcon` function.

The `oxy_getActionName`, `oxy_getActionDescription`, and `oxy_getActionIcon` functions accept the following 2 parameters:

- **framework.defined.action.id** (required) - The ID of an action defined in the current framework that gets the name, description, or icon for that action.
- **fallback** (optional) - A fallback value in case the ID value provided in the `framework.defined.action.id` parameter is not found.

**Example: oxy compound action Function**

```xml
oxy_button{
  action,
    oxy_compound_action{
      name, oxy_getActionName('framework.id', 'Fallback'),
      description, 'Inserts a paragraph and uses form controls to edit its @audience attribute',
      icon, url('http://www.oxygenxml.com/img/icn_oxy20.png'),
    }
}
```
oxy_action(
    name, 'Insert',
    description, 'Insert an element after the current one',
    operation, 'ro.sync.ecss.extensions.commons.operations.InsertFragmentOperation',
    icon, url('insert.png'),
    arg-fragment, "<p audience=''></p>",
    arg-insertLocation, '.',
    arg-insertPosition, 'After'
),
)
oxy_action(
    name, 'Activate edit mode',
    description, 'Sets a pseudo class that will activate a CSS rule that will present a text field form control for the @audience attribute',
    operation, 'SetPseudoClassOperation',
    arg-name, 'edit-mode-on',
    arg-elementLocation, '.'
)
), showIcon, true)

Tip: A code template is available to make it easy to add the oxy_compound_action function with the Content Completion Assistant (page 2704) by pressing Ctrl + Space (Command + Space on OS X) and select the oxy_action_list code template.

Related Information:

- Actions: oxy_action() Function (page 2235)
- Button Form Control (page 2261)

Concatenation: oxy_concat() Function

This function concatenates the received string arguments.

Syntax:

oxy_concat ( str_1 , str_2 )

str_1 ... str_n
The string arguments to be concatenated.

**Example: oxy_concat Function**

If an XML element has an attribute called *padding-left*:

```xml
<p padding-left="20">...
```

and you want to add a padding before it with that specific amount specified in the attribute value:

```xml
*{padding-left}{{padding-left:oxy_concat(attr(padding-left), "px")}}
```

**Get Text: oxy_getSomeText(text, length) Function**

This function allows you to truncate a long string and to set a maximum number of displayed characters.

**Syntax:**

```javascript
oxy_getSomeText(text, length, endsWithPoints)
```

- **text**
  - Displays the actual text.

- **length**
  - Sets the maximum number of characters that are displayed.

- **endsWithPoints**
  - Specifies if the truncated text ends with ellipsis.

**Example: oxy_getSomeText Function**

If an attribute value is very large, you can trim its content before it is displayed as static content:

```xml
*{longdesc}:before{
    content: oxy_getSomeText(attr(longdesc), 200);
}
```

**Indexing: oxy_indexof() Function**

This function is used to define searches.

The `oxy_indexof()` function has two signatures:
Syntax 1:

\texttt{oxy\_indexof\ (text, toFind)}

Returns the index within \texttt{text} string of the first occurrence of the \texttt{toFind} substring.

\texttt{text}

Text to search in.

\texttt{toFind}

The searched substring.

Syntax 2:

\texttt{oxy\_indexof\ (text, toFind, fromOffset)}

Returns the index within \texttt{text} string of the first occurrence of the \texttt{toFind} substring. The search starts from \texttt{fromOffset} index.

\texttt{text}

Text to search in.

\texttt{toFind}

The searched substring.

\texttt{fromOffset}

The index to start the search from.

Example: \texttt{oxy\_indexof\ Function}

\texttt{oxy\_indexof(\texttt{''abcd'', 'bc'}) \ returns \ 1.}

\texttt{oxy\_indexof(\texttt{''abcdbc'', 'bc', 2}) \ returns \ 4.}

If you only want to display part of an attribute value, for instance the part that comes before an \texttt{Appendix} string:

\begin{verbatim}
image\[longdesc\]{
    content: oxy\_substring\(\text{attr(longdesc)}, 0,\
    oxy\_indexof\(\text{attr(longdesc)}, \text{"Appendix"})\);
}
\end{verbatim}

Label: \texttt{oxy\_label\()\ Function

This function can be used in conjunction with the CSS \texttt{content} property to change the style of generated text.
The arguments of the function are \textit{property name} - \textit{property value} pairs. The following properties are supported:

- \textit{text} - This property specifies the built-in form control you are using.
- \textit{width} - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the \% character) length units. The \textit{width} property takes precedence over the \textit{columns} property (if the two are used together).
- \textit{color} - Specifies the foreground color of the form control. If the value of the \textit{color} property is \textit{inherit}, the form control has the same color as the element in which it is inserted.
- \textit{background-color} - Specifies the background color of the form control. If the value of the \textit{background-color} property is \textit{inherit}, the form control has the same color as the element in which it is inserted.
- \textit{styles} - Specifies styles for the form control. The values of this property are a set of CSS properties:
  - font-weight, font-size, font-style, font
  - text-align, text-decoration
  - width
  - color, background-color
  - link - For more information about this property, see the \textit{link property section} (page 2231).

```xml
<element>
  <content>oxy_label(text, "Label Text", styles, "font-size:2em;color:red;link:attr(href);")</content>
</element>
```

Instead of using the values of the \textit{styles} property individually, you can define them in a CSS file as in the following example:

```xml
* {
  width: 40%;
  text-align: center;
}
```

Then refer that file with an \texttt{@import} directive, as follows:

```xml
<elem>
  <content>oxy_label(text, 'my_label', styles, '@import 'labels.css';")</content>
</elem>
```

\textbf{CAUTION:} Extensive use of the \textit{styles} property may lead to performance issues.
If the text from an `oxy_label()` function contains new lines, for example `oxy_label(text, 'LINE1\A LINE2', width, 100px)`, the text is split in two. Each of the two new lines has the specified width of 100 pixels.

**Note:** The text is split after `\A`, which represents a new line character.

You can use the `oxy_label()` function together with a built-in form control (page 2255) function to create a form control based layouts.

**Example: oxy_label Function**

An example of a use case is if you have multiple attributes on a single element and you want use form controls on separate lines and style them differently. Consider the following CSS rule:

```css
person:before {
  content: "Name:*" oxy_textfield(edit, '@name', columns, 20)
    "\A Address:" oxy_textfield(edit, '@address', columns, 20)
}
```

Suppose you only want the Name label to be set to **bold**, while you want both labels aligned to look like a table (the first column with labels and the second with a text field). To achieve this, you can use the `oxy_label()` to style each label differently.

```css
person:before {
  content: oxy_label(text, "Name:*", styles, "font-weight:bold;width:200px")
    oxy_textfield(edit, '@name', columns, 20) "\A "
    oxy_label(text, "Address:", styles, "width:200px")
    oxy_textfield(edit, '@address', columns, 20)
}
```

**Tip:** A code template is available to make it easy to add the `oxy_label` function with the Content Completion Assistant (page 2704) by pressing `Ctrl + Space (Command + Space on OS X)` and select the `oxy_label` code template.

**Last Occurrence: oxy_lastindexof() Function**

This function is used to define last occurrence searches.

The `oxy_lastindexof()` function has two signatures:

**Syntax 1:**

```javascript
oxy_lastindexof (text, toFind)
```

Returns the index within `text` string of the rightmost occurrence of the `toFind` substring.
text
Text to search in.

toFind
The searched substring.

Syntax 2:

```
oxy_lastindexof ( text, toFind, fromOffset )
```

The search starts from `fromOffset` index. Returns the index within `text` string of the last occurrence of the `toFind` substring, searching backwards starting from the `fromOffset` index.

text
Text to search in.

toFind
The searched substring.

fromOffset
The index to start the search backwards from.

Example: `oxy_lastindexof` Function

```
oxy_lastindexof('abcdbc', 'bc') returns 4.
oxylastindexof('abcdbccdbc', 'bc', 2) returns 1.
```

If you only want to display part of an attribute value, for instance the part that comes before an `Appendix` string:

```
image[longdesc]{
  content: oxy_substring(attr(longdesc), 0,
    oxy_lastindexof(attr(longdesc), "Appendix"));
}
```

Link Text, `oxy_link-text()` Function

You can use this function on the CSS `content` property to obtain a text description from the source of a reference.

By default, the `oxy_link-text()` function resolves DITA and DocBook references. For further details about how you can also extend this functionality to other frameworks (page 2706), go to Configuring an Extensions Bundle (page 2105).
DITA Support

For DITA, the `oxy_link-text()` function resolves the `xref` element and the elements that have a `keyref` attribute. The text description is the same as the one presented in the final output for those elements. If you use this function for a `topicref` element that has the `navtitle` and `locktitle` attributes set, the function returns the value of the `navtitle` attribute.

DocBook Support

For DocBook, the `oxy_link-text()` function resolves the `xref` element that defines a link in the same document. The text description is the same as the one presented in the final output for those elements.

Example: `oxy_link-text` Function

For the following XML and associated CSS fragments the `oxy_link-text()` function is resolved to the value of the `xreflabel` attribute.

```xml
<para><code id="para.id" xreflabel="The reference label">my code</code></para>
<para><xref linkend="para.id"/></para>
```

If the text from the target cannot be extracted (for instance, if the `href` is not valid), you can use an optional argument to display fallback text.

```css
xref {
    content: oxy_link-text();
}
```

Local Name: `oxy_local-name()` Function

This function evaluates the local name of the current node. It does not have any arguments.

Example: `oxy_local-name` Function

To insert the local name as static text content before the element, use this CSS selector:
Lowercase: `oxy_lowercase()` Function

This function transforms the text received as argument to lower case.

**Syntax:**

```latex
oxy_lowercase (text)
```

- **text**
  - The text to be lower cased.

**Example: `oxy_lowercase` Function**

To insert a lower-cased qualified name as static text content before the element, use this CSS selector:

```css
*:before{
  content: oxy_lowercase(oxy_name()) "": ";
}
```

Name: `oxy_name()` Function

This function evaluates the qualified name of the current node.

It does not have any arguments.

**Example: `oxy_name` Function**

To insert a qualified name as static text content before the element, use this CSS selector:

```css
*:before{
  content: oxy_name() "": ";
}
```

Parent URL: `oxy_parent-url()` Function

This function evaluates the parent URL of a URL received as string.

**Syntax:**

```latex
oxy_parent-url (URL)
```
**URL**

The URL as string.

Replace: `oxy_replace()` Function

This function is used to replace a string of text.

The `oxy_replace()` function has two signatures:

**Syntax 1:**

```javascript
oxy_replace(text, target, replacement)
```

This function replaces each substring of the text that matches the literal target string with the specified literal replacement string.

- **text**
  
  The text in which the replace will occur.

- **target**
  
  The target string to be replaced.

- **replacement**
  
  The string replacement.

**Example:** Suppose that you have image references but you want to see other thumbnail images that reside in the same folder in the visual Author editing mode:

```javascript
image[href]{
  content:oxy_url(oxy_base-uri(), oxy_replace(attr(href), '.jpeg', 'Thumbnail.jpeg'));
}
```

**Syntax 2:**

```javascript
oxy_replace(text, target, replacement, isRegExp)
```

This function replaces each substring of the text that matches the target string with the specified replacement string.

- **text**
  
  The text in which the replace will occur.

- **target**
  
  The target string to be replaced.
replacement

The string replacement.

isRegExp

If true the target and replacement arguments are considered regular expressions, if false they are considered literal strings.

**Example:** Suppose that you want to use a regular expression to replace all space sequences with an underscore:

```
image[title] {
    content: oxy_replace(attr(title), "\s+", ",", true)
}
```

**Substring of Text**  oxy_substring() Function

This function is used to return a string of text.

The oxy_substring() function has two signatures:

**Syntax 1:**

```
oxoy_substring( text , startOffset )
```

Returns a new string that is a substring of the original text string. It begins with the character at the specified index and extends to the end of text string.

- **text**
  
The original string.

- **startOffset**
  
The beginning index, inclusive

**Syntax 2:**

```
substring( text , startOffset , endOffset )
```

Returns a new string that is a substring of the original text string. The substring begins at the specified startOffset and extends to the character at index endOffset - 1.

- **text**
  
The original string.

- **startOffset**
  
The beginning index, inclusive.
endOffset

The ending index, exclusive.

**Example: oxy_substring Function**

oxy_substring('abcd', 1) returns the string 'bcd'.

oxy_substring('abcd', 4) returns an empty string.

oxy_substring('abcd', 1, 3) returns the string 'bc'.

If you only want to display part of an attribute value, for instance the part that comes before an

**Appendix string:**

```
image[longdesc]{
    content: oxy_substring(attr(longdesc), 0, oxy_indexof(attr(longdesc), "Appendix"));
}
```

**Unescape URL Value:** oxy_unescapeURLValue(string) Function

This function returns the unescaped value of a URL-like string given as a parameter.

For example, if the value contains `%20` it will be converted to a simple space character.

**Example: oxy_unescapeURLValue Function**

oxy_unescapeURLValue("http://www.example.com/a%20simple%20example.html") returns the following value:

```
http://www.example.com/a simple example.html
```

**Unparsed Entity URI:** oxy_unparsed-entity-uri() Function

This function returns the URI value of an unparsed entity name.

**Syntax:**

```
oxy_unparsed-entity-uri ( unparsedEntityName )
```

unparsedEntityName

The name of an unparsed entity defined in the DTD.

This function can be useful to display images that are referenced with unparsed entity names.
Example: oxy_unparsed-entity-uri Function

CSS for displaying the image in Author for an `imagedata` with `entityref` to an unparsed entity:

```css
imagedata[entityref] {
    content: oxy_url(oxy_unparsed-entity-uri(attr(entityref)));
}
```

Uppercase: oxy_uppercase() Function

This function transforms the text received as argument to upper case.

Syntax:

```css
oxy_uppercase ( text )
```

```
text
```

The text to be capitalized.

Example: oxy_uppercase Function

To insert the upper-cased qualified name as static text content before the element, use this CSS selector:

```css
*:before{
    content: oxy_uppercase(oxy_name()) " : ";
}
```

URL: oxy_url() Function

This function extends the standard CSS `url()` function by allowing you to specify additional relative path components (parameters `loc_1` to `loc_n`).

Oxygen XML Editor plugin uses all these parameters to construct an absolute location. Note that any of the parameters that are passed to the function can be either relative or absolute locations. These locations can be expressed as String objects, functions, or editor variables (page 201) (built-in or custom).

Syntax:

```css
oxy_url ( base_location , loc_1 , loc_2 )
```

```
base_location
```
String representing the base location. If not absolute, will be solved relative to the CSS file URL.

\textbf{loc\_1 ... loc\_n (optional)}

Strings representing relative location path components.

\textbf{Examples: oxy\_url Function}

The following function receives String objects as input parameters:

\begin{verbatim}
\end{verbatim}

and returns:

\begin{verbatim}
'http://www.oxygenxml.com/dir1/dir4/dir5/test.xml'
\end{verbatim}

The following function receives the result of the evaluation of two other functions as parameters (for instance, this is useful if you have image references and you want to see thumbnail images stored in the same folder):

\begin{verbatim}
image[href]{
  content: oxy_url(oxy_base-uri(), oxy_replace(attr(href), '.jpeg', 'Thumbnail.jpeg'));
}
\end{verbatim}

The following function uses an \textit{editor variable (page 201)} as the first parameter to point to the Oxygen XML Editor plugin installation location:

\begin{verbatim}
image[href] {
  content: oxy_url('${oxygenHome}', 'logo.png');
}
\end{verbatim}

\textbf{Related Information:}

- Editor Variables (page 201)

\textbf{XPath: oxy_xpath() Function}

This function is used to evaluate XPath expressions.

\textbf{Syntax:}

\begin{verbatim}
oxy_xpath ( XPathExpression [, processChangeMarkers , value ] [, evaluate , value ])
\end{verbatim}
It evaluates the given XPath 2.0 expression using Saxon 9 and returns the result. XPath expressions that depend on the cursor location can be successfully evaluated only when the cursor is located in the actual XML content. Evaluation fails when the current editing context is inside a referenced \texttt{xi:include} section or inside artificially referenced content (for example, DITA \texttt{conref} or \texttt{topicref} references).

The parameters of the function are as follows:

- A required \texttt{expression} parameter, which is the XPath expression to be evaluated.
- An optional \texttt{processChangeMarkers} parameter, followed by its value, which can be either \texttt{true} or \texttt{false} (default value). When you set the parameter to \texttt{true}, the function returns the resulting text with all the change markers accepted (\texttt{delete} changes are removed and \texttt{insert} changes are preserved).
- An optional \texttt{evaluate} parameter, followed by its value, which can be one of the following:
  - \texttt{dynamic} - Evaluates the XPath each time there are changes in the document.
  - \texttt{dynamic-once} - Separately evaluates the XPath for each node that matches the CSS selector. It will not re-evaluate the expression when changes are made to other nodes in the document. This will lead to improved performance, but the displayed content may not be updated to reflect the actual document content.
  - \texttt{static} - If the same XPath is evaluated on several nodes, the result for the first evaluation will be used for all other matches. Use this only if the XPath does not contain a relationship with the node on which the CSS property is evaluated. This will lead to improved performance, but the static displayed content may not be updated to reflect the actual document content.

\textbf{Note:} When XPath expressions are evaluated, the entities and \texttt{xi:include} elements are replaced with the actual content that is referenced. For example, consider the following code snippet:

```xml
<article>
  <xi:include href="section1.xml" xmlns:xi="http://www.w3.org/2001/XInclude"/>
</article>
```

where \texttt{section1.xml} contains the following content:

```xml
<section>
  <p>Referenced content</p>
</section>
```
The latter will be the actual content in which the XPath expression is executed.

**Example: oxy_xpath Function**

The following example counts the number of words from a paragraph (including tracked changes (page 2711)) and displays the result in front of it:

```xml
para:before{
    content:
    concat("|Number of words: ",
    oxy_xpath{
        "count(tokenize(normalize-space(string-join(text(), '')), ' '))",
        processChangeMarkers,
        true),
    " | ");
}
```

**Note:** The `oxy_xpath()` function supports editor variables (page 201), as in the following example:

```xml
* {
    content:
    oxy_concat("Result: ",
    oxy_xpath("count(collection("$cfdu/?select=*.xml")')")
};
}
```

**Form Controls**

Oxygen XML Editor plugin provides a variety of built-in form controls that allow users to interact with documents with familiar user interface objects. These form controls are defined in CSS stylesheets that are used to render Author mode. For customization purposes, Oxygen XML Editor plugin also supports custom form controls in Java (page 2288).

**How to Add a Built-in Form Control in Author Mode**

Form controls can be added by defining them in the CSS associated with the XML document.

1. Create a custom CSS file.
2. Define the form control in the CSS using its dedicated CSS function. For example, to add a `date picker form control` (page 2273), its dedicated function is `oxy_datePicker`. 
3. Associate the CSS file with the XML document in one of the following ways:
   • If you have a framework (document type) already created for this XML vocabulary, create a
     CSS in the framework directory and associate the CSS with the framework (page 2061). This
     approach is recommended if you intend on sharing the customization with others.
   • If you do not have a framework, you can associate the CSS to the XML document through a
     Processing Instruction (page 2192).

For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzkMSLM

Audio File Player Form Control

The oxy_audio built-in form control is used for providing a mechanism to play audio clips.

The oxy_audio form control supports the following properties:

   • href - The absolute or relative location of a resource. This property is mandatory. Relative values
     are resolved relative to the CSS. If you have media resources relative to the XML document, you
     can specify their paths like this:

     ```
     oxy_audio(href, oxy_url(oxy_base-uri(), 'ex.mp3'), width, 400px)
     ```

   • width - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm,
     pt, pc, px), and percentage (followed by the % character) length units.

**Example: oxy_audio Form Control**

```javascript
object {
  content:
    oxy_audio(
      href, 'resources/audio.mp3',
      width, 200px),
}
```

**Tip:** To insert a sample of the oxy_audio form control in a CSS file, invoke the Content
Completion Assistant (page 2704) by pressing Ctrl + Space (Command + Space on OS X) and select
the oxy_audio code template.

To see more detailed examples and more information about how form controls work in Oxygen XML
Editor plugin, see the sample files in the following directory: [OXYGEN_INSTALL_DIR]/samples/form-controls.

For more information about form controls, watch our video demonstration:
Browser Form Control

The oxy_browser built-in form control is used for providing a mechanism to integrate HTML frames or interact with SVG documents directly in the Author mode editor. It can also be used to load HTML that executes JavaScript and from that JavaScript you can access the Oxygen XML Editor plugin workspace.

The oxy_browser form control supports the following properties:

- **href** - The absolute or relative location of a resource. This property is mandatory. Relative values are resolved relative to the CSS. If you have media resources relative to the XML document, you can specify their paths like this:
  
  ```
  oxy_browser(href, oxy_url(oxy_base-uri(), 'ex.svg'), width, 50%, height, 50%)
  ```

- **width** - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units.

- **height** - Specifies the height of the form control area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units.

**Example: oxy_browser Form Control**

```
object {
  content:
    oxy_browser{
      href, 'http://example.page',
      width, 600px,
      height, 400px),
    }
}
```

**Tip:** To insert a sample of the oxy_browser form control in a CSS file, invoke the *Content Completion Assistant* by pressing Ctrl + Space (Command + Space on OS X) and select the oxy_browser code template.
To see more detailed examples and more information about how form controls work in Oxygen XML Editor plugin, see the sample files in the following directory: \[OXYGEN_INSTALL_DIR\]/samples/form-controls.

**Interacting with the Oxygen XML Editor plugin Workspace**

The `oxy_browser` form control also provides the possibility of creating custom form control without having to use the Java-based API. You can use the `oxy_browser` form control to load HTML that executes JavaScript. In the JavaScript, you can use some predefined global variables that provide a gateway between the JavaScript and the Oxygen XML Editor plugin Java API. This allows you to perform changes in the document, open resources, and more, solely from the JavaScript.

⚠️ **Important:** This will only work if the loaded HTML is located inside a framework or plugin directory *(page 71)*, such as: \[OXYGEN_INSTALL_DIR\]/frameworks/ or \[OXYGEN_INSTALL_DIR\]/plugins/.

The following global variables can be used:

- **authorAccess** - This object is an instance of `ro.sync.ecss.extensions.api.AuthorAccess`.
- **contextElement** - An instance of `ro.sync.ecss.extensions.api.node.AuthorNode`. The form control is added over this node.
- **fcArguments** - A `java.util.Map` implementation with the properties (name and value pairs) passed on the form control function.
- **apiHelper** - A helper object for creating Java objects. It allows you to create Java objects from within the JavaScript code. These objects can then be passed to the Java methods as in the following example:

```javascript
var newAttrValue = apiHelper.newInstance(
    "ro.sync.ecss.extensions.api.node.AttrValue",
    ["normalizedValue", "rawValue", true]);
authorAccess.getDocumentController().setAttribute(
    "counter", newAttrValue, contextElement);
...
```

You can also specify the constructor signature:

```javascript
var newAttrValue = apiHelper.newInstance(
    "ro.sync.ecss.extensions.api.node.AttrValue
    (java.lang.String, java.lang.String, boolean)",
    ["normalizedValue", "rawValue", true]);
```
For more information, open the form-controls.xml file in the [OXYGEN_INSTALL_DIR]/samples/form-controls directory and go to section 11.1 - Interacting with the Oxygen Workspace.

⚠️ Warning: On Mac OS X, you need to use asynchronous calls to the API, due to the following JDK bug: https://bugs.openjdk.java.net/browse/JDK-8087465. By default, the API is called synchronously, but you can change this behavior for each API object by calling two methods: sync() and async().

```javascript
// By default, the methods are invoke synchronously.
var ctrl = authorAccess.getDocumentController();
try {
  // On Mac, methods that change the document must be executed asynchronously.
  ctrl.async();
  ctrl.setAttribute("counter", newAttrValue, contextElement);
} finally {
  ctrl.sync();
}
```

### Listening for Changes in the Document

If the form control presents some information from the document (for example, the value of an attribute), then it needs to be notified on changes in the document so that it can update that information. To do this, follow these steps:

1. In the JavaScript, the `bridgeReady()` method is invoked as soon as the form control is loaded and the API bridge is installed. This is where you can add a listener:

```javascript
function bridgeReady () {
  // We declare a member function for each method of the
  // ro.sync.ecss.extensions.api.AuthorListener interface (same function signature)
  var handler = {
    attributeChanged : function(event) {
      var node = event.getOwnerAuthorNode();
      var attrName = event.getAttributeName();

      if (node.equals(contextElement) && attrName === "counter") {
        init();
      }
    }
  }
```
{},
  contentDeleted : function(event) {},
  contentInserted : function(event) {}
};

// We create a proxy over an ro.sync.ecss.extensions.api.AuthorListener that
// will
// delegate its methods to the JS object's functions.
// We assign the listener to a global variable so that we can remove it later
// on,
// on the dispose() method.
authorDocumentListener = apiHelper.createProxyListener(
  "ro.sync.ecss.extensions.api.AuthorListener", handler);

var ctrl = authorAccess.getDocumentController();

// Add the proxy listener.
ctrl.addAuthorListener(authorDocumentListener);

2. Since a listener was added on the document, it is important to remove it once the form control is
not used anymore. When a form control is discarded, you can call the dispose() method from
the JavaScript. This is where the previously created listener can be removed:

```javascript
/**
 * The form control will not be used anymore. Clean up.
 */
function dispose() {
  // Dispose all added listeners.
  var ctrl = authorAccess.getDocumentController();
  ctrl.removeAuthorListener(authorDocumentListener);
}
```

### Debugging JavaScript Used for Custom Form Controls

If you encounter unexpected results when using the method described above (page 2258), you can
debug the script by using the following guidelines:

- Calls to alert("message.to.present") or console.log("message.to.present") will be
  presented in the Results panel (page 267).
- You can install the Firebug extension by executing the following script:
{code:javascript}

```javascript
function installFB() {
    if (!document.getElementById('FirebugLite')) {
        E = document['createElement' + 'NS'] && document.documentElement.namespaceURI;
        E = E ? document['createElement' + 'NS'](E, 'script') : document['createElement']('script');
        E['setAttribute']('id', 'FirebugLite');
        E['setAttribute']('src', 'https://getfirebug.com/' + 'firebug-lite.js' + '#startOpened');
        E['setAttribute']('FirebugLite', '4');
        (document['getElementsByTagName']('head')[0] || document['getElementsByTagName']('body')[0]).appendChild(E);
        E = new Image;
        E['setAttribute']('src', 'https://getfirebug.com/' + '#startOpened');
    }
}
{code}

**Note:** To force the *Browser Form Control* to reload after making changes to the JavaScript file, you need to use the **Reload page** action from the form control's contextual menu.

For more information about form controls, watch our video demonstration:

[https://www.youtube.com/embed/-WY3wzkMSLM](https://www.youtube.com/embed/-WY3wzkMSLM)

**Related Information:**

- Custom CSS Functions *(page 2234)*
- URL: `oxy_url()` Function *(page 2252)*

**Button Form Control**

The *oxy_button* built-in form control is used for graphical user interface objects that invoke a custom Author mode action (defined in the associated Document Type) referencing it by its ID, or directly in the CSS.

The *oxy_button* form control supports the following properties:
• **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.

• **color** - Specifies the foreground color of the form control. If the value of the `color` property is `inherit`, the form control has the same color as the element in which it is inserted.

• **visible** - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.

• **transparent** - Flattens the aspect of the button form control, removing its border and background. The values of this property can be `true` or `false` (default value).

• **showText** - Specifies if the action text should be displayed on the button form control. If this property is missing then the button displays the icon only if it is available, or the text if the icon is not available. The values of this property can be `true` or `false`.

```xml
element {
    content: oxy_button(actionID, 'remove.attribute', showText, true);
}
```

• **showIcon** - Specifies if the action icon should be displayed on the button form control. If this property is missing then the button displays the icon only if it is available, or the text if the icon is not available. The values of this property can be `true` or `false`.

```xml
element {
    content: oxy_button(actionID, 'remove.attribute', showIcon, true);
}
```

• **enableInReadOnlyContext** - To enable button form controls (page 2261) or groups of buttons form controls (page 2264) this property needs to be set to `true`. This property can be used to specify areas as read-only (by setting the `-oxy-editable` property to `false`). This is useful when you want to use an action that does not modify the context.

• **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```css
p:before {
    content: oxy_button(hoverPseudoclassName, 'showBorder')
}
```

```css
p:showBorder {
    border: 1px solid red;
}
```

• **actionContext** - Specifies the context in which the action associated with the form control is executed. Its possible values are `element` (default value) and `caret`. If you select the `element` value, the context is the element that holds the form control. If you select the `caret` value, the
action is invoked at the cursor location. If the cursor is not inside the element that holds the form
control, the element value is selected automatically.

- **actionID** - The ID of the action, specified in the `document type association (page 79)`, that is
invoked when you click the button.

**Note:** The element that contains the form control represents the context where the action is
invoked.

- **action** - Defines an action directly, rather than using the **actionID** parameter to reference
an action from the `document type association (page 79)`. This property is defined using the
`oxy_action function (page 2235)`.

**Tip:** You can also create a button form control directly from an `oxy_action function (page 2236)`.

```xml
oxy_button(action, oxy_action(
    name, 'Insert',
    description, 'Insert an element after the current one',
    icon, url('insert.png'),
    operation, 'InsertFragmentOperation',
    arg-fragment, '<element>${caret}</element>',
    arg-insertLocation, '.',
    arg-insertPosition, 'After'
))
```

**Tip:** To execute multiple actions sequentially, you can use the `oxy_compound_action
function (page 2239)`.

**Example: oxy_button Form Control**

```css
button:before {
    content: "Label:
    oxy_button{
        /* This action is declared in the document type
        associated with the XML document. */
        actionID, "insert.popupWithMultipleSelection";
    }
}
```

**Tip:** To insert a sample of the `oxy_button` form control in a CSS file, invoke the `Content
Completion Assistant (page 2704)` by pressing `Ctrl + Space` (Command + Space on OS X) and
select the `. oxy_button` code template. Also, an `. oxy_button_in_place_action` code template is
available that inserts an `oxy_button` function that includes an `action` parameter.
To see more detailed examples and more information about how form controls work in Oxygen XML Editor plugin, see the sample files in the following directory: 

```
[OXYGEN_INSTALL_DIR]/samples/form-controls.
```

For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzkMSLM

**Related Information:**

- Custom CSS Functions *(page 2234)*
- Actions: `oxy_action()` Function *(page 2235)*

**Button Group Form Control**

The `oxy_buttonGroup` built-in form control is used for a graphical user interface group of buttons that invokes one of several custom **Author mode** actions (defined in the associated Document Type) referencing it by its ID, or directly in the CSS.

The `oxy_buttonGroup` form control supports the following properties:

- **label** - Specifies the label to be displayed on the button. This label can be translated using the `$([I18n])` editor variable *(page 206)*.
- **icon** - The path to the icon to be displayed on the button.
- **visible** - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.
- **tooltip** - Specifies a tooltip to be displayed when you hover over the form control.
- **transparent** - Makes the button transparent without any borders or background colors. The values of this property can be `true` or `false`.
- **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.
- **enableInReadOnlyContext** - To enable button form controls *(page 2261)* or groups of buttons form controls *(page 2264)* this property needs to be set to `true`. This property can be used to specify areas as read-only (by setting the `oxy-editable` property to `false`). This is useful when you want to use an action that does not modify the context.
- **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.
p:before {
  content: oxy_buttonGroup(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
  border: 1px solid red;
}

- actionIDs - The IDs of the actions that will be presented in the group of buttons.
- actionID - The ID of the action, specified in the document type association (page 79), that is invoked when you click the button.

**Note:** The element that contains the form control represents the context where the action is invoked.

- actions - Defines a sequential list of actions directly, rather than using the actionID parameter to reference actions from the document type association (page 79). This property is defined using the oxy_action_list function (page 2237).

```
oxy_buttonGroup(
  label, 'A group of actions',
  icon, url('http://www.oxygenxml.com/img/icn_oxy20.png'),
  actions,
  oxy_action_list(
    oxy_action{
      name, 'Insert',
      description, 'Insert an element after the current one',
      operation, 'InsertFragmentOperation',
      arg-fragment, '<element></element>',
      arg-insertLocation, '.',
      arg-insertPosition, 'After'
    },
    oxy_action{
      name, 'Delete',
      description, 'Deletes the current element',
      operation, 'DeleteElementOperation'
    }
  )
)
```

**Tip:** To execute multiple actions sequentially, you can use the oxy_compound_action function (page 2239) in the oxy_action_list function (page 2237).
p:before {
  content: oxy_buttonGroup(
    label, 'A group of actions',
    icon, url('http://www.oxygenxml.com/img/icn_oxy20.png'),
    actions, oxy_action_list(
      oxy_compound_action{
        name, oxy_getActionName('framework.id', 'Fallback'),
        description, 'Inserts a paragraph and uses form controls to edit its @audience attribute',
        icon, url('http://www.oxygenxml.com/img/icn_oxy20.png'),
        oxy_action{
          name, 'Insert',
          description, 'Insert an element after the current one',
          operation, 'ro.sync.ecss.extensions.commons.operations.InsertFragmentOperation',
          icon, url('insert.png'),
          arg-fragment, "<p audience=''></p>",
          arg-insertLocation, '.',
          arg-insertPosition, 'After' }
      })
    oxy_action{
      name, 'Activate edit mode',
      description, 'Sets a pseudo class that will activate a CSS rule that will present a text field form control for the @audience attribute',
      operation, 'SetPseudoClassOperation',
      arg-name, 'edit-mode-on',
      arg-elementLocation, '.'
    }
  })
}
 oxy_action{
  name, 'Delete',
  description, 'Deletes the current element',
  operation, 'DeleteElementOperation' 
}
• `actionContext` - Specifies the context in which the action associated with the form control is executed. Its possible values are `element` (default value) and `caret`. If you select the `element` value, the context is the element that holds the form control. If you select the `caret` value, the action is invoked at the cursor location. If the cursor is not inside the element that holds the form control, the `element` value is selected automatically.

• `actionStyle` - Specifies what to display for an action in the form control. The values of this property can be `text` (default value), `icon`, or `both`.

**Example: oxy_buttonGroup Form Control**

```css
buttonGroup:before {
  content:
    oxy_label(text, "Button Group:", width, 150px, text-align, left)
  oxy_buttonGroup(
    label, 'A group of actions',
    /* The action IDs are declared in the document type associated with the XML document. */
    actionIDs,
    "insert.popupWithMultipleSelection,insert.popupWithSingleSelection",
    actionStyle, "both" );
}
```

**Tip:** To insert a sample of the `oxy_buttonGroup` form control in a CSS file, invoke the Content Completion Assistant (page 2704) by pressing `Ctrl + Space` (Command + Space on OS X) and select the `.i` `oxy_buttonGroup` code template. Also, an `.i` `oxy_buttonGroup_in_place_action` code template is available that inserts an `oxy_buttonGroup` function that includes an `oxy_action_list` function.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor plugin, see the sample files in the following directory: `[OXYGEN_INSTALL_DIR]/samples/form-controls`.

- Actions: oxy_action() Function (page 2235)
Checkbox Form Control

The `oxy_checkbox` built-in form control is used for a graphical user interface box that you can click to enable or disable an option. A single checkbox or multiple checkboxes can be used to present and edit the value on an attribute or element.

The `oxy_checkbox` form control supports the following properties:

- `edit` - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  - `@attribute_name` - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a QName (page 2710) and the CSS must have a namespace declaration for the prefix.
  - `#text` - Specifies that the presented/edited value is the simple text value of an element.

  **Note:** You can set the value of the `visibility` property to `-oxy-collapse-text` (page 2227) to render the text only in the form control that the `oxy_editor` function specifies.

- `resultSeparator` - If multiple check-boxes are used, the separator is used to compose the final result. If not specified, the `space` character is used.
- `tooltips` - Associates tooltips to each value in the `values` property. The value of this property is a list of tooltip messages separated by commas. If you want the tooltip to display a comma, use the ${{comma}} variable (page 205).
- `visible` - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.
- `values` - Specifies the values that are committed when the check-boxes are selected. If these values are not specified in the CSS, they are collected from the associated XML Schema.

  **Note:** Typically, when you use a comma in the values of a form control, the content that follows a comma is considered a new value. If you want to include a comma in the values, precede the comma with two backslashes. For example, `values, '1\, 2\, 3, 4, edit, false)` will display a form control that has `1, 2, 3` for the first value and `4` for the second value.
• **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.

• **uncheckedValues** - Specifies the values that are committed when check-boxes are not selected.

• **labels** - This property must have the same number of items as the `values` property. Each item provides a literal description of the items listed in the `values` property. These labels can be translated using the `$\{i18n()\}$ editor variable (page 206). If this property is not specified, the `values` property is used as the label.

• **columns** - Controls the layout of the form control. The check boxes will be grouped in a number of columns equal to the given value.

• **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```css
p:before {
  content: oxy_checkbox(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
  border: 1px solid red;
}
```

**Example: Single oxy_checkbox Form Control**

```css
checkBox[attribute]:before {
  content: "A check box editor that edits a two valued attribute (On/Off)"
  The values are specified in the CSS:
  oxy_checkbox(
    edit, "@attribute",
    values, "On",
    uncheckedValues, "Off",
    labels, "On/Off"
  );
}
```

**Example: Multiple oxy_checkbox Form Controls**

```css
multipleCheckBox[attribute]:before {
  content: "Multiple checkboxes editor that edits an attribute value."
  Depending whether the check-box is selected,
  a different value is committed:
  oxy_checkbox(
    edit, "@attribute",
    values, "true, yes, on",
    ...}
```
Unchecked Values, "false, no, off",
resultSeparator, ",",
labels, "Present, Working, Started";
}

Tip: To insert a sample of the oxy_checkbox form control in a CSS file, invoke the Content Completion Assistant (page 2704) by pressing Ctrl + Space (Command + Space on OS X) and select the .! oxy_checkbox code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor plugin, see the sample files in the following directory: [OXYGEN_INSTALL_DIR]/samples/form-controls.

ComboBox Form Control

The oxy_combobox built-in form control is used for providing a graphical user interface object that is a drop-down menu of proposed values. This form control can also be used for a combination of a drop-down menu and an editable single-line text field.

The oxy_combobox form control supports the following properties:

- edit - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  - @attribute_name - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a QName (page 2710) and the CSS must have a namespace declaration for the prefix.
  - #text - Specifies that the presented/edited value is the simple text value of an element.

  Note: You can set the value of the visibility property to -oxy-collapse-text (page 2227) to render the text only in the form control that the oxy_editor function specifies.

- columns - Controls the width of the form control. The unit size is the width of the w character.
- width - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units. The width property takes precedence over the columns property (if the two are used together).
- visible - Specifies whether or not the form control is visible. The possible values of this property are true (default value) and false.
- editable - This property accepts the true and false values. In addition to a drop-down menu, the true value also generates an editable text field box that allows you to insert other values than the proposed ones. The false value generates a drop-down menu that only accepts the proposed values.
- tooltips - Associates tooltips to each value in the values property. The value of this property is a list of tooltip messages separated by commas. If you want the tooltip to display a comma, use the ${comma} variable (page 205).
- values - Specifies the values that populate the list of proposals. If these values are not specified in the CSS, they are collected from the associated XML Schema.

Note: Typically, when you use a comma in the values of a form control, the content that follows a comma is considered a new value. If you want to include a comma in the values, precede the comma with two backslashes. For example, (values, '1\, 2\, 3, 4, edit, false) will display a form control that has 1, 2, 3 for the first value and 4 for the second value.

- fontInherit - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be true or false (default value). To make the form control inherit its font from its parent element, set the fontInherit property to true.
- labels - This property must have the same number of items as the values property. Each item provides a literal description of the items listed in the values property. These labels can be translated using the $i18n() editor variable (page 206).

Note: This property is only available for read-only combo boxes (the editable property is set to false).

- color - Specifies the foreground color of the form control. If the value of the color property is inherit, the form control has the same color as the element in which it is inserted.
- hoverPseudoclassName - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```css
p:before {
  content: oxy_combobox(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
  border: 1px solid red;
}
```
• canRemoveValue - If the value is set to true and the combo box is not editable, then a new <Empty> value is added in that combo box. This clears or removes the value being edited, depending on if it edits an element or attribute.

• onChange - Can be used to invoke an action when the value of the combo box changes. The action can be created in the CSS using the oxy_action() function (page 2235) or referenced from the framework (page 2706) by its ID. After the action is executed, the cursor remains in the combo box. Note that this property does not support actions defined by JavaScript code.

Example: oxy_combobox Form Control

```css
comboBox:before {
  content: "A combo box that edits an attribute value.
  The possible values are provided from CSS:";
  oxy_combobox(
    edit, "@attribute",
    editable, false,
    values, "value1, value2, value3",
    labels, "Value no1, Value no2, Value no3",
    onChange, oxy_action(
      name, 'Insert',
      operation, 'XQueryUpdateOperation',
      arg-script, 'insert node <product>{xs:string(@attribute)}</product>
as last into .');
  )
}
```

Tip: To insert a sample of the oxy_combobox form control in a CSS file, invoke the Content Completion Assistant (page 2704) by pressing Ctrl + Space (Command + Space on OS X) and select the oxy_combobox code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor plugin, see the sample files in the following directory: [OXYGEN_INSTALL_DIR]/samples/form-controls.

• Custom CSS Functions (page 2234)
**Date Picker Form Control**

The `oxy_datePicker` built-in form control is used for offering a text field with a calendar browser that allows the user to choose a certain date in a specified format.

The `oxy_datePicker` form control supports the following properties:

- **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  - `@attribute_name` - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a QName (page 2710) and the CSS must have a namespace declaration for the prefix.
  - `#text` - Specifies that the presented/edited value is the simple text value of an element.

  **Note:** You can set the value of the `visibility` property to `-oxy-collapse-text` (page 2227) to render the text only in the form control that the `oxy_editor` function specifies.

- **columns** - Controls the width of the form control. The unit size is the width of the `w` character.

- **width** - Specifies the width of the content area using relative (`em`, `ex`), absolute (`in`, `cm`, `mm`, `pt`, `pc`, `px`), and percentage (followed by the `%` character) length units. The `width` property takes precedence over the `columns` property (if the two are used together).

- **color** - Specifies the foreground color of the form control. If the value of the `color` property is `inherit`, the form control has the same color as the element in which it is inserted.

- **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.

- **format** - This property specifies the format of the inserted date. The pattern value must be a valid Java date (or date-time) format. If this property is missing, the format of the date is determined from the associated schema.

- **visible** - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.

- **validateInput** - Specifies if the form control is validated. If you introduce a date that does not respect the format, the `datePicker` form control is rendered with a red foreground. By default, the input is validated. To disable the validation, set this property to `false`.

- **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.
Example: \texttt{oxy\_datePicker} Form Control

```html
date {
  content: oxy\_label\(text, \text{"Date time attribute with format defined in CSS: \text{"}, width, 300px}\) 
  oxy\_datePicker{ 
    columns, 16, 
    edit, "@attribute", 
    format, "yyyy-MM-dd"};
}
```

\begin{itemize}
  \item \textbf{Tip:} To insert a sample of the \texttt{oxy\_datePicker} form control in a CSS file, invoke the \textit{Content Completion Assistant (page 2704)} by pressing Ctrl + Space (Command + Space on OS X) and select the \texttt{oxy\_datePicker} code template.

  To see more detailed examples and more information about how form controls work in Oxygen XML Editor plugin, see the sample files in the following directory: \texttt{[OXYGEN\_INSTALL\_DIR]/samples/form-controls}.

  For more information about form controls, watch our video demonstration: \texttt{https://www.youtube.com/embed/-WY3wzkMSLM}
\end{itemize}

Related Information:

\begin{itemize}
  \item Custom CSS Functions (page 2234)
  \item Label: \texttt{oxy\_label()} Function (page 2243)
\end{itemize}
The `oxy_htmlContent` built-in form control is used for rendering HTML content. This HTML content is displayed as a graphical element shaped as a box. The shape of the box is determined by a given width and the height is computed based upon the length of the text.

The `oxy_htmlContent` form control supports the following properties:

- **href** - The absolute or relative location of a resource. The resource needs to be a well-formed HTML file.
- **id** - The unique identifier of an item. This is a `div` element that has a unique `id` and is a child of the `body` element. The `div` element is the container of the HTML content to be rendered by the form control.
- **content** - An alternative to the `href` and `id` pair of elements. It provides the HTML content that will be displayed in the form control.
- **width** - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the `%` character) length units. The `width` property takes precedence over the `columns` property (if the two are used together).
- **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```html
p:before {
    content: oxy_htmlContent(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
    border: 1px solid red;
}
```

You can customize the style of the content using CSS that is either referenced by the file identified by the `href` property or is defined inline. If you change the HTML content or CSS and you want your changes to be reflected in the XML that renders the form control, then you need to refresh the XML file. If the HTML does not have an associated style, then a default text and background color will be applied.

**Example: oxy_htmlContent Form Control**

In the following example, the form control collects the content from the `p_description` `div` element found in the `descriptions.html` file. The box is 400 pixels wide and is displayed before a paragraph identified by the `intro_id` attribute value.

```html
p#intro_id:before {
    content: oxy_htmlContent{
```
An alternative example, using the `content` property:

```css
definition p#intro_id:before {
    content: oxy_htmlContent(
        content, "<div style='font-weight:bold;'>My content</div>"
    width, 400px);
}
```

**Note:** Anchor HTML elements are displayed but the links are inactive.

**Tip:** To insert a sample of the `oxy_htmlContent` form control in a CSS file, invoke the `Content Completion Assistant (page 2704)` by pressing `Ctrl + Space (Command + Space on OS X)` and select the `oxy_htmlContent` code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor plugin, see the sample files in the following directory: `[/OXYGEN_INSTALL_DIR]/samples/form-controls`.

For more information about form controls, watch our video demonstration:

---

**Pop-up Form Control**

The `oxy_popup` built-in form control is used to offer a contextual menu that provides quick access to various actions. A pop-up form control can display single or multiple selections.

The `oxy_popup` form control supports the following properties:

- `edit` - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
- **@attribute_name** - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a QName (page 2710) and the CSS must have a namespace declaration for the prefix.

- **#text** - Specifies that the presented/edited value is the simple text value of an element.

  Note: You can set the value of the `visibility` property to `-oxy-collapse-text` (page 2227) to render the text only in the form control that the `oxy_editor` function specifies.

- **rows** - This property specifies the number of rows that the form control presents.

  Note: If the value of the `rows` property is not specified, the default value of 12 is used.

- **color** - Specifies the foreground color of the form control. If the value of the `color` property is `inherit`, the form control has the same color as the element in which it is inserted.

  Note: This property is used for rendering in the Author mode.

- **visible** - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.

- **tooltips** - Associates tooltips to each value in the `values` property. The value of this property is a list of tooltip messages separated by commas. If you want the tooltip to display a comma, use the `${comma}` variable (page 205).

  Example:

  ```
  link:before{
    
    content: oxy_popup(
      edit, '@href',
      values, "Spring, Summer, Autumn, Winter",
      tooltips, "Iris${comma}Snowdrop, Gardenia${comma}Liliac,
                  Chrysanthemum${comma}Salvia, Gerbera",
      selectionMode, single);
  }
  ```

- **values** - Specifies the values that populate the list of proposals. If these values are not specified in the CSS, they are collected from the associated XML Schema.

  Note: Typically, when you use a comma in the values of a form control, the content that follows a comma is considered a new value. If you want to include a comma in the values, precede the comma with two backslashes. For example, `values, '1\\, 2\\, 3, 4, edit, false)` will display a form control that has 1, 2, 3 for the first value and 4 for the second value.

- **resultSeparator** - If multiple check-boxes are used, the separator is used to compose the final result. If not specified, the `space` character is used.
Note: The value of the `resultSeparator` property cannot exceed one character.

- `selectionMode` - Specifies whether the form control allows the selection of a single value or multiple values. The predefined values of this property are `single` (default value) and `multiple`.
- `labels` - Specifies the label associated with each entry used for presentation. If this property is not specified, the `values` property is used instead.
- `columns` - Controls the width of the form control. The unit size is the width of the `w` character. This property is used for the visual representation of the form control.
- `width` - Specifies the width of the content area using relative (`em`, `ex`), absolute (`in`, `cm`, `mm`, `pt`, `pc`, `px`), and percentage (followed by the `%` character) length units. The `width` property takes precedence over the `columns` property (if the two are used together).
- `rendererSort` - Specifies the sorting of the values (labels) displayed on the form control before clicking the popup control. The possible values of this property are `ascending` and `descending`.
- `editorSort` - Specifies the sorting of the values displayed after clicking the popup control (for example, clicking a drop-down arrow button). The possible values of this property are `ascending` and `descending`.
- `rendererSeparator` - Defines a separator used when multiple values are rendered. If not specified, the value of the `resultSeparator` property is used.
- `sort` - Specifies the default sorting of the form control values (the values displayed before and after clicking the popup control). However, the `editorSort` and `rendererSort` properties have a higher priority. The possible values of this property are `ascending` and `descending`.
- `fontInherit` - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.
- `hoverPseudoclassName` - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```html
p:before {
    content: oxy_popup(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
    border: 1px solid red;
}
```

Example: `oxy_popup` Form Control

```html
popupWithMultipleSelection:before {
    content: "This editor edits an attribute value. The possible values are specified inside the CSS: "
}
```
`oxy_popup(
    edit, "@attribute",
    values, "value1, value2, value3, value4, value5",
    labels, "Value no1, Value no2, Value no3, Value no4, Value no5",
    resultSeparator, "|",
    columns, 10,
    selectionMode, "multiple",
    color, "blue",
    fontInherit, true);
    font-size:30px;
);`

**Tip:** To insert a sample of the `oxy_popup` form control in a CSS file, invoke the `Content Completion Assistant (page 2704)` by pressing Ctrl + Space (Command + Space on OS X) and select the `oxy_popup` code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor plugin, see the sample files in the following directory: `[OXYGEN_INSTALL_DIR]/samples/form-controls`.

For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzkMSLM

**Related Information:**

- Collapse Text: -oxy-collapse-text Property Value (page 2227)

### Text Area Form Control

The `oxy_textArea` built-in form control is used for entering multiple lines of text in a graphical user interface box. A text area may include optional syntax highlight capabilities to present the form control.

The `oxy_textArea` form control supports the following properties:

- **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
• **@attribute_name** - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a *QName (page 2710)* and the CSS must have a namespace declaration for the prefix.

• **#text** - Specifies that the presented/edited value is the simple text value of an element.

---

**Note:** You can set the value of the *visibility property* to `-oxy-collapse-text (page 2227)` to render the text only in the form control that the *oxy_editor* function specifies.

• **#content** - This parameter is useful when an element has mixed or element-only content and you want to edit its content inside a text area form control.

For example, if you have the following XML content:

```
<codeblock outputclass="language-xml">START_TEXT<ph>phase</ph><apiname><text>API</text></apiname></codeblock>
```

and your CSS includes the following snippet:

```
codeblock:before{
  content:
    oxy_textArea{
      edit, '#content',
      contentType, 'text/xml');
    }
}
```

then the text area form control will edit the following fragment:

```
START_TEXT<ph>phase</ph><apiname><text>API</text></apiname>
```

---

**Note:** When the value of the *edit property* is *#content*, the text area form control will also offer content completion proposals.

• **#content** - This parameter is useful when an element has mixed or element-only content and you want to edit its content inside a text area form control.

For example, if you have the following XML content:

```
<codeblock outputclass="language-xml">START_TEXT<ph>phase</ph><apiname><text>API</text></apiname></codeblock>
```

and your CSS includes the following snippet:

```
codeblock:before{
  content:
    oxy_textArea{
      edit, '#content',
    }
}
```
contentType, 'text/xml');
}

then the text area form control will edit the following fragment:

```xml
<phase><apiname><text>API</text></apiname></phase></text></apiname>
```

### Note:
When the value of the *edit* property is *#content*, the text area form control will also offer content completion proposals.

- **columns** - Controls the width of the form control. The unit size is the width of the `w` character.
- **width** - Specifies the width of the content area using relative (`em, ex`), absolute (`in, cm, mm, pt, pc, px`), and percentage (followed by the `%` character) length units. The *width* property takes precedence over the *columns* property (if the two are used together).
- **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the *fontInherit* property to `true`.
- **visible** - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.
- **rows** - This property specifies the number of rows that the form control presents. If the form control has more lines, you can scroll and see them all.
- **contentType** - Specifies the type of content for which the form control offers syntax highlighting. The following values are supported: *text/css; text/shell; text/cc; text/xquery; text/xml; text/python; text/xsd; text/c; text/xpath; text/javascript; text/xsl; text/wsdl; text/html; text/xproc; text/properties; text/sql; text/rng; text/sch; text/json; text/perl; text/php; text/java; text/batch; text/rnc; text/dtd; text/nvdl; text/plain.*
- **indentOnTab** - Specifies the behavior of the *Tab* key. If the value of this property is set to `true` (default value), the *Tab* key inserts characters. If it is set to `false`, *Tab* is used for navigation, jumping to the next editable position in the document.
- **The **white-space** CSS property influences the value that you edit, as well as the from control size:**
  - **pre** - The whitespaces and new lines of the value are preserved and edited. If the *rows* and *columns* properties are not specifies, the form control calculates its size on its own so that all the text is visible.
  - **pre-wrap** - The long lines are wrapped to avoid horizontal scrolling.

### Note:
The *rows* and *columns* properties must be specified. If these are not specified, the form control considers the value to be *pre*.

- **normal** - The white spaces and new lines are normalized.
• `hoverPseudoclassName` - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```xml
p:before {
  content: oxy_textArea(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
  border: 1px solid red;
}
```

**Example: oxy_textArea Form Control**

The following example presents a text area with CSS syntax highlighting that calculates its own dimension, and a second one with XML syntax highlighting with defined dimension.

```xml
textArea {
  visibility: -oxy-collapse-text;
  white-space: pre;
}
textArea[language="CSS"]:before {
  content: oxy_textArea{
    edit, '#text',
    contentType, 'text/css'};
}
textArea[language="XML"]:before {
  content: oxy_textArea{
    edit, '#text',
    contentType, 'text/xml',
    rows, 10,
    columns, 30};
}
```

**Tip:** To insert a sample of the `oxy_textArea` form control in a CSS file, invoke the *Content Completion Assistant* (page 2704) by pressing `Ctrl + Space (Command + Space on OS X)` and select the `ozy_textArea` code template.
To see more detailed examples and more information about how form controls work in Oxygen XML Editor plugin, see the sample files in the following directory: 

```
[OXYGEN_INSTALL_DIR]/samples/form-controls
```

### Text Field Form Control

The **oxy_textfield** built-in form control is used for entering a single line of text in a graphical user interface box. A text field may include optional content completion capabilities, used to present and edit the value of an attribute or an element.

The **oxy_textfield** form control supports the following properties:

- **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  - `@attribute_name` - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a **QName** ([page 2710](#)) and the CSS must have a namespace declaration for the prefix.
  - `#text` - Specifies that the presented/edited value is the simple text value of an element.

  **Note:** You can set the value of the visibility property to -oxy-collapse-text ([page 2227](#)) to render the text only in the form control that the oxy_editor function specifies.

- **columns** - Controls the width of the form control. The unit size is the width of the `w` character.
- **width** - Specifies the width of the content area using relative (`em`, `ex`), absolute (`in`, `cm`, `mm`, `pt`, `pc`, `px`), and percentage (followed by the `%` character) length units. The width property takes precedence over the columns property (if the two are used together).
- **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the fontInherit property to `true`.
- **visible** - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`. 
• **values** - Specifies the values that populate the list of proposals. If these values are not specified in the CSS, they are collected from the associated XML Schema.

• **tooltips** - Associates tooltips to each value in the **values** property. The value of this property is a list of tooltip messages separated by commas. If you want the tooltip to display a comma, use the '${comma}' variable (page 205).

• **tooltip** - Specifies a tooltip to be displayed when you hover over the form control.

• **color** - Specifies the foreground color of the form control. If the value of the **color** property is **inherit**, the form control has the same color as the element in which it is inserted.

• **hasMultipleValues** - Specifies if the text field allows multiple values separated by spaces or just a single value.

    Note: If the value is **false**, the **Content Completion Assistant** (page 2704) considers the entire text as the prefix for its proposals. If the value is **true** (the default value), the space is the delimiter for the values and thus it is not included in the prefix (the prefix will be whatever comes after the space).

    For example, suppose the possible values for your text field are: value a, value b, and other values. If the **hasMultipleValues** property is set to **true** and the user enters “value ” (notice the space character after ‘value’) in the text field, the **Content Completion Assistant** will suggest all three values because the prefix is whatever comes after the space, and in this case the user did not enter anything after the space. If the **hasMultipleValues** property was set to **false**, the **Content Completion Assistant** would only suggest value a and value b because the space is considered part of the prefix.

• **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```javascript
p:before {
    content: oxy_textfield(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
    border: 1px solid red;
}
```

**Example: oxy_textfield Form Control**

```javascript
element {
    content: "Label: ">
    oxy_textfield(
        edit, "@my_attr",
        values, "value1, value2",
```
color, "red",
columns, 40);
}

**Tip:** To insert a sample of the `oxy_textfield` form control in a CSS file, invoke the *Content Completion Assistant (page 2704)* by pressing **Ctrl + Space** (**Command + Space on OS X**) and select the `oxy_textfield` code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor plugin, see the sample files in the following directory: `[OXYGEN_INSTALL_DIR]/samples/form-controls`.

**URL Chooser Form Control**

The `oxy_urlChooser` built-in form control is used for a dialog box that allows you to select the location of local or remote resources. The inserted reference is made relative to the URL of the currently opened editor.

The `oxy_urlChooser` editor supports the following properties:

- **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  - `@attribute_name` - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a *QName (page 2710)* and the CSS must have a namespace declaration for the prefix.
  - `#text` - Specifies that the presented/edited value is the simple text value of an element.

  **Note:** You can set the value of the `visibility property` to `-oxy-collapse-text (page 2227)` to render the text only in the form control that the `oxy_editor` function specifies.

- **columns** - Controls the width of the form control. The unit size is the width of the `w` character.
• **width** - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units. The `width` property takes precedence over the `columns` property (if the two are used together).

• **color** - Specifies the foreground color of the form control. If the value of the `color` property is `inherit`, the form control has the same color as the element in which it is inserted.

• **visible** - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.

• **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.

• **fileFilter** - String value that holds comma-separated file extensions. The URL chooser uses these extensions to filter the displayed files. A value such as "jpg, png, gif" is mapped to three filters that will display all jpg, png, and gif files respectively.

• **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```
.p:before {
  content: oxy_urlChooser(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
  border: 1px solid red;
}
```

**Example: oxy_urlChooser Form Control**

```
urlChooser[file]:before {
  content: "A URL chooser editor that allows browsing for a URL. The selected URL is made relative to the currently edited file:"
  oxy_urlChooser(
    edit, "@file",
    columns 25);
}
```

**Tip:** To insert a sample of the `oxy_urlChooser` form control in a CSS file, invoke the *Content Completion Assistant (page 2704)* by pressing *Ctrl + Space (Command + Space on OS X)* and select the `oxy_urlChooser` code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor plugin, see the sample files in the following directory: `[OXYGEN_INSTALL_DIR]/samples/form-controls`.

Related Information:

- Custom CSS Functions (page 2234)
- Collapse Text: oxy-collapse-text Property Value (page 2227)

**Video Player Form Control**

The oxy_video built-in form control is used for providing a mechanism to play videos.

The oxy_video form control supports the following properties:

- **href** - The absolute or relative location of a resource. This property is mandatory. Relative values are resolved relative to the CSS. If you have media resources relative to the XML document, you can specify their paths like this:

  oxy_video(href, oxy_url(oxy_base-uri(), 'ex.mp4')), width, 400px, height, 300px)

- **width** - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units.

- **height** - Specifies the height of the form control area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units.

**Example: oxy_video Form Control**

```css
object {
  content:
    oxy_video(
      href, 'resources/video.mp4',
      width, 400px,
      height, 300px),
}
```

**Tip:** To insert a sample of the oxy_video form control in a CSS file, invoke the **Content Completion Assistant (page 2704)** by pressing **Ctrl + Space (Command + Space on OS X)** and select the oxy_video code template.
To see more detailed examples and more information about how form controls work in Oxygen XML Editor plugin, see the sample files in the following directory: `[OXYGEN_INSTALL_DIR]/samples/form-controls`.

- URL: oxy_url() Function (page 2252)

**Implementing Custom Form Controls**

If the built-in form controls are not sufficient for your needs, you can implement custom form controls in Java.

**Custom Form Controls Implementation**

You can specify custom form controls using the following properties:

- **rendererClassName** - The name of the class that draws the edited value. It must be an implementation of `ro.sync.ecss.extensions.api.editor.InplaceRenderer`. The renderer has to be a SWING implementation and can be used both in the standalone and Eclipse distributions.

- **swingEditorClassName** - You can use this property for the standalone (Swing-based) distribution to specify the name of the class used for editing. It is a Swing implementation of `ro.sync.ecss.extensions.api.editor.InplaceEditor`.

- **swtEditorClassName** - You can use this property for the Eclipse plugin distribution to specify the name of the class used for editing. It is a SWT implementation of the `ro.sync.ecss.extensions.api.editor.InplaceEditor`.

   **Note:** If the custom form control is intended to work in the Oxygen XML Editor plugin standalone distribution, the declaration of `swtEditorClassName` is not required. The `renderer` (the class that draws the value) has different properties from the `editor` (the class that edits the value) because you can present a value in one way and edit it in another.

- **classpath** - You can use this property to specify the location of the classes used for a custom form control. The value of the `classpath` property is an enumeration of URLs separated by comma.
• **edit** - If your form control edits the value of an attribute or the text value of an element, you can use the `@attribute_name` and `#text` predefined values and Oxygen XML Editor plugin will perform the commit logic by itself. You can use the `custom` value to perform the commit logic yourself.

• **ecHeavyFormControlClassName** - This type of form control is effectively present at all times at its allocated bounds. This is useful if you need a form controls that renders dynamic or interactive SVG documents (for example, if you have an SVG document that displays tooltips when hovering over certain areas).

The value of this property is a class name that must implement the `ro.sync.ecss.extensions.api.editor.InplaceHeavyEditor` method. The JAR (page 2707) that contains this implementation can either be added in the Classpath tab in the Document Type Configuration dialog box (page 76) for your particular framework (page 2706) or specified with the classpath property (page 2288).

### Example: Java Code

The following is a sample Java code for implementing a custom combo box form control that inserts an XML element in the content when the editing stops:

```java
public class ComboBoxEditor extends AbstractInplaceEditor {
    /**
     * @see ro.sync.ecss.extensions.api.editor.InplaceEditor#stopEditing()
     */
    @Override
    public void stopEditing() {
        Runnable customCommit = new Runnable() {
            @Override
            public void run() {
                AuthorDocumentController documentController = context.getAuthorAccess().getDocumentController();
                documentController.insertXMLFragment("<custom/>", offset);
            }
        };
        EditingEvent event = new EditingEvent(customCommit, true);
        fireEditingStopped(event);
    }
}
```

The custom form controls can use any of the predefined properties of the built-in form controls (page 2255), as well as specified custom properties.
Example: CSS

The following is an example of how to specify a custom form control in the CSS:

```
myElement {
    content: oxy_editor{
        rendererClassName, "com.custom.editors.CustomRenderer",
        swingEditorClassName, "com.custom.editors.SwingCustomEditor",
        swtEditorClassName, "com.custom.editors.SwtCustomEditor",
        edit, "@my_attr",
        customProperty1, "customValue1",
        customProperty2, "customValue2"
    }
}
```

How to Implement Custom Form Controls

To implement a custom form control, follow these steps:

1. Download the Oxygen XML Editor plugin SDK at: https://www.oxygenxml.com/oxygen_sdk.html.
2. Implement the custom form control by extending ro.sync.ecss.extensions.api.editor.InplaceEditorRendererAdapter. You could also use ro.sync.ecss.extensions.api.editor.AbstractInplaceEditor, which offers some default implementations and listeners management.
3. Pack the previous implementation in a Java JAR (page 2707) library.
4. Copy the JAR library to the [OXYGEN_INSTALL_DIR]/frameworks/[FRAMEWORK_DIR] directory.
5. In Oxygen XML Editor plugin, open the Preferences dialog box (page 55), go to Document Type Association, edit the appropriate framework, and add the JAR library in the Classpath tab.
6. Specify the custom form control in your CSS, as described above.

Tip: To see more detailed examples and more information about how form controls work in Oxygen XML Editor plugin, see the sample files in the following directory: [OXYGEN_INSTALL_DIR]/samples/form-controls.

For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzkMSLM

Editing Processing Instructions Using Form Controls
Oxygen XML Editor plugin allows you to edit *processing instructions, comments*, and *CDATA* by using the built-in editors.

**Note:** You can edit both the content and the attribute value from a *processing instruction*.

**Example: Editing an Attribute from a Processing Instruction**

**PI content:**

```xml
<?pi_target attr="val"?>
```

**CSS:**

```css
@namespace oxy "http://www.oxygenxml.com/extensions/author";

oxy|processing-instruction:before {
    display:inline;
    content:"EDIT attribute: " oxy_textfield(edit, '@attr', columns, 15);
    visibility:visible;
}

oxy|processing-instruction{
    visibility:-oxy-collapse-text;
}
```

**Related Information:**

- [Text Field Form Control](#)
- [Collapse Text: -oxy-collapse-text Property Value](#)

**Custom CSS Pseudo-classes**

You can set your custom CSS pseudo-classes on the nodes from the *AuthorDocument* model. These are similar to the normal XML attributes, with the important difference that they are not serialized, and by changing them the document does not create undo and redo edits - the document is considered unmodified. You can use custom pseudo-classes for changing the style of an element (and its children) without altering the document.
In Oxygen XML Editor plugin they are used to hide/show the `colspec` elements from CALS tables. To take a look at the implementation, see:

1. `[/frameworks/docbook/css/cals_table.css](Search for -oxy-visible-colspecs)`
2. The definition of action `table.toggle.colspec` from the DocBook framework (page 2706) makes use of the pre-defined `TogglePseudoClassOperation` Author mode operation.

Here are some examples:

**Example: Controlling the visibility of a section using a pseudo-class**

You can use a non standard (custom) pseudo-class to impose a style change on a specific element. For instance, you can have CSS styles matching the custom pseudo-class `access-control-user`, like the one below:

```css
section {
    display:none;
}

section:access-control-user {
    display:block;
}
```

By setting the pseudo-class `access-control-user`, the element section will become visible by matching the second CSS selector.

**Example: Coloring the elements at the current cursor location**

You could create an `AuthorCaretListener` that sets the `caret-visited` pseudo-class to the element at the cursor location. The effect will be that all the elements traversed by the cursor become red.

```css
*:caret-visited {
    color:red;
}
```

The API that you can use from the `CaretListener`:

```java
rsync.css.extensions.api.AuthorDocumentController#setPseudoClass(java.lang.String, rsync.css.extensions.api.node.AuthorElement)
rsync.css.extensions.api.AuthorDocumentController#removePseudoClass(java.lang.String, rsync.css.extensions.api.node.AuthorElement)
```
Predefined Pseudo-Class Author Mode Operations

Pre-defined Author mode operations can be used directly in your framework to work with custom pseudo-classes:

1. `TogglePseudoClassOperation`
2. `SetPseudoClassOperation`
3. `RemovePseudoClassOperation`

Debugging CSS Stylesheets

To assist you with debugging and customizing CSS stylesheets the Author mode includes a CSS Inspector view (page 329) to examine the CSS rules that match the currently selected element.

This tool is similar to the Inspect Element development tool that is found in most browsers. The CSS Inspector view allows you to see how the CSS rules are applied and the properties defined. Each rule that is displayed in this view includes a link to the line in the CSS file that defines the styles for the element that matches the rule. You can use the link to open the appropriate CSS file and edit the style rules. Once you have found the rule you want to edit, you can click the link in the top-right corner of that rule to open the CSS file in the editor.

Figure 672: CSS Inspector View

There are two ways to open the CSS Inspector view:

1. Select CSS Inspector from the Window > Show View menu.
2. Select the Inspect Styles action from the contextual menu in Author mode.

Related Information:

- CSS Inspector View (page 329)
The Oxygen XML Editor plugin includes a number of extension (page 2709) points, which can be implemented by other Eclipse plugins (page 2709) that depend on it. All of them are listed in the plugin.xml file, along with samples of usage code. The following is a list with short descriptions for some of the most useful extension points:

**Extension point: ditaKeyDefinitionManager**

It can be used to provide an external keys manager, responsible of providing DITA keys that are then used for editing and resolving referenced content. Its EXSD schema can be found in: OXYGEN_PLUGIN_DIR/exsd-schema/ditaKeyDefinitionManager.exsd.

**Extension point: actionBarContributorCustomizer**

A very useful extension point that can add or remove actions from various menus, contextual menus, and toolbars that are contributed by the Oxygen XML Editor plugin. Its EXSD schema can be found in: OXYGEN_PLUGIN_DIR/exsd-schema/actionBarContributorCustomizer.exsd.

**Extension point: customEditorInputCreator**

Use this extension point to create your custom editor input for a certain resource that will be opened by the Oxygen XML Editor plugin when clicking links. Its EXSD schema can be found in: OXYGEN_PLUGIN_DIR/exsd-schema/customEditorInputCreator.exsd.

**Extension point: editorAdapterContributor**

When an adapter is requested to the opened XML editor you can provide your custom adapter from your external plugin. Its EXSD schema can be found in: OXYGEN_PLUGIN_DIR/exsd-schema/editorAdapterContributor.exsd.
Extension point: `extensionsBundleContributor`

Use this extension point to provide your own `ExtensionsBundle` implementation for a certain opened XML resource. Its EXSD schema can be found in: `OXYGEN_PLUGIN_DIR/exsd-schema/extensionsBundleContributor.exsd`.

Extension point: `stylesFilterContributor`

Use this extension point to provide your own `StylesFilter` implementation for special visual rendering when an XML resource is opened in the Author editing mode. Its EXSD schema can be found in: `OXYGEN_PLUGIN_DIR/exsd-schema/stylesFilterContributor.exsd`.

Extension point: `XMLRefactoringContributor`

Contributes a folder that contains the additional XML Refactoring operation descriptor files and XQuery scripts that can be used by the batch XML refactoring actions. Its EXSD schema can be found in: `OXYGEN_PLUGIN_DIR/exsd-schema/xmlRefactoringContributor.exsd`.

Extension point: `workspaceAccessPlugin`

Use this extension point to be notified when Oxygen XML Editor plugin has started. Its EXSD schema can be found in: `OXYGEN_PLUGIN_DIR/exsd-schema/exsd-schema/workspaceAccessExtension.exsd`.

Extension point: `AuthorStylesheet`

Use this extension point to provide a stylesheet layer that will be used when rendering any XML document in Author mode. Its EXSD schema can be found in: `OXYGEN_PLUGIN_DIR/exsd-schema/authorStylesheetContributor.exsd`.

How to Use a Custom View with the Oxygen XML Editor plugin Distribution

**Question**

Is it possible to create a custom view in Eclipse that can insert certain XML fragments in the documents opened with the Oxygen XML Editor plugin?
Answer

Here you can find more information about the Eclipse part of the Oxygen SDK:

https://www.oxygenxml.com/oxygen_sdk.html#oXygen_Eclipse_plugin

Use the provided Oxygen XML Editor plugin sample project as a starting point.
From any custom view/component you can have singleton access to the using the
ro.sync.exml.workspace.api.PluginWorkspaceProvider.getPluginWorkspace() API.

The Java code for inserting a certain XML fragment in the currently open editor (either in the Text or
Author editing modes) would look like this:

```java
WSEditor currentEditorAccess = PluginWorkspaceProvider.getPluginWorkspace().
    getCurrentEditorAccess(PluginWorkspace.MAIN_EDITING_AREA);
    
    if (currentEditorAccess.getCurrentPage() instanceof WSXMLTextEditorPage) {
        //Editor opened in Text page
        WSXMLTextEditorPage tp =
            (WSXMLTextEditorPage) currentEditorAccess.getCurrentPage();

        //You can access an API to insert text in the XML content
        //    tp.getDocument().insertString(tp.getCaretOffset(), "<testTag/>", null);
        //    This is the internal StyledText implementation
        //    tp.getTextComponent()
        //You can use this XPath API to find the range of an XML element.
        //    tp.findElementsByXPath(xpathExpression)
    } else if (currentEditorAccess.getCurrentPage() instanceof WSAuthorEditorPage) {
        //Editor opened in Author page
        //    try {
        WSAuthorEditorPage authPage = (WSAuthorEditorPage)
            currentEditorAccess.getCurrentPage();

        //Then you can do stuff like this to insert XML at cursor position
        //    authPage.getDocumentController().insertXMLFragment("<testTag/>",
        authPage.getCaretOffset());
        //    } catch (AuthorOperationException e) {
        //        // TODO Auto-generated catch block
        //        e.printStackTrace();
        //    }
```
Oxygen XML Editor plugin includes a variety of helpful tools to help you accomplish XML-related tasks. This section presents many of those tools. These tools are available in the Tools menu and some of them can be launched through keyboard shortcuts or command-line scripts.

**Refactoring XML Documents**

In the life cycle of XML documents there are instances when the XML structure needs to be changed to accommodate various needs. For example, when an associated schema is updated, an attribute may have been removed, or a new element added to the structure.

These types of situations cannot be resolved with a traditional Find/Replace tool, even if the tool accepts regular expressions. The problem becomes even more complicated if an XML document is computed or referenced from multiple modules, since multiple resources need to be changed.

To assist you with these types of refactoring tasks, Oxygen XML Editor plugin includes a specialized XML Refactoring tool that helps you manage the structure of your XML documents.

**XML Refactoring Tool**

The XML Refactoring tool is presented in the form of an easy to use wizard that is designed to reduce the time and effort required to perform various structure management tasks. For example, you can insert, delete, or rename an attribute in all instances of a particular element that is found in all documents within your project.

To access the tool, select the XML Refactoring action from one of the following locations:

- The XML Tools menu.
- The Refactoring submenu from the contextual menu in the Navigator view (page 250).
- The Refactoring submenu from the contextual menu in the DITA Maps Manager view (page 2400).

**Note:** The built-in refactoring operations are also available from the Refactoring submenu in the contextual menu of Author or Text mode. This is useful because by selecting the operations from the contextual menu, Oxygen XML Editor plugin considers the editing context to skip directly to the wizard.
page of the appropriate operation and to help you by preconfiguring some of the parameter values. For your convenience, the last 5 operations that were finished (page 916) or previewed (page 916) also appear in the Refactoring submenu of the contextual menu in the DITA Maps Manager.

**XML Refactoring Wizard**

The XML Refactoring tool includes the following wizard pages:

**Refactoring operations**

The first wizard page presents the available operations, grouped by category. To search for an operation, you can use the filter text box at the top of the page.

*Figure 673: XML Refactoring Wizard*

**Configure Operation Parameters**

The next wizard page allows you to specify the parameters for the refactoring operation. The parameters are specific to the type of refactoring operation that is being performed. For example, to delete an attribute you need to specify the parent element and the qualified name of the attribute to be removed.
Scope and Filters

The last wizard page allows you to select the set of files that represent the input of the operation.

Scope section

In the Scope section, you can select from predefined resource sets (such as the current file, your whole project, the current DITA map (page 2705) hierarchy for DITA projects, etc.) or you can define your own set of resources by creating a working set (page 2712).

Filters
The Filters section includes the following options:

- **Include files** - Allows you to filter the selected resources by using a file pattern. For example, to restrict the operation to only analyze build files you could use `build*.xml` for the file pattern.
- **Restrict only to known XML file types** - When selected, only resources with a known XML file type will be affected by the operation.

**Preview**

You can use the **Preview** button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.

**Finish**

After clicking the **Finish** button, the operation will be processed and Oxygen XML Editor plugin provides no automatic means for reverting the operations. Any **Undo** action will only revert changes on the current document.

**Troubleshooting:** If an operation fails, a notification will be displayed in the **Results** panel with some information about the error. For example, if the operation was invoked on a read-only resource, the error will indicate that a read-only file cannot be converted.

**Tip:** If an operation takes longer than expected you can use the **Stop** button in the progress bar to cancel the operation.

**Restriction:** XML refactoring operations cannot preserve CDATA sections. If your document contains XML CDATA sections, the refactoring operations will convert them to plain text nodes.

**Built-in Refactoring Operations**

The XML Refactoring tool includes a variety of built-in operations that can be used for common refactoring tasks. They are grouped by category in the **Refactoring operations** wizard page. You can also access the operations from the **Refactoring** submenu in the contextual menu of **Author** or **Text** mode. The operations are also grouped by category in this submenu. When selecting the operations from the contextual menu, Oxygen XML Editor plugin considers the editing context to get the names and namespaces of the current element or attribute, and uses this information to preconfigure some of the parameter values for the selected refactoring operation.
Tip: Each operation includes a link in the lower part of the wizard that opens the XML / XSLT-FO-XQuery / XPath preferences page where you can configure XPath options and declare namespace prefixes.

The following built-in operations are available:

Refactoring Operations for Attributes

Add/Change attribute

Use this operation to change the value of an attribute or insert a new one. This operation allows you to specify the following parameters:

Parent element section

Element

The parent element of the attribute to be changed, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Attribute section

Local name

The local name of the affected attribute.

Namespace

The namespace of the affected attribute.

Value

The value for the affected attribute.

Options section

You can choose between one of the following options for the Operation mode:

Add the attribute in the parent elements where it is missing

Adds the attribute to all instances of the specified parent element.

Change the value in the parent elements where the attribute already exists

Replaces the value of the already existing attribute in all instance of the specified parent element.
Both

Adds the attributes to the instances where it is missing and replaces the value in instances where the attribute already exists.

Convert attribute to element

Use this operation to convert a specified attribute to an element. This operation allows you to specify the following parameters:

Parent element section

Element

The parent element of the attribute to be converted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Attribute section

Local name

The local name of the affected attribute.

Namespace

The namespace of the affected attribute.

New element section

Local name

The local name of the new element.

Namespace

The namespace of the new element.

Delete attribute

Use this operation to remove one or more attributes. This operation requires you to specify the following parameters:

Element

The parent element of the attribute to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Attribute

The name of the attribute to be deleted.
Rename attribute

Use this operation to rename an attribute. This operation requires you to specify the following parameters:

**Element**

The parent element of the attribute to be renamed, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

**Attribute**

The name of the attribute to be renamed.

**New local name**

The new local name of the attribute.

Replace in attribute value

Use this operation to search for a text fragment inside an attribute value and change the fragment to a new value. This operation allows you to specify the following parameters:

**Target attribute section**

**Element**

The parent element of the attribute to be modified, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

**Attribute**

The name of the attribute to be modified.

**Find / Replace section**

**Find**

The text fragments to find. You can use Perl-like regular expressions.

**Replace with**

The text fragment to replace the target with. This parameter can bind regular expression capturing groups ($1, $2, etc.) from the find pattern.
Refactoring Operations for *Comments*

**Delete comments**

Use this operation to delete comments from one or more elements. This operation requires you specify the following parameter:

**Element**

The target element (or elements) for which comments will be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

*Note:* Comments that are outside the root element will not be deleted because the *serializer* preserves the content before and after the root.

Refactoring Operations for *DITA*

**Change topic ID to file name**

Use this operation to change the ID of a topic to be the same as its file name.

**Convert CALS tables to simple tables**

Use this operation to convert DITA CALS tables to simple tables.

**Convert conrefs to conkeyrefs**

Use this operation to convert `conref` attributes to `conkeyref` attributes. For more information and instructions for using this operation, see *Converting Conrefs to Conkeyrefs* (page 2540).

**Convert simple tables to CALS tables**

Use this operation to convert DITA simple tables to CALS tables.

**Convert Nested Topics to New Topics (Available from the contextual menu of editable maps/nodes in the DITA Maps Manager (page 2400))**

Use this operation on topics that contain nested `<topic>` elements to convert each nested topic to a new topic. Also, the new topics are added in the *DITA Maps Manager* as the first child topics of the original topic.

**Convert Sections to New Topics (Available from the contextual menu of editable maps/nodes in the DITA Maps Manager (page 2400))**

Use this operation on topics that contain multiple sections to convert each section to a new topic. Also, the new topics are added in the *DITA Maps Manager* as the first child topics of the original topic.

**Convert to Concept**
Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept). For more information, see Converting DITA Topics to Another Type (page 2468).

**Convert to General Task**

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). For more information, see Converting DITA Topics to Another Type (page 2468).

**Convert to Reference**

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference). For more information, see Converting DITA Topics to Another Type (page 2468).

**Convert to Task**

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task). For more information, see Converting DITA Topics to Another Type (page 2468).

**Convert to Topic**

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic). For more information, see Converting DITA Topics to Another Type (page 2468).

**Convert to Troubleshooting**

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting). For more information, see Converting DITA Topics to Another Type (page 2468).

**Rename Key**

Use this operation to rename a key. It also updates all references to it. Note that it does not work on DITA 1.3 key scopes.

All of these DITA refactoring actions allow you to choose a scope for the operation and some filters:

**Scope**

Select from a variety of options to define the scope for which resources will be affected by the operation. For example, you can choose to affect all resources in the Project, All opened files, Current DITA map hierarchy, or just the Current file.

**Filters section**

**Include files**
Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as * or ?).

**Restrict to known XML file types only**

Excludes non-XML file types from the operation.

**Refactoring Operations for Elements**

**Delete element**

Use this operation to delete elements. This operation requires you to specify the following parameter:

**Element**

The target element to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

**Delete element content**

Use this operation to delete the content of elements. This operation requires you to specify the following parameter:

**Element**

The target element whose content is to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

**Insert element**

Use this operation to insert new elements. This operation allows you to specify the following parameters:

**Element section**

**Local name**

The local name of the element to be inserted.

**Namespace**

The namespace of the element to be inserted.

**Location section**

**XPath**
An XPath expression that identifies an existing element to which the new element is relative, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

**Position**

The position where the new element will be inserted, in relation to the specified existing element. The possible selections in the drop-down menu are: *After*, *Before*, *First child*, or *Last child*.

**Rename element**

Use this operation to rename elements. This operation requires you to specify the following parameters:

**Target elements (XPath)**

The target elements to be renamed, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

**New local name**

The new local name of the element.

**Unwrap element**

Use this operation to remove the surrounding tags of elements, while keeping the content unchanged. This operation requires you to specify the following parameter:

**Target elements (XPath)**

The target elements whose surrounding tags will be removed, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

**Wrap element**

Use this operation to surround elements with element tags. This operation allows you to specify the following parameters:

**Target elements (XPath)**

The target elements to be surrounded with tags, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

**Wrapper element section**
Local name
The local name of the Wrapper element.

Namespace
The namespace of the Wrapper element.

Wrap element content
Use this operation to surround the content of elements with element tags. This operation allows you to specify the following parameters:

Target elements (XPath)
The target elements whose content will be surrounded with tags, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

Wrapper element section

Local name
The local name of the Wrapper element that will surround the content of the target.

Namespace
The namespace of the Wrapper element that will surround the content of the target.

Refactoring Operations for Fragments

Insert XML fragment
Use this operation to insert an XML fragment. This operation allows you to specify the following:

XML Fragment
The XML fragment to be inserted.

Location section

XPath
An XPath expression that identifies an existing element to which the inserted fragment is relative, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.
Position

The position where the fragment will be inserted, in relation to the specified existing element. The possible selections in the drop-down menu are: After, Before, First child, or Last child.

Replace element content with XML fragment

Use this operation to replace the content of elements with an XML fragment. This operation allows you to specify the following parameters:

Target elements (XPath)

The target elements whose content will be replaced, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

XML Fragment

The XML fragment with which to replace the content of the target element.

Replace element with XML fragment

Use this operation to replace elements with an XML fragment. This operation allows you to specify the following parameters:

Target elements (XPath)

The target elements to be replaced, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

XML Fragment

The XML fragment with which to replace the target element.

Refactoring Operations for JATSKit

Add BITS DOCTYPE - NLM/NCBI Book Interchange 2.0

Use this operation to add an NLM ‘BITS’ 2.0 DOCTYPE declaration.

Add Blue DOCTYPE - NISO JATS Publishing 1.1

Use this operation to add a JATS ‘Blue’ 1.1 DOCTYPE declaration.

Normalize IDs

Use this operation to normalize assigned IDs and assigned IDs to elements that are missing them.
All of these JATKit refactoring actions allow you to choose a scope for the operation and some filters:

**Scope**

Select from a variety of options to define the scope for which resources will be affected by the operation. For example, you can choose to affect all resources in the **Project, All opened files**, or just the **Current file**.

**Filters section**

**Include files**

Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as * or ?).

**Restrict to known XML file types only**

Excludes non-XML file types from the operation.

**Refactoring Operations for Publishing Template**

These operations are for those who use Oxygen Publishing Templates for WebHelp Responsive output customization.

**Migrate HTML Page Layout Files to v21**

Use this operation to convert custom HTML page layout files (page 1649) that are included in a custom Publishing Template that was created in Oxygen XML Editor plugin version 20.0 or 20.1 so that they will be compatible with Oxygen XML Editor plugin version 21.0.

**Update HTML Pages**

⚠️ **Attention**: This operation is only used by Oxygen XML Editor plugin and should not be used manually.

**Additional Notes**

**Note**: There are some operations that allow `<ANY>` for the **local name** and **namespace** parameters. This value can be used to select an element or attribute regardless of its local name or namespace. Also, the `<NO_NAMESPACE>` value can be used to select nodes that do not belong to a namespace.

**Note**: Some operations have parameters that accept XPath expressions to match elements or attributes. In these XPath expressions you can only use the prefixes declared in the **Options**.
Preferences > XML > XSLT-FO-XQUERY > XPath (page 184) page. This preferences page can be easily opened by clicking the link in the note *(Each prefix used in an XPath expression must be declared in the Default prefix-namespace mappings section)* at the bottom of the Configure Operation Parameters wizard page.

Custom Refactoring Operations

While Oxygen XML Editor plugin includes a variety of built-in XML refactoring operations to help you accomplish particular tasks, you can also create custom operations according to your specific needs. For example, you could create a custom refactoring operation to convert an attribute to an element and insert the element as the first child of the parent element.

An XML Refactoring operation is defined as a pair of resources:

- An *XQuery Update script* or *XSLT stylesheet* that Oxygen XML Editor plugin will run to refactor the XML files.
- An *XML Operation Descriptor* file that contains information about the operation (such as the name, description, and parameters).

*Figure 676: Diagram of an XML Refactoring Operation*

All the defined custom operations are loaded by the XML Refactoring Tool and presented in the Refactoring Operations wizard page (page 914), along with the built-in operations.
After the user chooses an operation and specifies its parameters, Oxygen XML Editor plugin processes an XQuery Update or XSLT transformation over the input file. This transformation is executed in a safe mode, which implies the following:

- When loading the document:
  - The XInclude mechanism is disabled. This means that the resources included by using XInclude will not be visible in the transformation.
  - The DTD entities will be processed without being expanded.
  - The associated DTD will be not loaded, so the default attributes declared in the DTD will not be visible in the transformation.

- When saving the updated XML document:
  - The DOCTYPE will be preserved.

  **Note:** This can be changed using Saxon extension functions in XSLT (page 944).

  - The DTD entities will be preserved as they are in the original document when the document is saved.
  - The attribute values will be kept in their original form without being normalized.
  - The spaces between attributes are preserved. Basically, the spaces are lost by a regular XML serialization since they are not considered important.

The result of this transformation overrides the initial input file.

**Note:** To achieve some of the previous goals, the XML Refactoring mechanism adds several attributes that are interpreted internally. The attributes belong to the http://www.oxygenxml.com/ns/xmlRefactoring/additional_attributes namespace. These attributes should not be taken into account when processing the input XML document since they are discarded when the transformed document is serialized.

**Restriction:** Comments or processing instructions that are in any node before or after the root element cannot be modified by an XML Refactoring operation. In other words, XML Refactoring operations can only be applied on the root element and the nodes inside it. However, as a work around to this limitation, you can use Saxon extension functions and the XSLT stylesheet method (page 944) to implement the new custom XML refactoring operation.

**Creating a Custom Refactoring Operation**

To create a custom refactoring operation, follow these steps:

1. Create an XQuery Update script (page 934) or XSLT stylesheet file (page 939).
2. Create an XML Refactoring Operation Descriptor file contains the path to the XQuery Update script (page 937) or XSLT stylesheet (page 941).
3. Store both files in one of the locations that Oxygen XML Editor plugin (page 946) scans when loading the custom operations.

**Result:** Once you run the XML Refactoring tool again, the custom operation appears in the Refactoring Operations wizard page (page 914).

### Related Information:

- Storing and Sharing Refactoring Operations (page 946)

---

### Custom Refactoring Script

The first step in creating a custom refactoring operation is to create an XQuery Update script (page 934) or XSLT stylesheet (page 939) that is needed to process the refactoring operations. The easiest way to create this script file is to use the New document wizard to create a new XQuery or XSLT file and you can use the XQuery method example (page 934) or XSLT method example (page 939) to help you with the content.

There are cases when it is necessary to add parameters in the XQuery script (page 934) or XSLT stylesheet (page 939). For instance, if you want to rename an element, you may want to declare an external parameter associated with the name of the element to be renamed. To allow you to specify the value for these parameters, they need to be declared in the refactoring operation descriptor file that is associated with this operation.

**Note:** The XQuery Update processing is disabled by default in Oxygen XML Editor plugin. Thus, if you want to create or edit an XQuery Update script you have to enable this mechanism by creating an XQuery transformation scenario (page 1489) and choose Saxon EE as the transformation engine. Also, you need to make sure the Enable XQuery update option is selected in the Saxon processor advanced options (page 1439).

**Note:** If you are using an XSLT file, XPath expressions that are passed as parameters will automatically be rewritten to conform with the mapping of the namespace prefixes declared in the XML /XSLT-FO-XQuery /XPath preferences page (page 184).

The next step in creating a custom refactoring operation is to create an XML Refactoring Operation Descriptor file contains the path to the XQuery Update script (page 937) or XSLT stylesheet (page 941).

### Related Information:
Custom Refactoring Operation Descriptor File

The second step in creating a custom refactoring operation is to create an operation descriptor file. The easiest way to do this is to use the **New** document wizard and choose the **XML Refactoring Operation Descriptor** template.

**Introduction to the Descriptor File**

This file contains information (such as **name**, **description**, and **id**) that is necessarily when loading an XML Refactoring operation. It also contains the path to the **XQuery Update script** (page 934) or **XSLT stylesheet** (page 939) that is associated with the particular operation through the **script** element.

You can specify a **category** for your custom operations to logically group certain operations. The **category** element is optional and if it is not included in the descriptor file, the default name of the category for the custom operations is **Other operations**.

The descriptor file is edited and validated against the following schema: frameworks/xml_refactoring/operation_descriptor.xsd.

**Declaring Parameters in the Descriptor File**

If the XQuery Update script or XSLT stylesheet includes parameters, they should be declared in the **parameters** section of the descriptor file. All the parameters specified in this section of the descriptor file will be displayed in the **XML Refactoring** tool within the **Configure Operation Parameters** wizard page (page 914) for that particular operation.

The value of the first **description** element in the **parameters** section will be displayed at the top of the **Configure Operation Parameters** wizard page (page 914).

To declare a parameter, specify the following information:

- **label** - This value is displayed in the user interface for the parameter.
- **name** - The parameter name used in the XQuery Update script or XSLT stylesheet and it should be the same as the one declared in the script.
• **type** - Defines the type of the parameter and how it will be rendered. There are several types available:
  - **TEXT** - Generic type used to specify a simple text fragment.
  - **XPATH** - Type of parameter whose value is an XPATH expression. For this type of parameter, Oxygen XML Editor plugin will use a text input with corresponding content completion and syntax highlighting.

  **Note:** The value of this parameter is transferred as plain text to the XQuery Update or XSLT transformation without being evaluated. You should evaluate the XPath expression inside the XQuery Update script or XSLT stylesheet. For example, you could use the `saxon:evaluate` Saxon extension function.

  **Note:** A relative XPath expression is converted to an absolute XPath expression by adding `//` before it (`//XPathExp`). This conversion is done before transferring the XPath expression to the XML refactoring engine.

  **Note:** When writing XPath expressions, you can only use prefixes declared in the Options > Preferences > XML > XSLT-FO-XQUERY > XPath (page 184) options page.

  - **NAMESPACE** - Used for editing namespace values.
  - **REG_EXP_FIND** - Used when you want to match a certain text by using Perl-like regular expressions.
  - **REG_EXP_REPLACE** - Used along with `REG_EXP_FIND` to specify the replacement string.
  - **XML_FRAGMENT** - This type is used when you want to specify an XML fragment. For this type, Oxygen XML Editor plugin will display a text area specialized for inserting XML documents.
  - **NC_NAME** - The parameter for NC_NAME values. It is useful when you want to specify the local part of a QName (page 2710) for an element or attribute.
  - **BOOLEAN** - Used to edit boolean parameters.
  - **TEXT_CHOICE** - It is useful for parameters whose value should be from a list of possible values. Oxygen XML Editor plugin renders each possible value as a radio button option.

• **description** - The description of the parameter. It is used by the application to display a tooltip when you hover over the parameter.

• **possibleValues** - Contains the list with possible values for the parameter and you can specify the default value, as in the following example:

```xml
<possibleValues onlyPossibleValuesAllowed="true">
  <value name="before">Before</value>
  <value name="after" default="true">After</value>
  <value name="firstChild">First child</value>
  <value name="lastChild">Last child</value>
</possibleValues>
```
Specialized Parameters to Match Elements or Attributes

If you want to match elements or attributes, you can use some specialized parameters, in which case Oxygen XML Editor plugin will propose all declared elements or attributes based on the schema associated with the currently edited file. The following specialized parameters are supported:

**elementLocation**

This parameter is used to match elements. For this type of parameter, the application displays a text field where you can enter the element name or an XPath expression. The text from the **label** attribute is displayed in the application as the label of the text field. The **name** attribute is used to specify the name of the parameter from the XQuery Update script or XSLT stylesheet. If the value of the **useCurrentContext** attribute is set to **true**, the element name from the cursor position is used as proposed values for this parameter.

Example of an **elementLocation**:

```xml
<elementLocation name="elem_loc" useCurrentContext="false">
    <element label="Element location">
        <description>Element location description.</description>
    </element>
</ElementLocation>
```

**attributeLocation**

This parameter is used to match attributes. For this type of parameter, the application displays two text fields where you can enter the parent element name and the attribute name (both text fields accept XPath expressions for a finer match). The text from the **label** attributes is displayed in the application as the label of the associated text fields. The **name** attribute is used to specify the name of the parameter from the XQuery Update script or XSLT stylesheet. The value of this parameter is an XPath expression that is computed by using the values of the expression from the **element** and **attribute** text fields. For example, if **section** is entered for the element and a **title** is entered for the attribute, the XPath expression would be computed as `//section/@title`. If the value of the **useCurrentContext** attribute is set to **true**, the element and attribute name from the cursor position is used as proposed values for the operation parameters.

Example of an **attributeLocation**:

```xml
<attributeLocation name="attr_xpath" useCurrentContext="true">
    <element label="Element path">
```

```xml
elementParameter

This parameter is used to specify elements by local name and namespace. For this type of parameter, the application displays two combo boxes with elements and namespaces collected from the associated schema of the currently edited file. The text from the label attribute is displayed in the application as label of the associated combo. The name attribute is used to specify the name of the parameter from the XQuery Update script or XSLT stylesheet. If you specify the allowsAny attribute, the application will propose <ANY> as a possible value for the Name and Namespace combo boxes. You can also use the useCurrentContext attribute and if its value is set to true, the element name and namespace from the cursor position is used as proposed values for the operation parameters.

Example of an elementParameter:

```
<elementParameter id="elemID" useCurrentContext="true">
  <localName label="Name" name="element_localName" allowsAny="true">
    <description>Local name of the parent element.</description>
  </localName>
  <namespace label="Namespace" name="element_namespace" allowsAny="true">
    <description>Local name of the parent element</description>
  </namespace>
</elementParameter>
```

attributeParameter

This parameter is used to specify attributes by local name and namespace. For this type of parameter, the application displays two combo boxes with attributes and their namespaces collected from the associated schema of the currently edited file. The text from the label attribute is displayed in the application as the label of the associated combo box. You can also use the useCurrentContext attribute and if its value is set to true, the attribute name and namespace from the cursor position is used as proposed values for the operation parameters.
Note: An `attributeParameter` is dependant upon an `elementParameter`.
The list of attributes and namespaces are computed based on the selection in the `elementParameter` combo boxes.

Example of an `attributeParameter`:

```
<attributeParameter dependsOn="elemID" useCurrentContext="true">
  <localName label="Name" name="attribute_localName">
    <description>The name of the attribute to be converted.</description>
  </localName>
</attributeParameter>
```

Note: All built-in operations are loaded from the `{OXYGEN_INSTALL_DIR}/refactoring` folder.

XSLT Stylesheet for Creating a Custom Operation

To demonstrate creating a custom operation, suppose that you have a task where you need to convert an attribute into an element and insert it inside another element. A specific example would be if you have a project with a variety of `image` elements where a deprecated `alt` attribute was used for the description and you want to convert all instances of that attribute into an element with the same name and insert it as the first child of the `image` element.

Thus, the task is to convert this attribute into an element with the same name and insert it as the first child of the `image` element.

Figure 677: Example: Custom XML Refactoring Operation
An XSLT stylesheet can be used to implement the new custom XML refactoring operation. The second requirement is an XML Refactoring operation descriptor file (page 941) that contains the path to the XSLT stylesheet.

**Example of an XSLT Script for Creating a Custom Operation to Convert an Attribute to an Element**

The XSLT stylesheet does the following:

- Iterates over all elements from the document that have the specified local name and namespace.
- Finds the attribute that will be converted to an element.
- Adds the new element as the first child of the parent element.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
 xmlns:xs="http://www.w3.org/2001/XMLSchema"
 exclude-result-prefixes="xs"
 xmlns:xr="http://www.oxygenxml.com/ns/xmlRefactoring"
 version="2.0">

 <xsl:param name="element_localName" as="xs:string" required="yes"/>
 <xsl:param name="element_namespace" as="xs:string" required="yes"/>
 <xsl:param name="attribute_localName" as="xs:string" required="yes"/>
 <xsl:param name="attribute_namespace" as="xs:string" required="yes"/>
```
<xsl:param name="new_element_localName" as="xs:string" required="yes"/>
<xsl:param name="new_element_namespace" as="xs:string" required="yes"/>

<xsl:template match="node() | @*">
  <xsl:copy>
    <xsl:apply-templates select="node() | @*"/>
  </xsl:copy>
</xsl:template>

<xsl:template match="/*[xr:check-local-name($element_localName, ., true())
  and
  xr:check-namespace-uri($element_namespace, .)]">
  <xsl:variable name="attributeToConvert"
    select="@*[xr:check-local-name($attribute_localName, ., true())
    and
    xr:check-namespace-uri($attribute_namespace, .)]"/>

  <xsl:choose>
    <xsl:when test="empty($attributeToConvert)">
      <xsl:copy>
        <xsl:apply-templates select="node() | @*"/>
      </xsl:copy>
    </xsl:when>
    <xsl:otherwise>
      <xsl:copy>
        <xsl:for-each select="@*[empty(. intersect $attributeToConvert)]">
          <xsl:copy-of select="."/>
        </xsl:for-each>
      </xsl:copy>
    </xsl:otherwise>
  </xsl:choose>

  <!-- The new element namespace -->
  <xsl:variable name="nsURI" as="xs:string">
    <xsl:choose>
      <xsl:when test="$new_element_namespace eq $xr:NO-NAMESPACE">
        <xsl:value-of select="''"/>
      </xsl:when>
      <xsl:otherwise>
        <xsl:value-of select="$new_element_namespace"/>
      </xsl:otherwise>
    </xsl:choose>
  </xsl:variable>

  <xsl:element name="{$new_element_localName}" namespace="{$nsURI}"/>
<xsl:value-of select="$attributeToConvert"/>
</xsl:element>
<xsl:apply-templates select="node()"/>
</xsl:copy>
</xsl:otherwise>
</xsl:choose>
</xsl:template>
</xsl:stylesheet>

Note: The XSLT stylesheet imports a module library that contains utility functions and variables. The location of this module is resolved via an XML Catalog (page 2712) set in the XML Refactoring framework (page 2706).

Example of an Operation Descriptor File That References the XSLT Stylesheet for Creating a Custom Operation to Convert an Attribute to an Element

After you have developed the XSLT stylesheet, you have to create an XML Refactoring operation descriptor. This descriptor is used by the application to load the operation details such as name, description, or parameters.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<refactoringOperationDescriptor
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xmlns="http://www.oxygenxml.com/ns/xmlRefactoring"
id="convert-attribute-to-element"
name="Convert attribute to element">
<description>Converts the specified attribute to an element.
The new element will be inserted as first child of the attribute's parent element.</description>
<!-- For the XSLT stylesheet option uncomment the following line and comment the line referring the XQuery Update script -->
<!-- <script type="XSLT" href="convert-attribute-to-element.xsl"/> -->
<script type="XQUERY_UPDATE" href="convert-attribute-to-element.xq"/>
<parameters>
<description>Specify the attribute to be converted to element.</description>
<section label="Parent element">
<elementParameter id="elemID">
<localName label="Name" name="element_localName" allowsAny="true">
<description>Local name of the parent element.</description>
</localName>
```
<namespace label="Namespace" name="element_namespace" allowsAny="true">
    <description>Local name of the parent element</description>
</namespace>
</elementParameter>
</section>

<section label="Attribute">
    <attributeParameter dependsOn="elemID">
        <localName label="Name" name="attribute_localName">
            <description>Name of the attribute to be converted.</description>
        </localName>
        <namespace label="Namespace" name="attribute_namespace" allowsAny="true">
            <description>Namespace of the attribute to be converted.</description>
        </namespace>
    </attributeParameter>
</section>

<section label="New element">
    <elementParameter>
        <localName label="Name" name="new_element_localName">
            <description>The name of the new element.</description>
        </localName>
        <namespace label="Namespace" name="new_element_namespace">
            <description>The namespace of the new element.</description>
        </namespace>
    </elementParameter>
</section>

</parameters>
</refactoringOperationDescriptor>

Note: If you are using an XSLT file, the line with the `script` element would look like this:

```xml
<script type="XSLT" href="convert-attribute-to-element.xsl"/>
```

Results

After you have created these files, copy them into a folder scanned by Oxygen XML Editor plugin when it loads the custom operation (page 946). When the XML Refactoring tool is started again, you will see the created operation.

Since various parameters can be specified, this custom operation can also be used for other similar tasks. The following image shows the parameters that can be specified in the example of the custom operation to convert an attribute to an element:
Using Saxon Extension Functions to Allow Custom Refactoring Operations to Read and Modify Content Outside the Root Node

One advantage to using an XSLT stylesheet is that there is limitation when using an XQuery Update script (page 934) in that refactoring operations can only be performed on comments or processing instructions that are inside the root element. Thus, using the XQuery method, comments or processing instructions that are in any node before or after the root element cannot be modified by an XML Refactoring operation.

The XSLT stylesheet method offers a work around to this limitation through the use of some Saxon extension functions.

To illustrate the use of these functions, consider the following sample XML file:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!-- comment before root -->
<?pi before root ?>
<root>
  <child/>
</root>
<!-- comment after root -->
<?pi after root ?>
```

The following Saxon extension functions can be used to read and modify content outside the root node:
Note: They belong to the `http://www.oxygenxml.com/ns/xmlRefactoring/functions` namespace.

- **get-content-after-root()** - Returns the content after root as `xs:string`.

  For the XML above, the call of this function will return the following string value:

  ```xml
  <!-- comment after root -->
  <?pi after root ?>
  ```

- **set-content-after-root(xs:string)** - Updates the content that will be serialized in the refactored document after the root node.

  The function call `set-content-after-root('&lt;!-- Inserted comment -->')` will result in replacing the nodes after the root element with the comment passed as string argument. The XML document will be modified as follows:

  ```xml
  <!-- Inserted comment -->
  <root>
    <child></child>
  </root>
  <!-- comment after root -->
  ```

- **get-content-before-root()** - Returns the content before root as `xs:string`.

  For the XML above, the call of this function will return the following string value:

  ```xml
  <!-- comment before root -->
  <?pi before root ?>
  ```

- **set-content-before-root(xs:string)** - Updates the content that will be serialized in the refactored document after the root node.

  The function call `set-content-before-root('&lt;!-- Inserted comment -->')` will result in replacing the nodes before the root element with the comment passed as string argument. The XML document will be modified as follows:

  ```xml
  <!-- Inserted comment -->
  <root>
    <child></child>
  </root>
  <!-- comment after root -->
  ```
XSLT Example:

To process content after the root node, the XSLT would look like this:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema" exclude-result-prefixes="xs"
    xmlns:xrf="http://www.oxygenxml.com/ns/xmlRefactoring/functions" version="3.0">
    <xsl:template match="/">
        <!-- The comment content that will be inserted after the root element -->
        <xsl:variable name="commentAsText">&lt;!-- COMMENT ADDED FROM XR OPERATION--&gt;</xsl:variable>
        <!-- Retrieve the content after the root element as string -->
        <xsl:variable name="after-root-content" as="xs:string">
            xrf:get-content-after-root()
        </xsl:variable>
        <xsl:variable name="processedContent">
            concat($after-root-content, $commentAsText)
        </xsl:variable>
        <!-- Update the content after the root element -->
        <xsl:value-of select="xrf:set-content-after-root($processedContent)"/>
    </xsl:template>
</xsl:stylesheet>
```

Note: The above XSLT retrieves the nodes after the root element as string, appends a new comment, and then sets back the updated content into the XML document.

Storing and Sharing Refactoring Operations
Oxygen XML Editor plugin scans the following locations when looking for XML Refactoring operations to provide flexibility:

- A refactoring folder, created inside a directory that is associated to a framework you are customizing. To associate the parent directory to the framework, you need to add it in the Classpath tab of the Document type configuration dialog box (page 76).
- A folder that you specify in the Load additional refactoring operations from text box (page 178) in the XML Refactoring preferences page (page 178).
- The refactoring folder from the Oxygen XML Editor plugin installation directory (/OXYGEN_INSTALL_DIR/refactoring/).

Sharing Custom Refactoring Operations

The purpose of Oxygen XML Editor plugin scanning multiple locations for the XML Refactoring operations is to provide more flexibility for developers who want to share the refactoring operations with the other team members. Depending on your particular use case, you can attach the custom refactoring operations to other resources, such as framework (page 2706) or projects.

After storing custom operations, you can share them with other users by sharing the resources.

Localizing XML Refactoring Operations

Oxygen XML Editor plugin includes localization support for the XML refactoring operations.

The translation keys for the built-in refactoring operations are located in /OXYGEN_INSTALL_DIR/refactoring/i18n/translation.xml.

The localization support is also available for custom refactoring operations. The following information can be translated:

- The operation name, description, and category.
- The description of the parameters element.
- The label, description, and possibleValues for each parameter.

Translated refactoring information uses the following form:

```java
${i18n(translation_key)}
```

Oxygen XML Editor plugin scans the following locations to find the translation.xml files that are used to load the translation keys:
• A `refactoring/i18n` folder, created inside a directory that is associated to a customized framework.

• A `i18n` folder, created inside a directory that is associated to a customized framework.

• An `i18n` folder inside any specified folder. In this case, you need to open the Preferences dialog box (page 55), go to XML > XML Refactoring, and specify the folder in the Load additional refactoring operations from text box.

• The `refactoring/i18n` folder from the Oxygen XML Editor plugin installation directory (`{OXYGEN_INSTALL_DIR}/refactoring/i18n`).

Example: Refactoring Operation Descriptor File with `i18n` Support

```xml
<?xml version="1.0" encoding="UTF-8"?>
<refactoringOperationDescriptor
    xmlns="http://www.oxygenxml.com/ns/xmlRefactoring" id="remove_text_content"
    name="${i18n(Remove_text_content)}">
    <description>${i18n(Remove_text_content_description)}</description>
    <script type="XQUERY_UPDATE" href="remove_text_content.xq"/>
    <parameters>
        <description>${i18n(parameters_description)}</description>
        <parameter label="${i18n(Element_name)}" name="element_localName"
            type="NC_NAME">
            <description>${i18n(Element_name_descriptor)}</description>
            <possibleValues>
                <value default="true" name="value1">${i18n(value_1)}</value>
                <value name="value2">${i18n(value_2)}</value>
            </possibleValues>
        </parameter>
    </parameters>
</refactoringOperationDescriptor>
```

Generating Sample XML Files

Oxygen XML Editor plugin offers support to generate sample XML files both from XML schema 1.0 and XML schema 1.1, depending on the XML schema version set in XML Schema preferences page (page 177).

To generate sample XML files from an XML Schema, use the Generate Sample XML Files action from the XML Tools menu. This action is also available in the contextual menu of the schema Design.
mode (page 1015). The action opens the Generate Sample XML Files dialog box that allows you to configure a variety of options for generating the files.

The Generate Sample XML Files dialog box contains three tabs with various configurable options. Default values for these options can be set in the Sample XML Files Generator preferences page (page 168).

Schema Tab (Generate Sample XML Files Tool)

The Generate Sample XML Files tool includes a dialog box that allows you to configure a variety of options for generating the XML files. The first set of options are found in the Schema tab.

Figure 679: Generate Sample XML Files Dialog Box (Schema Tab)

This tab includes the following options:

**URL**

Specifies the URL of the Schema location. You can specify the path by using the text field, the history drop-down menu, or the browsing actions in the Browse drop-down list.

**Namespace**

Displays the namespace of the selected schema.

**Root Element**
After the schema is selected, this drop-down menu is populated with all root candidates gathered from the schema. Choose the root of the output XML documents.

**Output folder**

Path to the folder where the generated XML instances will be saved.

**Filename prefix and Extension**

You can specify the prefix and extension for the file name that will be generated. Generated file names have the following format: `prefixN.extension`, where `N` represents an incremental number from 0 up to the specified [Number of instances](page 1071).

**Number of instances**

The number of XML files to be generated.

**Open first instance in editor**

When selected, the first generated XML file is opened in the editor.

**Namespaces section**

You can specify the Default Namespace, as well as the prefixes for the namespaces.

**Export settings**

Use this button to save the current settings for future use.

**Import settings**

Use this button to load previously exported settings.

You can click **OK** at any point to generate the sample XML files.

**Options Tab (Generate Sample XML Files Tool)**

The Generate Sample XML Files tool includes a dialog box that allows you to configure a variety of options for generating the XML files. The Options tab allows you to set specific options for namespaces and elements.

*Figure 680: Generate Sample XML Files Dialog Box (Options Tab)*
This tab includes the following options:

**Namespace / Element table**

Allows you to set a namespace for each element name that appears in an XML document instance. The following prefix-to-namespace associations are available:

- All elements from all namespaces ( `<ANY>` - `<ANY>` ). This is the default setting.
- All elements from a specific namespace.
- A specific element from a specific namespace.

**Settings subtab**

**Namespace**

Displays the namespace specified in the table at the top of the dialog box.

**Element**

Displays the element specified in the table at the top of the dialog box.

**Generate optional elements**

When selected, all elements are generated, including the optional ones (having the `minOccurs` attribute set to 0 in the schema).
Generate optional attributes

When selected, all attributes are generated, including the optional ones (having the use attribute set to optional in the schema).

Values of elements and attributes

Controls the content of generated attribute and element values. The following choices are available:

- **None** - No content is inserted.
- **Default** - Inserts a default value depending of data type descriptor of the particular element or attribute. The default value can be either the data type name or an incremental name of the attribute or element (according to the global option from the Sample XML Files Generator preferences page). Note that type restrictions are ignored when this option is selected. For example, if an element is of a type that restricts an `xs:string` with the `xs:maxLength` facet to allow strings with a maximum length of 3, the XML instance generator tool may generate string element values longer than 3 characters.
- **Random** - Inserts a random value depending of data type descriptor of the particular element or attribute.

⚠️ **Important**: If all of the following are true, the Generate Sample XML Files tool outputs invalid values:
  - At least one of the restrictions is a regexp.
  - The value generated after applying the regexp does not match the restrictions imposed by one of the facets.

Preferred number of repetitions

Allows you to set the preferred number of repeating elements related to `minOccurs` and `maxOccurs` facets defined in the XML Schema.

- If the value set here is between `minOccurs` and `maxOccurs`, then that value is used.
- If the value set here is less than `minOccurs`, then the `minOccurs` value is used.
- If the value set here is greater than `maxOccurs`, then `maxOccurs` is used.

Maximum recursion level
If a recursion is found, this option controls the maximum allowed depth of the same element.

**Type alternative strategy**

Used for the `xs:alternative` element from XML Schema 1.1. The possible strategies are:

- **First** - The first valid alternative type is always used.
- **Random** - A random alternative type is used.

**Choice strategy**

Used for `xs:choice` or `substitutionGroup` elements. The possible strategies are:

- **First** - The first branch of `xs:choice` or the head element of `substitutionGroup` is always used.
- **Random** - A random branch of `xs:choice` or a substitute element or the head element of a `substitutionGroup` is used.

**Generate the other options as comments**

If selected, generates the other possible choices or substitutions (for `xs:choice` and `substitutionGroup`). These alternatives are generated inside comments groups so you can uncomment and use them later. Use this option with care (for example, on a restricted namespace and element) as it may generate large result files.

**Element values subtab**

Allows you to add values that are used to generate the content of elements. If there are multiple values, then the values are used in a random order.

**Attribute values subtab**

Allows you to add values that are used to generate the content of attributes. If there are multiple values, then the values are used in a random order.

**Export settings**

Use this button to save the current settings for future use.

**Import settings**

Use this button to load previously exported settings.

You can click **OK** at any point to generate the sample XML files.
Advanced Tab (Generate Sample XML Files Tool)

The Generate Sample XML Files tool includes a dialog box that allows you to configure a variety of options for generating the XML files. The Advanced tab allows you to set some options regarding output values and performance.

Figure 681: Generate Sample XML Files Dialog Box (Advanced Tab)

This tab includes the following options:

**Use incremental attribute / element names as default**

If selected, the value of an element or attribute starts with the name of that element or attribute. For example, for an `<a>` element the generated values are: `a1`, `a2`, `a3`, and so on. If not selected, the value is the name of the type of that element / attribute (for example: `string`, `decimal`, etc.)

**Maximum length**

The maximum length of string values generated for elements and attributes.

**Discard optional elements after nested level**

The optional elements that exceed the specified nested level are discarded. This option is useful for limiting deeply nested element definitions that can quickly result in very large XML documents.

**Export settings**

Use this button to save the current settings for future use.

**Import settings**

Use this button to load previously exported settings.

Converting Schema to Another Schema Language
The **Generate/Convert Schema** tool allows you to convert a DTD or Relax NG (full or compact syntax) schema or a set of XML files to an equivalent XML Schema, DTD or Relax NG (full or compact syntax) schema. Where perfect equivalence is not possible due to limitations of the target language, Oxygen XML Editor plugin generates an approximation of the source schema. Oxygen XML Editor plugin uses *Trang multiple format converter* to perform the actual schema conversions.

To use this tool, select the **Generate/Convert Schema** (`Ctrl + Shift + BackSlash (Command + Shift + BackSlash on OS X)`) action from the XML Tools menu. This action opens the **Generate/Convert Schema** dialog box that allows you to configure various options for conversion.

*Figure 682: Generate/Convert Schema Dialog Box*

The **Generate/Convert Schema** dialog box includes the following options:

**Input section**

Allows you to select the language of the source schema. If the conversion is based on a set of XML files, rather than just a single XML file, select the **XML Documents** option and use the file selector to add the XML files involved in the conversion.

**Output section**

Allows you to select the language of the target schema.

**Options**

You can choose the **Encoding**, the maximum **Line width**, and the **Indent size** (in number of spaces) for one level of indentation.

**Output file**
Specifies the path for the output file that will be generated.

**Close dialog when finished**

If you deselect this option, the dialog box will remain opened after the conversion so that you can easily continue to convert more files.

**Advanced options**

If you select **XML 1.0 DTD** for the input, you can click this button to access more advance options to further fine-tune the conversion. The following advanced options are available:

**XML 1.0 DTD Input section**

These options apply to the source DTD:

- **xmlns** - Specifies the default namespace, that is the namespace used for unqualified element names.
- **attlist-define** - Specifies how to construct the name of the definition representing an attribute list declaration from the name of the element. The specified value must contain exactly one percent character. This percent character is replaced by the name of element (after colon replacement) and the result is used as the name of the definition.
- **colon-replacement** - Replaces colons in element names with the specified chars when constructing the names of definitions used to represent the element declarations and attribute list declarations in the DTD.
- **any-name** - Specifies the name of the definition generated for the content of elements declared in the DTD as having a content model of ANY.
- **element-define** - Specifies how to construct the name of the definition representing an element declaration from the name of the element. The specified value must contain exactly one percent character. This percent character is replaced by the name of element (after colon replacement) and the result is used as the name of the definition.
- **annotation-prefix** - Default values are represented using an annotation attribute prefix:defaultValue where prefix is the specified value and is bound to http://relaxng.org/ns/compatibility/annotations/1.0 as defined by the RELAX NG DTD Compatibility Committee Specification. By default, the conversion engine will use a for prefix unless that conflicts with a prefix used in the DTD.
• **inline-attlist** - Instructs the application not to generate definitions for attribute list declarations, but instead move attributes declared in attribute list declarations into the definitions generated for element declarations. This is the default behavior when the output language is XSD.

• **strict-any** - Preserves the exact semantics of ANY content models by using an explicit choice of references to all declared elements. By default, the conversion engine uses a wildcard that allows any element

• **generate-start** - Specifies whether or not the conversion engine should generate a start element. DTD's do not indicate what elements are allowed as document elements. The conversion engine assumes that all elements that are defined but never referenced are allowed as document elements.

• **xmlns mappings** table - Each row specifies the prefix used for a namespace in the input schema.

**W3C XML Schema Output section**

This section is available if you select **W3C XML Schema** for the output.

• **disable-abstract-elements** - Disables the use of abstract elements and substitution groups in the generated XML Schema. This can also be controlled using an annotation attribute.

• **any-process-contents** - One of the values: strict, lax, skip. Specifies the value for the `processContents` attribute of any elements. The default is skip (corresponding to RELAX NG semantics) unless the input format is DTD, in which case the default is strict (corresponding to DTD semantics).

• **any-attribute-process-contents** - Specifies the value for the `processContents` attribute of anyAttribute elements. The default is skip (corresponding to RELAX NG semantics).

**Converting Database to XML Schema**

Oxygen XML Editor plugin includes a tool that allows you to create an XML Schema from the structure of a database.

To convert a database structure to an XML Schema, use the following procedure:

1. Select the **Convert DB Structure to XML Schema** action from the **Tools** menu.
Result: The Convert DB Structure to XML Schema dialog box is opened and your current database connections are displayed in the Connections section.

2. If the database source is not listed, click the Configure Database Sources button to open the Data Sources preferences page (page 60) where you can configure data sources and connections.

3. In the Format for generated schema section, select one of the following formats:
   - Flat schema - A flat structure that resembles a tree-like view of the database without references to elements.
   - Hierarchical schema - Display the table dependencies visually, in a type of tree view where dependent tables are shown as indented child elements in the content model. Select this option if you want to configure the database columns of the tables to be converted.

4. Click Connect.

Result: The database structure is listed in the Select database tables section according to the format you chose.

5. Select the database tables that you want to be included in the XML Schema.

6. If you selected Hierarchical schema for the format, you can configure the database columns.
   a. Select the database column you want to configure.
   b. In the Criterion section you can choose to convert the selected database column as an Element, Attribute, or to be Skipped in the resulting XML Schema.
   c. You can also change the name of the selected database column by changing it in the Name text field.

7. Click Generate XML Schema.

Result: The database structure is converted to an XML Schema and it is opened for viewing and editing.

JSON to XML Converter

Oxygen XML Editor plugin includes a useful and simple tool for converting JSON files to XML. It can be found in the XML Tools menu.

To convert a JSON document to XML, follow these steps:

1. Select the JSON to XML action from the XML Tools menu. The JSON to XML dialog box is displayed:

   Figure 683: JSON to XML Dialog Box
2. Choose or enter the **Input URL** of the JSON document.

3. Choose the path of the **Output file** that will contain the resulting XML document.

4. Select the **Open in Editor** option to open the resulting XML document in the main editing pane.

5. Click the **Convert** button.

The original JSON document is now converted to an XML document.

*Figure 684: Example: XML to JSON Operation Result*

---

**Online JSON to XML Converter**

For a simple ONLINE tool for converting a single JSON file to XML, or vice versa, go to: [https://www.oxygenxml.com/xml_json_converter.html](https://www.oxygenxml.com/xml_json_converter.html).
XML to JSON Converter

Oxygen XML Editor plugin includes a useful and simple tool for converting XML files to JSON. It can be found in the XML Tools menu.

To convert an XML document to JSON, follow these steps:

1. Select the XML to JSON action from the XML Tools menu. The XML to JSON dialog box is displayed:

   Figure 685: XML to JSON Dialog Box

2. Choose or enter the Input URL of the XML document.
3. Choose the path of the Output file that will contain the resulting JSON document.
4. Select the Open in Editor option to open the resulting JSON document in the main editing pane.
5. Click the Convert button.

The original XML document is now converted to a JSON document.

Figure 686: Example: XML to JSON Operation Result
Online XML to JSON Converter

For a simple ONLINE tool for converting a single XML file to JSON, or vice versa, go to: https://www.oxygenxml.com/xml_json_converter.html.

Compiling an XSL Stylesheet for Saxon

As of Saxon 9.7, it is possible to export a compiled form of a stylesheet as an XML file (called a stylesheet export file or SEF). Oxygen XML Editor plugin includes a simple tool called Compile XSL Stylesheet for Saxon (found in the XML Tools menu) that does this for you.

Use-Cases for a Stylesheet Export File (SEF)

• Use Saxon-JS to run transformations in a browser - A stylesheet export file (SEF) is needed if you want to use the Saxon-JS product to run transformations in a browser, as in the following example:

```xml
<script type="text/javascript" src="SaxonJS/SaxonJS.min.js"></script>
<script>
    window.onload = function() {
```
- Use SEF to run transformations in Oxygen XML Editor plugin - You can also use a stylesheet export file (SEF) in Oxygen XML Editor plugin to apply an XSLT transformation over an XML file. This requires Saxon-EE or Saxon-PE versions of the Saxon product and you must select one of those two versions for the Target when you configure the SEF file (page 1011). When configuring the XSLT transformation, you will specify the SEF file in the XSL URL field (page 1417).

Compiling an SEF File

The Compile XSL Stylesheet for Saxon tool can be found in the XML Tools menu and it compiles a specified stylesheet as an XML file (stylesheet export file with a file extension of .sef).

Selecting this tool opens the Compile XSL Stylesheet for Saxon dialog box that allows you to configure some options for conversion.

Figure 687: Compile XSL Stylesheet for Saxon Dialog Box

This dialog box includes the following options:

**XSL URL**

Allows you to select URL of the source XSL stylesheet. You can specify the URL by using the text field, the history drop-down, or the browsing actions in the Browse drop-down list.

**Target**

- Saxon-JS
- Saxon-EE
- Saxon-PE
- Relocatable ("-relocate")

**Output file**

Allows you to specify the output file name and path.

**Use a configuration file ("-config")**

Allows you to specify an XSLT configuration file.

**Open in Editor**

Opens the compiled stylesheet in the editor.
Allows you to select the type of Saxon product that the export file will be used with. You can choose Saxon-JS, Saxon-EE, Saxon-PE, or Saxon-HE.

**Relocatable**

Can be used to control the Saxon -relocate parameter. You can select this option to produce a relocatable export package (SEF) that can be deployed to a different location, with a different base URL.

**Output file**

You can specify the path where the output file will be saved by entering it in the text field, using the Insert Editor Variables button, or using the browsing actions in the Browse drop-down list.

**Open in Editor**

Select this option to open the resulting stylesheet export file in the main Oxygen XML Editor plugin editing pane.

**Use a configuration file ("-config")**

Select this option if you want to use a Saxon 9.8.0.12 configuration file that will be executed for the XSLT transformation and validation processes. You can specify the path to the configuration file by entering it in the URL field, or by using the Insert Editor Variables button, or using the browsing actions in the Browse drop-down list.

**Compile**

Use this button to generate the stylesheet export file according the options selected in this dialog box.

**Generate Documentation**

Oxygen XML Editor plugin includes a tool for generating documentation for XSLT, XML Schema, XQuery, and WSDL documents.

**Generating Documentation for an XML Schema**

Oxygen XML Editor plugin can generate detailed documentation for the components of an XML Schema in HTML, PDF, DocBook, or other custom formats. You can select the components and the level of detail. The components are hyperlinked in both HTML and DocBook documents.

**Note:** You can generate documentation for both XML Schema version 1.0 and 1.1.
To generate documentation for an XML Schema document, select **XML Schema Documentation** from the **XML Tools > Generate Documentation** menu or from the **Generate XML Schema Documentation** action from the contextual menu of the **Navigator view** (page 250).

**Figure 688: XML Schema Documentation Dialog Box**

The **Schema URL** field of the dialog box must contain the full path to the XML Schema (XSD) file for which you want to generate documentation. The schema may be a local or a remote file. You can specify the path to the schema by entering it in the text field, or by using the **Insert Editor Variables** button or the options in the **Browse** drop-down menu.

**Output Tab**

The following options are available in the **Output** tab:

- **Format** - Allows you to choose between the following formats:
  - **HTML** - The documentation is generated in **HTML output format** (page 1080).
  - **PDF** - The documentation is generated in **PDF output format** (page 1083).
  - **DocBook** - The documentation is generated in **DocBook output format** (page 1084).
  - **DITA** - The documentation is generated in **DITA output format** (page 1084).
• **Custom** - The documentation is generated in a custom output format *(page 1084)*, allowing you to control the output. Click the Options button to open a Custom format options dialog box where you can specify a custom stylesheet for creating the output. There is also an option to Copy additional resources to the output folder and you can select the path to the additional Resources that you want to copy. You can also choose to keep the intermediate XML files created during the documentation process by deselecting the Delete intermediate XML file option.

• **Output file** - You can specify the path of the output file by entering it in the text field, or by using the `Insert Editor Variables` button or the options in the `Browse` drop-down menu.

• **Split output into multiple files** - Instructs the application to split the output into multiple files. You can choose to split them by namespace, location, or component name.

• **Open in Browser/System Application** - Opens the result in the system application associated with the output file type. For DITA and DocBook documents, this option appears as Open in Editor and the result will be opened in Oxygen XML Editor plugin (in the current editor).

![Note:](Image) To set the browser or system application that will be used, go to Window > Preferences > General > Web Browser and specify it there. This will take precedence over the default system application settings.

• **Keep only the annotations with xml:lang set to** - The generated output will contain only the annotations with the xml:lang attribute set to the selected language. If you choose a primary language code (for example, en for English), this includes all its possible variations (en-us, en-uk, etc.).

### Settings Tab

When you generate documentation for an XML schema you can choose what components to include in the output and the details to be included in the documentation.

*Figure 689: Settings Tab of the XML Schema Documentation Dialog Box*
The Settings tab allows you to choose whether or not to include the following components: **Global elements, Global attributes, Local elements, Local attributes, Simple Types, Complex Types, Groups, Attribute Groups, Redefines, Referenced schemas, Include notations**.

You can choose whether or not to include the following other details:

- **Diagram** - Displays the diagram for each component. You can choose the image format (JPEG, PNG, SVG) to use for the diagram section. The generated diagrams are dependent on the options from the Schema Design Properties (page 134) page.
- **Diagram annotations** - This option controls whether or not the annotations of the components presented in the diagram sections are included.
- **Namespace** - Displays the namespace for each component.
- **Location** - Displays the schema location for each component.
- **Type** - Displays the component type if it is not an anonymous one.
- **Type hierarchy** - Displays the types hierarchy.
- **Model** - Displays the model (sequence, choice, all) presented in BNF form. The separator characters that are used depend upon the information item used:
  - `xs:all` - Its children will be separated by space characters.
  - `xs:sequence` - Its children will be separated by comma characters.
  - `xs:choice` - Its children will be separated by `/` characters.
- **Children** - Displays the list of component's children.
• **Instance** - Displays an XML instance generated based on each schema element.
• **Used by** - Displays the list of all the components that reference the current one. The list is sorted by component type and name.
• **Properties** - Displays some of the component's properties.
• **Facets** - Displays the facets for each simple type
• **Identity constraints** - Displays the identity constraints for each element. For each constraint there are presented the name, type (unique, key, keyref), reference attribute, selector and field(s).
• **Attributes** - Displays the attributes for the component. For each attribute there are presented the name, type, fixed or default value, usage and annotation.
• **Asserts** - Displays the assert elements defined in a complex type. The test, XPath default namespace, and annotation are presented for each assert.
• **Annotations** - Displays the annotations for the component. If you choose Escape XML Content, the XML tags are present in the annotations.
• **Source** - Displays the text schema source for each component.
• **Generate index** - Displays an index with the components included in the documentation.
  - Include local elements and attributes - If selected, local elements and attributes are included in the documentation index.
  - Include resource hierarchy - Specifies whether or not the resource hierarchy for an XML Schema documentation is generated. It is deselected by default.

**Export settings** - Save the current settings in a settings file for further use (for example, with the exported settings file you can generate the same documentation from the command line interface (page 1086).)

**Import settings** - Reloads the settings from the exported file.

**Generate** - Use this button to generate the XML Schema documentation.

---

**Generating Documentation for an XSLT Stylesheet**

You can use Oxygen XML Editor plugin to generate detailed documentation in HTML format for the elements (top-level elements whose names are in the XSLT namespace) of an XSLT stylesheet. You can select what XSLT elements to include in the generated documentation and also the level of details to present for each of them. The elements are hyperlinked. To generate documentation in a custom
output format (page 1006), you can edit the XSLT stylesheet used to generate the documentation, or create your own stylesheet.

To open the XSLT Stylesheet Documentation dialog box, select XSLT Stylesheet Documentation from the XML Tools > Generate Documentation menu or from the Generate Stylesheet Documentation action from the contextual menu of the Navigator view (page 250).

Figure 690: XSLT Stylesheet Documentation Dialog Box

The XSL URL field of the dialog box must contain the full path to the XSL Stylesheet file you want to generate documentation for. The stylesheet may be a local or a remote file. You can specify the path to the stylesheet by entering it in the text field, or by using the Insert Editor Variables button or the options in the Browse drop-down menu.

Output Tab

The following options are available in the Output tab:

- **Format** - Allows you to choose between the following formats:
  - HTML - The documentation is generated in HTML output format (page 1003).
  - Custom - The documentation is generated in a custom output format (page 1006), allowing you to control the output. Click the Options button to open a Custom format options dialog box (page 1007) where you can specify a custom stylesheet for creating the output. There is also an option to Copy additional resources to the output folder and you can select the path to the additional Resources that you want to copy. You can also choose to keep the intermediate XML files created during the documentation process by deselecting the Delete intermediate XML file option.
- **Output file** - You can specify the path of the output file by entering it in the text field, or by using the **Insert Editor Variables** button or the options in the **Browse** drop-down menu.

- **Split output into multiple files** - Instructs the application to split the output into multiple files. For large XSLT stylesheets, choosing another split criterion may generate smaller output files, providing faster documentation browsing. You can choose to split them by namespace, location, or component name.

- **Open in Browser/System Application** - Opens the result in the system application associated with the output file type.

  **Note:** To set the browser or system application that will be used, go to **Window > Preferences > General > Web Browser** and specify it there. This will take precedence over the default system application settings.

**Settings Tab**

When you generate documentation for an XSLT stylesheet you can choose what XSLT elements to include in the output (templates, functions, global parameters, global variables, attribute sets, character maps, keys, decimal formats, output formats, XSLT elements from referenced stylesheets) and the details to include in the documentation.

**Figure 691: Settings Tab of the XSLT Stylesheet Documentation Dialog Box**

The **Settings** tab allows you to choose whether or not to include the following components: **Templates, Functions, Global parameters, Global variables, Attribute sets, Character maps, Keys, Decimal formats, Output formats, Referenced stylesheets**.

You can choose whether or not to include the following other details:
• **Documentation** - Shows the documentation for each XSLT element. For HTML format, the user-defined data elements that are recognized and transformed in documentation blocks of the XSLT elements they precede, are the ones from the following schemas:
  - Oxygen XML Editor plugin built-in XSLT documentation schema.
  - A subset of DocBook 5 elements. The recognized elements are: *section*, *sect1* to *sect5*, *emphasis*, *title*, *ulink*, *programlisting*, *para*, *orderedlist*, *itemizedlist*.
  - A subset of DITA elements. The recognized elements are: *concept*, *topic*, *task*, *codeblock*, *p*, *b*, *i*, *ul*, *ol*, *pre*, *sl*, *sli*, *step*, *steps*, *li*, *title*, *xref*.
  - Full XHTML 1.0 support.
  - XSLStyle documentation environment. XSLStyle uses DocBook or DITA languages inside its own user-defined data elements. The supported DocBook and DITA elements are the ones mentioned above.
  - DOXSL documentation framework (page 2706). Supported elements are: *codefrag*, *description*, *para*, *docContent*, *documentation*, *parameter*, *function*, *docSchema*, *link*, *list*, *listitem*, *module*, *parameter*, *template*, *attribute-set*.

Other XSLT documentation blocks that are not recognized will just be serialized inside an HTML `pre` element. You can change this behavior by using a custom format (page 1006) instead of the built-in HTML format (page 1003) and providing your own XSLT stylesheets.

• **Use comments** - Controls whether or not the comments that precede an XSLT element is treated as documentation for the element they precede. Comments that precede or succeed the `xsl:stylesheet` element, are treated as documentation for the whole stylesheet. Note that comments that precede an import or include directive are not collected as documentation for the imported/included module. Also, comments from within the body of the XSLT elements are not collected at all.

• **Namespace** - Shows the namespace for named XSLT elements.

• **Location** - Shows the stylesheet location for each XSLT element.

• **Parameters** - Shows parameters of templates and functions.

• **References** - Shows the named XSLT elements that are referenced from within an element.

• **Used by** - Shows the list of all the XSLT elements that reference the current named element.

• **Supersedes** - Shows the list of all the XSLT elements that are superseded the current element.

• **Overriding** - Shows the list of all the XSLT elements that override the current element.

• **Return type** - Shows the return type of the function.

• **Source** - Shows the text stylesheet source for each XSLT element.

• **Import precedence** - Shows the computed import precedence as declared in the XSL transformation specifications.

• **Generate index** - Creates an index with all the XSLT elements included in the documentation.
Export settings - Save the current settings in a settings file for further use (for example, with the exported settings file you can generate the same documentation from the command-line interface (page 1007).)

Import settings - Reloads the settings from the exported file.

Generate - Use this button to generate the XSLT documentation.

Related Information:

- XSLT Stylesheet Component Documentation Support (page 986)

Generating HTML Documentation for an XQuery Document

To generate HTML documentation for an XQuery document, use the XQuery Documentation dialog box. It is opened with the XQuery Documentation action that is available from the XML Tools > Generate Documentation menu or from the Generate XQuery Documentation action from the contextual menu of the Navigator view (page 250).

The dialog box allows you to configure a set of parameters for the process of generating the HTML documentation.

Figure 692: XQuery Documentation Dialog Box
The following options are available:

- **Input** - The full path to the XQuery file must be specified in one of the two fields in this section:
  - **URL** - The URL of the file in which you want to generate the documentation.
  - **Folder** - The directory that contains the files for which you want to generate the documentation. You can also specify the XQuery file extensions to be searched for in the specified directory.

- **Default function namespace** - Optional URI for the default namespace for the submitted XQuery.

- **Predefined function namespaces** - Optional, engine-dependent, predefined namespaces that the submitted XQuery refers to. They allow the conversion to generate annotation information to support the presentation component hypertext linking (only if the predefined modules have been loaded into the local xqDoc XML repository).

- **Open in Browser/System Application** - Select this option if you want the result to be opened in the system application associated with that file type.

  **Note:** To set the browser or system application that will be used, go to **Window > Preferences > General > Web Browser** and specify it there. This will take precedence over the default system application settings.

- **Output** - Allows you to specify where the generated documentation is saved on disk.

**Generating Documentation for WSDL Documents**
You can use Oxygen XML Editor plugin to generate detailed documentation for the components of a WSDL document in HTML format. You can select the WSDL components to include in your output and the level of details to present for each of them. Also, the components are hyperlinked. You can also generate the documentation in a custom output format (page 1140) by using a custom stylesheet.

**Note:** The WSDL documentation includes the XML Schema components that belong to the internal or imported XML schemas.

To generate documentation for a WSDL document, select **WSDL Documentation** from the **XML Tools > Generate Documentation** menu or from the **Generate WSDL Documentation** action from the contextual menu of the **Navigator view** (page 250).

**Figure 693: WSDL Documentation Dialog Box**

The **Input URL** field of the dialog box must contain the full path to the WSDL document that you want to generate documentation for. The WSDL document may be a local or a remote file. You can specify the path to the WSDL file by entering it in the text field, or by using the **Insert Editor Variables** button or the options in the **Browse** drop-down menu.

**Output Tab**

The following options are available in the **Output** tab:

- **Format** - Allows you to choose between the following formats:
  - **HTML** - The documentation is generated in HTML output format (page 1139).
- **Custom** - The documentation is generated in a custom output format ([page 1140](#)), allowing you to control the output. Click the **Options** button to open a **Custom format options** dialog box where you can specify a custom stylesheet for creating the output. There is also an option to **Copy additional resources to the output folder** and you can select the path to the additional **Resources** that you want to copy. You can also choose to keep the intermediate XML files created during the documentation process by deselecting the **Delete intermediate XML file** option.

- **Output file** - You can specify the path of the output file by entering it in the text field, or by using the **Insert Editor Variables** button or the options in the **Browse** drop-down menu.

- **Split output into multiple files** - Instructs the application to split the output into multiple files. For large WSDL documents, choosing a different split criterion may generate smaller output files providing a faster documentation browsing. You can choose to split them by namespace, location, or component name.

- **Open in Browser/System Application** - Opens the result in the system application associated with the output file type.

**Note:** To set the browser or system application that will be used, go to **Window > Preferences > General > Web Browser** and specify it there. This will take precedence over the default system application settings.

- **Keep only the annotations with xml:lang set to** - The generated output will contain only the annotations with the **xml:lang** attribute set to the selected language. If you choose a primary language code (for example, **en** for English), this includes all its possible variations (**en-us**, **en-uk**, etc.).

### Setting Tab

When you generate documentation for a WSDL document, you can choose what components to include in the output and the details to be included in the documentation.

*Figure 694: Settings Tab of the WSDL Documentation Dialog Box*
The **Settings** tab allows you to choose whether or not to include the following:

- **Components**
  - **Services** - Specifies whether or not the generated documentation includes the WSDL services.
  - **Bindings** - Specifies whether or not the generated documentation includes the WSDL bindings.
  - **Port Types** - Specifies whether or not the generated documentation includes the WSDL port types.
  - **Messages** - Specifies whether or not the generated documentation includes the WSDL messages.
  - **XML Schema Components** - Specifies whether or not the generated documentation includes the XML Schema components.
  - **Only global elements and types** - Specifies whether or not the generated documentation includes only global elements and types.

- **Component Details**
  - **Namespace** - Presents the namespace information for WSDL or XML Schema components.
  - **Location** - Presents the location information for each WSDL or XML Schema component.
  - **Used by** - Presents the list of components that reference the current one.
  - **Documentation** - Presents the component documentation. If you choose **Escape XML Content**, the XML tags are presented in the documentation.
  - **Source** - Presents the XML fragment that defines the current component.
  - **Instance** - Generates a sample XML instance for the current component.
**Note:** This option applies to the XML Schema components only.

- **XML Schema Diagram** - Displays the diagram for each XML Schema component. You can choose the image format (JPEG, PNG, SVG) to use for the diagram section.
- **Diagram annotations** - Specifies whether or not the annotations of the components presented in the diagram sections are included.
- **Generate index** - Displays an index with the components included in the documentation.
  - **Include local elements and attributes** - If selected, local elements and attributes are included in the documentation index.
  - **Include resource hierarchy** - Specifies whether or not the resource hierarchy for an XML Schema documentation is generated. It is deselected by default.

**Export settings** - Save the current settings in a settings file for further use (for example, with the exported settings file you can generate the same documentation from the command-line interface (page 1141).)

**Import settings** - Reloads the settings from the exported file.

**Generate** - Use this button to generate the WSDL documentation.

### Canonicalizing Files

You can select the [canonicalization](page 2704) algorithm to be used for a document from the dialog box that is displayed by using the **Canonicalize** action that is available from the **Source** submenu when invoking the contextual menu in **Text** mode or from the **XML Tools** menu.

*Figure 695: Canonicalization Settings Dialog Box*
The **Canonicalize** dialog box allows you to set the following options:

- **Input URL** - Available if the **Canonicalize** action was selected from the **XML Tools** menu. It allows you to specify the location of the input file.

- **Exclusive** - If selected, the exclusive (uncommented) **canonicalization** (page 2704) method is used.

  **Note:** *Exclusive Canonicalization* just copies the namespaces you are actually using (the ones that are a part of the XML syntax). It does not look into attribute values or element content, so the namespace declarations required to process these are not copied. This is useful if you have a signed XML document that you want to insert into other XML documents (or you need self-signed structures that support placement within various XML contexts), as it will ensure the signature is verified correctly each time.

- **Exclusive with comments** - If selected, the exclusive with comments **canonicalization** (page 2704) method is used.

- **Inclusive** - If selected, the inclusive (uncommented) **canonicalization** (page 2704) method is used.

  **Note:** *Inclusive Canonicalization* copies all the declarations, even if they are defined outside of the scope of the signature, and all the declarations you might use will be unambiguously specified. Inclusive **Canonicalization** is useful when it is less likely that the signed data will be inserted in other XML document and it is the safer method from the security standpoint because it requires no knowledge of the data that are to be secured to safely sign them. A problem may occur if the signed document is moved into another XML document that has other declarations because the Inclusive **Canonicalization** will copy them and the signature will be invalid.
- **Inclusive with comments** - If selected, the inclusive with comments canonicalization (page 2704) method is used.
- **XPath** - The XPath expression provides the fragments of the XML document to be signed.
- **Output** - Available if the **Canonicalize** action was selected from the **XML Tools** menu. It allows you to specify the output file path where the signed XML document will be saved.
- **Open in editor** - If selected, the output file will be opened in the editor.

**Related Information:**

- Digital Signatures Overview (page 948)

**Signing Files**

You can select the type of signature to be used for documents from a signature settings dialog box. To open this dialog box, select the **Sign** action from the **Source** submenu when invoking the contextual menu in **Text** mode or from the **XML Tools** menu.

**Figure 696: Signature Settings Dialog Box**
The following options are available:

![Note: If Oxygen XML Editor plugin could not find a valid certificate, a link is provided at the top of the dialog box that opens the XML Signing Certificates preferences page (page 178) where you can configure a valid certificate.]

- **Input** - Available if the Sign action was selected from the XML Tools menu. Specifies the location of the input URL.
- **Transformation Options** - See the Digital Signature Overview (page 948) section for more information about these options.
  - **None** - If selected, no canonicalization (page 2704) algorithm is used.
  - **Exclusive** - If selected, the exclusive (uncommented) canonicalization (page 2704) method is used.
    
    ![Note: Exclusive Canonicalization just copies the namespaces you are actually using (the ones that are a part of the XML syntax). It does not look into attribute values or element content, so the namespace declarations required to process these are not copied. This is useful if you have a signed XML document that you want to insert into other XML documents (or you need self-signed structures that support placement within various XML contexts), as it will ensure the signature is verified correctly each time.

  - **Exclusive with comments** - If selected, the exclusive with comments canonicalization (page 2704) method is used.
  - **Inclusive** - If selected, the inclusive (uncommented) canonicalization (page 2704) method is used.
    
    ![Note: Inclusive Canonicalization copies all the declarations, even if they are defined outside of the scope of the signature, and all the declarations you might use will be unambiguously specified. Inclusive Canonicalization is useful when it is less likely that the signed data will be inserted in other XML document and it is the safer method from the security standpoint because it requires no knowledge of the data that are to be secured to safely sign them. A problem may occur if the signed document is moved into another XML document that has other declarations because the Inclusive Canonicalization will copy them and the signature will be invalid.

    - **Inclusive with comments** - If selected, the inclusive with comments canonicalization (page 2704) method is used.
- **XPath** - The XPath expression provides the fragments of the XML document to be signed.
- **ID** - Provides ID of the XML element to be signed.
• **Envelope** - If selected, the *enveloped* signature is used. See the Digital Signature Overview (page 948) for more information.

• **Detached** - If selected, the *detached* signature is used. See the Digital Signature Overview (page 948) for more information.

• **Append KeyInfo** - If this option is selected, the `ds:KeyInfo` element will be added in the signed document.

• **Signature algorithm** - The algorithm used for signing the document. The following options are available: **RSA with SHA1**, **RSA with SHA256**, **RSA with SHA384**, and **RSA with SHA512**.

• **Output** - Available if the **Sign** action was selected from the **XML Tools** menu. Specifies the path of the output file where the signed XML document will be saved.

• **Open in editor** - If selected, the output file will be opened in Oxygen XML Editor plugin.

---

### Related Information:

- Verifying Signature (page 956)
- Example of How to Digitally Sign XML Files or Content (page 956)

---

### Verifying Signature

You can verify the signature of a file by selecting the **Verify Signature** action from the **Source** submenu when invoking the contextual menu in **Text** mode or from the **XML Tools** menu. The **Verify Signature** dialog box then allows you to specify the location of the file whose signature is verified.

If the signature is valid, a dialog box displays the name of the signer. Otherwise, an error shows details about the problem.

---

- Signing Files (page 953)
- Example of How to Digitally Sign XML Files or Content (page 956)
WSDL SOAP Analyzer

WSDL SOAP Analyzer is a tool that helps you test if the messages defined in a Web Service Descriptor (WSDL) are accepted by a Web Services server.

After you edit and validate your Web service descriptor against a mix of the XML Schemas for WSDL and SOAP, it is easy to check if the defined SOAP messages are accepted by the remote Web Services server by using the integrated WSDL SOAP Analyzer tool (available from the toolbar or WSDL menu).

Oxygen XML Editor plugin provides two ways of testing, one for the currently edited WSDL document and another for the remote WSDL documents that are published on a web server. To open the WSDL SOAP Analyzer tool for the currently edited WSDL document do one of the following:

- Click the 🔄 WSDL SOAP Analyzer toolbar button.
- Use the 🔄 WSDL SOAP Analyzer action from the WSDL menu.
- Go to Open with > WSDL Editor action in the contextual menu of the Navigator (page 250) view.

Figure 697: WSDL SOAP Analyzer View

This tool contains a SOAP analyzer and sender for Web Services Description Language file types. The analyzer fields are as follows:

- **Services** - The list of services defined by the WSDL file.
- **Ports** - The ports for the selected service.
- **Operations** - The list of available operations for the selected service.
- **Action URL** - The script that serves the operation.
- **SOAP Action** - Identifies the action performed by the script.
• **Version** - Choose between 1.1 and 1.2. The SOAP version is selected automatically depending on the selected port.

• **Request Editor** - It allows you to compose the web service request. When an action is selected, Oxygen XML Editor plugin tries to generate as much content as possible for the SOAP request. The envelope of the SOAP request has the correct namespace for the selected SOAP version, that is `http://schemas.xmlsoap.org/soap/envelope/` for SOAP 1.1 or `http://www.w3.org/2003/05/soap-envelope` for SOAP 1.2. Usually you just have to change a few values for the request to be valid. The **Content Completion Assistant (page 2704)** is available for this editor and is driven by the schema that defines the type of the current message. While selecting various operations, Oxygen XML Editor plugin remembers the modified request for each one. You can press the **Regenerate** button to overwrite your modifications for the current request with the initial generated content.

• **Attachments List** - You can define a list of file URLs to be attached to the request.

• **Response Area** - Initially it displays an auto generated server sample response so you can have an idea about how the response looks like. After pressing the **Send** button, it presents the message received from the server in response to the Web Service request. It may show also error messages. If the response message contains attachments, Oxygen XML Editor plugin prompts you to save them, then tries to open them with the associated system application.

• **Errors List** - There may be situations where the WSDL file is respecting the WSDL XML Schema, but it fails to be valid (for example, in the case of a message that is defined by means of an element that is not found in the types section of the WSDL). In such a case, the errors are listed here. This list is presented only when there are errors.

• **Send Button** - Executes the request. A status dialog box is displayed when Oxygen XML Editor plugin is connecting to the server.

The testing of a WSDL file is straight-forward: click the WSDL analysis button, then select the service, the port, and the operation. The editor generates the skeleton for the SOAP request. You can edit the request, eventually attach files to it and send it to the server. Watch the server response in the response area. You can find more details in the **Testing Remote WSDL Files (page 1143)** section.

**Note:** SOAP requests and responses are automatically validated in the **WSDL SOAP Analyzer** using the XML Schemas specified in the WSDL file.

Once defined, a request derived from a Web Service descriptor can be saved with the **Save** button to a Web Service SOAP Call (WSSC) file for later reuse. In this way, you save time in configuring the URLs and parameters.

You can open the result of a Web Service call in an editor panel using the **Open** button.

**Testing Remote WSDL Files**

To open and test a remote WSDL file the steps are the following:
1. Go to **Window > Show View > Other > Oxygen XML Editor plugin > WSDL SOAP Analyzer**.

2. Press the **Choose WSDL** button and enter the URL of the remote WSDL file.
   You enter the URL:
   • by typing
   • by browsing the local file system
   • by browsing a remote file system
   • by browsing a UDDI Registry ([page 1143](#))

3. Press the **OK** button.
   This will open the **WSDL SOAP Analyzer tool** ([page 1141](#)). In the **Saved SOAP Request** tab you can open directly a previously saved Web Service SOAP Call (WSSC) file, thus skipping the analysis phase.

### UDDI Registry Browser

Pressing the button in the **WSDL File Opener** dialog box (menu **Tools > WSDL SOAP Analyzer**) opens the **UDDI Registry Browser** dialog box.

*Figure 698: UDDI Registry Browser Dialog Box*
The fields of the dialog box are as follows:

- **URL** - Type the URL of an UDDI registry or choose one from the default list.
- **Keywords** - Enter the string you want to be used when searching the selected UDDI registry for available Web services.
- **Rows to fetch** - The maximum number of rows to be displayed in the result list.
- **Search by** - You can choose to search either by company or by provided service.
- **Case sensitive** - When selected, the search takes into account the keyword case.
- **Search** - The WSDL files that matched the search criteria are added in the result list.

When you select a WSDL from the list and click the **OK** button, the **UDDI Registry Browser** dialog box is closed and you are returned to the **WSDL File Opener** dialog box.

**XML Schema Regular Expressions Builder**

The XML Schema regular expressions builder allows you to test regular expressions on a fragment of text as they are applied to an XML instance document. Start the tool by selecting **XML Schema Regular Expressions Builder** from the **XML Tools** menu.
Figure 699: XML Schema Regular Expressions Builder Dialog Box

The dialog box contains the following:

**Regular expressions editor**

Allows you to edit the regular expression to be tested and used. Content completion is available and presents a list with all the predefined expressions. It is triggered by pressing **Ctrl + Space (Command + Space on OS X)**.

**Error display area**

If the edited regular expression is incorrect, an error message will be displayed here. The message contains the description and the exact location of the error. Also, clicking the quick navigation button (←) highlights the error inside the regular expression.

**Category**

You can choose from several categories of predefined expressions. The selected category influences the displayed expressions in the **Available expressions** table.

**Available expressions**

This table includes the available regular expressions and a short description for each of them. The set of expressions depends on the category selected in the previous **Category** combo box. You can add an expression in the **Regular expressions editor** by double-
clicking the expression row in the table. You will notice that in the case of Character categories and Block names, the expressions are also listed in complementary format.

**Evaluate expression on**

You can choose between two options:

- **Evaluate expression on each line** - The edited expression will be applied on each line in the Test area.
- **Evaluate expression on all text** - The edited expression will be applied on the whole text.

**Test**

A text editor that allows you to enter a text sample for which the regular expression will be applied. All matches of the edited regular expression will be highlighted.

After editing and testing your regular expression you can insert it in the current editor. The **Insert** button will become active when an editor is opened in the background and there is an expression in the Regular expressions editor.

The regular expression builder cannot be used to insert regular expressions in the Grid mode (page 292) or schema Design mode (page 505). Accordingly, the **Insert** button will be not available if the current document is edited in these modes.

**Tip:** Some regular expressions may indefinitely block the Java Regular Expressions engine. If the execution of the regular expression does not end in about five seconds, the application displays a dialog box that allows you to interrupt the operation.
19. Common Problems

This section provides a collection of common performance and other types of problems that might be encountered when using Oxygen XML Editor plugin, along with their possible solutions.

Performance Problems and Solutions

This section contains solutions for some common performance problems that may appear when running Oxygen XML Editor plugin.

Out of Memory on External Processes

Problem

Oxygen XML Editor plugin throws an Out Of Memory error when trying to generate PDF output with the built-in Apache FOP processor.

Cause

The amount of allocated memory might be insufficient.

Solutions

- Open the Preferences dialog box (page 55), go to XML > XSLT-FO-XQuery > FO Processors, and increase the value of the Memory available to the built-in FOP option (page 165).
- For external XSL-FO processors, XSLT processors, and external tools, the maximum value of the allocated memory is set in the command line of the tool using the -Xmx parameter set to the Java virtual machine.

Related Information:

- FO Processors Preferences (page 164)
Performance Issues with Large Documents

Problem
The performance of the application slows down considerably over time when working with large documents.

Cause
A possible cause is that the application needs more memory to run properly.

Solutions

- You can increase the maximum amount of memory available to Oxygen XML Editor plugin by setting the `-vmargs` and `-Xmx` parameters in the command used to launch the Eclipse platform.

  **Attention:** The maximum amount of memory should be less than 75% of the physical amount of memory available on the machine. Otherwise, the operating system and other applications will have no memory available.

Note:

Misc Problems and Solutions
This chapter presents common problems that may appear when running the application along with solutions for these problems.

'Address Family Not Supported by Protocol Family; Connect' Error
Problem

I have experienced the following error: "Address Family Not Supported by Protocol Family; Connect". How do I solve it?

Cause

This seems to be an IPv6 connectivity problem. By default, the Java runtime used by Oxygen XML Editor plugin prefers to create connections via IPv6, if the support is available. However, even though it is available in appearance, IPv6 sometimes happens to be configured incorrectly on some systems.

Solution

A quick solution for this problem is to set the java.net.preferIPv4Stack Java property to true (java.net.preferIPv4Stack=true), by following this procedure:

1. Create a file named custom_commons.vmoptions and add on a single line -Djava.net.preferIPv4Stack=true. Then save the file and copy it to the Oxygen XML Editor plugin installation folder (may need admin access).
2. Restart Oxygen XML Editor plugin.
3. Make sure the procedure was successful by going to Help > About > System properties and check that the value of the java.net.preferIPv4Stack property is true.

Application Takes Several Minutes to Start

Problem

Oxygen XML Editor plugin seems to take an abnormally long amount of time to start.

Cause

Some anti-virus software can cause Java applications, such as Oxygen XML Editor plugin, to start very slowly due to scanning compressed archives (such as the JAR libraries that all Java applications use).

Solution

A possible solution is to add the Oxygen XML Editor plugin folder to the list of exceptions in the anti-virus software settings.
Compatibility Issue Between Java and Certain Graphics Card Drivers

Problem
Under certain settings, a compatibility issues can appear between Java and some graphics card drivers, which results in the text from the editor (in Author or Text mode) being displayed garbled.

Solution
If you encounter this problem, update your graphics card driver.

Damaged File Associations on OS X

Problem
After upgrading OS X and Oxygen XML Editor plugin, it is no longer associated to the appropriate file types (such as XML, XSL, XSD). How can I re-create the file associations?

Cause
The upgrade damaged the file associations in the LaunchService Database on your OS X machine.

Solution
You can rebuild the LaunchService Database with the following procedure. This will reset all file associations and rescan the entire file system searching for applications that declare file associations and collect them in a database used by Finder.

1. Find all the Oxygen XML Editor plugin installations on your hard drive.
2. Delete them by dragging them to the Trash.
3. Clear the Trash.
4. Unpack the Oxygen XML Editor plugin installation kit on your desktop.
5. Copy the contents of the archive into the folder / Applications / Oxygen.
6. Run the following command in a Terminal:

   ```
   /System/Library/Frameworks/CoreServices.framework/Versions/A/Frameworks/LaunchServices.framework/Versions/A/Support/lsregister -kill -r -domain local -domain system -domain user
   ```
7. Restart Finder with the following command:
8. Create an XML or XSD file on your desktop. It should have the Oxygen XML Editor plugin icon.
10. Accept the confirmation.

**Result:** When you start Oxygen XML Editor plugin, the file associations should work correctly.

---

**Details to Submit in a Request for Technical Support Using the Online Form**

**Problem**

What details should I add to my request for technical support on the online form in the product website?

**Solution**

When completing a request for Technical Support using the online form, include as many details as possible about your problem. For problems where a simple explanation may not be enough for the Technical Support team to reproduce or address the issue (such as server connection errors, unexpected delays while editing a document, an application crash, etc.), you should generate a log file and attach it to the problem report. In the case of a crash, you should also attach the crash report file generated by your operating system.

If the text content of an XML document you want to send to the support team contains sensitive or private information, you can use the Randomize XML text content action (page 21) to create filler content. Before using this action, you need to copy the initial XML resources and save them in a separate folder. Otherwise, you might lose your original information.

To generate an Oxygen XML Editor plugin log file, follow these steps:

1. Create a text file called `log4j.properties` in the `lib` folder of the installed plugin folder, with the following content:

```properties
log4j.rootCategory= debug, R2
log4j.appender.R2=org.apache.log4j.RollingFileAppender
log4j.appender.R2.File=${user.home}/Desktop/oxygenLog/oxygen.log
log4j.appender.R2.MaxFileSize=12000KB
log4j.appender.R2.MaxBackupIndex=20
log4j.appender.R2.layout=org.apache.log4j.PatternLayout
```
2. Restart the application.
3. Reproduce the error.
4. Close the application.
5. Delete the log4j.properties file because it might cause performance issues if you leave it in the lib folder.

⚠️ **Important:** The logging mode may severely decrease the performance of the application. Therefore, do not forget to delete the log4j.properties file when you are done with the procedure.

**Result:** The resulting log file is named oxygen#.log (for example, oxygen.log, oxygen.log.1, oxygen.log.2, etc.) and is located in the Desktop\oxygenLog folder.

### DITA Map Transformation Fails (Cannot Connect to External Location)

**Problem**

*DITA map (page 2705)* transformation fails because it cannot connect to an external location.

**Solution**

The transformation is run as an external Ant process so you can continue using the application as the transformation unfolds. All output from the process appears in the DITA Transformation tab.

The HTTP proxy settings are used for the Ant transformation, so if the transformation fails because it cannot connect to an external location, you can check the Network Connections.

### DITA Map WebHelp Transformation Fails (Duplicate Topic References Found)

**Problem**

*DITA Map WebHelp* transformation fails with a message that indicates duplicate topic references were found.
Cause

By default the WebHelp transformation uses the `force-unique` parameter set to `true` to force the transformation to create unique output files for each instance of a resource when a map contains multiple references to a single topic. However, there are cases when this feature does not work as expected and the duplicate topic references are not handled properly.

Solution

To solve this issue, you should manually set a unique `copy-to` attribute on any duplicate topic reference that was not handled automatically by DITA-OT:

```xml
<map>
  ...
  <topicref href="../topics/MyTopic.dita"/>
  ...
  <topicref href="../topics/MyTopic.dita" copy-to="../topics/MyTopic-2.dita"/>
</map>
```

DITA OT Transformation Takes a Long Time to Process

Problem

A DITA transformation takes an extremely long time to process (over an hour, for example).

Cause

Large delays in DITA OT processing are usually caused by intensive disk operations, CPU usage, or connections to remote websites. The DITA OT processing is very disk-intensive, each stage takes the entire content from the transformation temporary files folder, reads it, modifies it, and then writes it back.

Solution

There are several things you can try to troubleshoot this problem:

- If you are using a shared or remote drive, it is recommended to specify a local drive for the output and temporary files directory (edit the transformation scenario and in the Output tab, select a local directory for Temporary files directory and Output directory).
• If you want to test if the publishing has a problem downloading remote resources, you could disable the network adapter on the computer and then try to publish. The purpose is to see if the publishing finishes without any reported error about obtaining a certain HTTP resource.

• Using DTDs instead of XML Schemas is faster. This is because of a default transformation parameter called `args.grammar.cache` that only works for DTD-based DITA topics.

• You can increase the memory available to Oxygen XML Editor plugin (page 2368). Sometimes, just increasing the amount of memory available to the DITA OT process may be enough to lower the time necessary for the publishing to run.

• You can enable some logging to help you determine which stage in the process is taking a long time. Edit the transformation scenario and in the Advanced tab, enter `logger org.apache.tools.ant.listener.ProfileLogger` in the Additional arguments field. Then go to Options > Preferences > DITA > Logging and select Always for the Show console output option.

• You could try disabling antivirus applications since the publishing process is very disk intensive and certain antivirus application might slow down the process.

• If the published DITA map is part of a larger DITA project with lots of maps and topics, references from topics in the current map to topics in other sub-projects might result in problems resolving those references. You could look in the output folder to see if the number of HTML documents match the number of DITA topics in your map.

DITA PDF Transformation Fails

Problem

The DITA to PDF transformation fails.

Cause

To generate the PDF output, Oxygen XML Editor plugin uses the DITA Open Toolkit. This process sometimes results in errors. For information about some of the most common errors, see DITA PDF Processing Common Errors (page 2375).

Solution

If your transformation fails, you can detect some of the problems that caused the errors by running the Validate and Check for Completeness action (page 2446). Depending on the options you select when you run it, this action reports errors such as topics referenced in other topics but not in the DITA map (page 2705), broken links, and missing external resources.

You can analyze the Results tab of the DITA transformation and search for messages that contain text similar to `[fop] [ERROR]`. If you encounter this type of error message, edit the transformation
scenario you are using and set the `clean.temp` parameter to `no` and the `retain.topic.fo` parameter to `yes`. Run the transformation, go to the temporary directory of the transformation, open the `topic.fo` file and go to the line indicated by the error. Depending on the XSL FO context try to find the DITA topic that contains the text that generates the error.

If none of the above methods helps you, go to **Help > About > Components > Frameworks** and check what version of the DITA Open Toolkit you are using. Copy the whole output from the DITA OT console output and either report the problem on the DITA User List or send it to support@oxygenxml.com.

**Related Information:**

- How to Enable Debugging for FO Processor Transformations *(page 1482)*

**DITA PDF Processing Common Errors**

There are cases when the PDF processing fails when trying to publish DITA content to a PDF file. This topic lists some of the common problems and possible solutions.

**Problem: Cannot Save PDF**

The FO processor cannot save the PDF at the specified target. The console output contains messages like this:

```
[fop] [ERROR] Anttask - Error rendering fo file: C:samples\dita_temp\pdf\oxygen_dita_temp\topic.fo
<Failed to open C:samples\dita\out\pdf\test.pdf>
Failed to open samples\dita\out\pdf\test.pdf
          .......... 
[fop] Caused by: java.io.FileNotFoundException:
C:\\Users\\default\\Desktop\\bev\\out\\pdf\\test.pdf
(The process cannot access the file because it is being used by another process)
```

**Solution: Cannot Save PDF**

Such an error message usually means that the PDF file is already opened in a PDF reader application. The solution is to close the open PDF before running the transformation.
Problem: Table Contains More Cells Than Defined in Colspec

One of the DITA tables contains more cells in a table row than the defined number of `colspec` elements. The console output contains messages like this:

```
|fop| [ERROR] Anttask - Error rendering fo file:
D:\projects\eXml\samples\dita\flowers\temp\pdf\oxygen_dita_temp\topic.fo

<net.sf.saxon.trans.XPathException: org.apache.fop.fo.ValidationException:
The column-number or number of cells in the row overflows the number of
fo:table-columns specified for the table.
(See position 179:-1)>net.sf.saxon.trans.XPathException:
org.apache.fop.fo.ValidationException: The column-number or number of cells
in the row overflows the number of fo:table-columns specified for the table.
(See position 179:-1)
[fop]  at org.apache.fop.tools.anttasks.FOPTaskStarter.renderInputHandler
(Fop.java:657)
[fop]  at net.sf.saxon.event.ContentHandlerProxy.startContent
(ContentHandlerProxy.java:375)
............
[fop] D:\projects\samples\dita\flowers\temp\pdf\oxygen_dita_temp\topic.fo ->
D:\projects\samples\dita\flowers\out\pdf\flowers.pdf
```

Solution: Table Contains More Cells Than Defined in Colspec

To resolve this issue, correct the `colspec` attribute on the table that caused the issue. To locate the table that caused the issue:

1. Edit the transformation scenario and set the parameter `clean.temp` to `no`.
2. Run the transformation, open the `topic.fo` file in Oxygen XML Editor plugin, and look in it at the line specified in the error message (See position 179:-1).
3. Look around that line in the XSL-FO file to find relevant text content that you can use (for example, with the Find/Replace in Files action in the DITA Maps Manager view (page 2400)) to find the original DITA topic for which the table was generated.

Problem: Broken Link

There is a broken link in the generated XSL-FO file. The PDF is generated but contains a link that is not working. The console output contains messages like this:

```
[fop] 1248 WARN [ main ] org.apache.fop.apps.FOUserAgent -
```

Solution: Broken Link

To resolve this issue:

1. Use the Validate and Check for Completeness action available in the DITA Maps Manager view (page 2400) to find such problems.
2. If you publish to PDF using a DITAVAL filter, select the same DITAVAL file in the DITA Map Completeness Check dialog box.
3. If the Validate and Check for Completeness action does not discover any issues, edit the transformation scenario and set the clean.temp parameter to no.
4. Run the transformation, open the topic.fo file in Oxygen XML Editor plugin, and search for the unresolved ID references (for example: unique_4_Connect_42_wrongID).
5. Look in the XSL-FO file to find relevant text content that you can use (for example, with the Find/Replace in Files action in the DITA Maps Manager view (page 2400)) to find the original DITA topic for which the table was generated.

Related Information:

- How to Enable Debugging for FO Processor Transformations (page 1482)

DITA to CHM Transformation Fails - Cannot Open File

Problem

The DITA to CHM transformation fails with the following error: [exec] HHC5010: Error: Cannot open "fileName.chm". Compilation stopped.

Cause

This error occurs when the CHM output file is opened and the transformation scenario cannot rewrite its content.

Solution

To solve this issue, close the CHM help file and run the transformation scenario again.
Tip: It is a good practice to validate the DITA map (page 2705) before executing the transformation scenario. To do so, run the Validate and Check for Completeness action (page 2446). Depending on the selected options, this action reports errors, such as topics referenced in other topics (but not in the DITA map), broken links, and missing external resources.

Related Information:
- DITA Map to CHM (Compiled HTML Help) Transformation (page 1405)

DITA to CHM Transformation Fails - Compilation Failed

Problem

The DITA to CHM transformation fails with the following error: [exec] HHC5003: Error: Compilation failed while compiling fileName.

Cause 1

One possible cause for this error is that the processed file does not exist.

Solution 1

To solve this issue, fix the file reference before executing the transformation scenario again.

Cause 2

Another possible cause for this error is that the processed file has a name that contains space characters.

Solution 2

To solve the issue, remove any spacing from the file name and run the transformation scenario again.

Tip: It is a good practice to validate the DITA map (page 2705) before executing the transformation scenario. To do so, run the Validate and Check for Completeness action (page 2446). Depending on the selected options, this action reports errors, such as topics referenced in other topics (but not in the DITA map), broken links, and missing external resources.
Error After Switching Oxygen Products in Eclipse

Problem

On an Eclipse deployment, after installing and using the Editor product, I later decided to uninstall it and use Author or Developer instead. After installing the new product, I received an error that looked like this:

```
java.lang.Exception
   at org.eclipse.ui.internal.ViewReference.createErrorPart(ViewReference.java:112)
   at org.eclipse.ui.internal.ViewReference.createPart(ViewReference.java:98)
   at org.eclipse.ui.internal.e4.compatibility.CompatibilityPart.createPart
   (CompatibilityPart.java:279)
   at org.eclipse.ui.internal.e4.compatibility.CompatibilityPart.create
   (CompatibilityPart.java:317)
   at sun.reflect.NativeMethodAccessorImpl.invoke0(Native Method)
   at sun.reflect.NativeMethodAccessorImpl.invoke(NativeMethodAccessorImpl.java:62)
   at sun.reflect.DelegatingMethodAccessorImpl.invoke
   (DelegatingMethodAccessorImpl.java:43)
   at java.lang.reflect.Method.invoke(Method.java:498)
   ...
```

Solution

You need to manually delete the perspective for the product you uninstalled by following this procedure:

1. Go to Window > Preferences > General > Perspectives.
2. Select the perspective for the product you uninstalled (for example, <oXygen/> XML) and click Delete.
3. Restart Eclipse.
4. Go to Window > Open Perspective and select the perspective for the new product (for example, <oXygen/> XML Author).
Hunspell Spell Checker is Unusable on Your Platform Error

**Problem**

When trying to use the Check Spelling option, I receive the error *Hunspell spell checker is unusable on your platform. It has crashed the application in a previous session.*

**Cause**

There are instances where Oxygen XML Editor plugin determines that an internal component (such as the spell checker) has crashed the application and disables that component from running in the future (to prevent a possible future crash).

**Solution**

To re-enable the spell checker component, follow these steps:

1. Close Oxygen XML Editor plugin.
2. Open the `%APPDATA%/com.oxygenxml` folder and look for a file called something like `HunspellCrashGuard*.txt`. Delete that file.
3. Restart Oxygen XML Editor plugin.

High Resolution Scaling Issues

**Problem**

I encounter scaling detection issues in a high resolution display. For example, some GUI components are too small.

**Cause**

This sometimes happens when using multiple displays with different resolutions because the application cannot detect the correct scaling setting.

**Solution**

You can use the `com.oxygenxml.hidpi.scaling` custom system property (page 212) to force a specific scaling setting. For example: `-Dcom.oxygenxml.hidpi.scaling=1.5` for 150% scaling.
Images Appear Stretched Out in the PDF Output

Problem

When publishing XML content (DITA, DocBook, etc.), images are sometimes scaled up in the PDF outputs but are displayed perfectly in the HTML (or WebHelp) output.

Solution

PDF output from XML content is obtained by first obtaining an intermediary XML format called XSL-FO and then applying an XSL-FO processor to it to obtain the PDF. This stretching problem is caused by the fact that all XSL-FO processors take into account the DPI (dots-per-inch) resolution when computing the size of the rendered image.

The PDF processor that comes out of the box with the application is the open-source Apache FOP processor. Here is what Apache FOP does when deciding the image size:

1. If the XSL-FO output contains width, height or a scale specified for the image `external-graphic` tag, then these dimensions are used. This means that if in the XML (DITA, DocBook, etc.) you set explicit dimensions to the image they will be used as such in the PDF output.
2. If there are no sizes (width, height or scale) specified on the image XML element, the processor looks at the image resolution information available in the image content. If the image has such a resolution saved in it, the resolution will be used and combined with the image width and height to obtain the rendered image dimensions.
3. If the image does not contain resolution information inside, Apache FOP will look at the FOP configuration file for a default resolution. The FOP configuration file for XSLT transformations that output PDF is located in the \[OXYGEN_INSTALL_DIR\]/lib/fop.xconf. DITA publishing uses the DITA Open Toolkit that has the Apache FOP configuration file located in \[DITA-OT-DIR\]/plugins/org.dita.pdf2.fop/fop/conf/fop.xconf. The configuration file contains two XML elements called `source-resolution` and `target-resolution`. The values set to those elements can be increased (usually a DPI value of 110 or 120 should render the image in PDF the same as in the HTML output).

The commercial RenderX XEP XSL-FO processor behaves similarly but as a fallback it uses 120 as the DPI value instead of using a configuration file.

Tip: It is best to save your images without any DPI resolution information. For example, when saving a PNG image in the open-source GIMP image editor, you do not want to save the resolution.
This allows you to control the image resolution from the configuration file for all referenced images.

Increasing the Memory for the Ant Process

**Problem**

The Ant build process runs out of memory.

**Solution**

For details about setting custom JVM arguments to the Ant build process, see [JVM Arguments](#page-2619).

JPEG CMYK Color Space Issues

**Problem**

JPEG images with the CMYK color profile and have the color profiles embedded in the image aren't rendered in the **Author** mode.

**Solution**

If the color profile information is missing from the JPEG image but you have the ICC file available, you can copy the `profileFileName.icc` to the `{OXYGEN_INSTALL_DIR}\lib` directory.

If the color space profile is missing, JPEG images that have the CMYK color space are rendered without taking the color profile into account. The **Unsupported Image Type** message is displayed above the image.

Mac Touch Bar Function Keys Do Not Work
Problem

I am using a Mac that has a Touch Bar but its function keys do not work in Oxygen XML Editor plugin.

Causes

By default, the Touch Bar function keys are not enabled for Oxygen XML Editor plugin.

Solutions

To enable the Touch Bar function keys for Oxygen XML Editor plugin, follow these steps:

1. Go to System Preferences and select Keyboard.
2. Click Shortcuts.
3. From the left sidebar, select Function Keys.
4. Click the + symbol, select Oxygen from the list of apps, and click Add.

Machine Signature Mismatch Error

Problem

I receive an error indicating that the current license was already activated on a License Server or that the License Server’s Machine Signature does not match.

During the license activation process, the license key becomes bound to a particular license server deployment. This means that a code that uniquely identifies your license server deployment (called Machine Signature) is sent to the Oxygen XML Editor plugin servers, which in turn will sign the license key. The Machine Signature is computed from the list of network interfaces of the machine where you deployed the license.

When starting the license server, if you receive an error stating that your server’s Machine Signature does not match, there are several possible causes:

Possible Cause 1

The license key was moved to a new machine that hosts your license server.

Solution

Revert to your previous configuration.
Possible Cause 2

A new network interface was changed, added, or activated in the machine that hosts your license server.

![Note:](#) A specific example of when this could happen is if the Bluetooth or the WiFi module is activated/deactivated.

Solution

If reverting is not possible, contact the Oxygen support team.

Possible Cause 3

The license server was restarted from a different location as the previous restart. For example, some server configurations will have the Apache Tomcat server installed in a versioned folder (/usr/local/apache-tomcat-V.V.V) with a symbolic link to the typical folder (/usr/local/tomcat). The server can be restarted from either location, but it is recommended to always restart from the typical folder (/usr/local/tomcat) and always restart from the same location.

Solution

The server simply needs to always be restarted from the same location.

MSXML 4.0 Transformation Issues

Problem

When running a transformation scenario that uses the MSXML 4.0 transformer, I receive an error that looks like this:

```
Could not create the 'MSXML2.DOMDocument.4.0' object.
Make sure that MSXML version 4.0 is correctly installed on the machine.
```

Cause

It is likely that the latest MSXML 4.0 service pack is not installed on your computer.
Solution

To fix this issue, go to the Microsoft website and get the latest MSXML 4.0 service pack.

Navigation to a Web Page is Canceled when Viewing CHM on a Network Drive

Problem

When viewing a CHM on a network drive, I only see the TOC and an empty page that displays the message: Navigation to the web page was canceled.

Cause

This is actually normal behavior. The Microsoft viewer for CHM does not display the topics for a CHM opened on a network drive.

Solution

As a workaround, copy the CHM file on your local system and view it there.

References Outside the Main DITA Map Folder

Problem

A reference to a DITA topic, map, or binary resource (for example, an image) that is located outside of the folder where the main DITA map (page 2705) is located leads to problems when publishing the content using the DITA Open Toolkit.

Cause

DITA-OT often has trouble resolving references that are outside the directory where the published DITA map is found. By default, it does not even copy the referenced topics to the output directory.

Solution

To solve this, try one of the following solutions:
• Create another DITA map that is located in a folder path above all referenced folders and reference the original DITA map from this new map. Then transform this DITA map instead.

• Edit the transformation scenario and in the Parameters tab, change the value of the fix.external.refs.com.oxygenxml parameter to true. This parameter is used to specify whether or not the application tries to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content.

⚠️ Important: The fix.external.refs.com.oxygenxml parameter is only supported when the DITA OT transformation process is started from Oxygen XML Editor plugin.

• For PDF output, you can edit the transformation scenario and in the Parameters tab set the value of the generate.copy.outer parameter to 3. This parameter specifies whether to generate output files for content that is not located in or beneath the directory containing the DITA map file. By setting the value of this parameter to 3, the transformation scenario shifts the output directory so that it contains all output for the publication.

⚠️ Important: This method is recommended for transformation scenarios that use an external DITA-OT.

Syntax Highlights Not Available in Eclipse Plugin

Problem

I associated the .ext extension with Oxygen XML Editor plugin in Eclipse but an .ext file opened with the Oxygen XML Editor plugin plugin does not have syntax highlights.

Solution

Associate an extension with Oxygen XML Editor plugin in Eclipse versions 3.6-3.8, 4.2-4.10 by following these steps:

1. Associate the .ext extension with the Oxygen XML Editor plugin plugin:
   a. Open the Preferences dialog box (page 55) and go to General > Editors > File Associations.
   b. Add *.ext to the list of file types.
   c. Select *.ext in the list by clicking it.
   d. Add Oxygen XML Editor plugin to the list of Associated editors and make it the default editor.

2. Associate the .ext extension with the Oxygen XML content type:
   a. Open the Preferences dialog box (page 55) and go to General > Content Types.
   b. Add *.ext to the File associations list for the Text > XML > Oxygen XML Editor plugin content type.
3. Press the OK button in the Eclipse preferences dialog box.

**Result:** Now when an *.ext file is opened, the icon and the syntax highlights should be the same as for XML files opened with the Oxygen XML Editor plugin plugin.

### TocJS Transformation Does not Generate All Files for a Tree-Like TOC

#### Problem

The TocJS transformation of a DITA map (page 2705) does not generate all the files needed to display the tree-like table of contents.

#### Solution

To get a complete set of output files, follow these steps:

1. Run the XHTML transformation on the same DITA map. Make sure the output gets generated in the same output folder as for the TocJS transformation.
2. Copy the content of the DITA-OT-DIR/plugins/com.sophos.tocjs/basefiles folder to the transformation output folder.
3. Copy the DITA-OT-DIR/plugins/com.sophos.tocjs/sample/basefiles/frameset.html file to the transformation output folder.
5. Locate element `<frame name="contentwin" src="concepts/about.html">`.
6. Replace "concepts/about.html" with "index.html".

### Windows Service Reports Incorrect Function Error When Starting (TCP Server)

#### Problem

My TCP floating license server reports an "Incorrect Function" error message when starting the Windows service.

#### Cause

This usually appears because the Windows service launcher cannot locate a Java virtual machine on your system.
Solution

Make sure that you have installed a 32-bit Java SE from Oracle (or Sun) on the system: http://www.oracle.com/technetwork/java/javase/downloads/index.html.

Windows Service Reports Process Terminated Unexpectedly Error (TCP Server)

Problem

My TCP floating license server reports a "Process Terminated Unexpectedly" error message for the Windows service.

Cause

This error message appears if the Windows service launcher quits immediately after being started. This problem usually happens because the license key has not been correctly deployed (license.txt file in the license folder).

Solution

Re-deploy your license key. For more information, see the Setting up a Floating License Server section (page 45).

XSLT Debugger Is Very Slow

Problem

When I run a transformation in the XSLT Debugger perspective (page 2709), it is very slow.

Solution

If the transformation produces HTML or XHTML output, you can disable rendering of output in the XHTML output view (page 182) during the transformation process. To view the XHTML output result do one of the following:

- Run the transformation in the Editor perspective (page 2709) and make sure the Open in Browser/System Application option (page 1426) is selected.
• Run the transformation in the XSLT Debugger perspective (page 2709), save the text output area to a file, and use a browser application for viewing it (for example, Firefox or Internet Explorer).
20. DITA Authoring

DITA is an XML standard, an architectural approach, and a writing methodology, developed by technical communicators for technical communicators. It provides a standardised architectural framework \( \text{page 2706} \) for a common structure for content that promotes the consistent creation, sharing, and re-use of content.

Some of the benefits of using DITA include the following:

- **Flexibility** - DITA is a topic-based architecture and it offers flexibility in content organization.
- **Modularity** - DITA allows for content reuse that saves time and reduces the number of modifications.
- **Structured Authoring** - DITA offers a standardized, methodological approach that helps to reduce authoring time and improve consistency.
- **Single-Source Publishing** - DITA provides the ability to change content in one place and have the change propagate everywhere.
- **Multiple Output Formats** - DITA supports multiple types of output.
- **Inheritance** - The DITA inheritance model makes it easy to specialize topics or elements within topics and you only have to define how the element is different from its immediate ancestor.
- **Process Automation** - DITA offers various ways to automate processes, such as with index or glossary production, output delivery, validation, and more.
- **Specialization** - DITA allows you to define your own information types and semantic elements/attributes to suit the needs of your particular content model.
- **Multi-Lingual** - DITA is a translation-friendly structure that supports numerous languages and text encodings.
- **Conditional Profiling** - DITA supports conditional text processing and profiling to filter content in the publishing stage.

This chapter is designed to be a guide to help content authors who use DITA. It also presents the Oxygen XML Editor plugin features that are specific to working with DITA documents and concepts.

**DITA Resources**

For more general information and technical details about working with DITA, refer to the following resources:
• The DITA Specifications.
• The DITA Style Guide Best Practices for Authors.
• Various sample DITA topics and maps can be found in the `{OXYGEN_INSTALL_DIR}/samples/dita` folder.

Related Information:

• DITA Topics Document Type (Framework) (page 1313)
• DITA Map Document Type (Framework) (page 1336)

Getting Started with DITA

The information in this topic is meant to be a very basic starting point for those who are just getting started using DITA in Oxygen XML Editor plugin. Oxygen XML Editor plugin makes it easy to create, edit, manage, and publish DITA content, but it requires at least some basic DITA knowledge. To truly get the most out of Oxygen XML Editor plugin and all of its DITA-related features, you should explore resources in the online DITA community to acquire knowledge of its concepts and uses.

Understanding DITA Topics

It is important to understand the role that a DITA topic plays in a DITA project. A DITA topic is not associated with a single published document. It is a separate entity that can potentially be included in many different books, help systems, or websites. Therefore, when you write a DITA topic you are not writing a book, a help system, or a website. You are writing an individual piece of content. This affects how you approach the writing task and how Oxygen XML Editor plugin works to support you as you write.

Most of your topics are actually related to other topics, and those relationships can affect how you write and handle things such as links and content reuse. Oxygen XML Editor plugin helps you manage those relationships. Depending on how your topics are related, you can use the tools provided in Oxygen XML Editor plugin, along with the features of DITA, in a variety of ways.

Creating a DITA Topic in Oxygen XML Editor plugin

To create a DITA topic (page 2459):
1. Select File > New > Other > Oxygen XML Editor plugin, or click the New button on the toolbar, and select New from Templates.

**Step Result:** The New from Templates Wizard (page 550) is displayed:

![New DITA Document from Templates Wizard](image)

2. Go to Framework templates > DITA > topic and select the type of topic that you want to create, then click Next.

**Note:** If your organization has created DITA customizations, the appropriate template files may be in another location, and various types of topics may be provided for your use. Check with the person who manages your DITA system to see if you should be using templates from another directory.

3. Select a file path where it will be saved.
4. Click Finish.

**Result:** Your document is opened in the editor. Eventually you will need to add a reference to it in your DITA map (page 14).
Your DITA topic is an XML document, thus all the editing features that Oxygen XML Editor plugin provides for editing XML documents (page 6) also apply to DITA topics. Oxygen XML Editor plugin also provides additional specific DITA-related support for working with DITA topics (page 2457), their associated DITA maps (page 2398), and for creating DITA output (page 2580).

Role of Maps

The basic method that DITA uses to express the relationship between topics is through a DITA map (page 2705). Other relationships between topics, such as cross references, generally need to be made between topics in the same root map. DITA uses maps to determine which topics are part of any output that you create. While customized DITA solutions can use other mechanisms, generally DITA is not used as a way to publish individual topics. Output is created from a map and includes all the topics referenced by the map.

A publication is not always represented by a single map. For instance, if you are writing a book, you might use a submap to create each chapter and then organize the chapters in a main root map to create the book. This helps you to manage your content, offers the possibility of reusing submaps, and segregates content to support multiple people working on the same project.

Creating a Map in Oxygen XML Editor plugin

To create a map (page 2416):

1. Select File > New > Other > Oxygen XML Editor plugin, or click the New button on the toolbar, and select New from Templates.
2. Go to Framework templates > DITA > map and select the type of map you want to create.
3. Choose whether you want to open the map in the Editor or in the DITA Maps Manager (page 2400). Usually, opening it in the DITA Maps Manager is the best choice. The DITA Maps Manager presents a view of the DITA map that is similar to a table of contents.

Figure 701: DITA Maps Manager View
Adding Existing Topics to a Map in Oxygen XML Editor plugin

There are several ways to add a topic reference to a map (page 2419). Perhaps the easiest method is to add a reference to a topic that is already open in the editor:

1. Open the DITA topic in the main editing window.
2. Right-click the DITA map in the DITA Maps Manager view (page 2400) and choose Reference to the currently edited file from the Append Child, Insert Before, or Insert After submenu.

**Step Result:** This opens the Insert Reference dialog box (page 2426) with all of the required fields already filled in for you.

*Figure 702: Insert Reference Dialog Box*
3. You can fill in additional information in the various tabs in this dialog box or add it to the map later.
4. Select **Insert and close** to add a reference to your topic in the map.
5. Save the **DITA map**.

### Adding New Topics to a Map in Oxygen XML Editor plugin

As you add topics to your map, you may want to create a new topic as a child or sibling of another topic. This is usually done at the map level.

To **add a new topic to a map** *(page 2419)*, follow these steps:

1. In the **DITA Maps Manager** *(page 2400)*, right-click the node in the current map where you want to add the new topic.
2. Select one of the following actions:
   - **Append Child > New** - Select this action to insert the new topic as a child of the selected node. This action opens a **New file dialog box** *(page 2460)* that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.
   - **Insert Before > New** - Select this action to insert the new topic as a sibling to the current node, before it. This action opens a **New file dialog box** *(page 2460)* that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.
   - **Insert After > New** - Select this action to insert the new topic as a sibling to the current node, after it. This action opens a **New file dialog box** *(page 2460)* that allows you to select the
type of document and assists you with naming it. After you have configured your new topic, click **Create**.

- **Duplicate** - Select this action to create a copy of the selected topic and insert it as a sibling. This action opens a dialog box that allows you to choose the file name and location for the newly created copy of the topic. After you have selected the name and path for your new topic, click **OK**.

**Step Result:** The new topic is now referenced (as a `topicref`) in the **DITA map** at the location where you inserted it and the new topic is opened in the editor.

3. **Save the DITA map.**

You can also change the order and nesting of topics in the **DITA Maps Manager** view by doing either of the following:

- Select the topic to move while holding down the **Alt** key and use the arrow keys to move it around.
- Use the mouse to drag and drop the topic to the desired location.

The way your parent and child topics are organized in any particular output depends on both the configuration of those topics in the map and the rules of the output transformation that is applied to them. Do not assume that your topics must have the same organization for all output types. The map defines the organization of the topics, not the topics themselves. It is possible to create a variety of maps, each with different organization and configuration options to produce a variety of outputs.

**Adding Submaps in Oxygen XML Editor plugin**

If you have a large set of information, such as a long book or extensive help system, a single map can become long and difficult to manage. To make it easier to manage, you can **break up the content into smaller submaps** (page 2417). A submap might represent a chapter of a book, a section of a user manual, or a page on a website. To build a publication out of these smaller maps, you must add them to a map that represents the overall publication.

To **add a child map to the current map** (page 2417):

1. **Right-click the parent DITA map** in the **DITA Maps Manager** view (page 2400) and choose **Append child > Map reference**.

   **Step Result:** This opens the **Insert Reference** dialog box (page 2426) with all of the required fields already filled in for you.

2. You can fill in additional information in the various tabs in this dialog box or add it to the map later.

3. **Select Insert and close** to add a reference to your submap in the main map.
4. Save the main DITA map.

### Validating a Map in Oxygen XML Editor plugin

Just as it is with your individual topics, it is important to validate your maps (page 2446). Oxygen XML Editor plugin provides a validation function for DITA maps that does more than simply validating that the XML is well formed. It also does the following:

- Validates all of the relationships defined in the maps.
- Validates all of the files that are included in the map.
- Validates all of the links that are expressed in the files.

Validating the map that describes your entire publication validates all the files that make up the publication and all of the relationships between them.

To validate a map:

1. Click the Validate and Check for Completeness button in the DITA Maps Manager view (page 2400).

   **Step Result:** This opens the DITA Map Completeness Check dialog box (page 2447).

2. Select any of the various options you want to check.

3. Click Check to run the validation process.

### Publishing Your Topics in Oxygen XML Editor plugin

As noted previously, in DITA standards you usually do not publish output from an individual topic. Instead, you create published output (page 2580) by running a DITA transformation on a map. This collects all the topics that are referenced in the map, organizes them, and produces output in a particular format. By default, Oxygen XML Editor plugin uses the transformations provided by the DITA Open Toolkit for publishing to various output formats (such as PDF, WebHelp or EPUB). Your organization may have created various custom transformations or modified the built-in DITA Open Toolkit transformations. In either case, Oxygen XML Editor plugin manages them by using transformation scenarios.

To publish output for a map:

1. Click the Configure Transformation Scenario(s) button in the DITA Maps Manager view (page 2400).

   **Step Result:** This opens the Configure Transformation Scenario(s) dialog box (page 1502).

   *Figure 703: Configure Transformation Scenarios Dialog Box*
2. Select the appropriate transformation depending on the type of output you desire.

3. To change or view the configuration or storage options for a transformation scenario, select the transformation and click **Edit**.

4. Click **Apply associated**.

   **Result:** Depending on the configuration of the transformation scenario, when the transformation is finished, your output may automatically be opened in the appropriate application.

**Related Information:**

- DITA Authoring *(page 2390)*

- Editing XML Documents in Author Mode *(page 672)*

---

**Working with DITA Maps**

In the DITA standard architecture you create documents by collecting topics into maps.
DITA Maps

A DITA map (page 2705) organizes a set of topics into a hierarchy. In most output formats, the structure of the map becomes the structure of the table of contents. Oxygen XML Editor plugin provides support for creating (page 2416) and managing DITA maps (page 2419) through the DITA Maps Manager (page 2400). There are also specialized types of DITA maps, such as a bookmap (page 2704), which is intended for creating the structure of a book.

Submaps

You do not have to create an entire publication using a single map. It is generally good practice to break up a large publication into several smaller submaps (page 2417) that are easier to manage. You can reuse submaps in multiple publications by including them in each of the main maps. The DITA Maps Manager (page 2400) provides support for easily creating and managing submaps.

Opening a DITA Map

There are several ways to open a DITA map and you can choose to open it in the DITA Maps Manager (page 2400) or in the XML Editor. Use any of the following methods to open a map:

- To open a submap in its own tab in the DITA Maps Manager, simply double-click it (or right-click it and select Open).
- To open a map in the XML editor from the DITA Maps Manager, right-click it and select Open Map in Editor.
- Drag a DITA map file from your system browser and drop it in the XML editor. This will open the map in the editor.
- To open a map in the DITA Maps Manager, you can right-click a map file in the Navigator view (page 250) and select Open in DITA Maps Manager.

Chunking DITA Maps

By default, many output types place a single topic on each output page. In some cases you may want to output multiple topics as a single output page (also known as chunking) (page 2446). To support this, Oxygen XML Editor plugin provides an Edit Properties dialog box (page 2436) that allows you to easily configure the attributes of a topic to control how your table of contents and topics are rendered in the output.
Validating a Map

You should validate your maps ([page 2446](#)) to make sure that the individual topics are valid and that the relationships between them are working. Oxygen XML Editor plugin provides a validation function for DITA maps that performs a comprehensive validation of a map and its topics.

For more information about DITA editing, watch our video demonstration:

https://www.youtube.com/embed/t2cG3Xe1TXY

Related Information:

- DITA Map Document Type (Framework) ([page 1336](#))
- DITA Map Author Mode Actions ([page 1338](#))

DITA Maps Manager

Oxygen XML Editor plugin provides a view for managing and editing DITA maps. The DITA Maps Manager view presents a DITA map as a Table of Contents. It allows you to navigate the topics and maps, make changes, and apply transformation scenarios to obtain various output formats. By default, it is located to the left of the main editor. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

The DITA Maps Manager includes a variety of useful actions to help you edit and organize the structure of your DITA maps and topics. The actions that are available and their functions depend on the type of nodes that are selected in the DITA Maps Manager. If you select multiple sibling nodes, the result of the actions will be applied to all the selected nodes. If you select multiple nodes that are not on the same hierarchical level, the actions will be applied to the parent node and the child nodes will inherit certain attributes from the parent node.

Figure 704: DITA Maps Manager View
Opening Maps in the DITA Maps Manager

The DITA Maps Manager view supports opening multiple maps at the same time, with each one presented in its own tab. To open a DITA map in the DITA Maps Manager, use any of the following methods:

- To open a submap in its own tab, simply double-click it (or right-click it and select Open).
- Right-click a map file in the Navigator view (page 250) and select Open in DITA Maps Manager.

Submap Nodes

If your root map (page 2711) (main DITA map) references other maps (submaps), they can be expanded and you can navigate their content in the DITA Maps Manager, but the references within those submaps are not editable unless you open the submap separately in its own tab. The references within submap nodes are shown with a gray background.

Moving Nodes in the DITA Maps Manager

You can move topics or nodes within the same map, or other maps, by dragging and dropping them into the desired position. You can arrange the nodes by dragging and dropping one or more nodes at a time. You can arrange multiple topics by dragging them while pressing the Ctrl or Shift key. Drop operations can be performed before, after, or as child of the targeted node.

Operations include:
Copy
Select the nodes you want to copy and start dragging them. Before dropping them in the appropriate place, press and hold the Ctrl key. The mouse pointer changes to a symbol to indicate that a copy operation is being performed.

Move
Select the nodes you want to move and drag and drop them in the appropriate place.

Promote (Alt + LeftArrow) / Demote (Alt + RightArrow)
You can move nodes between child and parent nodes by using the Promote (Alt + LeftArrow) and Demote (Alt + RightArrow) operations.

DITA Maps Manager Toolbar
The toolbar includes the following actions (also available in the DITA Maps menu) and their availability depend on the nodes that are selected:

Note: If multiple nodes are selected, the availability of the actions depends on the nodes that are selected.

 النقد: If multiple nodes are selected, the availability of the actions depends on the nodes that are selected.

- Open Drop-down Menu
You can use this drop-down menu to open new DITA maps or to reopen recently viewed maps. The drop-down menu contains the following:

- List of recently viewed DITA maps that can be selected to reopen them.
- Clear history - Clears the history list of the recently viewed DITA maps.
- Open - Allows you to open the map in the DITA Maps Manager view (page 2400). You can also open a map by dragging it from the file system explorer and dropping it into the DITA Maps Manager view (page 2400).
- Browse workspace - Opens a file browser dialog box allowing you to select a file from the local workspace.
- Open URL - Displays the Choose DITA Map dialog box where you can specify a URL (defined by a protocol, host, resource path, and an optional port) or use the browsing actions in the Browse for remote file drop-down menu.

Save (Ctrl (Meta on Mac OS)+S)
Saves the current DITA map.

Validate and Check for Completeness
Checks the validity and integrity (page 2446) of the map.
Apply Transformation Scenario(s)

Applies the DITA Map transformation scenario (page 1382) that is associated with the current map.

Configure Transformation Scenario(s)

Opens the Configure Transformation Scenarios(s) dialog box (page 1502) where you can edit or create transformation scenarios or associate a DITA Map transformation scenario (page 1444) with the current map.

Refresh References

You can use this action to manually trigger a refresh and update of all referenced documents. This action is useful when the referenced documents are modified externally. When they are modified and saved from Oxygen XML Editor plugin, the DITA map is updated automatically.

Open Map in Editor with Resolved Topics

Opens the DITA map in the main editor area with content from all topic references, expanded in-place. Content from the referenced topics is presented as read-only and you have to use the contextual menu action Edit Reference to open the topic for editing.

Tip: If you want to print the expanded content, you should consider changing the Styles drop-down to + Print ready.

Open Map in Editor

For complex operations that cannot be performed in the simplified DITA Maps Manager view (for instance, editing a relationship table) you can open the map in the main editing area.

Note: You can also use this action to open referenced DITA maps in the Editor.

Profiling/Conditional Text Drop-down Menu

This drop-down menu contains the following actions:

• Show Profiling Colors and Styles - Select this option to turn on conditional styling. To configure the colors and styles open the Preferences dialog box (page 55) and go to Editor > Edit modes > Author > Profiling/Conditional Text > Colors and Styles.

• Show Profiling Attributes - Select this option to display the values of the profiling attributes at the end of the titles of topic references. When selected, the values of the profiling attributes are displayed in both the DITA Maps Manager view and in the Author view.
• **Show Excluded Content** - Controls if the content filtered out by a particular condition set is hidden or grayed-out in the editor area and in the Outline (page 316) and DITA Maps Manager views. When this option is selected, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, deselect this option.

• **Profiling Settings** - Opens the preferences page for adding and editing the profiling conditions that you can apply in the DITA Maps Manager view and the Author mode editing pane. When a profiling condition set (page 752) is applied, the keys that are defined in the DITA map are gathered by filtering out the excluded content.

### Link with Editor

Toggles the synchronization between the file path of the current editor and the selected topic reference in the DITA Maps Manager view. If enabled, it results in the following types of synchronizations:

• If you select a topic tab in the main editing area and it is referenced in the map currently opened in the DITA Maps Manager, the reference to that topic is selected in the DITA Maps Manager.

• If you have a map opened in both the DITA Maps Manager and the main editor, selecting the map tab in the main editing area opens that map in the DITA Maps Manager.

• If you have a map opened in both the DITA Maps Manager and the main editor (Author mode) and, selecting one or more topicrefs in the DITA Maps Manager will also select the same topicrefs in the main editor.

• If you have a map opened in both the DITA Maps Manager and the main editor (Author mode) and, selecting one or more topicrefs in the main editor will also select the same topicrefs in the DITA Maps Manager.

### Settings

**Show extended toolbar**

Toggles whether or not the extended toolbar will be displayed in the DITA Maps Manager toolbar.

**Show root map toolbar**

Toggles whether or not the Root map option (page 2405) will be displayed in the DITA Maps Manager toolbar.

**Show topic titles**
Toggles how topics are presented in the DITA Maps Manager. If selected, the title of each topic is shown. Otherwise, the file path (value of the `href` attribute) for each topic is shown.

**Root map**

Specifies a master DITA map (root map (page 2711)) that Oxygen XML Editor plugin uses to define a hierarchical structure of submaps and to establish a key space (page 2707) that defines the keys that are propagated throughout the entire map structure. For more information, see Selecting a Root Map (page 2416).

**Browse Drop-down menu**

You can use this drop-down menu to browse for root maps with the following choices:

- **Browse for local file** - Opens a local file browser dialog box, allowing you to select a local root map.
- **Browse workspace** - Allows you to select a root map from the local workspace.
- **Browse for remote file** - Displays the Open using FTP/SFTP dialog box (page 562) that allows you to select a remotely stored root map.
- **Browse for archived file** - Displays the Archive Browser (page 1910) that allows you to browse the content of an archive and choose a root map.
- **Browse Data Source Explorer** - Opens the Data Source Explorer (page 1917) that allows you to browse the data sources defined in the Data Sources preferences page (page 60).

**Tip:** You can open the Data Sources preferences page by using the Configure Database Sources shortcut from the Open URL dialog box.

- **Search for file** - Displays the Find Resource dialog box to search for a root map.

**Insert Topic Reference**

Opens the Insert Reference dialog box (page 2426) that allows you to insert references to targets such as topics, maps, topic sets, or key definitions.

**Edit Properties**

Opens the Edit Properties dialog box that allows you to configure the properties of a selected node. For more details about this dialog box, see Edit Properties Dialog Box (page 2436).

**Edit Attributes**
Opens a small in-place editor that allows you to edit the attributes of a selected node. You can find more details about this action in the Attributes View in Author Mode (page 319) topic.

X Delete
Deletes the selected node.

.Nav-icon nav-up
Move Up
Moves the selected node up within the DITA map tree.

.Nav-icon nav-down
Move Down
Moves the selected node down within the DITA map tree.

Promote
Moves the selected node up one level to the level of its parent node.

Demote
Moves the selected node down one level to the level of its child nodes.

Contextual Menu of the DITA Maps Manager

Root Map
The following actions can be invoked from the contextual menu on the root map (page 2711) of an opened DITA map (many of them are also available in the DITA Maps menu):

Open Map in Editor
For complex operations that cannot be performed in the simplified DITA Maps Manager view (for instance, editing a relationship table) you can open the map in the main editing area.

Open Map in Editor with Resolved Topics
Opens the DITA map in the main editor area with content from all topic references, expanded in-place. Content from the referenced topics is presented as read-only and you have to use the contextual menu action Edit Reference to open the topic for editing.

Export DITA Map
Opens a dialog box that allows you to choose a destination for exporting the DITA map. It also includes a Export as Zip archive option that allows you to package the DITA map as a zip archive. The result will contain all
directly and indirectly referenced topics from the DITA Map by following all
	topicref, conref, and xref elements.

Find Unreferenced Resources

Allows you to search for orphaned resources that are not referenced in the
	DITA maps.

Edit Properties

Opens the Edit Properties dialog box that allows you to configure the
	properties of a selected node. For more details about this dialog box, see
	Edit Properties Dialog Box (page 2436).

Fast Create Topics

Opens the Fast Create Topics dialog box (page 2462) that allows you to
	quickly create multiple skeleton topics at once and you can specify their
	 hierarchical structure within the DITA map (page 2705).

Append Child submenu

Container sub-menu for a number of actions that create a map node as a
	child of the currently selected node:

• New - Opens a dialog box that allows you to configure some options
	for inserting a new topic (page 2459).

• Reference - Inserts a reference to a topic file. You can find more
details about this action in the Inserting References (page 2426)

topic.

• Reference to the currently edited file - Inserts a reference to the

currently edited file. You can find more details about this action in the
	Inserting References (page 2426) topic.

• Key Reference - Opens an Insert Key Definition dialog box that allows

you to insert a targeted key definition (page 2436) (for example, to
	target a resource such as an image or external link).

• Key Reference with Keyword - Opens an Insert Key Definition dialog
	box that allows you to define a key and a value inside a keyword (page
	2435).

• A set of actions that open the Insert Reference dialog box (page
	2426) that allow you to insert various reference specializations (such
	as Anchor Reference, Glossary Reference, Map Reference, Navigation
	Reference, Topic Group, Topic Head, Topic Reference, Topic Set, Topic
	Set Reference).

Search References
Searches all references to the current topic in the entire DITA map (page 2705).

Refactoring submenu

The following actions are available from this submenu when invokes from a root map:

**Rename resource**

Allows you to change the name of a resource linked in the edited DITA map (page 2422).

**Move resource**

Allows you to change the location on disk of a resource linked in the edited DITA map (page 2422).

**Rename Key**

Use this operation to rename a key. It also updates all references to it. Note that it does not work on DITA 1.3 key scopes.

**Convert to Concept**

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

**Convert to General Task**

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA General Task is a less restrictive alternative to the Strict Task information type.

**Convert to Reference**

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

**Convert to Task**

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

**Convert to Topic**

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

**Convert to Troubleshooting**
Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

Other XML Refactoring Actions

For your convenience, the last 5 XML Refactoring tool operations (page 913) that were finished or previewed will also appear in this submenu.

XML Refactoring

Opens the XML Refactoring tool wizard (page 913) that presents refactoring operations to assist you with managing the structure of your XML documents.

Check Spelling in Files

Allows you to spell check multiple files (page 598).

Paste

Allows you to paste content from the clipboard into the DITA map.

Paste Before

Pastes the content of the clipboard (only if it is a part of the DITA map) before the currently selected DITA map node.

Paste After

Pastes the content of the clipboard (only if it is a part of the DITA map) after the currently selected DITA map node.

Expand All

Allows you to expand the entire DITA map structure.

Collapse All

Allows you to collapse the entire DITA map structure.

Editable Child Nodes

The following actions are available when the contextual menu is invoked on an editable child node of a DITA map (submaps need to be opened in the DITA Maps Manager to access these actions since they are in a read-only state in the parent map):

Note: If multiple nodes are selected, the availability of the actions depends on the nodes that are selected.

Open
Opens the selected resource in the editor.

**Edit Properties**

Opens the Edit Properties dialog box that allows you to configure the properties of a selected node. For more details about this dialog box, see Edit Properties Dialog Box (page 2436).

**Fast Create Topics**

Opens the Fast Create Topics dialog box (page 2462) that allows you to quickly create multiple skeleton topics at once and you can specify their hierarchical structure within the DITA map (page 2705).

**Append Child submenu**

Container sub-menu for a number of actions that create a map node as a child of the currently selected node:

- **New** - Opens a dialog box that allows you to configure some options for inserting a new topic (page 2459).
- **Reference** - Inserts a reference to a topic file. You can find more details about this action in the Inserting References (page 2426) topic.
- **Reference to the currently edited file** - Inserts a reference to the currently edited file. You can find more details about this action in the Inserting References (page 2426) topic.
- **Key Reference** - Opens an Insert Key Definition dialog box that allows you to insert a targeted key definition (page 2436) (for example, to target a resource such as an image or external link).
- **Key Reference with Keyword** - Opens an Insert Key Definition dialog box that allows you to define a key and a value inside a keyword (page 2435).
- A set of actions that open the Insert Reference dialog box (page 2426) that allow you to insert various reference specializations (such as Anchor Reference, Glossary Reference, Map Reference, Navigation Reference, Topic Group, Topic Head, Topic Reference, Topic Set, Topic Set Reference).

**Insert Before submenu**

Container sub-menus for a number of actions that create a map node as a sibling of the currently selected node, above the current node in the map:
• **New** - Opens a dialog box that allows you to configure some options for inserting a new topic *(page 2459).*

• **Reference** - Inserts a reference to a topic file. You can find more details about this action in the Inserting References *(page 2426)* topic.

• **Reference to the currently edited file** - Inserts a reference to the currently edited file. You can find more details about this action in the Inserting References *(page 2426)* topic.

• **Key Reference** - Opens an Insert Key Definition dialog box that allows you to insert a targeted key definition *(page 2436)* (for example, to target a resource such as an image or external link).

• **Key Reference with Keyword** - Opens an Insert Key Definition dialog box that allows you to define a key and a value inside a keyword *(page 2435).*

• A set of actions that open the Insert Reference dialog box *(page 2426)* that allow you to insert various reference specializations (such as Anchor Reference, Glossary Reference, Map Reference, Navigation Reference, Topic Group, Topic Head, Topic Reference, Topic Set, Topic Set Reference).

**Insert After submenu**

Container sub-menus for a number of actions that create a map node as a sibling of the currently selected node, below the current node in the map:

• **New** - Opens a dialog box that allows you to configure some options for inserting a new topic *(page 2459).*

• **Reference** - Inserts a reference to a topic file. You can find more details about this action in the Inserting References *(page 2426)* topic.

• **Reference to the currently edited file** - Inserts a reference to the currently edited file. You can find more details about this action in the Inserting References *(page 2426)* topic.

• **Key Reference** - Opens an Insert Key Definition dialog box that allows you to insert a targeted key definition *(page 2436)* (for example, to target a resource such as an image or external link).

• **Key Reference with Keyword** - Opens an Insert Key Definition dialog box that allows you to define a key and a value inside a keyword *(page 2435).*
A set of actions that open the Insert Reference dialog box (page 2426) that allow you to insert various reference specializations (such as Anchor Reference, Glossary Reference, Map Reference, Navigation Reference, Topic Group, Topic Head, Topic Reference, Topic Set, Topic Set Reference).

Search References

Searches all references to the current topic in the entire DITA map (page 2705).

Refactoring submenu

The following actions are available from this submenu:

Convert Markdown to DITA Topic (Available for Markdown documents)

Opens a dialog box that allows you to configure options for converting the Markdown document into a DITA topic (page 1260).

Rename resource

Allows you to change the name of a resource linked in the edited DITA map (page 2422).

Move resource

Allows you to change the location on disk of a resource linked in the edited DITA map (page 2422).

Extract to New DITA Map

Use this operation to extract editable topics into a new DITA map. The operation will open a map creation dialog box where you can select the type of map and configure the title or file name. Click Create to complete the operation and a new DITA map will be inserted at the location where the action was invoked with the selected topic references moved into the new map.

Rename Key

Use this operation to rename a key. It also updates all references to it. Note that it does not work on DITA 1.3 key scopes.
Convert Nested Topics to New Topics (Available from the contextual menu of editable maps/nodes in the DITA Maps Manager (page 2400))

Use this operation on topics that contain nested `<topic>` elements to convert each nested topic to a new topic. Also, the new topics are added in the DITA Maps Manager as the first child topics of the original topic.

Convert Sections to New Topics (Available from the contextual menu of editable maps/nodes in the DITA Maps Manager (page 2400))

Use this operation on topics that contain multiple sections to convert each section to a new topic. Also, the new topics are added in the DITA Maps Manager as the first child topics of the original topic.

Convert to Concept

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

Convert to General Task

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA General Task is a less restrictive alternative to the Strict Task information type.

Convert to Reference

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

Convert to Task

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

Convert to Topic

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

Convert to Troubleshooting

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

Other XML Refactoring Actions
For your convenience, the last 5 XML Refactoring tool operations (page 913) that were finished or previewed will also appear in this submenu.

**XML Refactoring**

Opens the XML Refactoring tool wizard (page 913) that presents refactoring operations to assist you with managing the structure of your XML documents.

**Check Spelling in Files**

Allows you to spell check multiple files (page 598).

**Cut**

Deletes the currently selected node and copies it to the clipboard.

**Copy**

Copies the currently selected node to the clipboard.

**Paste**

Allows you to paste content from the clipboard into the DITA map.

**Paste Before**

Pastes the content of the clipboard (only if it is a part of the DITA map) before the currently selected DITA map node.

**Paste After**

Pastes the content of the clipboard (only if it is a part of the DITA map) after the currently selected DITA map node.

**Delete**

Deletes the currently selected node from the DITA map.

**Remove from Disk**

This action can be used to remove the selected resource(s) from disk. Selecting this action will open a confirmation dialog box where you can also choose to remove the descendants by selecting the Also remove all descendants option. If you proceed, a search for references is triggered. If multiple references are detected for any of the selected resources, you will have the option to review them since this would lead to broken links.

**Organize**

Allows you to organize the DITA map with the several submenu actions:

- **Move Up** - Moves the selected node up within the DITA map tree.
• 💼 Move Down - Moves the selected node down within the DITA map tree.
• ⬇️ Promote - Moves the selected node up one level to the level of its parent node.
• ⬇️ Demote - Moves the selected node down one level to the level of its child nodes.

Expand All
Allows you to expand the entire DITA map structure.

Collapse All
Allows you to collapse the entire DITA map structure.

Other Nodes
The following additional actions are available when the contextual menu is invoked from other nodes, such as a submap node or a relationship table:

Open Map in Editor (available when invoking on a submap)
Opens the currently selected DITA map in the editor.

Open parent DITA map (available when invoking on a read-only topic reference or a submap reference)
Opens the parent DITA map of the currently selected reference in the DITA Maps Manager.

Edit Attributes (only available for relationship table nodes)
Opens a small in-place editor that allows you to edit the attributes of a selected node. You can find more details about this action in the Attributes View in Author Mode (page 319) topic.

Edit Profiling Attributes (only available for relationship table nodes)
Allows you to change the profiling attributes (page 746) defined on the selected node.

For more information about the DITA Maps Manager view and many of its features, watch our video demonstration:

https://www.youtube.com/embed/ozFZz6YZMCY

Related Information:

• DITA Map Validation and Completeness Check (page 2446)
Creating a Map

To create a DITA map (page 2705), subject scheme map (page 2711), bookmap (page 2704), or other types of DITA maps, follow these steps:

1. Use the New Document wizard (page 550) to start creating your map.

   **Tip:** If you want the map to be a submap, you can create it the same way by right-clicking the place in the current map where you want to add it (in the DITA Maps Manager (page 2400)) and selecting New from the Append Child, Insert Before, or Insert After submenu.

2. Select one of the DITA Map templates from the Framework templates folder.

3. Click the Next button.

4. Select a parent folder and the file name and click Finish.

5. Save the map after opening it in the DITA Maps Manager (page 2400) or the Editor.

Related Information:

- Customizing Profiling Values with a Subject Scheme Map (page 2652)
- Managing DITA Maps (page 2419)

Selecting a Root Map

Oxygen XML Editor plugin allows you to select a root map (page 2711) (a master DITA map (page 2705)) that defines a hierarchical structure of submaps and establishes a key space (page 2707) that defines the keys used in all the other DITA maps and topics in the project. Specifying the correct root map helps to prevent validation problems when you work with keyrefs and also acts as the foundation for content completion. All the keys that are defined in a root map are available in the submaps that are contained within the root map.

There are several ways to select or change the root map:
• The easiest method is to use the **Root map drop-down menu** *(page 2405)* in the **DITA Maps Manager** *(page 2400)* toolbar to select the appropriate **root map**.

• If you insert a **key reference** using the **Cross Reference** action from the **Link** drop-down menu (from the toolbar or **Link** submenu of the contextual menu) and keys are not gathered from the expected **DITA map**, you can change the **root map** by using the **Change Root Map** link in the **Choose Key** dialog box that is opened when you click the **Choose Key Reference** button.

• If you insert a **content key reference** or **key reference** using the **Reuse Content** action (from the toolbar, **DITA** menu, or **Reuse** submenu of the contextual menu) and keys are not gathered from the expected **DITA map**, you can change the **root map** by using the **Change Root Map** link in the **Choose Key** dialog box that is opened when you click the **Choose Key Reference** button.

For more information about the DITA **root map** support, watch our video demonstration:

https://www.youtube.com/embed/e81r3Y1qjnE

### Creating DITA Submaps

You can break up a large **DITA map** *(page 2705)* into more manageable pieces by creating submaps. A submap is simply a **DITA map** that is included by another **DITA map**. There is no separate markup for a submap.

For example, if you are creating a book, you might use one submap for each chapter of the book. If you are reusing a set of topics in multiple publications, you might collect them into a map and reuse the map as a submap in multiple other maps, rather than referencing the topics individually from the new maps.

You add a submap to a map the same way that you would **add a new topic or insert an existing topic into a map** *(page 2419)*, except you choose a map rather than a topic to create or add. When adding a submap to a map make sure that you use a **mapref** element or a **topicref** element with the **format** attribute set to **ditamap**. In most cases, Oxygen XML Editor plugin takes care of this for you.

### Adding a Submap to a Map

To add a submap to a map:

1. Right-click the place in the current map where you want to add the new submap.
2. To insert the submap as a child of the selected node, select **Append Child > New**. To insert the submap as a sibling to the current node, select **Insert After > New** or **Insert Before > New**.
Step Result: This opens a **New DITA file dialog box (page 2459)** that allows you to select the type of document and assists you with naming it.

3. Select the type of map in one of the folders inside the **DITA Map** folder and give it a name (the file type should be `.ditamap`).
4. Click **Create** to insert the submap.

You can also manage and move submaps the same as you would with topics. For more information, see **Managing DITA Maps (page 2419)**.

Creating a Bookmap in DITA

If you want to create a traditional book in DITA, you can use a **bookmap (page 2704)** to organize your topics into a book. A DITA **bookmap** is a specialized type of map, intended for creating output that is structured like a book. A bookmap allows you to add book-specific elements such as `frontmatter`, `part`, `chapter`, `appendix`, and `backmatter` to the map. How these book-specific elements are processed for publication is up to the processing script for each media. See the **DITA documentation** for details.

You can find additional support for creating books in DITA in the DITA for Publishers plugin, which is included with Oxygen XML Editor plugin.

To create a book in DITA using a **bookmap**, follow these steps:

1. Create a new **bookmap (page 2418)** (**File > New > Framework templates > DITA Map > map > Bookmap**). If you want the **bookmap** to be a submap, you can create it the same way by right-clicking the place in the current map where you want to add it (in the **DITA Maps Manager (page 2400)**) and selecting **New** from the **Append Child, Insert Before, or Insert After** submenus.
2. Create the structure of your book by adding the appropriate book sections and defining containers for chapters and any appendices. To add sections to a **bookmap**, or children to a section, right-click the **bookmap** or section icon and choose any of the reference actions in the **Append child** menu. The selections offered in the menu will adjust depending on the element they are applied to. Consult the **DITA documentation** to fully understand the structure of a DITA **bookmap** and where to create each element.
3. Create special elements such as an **index (page 2444)** and **table of contents (page 2443)**. The index and table of contents will be generated by the build process, based on the content of the map and the topics it points to.
4. **Add topics (page 2419)** to your chapters to add content to your book. You may find it easier to manage if you use **submaps (page 2417)** to create the content of your chapters. This keeps your **bookmap** from becoming long and difficult to manage.
Managing DITA Maps

You may want to manage your DITA maps in a variety of ways, including:

- Change the order and nesting of topics in a map.
- Add topics to a map.
- Insert various types of references in a map.
- Find, move, or rename resources in a map.
- Change other properties of the items in a map.
- Use the Edit Properties dialog box to manage attributes, keys, metadata, or add profiling to any section of a map.

This section includes various topics that describe how you can manage DITA maps and resources.

For more information about the DITA Maps Manager view and many of its features, watch our video demonstration:

https://www.youtube.com/embed/ozFZz6YZMCY

Change the Order of Topics in DITA Maps

You can change the order and nesting of the topics in a map in several ways:

- By dragging and dropping topics within the DITA Maps Manager.
- By showing the extended DITA Maps Manager toolbar (press the Settings icon on the DITA Maps Manager toolbar and select the extended toolbar) and then using the node moving buttons on the toolbar to move topics around in the map.

To understand how to organize topics in a DITA map using the DITA Maps Manager, you can examine and experiment with the sample map called flowers.ditamap, located in the [OXYGEN_INSTALL_DIR]/samples/dita folder.

Adding Topics to a DITA Map

When you are working in DITA, there are several approaches that you can use to create topics and maps. You can start by first creating topics and then assembling your finished topics into one or more documents by creating one or more maps, or you can start by creating a map and then adding new topics to it as you work.

The topics-first approach is generally more appropriate if you intend to do a lot of content reuse, as it encourages you to think of each topic as an independent unit that can be combined with other topics.
in various ways. The map-first approach will be more familiar to you if you are used to creating books or manuals as a whole. Oxygen XML Editor plugin supports both approaches.

A DITA map (page 2705) organizes content hierarchically, so you can add a topic as a child of the map root element or as a child or sibling of any item already in the map. Therefore, the first step to adding a topic to a map is always to choose the place it will be inserted into the map.

**Adding Existing Topics to a Map**

At the XML-level, a topic is added to a map by adding a reference to the map that points to the topic. There are a variety of reference types that you can use. The default type is the `topicref` element. See the DITA documentation for the full range of reference elements and their uses. Oxygen XML Editor plugin provides several tools for inserting reference elements into a map:

**Using the Insert Reference Dialog Box**

The Insert Reference dialog box (page 2426) allows you to create various reference types and configure the most commonly used attributes. You can open the Insert Reference dialog box with any of the following methods:

- Right-click an item in the current map where you want to add the reference, select Append Child, Insert Before, or Insert After and select the type of reference to enter.
- If the topic you want to add is currently open in the editor, you can right-click an item in the current map where you want to add the reference and select Reference to the currently edited file.
- Selecting an item in the map and click the Insert Reference button from the DITA Maps Manager (page 2400) toolbar.
- Select Insert Reference from the DITA Maps menu.

**Dragging and Dropping a File into the DITA Maps Manager**

You can add a topic to a DITA map by dragging and dropping the file into the DITA Maps Manager (page 2400). You can drag and drop files from any of the following:

- Your OS file system explorer.
- The Navigator view (page 250).

Adding topics this way will not open the Insert Reference dialog box, but you can adjust all the same properties by invoking the contextual menu from the topic and selecting Edit Properties.
Adding a New Topic to a Map

To add a new topic to a map, follow these steps:

1. In the **DITA Maps Manager** *(page 2400)*, right-click the node in the current map where you want to add the new topic.
2. Select one of the following actions:
   - **Append Child > New** - Select this action to insert the new topic as a child of the selected node. This action opens a **New file dialog box** *(page 2460)* that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click Create.
   - **Insert Before > New** - Select this action to insert the new topic as a sibling to the current node, before it. This action opens a **New file dialog box** *(page 2460)* that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click Create.
   - **Insert After > New** - Select this action to insert the new topic as a sibling to the current node, after it. This action opens a **New file dialog box** *(page 2460)* that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click Create.
   - **Duplicate** - Select this action to create a copy of the selected topic and insert it as a sibling. This action opens a dialog box that allows you to choose the file name and location for the newly created copy of the topic. After you have selected the name and path for your new topic, click OK.

   **Step Result:** The new topic is now referenced (as a `topicref`) in the **DITA map** at the location where you inserted it and the new topic is opened in the editor.

3. Save the **DITA map**.

Adding Multiple Skeleton Topics at Once

Oxygen XML Editor plugin includes a feature in the **DITA Maps Manager** *(page 2400)* that allows you to quickly create multiple skeleton topics at once and you can specify their hierarchical structure within the **DITA map** *(page 2705)*.

To access this feature, right-click a node in the **DITA Maps Manager** where you want the new topics to be inserted and select **Fast Create Topics**. This opens the **Fast Create Topics** dialog box where you can configure the structure for the new topics.

For more information, see **Fast Create Multiple DITA Topics** *(page 2462)*.
Adding Multiple References to the Same Topic in a Map

Oxygen XML Editor plugin allows you to reuse entire topics by adding multiple references to the same topic in a DITA map. Whenever multiple references to the same topic are detected in the context of the current map in the DITA Maps Manager (page 2400), an indicator will appear in the top-right corner of the Author mode editor that shows the number of times the topic is referenced in the DITA map. It also includes navigation arrows that allow you to jump to the next or previous reference.

Remove Topics from a Map

You can remove topics from a map in a number of ways. Some ways to remove a topic from a map include:

- Highlight the topic and press Delete.
- Highlight the topic and click the Delete button on the DITA Maps Manager (page 2400) extended toolbar.

Moving and Renaming Resources

You can move or rename resources on disk directly from Oxygen XML Editor plugin and you have the option of updating all the references to the moved or renamed resources. For DITA resources (such as topics and maps), you can do this from the DITA Maps Manager view (page 2400). For non-DITA resources (such as folders, images, html files, audio, video, text files, Markdown documents), you can do this from the Navigator view (page 250).

Moving or Renaming DITA Resources (Topics or Maps)

To move or rename normal DITA resources (such as topics or maps), use one of the following actions available in the Refactoring submenu of the contextual menu when invoked on the resource in the DITA Maps Manager view (page 2400):

Refactoring > Move resource
This action allows you to change the location of a resource linked in the edited DITA map, using the **Move resource** dialog box. This dialog box contains the following options:

- **Destination** - Specifies the target location of the edited resource.
- **File name** - Allows you to change the name of the edited resource.
- **Update references** - Select this checkbox to update all references of the file in the edited DITA map and in the files referenced from the DITA map, preserving the completeness of the DITA map.
- **Preview** - Select this button to display a preview of the changes Oxygen XML Editor plugin is about to make.
- **Move** - Moves the edited resource in the target location on disk.
- **Cancel** - Cancels the Move resource operation. No changes are applied.

**Refactoring > Rename resource**

This action allows you to change the name of a resource linked in the edited DITA map (page 2705), using the **Rename resource** dialog box. This dialog box contains the following options:

- **New name** - Presents the current name and allows you to change it.
- **Update references** - Select this checkbox to update all references of the file in the edited DITA map and in the files referenced from the DITA map, preserving the completeness of the DITA map.
- **Preview** - Select this button to display a preview of the changes Oxygen XML Editor plugin is about to make.
- **Rename** - Executes the Rename resource operation.
- **Cancel** - Cancels the Rename resource operation. No changes are applied.

**Note:** If a root DITA map (page 2711) is not defined, the move and rename actions are executed in the context of the current DITA map.

**Moving or Renaming Non-DITA Resources and Updating the References to Them**

To move or rename non-DITA resources (such as folders, images, html files, audio, video, text files, Markdown documents), you can simply follow the procedures described in Moving/Renaming Resources in the Navigator View (page 579). However, this approach will not give you the option to update the references to the moved or renamed resources.

To perform move or rename operation on non-DITA resources while also updating all the references to them, use the following sets of procedures:
1. Enable *Master Files* support and add your *root DITA map (page 2711)* to the *Master Files* folder by following the procedure found here: *How to Enable Master Files Support in DITA (page 2675)*.

2. Move or rename resources and update the references to them by following the procedure found here: *Moving or Renaming Non-DITA Resources and Updating the References to Them (page 2676)*.

**Related Information:**

- *Master Files Support in DITA (page 2675)*
- *Finding Resources Not Referenced in DITA Maps (page 2424)*

**Finding Resources Not Referenced in DITA Maps**

Over the course of time, large projects can accumulate a vast amount of resources from a variety of sources. Especially in organizations with a large number of content authors or complex project structures, organizing the project resources can become a challenge. Over time a variety of actions can cause resources to become orphaned from *DITA maps (page 2705)*. To assist you with organizing project resources, Oxygen XML Editor plugin includes the *Find Unreferenced Resources* action, that searches for such resources.

To perform this search, open the *DITA map* in the *DITA Maps Manager (page 2400)*, invoke the contextual menu on the *map*, and select the *Find Unreferenced Resources* action. This action opens the *Find Unreferenced Resources* dialog box, shown below.

*Figure 705: Find Unreferenced Resources Dialog Box*
The Find Unreferenced Resources dialog box includes the following options:

- **DITA Maps** - Provides a list of DITA maps to be included in the search and allows you to **Add** maps to the list or **Remove** them.
- **Folders** - Provides a list of folders to be included in the search and allows you to **Add** or **Remove** specific folders. All files from this list of folders that are not referenced from the maps specified in the DITA Maps list will be reported.
- **Filters** - Provides three combo boxes that allow you to filter the search to include or exclude certain files or folders:
  - **Include files** - Allows you to filter specific files to include in the search.
  - **Exclude files** - Allows you to filter specific files to exclude from the search.
  - **Exclude folders** - Allows you to filter specific folders to exclude from the search.

**Note:** In any of the filter combo boxes you can enter multiple filters by separating them with a comma and you can use the ? and * wildcards. Use the drop-down arrow to select a previously used filter pattern.

When you click the **Find** button, if the search operation finds unreferenced resources, they are displayed in the **Results** panel at the bottom of the editor. If you want to delete an unreferenced resource, you can right-click its result and select **Remove from Disk**. If you want to see the resource before deciding what to do with it, you can right-click its result and select **Show in Explorer**.

Inserting References in DITA Maps
A **DITA map (page 2705)** may contain various types of references. The targets of the references can be a variety of references, such as chapters, maps, topics, topic sets, or key definitions. You can insert references to such targets with the **Insert Reference dialog box (page 2426)**.

This section explains how to insert and configure references (such as topic references, topic groups, topic headings, and key definitions) in a **DITA map**.

**Insert Reference Dialog Box**

The **Insert Reference** dialog box allows you to insert and configure references in **DITA maps (page 2705)**. There are numerous types of references that can be inserted into maps. They include references to topics, other maps, glossary terms, and keys. You can also use this dialog box to configure the attributes of a reference, add profiling or metadata, and define keys.

To open the **Insert Reference** dialog box, use one of the following methods:

- Select ✉️ **Reference, Reference to the currently edited file**, or any of the other specific reference actions that are available from the **Append Child**, **Insert Before**, and **Insert After** submenus when invoking the contextual menu in the **DITA Maps Manager (page 2400)**.
  - To insert the reference as a child of the current node, select the reference from the **Append Child** submenu.
  - To insert the reference as a sibling of the current node, below the current node in the map, select the reference from the **Insert After** submenu.
  - To insert the reference as a sibling of the current node, above the current node in the map, select the reference from the **Insert Before** submenu.

  **Note:** The content of these submenus depends on the node that is selected in the **DITA map** tree when the contextual menu is invoked. For example, if the selected node is a topic reference (**topicref**), its possible child nodes include the following elements: anchorref, chapter, keydef, mapref, topicgroup, topichead, topicref, topicset, and topicsetref.

- Click the ✉️ **Insert Reference** button on the **DITA Maps Manager** extended toolbar. This action will insert the reference as a sibling of the current node (below the current node in the map).
- Select ✉️ **Insert Reference** from the **DITA Maps** menu. This action will insert the reference as a sibling of the current node (below the current node in the map).

For the ✉️ **Reference** or **Reference to the currently edited file** actions, a **Reference type** drop-down list is displayed at the top of the **Insert Reference** dialog box and you can select the type of reference you want to insert. Depending on the place where the reference will be inserted, Oxygen XML Editor plugin will propose only valid reference types. When you change the reference type, the fields in the various tabs of the dialog box are reconfigured depending upon the availability of the associated attributes.
For the other reference actions in the Append Child, Insert Before, and Insert After submenus, the reference type is automatically chosen based upon the invoked action and you cannot change it.

The main section of the dialog box includes the following tabs: Target, Keys, Attributes, Metadata, and Profiling.

**Target Tab**

*Figure 706: Insert Reference Dialog Box - Target Tab*

The Target tab of the Insert Reference dialog box allows you to specify information about the target reference. It includes the following sections and fields:

**Choose a file location section**

You can browse for and select the source target file by using the file window in this section. You can use the File filter drop-down menu to narrow the list of possible file types that will be displayed.

**URL**

Displays the path to the target and allows you to select or change it by using the combo box or browsing buttons.

**ID**
The drop-down list displays all of the target elements that are available for the selected target URL.

**Href**

The selected target automatically modifies this value to point to the corresponding `href` attribute of the target element.

**Note:** If the **Reference type** is a **Navigation Reference**, the **Href** field is changed to **Mapref**, since a `navref` element requires a `mapref` attribute instead.

**Keys Tab**

*Figure 707: Insert Reference Dialog Box - Keys Tab*

The **Keys** tab allows you to use and define keys (page 2434) for indirect referencing. For more information, see Working with Keys in DITA (page 2524). This tab includes the following:

**Define keys**

Use this text field to define the `keys` attribute for the target.

**Key scopes**

Use this text field to define or edit the value of a `keyscope` attribute. Key scopes allow you to specify different sets of key definitions for different map branches.

**Key reference**

Instead of using the **Target** tab to select a file that contains the target reference, you can reference a key definition by using this text field. Use the **Choose key reference** button to access the list of keys that are already defined in the current root map (page 2711).
Attributes Tab

The Attributes tab of the Insert Reference dialog box allows you to insert and edit attribute values for the target reference. This tab includes the following sections and actions:

Navigation title

This text field allows you to specify a custom navigation title for the target reference. If you want this attribute to always be populated with a detected value (based on the specifications for the target file), select the Navigation title checkbox for the Always fill values for attributes option in the DITA preferences page (page 66). For references to DITA resources, you can enforce the use of the specified title by selecting the Lock checkbox (otherwise, the topic <title> takes precedence).

Collection type

This drop-down list allows you to select the collection-type attribute to create hierarchical linking between topics in a DITA map (for example, unordered, sequence, choice, family, -dita-use-conref-target).

Type

Allows you to select a type attribute (such as topic, task, concept, etc.) for the target element. If you want this attribute to always be populated with a detected value (based on the specifications for the target file), select the Type checkbox for the Always fill values for attributes option in the DITA preferences page (page 66).

Scope
This property corresponds to the `scope` attribute of the target element. It is populated automatically, based on the selected file type, unless its value for the selected target file is the same as the default attribute value. If you want this attribute to always be populated with a detected value based on the specifications (regardless of the default value), select the **Scope** checkbox for the **Always fill values for attributes** option in the **DITA preferences page** (page 66).

**Format**

This property corresponds to the `format` attribute of the target element. It is populated automatically, based on the selected file type, unless its value for the selected target file is the same as the default attribute value. If you want this attribute to always be populated with a detected value based on the specifications (regardless of the default value), select the **Format** checkbox for the **Always fill values for attributes** option in the **DITA preferences page** (page 66).

**Processing Role**

This drop-down list allows you to set the `processing-role` attribute to one of the allowed values for DITA reference elements (for example, `resource-only`, `normal`, `-dita-use-conref-target`).

**Other attributes table**

This table contains the attributes that are available for the selected reference. You can use this table to insert or edit the values of any of the listed attributes. Clicking a cell in the **Value** column allows you to use the combo box to enter, edit, or select attribute values.

**Metadata Tab**

*Figure 709: Insert Reference Dialog Box - Metadata Tab*
The **Metadata** tab allows you to add metadata elements to the target reference. Use the buttons on the right side of the tab to insert specific metadata elements (you can add the following metadata elements: `navtitle`, `linktext`, `shortdesc`, `keyword`, `indexterm`). The metadata elements are inserted inside a `topicmeta` element. The editing window allows you to easily insert and modify the content of the metadata that will be inserted.

**Profiling Tab**

*Figure 710: Insert Reference Dialog Box - Profiling Tab*

The **Profiling** tab allows you to select or change profiling attributes for the selected reference. This tab displays profiling attributes and their values as determined by the following:

- If your root map (page 2711) references a DITA subject scheme map (page 2711) that defines values for the profiling attributes, those values are used.
- Otherwise, a basic default set of profiling attributes and values are used.

When you modify a selection of values in this tab, the change will also automatically be reflected in the **Attributes** tab. For more information, see DITA Profiling / Conditional Text (page 2634).

**Finalizing Your Insert Reference Configuration**

Once you click **Insert** or **Insert and close**, the configured reference is added in the map.

**Tip:** You can easily insert multiple references by keeping the **Insert Reference** dialog box opened, using the **Insert** button.

**Related Information:**

- DITA Profiling / Conditional Text (page 2634)
Inserting Topic Headings

The `topichead` element provides a title-only entry in a navigation map, as an alternative to the fully-linked title provided by the `topicref` element.

You can insert a topic heading by doing the following:

- Select `Topic Head` from the `Append Child`, `Insert Before`, or `Insert After` submenus when invoking the contextual menu in the [DITA Maps Manager](#) view.
- Open the [DITA map](#) in the XML editor and select the `Insert Topic Heading` action from the main toolbar (or from the `Insert` submenu of the contextual menu).

Those actions open the [Insert Topic Head](#) dialog box that allows you to easily insert a `topichead` element. A `Navigation title` (navtitle attribute) is required but other attributes can also be specified from this dialog box (such as `Type`, `Scope`, `Format`, etc.)

![Insert Topic Heading Using the Insert Reference Dialog Box](image)

**Figure 711: Insert Topic Heading Using the Insert Reference Dialog Box**

**Related Information:**
Inserting Topic Groups

The `topicgroup` element identifies a group of topics (such as a concepts, tasks, or references) or other resources. A `topicgroup` can contain other `topicgroup` elements, allowing you to express navigation or table-of-contents hierarchies, as well as implying relationships between the containing `topicgroup` and its children. You can set the collection-type of a container `topicgroup` to determine how its children are related to each other. Relationships end up expressed as links in the output (with each participant in a relationship having links to the other participants by default).

You can insert a topic group by doing the following:

- Select **Topic Group** from the **Append Child, Insert Before**, or **Insert After** submenus when invoking the contextual menu in the **DITA Maps Manager view** (page 2400).
- Open the **DITA map** in the XML editor (page 2399) and select the **Insert Topic Group** action from the main toolbar (or from the **Insert** submenu of the contextual menu).

Those actions open the **Insert Topic Group dialog box** (page 2426) that allows you to easily insert a `topicgroup` element and various attributes can be specified (such as **Collection type, Type, Scope, Format**, etc.)

*Figure 712: Insert Topic Group Using the Insert Reference Dialog Box*
Defining Keys in DITA Maps

DITA uses keys (page 2524) to insert content that may have different values in various circumstances. Keys provide the means for indirect referencing in DITA. This can make it easier to manage and to reuse content. In DITA, keys are defined in maps and can then be reused and referenced throughout the whole structure of the map. It is considered best practice to create a separate submap that contains all of the key definitions and reference that submap in the main (root) map (page 2711). This makes it easier to manage since they're all in one location.

There are two types of key definitions that can be created in a map.

- Key with a value inside a keyword.
- Key with a target (for example, to target a resource such as an image or external link).

The following example is a DITA map (page 2705) (a key definition submap) that contains some key definitions with various values for the product key and some targets to external URLs:
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE map PUBLIC "-//OASIS//DTD DITA Map//EN" "map.dtd">
<map id="keydefs">
<!-- product name -->
<title>Key Definitions</title>
<keydef keys="product" product="basic">
  <topicmeta>
    <keywords>
      <keyword>Basic Widget</keyword>
    </keywords>
  </topicmeta>
</keydef>
<keydef keys="product" product="pro">
  <topicmeta>
    <keywords>
      <keyword>Professional Widget</keyword>
    </keywords>
  </topicmeta>
</keydef>
<keydef keys="uri_eula" href="https://www.example.com/eula.html" format="html" scope="external"/>
<keydef keys="uri_eula2" href="https://www.example.com/eula2.html" format="html" scope="external"/>
</map>

Note: The profiling of the names is now contained in the map, where it only has to occur once to reuse throughout the whole map structure.

Key Definition with a Keyword Value

To define a key with a value inside a keyword, follow these steps:

1. [Optional but Recommended] Create a submap (page 2417) that will contain all of your key definitions and reference the submap in your main (root) map (if you don't already have one created).
2. Open that map in the DiTA Maps Manager (page 2400).
3. Right-click the map or an item in the map where you want to add the reference and select Key Definition with Keyword from the Append Child, Insert Before, or Insert After submenu (depending on where you want to insert the key definition). This opens an Insert Key Definition dialog box.
4. Enter the name of the key in the **Key** field.
5. Enter the key's value in the **Keyword** field.
6. Click **Insert and close**.

**Tip:** If you need to profile the key or add other attributes, you can right-click the key definition in the **DITA Maps Manager**, select **Edit properties**, and configure them in the **Profiling** tab or **Attributes** tab, respectively.

### Key Definition with a Target

To insert a **targeted key definition** (for example, to target a resource such as an image or external link), follow these steps:

1. **[Optional but Recommended]** Create a submap ([page 2417](#)) that will contain all of your key definitions and reference the submap in your **main (root) map** (if you don't already have one created).
2. Open that map in the **DITA Maps Manager** ([page 2400](#)).
3. Right-click the map or an item in the map where you want to add the reference and select **Key Definition** from the **Append Child**, **Insert Before**, or **Insert After** submenu (depending on where you want to insert the key definition in the **DITA map**). This opens an **Insert Key Definition** dialog box.
4. Go to the **Keys** tab and enter the name of the key in the **Define keys** field.
5. Go to the **Target** tab and select a target resource (such as an image or external link).

**Tip:** You can profile the key by using the **Profiling** tab and other attributes can also be defined in the **Attributes** tab.

6. Once you are done configuring the **targeted key definition**, click **Insert and close**.

**Related Information:**

- Working with Variable Text in DITA ([page 2557](#))
- Working with Keys in DITA ([page 2524](#))
- DITA 1.3 Specification: Indirect Key-based Addressing
The DITA Maps Manager view (page 2400) includes a feature that allows you to view and edit the properties of a selected node. The Edit properties action is available on both the DITA Maps Manager toolbar and in the contextual menu. This action is also available in the contextual menu when you edit a DITA map (page 2705) document in Author mode. The action opens the Edit Properties dialog box and it includes several tabs with various functions and fields that are initialized with values based upon the node for which the action was invoked.

Note: If you select multiple sibling nodes and invoke the Edit properties action, only the Profiling tab will be available and your modifications in that tab will be applied to all the selected nodes. If you select multiple nodes that are not on the same hierarchical level, the other tabs will also be available and your modifications will be applied to the parent node (the child nodes will inherit the attributes of the parent node).

You can use the Edit Properties dialog box to modify or define attributes, metadata, profiling, or keys in DITA maps or topics. You can also use it to modify the title of root maps (page 2711).

At the top of the Edit Properties dialog box, the Reference type drop-down list displays the type of the selected node and it depends on the node for which the action was invoked.

The main section of the dialog box includes the following tabs: Target, Keys, Attributes, Metadata, and Profiling. The availability of the tabs and their functions depend on the selected node. For example, if you invoke the action on a root map (page 2711), only the Attributes, Metadata, and Profiling tabs are accessible and the Title property can be configured. Also, if you select multiple nodes, only the Profiling tab is available.

Target Tab

Figure 713: Edit Properties Dialog Box - Target Tab
The **Target** tab of the **Edit Properties** dialog box displays information about the target node on which the action was invoked and allows you to change the target. It includes the following sections and fields:

**Choose a file location section**

You can browse for and select the source target file by using the file window in this section. You can use the **File filter** drop-down menu to narrow the list of possible file types that will be displayed.

**URL**

Displays the path to the target and allows you to select or change it by using the combo box or browsing buttons.

**ID**

The drop-down list displays all of the target elements that are available for the selected target URL.

**Href**

The selected target automatically modifies this value to point to the corresponding `href` attribute of the target element.

**Note:** If the **Reference type** is a **Navigation Reference**, the **Href** field is changed to **Mapref**, since a `navref` element requires a `mapref` attribute instead.
Keys Tab

Figure 714: Edit Properties Dialog Box - Keys Tab

The **Keys** tab allows you to use and **define keys (page 2434)** for indirect referencing. For more information, see **Working with Keys in DITA (page 2524)**. This tab includes the following:

**Define keys**

Use this text field to define the `keys` attribute for the target.

**Key scopes**

Use this text field to define or edit the value of a `keyscope` attribute. Key scopes allow you to specify different sets of key definitions for different map branches.

**Key reference**

Use this combo box (or the Choose key reference button) to select a key that is already defined in the root map (page 2711).

Attributes Tab

Figure 715: Edit Properties Dialog Box - Attributes Tab
The **Attributes** tab of the **Edit Properties** dialog box allows you to insert and edit attribute values for the target node for which the action was invoked.

If the target is a *root map* (page 2711), the tab displays the title of the map. You can change it in the **Title** text field and assign it to an **Attribute**, **Element**, or **All**.

**Figure 716: Attributes Tab for a Root Map**

For other types of targets, the tab includes the following sections and fields that can be used to edit the attributes of the target:

**Navigation title**

This text field allows you to specify a custom navigation title for the target reference. If you want this attribute to always be populated with a detected value (based on the specifications for the target file), select the **Navigation title** checkbox for the **Always fill values for attributes** option in the **DITA preferences** page (page 66). For references to DITA resources, you can enforce the use of the specified title by selecting the **Lock** checkbox (otherwise, the topic `<title>` takes precedence).
Tip: You can also select the **Prefer navigation title for topicref rendering** option in the [DITA preferences page](page 66) to always enforce the use of the `navtitle` value rather than selecting this **Lock** option on individual topics.

**Collection type**

This drop-down list allows you to select the `collection-type` attribute to create hierarchical linking between topics in a DITA map (for example, `unordered`, `sequence`, `choice`, `family`, `-dita-use-conref-target`).

**Type**

Allows you to select a `type` attribute (such as `topic`, `task`, `concept`, etc.) for the target element. If you want this attribute to always be populated with a detected value (based on the specifications for the target file), select the **Type** checkbox for the **Always fill values for attributes** option in the [DITA preferences page](page 66).

**Scope**

This property corresponds to the `scope` attribute of the target element. It is populated automatically, based on the selected file type, unless its value for the selected target file is the same as the default attribute value. If you want this attribute to always be populated with a detected value based on the specifications (regardless of the default value), select the **Scope** checkbox for the **Always fill values for attributes** option in the [DITA preferences page](page 66).

**Format**

This property corresponds to the `format` attribute of the target element. It is populated automatically, based on the selected file type, unless its value for the selected target file is the same as the default attribute value. If you want this attribute to always be populated with a detected value based on the specifications (regardless of the default value), select the **Format** checkbox for the **Always fill values for attributes** option in the [DITA preferences page](page 66).

**Processing Role**

This drop-down list allows you to set the `processing-role` attribute to one of the allowed values for DITA reference elements (for example, `resource-only`, `normal`, `-dita-use-conref-target`).

**Other attributes table**

This table contains the attributes that are available for the selected reference. You can use this table to insert or edit the values of any of the listed attributes. Clicking a cell in the **Value** column allows you to use the combo box to enter, edit, or select attribute values.
Metadata Tab

Figure 717: Edit Properties Dialog Box - Metadata Tab

The Metadata tab allows you to add metadata elements to the target node. Use the buttons on the right side of the tab to insert specific metadata elements (you can add the following metadata elements: navtitle, linktext, shortdesc, keyword, indexterm). The metadata elements are inserted inside a topicmeta element. The editing window allows you to easily insert and modify the content of the metadata that will be inserted.

Profiling Tab

Figure 718: Edit Properties Dialog Box - Profiling Tab

The Profiling tab allows you to select or change profiling attributes for the selected target nodes. This tab displays profiling attributes and their values as determined by the following:

- If your root map (page 2711) references a DITA subject scheme map (page 2711) that defines values for the profiling attributes, those values are used.
- Otherwise, a basic default set of profiling attributes and values are used.
If you have a large list of profiling attributes, you can use the text filter field to search for attributes or values, and you can expand or collapse attributes by using the Expand All/ Collapse All buttons to the right of the text filter or the arrow button to the left of the profiling attribute name.

When you modify a selection of values in this tab, the change will also automatically be reflected in the Attributes tab. For more information, see DITA Profiling / Conditional Text (page 2634).

**Note:** If you invoke the Edit properties action on a selection of multiple nodes that have different values for the same profiling attribute, a conflict panel will be displayed in the Profiling tab and you can choose between the following actions for resolving it:

- **Keep** - Preserves the current attribute values.
- **Change Now** - Allows you to edit the selection of values in this Profiling tab and the changes will be applied to all the selected nodes.

**Figure 719: Profiling Conflict Panel**

Finalizing Your Modifications

Once you click OK, all your changes are applied to the target node.

**Related Information:**

- DITA Profiling / Conditional Text (page 2634)
- Working with Keys in DITA (page 2524)
In DITA, the order and hierarchy of the table of contents of a document is based directly on the DITA map that defines the document (page 2398). In most cases, the processor generates a table of contents (TOC) based on the hierarchy of the topics in a DITA map. By default, each topicref element in a map represents a node in the TOC.

It is also possible to instruct DITA where the table of contents should occur (or other content lists, such as a list of figures or tables). If you want to instruct the processor to generate a table of contents at a particular location within your DITA map structure, you can use the toc element in a bookmap (page 2418) (as in the example below). For more information about the toc element, see https://docs.oasis-open.org/dita/v1.2/os/spec/langref/toc.html.

Example:

```xml
<bookmap>
   ....
   <frontmatter>
      <booklists>
         <toc href="chapter1.dita"/>
      </booklists>
   </frontmatter>
   ....
</bookmap>
```

Creating an Index in DITA

In DITA, indexes are created from indexterm elements. You can insert index term elements:

- In the header of a topic. In paginated media, such as a printed book or a PDF, this results in an index entry that points to the page in which the topic starts, even if it is not the page in which the indexed term occurs.
- In the topicref element in a map that references the topic. This applies those index terms to that topic only when used in that map, allowing you to index topics differently in various publications. In paginated media, index entries point to the page in which the topic starts.
- In the body of a topic. In paginated media, this results in an index entry that points to the page in which the indexterm element occurs, even if that is not the page in which the topic starts.

To add index terms to the text of a topic of the topic header, create the elements as you normally would in Oxygen XML Editor plugin (page 2464). To add index terms to a map, open the map in the editor and add the elements, as you normally would, in a topic.

In some media, indexes will be generated automatically when index entries are found in the source. For other media, such as books, you may need to tell DITA where to place the index. For instance, to
add an index to a bookmap (page 2704), you need to add an indexlist element to the backmatter of the book.

1. Open your bookmap (page 2418) in the DITA Maps Manager (page 2400).
2. Right-click the bookmap and select Append Child > Backmatter.
   The Insert Reference dialog box (page 2426) appears.
3. Click Insert and Close to insert the backmatter element.
4. Right-click the backmatter element and create a booklists element using Append Child > Book Lists.
5. Use the same steps to create an indexlist element.

⚠️ CAUTION: Adding index entries and an indexlist to your project creates an instruction to the DITA publishing routines to create an index. There is no guarantee that all DITA output types or third-party customizations obey that instruction or create the index the way you want it. Modifying the output may be necessary to get the result you want.

Resolving Topic References Through an XML Catalog

There are situations where you want to resolve URIs with an XML Catalog (page 2712):

- You customized your DITA map (page 2705) to reference topics using URIs instead of local paths.
- You have URI content references in your DITA topic files and you want to map them to local files when the map is transformed.

In such situations, you have to add the catalog to Oxygen XML Editor plugin. The DITA Maps Manager view (page 2400) will solve the displayed topic refs through the added XML catalog, as will as DITA map transformations (for PDF output, XHTML output, etc.)

To add an XML catalog to the DITA framework (page 2706), follow these steps:

1. Create an XML catalog using the guidelines described in Working with XML Catalogs (page 897).
2. Open the Preferences dialog box (page 55) and go to Document Type Association.
3. Select the DITA document type and use the Edit, Duplicate, or Extend button to open a Document type configuration dialog box (page 72).
4. Go to the Catalogs tab (page 95).
5. Click on the + Add button to open a dialog box that allows you to add your created XML Catalog to the list.
6. After adding your catalog, click **OK**. You may need to reopen any currently edited files that use the new catalog or run a manual **Validate** action (page 857) for the changes to take effect.

**Note:** You could also add your created catalog to the list of global catalogs in the **XML Catalog** preferences (page 171) page.

### Chunking DITA Topics

By default, when a *DITA map* (page 2705) is published to an online format, each topic becomes a separate page in the output. In some cases, you may want to combine multiple source topics into one output page. For instance, you may want to combine several types of information into a single page, or you may have chosen to create many small DITA topics for reuse purposes but feel they are too small to be useful to a reader by themselves. This is referred to as **chunking**.

To chunk DITA topics, you set the chunking attribute on the `topicref` that contains the sub-topics in a *DITA map*. There are several values that you can set on the chunking attribute (for example, `by-topic` or `to-content`). See the **DITA documentation** for full details. To achieve the effects you want in your topics and table of contents, you may also need to set the `toc` and `collection-type` attributes on the sub-topics or container topic to suitable values. See the **DITA documentation** for details.

You can set the `collection-type` attribute on your topics using the **Edit Properties** action in the **DITA Maps Manager** (page 2400). To set the `toc` and `chunk` attributes, you must open the map file in the editor and add or edit the attributes directly (double-click the map icon  in the **DITA Maps Manager** (page 2400) to open the map in the editor).

### DITA Map Validation and Completeness Check

You should validate your *DITA maps* (page 2705) regularly to make sure that your maps and topics are valid, and all of the relationships between them are working. Changing one topic, image, or piece of metadata may create errors in references that rely on them. You may not discover these problems all at once. Validate your map to catch all of these kinds of problems. The longer you wait between validating your maps, the more difficult it may be to detect and correct any errors you find.

#### Validating a DITA Map

To validate a DITA, follow these steps:
1. In the DITA Maps Manager view (page 2400), make sure that the tab that holds your root map (page 2711) is selected and that the Root map selection is set either to the name of your root map or to <current map>.

2. It is a good practice to refresh your DITA map before running the validation process. To do so, select the DITA map in the DITA Maps Manager view and click File > Refresh (F5).

3. Click the Validate and Check for Completeness button on the DITA Maps Manager toolbar to open the DITA Map Completeness Check dialog box (page 2447).

4. If you are using profiling, check the Use DITAVAL filters box and select the appropriate option.

5. Select any other options you want to check.

6. Click Check to run the validation process.

Validation Process

The validation process of a DITA map includes the following:

- Verifies that the file paths of the topic references are valid. For example, if an href attribute points to an invalid file path, it is reported as an error in the message panel at the bottom of the editor.
- Validates each referenced topic and map. Each topic file is opened and validated against the appropriate DITA DTD. If another DITA map is referenced in the main one, the referenced DITA map is verified recursively, applying the same algorithm as for the main map.
- If errors or warnings are found, they are displayed in a separate message pane at the bottom of the editor and clicking them takes you to the location of the error or warning in the file where it was found.

DITA Map Completeness Check Dialog Box

The DITA Map Completeness Check dialog box allows you to configure the DITA map validation.
You can configure the validation process with the following options that are available in the **DITA Map Completeness Check** dialog box:

**Batch validate referenced DITA resources**

This option specifies the level of validation that applies to referenced DITA files:

- If the checkbox is left unchecked (default setting), the DITA files will be validated using the rules defined in the DTD or XML Schema declared in the document.
- If the checkbox is selected, the DITA files will be validated using rules defined in their associated validation scenario *(page 868).*

**Check the existence of non-DITA references resources**

Extends the validation of referenced resources to non-DITA files.

**Include remote resources**
Select this option if you want to check that remote referenced binary resources (such as images, movie clips, ZIP archives) exist at the specified location.

Use DITAVAL filters

The content of the map is filtered by applying a profiling condition set (page 2634) before validation. You can choose between the following options:

- **From the current condition set** - The map is filtered using the condition set currently applied in the DITA Maps Manager view (page 2400). Clicking the Details icon opens a topic in the Oxygen XML Editor plugin User Guide that explains how to create a profiling condition set.
- **From all available condition sets** - For each available condition set, the map content is filtered using that set before validation.
- **From the associated transformation scenario** - The filtering condition set is specified explicitly as a DITAVAL file in the current transformation scenario associated with the DITA map.
- **Other DITAVAL files** - For each DITAVAL file from this list, the map content is filtered using the DITAVAL file before validation. Use the Add or Remove buttons to configure the list. The Add button opens a dialog box that allows you to select a local or remote path to a DITAVAL file. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (page 201) button, or the browsing actions in the Browse drop-down list.

Report references to resources outside of the DITA map folder

If selected, it will report any references to DITA resources that are located outside the main DITA map (page 2711) folder.

Report links to topics not referenced in DITA maps

Checks that all the topics referenced by other topics are also linked in the DITA map.

Report multiple references to the same topic

If selected, it will report warnings when a topic is referenced multiple times in the DITA map, unless a unique copy-to attribute is used on the topicref element for any topic that is referenced multiple times.

For example, it will not report a warning if there is a topic referenced twice, but the second topicref has a copy-to attribute set:

```xml
<topicref href="topic.dita"/>
.....
```
On the other hand, it will report a warning if there is a topic referenced twice and none of the reference-type elements has a `copy-to` attribute set or both of them have the `copy-to` attribute set to the same value:

```xml
<topicref href="topic.dita" copy-to="topic2.dita"/>
```

```
......
```

```xml
<topicref href="topic.dita" copy-to="topic2.dita"/>
```

**Check for duplicate topic IDs within the DITA map context**

Checks for multiple topics with the same ID in the context of the entire map.

**Report duplicate key definitions**

Checks the *DITA map* for multiple key references with the same key defined for them. This is helpful because if you have two different resources with the same value for the `keys` attribute, all references will point to the first one encountered and the other will be ignored.

**Note:** This option takes *key scopes (page 2559)* into account. For example, if you have something like this:

```xml
<topicref href="t2.dita" keys="k2"/>
<topicgroup keyscope="ks">
  <topicref href="t2.dita" keys="k2"/>
</topicgroup>
```

it will not report the "k2" key as a duplicate because it is defined in a *key scope (page 2559)* on the second occurrence.

**Report unreferenced key definitions**

Checks the entire *DITA map* and reports any key definitions that are not referenced anywhere. Note that if the *Use DITAVAL filters option (page 2449)* is selected, this check will search for unreferenced key definitions based upon your selected filter.

**Report unreferenced reusable elements**

Checks the entire *DITA map* and reports any detected reusable elements that are not referenced anywhere. It looks for elements that have an ID specified in the following types of topic references:

- Any `topicref` that contains a `processing-role` attribute set to `resource-only`.
- Any other referenced topic that contains elements that are reused elsewhere through a `conref` or `conkeyref`.
Report table layout problems

Looks for table layout problems. The types of errors that may be reported include:

- If a row has fewer cells than the number of columns detected.
- For a CALS table, if a cell has a vertical span greater than the available rows count.
- For a CALS table, if the number of colspecs is different than the number of columns detected from the table cols attribute.
- For a CALS table, if the number of columns detected from the table cols attribute is different than the number of columns detected in the table structure.
- For a CALS table, if the value of the cols, rowsep, or colsep attributes are not numeric.
- For a CALS table, if the namest, nameend, or colname attributes point to an incorrect column name.

Identify possible conflicts in profile attribute values

When the profiling attributes of a topic contain values that are not found in parent topic profiling attributes, the content of the topic is overshadowed when generating profiled output. This option reports these possible conflicts.

Report attributes and values that conflict with profiling preferences

Looks for profiling attributes and values that are not defined in the Profiling / Conditional Text preferences page (page 119) (you can click the Profiling Preferences button to open this preferences page). It also checks if profiling attributes defined as single-value have multiple values set in the searched topics.

Additional Schematron checks

Allows you to select a Schematron file that Oxygen XML Editor plugin will use for the validation of DITA resources. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (page 201) button, or the browsing actions in the Browse drop-down list.

Export settings

Allows you to export the settings assigned in this dialog box to an XML file that you can share with other users or use on other systems.

Import settings

Allows you to import settings for this dialog box from an XML file that was created by the Export settings action.

Check
Use the **Check** button to begin the validation process. The options that you choose in this dialog box are preserved between sessions.

**Related Information:**

- DITA Maps Manager *(page 2400)*

**DITA Map Author Mode Actions**

A variety of actions are available in the DITA map *(page 2705)* framework *(page 2706)* that can be added to the DITA menu, the Author Custom Actions toolbar, the contextual menu, and the Content Completion Assistant *(page 2704)*.

**DITA Map Toolbar and Menu Actions**

When a DITA map is opened in Author mode, the following default actions are available on the DITA Map Author Custom Actions toolbar (by default, they are also available in the DITA menu and in various submenus of the contextual menu):

- **Insert New Topic**
  
  Opens a New DITA topic dialog box *(page 2459)* that allows you to create a new topic and inserts a reference to it at the cursor position.

- **Insert Topic Reference**
  
  Opens the Insert Reference dialog box *(page 2426)* that allows you to insert and configure a reference to a topic at the cursor position.

- **Reuse Content**
  
  Opens the Reuse Content dialog box *(page 2542)* that allows you to insert and configure a content reference (*conref*), or a content key reference (*conkeyref*) at the cursor position.

- **Insert Topic Heading**
  
  Opens the Insert Reference dialog box *(page 2426)* that allows you to insert a topic heading at the cursor position.

- **Insert Topic Group**
  
  Opens the Insert Reference dialog box *(page 2426)* that allows you to insert a topic group at the cursor position.
**Insert Relationship Table**

Opens a dialog box that allows you to configure the relationship table to be inserted. The dialog box allows you to configure the number of rows and columns of the relationship table, if the header will be generated and if the title will be added.

**Relationship Table Properties**

Allows you to change the properties of rows in relationship tables.

**Insert Relationship Row**

Inserts a new table row with empty cells. The action is available when the cursor position is inside a table.

**Insert Relationship Column**

Inserts a new table column with empty cells after the current column. The action is available when the cursor position is inside a table.

**Delete Relationship Column**

Deletes the table column where the cursor is located.

**Delete Relationship Row**

Deletes the table row where the cursor is located.

**Move Up**

Moves the selected node up one position on its same level.

**Move Down**

Moves the selected node down one position on its same level.

**Promote**

Moves the selected node up one level to the level of its parent node.

**Demote**

Moves the selected node down one level to the level of its child nodes.

**DITA Menu Actions**

The following additional actions can be found in the **DITA** menu when editing a **DITA map** in **Author** mode:

**Refresh References**

You can use this action to manually trigger a refresh and update of all referenced resources.
Tags display mode Submenu

- **Full Tags with Attributes**
  
  Displays full tag names with attributes for both *block* (page 2703) and *inline elements* (page 2707). Oxygen XML Editor plugin

- **Full Tags**
  
  Displays full tag names without attributes for both *block* and *inline elements*.

- **Block Tags**
  
  Displays full tag names for *block elements* and simple tags without names for *inline elements*.

- **Inline Tags**
  
  Displays full tag names for *inline elements*, while *block elements* are not displayed.

- **Partial Tags**
  
  Displays simple tags without names for *inline elements*, while *block elements* are not displayed.

- **No Tags**
  
  No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

Configure Tags Display Mode

Use this option to go to the Author preferences page (page 110) where you can configure the Tags Display Mode options.

Profiling/Conditional Text Submenu

- **Edit Profiling Attributes**
  
  Allows you to configure the profiling attributes (page 746) and their values.

- **Show Profiling Colors and Styles**
  
  Select this option to turn on conditional styling.

- **Show Profiling Attributes**
  
  Select this option to turn on conditional text markers. They are displayed at the end of conditional text blocks, as a list of attribute name and their currently set values.

- **Show Excluded Content**
When this option is selected, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, deselect this option.

**List of all profiling condition sets that match the current document type**

You can click a listed condition set (page 752) to activate it.

**Profiling Settings**

Opens the profiling options preferences page (page 119), where you can manage profiling attributes and profiling conditions sets. You can also configure the profiling styles and colors options from the colors/styles preferences page (page 122) and the attributes rendering preferences page (page 121).

**ID Options**

Opens the **ID Options** dialog box that allows you to configure options for generating IDs in **Author** mode. The dialog box includes the following:

**ID Pattern**

The pattern for the ID values that will be generated. This text field can be customized using constant strings or any of the Oxygen XML Editor plugin Editor Variables (page 201).

**Element name or class value to generate ID for**

The elements for which ID values will be generated, specified using class attribute values. To customize the list, use the Add, Edit, or Remove buttons.

**Auto generate IDs for elements**

If selected, Oxygen XML Editor plugin will automatically generate unique IDs for the elements listed in this dialog box when they are created in Author mode.

**Remove IDs when copying content in the same document**

When copying and pasting content in the same document, this option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs. To retain the element IDs, deselect this option.

**Note:** This option does not have an effect on content that is cut and pasted.

**Generate IDs**
Oxygen XML Editor plugin generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the ID Options dialog box that are found in the current selection.

**Note:** The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

### DITA Map Contextual Menu Actions

In addition to many of the [DITA Map toolbar actions](page 1338) and the [general Author mode contextual menu actions](page 840), the following DITA map framework-specific actions are also available in the contextual menu when editing in Author mode:

#### Edit Properties

Opens the Edit Properties dialog box that allows you to configure the properties of a selected node. For more details about this dialog box, see [Edit Properties Dialog Box](page 2436).

#### Generate IDs

Oxygen XML Editor plugin generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the ID Options dialog box that are found in the current selection.

**Note:** The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

#### Search References

Finds the references to the `href` or `keys` attribute value of the topic/map reference element at the current cursor position, in all the topics from the current DITA map.
(opened in the DITA Maps Manager view (page 2400)). The current topic/map reference element must have an href or keys attribute defined to complete the search.

Show Key Definition

Available for elements that have a conkeyref or keyref attribute set (or elements with an ancestor element that has a conkeyref or keyref attribute). It computes the key name and opens the DITA map (page 2705) that contains the definition of the key with the element that defines that key selected.

DITA Map Drag/Drop Actions

Dragging a file from the Navigator view (page 250) or DITA Maps Manager view (page 2400) and dropping it into a DITA map document that is edited in Author mode creates a link to the dragged file (a topicref element, chapter, part, etc.) at the drop location.

Open Topic from DITA Map in Author Mode

When a DITA map is opened in Author mode, you can click the icon to the left of a topic to open that particular topic in the editor.

Tip: For information about customizing Author mode actions for a particular framework (page 2706) (document type), see the Configuring Actions, Menus, Toolbars, Content Completion for a Framework (page 2038) section.

Related Information:

• Configuring Actions, Menus, Toolbars, Content Completion for a Framework (page 2038)

Working with DITA Topics

DITA is a structured writing format. Structure can have several meanings, all of which are relevant to DITA. This section includes information about working with DITA topics and the structure.

Information Types

The structure of a piece of content refers to how the words and images are selected and organized to convey information. One approach to structured writing is to divide content into discrete blocks that contain various types of information, and then to combine those blocks to form publications. DITA is based on this approach, and encourages the author to write in discrete blocks called topics. DITA
provides three base topic types (concept, task, and reference), a number of extended topic types, and the capability to create new topic types through specialization.

Text Structure

Every piece of text is made up of certain text structures, such as paragraphs, lists, and tables. DITA supports text structures through XML elements such as `p`, `ol`, and `simpletable`. The DITA markup specifies the text structures, but not how they will be published in various types of media. The formatting of text structures is determined by the output transformations and may be customized to meet the needs of various organizations and type of media.

Semantic Structure

Semantic structure is structure that shows the meaning of things. For example:

- A `task` element specifies that a block of content contains the description of a task.
- A `codeblock` element specifies that a block of text consists of programming code.
- A `uicontrol` element specifies that a word is the name of a control in a computer GUI.
- The `platform` profiling attribute specifies that a particular piece of content applies only to certain computing platforms.

Semantic structure is important in a structured writing system because it allows both authors and readers to find content, and it allows processing scripts to process various pieces of content differently, based on their role or meaning. This can be used to do things such as filtering content related to a specific product so that you can produce documentation on many products from the same source.

There can be many forms of semantics captured in a document set. DITA captures some of these in topics and some of them in maps. If you are using a CMS, it may capture additional semantics.

Document Semantics

Documents consist of elements that may be made up of the same basic text structures as the rest of the text, but have a special function within the structure of the document. For instance, both tables of contents and indexes are lists, but they play a special role in the document. Chapters and sections are just sequences of paragraphs and other text structures, yet they are meaningful in the structure of the document. In some cases, such as indexes and tables of contents, these structures can be generated from semantic information embedded in the source. For instance, a table of contents can be built by reading the titles of chapters and sections. DITA provides elements to describe common document semantics.
Subject Matter Semantics

In some cases, the semantics of the content relate directly to the subject matter that the content describes. For instance, DITA supports tags that allow you to mark a piece of text as the name of a window in a software application (\texttt{wintitle}), or to mark a piece of text as applying only to a particular product.

Audience Semantics

In some cases, the semantics of the content relate to the audience that it is addressed to. For instance, a topic might be addressed to a particular role, or to a person with a particular level of experience. DITA provides an \texttt{audience} element to capture audience metadata.

Creating Topic Structures

Oxygen XML Editor plugin provides a number of tools to help you create topic structures:

- \textit{Content Completion Assistant (page 2704)} - Shows you which elements can be created at the current position.
- \textit{Model view (page 263)} - Shows you the complete structure supported by the current element.
- \textit{Outline view (page 316)} - Shows you the current structure of your document.
- \textit{DITA toolbar} - Helps you to easily insert many common structures.

Related Information:

- Getting Started with DITA (page 12)
- DITA Topics Document Type (Framework) (page 1313)

Creating a New DITA Topic

The basic building block for DITA information is the DITA topic. DITA provides a variety of specialized topic types, the most common of which are:

- \textit{Topic} - The base topic type from which all other topic types are specialized. Typically, it is used when a more specialized topic type is inappropriate.
- \textit{Task} - For procedural information such as how to use a dialog box.
- \textit{Concept} - For general, conceptual information such as a description of a product or feature.
Oxygen XML Editor plugin also supports numerous other specialized topic types that you will find templates for in the various folders in the New DITA file dialog box (page 2460). They include DITA 1.3 specializations, Lightweight DITA templates, MathML composites, Markdown documents, and other DITA specialized topic and DITA map (page 2705) types such as Glossentry, Troubleshooting, Bookmap (page 2704), and Subject Scheme Map (page 2711).

To create a new DITA topic and add a reference to it in your DITA map (page 2705), follow these steps:

1. In the DITA Maps Manager (page 2400), right-click the node in the current map where you want to add the new topic.
2. Select one of the following actions:
   - **Append Child > New** - Select this action to insert the new topic as a child of the selected node. This action opens a New file dialog box (page 2460) that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click Create.
   - **Insert Before > New** - Select this action to insert the new topic as a sibling to the current node, before it. This action opens a New file dialog box (page 2460) that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click Create.
   - **Insert After > New** - Select this action to insert the new topic as a sibling to the current node, after it. This action opens a New file dialog box (page 2460) that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click Create.
   - **Duplicate** - Select this action to create a copy of the selected topic and insert it as a sibling. This action opens a dialog box that allows you to choose the file name and location for the newly created copy of the topic. After you have selected the name and path for your new topic, click OK.

   **Step Result:** The new topic is now referenced (as a topicref) in the DITA map at the location where you inserted it and the new topic is opened in the editor.

3. Save the DITA map.

**New DITA File Dialog Box**

The New DITA file dialog box allows you to create a new DITA topic using various types of DITA file templates and provides some options that help you to configure the new topic.

*Figure 721: New DITA File Dialog Box*
**Note:** The templates that appear in this dialog box include all templates that have an associated `.properties` file and the `type` property is set to `dita`, as well as templates that do not have an associated properties file or the `type` property is not defined. It will also include custom templates that you create using the procedures presented in *Creating New Document Templates* (page 555).

The **New** DITA file dialog box includes the following features and options:

**Choose a file template**

Use the template preview pane to select the appropriate type of DITA file you want to create. Once you select a template, the other options will appear below the preview pane.

**Tip:** You can use the text filter field at the top of the dialog box to search for a specific template.

**Title**

Depending on the selected file template, the value of the **Title** field is set in:

- The `title` element of a DITA topic file. The `title` element needs to be the first child of the root element.
- The `glossterm` element of a `Glossentry` file.

**New Topics Preferences**
Pressing this button opens the DITA New Topics preference page (page 67)

**Save as**

Use this option to specify a file name and path for the new file. You can specify the path by using the text field, the history drop-down, or the browsing actions in the **Browse** drop-down menu.

**Create**

When you click this button, a reference (topicref) to the new topic is added to the current DITA map and the new topic is opened in the editor.

**Related Information:**

- Getting Started with DITA (page 12)
- Adding Topics to a DITA Map (page 2419)
- Working with Markdown Documents in DITA (page 1259)
- Fast Create Multiple DITA Topics (page 2462)

**Fast Create Multiple DITA Topics**

The DITA Maps Manager (page 2400) includes a feature that allows you to quickly create multiple skeleton topics at once and you can specify their hierarchical structure within the DITA map (page 2705). A common use-case for using this feature is when you need to insert a new chapter or section that will include multiple topics and you have the structure and titles planned out in advance.

**Note:** The Fast Create Topics feature works for the following types of local and remote resource protocols: file, http, https, ftp, ftps.

To access this feature, right-click a node in the DITA Maps Manager where you want the new topics to be inserted and select Fast Create Topics. This opens the Fast Create Topics dialog box where you can configure the structure for the new topics.

*Figure 722: Fast Create Topics Dialog Box*
The **Fast Create Topics** dialog box includes the following features and options:

**Hierarchy Text Pane**

Use this text area to enter the titles for your new topics, one per line, and specify the hierarchy by using indents (**Tab** or **Space**). Topic references will be created in the **DITA map** according to the hierarchy you enter in this section.

**File name generation rules**

The titles that you enter in the text pane will not only be used for the topic titles but also to generate their file names and you can click the **File name generation rules** link to configure the rules (page 67) for how those file names will be generated.

**Tip:** If you have added a file name prefix or suffix to the properties file (page 558) for DITA document templates, the generated file name will include that prefix or suffix.

**File name prefix**

Use this option to add a specified prefix to the file name. If you have added a file name prefix to the properties file (page 558) for DITA document templates, the prefix you enter here will override the one from the properties file.

**File name suffix**
Use this option to add a specified suffix to the end of the file name. If you have added a file name suffix to the properties file (page 558) for DITA document templates, the suffix you enter here will override the one from the properties file.

**Topic type**

All of the topics that will be created will have the same DITA topic type, which is detected from the most recently created topic. You can click the Change button to select a different type from a list of possible DITA templates.

**Tip:** You can convert any of these new files to a different DITA topic type at a later time by using another feature that allows you to easily convert DITA documents to other types (page 2468).

**Add created topic hierarchy relative to the selection as**

By default, the hierarchy of topics will be added to the DITA map as the First Child of the node where the action was invoked. You can change this to Last Child, Preceding Sibling, or Following Sibling if the selected node allows topics to be inserted as such.

**Create**

When you click Create, the specified hierarchy is added as topic references in the DITA map. The new documents are created as bare skeleton topics with only the topic title and possibly the root ID populated.

**Tip:** You can easily change the order of the topics in the DITA map (page 2419) at a later time,

---

**Related Information:**

- Adding Topics to a DITA Map (page 2419)
- Converting DITA Topics to Another Type (page 2468)

---

**Editing DITA Topics**

Oxygen XML Editor plugin provides a number of features to help you edit DITA topics. A DITA topic is an XML document, thus all the editing features that Oxygen XML Editor plugin provides for editing XML documents also apply to DITA topics. Oxygen XML Editor plugin also provides extensive additional support specifically for DITA.
Opening a DITA Topic

There are several ways to open a DITA topic in the XML editor. Use any of the following methods to open a topic:

- Double-click the topic in the DITA Maps Manager (page 2400) (or right-click the topic and select Open).
- Double-click the file in the Navigator view (page 250) (or right-click the file and select Open).
- If you have a DITA map (page 2705) opened in the XML editor, you can click the icon to the left of the topic.
- Drag a DITA file from your system browser and drop it in the XML editor.

Visual Editing in Author Mode

DITA is an XML format (page 6), although you do not have to write raw XML to create and edit DITA topics. Oxygen XML Editor plugin provides a graphical view of your topics in Author mode (page 303). Your topics will likely open in Author mode by default, so this is the first view you will see when you open or edit a DITA topic. If your topic does not open in Author mode, just click Author at the bottom left of the editor window to switch to this mode.

Author mode presents a graphical view of the document you are editing, similar to the view you would see in a word processor. However, there are some differences, including:

- Author mode is not a WYSIWYG view. It does not show you exactly what your content will look like when printed or displayed on-screen. The appearance of your output is determined by the DITA publishing process, and your organization may have modified that process to change how the output is displayed. Oxygen XML Editor plugin has no way of determining what your final output will look like or where line breaks or page breaks will fall. Treat Author mode as a friendly visual editing environment, not a faithful preview of your output.
- Your document is still an XML document. Author mode creates a visual representation of your document by applying a CSS stylesheet to the XML. You can see the XML at any time by switching to Text mode (page 223). You, or someone in your organization, can change how the Author view looks by changing the CSS stylesheet or providing an alternate stylesheet.
- Your aim in editing a DITA document is not to make it look right, but to create a complete and correct DITA XML document. Author mode keeps you informed of the correctness of your content by highlighting XML errors in the text and showing you the current status in a box at the top right of the editor window. Green means that your document is valid, yellow means valid with warnings, and red means invalid. Warnings and errors are displayed when you place the cursor on the error location.
• Your XML elements may have attributes set on them. Conventionally, attributes are used to contain metadata that is not displayed to the reader. By default, attributes are not displayed in the Author view (though there are some exceptions) and cannot be edited directly in the Author view (though in some cases the CSS that drives the display may use form controls to let you edit attributes directly). To edit the attributes of an element, place your cursor on the element and press Alt+Enter to bring up the attribute editor. Alternatively, you can use the Attributes view (page 319) to edit attributes.

Tip: You can select Hints from the Styles drop-down menu (available on the Author Styles toolbar) to display tooltips throughout the DITA document that offers additional information to help you with the DITA structure. For more information, see the Selecting and Combining Multiple CSS Styles (page 2063) section.

**Content Completion Assistance**

Since it is a structured format, DITA only allows certain elements in certain places. The set of elements allowed differ from one DITA topic type to another (this is what makes one topic type different from another). To help you figure out which elements you can add in any given place and help you understand what they mean, Oxygen XML Editor plugin has a number of Content Completion Assistant (page 2704) features.

• **The Enter key**: In Author mode, the Enter key does not create line breaks, it brings up the Content Completion Assistant to help you enter a new element. In XML, you do not use line breaks to separate paragraphs. You create paragraphs by creating paragraph elements (element `p` in DITA) and tools insert the line breaks in the output and on-screen.

*Figure 723: Content Completion Assistant*

The Content Completion Assistant not only suggests new elements you can add. If you press Enter at the end of a block element (page 2703) (such as a paragraph) it suggests creating a new element of the same type. If you press Enter in the middle of a block element, it suggests splitting that element into two elements.

A useful consequence of this behavior is that you can create a new paragraph simply by hitting Enter twice (just as you might in a text editor).
As you highlight an element name, a basic description of the element is displayed. Select the desired element and press Enter to create it.

To wrap an element around an existing element or piece of text, simply select it and press Enter and use the Content Completion Assistant to choose the wrapper element.

- The Model view: You can see the entire model of the current element by opening the Model view (page 263) (Window > Show View > Model, if the view is not already open). The Model view shows you what type of content the current element can contain, all the child elements it can contain, all its permitted attributes, and their types.

Tip: You can also select Inline actions from the Styles drop-down menu (available on the Author Styles toolbar) to display possible elements that are allowed to be inserted at various locations throughout the DITA document. For more information, see the Selecting and Combining Multiple CSS Styles (page 2063) section.

DITA Editing Actions

A variety of actions are available in the DITA framework (page 2706) to specifically assist you with editing DITA documents. These various actions are available in the contextual menu, the DITA menu, the DITA (Author Custom Actions) toolbar, or the Content Completion Assistant.

The DITA toolbar contains buttons for inserting a number of common DITA elements (elements that are found in most DITA topic types).

If the DITA toolbar is not displayed, right-click anywhere on the toolbar area, select Configure Toolbars, and select it from the displayed dialog box.

Note: The DITA toolbar contains a list of the most common elements and actions for DITA, such as inserting an image, creating a link, inserting a content reference, or creating a table. It does not contain a button for inserting every possible DITA element. For a complete list of elements that you can insert at the current location in your document, press Enter to open the Content Completion Assistant.

Whenever the current document in the editor is a DITA document, the DITA menu is displayed in the menu bar. It contains a large number of actions for inserting elements, creating content references and keys, editing DITA documents, and controlling the display. These actions are specific to DITA and supplement the general editing commands available for all document types. Many of these actions are also conveniently available in the contextual menu. In addition to the DITA framework-specific actions (page 1315), the contextual menu also includes various general Author mode contextual menu actions (page 840).
Oxygen XML Editor plugin includes a feature that allows you to convert an existing DITA document to a different topic type. For example, if you want to convert a DITA Task to a DITA Topic, or vice versa. There are several ways to access these refactoring actions and you can choose a scope for the operation and some filtering options.

**DITA Conversion Refactoring Operations for DITA**

The following conversion operations are available:

- **Convert Nested Topics to New Topics** *(Available from the contextual menu of editable maps/nodes in the DITA Maps Manager)*
  
  Use this operation on topics that contain nested `<topic>` elements to convert each nested topic to a new topic. Also, the new topics are added in the DITA Maps Manager as the first child topics of the original topic.

- **Convert Sections to New Topics** *(Available from the contextual menu of editable maps/nodes in the DITA Maps Manager)*
  
  Use this operation on topics that contain multiple sections to convert each section to a new topic. Also, the new topics are added in the DITA Maps Manager as the first child topics of the original topic.

- **Convert to Concept**
  
  Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

- **Convert to General Task**
  
  Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA *General Task* is a less restrictive alternative to the *Strict Task* information type.

- **Convert to Reference**
Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

**Convert to Task**

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

**Convert to Topic**

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

**Convert to Troubleshooting**

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

**Methods for Accessing the DITA Conversion Refactoring Operations**

To access the conversion operations, use one of the following methods:

**Single Document Method**

With the document opened in the editor, right-click anywhere in the main editing pane (or right-click the topic reference in the DITA Maps Manager (page 2400)), go to the Refactoring submenu, and choose whichever operation is appropriate for your needs.

**Multiple Documents At Once Method**

Select ➡️ XML Refactoring from the XML Tools menu (or from the Refactoring submenu when you right-click one or more documents in the Navigator view (page 250) or the DITA Maps Manager view (page 2400)). Then select whichever operation is appropriate for your needs.

**XML Refactoring Wizard Dialog Box**

When you select any of the operations, Oxygen XML Editor plugin proceeds to the XML Refactoring Wizard. If you used the Multiple Documents At Once Method (page 2469), the wizard page allows you to choose a scope for the operation and some filtering options:

- **Scope** - Select from a variety of options to define the scope for which resources will be affected by the operation. For example, you can choose to affect all resources in the Project, All opened files, Current DITA map hierarchy, Selected reference, and others depending on the context.
- **Filters** section
  - **Include files** - Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as * or ?).
Restrict to known XML file types only - Excludes non-XML file types from the operation.

If you used the Single Document Method (page 2469), the scope will be the current file so the scope and filtering options are not displayed.

You can then use one of the following buttons to proceed with the operation:

**Preview**

You can use the Preview button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.

**Warning**: It is always recommended to use the Preview button to make sure the operation is not going to do something unexpected and after you click the Finish button, any Undo action will only revert changes on the current document.

**Finish**

When you use the Finish button, behind the scenes Oxygen XML Editor plugin maps the structure of the previous DITA document type to a structure that fits the new type. In some cases, especially when the previous structure was very complex, the conversion might result in an invalid structure and some manual adjustments might be required.

**Handling Special Characters When Generating New File Names**

For refactoring operations that generate a new file, if special characters are detected in an element that will be used to generate the new file name, the special characters will automatically be replaced with their ASCII equivalents (for example, Ä is changed to AE). If an ASCII equivalent does not exist, it will be replaced with an underline character ( _ ). The purpose of this functionality is to avoid generating invalid file names.

It is possible to customize the list of replaceable symbols by editing the following XSLT character map file:

```
{OXYGEN_INSTALL_DIR}/frameworks/dita/refactoring/utils/character-map.xsl.
```

**Converting To and From DITA Specialization Document Types**

If you use your own DITA specialization document type (page 2669), you can modify the predefined conversion operations to work with your specialization by customizing the values of particular variables.

To use the conversion operations with your DITA specialization, follow these steps:

1. Locate the conversion stylesheets in the following directory: {OXYGEN_INSTALL_DIR}/frameworks/dita/refactoring/dita-files-conversion-systlesheets.
2. Each conversion operation has a stylesheet with the word `entrypoint` at the end of its name. Edit the appropriate `*-entrypoint.xsl` file (for example, to modify the Convert to Task operation, edit the `convert-resource-to-task-entrypoint.xsl` file).

3. Depending on whether you use a DTD, XML Schema, or Relax NG-based specialization, you can:
   a. Modify the values of the declared `root-element`, `public-literal-target`, and `system-literal-target` variables to match your specialization's DTD information.
   b. Modify the value of the declared `schema-location` variable to match the location of your specialization's XML schema.
   c. Modify the value of the declared `xml-model-location` variable to match your Relax NG specialization.

4. Save your changes to the stylesheet.

5. If you want to change the name of the operation that will be displayed in Oxygen XML Editor plugin, follow these substeps:
   a. Locate the resource XML file for the same conversion operation in the following directory:
      
      \[OXYGEN_INSTALL_DIR]/frameworks/dita/refactoring/ (for example, for the Convert to Task operation, it is `convertResource2Task.xml`).
   b. Edit that XML file and change the `name` attribute to match whatever you want to be displayed for that operation (for example, `name="Convert to My DocType"`).
   c. Save your changes to the XML file.

6. Restart Oxygen XML Editor plugin.

**Result:** You should now see your changes when accessing the conversion operations (page 2469).

**Tip:** You can also create your own customized refactoring operations. For more information, see Custom Refactoring Operations (page 927).

### Related Information:

- Editing DITA Topics (page 2464)
- Refactoring XML Documents (page 913)

### Adding Images in DITA Topics

There are several ways to add images to a DITA topic, depending on if you want to create a figure element (with a title and caption), just insert an image inline, or if you want to use multiple versions of a graphic depending on the situation. For instance, you might want to use a specific image for each different product version or output media.
Adding an Image Inline with the Insert Image Dialog Box

Use the following procedure to add an image inline:

1. Place the cursor in the position you want the graphic to be inserted.
2. Select the Insert Image action. The Insert Image dialog box appears.

3. Configure the options in this dialog box and click Insert.

The Insert Image dialog box includes the following options and features for inserting images into a DITA document:

- **Location**
  Use this option to specify a URL for the image as the value of an @href attribute inside the `<image>` element. You can type the URL of the image you want to insert or use browsing actions in the Browse drop-down menu (there is also a history drop-down).

- **Key**
  Use this option to insert the selected key as the value of a @keyref attribute inside the `<image>` element. All keys that are presented in the dialog box are gathered from the root map (page 2711) of the current DITA map. You can use the Choose Key Reference button to open the Choose Key dialog box that presents the list of keys available in the selected root map.
Note: If your defined keys are not listed in this dialog box, it is most likely trying to gather keys from the wrong root map. You can change the root map by using the Change Root Map link in the Choose Key dialog box or change it in the Root map option in the toolbar of the DITA Maps Manager.

Figure title

Use this text box to insert a `<title>` and `<image>` element inside a `<fig>` element.

Alternate text

Use this text box to insert an `<alt>` element inside the `<image>` element.

Size

Use this section to configure the Width and Height of the image, or Scale the image. Specifying a value in these options inserts a `@width`, `@height`, and `@scale` attribute, respectively.

Layout

Use the options in this section to insert `@placement` and `@align` attributes into the `<image>` element.

Preview

The Preview box shows a thumbnail of the selected image so that you can see a preview of the image before clicking Insert.

Adding an Image Inline with Drag/Drop (or Copy/Paste) Actions

You can drag images from your system explorer or the Navigator view (page 250) and drop them into a DITA document (or copy and paste). This will insert the path of the image file as the value of the `@href` attribute in a DITA `<image>` element:

```
<image href="../images/image_file.png"/>
```

Tip: To replace an image, just drag and drop a new image over the existing one. Oxygen XML Editor plugin will automatically update the reference to the new image.

Adding an Image in a Figure Element

To add an image in a figure:

1. Add a `<fig>` element to your document at the appropriate place.
2. Add a `<title>` and/or `<desc>` element to the `<fig>` element, according to your needs.
3. **Add an `<image>` element** *(page 2471)* to the `<fig>` element.

- **Note:** The `<fig>` element has a number of other child elements that may be appropriate to your content. See the [DITA documentation](#) for complete information about the `<fig>` element.

- **Note:** The order that the content of the `<image>`, `<title>`, and `<desc>` elements will appear in the output is determined by the output transformation. If you want to change how they appear, you may have to modify the output transformation, rather than your source content.

---

**Floating Images in DITA Topics for PDF or XHTML Output**

Oxygen XML Editor plugin provides the possibility of floating an image to the left or right of blocks of content in DITA topics for both PDF and XHTML output.

To float an image, you simply need to set the `outputclass` attribute on the `<image>` element. The possible values are:

- `float-left`
- `float-right`

For example, the following DITA structure will present the image to the right of the paragraph content in the output:

```dita
<p><image href="../../images/Lilac.jpg" scale="45" outputclass="float-right"/></p>
<b>Lilac</b> (<b>Syringa</b>) is a genus of about 20–25 species of flowering plants in the olive family (<b>Oleaceae</b>), native to Europe and Asia.
```

*Figure 725: Image Floated to the Right*
Adding Video, Audio, and Embedded HTML Resources in DITA Topics

You can insert references to media resources (such as videos, audio clips, or embedded HTML frames) in your DITA topics. The media resources can be played directly in Author mode and in all HTML5-based outputs. There is a toolbar button ( ) that allows you to insert and configure a reference to the media resource. You can also drag media files from your system explorer or the Navigator view (page 250) and drop them into your documents (or copy and paste them).

Table 77. Supported Media Types

<table>
<thead>
<tr>

<td>Width &amp; Height</td>
</tr>
<tr>
<td>embedded video (such as YouTube or Vimeo)</td>
<td>Embedded Iframe Code</td>
<td>iframe</td>
<td>Width &amp; Height</td>
</tr>
</tbody>
</table>

Adding a Media Resource

To insert a media resource in a DITA document, use the following procedure:

1. Place the cursor at the location where you want the media resource.
2. Select the Insert Media Resource action from the toolbar. The Insert Media dialog box appears.
Note: You can also drag media files from your system explorer or the Navigator view (page 250) and drop them into your documents (or copy and paste them). Note that this method will bypass the Insert Media dialog box, so if you need to adjust the size you will need to adjust the @width or @height attributes manually.

Figure 726: Insert Media Dialog Box

3. Configure the options in this dialog box and click Insert.

The Insert Media dialog box includes the following options:

Location

Use this option to specify a URL for the media resource as the value of a @data attribute inside the <object> element. You can type the URL of the resource you want to insert or use browsing actions in the Browse drop-down menu (there is also a history drop-down).

Key

Use this option to insert the selected key as the value of a @datakeyref attribute inside the <object> element. All keys that are presented in the dialog box are gathered from the root map (page 2711) of the current DITA map. You can use the Choose Key Reference button to open the Choose Key dialog box that presents the list of keys available in the selected root map.

Note: If your defined keys are not listed in this dialog box, it is most likely trying to gather keys from the wrong root map. You can change the root map by using the Change Root Map link in the Choose Key dialog box or change it in the Root map option in the toolbar of the DITA Maps Manager.

Type
Oxygen XML Editor plugin detects and automatically selects the media type based upon the specified resource in the URL field (page 2476). You can manually change the type, but keep in mind that in the publishing stage the object element is converted to an HTML5 element (page 2477) based upon the type selected here. You can choose between audio, video, or iframe.

Size

Use this section to configure the Width and Height of the frame for the media resource. Specifying a value in these options inserts a width and height attribute, respectively. For audio clips, only the Width can be adjusted.

Result in Author Mode: A reference to the specified video, audio, or embedded HTML frame is inserted in an object element and it is rendered in Author mode so that it can be played directly from there.

⚠️ Attention:

- On Mac OS X, if you receive a Blocked Plug-in error message, you need to update your Flash Player to the latest version.
- On Ubuntu 17.10, if you receive an error when trying to play videos in Author mode, you need to install the libavformat57 library.

Result in Output: In the publishing stage, the object element is converted to an HTML5 element so that it can be rendered properly and played in all HTML5-based outputs.

- Videos - The object element is converted to an HTML5 video element.
- Audio Clips - The object element is converted to an HTML5 audio element.
- Embedded HTML Frames - The object element is converted to an HTML5 iframe element.

⚠️ Tip: There is an even faster way of inserting an embedded video (such as a YouTube or Vimeo). If you copy the embed code from the source (for example, you can right-click on a YouTube video and select Copy embed code), you can then paste the contents of the clipboard in the URL field (page 2476) and the Type (page 2476) will automatically be set on iframe, while the Width and Height (page 2477) will be populated according to the detected size, and an allowfullscreen parameter will automatically be added (set the value of this parameter to true to allow videos to play in full screen mode once the document is converted to XHTML output).

Inserting Media in HTML Outputs That Do Not Support Embedded Media

For certain types of HTML output (for example, CHM) that do not support embedded media (such as videos or audio files), Oxygen XML Editor plugin provides a parameter that can be set in the transformation scenario to present the media object as a plain link in the output.
This can be achieved by following these steps:

1. Edit the DITA transformation scenario (page 2605) for the output type that does not support embedded objects (for example, DITA Map CHM).
2. Go to the Parameters tab (page 2614) and click the New button to add a new parameter.
3. For the Name, enter: com.oxygenxml.xhtml.linkToMediaResources.
4. For the Value, enter: true.
5. Click OK and continue on to run the transformation.

   **Result:** The media object will appear in the output as a plain link instead of an embedded object.

For more information, see the following video demonstration:

[https://www.youtube.com/embed/lfX11gS4WaU](https://www.youtube.com/embed/lfX11gS4WaU)

- How to Add Video and Audio Objects in DITA WebHelp Output (page 1705)

### Image Maps in DITA

Oxygen XML Editor plugin includes support for **image maps** in DITA documents through the use of the imagemap element. This feature provides an easy way to create hyperlinks in various areas within an image without having to divide the image into separate image files. The visual Author editing mode includes an **Image Map Editor** that helps you to easily create and configure image maps.

*Figure 727: Image Map Editor in DITA*
Image Map Editor Interface in DITA

The interface of the Image Map Editor consists of the following sections and actions:

**Toolbar**

- **New Rectangle**
  
  Use this button to draw a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

- **New Circle**
  
  Use this button to draw a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

- **New Polygon**
  
  Use this button to draw a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

- **New Free Form Shape**
Use this button to draw a free form shape over an area in the image. After selecting this button, left-click anywhere in the image to place the first point of your shape. Then move the cursor to the location of the next desired point and left-click to place the next point, and so on. To complete the shape (area), click the first point again and a line will automatically be added from the last point that was added, or simply double-click the last point to automatically add the line from the last point back to the first.

Duplicate

Use this button to create a duplicate of the currently selected shape.

Delete

Use this button to delete the currently selected shape.

Undo

Use this button to undo the last action.

Redo

Use this button to redo the last action that was undone.

Show/Hide Numbers

Use this button to toggle between showing or hiding the numbers for the shapes.

Bring Shape to Front

Use this button to bring the currently selected shape forward to the top layer.

Bring Shape Forward

Use this button to bring the currently selected shape forward one layer.

Send Shape Backward

Use this button to send the currently selected shape back one layer.

Send Shape to Back

Use this button to send the currently selected shape back to the bottom layer.

Color Chooser

Use this drop-down menu to select a color scheme for the lines and numbers of the shapes.
Zoom Slider

Use this slider to zoom the image in or out in the main image pane.

Image Pane

This main Image Pane is where you work with shapes to add hyperlinks to multiple areas within an image. The editing mechanisms that are supported in the Image Pane include the following:

Mouse Controls and Keyboard Shortcuts

- Use the mouse to select and move shapes around in the image pane. It is easy to see which shape is selected in this image pane because the border of the selected shape changes from a solid line to a dotted one.
- You can also drag any of the points of a selected shape to adjust its size and shape.
- You can hold down the Ctrl key to select multiple shapes and then move them simultaneously.
- You can also move shapes by using the arrow keys on your keyboard. In addition, you can hold down Shift while using the arrow keys to move the shape farther or Alt to move it 1 pixel at a time.
- To zoom in or out, you can use the NumPad + or NumPad - keys respectively. Use Ctrl + NumPad 0 to reset the zoom level to its default value.
- You can use Ctrl + Z to undo an action or Ctrl + Y to redo the last action that was undone.

Contextual Menu Actions Available in the Image Pane

You can right-click the shapes, points, or anywhere in the Image Pane to invoke the contextual menu where the following actions are available:

- **Add Point**
  Adds a point to Polygon or Free Form shapes.

- **Remove Point**
  Removes the current point from Polygon or Free Form shapes.

- **Duplicate**
  Create a duplicate of the currently selected shape.
Delete
Delete the currently selected shape.

New Rectangle
Creates a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

New Circle
Creates a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

New Polygon
Creates a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

Undo
Use this action to undo the last action.

Redo
Use this action to redo the last action that was undone.

Shape Table
The table at the right of the Image Pane is a sequential list of all the areas (shapes) that have been added in the image. It shows their number, type, and description (if one has been added). If you select one of the entries in the table, the corresponding shape will be selected in the Image Pane.

Properties

Type
Displays information about the selected coordinate.

Target
Allows you to choose the target resource that you want the selected area (shape) to be linked to. Select a target by using the Link drop-down menu to the right of the text field. You can choose between the following types of links: Cross Reference, File Reference, or Web Link. All three types will open a dialog box that allows you to define the target resource. This linking process is similar to the normal process of inserting links in
DITA (page 2572) by using the identical Link drop-down menu from the main toolbar.

When you click OK to finalize your changes in the Image Map Editor, an xref element will be inserted with either an href attribute or a keyref attribute. Additional attributes may also be inserted and their values depend on the target and the type of link. For details about the three types of links and their dialog boxes, see Inserting a Link in Oxygen XML Editor plugin (page 2572).

Description

You can enter an optional description for the selected area (shape) that will be displayed in the Image Map Details section (page 811) in Author mode and as a tooltip message when the end user hovers over the hyperlink in the output.

How to Create an Image Map in DITA

To create an image map on an existing image in a DITA document, follow these steps:

1. Right-click the image and select Image Map Editor.

   Result: This action will apply an image map to the current image and open the Image Map Editor dialog box.

2. Add hyperlinks to the image by selecting one of the shape buttons (New Rectangle, New Circle, or New Polygon).

3. Move the shape to the desired area in the image and drag any of the points on the shape to adjust its size or form. You can use the other buttons on the toolbar (page 806) to adjust its layer and color, or to perform other editing actions.

   Tip: You can right-click any of the points, shapes, or anywhere in the Image Pane to access various helpful contextual menu actions (page 808). For example, the easiest way to remove a point is to right-click the point and select Remove Point.

4. With the shape selected, use one of the linking options (page 809) in the Link drop-down menu to select a target resource (or enter its path in the Target (page 809) text field).

5. (Optional) Enter a Description (page 810) for the selected area (shape).

6. If you want to add more hyperlinks to the image, select a shape button again and repeat the appropriate steps.

7. When you are finished creating hyperlinks, click OK to process your changes.
**Result:** The image map is applied on the image and the appropriate elements and attributes are automatically added. In **Author** mode, the image map is now rendered over the image. If the image includes an `alt` element, its value will be displayed under the image. The following two buttons will also now be available under the image in **Author** mode:

- **Image Map Editor** - Click this button to open the **Image Map Editor**.
- **Image Map Details** - Click this button to expand a section that displays the details of the image map and allows you to change the shape and coordinates of the hyperlinked areas. Keep in mind that if you change the shape in this section, you also need to add or remove coordinates to match the requirements of the new shape.

![Figure 728: Image Map Details](image)

**How to Edit an Existing Image Map in DITA**

To edit an existing image map, use any of the following methods:

- Simply double-click the image.
- Right-click the image and select **Image Map Editor**.
- Click the **Image Map Editor** button below the image.

All three methods open the **Image Map Editor** where you can make changes to the image map using the various features described above. You can also make changes to the XML structure of the image map in the **Text** editing mode.

You can also click the **Image Map Details** button below the image to expand a section that displays the details of the image map and allows you to change the shape and coordinates of the hyperlinked areas. Keep in mind that if you change the shape in this section, you also need to add or remove coordinates to match the requirements of the new shape.

**Overlapping Areas**

If shapes overlap one another in the **Image Map Editor**, the one on the top layer takes precedence. The number shown inside each shape represent its layer (if the numbers are not displayed, click the
Show/Hide Numbers button on the Image Map Editor toolbar (page 806). To change the layer order for a shape, use the layer buttons on the Image Map Editor toolbar (page 806) (, , , ).

If you insert a shape and all of its coordinates are completely inside another shape, the Image Map Editor will display a warning to let you know that the shape is entirely covered by a bigger shape. Keep in mind that if a shape is completely inside another shape, its hyperlink will only be accessible if its layer is on top of the bigger shape.

- DITA 'imagemap' Element Specifications
- Adding Images in DITA Topics (page 2471)

Adding Tables in DITA Topics

You can use the Insert Table action on the toolbar or from the contextual menu to add a table in a DITA topic. By default, DITA supports four types of tables:

- DITA Simple table model (page 775) - This is the most commonly used model for basic tables.
- CALS table model (OASIS Exchange Table Model) (page 777) - This is used for more advanced functionality.
- DITA Choice table model (page 780) - This is used within a step element in a DITA Task document to describe a series of optional choices that a user must make before proceeding.
- DITA Properties table model (page 782) - This is used in DITA Reference documents to describe a property (for example, its type, value, and description).

If you are using a specialized DITA vocabulary, it may contain specialized versions of these table models.

Since DITA is a structured format, you can only insert a table in places in the structure of a topic where tables are allowed. The Oxygen XML Editor plugin toolbar provides support for entering and editing tables. It also helps to indicate where you are allowed to insert a table or its components by disabling the appropriate buttons.
Inserting a Simple Table Model

To insert a Simple DITA table, select the Insert Table action on the toolbar or from the contextual menu (or the Table submenu from the DITA menu). The Insert Table dialog box appears. Select Simple for the table Model.

Figure 729: Insert Table Dialog Box - Simple Model

The dialog box allows you to configure the following options when you select the Simple table model:

**Title**

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

**Generate table header**

If selected, an extra row will be inserted at the top of the table to be used as the table header.

**Column widths**

Allows you to specify the type of properties for column widths (colwidth attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a relcolwidth attribute with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, relcolwidth="1* 2* 3*" causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in Author mode, the values of the relcolwidth attribute are
automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the relcolwidth attribute is \texttt{1*}.

- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in Author mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

**Frame**

Allows you to specify a value for the frame attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the conref target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

\textbf{Note:} The options in the Insert Table dialog box for DITA documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, a simple table is inserted into your document at the current cursor position.

**Inserting a CALS Table Model (OASIS Exchange Table)**

To insert an OASIS Exchange Table (CALS), select the **Insert Table** action on the toolbar or from the contextual menu (or the Table submenu from the DITA menu). The Insert Table dialog box appears. Select CALS for the table Model. This model allows you to configure more properties than the Simple model.

\textit{Figure 730: Insert Table Dialog Box - CALS Model}
The dialog box allows you to configure the following options when you select the CALS table model:

**Title**

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

**Table Size**

Allows you to choose the number of Rows and Columns for the table.

**Generate table header**

If selected, an extra row will be inserted at the top of the table to be used as the table header.

**Column widths**

Allows you to specify the type of properties for column widths (colwidth attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a colwidth attribute with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, colwidth="1* 2* 3*" causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in Author mode, the values of the colwidth attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the colwidth attribute is 1*.

- **dynamic** - If you choose this option, the columns are created without a specified width (colwidth attribute). Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in Author mode, a dialog
box will be displayed that asks you if you want to switch to proportional or fixed column widths.

- **fixed** - The width is specified in fixed units. By default, the pt unit is inserted, but you can change the units in the colspecs (column specifications) section above the table or in Text mode. The following units are allowed: pt (points), cm (centimeters), mm (millimeters), pi (picas), in (inches).

**Frame**

Allows you to specify a value for the frame attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **dita-use-conref-target** - Normally, when using a conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the conref target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

**Row separator**

Specifies whether or not to include row separators (rowsep attribute). The allowed values are: 0 (no separator) and 1 (include separators).

**Column separator**

Specifies whether or not to include column separators (colsep attribute). The allowed values are: 0 (no separator) and 1 (include separators).

**Alignment**

Specifies the alignment of the text within the table (align attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.
Note: The `justify` value cannot be rendered in `Author` mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the `char` attribute for alignment.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

Note: The options in the `Insert Table` dialog box for DITA documents are persistent, so changes made in one session will carry over to another.

When you click `Insert`, a CALS table is inserted into your document at the current cursor position.

When you insert a CALS table, you see a link for setting the `colspecs` (column specifications) of your table. Click the link to open the controls that allow you to adjust various column properties. Although they appear as part of the `Author mode (page 303)`, the `colspecs` link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

Figure 731: CALS Table in DITA

![Sample CALS Table with Fixed Width](image)

Inserting a Choice Table Model

To insert a `Choice` table within a `step` element in a DITA Task document, select the `Insert Table` action on the toolbar or in the `Insert` submenu from the contextual menu (or the `Table` submenu from the `DITA` menu), or select `choicetable` from the `Content Completion Assistant (page 2704)`. The `Insert Table` dialog box appears. Select `Simple` for the table `Model`.

Figure 732: Insert Table Dialog Box - Choice Model
The dialog box allows you to configure the following options when you insert a Choice table model within a DITA Task:

**Table Size**

Allows you to choose the number of **Rows** and **Columns** for the table.

**Generate table header**

If selected, an extra row will be inserted at the top of the table to be used as the table header.

**Column widths**

Allows you to specify the type of properties for column widths (colwidth attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a relcolwidth attribute with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, relcolwidth="1* 2* 3*" causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the relcolwidth attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the relcolwidth attribute is 1*.

- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

**Frame**

Allows you to specify a value for the frame attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
• all - A border will be added to all frames.
• top - A border will be added to the top frame.
• topbot - A border will be added to the top and bottom frames.
• bottom - A border will be added to the bottom frame.
• sides - A border will be added to the side frames.
• -dita-use-conref-target - Normally, when using a conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the conref target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

When you click Insert, a Choice table is inserted into your DITA Task document at the current cursor position (within a step element).

**Inserting a Properties Table Model**

To insert a Properties table within a refbody element in a DITA Reference document, select the Insert Table action on the toolbar or in the Insert submenu from the contextual menu (or the Table submenu from the DITA menu), or select properties(wizard) from the Content Completion Assistant (page 2704). The Insert Table dialog box appears. Select Properties for the table Model.

![Insert Table Dialog Box - Properties Model](image)

The dialog box allows you to configure the following options when you insert a Properties table model within a DITA Reference:

**Table Size**

Allows you to choose the number of Rows and Columns for the table.
**Generate table header**

If selected, an extra row will be inserted at the top of the table to be used as the table header.

**Frame**

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

When you click **Insert**, a **Properties** table is inserted into your DITA Reference document at the current cursor position (within a `refbody` element).

**Editing an Existing Table**

You can edit the structure of an existing table using the table buttons on the toolbar (or in the contextual menu) to add or remove cells, rows, or columns, and to set basic table properties. Additional attributes can be used to fine-tune the formatting of your tables by using the **Attributes view** (page 319) (Window > Show View > Attributes). See the DITA documentation for a full explanation of these attributes.

You can also use the **Table Properties (Ctrl + T (Command + T on OS X))** (page 786) action from the toolbar or contextual menu (or DITA menu) to modify many of the properties of the table (page 786).

Also, remember that underneath the visual representation, both table models are really just XML. If necessary, you can edit the XML directly by switching to **Text mode** (page 223).

**Related Information:**
DITA Table Layouts

Depending on the context, DITA accepts the following table layouts:

- **CALS table model** (page 784)
- **Simple table model** (page 784)
- **Choice table model** (page 785)
- **Properties table model** (page 785)

**CALS Table Model Layout**

The **CALS** table model allows for more flexibility and table customization than other models. When choosing a **CALS** table model from the **Insert Table** dialog box, you have access to more configurable properties. The layout of a **CALS** table includes a **colspecs** section that allows you to easily configure some properties without opening the **Table Properties** dialog box. For example, you can change the value of column widths (**colwidth** attribute) or the text alignment (**align** attribute). Although they appear as part of the **Author mode** (page 303), the **colspecs** link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

*Figure 734: CALS Table in DITA*
Simple Table Model Layout

When choosing a Simple table model from the Insert Table dialog box, you only have access to configure a few properties. For example, you can choose the number of rows and columns, specify values for frames, and choose from a few types of properties for the column width. The layout of this type of table is very simple, as the name suggests.

Figure 735: DITA Simple Table

<table>
<thead>
<tr>
<th>Header 1</th>
<th>Header 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Column 1</td>
<td>Column 2</td>
</tr>
</tbody>
</table>

Choice Table Model Layout

A Choice table model is used within a step element in a DITA Task document to describe a series of optional choices that a user must make before proceeding. The choicetable element is a useful device for documenting options within a single step of a task. You can insert Choice tables in DITA Task documents either by selecting choicetable from the Content Completion Assistant (page 2704) (within a step element) or by using the Insert Table action on the toolbar or from the contextual menu). The options and layout of a Choice table is similar to the Simple table model.

Figure 736: DITA Choice Table

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Opt A</td>
<td></td>
</tr>
<tr>
<td>Opt B</td>
<td></td>
</tr>
<tr>
<td>Opt C</td>
<td></td>
</tr>
</tbody>
</table>

Properties Table Model Layout

A Properties table model is used within a refbody element in a DITA Reference document to describe a property (for example, its type, value, and description). You can insert Properties tables in DITA Reference documents either by selecting properties(wizard) from the Content Completion Assistant (page 2704) (within a refbody element) or by using the Insert Table action on the toolbar (or from the contextual menu) and selecting Properties for the Model. The layout of a Properties table is very simple. It allows for a maximum of 3 columns (typically for property type, value, and description) and the only options available are for whether or not you want a header row and for specifying frames (borders).

Figure 737: DITA Properties Table
Table Validation in DITA

Oxygen XML Editor plugin reports table layout problems that are detected in manual or automatic validations. When you validate a DITA map (page 2705) with the Validate and Check for Completeness action, if the Report table layout problems option is selected in the DITA Map Completeness Check dialog box (page 2450), table layout problems will be reported in the validation results. The types of errors that may be reported for DITA table layout problems include:

**CALS Tables**

- A row has fewer cells than the number of columns detected from the table `cols` attribute.
- A row has more cells than the number of columns detected from the table `cols` attribute.
- A cell has a vertical span greater than the available rows count.
- The number of `colsargs` is different than the number of columns detected from the table `cols` attribute.
- The number of columns detected from the table `cols` attribute is different than the number of columns detected in the table structure.
- The value of the `cols`, `rowsep`, or `colsep` attributes are not numeric.
- The `namest`, `nameend`, or `colname` attributes point to an incorrect column name.

**Simple or Choice Tables**

A row has fewer cells than the number of table columns.

Editing Table Properties in DITA

To customize the look of a table in DITA, place the cursor anywhere in a table and invoke the Table Properties (`Ctrl + T (Command + T on OS X)`) action from the toolbar or the Table submenu of the contextual menu (or DITA menu). This opens the Table properties dialog box.

The Table properties dialog box allows you to set specific properties to the table elements. The options that are available depend on the context and location within the table in which the action was invoked.

**Note:** Some properties allow the following special values, depending on the context and the current properties or values:
• `<not set>` - Use this value if you want to remove a property.
• `<preserve>` - If you select multiple elements that have the same property set to different values, you can choose this value to keep the values that are already set. In some cases it can also be used to keep the current non-standard value for a particular property.

**Edit Table Properties for a CALS Table Model**

For a CALS table model, the **Table properties** dialog box includes four tabs of options:

• **Table** tab - The options in this tab apply to the entire table.
• **Row** tab - The options in this tab apply to the current row or selection of multiple rows. A message at the bottom of the tab tells you how many rows will be affected.
• **Column** tab - The options in this tab apply to the current column or selection of multiple columns. A message at the bottom of the tab tells you how many columns will be affected.
• **Cell** tab - The options in this tab apply to the current cell or selection of multiple cells. A message at the bottom of the tab tells you how many cells will be affected.

The options in four tabs include a **Preview** pane that shows a representation of the modification.

*Figure 738: Table Properties Dialog Box with Cell Tab Selected (DITA CALS Table Model)*

The options in the four tabs include the following:

**Horizontal alignment (Available in the Table, Column, and Cell tabs)**
Specifies the horizontal alignment of text within the current table/column/cell or selection of multiple columns/cells (`align` attribute). The allowed values are as follows:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

**Note:** The `justify` value cannot be rendered in Author mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the `char` attribute for alignment.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

**Vertical alignment (Available in the Row and Cell tabs)**

Specifies the vertical alignment of text within the current row/cell or selection of multiple rows/cells (`valign` attribute). The allowed values are as follows:

- **top** - Aligns the text at the top of the cell.
- **middle** - Aligns the text in a vertically centered position.
- **bottom** - Aligns the text at the bottom of the cell.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

**Column separator (Available in the Table, Column, and Cell tabs)**

Specifies whether or not to include column separators (borders/grid lines) in the form of the `colsep` attribute. The allowed values are: 0 (no separator) and 1 (include separators).

**Row separator (Available in all four tabs)**

Specifies whether or not to include row separators (borders/grid lines) in the form of the `rowsep` attribute. The allowed values are: 0 (no separator) and 1 (include separators).
Frame (Available only in the Table tab)

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

Edit Table Properties for a Simple, Choice, or Properties Table Model

For a Simple, Choice, Properties table model, the Table properties dialog box only allows you to edit a few options.

**Table tab**

**Frame**

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).
Row tab (not available for Properties tables)

Row type

Allows you change the row to a body or header type of row.

Related Information:

- Adding Tables in DITA Topics (page 775)
- Editing Tables in Author Mode (page 761)

Adding MathML Equations in DITA Topics

You can add MathML equations in a DITA document using one of the following methods:

- Reference an external MathML file as an image, using the Insert Image action that is available on the DITA toolbar (or from the DITA > Insert menu).

Note: MathML equations contained in DITA topics can only be published out-of-the-box in PDF using the DITA PDF transformation scenario. For other publishing formats, you must employ additional customizations for handling MathML content.

DITA Topic Author Mode Actions

A variety of actions are available for the DITA framework (page 2706) that can be found on the toolbar, the contextual menu, or the DITA menu.

DITA Toolbar Actions

The following default actions are readily available on the DITA (Author Custom Actions) toolbar when editing in Author mode (by default, most of them are also available in the DITA menu and in various submenus of the contextual menu):

B Bold

Surrounds the selected text with a `b` tag. You can use this action on multiple non-contiguous selections.
Italic

Surrounds the selected text with an `<i>` tag. You can use this action on multiple non-contiguous selections.

Underline

Surrounds the selected text with a `<u>` tag. You can use this action on multiple non-contiguous selections.

🔗 Link Actions Drop-Down Menu

The following link actions are available from this menu:

Cross Reference

Opens the Cross Reference (xref) dialog box (page 2572) that allows you to insert a link to a target DITA resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map (page 2705) structure. Once the target resource has been selected, you can also target specific elements within that resource. For more information, see Linking in DITA Topics (page 2571).

File Reference

Opens the File Reference dialog box (page 2572) that allows you to insert a link to a target non-DITA file resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. For more information, see Linking in DITA Topics (page 2571).

Web Link

Opens the Web Link dialog box (page 2573) that allows you to insert a link to a target web-related resource at the current location within a document. The target resource can be a URL or a key that is already defined in your DITA map structure. For more information, see Linking in DITA Topics (page 2571).

Related Link to Topic

Opens the Cross Reference (xref) dialog box (page 2573) that allows you to insert a link to a target DITA resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. Once the target resource has been selected, you can also target specific elements within that resource. If a related links section does not already
exist, this action creates one. For more information, see Linking in DITA Topics (page 2571).

**Related Link to File**

Opens the **File Reference** dialog box (page 2573) that allows you to insert a link to a target non-DITA file resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics (page 2571).

**Related Link to Web Page**

Opens the **Web Link** dialog box (page 2573) that allows you to insert a link to a target web-related resource in a related links section at the bottom of the current document. The target resource can be a URL or a key that is already defined in your DITA map structure. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics (page 2571).

**Insert Image**

Opens the **Insert Image** dialog box (page 2471) that allows you to configure the properties of an image to be inserted into a DITA document at the cursor position.

**Insert Media Resource**

Opens the **Insert Media** dialog box (page 2475) that allows you to select and configure the properties of a media object to be inserted into a DITA document at the cursor position. The result will be that a reference to the specified video, audio, or embedded HTML frame is inserted in an object element and it is rendered in Author mode so that it can be played directly from there.

**Insert Section Drop-Down Menu**

The following insert actions are available from this menu:

- **Insert Section**
  
  Inserts a new section element in the document, depending on the current context.

- **Insert Concept**
  
  Inserts a new concept element, depending on the current context. Concepts provide background information that users must know before they can successfully work with a product or interface.

- **Insert Task**
Inserts a new `task` element, depending on the current context. Tasks are the main building blocks for task-oriented user assistance. They generally provide step-by-step instructions that will help a user to perform a task.

**Insert Topic**

Inserts a new `topic` element, depending on the current context. Topics are the basic units of DITA content and are usually organized around a single subject.

**Insert Reference**

Inserts a new `reference` element, depending on the current context. A reference is a top-level container for a reference topic.

**Insert Paragraph**

Inserts a new paragraph at current cursor position.

**Reuse Content**

This action provides a mechanism for reusing content fragments. It opens the **Reuse Content** dialog box (page 2542) that allows you to insert several types of references to reusable content at the cursor position. The types of references that you can insert using this dialog box include content references (`conref`) (page 2543), content key references (`conkeyref`) (page 2545), or key references to metadata (`keyref`) (page 2548).

**Insert step or list item**

Inserts a new list or step item in the current list type.

**Insert Unordered List**

Inserts an unordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an unordered list.

**Insert Ordered List**

Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

**Sort**

Sorts cells or list items in a table.

**Insert Table**
Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a block element (page 2703)) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

**Note:** If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that *Only lists, paragraphs, or inline content can be converted to tables.*

- **Insert Row Below**
  Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

- **Delete Row(s)**
  Deletes the table row located at cursor position or multiple rows in a selection.

- **Insert Column After**
  Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

- **Delete Column(s)**
  Deletes the table column located at cursor position or multiple columns in a selection.

- **Table Properties**
  Opens the Table properties dialog box that allows you to configure properties of a table (such as frame borders).

- **Join Cells**
  Joins the content of the selected cells (both horizontally and vertically).

- **Split Cell**
  Splits the cell at the cursor location. If Oxygen XML Editor plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

### DITA Contextual Menu Actions

In addition to many of the DITA toolbar actions (page 1315) and the general Author mode contextual menu actions (page 840), there are numerous DITA-specific actions that are available in the
contextual menu when editing DITA documents in Author mode (most of them are also available in the DITA menu at the top of the interface):

- **Edit Attributes**
  Displays an in-place attributes editor (page 322) that allows you to manage the attributes of an element.

- **Edit Profiling Attributes**
  Allows you to change the profiling attributes (page 746) defined on all selected elements.

- **Cut (Ctrl + X (Command + X on OS X))**
  Removes the current selected content from the document and places it in the clipboard.

- **Copy (Ctrl + C (Command + C on OS X))**
  Places a copy of the current selected content in the clipboard.

- **Paste (Ctrl + V (Command + V on OS X))**
  Inserts the current clipboard content into the document at the cursor position.

- **Paste special submenu**
  This submenu includes the following special paste actions that are specific to the DITA framework:

  - **Paste as content reference**
    Inserts a content reference (a DITA element with a conref attribute) to the DITA XML element from the clipboard. An entire DITA XML element with an ID attribute must be present in the clipboard when the action is invoked. The conref attribute will point to this ID value.

  - **Paste as content key reference**
    Allows you to indirectly reference content using the conkeyref attribute. When the DITA content is processed, the key references are resolved using key definitions from DITA maps (page 2705). To use this action, you must first do the following:

    1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
    2. In the DITA Maps Manager view, make sure that the Root map combo box (page 2405) points to the correct map that stores the keys.
    3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its
parent map opened in the DITA Maps Manager, select Edit Properties, and enter a value in the Keys field.

**Paste as link**

Looks for the first element with an ID value in the clipboard and inserts an xref that points to that element. If no elements with an ID value are found, a message will appear that informs you that to use this action, the clipboard contents must include at least one element with a declared ID.

**Paste as link (keyref)**

Inserts a link to the element that you want to reference. To use this action, you must first do the following:

1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
2. In the DITA Maps Manager view, make sure that the Root map combo box (page 2405) points to the correct map that stores the keys.
3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the DITA Maps Manager, select Edit Properties, and enter a value in the Keys field.

**Insert submenu**

This submenu includes the following insert actions that are specific to the DITA framework:

- **Insert Table**

  Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a block element (page 2703)) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

  **Note:** If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that Only lists, paragraphs, or inline content can be converted to tables.

- **Insert Image**
Inserts an image reference (page 798) at the cursor position. Depending on the current location, an image-type element is inserted.

**Insert Media Resource**

Opens a Choose Media dialog box (page 830) that allows you to select the URL of a media object to be inserted into a document at the cursor position. The result will be that a reference to the specified video, audio, or embedded HTML frame is inserted and rendered in Author mode so that it can be played directly from there.

**Insert Equation**

Opens the XML Fragment Editor that allows you to insert and edit MathML notations (page 832).

**Insert Paragraph**

Inserts a new paragraph at current cursor position.

**Insert Section**

Inserts a new section element in the document, depending on the current context.

**Insert Topic**

Inserts a new topic element, depending on the current context. Topics are the basic units of DITA content and are usually organized around a single subject.

**Insert Entity**

Allows you to insert a predefined entity or character entity. Surrogate character entities (range #x10000 to #x10FFFF) are also accepted. Character entities can be entered in one of the following forms:

- `#<decimal value>` - e. g. #65
- `&#<decimal value>` - e. g. &#65
- `#x<hexadecimal value>` - e. g. #x41
- `&#x<hexadecimal value>` - e. g. &#x41

**Image Map Editor**

This action is available in the contextual menu when it is invoked on an image. This action applies an image map to the current image (if one does not already exist) and opens the Image Map Editor dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.
Table Actions

The following table editing actions are available in the contextual menu when it is invoked on a table:

- **Insert Rows**
  Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (Above or Below the current row).

- **Delete Row(s)**
  Deletes the table row located at cursor position or multiple rows in a selection.

- **Insert Columns**
  Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (Above or Below the current column).

- **Delete Column(s)**
  Deletes the table column located at cursor position or multiple columns in a selection.

- **Join Cells**
  Joins the content of the selected cells (both horizontally and vertically).

- **Split Cell**
  Splits the cell at the cursor location. If Oxygen XML Editor plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

- **Sort**
  Sorts cells or list items in a table.

- **Table Properties**
  Opens the Table properties dialog box that allows you to configure properties of a table (such as frame borders).

**Other Actions submenu**

This submenu gives you access to all the usual contextual menu actions.

**Link submenu**

The following link actions are available from this submenu:
Cross Reference

Opens the Cross Reference (xref) dialog box (page 2572) that allows you to insert a link to a target DITA resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map (page 2705) structure. Once the target resource has been selected, you can also target specific elements within that resource. For more information, see Linking in DITA Topics (page 2571).

File Reference

Opens the File Reference dialog box (page 2572) that allows you to insert a link to a target non-DITA file resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. For more information, see Linking in DITA Topics (page 2571).

Web Link

Opens the Web Link dialog box (page 2573) that allows you to insert a link to a target web-related resource at the current location within a document. The target resource can be a URL or a key that is already defined in your DITA map structure. For more information, see Linking in DITA Topics (page 2571).

Related Link to Topic

Opens the Cross Reference (xref) dialog box (page 2573) that allows you to insert a link to a target DITA resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. Once the target resource has been selected, you can also target specific elements within that resource. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics (page 2571).

Related Link to File

Opens the File Reference dialog box (page 2573) that allows you to insert a link to a target non-DITA file resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics (page 2571).

Related Link to Web Page
Opens the **Web Link dialog box** *(page 2573)* that allows you to insert a link to a target web-related resource in a related links section at the bottom of the current document. The target resource can be a URL or a key that is already defined in your *DITA map* structure. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics *(page 2571)*.

**Sort**

Available when invoked on a list, it opens a dialog box where you can configure a sorting operation for an entire list or a selection of list items.

**Generate IDs**

Oxygen XML Editor plugin generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the **ID Options** dialog box that are found in the current selection.

**Note:** The Generate IDs action does not overwrite existing ID values. It only affects elements that do not already have an `<id>` attribute.

**Reuse submenu**

This submenu includes the following actions regarding reusing content in DITA:

**Reuse Content**

This action provides a mechanism for reusing content fragments. It opens the **Reuse Content dialog box** *(page 2542)* that allows you to insert several types of references to reusable content at the cursor position. The types of references that you can insert using this dialog box include content references *(conref)* *(page 2543)*, content key references *(conkeyref)* *(page 2545)*, or key references to metadata *(keyref)* *(page 2548)*.

**Push Current Element**

Opens the **Push current element dialog box** *(page 2552)* that allows content from a source topic to be inserted into another topic without any special coding in the topic where the content will be re-used.
Edit Content Reference

This action is available for elements with a `conref` or `conkeyref` attribute. It opens the **Edit Content Reference** dialog box that allows you to edit the source location (or key) and source element of a content reference (or content key reference), and the reference details (`conref` / `conkeyref` and `conrefend` attributes). For more information, see [Reuse Content Dialog Box](page 2542).

Replace Reference with Content

Replaces the referenced fragment (`conref` or `conkeyref`) at the cursor position with its content from its source. This action is useful if you want to make changes to the content in the currently edited document without changing the referenced fragment in its source location. If the source content includes references to other topics/resources (`hrefs`), the operation also resolves those references relative to the new location.

Attributes are preserved according to the following priority:

1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a `-dita-use-conref-target` value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for `id` attributes.

Replace All References with Content

Replaces all referenced fragments (`keyref`, `conref`, or `conkeyref`) in the current document with the content. Attributes are preserved according to the following priority:

1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a `-dita-use-conref-target` value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for `id` attributes.

For `keyrefs` inside `xref` or `link` elements, the `keyref` attribute is changed to an `href` attribute, while the rest of the content for the `keyref` is replaced with its source content.

If the source content includes references to other topics/resources (`hrefs`), the operation also resolves those references relative to the new location.
Remove Content Reference

Removes the content reference (conref or conkeyref) inside the element at the cursor position.

Create Reusable Component

Creates a reusable component from the selected fragment of text. For more information, see Creating a Reusable Content Component (page 2555).

Insert Reusable Component

Inserts a reusable component at cursor location. For more information, see Inserting a Reusable Content Component (page 2556).

Search References (Ctrl + Shift + G)

Combination of 

Finds the references to the id attribute value for the element at the current cursor position, in all the topics contained in the current DITA map (page 2705) (opened in the DITA Maps Manager view (page 2400)). If no references are found for the current element, a dialog box will be displayed that offers you the option of searching for references to its ancestor elements.

Show Key Definition

Available for elements that have a conkeyref or keyref attribute set (or elements with an ancestor element that has a conkeyref or keyref attribute). It computes the key name and opens the DITA map (page 2705) that contains the definition of the key with the element that defines that key selected.

About Element submenu

This submenu includes the following actions:

Style Guide

Opens the DITA Style Guide Best Practices for Authors in your browser and displays a topic that is relevant to the element at the cursor position. When editing DITA documents, this action is available in the contextual menu of the editing area (under the About Element sub-menu), in the DITA
menu, and in some of the documentation tips that are displayed by the Content Completion Assistant (page 2704).

Browse reference manual

Opens a reference to the documentation of the XML element closest to the cursor position in a web browser.

Go to Definition

Moves the cursor to the definition of the current element.

Select submenu

This submenu allows you to select the following:

Element

Selects the entire element at the current cursor position.

Content

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

Parent

Selects the entire parent element at the current cursor position.

Text submenu

This submenu contains the following actions:

To Lower Case

Converts the selected content to lower case characters.

To Upper Case

Converts the selected content to upper case characters.

Capitalize Sentences

Converts to upper case the first character of every selected sentence.

Capitalize Words

Converts to upper case the first character of every selected word.

Count Words

Counts the number of words and characters (no spaces) in the entire document or in the selection for regular content and read-only content.
Note: The content marked as deleted with change tracking (page 2711) is ignored when counting words.

Convert Hexadecimal Sequence to Character (Ctrl + Shift + H (Command + Shift + H on OS X))

Converts a sequence of hexadecimal characters to the corresponding Unicode character (page 602). The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the 0x or 0X prefix. Examples of valid sequences and the characters they will be converted to:

- 0x0045 will be converted to E
- 0X0125 to #
- 265 to #
- 2190 to #

Note: For more information about finding the hexadecimal value of a character, see Finding the Decimal, Hexadecimal, or Character Entity Equivalent (page 609).

Refactoring submenu

Contains a series of actions designed to alter the XML structure of the document:

†† Toggle Comment

Encloses the currently selected text in an XML comment, or removes the comment if it is commented.

Move Up (Alt + UpArrow)

Moves the current node or selected nodes in front of the previous node.

Move Down (Alt + DownArrow)

Moves the current node or selected nodes after the subsequent node.

Split Element

Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

Join Elements
Joins two adjacent block elements (page 2703) that have the same name. The action is available only when the cursor position is between the two adjacent block elements. Also, joining two block elements can be done by pressing the Delete or Backspace keys and the cursor is positioned between the boundaries of these two elements.

**Surround with Tags (Alt + Shift + E)**

Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

- If the Position cursor between tags option (page 101) is selected in the Content Completion preferences page, the cursor is placed between the start and end tag.
- If the Position cursor between tags option (page 101) is not selected in the Content Completion preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

**Surround with '[tag]' (Alt + Shift + ForwardSlash)**

Surround the selected content with the last tag used.

**Rename Element**

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the Rename dialog box.

**Delete Element Tags**

Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the Delete or Backspace keys.

**Remove All Markup**

Removes all the XML markup inside the selected block of content and keeps only the text content.

**Remove Text**

Removes the text content of the selected block of content and keeps the markup intact with empty elements.

**DITA Refactoring Actions**
A variety of built-in XML refactoring operations that pertain to DITA documents with some of the information preconfigured based upon the current context.

**Change Topic ID to File Name**

Use this operation to change the ID of a topic to be the same as its file name.

**Convert CALS Tables to Simple Tables**

Use this operation to convert DITA CALS tables to simple tables. If you invoke this operation from a nested table (a table inside a table), only the nested table will be affected. If it is invoked on a parent table that contains nested tables, all of the contained tables will be converted.

**Convert conrefs to conkeyrefs**

Use this operation to convert `conref` attributes to `conkeyref` attributes.

**Convert Simple Tables to CALS Tables**

Use this operation to convert DITA simple tables to CALS tables. If you invoke this operation from a nested table (a table inside a table), only the nested table will be affected. If it is invoked on a parent table that contains nested tables, all of the contained tables will be converted.

**Convert to Concept**

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

**Convert to General Task**

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA *General Task* is a less restrictive alternative to the *Strict Task* information type.

**Convert to Reference**

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

**Convert to Task**

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).
Convert to Topic

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

Convert to Troubleshooting

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

Rename Key

Available when invoked on a key, and can be used to quickly rename a key. It also updates all references to it. Note that it does not work on DITA 1.3 key scopes.

Attributes Refactoring Actions

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

Add/Change attribute

Allows you to change the value of an attribute or insert a new one.

Convert attribute to element

Allows you to change an attribute into an element.

Delete attribute

Allows you to remove one or more attributes.

Rename attribute

Allows you to rename an attribute.

Replace in attribute value

Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

Comments Refactoring Actions

Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

Delete comments

Allows you to delete comments found inside one or more elements.
Elements Refactoring Actions

Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

Delete element

Allows you to delete elements.

Delete element content

Allows you to delete the content of elements.

Insert element

Allows you to insert new elements.

Rename element

Allows you to rename elements.

Unwrap element

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

Wrap element

Allows you to surround elements with element tags.

Wrap element content

Allows you to surround the content of elements with element tags.

Fragments Refactoring Actions

Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

Insert XML fragment

Allows you to insert an XML fragment.

Replace element content with XML fragment

Allows you to replace the content of elements with an XML fragment.

Replace element with XML fragment

Allows you to replace elements with an XML fragment.

Review submenu

This submenu includes the following actions:
Track Changes

Enables or disables the Track Changes (page 2711) support for the current document.

Accept Change(s) and Move to Next

Accepts the Tracked Change (page 2711) located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is accepted.

Accept All Changes

Accepts all Tracked Changes (page 2711) in the current document.

Reject Change(s) and Move to Next

Rejects the Tracked Change (page 2711) located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is rejected.

Reject All Changes

Rejects all Tracked Changes (page 2711) in the current document.

Comment Change

Opens a dialog box that allows you to add a comment to an existing Tracked Change (page 2711). The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

Highlight

Enables the highlighting tool that allows you to mark text in your document.

Colors

Allows you to select the color for highlighting text.

Stop highlighting

Use this action to deactivate the highlighting tool.

Remove highlight(s)

Use this action to remove highlighting from the document.

Add Comment
Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).

**Show/Edit Comment**

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

**Remove Comment**

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

**Manage Reviews**

Opens the Review view (page 742).

**Folding submenu**

This submenu includes the following actions:

- **Toggle Fold**
  Toggles the state of the current fold.
- **Collapse Other Folds (Ctrl + NumPad/ (Command + NumPad/ on OS X))**
  Folds all the elements except the current element.
- **Collapse Child Folds (Ctrl + NumPad- (Command + NumPad- on OS X))**
  Folds the elements indented with one level inside the current element.
- **Expand Child Folds (Ctrl + NumPad+ (Command + NumPad+ on OS X))**
  Unfolds all child elements of the currently selected element.
- **Expand All (Ctrl + NumPad* (Command + NumPad* on OS X))**
  Unfolds all elements in the current document.

**Inspect Styles**

Opens the CSS Inspector view (page 329) that allows you to examine the CSS rules that match the currently selected element.

**Options**

Opens the Author mode options page (page 110).

**DITA Drag/Drop (or Copy/Paste) Actions**
Dragging a file from the Navigator view (page 250) or DITA Maps Manager view (page 2400) and dropping it into a DITA document that is edited in Author mode, creates a link to the dragged file (the `xref` DITA element with the `href` attribute) at the drop location. Copy and paste actions work the same.

You can also drag images or media files from your system explorer or the Navigator view (page 250) and drop them into a DITA document (or copy and paste). This will insert the appropriate element at the drop or paste location (for example, dropping/pasting an image will insert the DITA `image` element with an `href` attribute).

**Tip:** For information about customizing Author mode actions for a particular framework (page 2706) (document type), see the Configuring Actions, Menus, Toolbars, Content Completion for a Framework (page 2038) section.

**Related Information:**
- Configuring Actions, Menus, Toolbars, Content Completion for a Framework (page 2038)

### Working with Markdown Documents in DITA

Oxygen XML Editor plugin includes some unique features that allow you to easily integrate Markdown documents in a DITA project. This is especially helpful for teams that have contributors who are familiar with the Markdown syntax, but they want their output to be generated from DITA projects. The integration between the Markdown editor and DITA includes actions to export or convert Markdown documents to DITA topics and the DITA tab in the Preview pane provides a visualization of how the topic will look after conversion.

**Export Markdown as a DITA Topic**

The Markdown editor includes an option to quickly convert the current Markdown document into a DITA topic. The Export as DITA Topic action is available in the contextual menu.

The conversion creates a new XML file that is defined as a DITA topic and opens it in the Text editing mode. You can then work with the document as you would with any other DITA topic, although you may need to manually correct some issues where the parser could not properly map Markdown syntax to DITA markup.
Working with Markdown Documents in the DITA Maps Manager

Oxygen XML Editor plugin has some specialized features that allow you to integrate Markdown documents directly into your DITA project using the DITA Maps Manager (page 2400). The following features are available for Markdown documents in the DITA Maps Manager view:

- **Insert Reference to Markdown Document** - You can use the New, Reference, and Reference to the currently edited file actions from the Append Child, Insert Before, or Insert After submenu when invoking the contextual menu in the DITA Maps Manager to insert a reference to a Markdown document at the selected location in the map. Markdown documents will be inserted as a topic reference (topicref element) with the format attribute set to markdown.

- **Validate Markdown Documents in DITA Maps** - When you use the Validate and Check for Completeness action from the DITA Maps Manager toolbar to check the integrity of the structure of a DITA map, Markdown documents that are referenced in the DITA map will be converted to DITA topics in the background and validated the same as any other DITA topic.

- **Transforming DITA Maps with Markdown Documents** - When transforming DITA maps that have Markdown documents referenced, the transformation will convert the Markdown documents to normal DITA output without you needing to manually convert the Markdown documents to DITA topics.

- **Manually Convert Markdown Documents to DITA Topics** - If you need to use DITA semantics that are not possible in Markdown syntax (such as content references, related links, and other DITA-specific syntax), you can manually convert the Markdown document into a DITA topic. To do so, right-click the Markdown document in the DITA Maps Manager and select Refactoring > Convert Markdown to DITA Topic. This will open a dialog box that allows you to configure options for converting the document to an XML file that is defined as a DITA topic.

*Figure 740: Convert Markdown to DITA Topic Dialog Box*

This dialog box includes the following options:

- **Destination**
  - The destination path for the new DITA topic.
File Name

Presents the current name and allows you to change it.

Update references

Select this option to update all references of the file in the DITA map and in the files referenced from the DITA map.

Delete Markdown file

If selected, the Markdown version of the file is deleted when the document is converted into a DITA file. If deselected (default value), when the document is converted into a DITA file, the original Markdown file is also preserved in its current location.

Preview

Select this button to display a preview of the changes Oxygen XML Editor plugin is about to make.

Convert

Select this button to perform the conversion. If the Markdown file has format="markdown", it will be converted to a DITA topic. If it has format="mdita", it will be converted to a LightWeight DITA topic.

Tip: Oxygen XML Editor plugin comes with a sample ditamap project for converting Markdown to DITA. Go to the Navigator view (page 250), open the sample.xpr project, and navigate to the dita/markdown-dita folder.

Working with Keys in DITA

DITA uses keys to insert content that may have different values in various circumstances. Keys provide a way to reference something indirectly. This can make it easier to manage and to reuse content in a number of ways.

You can think of keys as like renting a post office box. Instead of the mail going directly from the sender to your house, it now goes to the post office box. You then go to the post office box and bring the mail back to your house. If you move to a new house, your mail still gets to you because it comes to the same post office box. You do not have to send change of address cards to all the people who send you mail. Your mailbox address is the key that makes sure your mail always reaches you, even if you move.

Similarly, if you use keys in your content to reference other content, you do not have to update the source content to change the value of the key or what it points to. You just change the definition of the key.

Defining Keys in DITA Maps

Keys are defined in maps and can then be reused and referenced throughout the whole structure of the map. It is considered best practice to create a separate submap that contains all of the key definitions and reference that submap in the main (root) map (page 2711). This makes it easier to manage since they're all in one location.

There are two types of key definitions that can be created in a map:

- Key with a value inside a keyword. To define this type of key, follow these instructions: Key Definition with a Keyword Value (page 2435).
- Key with a target (for example, to target a resource such as an image or external link). To define this type of key, follow these instructions: Key Definition with a Target (page 2436).

Using Keys for Values

You can use keys to represent values that may vary depending on the type of output. For instance, you may have several products that share a common feature. When you want to describe that feature, you need a way to insert the name of the product, even though that name is different depending on which product the feature description is being used for. For more information, see Working with Variable Text in DITA (page 2557).
Assigning Keys to Topics

You can assign a key to a topic and use that key to reference that topic for various purposes, such as reuse or linking. As always, keys are defined in maps, so the key definition is done using the keys attribute of the `topicref` element:

```
<topicref href="quick-heat.dita" keys="feature.quick-heat"/>
```

The easiest way to assign keys to a topic (and insert the `topicref` element in its DITA map) is to use the Keys tab in the Edit Properties dialog box. In the DITA Maps Manager, invoke the contextual menu on the topic for which you want to assign a key and select Edit Properties. Go to the Keys tab and enter the name of the key in the Define keys field.

Once a key is assigned to a topic, you can use it to reference that topic for various purposes:

- You can create a link (page 2571) to it using `<xref keyref="feature.quick-heat"/>`. This allows you to change the target of the link by changing the topic that is pointed to by the key (for example, by profiling).
- You can use it in a map to create a reference to a topic (page 2419) by key: `<topicref keyref="feature.quick-heat"/>`. This allows you to change which topic is inserted in the map by the build, by changing the topic that is pointed to by the key.
- You can use it to insert a content reference (page 2537). In this case, the content reference uses the key to locate the topic to pull content from. It uses a `conkeyref` attribute: `<procedure conkeyref="feature.quick-heat/preheat-procedure"/>`. In this example, `feature.quick-heat` is the key, and `preheat-procedure` is the ID of a procedure within the topic for that key. Using this mechanism, you could have multiple versions of the preheat procedure in various topics and control which one is inserted by changing the topic that is pointed to by the key.

Assigning Keys to Graphics

You can assign a key to an image (using a map to point to the image file) and then insert the image using the key (page 2471).

Example of a key definition for a targeted image file:

```
<map id="keydefs">
  <!-- product name -->
  <title>Key Definitions</title>
  <keydef keys="imagel" href="../img/imagel.png" format="png"/>
</map>
```
Working with a Glossary of Terms in DITA

There are several ways to manage a Glossary of Terms in DITA, but it is considered best practices to create a separate submap for the glossary and embed that glossary map in the main (root) map (page 2711). The actual glossary terms are small glossary entry topics that are referenced in the glossary map. You can add links to the glossary terms (page 2527) in the output and you can even define abbreviated forms (page 2528) for terms that have an acronym or some other type of abbreviation.

How to Create a Glossary of Terms in Oxygen XML Editor plugin

Even though there are several ways to create a glossary and reference the glossary terms, the following is the recommended approach:

1. Create a new submap (page 2417) for your glossary and embed it in your main map.
2. Create a glossary entry topic ( <glossentry> ) for each glossary term. The <glossentry> element may contain numerous optional glossentry elements, but every glossentry topic must contain a <glossterm> and <glossdef> element. The <glossterm> is the name of the term while the <glossdef> is its definition.

Here is an simple example:

```xml
<glossentry id="ddl">
  <glossterm>Data Definition Language</glossterm>
  <glossdef>A language used for defining database schemas.</glossdef>
</glossentry>
```
The easiest way to create a glossentry topic in Oxygen XML Editor plugin:

a. Click the New file wizard button on the toolbar.
b. Type glossentry in the search field at the top of the dialog box.
c. Select the Glossentry DITA topic type, configure the name and optionally the title, and click Create.

3. Reference each glossary entry topic in your glossary submap using the <glossref> element. This element requires a @keys attribute.

   <glossref keys="gloss_ddl" href="ddl.dita"/>

The easiest way to reference a glossentry in Oxygen XML Editor plugin:

a. With the glossary entry topic opened in the main editor, open the glossary submap in the DITA Maps Manager, right-click the map node and select Append Child > Reference to the currently edited file (if you already have existing glossentry topics, you can right-click the glossentry where you want to insert the new one and select Insert After > Reference to the currently edited file).

   Step Result: This opens the Insert Reference dialog box (page 2426).

b. Go to the Keys tab and enter a name in the Define keys field.
c. Go to the Attributes tab and select Glossary Reference from the Reference type drop-down list at the top of the dialog box.
d. Click Insert and Close.

i Tip: You could also group multiple glossentry topics into a single collection by using the <glossgroup> element.

### How to Create Links to Glossary Terms

To specify that a link is generated in the output from the glossary term to its definition, use the <term> element (or <abbreviated-form> element as described in the next section (page 2528)) with a @keyref attribute that references the corresponding key specified in the <glossref>. Of course, the glossref points to the glossentry topic where the glossary term is defined.

   <term keyref="gloss_ddl"/>

In the output, the text specified in the <glossterm> element is displayed for the glossary term with a link to its glossentry topic that contains its definition.

The easiest way to add a <term> element and reference the glossary term in Oxygen XML Editor plugin:

1. Place the cursor at the location where you want to insert a link to the glossary term.
2. In the DITA Reusable Components view (page 2562), go to the Keys tab and use the search filter field at the top of the view to find the key for the particular glossary term.
3. Right-click the key and select Insert as Keyref > More > Term.

Using Abbreviated Forms (Acronyms) with Glossary Terms

The `<abbreviated-form>` element can be used for glossary terms that you want to appear in an abbreviated form (such as an acronym). Abbreviated forms are expanded to their full form the first time that they appear in a document, and then all subsequent instances will display the short form (or acronym). You would need to define the long and short forms in the `<glossentry>` and then reference it with the `<abbreviated-form>` element (instead of the `<term>` element).

The recommended best practices for defining the long and short forms would be to use a structure similar to this:

```xml
<glossentry id="ddl">
  <glossterm>Data Definition Language</glossterm>
  <glossBody>
    <glossSurfaceForm>Data Definition Language (DDL)</glossSurfaceForm>
    <glossAlt>
      <glossAcronym>DDL</glossAcronym>
    </glossAlt>
  </glossBody>
</glossentry>
```

The long form is declared using the `<glossSurfaceForm>` element while the short form is declared using the `<glossAcronym>` element.

Then you need to reference the glossentry that contains the long and short forms using the `<abbreviated-form>` element:

```xml
<abbreviated-form keyref="gloss_ddl"/>
```

For more information about the recommended best practices for using abbreviations, including information about using multiple languages, see: http://www.oasis-open.org/committees/download.php/29734/AcronymBestPractice_08112008.doc.

Reusing DITA Content

Reusing content is one of the key features of DITA. DITA provides several methods for reusing content. Oxygen XML Editor plugin provides support for each of these methods.

Reusing Topics in DITA Maps

A DITA topic does not belong to any one publication. You add a DITA topic to a publication by referencing it in a map. You can reference the same topic in multiple maps (page 2532).

Reusing Content with References and Keys

DITA allows you to reuse content by referencing it in another topic. DITA provides several mechanisms for including content by reference (page 2534) (conref, conkeyref, coderef). A conref (content reference) (page 2535) creates a direct reference to a specific element of another topic. A conkeyref (content key reference) (page 2537) creates a reference to a key, which then points to a specific element in another topic. The advantage of using a conkeyref is that you can change the element that is included by changing the key reference. For example, since keys are defined in maps, if you include a topic in multiple maps, you can use a different key reference in each map. A coderef references an external file that contains literal code.

Oxygen XML Editor plugin provides support for all of these mechanisms.

While the conref and conkeyref mechanisms can be used to reference any content element, it is considered best practice to only conref or conkeyref content that is specifically set and managed as reusable content. This practice helps reduce expensive errors, such as an author accidentally deleting the source element that other topics are including by conref. Oxygen XML Editor plugin can help you create a reusable component from your current content.

Reusing Content with Reusable Components

DITA allows you to select content in a topic, create a reusable component (page 2554) from it and reference that component in other locations. Each reusable component is created as a separate file. Anytime the content needs to be edited, you only need to update it in the component file and all the locations in your topics that reference it will also be updated. This can help you to maintain continuity and accuracy throughout your documents.
Reusing Content with Variables

DITA allows you to replace the content of certain elements with a value that is pointed to by a key. This mechanism effectively means that you can create variables in your content (page 2557), which you can then create multiple outputs by changing the value that the key points to. This is done by profiling the definition of the key value, or by substituting another map with a different key value.

Reusing Content with DITA 1.3 Concepts

DITA 1.3 allows you to use some advanced concepts to expand content reuse possibilities even further. Key Scopes (or scoped keys) (page 2559) allow you to reuse topics with variable content depending on the particular context and it maximizes reuse possibilities for keys. Branch Filtering (page 2560) allows you to reuse the same content that is profiled in multiple ways within the same publication, each time using a different filter.

DITA Reusable Components View

If you use a large amount of keys or reusable components in your DITA project, the DITA Reusable Components view (page 2562) can be quite helpful. It collects all of the keys and reusable components that are defined in the root map (page 2711) and presents them in a dynamic table where you can easily locate and insert references to them.

Reuse Actions in Oxygen XML Editor plugin

Oxygen XML Editor plugin includes some actions that are specifically designed for DITA reusable content. These actions are available in the contextual menu, the DITA menu, and some are available on the toolbar.

Reuse Content

This action provides a mechanism for reusing content fragments. It opens the Reuse Content dialog box (page 2542) that allows you to insert several types of references to reusable content at the cursor position. The types of references that you can insert using this dialog box include content references (conref) (page 2543), content key references (conkeyref) (page 2545), or key references to metadata (keyref) (page 2548).

Push Current Element

Opens the Push current element dialog box (page 2552) that allows content from a source topic to be inserted into another topic without any special coding in the topic where the content will be re-used.
**Edit Content Reference**

This action is available for elements with a `conref` or `conkeyref` attribute. It opens the **Edit Content Reference** dialog box that allows you to edit the source location (or key) and source element of a content reference (or content key reference), and the reference details (`conref`, `conkeyref`, and `conrefend` attributes). For more information, see **Reuse Content Dialog Box** (page 2542).

**Replace Reference with Content**

Replaces the referenced fragment (`conref` or `conkeyref`) at the cursor position with its content from its source. This action is useful if you want to make changes to the content in the currently edited document without changing the referenced fragment in its source location. If the source content includes references to other topics/resources (`hrefs`), the operation also resolves those references relative to the new location. Attributes are preserved according to the following priority:

1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a `-dita-use-conref-target` value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for `id` attributes.

**Replace All References with Content**

Replaces all referenced fragments (`keyref`, `conref`, or `conkeyref`) in the current document with the content. Attributes are preserved according to the following priority:

1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a `-dita-use-conref-target` value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for `id` attributes.

For `keyrefs` inside `xref` or `link` elements, the `keyref` attribute is changed to an `href` attribute, while the rest of the content for the `keyref` is replaced with its source content.

If the source content includes references to other topics/resources (`hrefs`), the operation also resolves those references relative to the new location.

**Remove Content Reference**

Removes the content reference (`conref` or `conkeyref`) inside the element at the cursor position.

**Create Reusable Component**

Creates a reusable component from the selected fragment of text. For more information, see **Creating a Reusable Content Component** (page 2555).
Insert Reusable Component

Inserts a reusable component at cursor location. For more information, see Inserting a Reusable Content Component (page 2556).

Related Information:

• Working with Keys in DITA (page 2524)

Reusing DITA Topics in Multiple Maps

You can reuse an entire DITA topic simply by referencing it in multiple maps (or multiple locations within the same map (page 2421)) using one of the following procedures:

Reuse Topics Using the DITA Maps Manager

1. Make sure the DITA map (page 2705) is opened in the DITA Maps Manager (page 2400).
2. Add a reference to an existing topic by using one of the following methods (depending on your particular situation):
   a. If the topic already exists in this DITA map, do one of the following:
      • Simply drag the topic and press Ctrl (or Alt on OS X) at the new location within the map (or use the Copy and Paste contextual menu actions).
      • If the topic is the currently opened document in the main editor, determine the new location in the map (in the DITA Maps Manager (page 2400)), right-click a parent or sibling topic, and select Append Child > Reference to the currently edited file or Insert After > Reference to the currently edited file.
   b. If the topic already exists in another DITA map, do one of the following:
      • Open the other map in the DITA Maps Manager (page 2400), right-click the topic, select Copy, switch back to the original DITA map in the DITA Maps Manager, determine the new location in the map, right-click a parent or sibling topic, and use one of the Paste contextual menu actions (Paste, Paste Before, or Paste After).
      • If the topic is the currently opened document in the main editor, determine the new location in the map (in the DITA Maps Manager (page 2400)), right-click a parent or sibling topic, and select Append Child > Reference to the currently edited file or Insert After > Reference to the currently edited file.
   c. If the topic exists in the project, but has not yet been added to a DITA map, do one of the following:
Right-click the topic in the **Navigator view** (page 250) (or the file system), select **Copy**, switch to the **DITA Maps Manager** (page 2400) view, determine the new location in the map, right-click a parent or sibling topic, and use one of the **Paste** contextual menu actions (**Paste**, **Paste Before**, or **Paste After**).

- If the topic is the currently opened document in the main editor, determine the new location in the map (in the **DITA Maps Manager** (page 2400)), right-click a parent or sibling topic, and select **Append Child > Reference to the currently edited file** or **Insert After > Reference to the currently edited file**.

3. If your topic uses a **key reference** (page 2524), set up the appropriate **key definition in your map** (page 2434).

4. If you want to define relationships between topics, other than those defined in the topics themselves, you can **add a relationship table to your map** (page 2578).

5. When you have finished adding topics, check that your map is complete and that all topic links and keys resolve correctly. To do this validation, click the **Validate and Check for Completeness** action (page 2446) on the toolbar in the **DITA Maps Manager**.

### Reuse Topics Using Author Mode Editor

1. **Open the DITA map** (page 2399) in the **Author** mode editor.
2. Add a reference to an existing topic by dragging it from the **Navigator view** (page 250) (or the file system) and dropping it in the desired location in the **DITA map** opened in **Author** mode. You can also accomplish the same thing by using the **Copy** and **Paste** contextual menu actions.

3. If your topic uses a **key reference** (page 2524), set up the appropriate **key definition in your map** (page 2434).

4. If you want to define relationships between topics, other than those defined in the topics themselves, you can **add a relationship table to your map** (page 2578).

5. When you have finished adding topics, check that your map is complete and that all topic links and keys resolve correctly. To do this validation, click the **Validate and Check for Completeness** action (page 2446) on the toolbar in the **DITA Maps Manager**.

### Displaying Multiple References to the Same Topics

Whenever multiple references to the same topic are detected in the context of the current map in the **DITA Maps Manager** (page 2400), an indicator will appear in the top-right corner of the **Author** mode editor that shows the number of times the current topic is referenced in the **DITA map**. It also includes navigation arrows that allow you to jump to the next or previous reference in the **DITA Maps Manager**.
Working with Content References

The DITA `conref` feature (short for content reference) lets you insert a piece of source content by referencing it from its source. When you need to update that content, you only need to do it in one place.

There are several strategies for managing content references:

- **Reusable components** - With this strategy, you create a new file for each piece of content that you want to reuse and you insert references from the content of the reusable component files. For example, suppose that you have a disclaimer that needs to be included in certain sections of your documentation. You can create a reusable component that contains your disclaimer and reuse it as often as you need to. If the disclaimer ever needed to be updated, you only have to edit it in one file.

- **Single-source content references** - You may prefer to keep many pieces of reusable content in one file. For example, you might want to create a single file that contains all the actions that are available in various menus or toolbars for your software application. Then, wherever you need to describe or display an action in your documentation, you can reuse content from that single file by inserting content references. This strategy requires more setup than reusable components, but might make it easier to centrally managing the reused content and it allows for more flexibility in the XML structure of the reusable content.

- **Arbitrary content references** - Although it is not recommended, you can create content references amongst topics without storing the reusable content in components or a single file. This strategy might make it difficult to manage content that is reused and to maintain continuity and accuracy, since you may not have any indication that content you are editing is reused elsewhere.

Oxygen XML Editor plugin creates a reference to the external content by adding a `conref` attribute to an element in the local document. The `conref` attribute defines a link to the referenced content, made up of a path to the file and the topic ID within the file. The path may also reference a specific element ID within the topic. Referenced content is not physically copied to the referencing file. However, by default Oxygen XML Editor plugin displays it in Author mode as if it is there in the referencing file. If you do not want referenced content displayed, open the Preferences dialog box (page 55), go to Editor > Edit modes > Author, and deselect the Display referenced content option (page 111).

⚠️ Note: A reference also displays tracked changes (page 2711) and comments that are included in the source fragment. To edit these comments (or accept/reject changes) right-click the comment or tracked change and select Edit Reference.
**Tip:** To search for references made through a direct content references, use the **Search References** action from the contextual menu.

Related Information:

- Working with Reusable Components (page 2554)
- Working with Keys in DITA (page 2524)
- Working with the Conref Push Mechanism (page 2552)
- DITA Reusable Components View (page 2562)

Creating a DITA Content Reference

**DITA Content Reference**

A DITA content reference, or conref, is one of the main content reuse features of DITA (page 2529). It is a mechanism for re-using the same content in multiple topics (or even in multiple locations within the same topic).

For a conref to be created, the source content must have an id attribute that the conref can reference. Therefore, creating a conref requires that you add an id to the content to be reused before inserting a conref into the topic that reuses the referenced content.

**Assigning an ID to the Referenced Content**

To add an id to a DITA element in a topic, place the cursor on the element and select **Edit Attributes** from the contextual menu to open the in-place attribute editor (page 322). Enter id as the Name of the attribute and a value of your choice in the Value field. You can also use the Attributes view (page 319) to enter a value in the id attribute.

**Note:** The element may already have an id, since in some cases Oxygen XML Editor plugin automatically generates an ID value when the id attribute is created.

**Creating a Content Reference**

To create a content reference (conref), follow these steps:
1. Make sure the element you want to reference has an ID assigned to it (page 2535).
2. In Author mode (page 303), place the cursor at the location where you want the reused content to be inserted.
3. Select the Reuse Content action on the main toolbar (or from the DITA menu or Reuse submenu of the contextual menu). The Reuse Content dialog box (page 2542) is displayed.
4. In the Location field of the Reuse Content dialog box, select the topic that contains the element you want to reference. The elements that you can reference are presented in a table.
5. Select the Target ID of the element (or elements) from which you want to insert the content, and verify the content in the Preview pane. The id value of the element that you select is automatically added to the Reference to (conref) field.
6. Make any other selections you need in the Reuse Content dialog box (page 2542). If you select multiple elements, the Expand to (conrefend) field is automatically filled with the id value of the last element in your selection.
7. Click Insert or Insert and close to create the content reference.

Using Copy/Paste Actions to Create a Content Reference

Oxygen XML Editor plugin also includes support for creating content references with simple copy/paste actions. The copied content must be an entire DITA XML element with an ID attribute. Also, the location in the document where you paste the element must be valid, although as long as the Smart paste and drag and drop option (page 129) is selected in the Schema Aware preferences page, if you try to paste it in an invalid location, Oxygen XML Editor plugin will attempt to place it in a valid location, and may prompt you with one or more choices for where to place it.

To create a content reference (_conref_) using copy/paste actions, follow these steps:

1. Copy an entire DITA element that has an ID attribute assigned to it.
2. Place the cursor at a location where the copied element will be valid.
3. Select the Paste as Content Reference action from the Paste Special submenu from the contextual menu.

Other Ways to Reuse Content

- You can use the Components tab in the DITA Reusable Components view (page 2566) to easily insert content references.
- An alternate way to reuse content is to use the Oxygen XML Editor plugin Create Reusable Component (page 2555) and Insert Reusable Component (page 2556) actions (available in the DITA menu and the Reuse submenu of the contextual menu). They handle the details of creating
an ID and conref and creates reusable component files, separate from your normal content files. This can help you manage your reusable content more effectively.

- You can also insert reusable content using content key references (page 2537). This may also make reusable content easier to manage, depending on your particular situation and needs.
- Other topics in this section include information about more specialized or advanced ways or reusing content, such as code references (page 2551), the conref push mechanism (page 2552), variable text (page 2557), key scopes (page 2559), and branch filtering (page 2560).

- Working with Reusable Components (page 2554)
- Editing DITA Content References (page 2539)
- DITA Reusable Components View (page 2562)
- Creating a DITA Content Key Reference (page 2537)

Creating a DITA Content Key Reference

**DITA Content Key Reference**

A DITA content key reference, or `conkeyref`, is a mechanism for inserting a piece of content from one topic into another. It is a version of the DITA content reference mechanism (page 2535) that uses keys (page 2524) to locate the content to reuse rather than direct references to topics that contain reused content.

As with a conref, a conkeyref requires that the element to be reused has an id attribute. It also requires the topic that contains the reusable content to be assigned a key (page 2524) in a map. As with all uses of keys, you can substitute multiple maps or use profiling (page 2634) to create multiple definitions of keys in a single map. This allows the same conkeyref to pull in content from various sources, depending on how your build is configured. This can make it easier to create and manage sophisticated content reuse scenarios.
Creating a Content Key Reference

To create a content key reference (conkeyref), follow these steps:

1. Make sure the topic that contains the reusable content is assigned a key in the DITA map and the element you want to reference has an ID assigned to it.
2. In Author mode (page 303), place the cursor at the location where you want the reused content to be inserted.
3. Select Reuse Content on the main toolbar (or from the DITA menu or Reuse submenu of the contextual menu). The Reuse Content dialog box (page 2542) is displayed.
4. Select the Key radio button for the content source and use the Choose Key Reference button to select the key for the topic that contains the reusable content (you can also select one from the drop-down list in the Key field). The elements that you can reference from the source are presented in the table in the middle of the Reuse Content dialog box.
5. Select the Target ID of the element (or elements) that you want to insert, and verify the content in the Preview pane. The id value of the element that you select is automatically added to the Reference to (conkeyref) field.
6. Make any other selections you need in the Reuse Content dialog box (page 2545). If you select multiple elements, the Expand to (conrefend) field is automatically filled with the id value of the last element in your selection.
7. Click Insert or Insert and close to create the content reference.

**Note:** If you are using Text mode (page 223), when you insert a conkeyref attribute, after you enter the first quote (conkeyref=”), the Content Completion Assistant will list all the defined keys that you can select from. Also, after you select the key, the Content Completion Assistant will then list the element IDs from the referenced topic, allowing you to insert an anchor. Note that this only works for local files.

Using Copy/Paste Actions to Create a Content Key Reference

Oxygen XML Editor plugin also includes support for creating content key references with simple copy/paste actions. When the DITA content is processed, the key references are resolved using key definitions from DITA maps. The copied content must be an entire DITA XML element with an ID attribute and the topic that contains the reusable content must have a key assigned in a DITA map. Also, the location in the document where you paste the element must be valid, although as long as the Smart paste and drag and drop option (page 129) is selected in the Schema Aware preferences page, if you try to paste it in an invalid location, Oxygen XML Editor plugin will attempt to place it in a valid location, and may prompt you with one or more choices for where to place it.

To create a content key reference (conkeyref) using copy/paste actions, follow these steps:
1. In the DITA Maps Manager view (page 2400), make sure that the Root map combo box (page 2405) points to the correct map that stores the keys.

2. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the DITA Maps Manager (page 2400), select Edit Properties, and enter a value in the Keys field.

3. In a topic with an assigned key, copy an entire DITA element that has an ID attribute assigned to it.

4. Place the cursor at a location where the copied element will be valid.

5. Select the Paste as Content Key Reference action from the Paste Special submenu from the contextual menu.

Other Ways to Reuse Content

• You can use the Components tab in the DITA Reusable Components view (page 2566) to easily insert content key references.

• You can also insert reusable content using content references (conref) (page 2535).

• Other topics in this section include information about more specialized or advanced ways or reusing content, such as code references (page 2551), the conref push mechanism (page 2552), variable text (page 2557), key scopes (page 2559), and branch filtering (page 2560).

Related Information:

• Reuse Content Dialog Box (page 2542)

• Working with Reusable Components (page 2554)

• Editing DITA Content References (page 2539)

• DITA Reusable Components View (page 2562)

• Creating a DITA Content Reference (page 2535)

Editing DITA Content References

Oxygen XML Editor plugin also includes some actions that allows you to quickly edit existing content references. When the element that contains a content reference (conref or conkeyref) is selected, the following actions are available in the DITA menu and the Reuse submenu of the contextual menu:
Edit Content Reference

This action is available for elements with a `conref` or `conkeyref` attribute. It opens the **Edit Content Reference** dialog box that allows you to edit the source location (or key) and source element of a content reference (or content key reference), and the reference details (`conref`/`conkeyref` and `conrefend` attributes). For more information, see Reuse Content Dialog Box (page 2542).

Replace Reference with Content

Replaces the referenced fragment (`conref` or `conkeyref`) at the cursor position with its content from its source. This action is useful if you want to make changes to the content in the currently edited document without changing the referenced fragment in its source location. If the source content includes references to other topics/resources (`hrefs`), the operation also resolves those references relative to the new location.

Attributes are preserved according to the following priority:

1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a `-dita-use-conref-target` value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for `id` attributes.

Replace All References with Content

Replaces all referenced fragments (`keyref`, `conref`, or `conkeyref`) in the current document with the content. Attributes are preserved according to the following priority:

1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a `-dita-use-conref-target` value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for `id` attributes.

For `keyrefs` inside `xref` or `link` elements, the `keyref` attribute is changed to an `href` attribute, while the rest of the content for the `keyref` is replaced with its source content.

If the source content includes references to other topics/resources (`hrefs`), the operation also resolves those references relative to the new location.

Remove Content Reference

Removes the content reference (`conref` or `conkeyref`) inside the element at the cursor position.
Converting Conrefs to Conkeyrefs

Oxygen XML Editor plugin includes a DITA refactoring operation called **Convert conrefs to conkeyrefs** that will find all content references (that reference content outside the current document) and convert them to content key references. You can also use it to quickly convert all content references in the current document or multiple documents at once.

To access the **Convert conrefs to conkeyrefs** operation, use one of the following methods:

**Single Document Method**

With the document opened in the editor, right-click anywhere in the main editing pane (or right-click the topic reference in the DITA Maps Manager (page 2400)), go to the Refactoring submenu, and choose Convert conrefs to conkeyrefs.

**Multiple Documents At Once Method**

Select XML Refactoring from the XML Tools menu (or from the Refactoring submenu when you right-click a document in the Navigator view (page 250) or the DITA Maps Manager view (page 2400)). Then select Convert conrefs to conkeyrefs from the DITA section and click Next.

Either method will proceed to the XML Refactoring Wizard. If you used the Multiple Documents At Once Method (page 2541), the wizard page allows you to choose a scope for the operation and some filtering options:

- **Scope** - Select from a variety of options to define the scope for which resources will be affected by the operation. For example, you can choose to affect all resources in the Project, All opened files, Current DITA map hierarchy, or just the Current file.
- **Filters** section
  - **Include files** - Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as * or ?).
  - **Restrict to known XML file types only** - Excludes non-XML file types from the operation.

If you used the Single Document Method (page 2541), the scope will be the current file so the scope and filtering options are not displayed.

You can then use one of the following buttons to proceed with the operation:

**Preview**

You can use the Preview button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.
Warning: It is always recommended to use the **Preview** button to make sure the operation is not going to do something unexpected and after you click the **Finish** button, any **Undo** action will only revert changes on the current document.

Finish

When you use the **Finish** button, the operation will be processed and all content references will be converted to content key references (either all content references in the current document or all content references in all of the documents specified in the scope). The file name for each converted document is used as the value for its new key. However, the operation does NOT automatically add the key to the DITA Map (page 2705), so you still need to manually define each key in your DITA map (page 2434).

- Creating a DITA Content Reference *(page 2535)*
- Creating a DITA Content Key Reference *(page 2537)*
- Defining Keys in DITA Maps *(page 2434)*

Reuse Content Dialog Box

The **Reuse Content** dialog box provides a mechanism for reusing content fragments. DITA `conref`, `conkeyref`, and `keyref` attributes can be used to insert references to reusable content. The `conref` attribute stores a reference to another element and is processed to replace the referencing element with the referenced element. The `conkeyref` attribute uses `keys (page 2524)` to locate the content to reuse rather than direct references to the topic that contains the reusable content. The `keyref` attribute also uses `keys (page 2524)` and can be used to indirectly reference metadata that may have different values in various circumstances.

**Note:** For a `conref` or `conkeyref`, to reference the content inside a DITA element, the source element must have an `id` attribute assigned to it. The element containing the content reference acts as a placeholder for the referenced element. For more details about DITA `conref` and `conkeyref` attributes, go to [https://www.oxygenxml.com/dita/1.3/specs/archSpec/base/conref.html](https://www.oxygenxml.com/dita/1.3/specs/archSpec/base/conref.html).

**Note:** For the purposes of using a `keyref`, keys are defined at map level and referenced afterwards. For more information about the DITA `keyref` attribute, go to [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/thekeyrefattribute.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/thekeyrefattribute.html).
Oxygen XML Editor plugin displays the referenced content (page 678) of a DITA content reference if it can resolve it to a valid resource. If you use URIs instead of local paths in your XML documents and your DITA OT transformation needs an XML Catalog (page 2712) to map the URIs to local paths, you need to add the catalog to Oxygen XML Editor plugin (page 897). If the URIs can be resolved, the referenced content is displayed in Author mode and in the transformation output.

In Author mode, a references to reusable content (conref, conkeyref, or keyref) can easily be inserted at the cursor position by using the Reuse Content dialog box. It can be opened with any of the following methods:

- Click the Reuse Content action on the main toolbar.
- In the contextual menu of the editing area, go to Reuse > Reuse Content.
- Go to DITA > Reuse Content.

Your selection at the top of the dialog box for choosing the content source determines whether Oxygen XML Editor plugin will insert a conref, conkeyref, or keyref.

If you select Location for the content source, a content reference (conref) will be inserted. If you select Key for the content source, keys will be used to insert a content key reference (conkeyref) or a key reference (keyref).

Content Reference (conref) Options Using the Reuse Content Dialog Box

Figure 741: Reuse Content Dialog Box (with the Default Insert Content Reference Options Displayed)
Choose the content source Section

When **Location** is selected for the content source, a content reference (`conref`) will be inserted. Here you can specify the path of the topic that contains the content you want to reference.

The dialog box offers the following options:

**Select an element from the content source Section**

**Show elements of type**

You can use this drop-down list to select specific types of elements to be displayed in the subsequent table. This can help you narrow down the list of possible source elements that you can select.

**Text Filter Field**

You can also use the text filter field to narrow down the list of possible source elements to be displayed in the subsequent table.
Element Table

Presents all the element IDs defined in the source topic. Use this table to select the **Target ID** of the element that you want to reference. You can select multiple contiguous elements to reference a block of content.

Preview Pane

Displays the content that will be references. If you select multiple elements in the element table, the content from all the selected elements is displayed.

Source Pane

Displays the source code of the element to be referenced.

Reference details Section

Reference to (conref)

Oxygen XML Editor plugin automatically fills this text field with the value of the `conref` attribute to be inserted. However, you can edit this value if need be.

Reference to range end (conrefend)

If you select multiple elements (of the same type) in the element table, Oxygen XML Editor plugin automatically fills this text field with the `id` value of the last element in your selection. This value will be inserted as a `conrefend` attribute, defining the end of the `conref` range.

Content Key Reference (conkeyref) Options Using the Reuse Content Dialog Box

*Figure 742: Insert Content Key Reference Options*
Choose the content source Section

When **Key** is selected for the content source, you can use keys to reference content. You can use the **Choose Key Reference** button to open the **Choose Key** dialog box that allows you to select one from a list of all the keys that are gathered from the root map (page 2711) (you can also select one from the drop-down list in the **Key** field).

**Note:** If the current DITA map is not selected as the root map, no keys will be listed.

**Tip:** You can also use the DITA Reusable Components view (page 2562) for similar purposes.

*Figure 743: Choose Key Dialog Box*
The **Choose Key** dialog box includes the following:

- **Change Root Map** - Opens a small dialog box that allows you to select a root map (page 2416).
- **Search Filter** - You can enter text in the filter field at the top of the dialog box to filter the list and search for a specific key.
- **Sortable Columns** - The dialog box includes the following columns that can be sorted by clicking on the heading:
  - **Key** - The name of the key (the value of the `keys` attribute).
  - **Description** - The description of the key that is obtained from its definition. Keys that are defined with a text value in the `navtitle` or `keyword` element have that value listed in this column.
  - **Href** - Keys that are defined with a value in an `href` attribute have that href value listed in this column.
  - **Definition Location** - The name of the DITA map (page 2705) where the key is defined.
- **Group by Definition Location** - A contextual menu action that can be used to group (and sort) all the keys based upon the value in the **Definition Location** column.

To insert a content key reference (`conkeyref`), select the key that contains the content you want to reference. Notice that the file path is shown in the **Href** column. Keys that do not have a value in the **Href** column are for referencing metadata with a `keyref` attribute. Therefore, to insert a `conkeyref`, you need to select a key that does have a value (file path) in the **Href** column.

After you select a key, click **OK** to return to the **Reuse Content** dialog box.

When a key that is defined as a content key reference has been selected, the **Reuse Content** dialog box offers the following additional options for inserting a `conkeyref`:

- **Select an element from the content source Section**
  - **Show elements of type**
You can use this drop-down list to select specific types of elements to be displayed in the subsequent table. This can help you narrow down the list of possible source elements that you can select.

**Text Filter Field**

You can also use the text filter field to narrow down the list of possible source elements to be displayed in the subsequent table.

**Element Table**

Presents all the element IDs defined in the source topic. Use this table to select the **Target ID** of the element that you want to reference. You can select multiple contiguous elements to reference a block of content.

**Preview Pane**

Displays the content that will be references. If you select multiple elements in the element table, the content from all the selected elements is displayed.

**Source Pane**

Displays the source code of the element to be referenced.

**Reference details Section**

**Reference type**

The type of reference that will be inserted. If you selected a key that references a DITA resource, you will notice that **conkeyref** value is automatically selected.

**Reference to**

Oxygen XML Editor plugin automatically fills this text field with the value of the **conkeyref** attribute to be inserted. However, you can edit this value if need be.

**Fallback to (conref)**

You can select this option to define a **conref** attribute to be used as a fallback to determine the content reference relationship if the specified **conkeyref** cannot be resolved.

**Reference to range end (conrefend)**

If you select multiple elements (of the same type) in the element table, Oxygen XML Editor plugin automatically fills this text field with the **id** value of the last element in your selection. This value will be inserted as a **conrefend** attribute, defining the end of the **conkeyref** range.
Key Reference to Metadata (keyref) Options Using the Reuse Content Dialog Box

Figure 744: Insert Key Reference Options

Choose the content source Section

When Key is selected for the content source, you can use keys to reference content. You can use the Choose Key Reference button to open the Choose Key dialog box that allows you to select one from a list of all the keys that are gathered from the root map (page 2711) (you can also select one from the drop-down list in the Key field).

Note: If the current DITA map is not selected as the root map, no keys will be listed.

Tip: You can also use the DITA Reusable Components view (page 2562) for similar purposes.

Figure 745: Choose Key Dialog Box
The Choose Key dialog box includes the following:

- **Change Root Map** - Opens a small dialog box that allows you to select a root map (page 2416).
- **Search Filter** - You can enter text in the filter field at the top of the dialog box to filter the list and search for a specific key.
- **Sortable Columns** - The dialog box includes the following columns that can be sorted by clicking on the heading:
  - **Key** - The name of the key (the value of the keys attribute).
  - **Description** - The description of the key that is obtained from its definition. Keys that are defined with a text value in the navtitle or keyword element have that value listed in this column.
  - **Href** - Keys that are defined with a value in an href attribute have that href value listed in this column.
  - **Definition Location** - The name of the DITA map (page 2705) where the key is defined.
- **Group by Definition Location** - A contextual menu action that can be used to group (and sort) all the keys based upon the value in the Definition Location column.

To insert a key reference to metadata (keyref), select the key you want to reference. Keys that do not have a value in the Href column are for referencing metadata with a keyref attribute. Therefore, to insert a keyref, you need to select a key that does not have a value (file path) in the Href column.

After you select a key, click OK to return to the Reuse Content dialog box.

When a key that references metadata has been selected, the Reuse Content dialog box offers the following additional options for inserting a keyref:

**Select an element from the content source Section**

This section is not used when referencing metadata.

**Reference details Section**
Reference type

The type of reference that will be inserted. If you selected a key that does not reference a DITA resource, you will notice that keyref value is automatically selected.

Reference to

Oxygen XML Editor plugin automatically fills this text field with the value of the keyref attribute to be inserted.

Element name

Oxygen XML Editor plugin automatically selects the element that is most commonly used for the selected type of key reference, but you can use the drop-down list to choose another element to use for the reference.

Finalizing Your Content Reference Configuration

Once you click Insert or Insert and close, the configured content reference is inserted into your document.

Tip: You can easily insert multiple content references by keeping the Reuse Content dialog box opened, using the Insert button.

Working with Code References

Code References

The DITA coderef element can be used to reference an external file that contains literal code. This is especially useful if you need to reference code from an external source that may occasionally change. Another advantage is that you don't have to convert illegal characters into their character equivalents. When the coderef is processed, the referenced code file is imported and delimiting characters (such as < or >) are displayed as standard text, rather than treated as XML markup.

For more information about code references, see DITA 1.3 Specification: Coderef.

Example of using a Coderef

<p>This code is an example of how to use a coderef.</p>
<codeblock><coderef href="MyExternalCode.xsl"/></codeblock>
Defining Line Ranges

DITA-OT provides additional code reference processing support that allows you to define line ranges in case you only want to reference certain parts of the external file, rather than the whole file.

For information and examples of how to define line ranges, see DITA Open Toolkit Documentation: Extended Code Reference Processing.

Working with the Conref Push Mechanism

Content Reference Push Mechanism

The usual method of using content references pulls element content from a source element and inserts it in the current topic. DITA 1.2 introduced an alternative method of content referencing, allowing element content to be pushed, or injected, from a source topic to another topic without any special coding in the topic where the content will be re-used. This technique is known as a content reference push mechanism (conref push).

The conref push mechanism requires elements in the target topic (the topic where the content is to be pushed) to have ID elements, as the push mechanism inserts elements before or after a named element, or replaces the named element. Assuming the source topic is included in the DITA map (page 2705), the conref push will be processed during publishing stage for the DITA map.

Example of a Conref Push Scenario

An example of a scenario in which a conref push would be useful is where a car manufacturer produces driver manuals that are distributed to various regions with their own specific regulations and certain sections need to be customized by the local car dealers before publishing. The local dealer could use a conref push technique to insert specific content without modifying the manufacturer-supplied content.

Push Current Element Action

Oxygen XML Editor plugin includes an action that allows you to easily reference content with a conref push mechanism. The Push Current Element action is available in the DITA menu and in the Reuse subfolder of the contextual menu when editing in Author mode. Selecting this action opens the Push current element dialog box that allows you to select a target resource and element, and where to insert the current element content.

Figure 746: Push Current Element Dialog Box
This dialog box allows you to configure the following options for the conref push action:

**Choose the target resource**

Allows you to select a Location URL or a Key for the target resource and the table in the next section of the dialog box will be populated using the information from the specified resource.

**Select the target element**

The table in this section contains the available elements (identified by their ID) that belong to the same class as the current element on which the action was invoked.

**Push action**

Allows you to choose one of the following options for where you want to insert the current element content:

- **replace the target element**
  
  The target element will be replaced with the current element content.  
  
  On the technical side, the value of the conaction attribute in the current element will be set to pushreplace and the conref or conkeyref attribute will be set to the specified reference.

- **push before**
  
  The current element content will be inserted before the specified target element in the target resource.
On the technical side, the value of the `conaction` attribute in the current element will be set to `pushbefore`. Another element with the same name and class as the target element will be inserted in the document after the current element. The new element will have the `conaction` attribute set to `mark` and the `conref` or `conkeyref` attribute will be set to the specified reference.

**push after**

The current element content will be inserted after the specified target element in the target resource.

On the technical side, the value of the `conaction` attribute in the current element will be set to `pushafter`. Another element with the same name and class as the target element will be inserted in the document before the current element. The new element will have the `conaction` attribute set to `mark` and the `conref` or `conkeyref` attribute will be set to the specified reference.

You can also use the **Preview** panel to view the content that will be pushed and the **Source** panel to see the XML code for the content to be pushed. After you click **OK**, the `conref push` mechanism is inserted in the current document. The changes in the target resource will be processed when you transform the **DITA map**.

**Related Information:**

- For more technical details about the `conref push` mechanism, refer to “The Conref Push Technique” section of The DITA Style Guide Best Practices for Authors.

**Working with Reusable Components**

In DITA, the content of almost any element can be made reusable simply by adding an `id` attribute to the element. The DITA content reference mechanism can reuse any element with an `ID`. However, it is not considered best practice to arbitrarily reuse pieces of text from random topics due to the difficulties this creates in trying to manage it. It also creates the possibility of authors deleting or changing content that is reused in other topics without being aware that the content is reused.

To prevent these types of problems, you can create reusable components to manage a separate set of topics that contain topics designed specifically for reuse. Then, all of your reusable content can be
referenced from the reusable components and if the content needs to be updated you only need to edit it in one place.

Oxygen XML Editor plugin allows you to select content in a topic, create a reusable component from it and reference that component in other locations by using the Create Reusable Component and Insert Reusable Component actions.

Related Information:

- DITA Reusable Components View (page 2562)

Creating a Reusable Content Component

Oxygen XML Editor plugin makes it easy to create reusable content components from existing topic content.

Note: To ensure that the topic file that contains the reusable component is a valid container for just the reusable content component, without having to include the other elements required by a standard topic type, Oxygen XML Editor plugin creates a specialized topic type on the fly. This specialization is designed to make sure that the content is compatible with the topic type from which it is created.

Follow these steps to create a reusable component:

1. In Author mode, select the content you want to make into a reusable component.

2. Select the Create Reusable Component action that is available in the DITA menu or the Reuse submenu of the contextual menu.
   The Create Reusable Component dialog box is displayed.

3. Use the Reuse Content drop-down list to select the scope of the content to be made reusable. It allows you to select how much of the current content you want to make reusable. The choices presented include the element at the current cursor position and its ancestor elements.

4. Add a description. This becomes the title of the topic that contains the reusable component, but is not part of the reusable content. It is just to help you identify the reusable content and will not become part of your output.

5. If you want to replace the extracted content with a reference to the new component you should leave the Replace selection with content reference option selected. This is recommended, since the point of reuse is to maintain only one copy of the content.
6. Select a file name and location to save the topic containing the reusable component and click **Save**. It is considered best practice to save or store reusable components in an area set aside for that purpose.

If the **Replace selection with content reference** option was selected, Oxygen XML Editor plugin replaces the current content with a `conref` attribute. The content of the content reference will be displayed in your current topic with a gray background, but it will no longer be editable since it is stored in a separate file. To edit the source of the reusable component, click the edit content icon at the beginning of the inserted content.

You now have a reusable component that you can include in other topics by using the **Insert Reusable Component** action that is available in the **DITA** menu or the **Reuse** submenu of the contextual menu. You can also reference this new reusable component by using a content reference (page 2535) or content key reference (page 2537).

Inserting a Reusable Content Component

Oxygen XML Editor plugin includes an **Insert Reusable Content** action that allows you to easily insert a reusable content component that you created using the Create Reusable Component action (page 2555).

⚠️ **CAUTION:** This action is only designed to insert reusable components created using the Oxygen XML Editor plugin Create Reusable Component action. It assumes certain things about the structure of the reusable content file that may not be true of reusable content created by other methods and it may not provide the expected results if used with content that does not have the same structure.

The **Insert Reusable Content** action creates a DITA `conref` to insert the content, and creates a parent element for the `conref` attribute based on the type of the reusable element in the reusable component file. This action ensures that the correct element is used to create the `conref`. However, that element must still be inserted at a point in the current topic where that element type is permitted.

To insert a reusable component that was created using the Create Reusable Component action, follow these steps:

1. Place the cursor at the insertion point where you want the reusable component to be inserted.

2. Select the **Insert Reusable Component** action that is available in the **DITA** menu or the **Reuse** submenu of the contextual menu.

   The **Insert Reusable Component** dialog box is displayed.

3. Locate the reusable content file in which you want to insert its content.
4. If you select **Content reference** in the **Insert as** drop-down list, the action will add a `conref` attribute to the DITA element at the current location. If you select **Copy** in the drop-down list, the content of the reusable component file will simply be pasted at the current location (assuming the content is valid at the current location).

5. Click **Insert** to perform the action.

---

## Working with Variable Text in DITA

You may often find that you want a certain piece of text in a topic to have a different value in various circumstances. For example, if you are reusing a topic about a feature that is shared between several products, you might want to make the name of the product a variable so that the correct product name is used in the manual for each product.

For example, you might have a sentence like this:

The quick-heat feature allows \[product-name\] to come up to temperature quickly.

You need a way to substitute the correct product name for each product.

One way to do this would be to use conditional profiling to provide conditional values using the `product` profiling attribute, as in the following example:

```xml
<p>The quick-heat feature allows <ph product="basic">Basic Widget</ph> to come up to temperature quickly.</p>
```

However, this approach means that you are repeating the product names over and over again everywhere the product name is mentioned. This is time consuming for authors and will create a maintenance problem if the product names change.

The alternative is to use a key reference, as in the following example:

```xml
<p>The quick-heat feature allows <ph keyref="product"/> to come up to temperature quickly.</p>
```

The definition of the key reference determines the name of the product:

```xml
<keydef keys="product" product="basic">
  <topicmeta>
    <keywords>
      <keyword>Basic Widget</keyword>
    </keywords>
  </topicmeta>
</keydef>
```
When the content is published, the value defined in the `product` key will be inserted for each product.

### Inserting a Keyref

To insert a defined key reference (page 2434) into a document in Oxygen XML Editor plugin Author mode, use one of the following methods (the method you choose simply depends on which Oxygen XML Editor plugin feature you prefer):

- **DITA Reusable Components View Method**

  Use the DITA Reusable Components view (page 2562) to insert a variable reference to the defined key (page 2434). For example, in the Keys tab, find a key defined as a variable and double-click it. Oxygen XML Editor plugin will insert the variable as a `<ph>` element with a `@keyref` attribute that references the specified key.

- **Code Template Method**

  Add the source code pattern of the defined key (page 2434) to a code template (page 150) so that it appears in the list of proposals in the Content Completion Assistant (page 2704). For example, the code pattern could be something like `<ph keyref="product"/>` for defined `product` key.

- **Reuse Content Dialog Box Method**

  Use the Reuse Content action on the main toolbar to open the Reuse Content dialog box (page 2542). Use the Key option to select a key that is defined as a variable (key reference to metadata) (page 2548) and Oxygen XML Editor plugin will insert the variable as a `<ph>` element with a `@keyref` attribute that references the specified key.

- **Manual Method**

  Manually insert the `keyref` attribute using the attributes editor as follows:
1. Press **Enter** and select a DITA element (for example, `<ph>`) that supports the `keyref` attribute.
2. Select **Edit Attributes** from the contextual menu to bring up the attributes editor *(page 322)*.
3. In the **Name** field, select `keyref`.
4. In the **Value** field, select or enter the name of the defined key *(page 2434)*.

---

**Working with DITA 1.3 Key Scopes**

DITA 1.3 includes the possibility of using a concept called *Key Scopes* (or scoped keys). It allows you to reuse a topic in multiple places within the same DITA map *(page 2705)*, but with slightly different content in each instance.

**Key Scopes Use-Case**

Suppose that you develop a software product and you have a topic in your user guide that explains how to install your product on a Windows operating system. Suppose that the steps are exactly the same for installing it on Linux and the only difference is the name of the operating system. Therefore, it would be helpful if you could reuse the exact same content in two different topics, but with the name of the operating system different in each instance. In DITA 1.2, this is not possible since keys can only be resolved to a single value. However, with the DITA 1.3 *Key Scopes* mechanism, you can define multiple values for the same key depending on the context.

**How to Use Key Scopes in Oxygen XML Editor plugin**

To use DITA 1.3 key scopes in Oxygen XML Editor plugin, follow these steps:

1. **Define the keys** *(page 2524)* to be used in multiple places within your DITA map.
2. For each particular topic that contains the keys, define the key scopes:
   a. Right-click the topic in the **DITA Maps Manager** *(page 2400)* and select **Edit properties**.
   b. In the **Keys tab** *(page 2438)*, enter a value (or multiple values) in the **Key scopes** field.
   c. Click **OK** to save your changes.
3. Save the *DITA map*.

**Result:** In the *DITA Maps Manager* (page 2400), you can now see the key scopes in brackets and when you open each topic reference.

*Figure 747: Key Scopes in DITA Maps Manager*

The content will also be expanded in **Author** mode according to the context of the key scope you defined for that particular topic. Also, when you transform the *DITA map*, the scoped keys will be reflected in the published content.

**Resources**

- You can find a more detailed example and download samples for reuse possibilities based on key scopes in the *DITA 1.3 Key Scopes - Next Generation of Reuse* blog post.
- You can also watch our *DITA 1.3 video tutorial* to see how key scopes can be used in Oxygen XML Editor plugin.

**Related Information:**

- Working with DITA 1.3 Branch Filtering (page 2560)
- Oxygen XML Blog: DITA 1.3 Key Scopes - Next Generation of Reuse
- Oxygen Video Tutorial: DITA 1.3 (Key Scopes, Branch Filtering)

**Working with DITA 1.3 Branch Filtering**

DITA 1.3 allows you to use a mechanism called *Branch Filtering* that enables you to set filtering conditions for specific branches of a *DITA map* (page 2705). This makes it possible for multiple conditional profiles to be applied within a single publication, each time with a different filter.
Branch Filtering Use-Case

Suppose that you sell two models of a mobile phone and you need to create a brochure for each model. You want both brochures to have the same structure and most of the content is the same for both brochures. The only differences are in the values for certain details (for example, the model name, size dimensions, battery life, etc.) Therefore, it would be helpful if you could use the same topic and reference it twice in the same map, with each reference using different filtering conditions. In DITA 1.2, this is not possible since you can only apply one DITAVAL filter to a map. However, with the DITA 1.3 Branch Filtering mechanism, you can reuse content multiple times within the same map, each time using different filters.

How to Use Branch Filtering in Oxygen XML Editor plugin

To use DITA 1.3 branch filtering in Oxygen XML Editor plugin, follow these steps:

1. The support for DITA 1.3 must be enabled in the DITA preferences page (page 66).
2. Assuming you have already defined your profiling attributes (page 747), create a DITAVAL filter file (page 2658).
3. Insert a reference to the DITAVAL filter file in the DITA map:
   a. Right-click the DITA map reference in the DITA Maps Manager (page 2400) and select Append Child > DITAVAL Reference.
   b. Select the DITAVAL file.
   c. Click Insert and Close.
4. Save the DITA map.

Result: You can now see the ditaval files referenced in the DITA Maps Manager (page 2400) and when you transform the DITA map, filtered content will be reflected in the published output.

![Branch Filtering in DITA Maps Manager](image)

DITA Reusable Components View

The **DITA Reusable Components** view is helpful if you use a large amount of keys or reusable components in your DITA project. It collects all of the keys and reusable components that are defined in the *root map* *(page 2711)* and presents them in a side view where you can easily locate and insert references to them. It re-collects the keys anytime the *root map* is changed *(page 2416)* or you switch the editor focus to a different file.

If the view is not displayed, it can be opened by selecting it from **Window > Show View > Other**. By default, it will appear in the bottom-right section of the editor.

It includes two tabs:

- **Keys** *(page 2563)* - Displays all the keys that are defined in the *root map* *(page 2711)* and provides ways to easily insert references to them as cross reference links, key references, or variables. It includes a search field, some filtering and sorting options to help you find particular keys, and some contextual menu actions. It also supports drag and drop actions and double-clicking a key is the fastest way to insert a reference.
- **Components** *(page 2566)* - Displays all the reusable components found in the *root map* *(page 2711)* and provides ways to easily insert them as content references or content key references. To determine which components to display in this tab, Oxygen XML Editor plugin looks for any `topicref` in the *root map* *(page 2711)* that is marked as `resource-only` and then looks for elements with an assigned `@id` attribute value. This tab includes a search field, some filtering options, and
some simple links and contextual menu actions to quickly insert references or open their source file. It also supports drag and drop and double-clicking actions.

**Keys Tab**

The **DITA Reusable Components** view collects all the keys that are defined in the current root map *(page 2711)* and displays them in the **Keys** tab. This tab has two view modes. The default *tiles* style view mode and a *table* style view mode.

**Tiles Mode**

The default *tiles* mode displays the keys as blocks (cards). The advantage of this display mode is that more information about each particular key can be seen even when the view is sized with a small width. Each block (card) displays the name of the key (the value of the *keys* attribute), followed by its description and/or *href* value, followed by the name of the DITA map file where the key is defined.

*Figure 749: DITA Reusable Components View - Keys Tab (Default tiles mode)*

**Table Mode**

You can switch to a *table* style display mode by selecting the **Table mode** toggle action from the *Settings* menu. The advantage of this display mode is that more keys can be listed at once. In this mode, keys that are defined with a text value in the *navtitle* or *keyword* element have that value listed in the **Description** column, while keys that are defined with a value in an *href* attribute have that href value listed in the **Href** column.

*Figure 750: DITA Reusable Components View - Keys Tab (Table mode)*
Both display modes in the **Keys** tab include a variety of features and options:

**Search Filter**

You can enter text in the filter field at the top of this tab to filter the list and search for specific keys.

**Sorting**

**Tiles Mode:** In the default tiles display mode, to sort the keys alphabetically in ascending order, select **Sort by key name** from the Settings menu.

**Table Mode:** In the table display mode, the following columns can be sorted by clicking on the heading:

- **Key** - The name of the key (the value of the **keys** attribute).
- **Description** - The description of the key that is obtained from its definition. Keys that are defined with a text value in the **navtitle** or **keyword** element have that value listed in this column.
- **Href** - Keys that are defined with a value in an **href** attribute have that href value listed in this column.
- **Definition Location** - The name of the DITA map (page 2705) where the key is defined.

**Double-Click Mechanism**

You can double-click any key listed in this tab to insert a key reference at the current cursor position or surrounding the current selection.

- If the selected key points to an **href** value, it is inserted as a cross reference link (**xref**) (page 2571).
- If the selected key is a reference to an image, it is inserted as an **image** element.
- If the selected key does not have an associated **href**, it is inserted as a variable reference (**ph**) (page 2557).
Drag and Drop Mechanism

You can drag a key from this tab and drop it in the main editor to insert a key reference at the current cursor position.

• If the selected key points to an `href` value, it is inserted as a cross reference link (`xref`) (page 2571).
• If the selected key is a reference to an image, it is inserted as an `image` element.
• If the selected key does not have an associated `href`, it is inserted as a variable reference (`ph`) (page 2557).

Contextual Menu Actions

Insert as Link

Inserts a cross reference link (`xref`) (page 2571) to the selected key at the current cursor position or surrounding the current selection.

Insert as Variable

Inserts a variable reference (`ph`) (page 2557) to the selected key at the current cursor position or surrounding the current selection. However, if the selected key is a reference to an image, this action inserts the key reference in an `image` element.

Insert as Keyref

Presents a submenu with all the elements that can be inserted at the current cursor position. Selecting an element will insert that element at the current cursor position or surrounding the current selection with a `keyref` attribute and its value set to the selected key.

Rename Key

Opens a refactoring wizard (page 916) where you can easily rename the key and define the scope of the operation. It also updates all references to it.

Notes:

• This action does not work on DITA 1.3 key scopes.
• This action is only available if the DITA map opened in the DITA Maps Manager is also selected as the Root map.

Go to Definition

Opens the DITA map where the key is defined.
Search References

Searches for all references to the selected key in the entire DITA map structure.

Group by Definition Location (Available in Table mode only)

A toggle action that can be used to group (and sort) all the keys based upon the value in the Definition Location column.

Settings Menu

This menu includes the following options:

Filtering Options

- **Show all** - Shows all defined keys found in the current root map (page 2711).
- **Show only variables** - Filters the keys to show only those defined as variable references (page 2557).
- **Show only maps and topics** - Filters the keys to show only those that reference DITA maps or topics.
- **Show only multimedia resources** - Filters the keys to show only those that reference multimedia resources (such as images).
- **Show only external resources** - Filters the keys to show only those that reference external resources (such as web links).

Sort by key name (Available in Tiles mode only)

Sorts the keys alphabetically in ascending order.

Table mode

A toggle action that switches between the table and tiles display modes.

Components Tab

The DITA Reusable Components view collects all the topics from the current root map (page 2711) that are marked as resource-only, then collects the reusable components from those topics, and displays them in the Components tab. To set a topic as resource-only, the topicref in the DITA map file needs to have a processing-role attribute set like this:

```xml
<topicref href="topics/randomize-xml-content.dita" processing-role="resource-only"/>
```

The DITA Reusable Components view considers topic references that contain processing-role="resource-only" to be candidates to contain reusable components. The reusable components inside these topics are collected from all elements that have an ID specified. These reusable
Components are displayed in the **Components** tab along with the file name and the specific names of the elements that contain an *ID* attribute.

*Figure 751: DITA Reusable Components View - Components Tab*

The **Components** tab includes the following features and options:

**Search Filter**

You can enter text in the filter field at the top of this tab to filter the list and search for specific content inside the list of reusable components. This field supports many of the Lucene-based search patterns, such as wildcards (*, ?), boolean operators (AND, OR, NOT), fuzzy searches (~), boosting searches (^), and more.

**Settings Menu**

This menu includes the following options:

**Compact Mode**

You can use this toggle action to switch the display for the **Components** tab to a compact visualization mode. When switched to **Compact mode**, fewer details are shown for each component, but more components are displayed in the view.

**Reindex**

You can use this action force a re-indexing of the reusable components.
Show Elements of Type

You can use this drop-down list to select specific types of elements to be displayed in the list of components. This can help you narrow down the list of possible source elements that you can select.

Source File(s)

You can use this combo box to search for specific source files (the topics that contain reusable components) or select a file from its drop-down list. You can also use wildcards (such as * or ? ) in this field.

Double-Click Mechanism

You can double-click any reusable component listed in preview window in this tab to insert it as a content reference or content key reference at the current cursor position or replace the current selection.

• If the parent topic of the selected component has a key defined, it is inserted as a content key reference (conkeyref) (page 2537).
• If the parent topic of the selected component does not have a key defined, it is inserted as a content reference (conref) (page 2535).

Drag and Drop Mechanism

You can drag a reusable component from the preview window in this tab and drop it in the main editor to insert a content reference or content key reference at the current cursor position.

• If the parent topic of the selected component has a key defined, it is inserted as a content key reference (conkeyref) (page 2537).
• If the parent topic of the selected component does not have a key defined, it is inserted as a content reference (conref) (page 2535).

Hover and Click Actions

If you hover over a component shown in the preview window, you have access to the following link actions:

Insert

Inserts the component as a content reference or content key reference at the current cursor position or replaces the current selection. If the parent topic has a key defined, it is inserted as a content key reference (conkeyref) (page 2537). Otherwise, it is inserted as a content reference (conref) (page 2535).
Open

Opens the source file that contains the reusable component.

Contextual Menu Actions

Insert Content Reference

Inserts the component as a content reference (conref) (page 2535) at the current cursor position or replaces the current selection.

Insert Content Key Reference

Inserts the component as a content key reference (conkeyref) (page 2537) at the current cursor position or replaces the current selection. This action is only available if the parent topic has a key defined.

Go to Definition

Opens the source file that contains the reusable component.

Search References

Searches for all references to the selected component in the entire DITA map (page 2705) structure.

Linking in DITA
DITA provides support for various types of linking between topics, some of which is automated, while others are specified by the author. Oxygen XML Editor plugin provides support for all forms of linking in DITA.

**Linking Between Parent, Child, and Sibling Topics**

A DITA map (page 2705) creates a hierarchical relationship between topics. That relationship map expresses a narrative flow from one topic to another, or it may be used as a classification system to help the reader find topics based on their classification, without creating a narrative flow. Since there may be various types of relationships between topics in a hierarchy, you may want to create links between topics in a variety of ways. For instance, if your topics are supposed to be organized into a narrative flow, you may want to have links to the next and previous topics in that flow. If your topics are part of a hierarchical classification, you may want links from parent to child topics, and vice versa, but not to the next and previous topics.

Parent, child, and sibling links are created automatically by the DITA output transformations (and may differ between various output formats). The kinds of links that are created are determined by the DITA collection-type attribute (page 2441).

**In-Line Linking in the Content of a Topic**

DITA supports linking within the text of a topic using the `xref` element. The destination of the link can be expressed directly using the `href` attribute or indirectly using the `keyref` attribute. If you use the `keyref` attribute, you link to a key rather than directly to a topic. That key is then assigned to a topic in a map that includes that topic. This means that you can change the destination that a key points to by editing the key definition in the map or by substituting another map in the build.

**Linking Between Related Topics**

In addition to the relationships between topics that expressed by their place in the hierarchy of a map, a topic may be related to other topics in various ways. For instance, a task topic may be related to a concept topic that gives the background of the task, or to a reference topic that provides data needed to complete the task. Task topics may also be related to other tasks in a related area, or concepts to related concepts.

Typically, they are grouped in a list at the end of the topic, although this depends on the behavior of the output transformation. DITA provides two mechanisms for expressing relationships between topics at the topic level: the Related Links section of a topic and relationship tables in maps.
Managing Links

Links can break for a variety of reasons. The topic that a link points to may be renamed or removed. A topic may be used in a map that does not include a linked topic. A topic or a key may not exist in a map when a particular profile is applied. The DITA Maps Manager (page 2400) provides a way to validate all the links in the documents that are included in the map (page 2446). This can include validating all the profiling conditions that are applied.

Hierarchical Linking in DITA Maps

To create hierarchical linking between the topics in a DITA map (page 2705), you set the appropriate value of the collection-type attribute on the map. See the DITA documentation for the meaning of each of the values of the collection-type attribute.

Note: Publishing scripts determine when and how to create hierarchical links. The collection-type attribute does not force a particular style of linking. Instead, it declares what the nature of the relationship is between the topics. The publishing scripts use that information to determine how to link topics. Scripts for different types of media might make the determination depending on what is appropriate for the particular type of media. You can provide additional instructions to the scripts using the linking attribute.

To add the collection-type to an item in a map:

1. Right-click the topic and choose Edit Properties. The Edit Properties dialog box is displayed.
2. In the Attributes tab, select the appropriate value from the Collection type drop-down list.
3. You can use the Other attributes table to add a value to the linking attribute.

Linking in DITA Topics

Direct Links

Inline links can be created DITA topics using the xref element. The destination of the link can be expressed directly by using the href attribute and the target can be another topic or a specific element within the other topic, another location within the same topic, a file, or a web link. You can also create direct related links to topics, files, or websites in a DITA topic using the related-links element.
Indirect Links Using Keys

The destination of the link can also be expressed indirectly by using keys (page 2524) to create either inline links or related links (with the keyref attribute). By using keys, you avoid creating a direct dependency between topics. This makes links easier to manage and can make it easier to reuse topics in various publications. It can also be helpful in verifying the completeness of a publication, by ensuring that a publication map provides a key definition for every key reference used in the content.

Links based on keys require two pieces:

- Key Definition - Assigns a key to a topic so that other topics can link to it. For more information, see Defining Keys in DITA Maps (page 2434).
- Key Reference - Created in an xref element and specifies the key to link to.

The key reference points to a key definition, and the key definition points to a topic. Key definitions are created in maps, as an element on the topicref element that points to a topic. This allows you to assign a particular key to one topic in one map and to another topic in another map. When a topic that links to that key is used in each of these maps, the links work correctly in both maps.

Inserting a Link in Oxygen XML Editor plugin

To insert a link in Author mode (page 303), use the actions available in the Link drop-down menu from the toolbar (or the Link submenu in the contextual menu or DITA menu). You can choose between the following types of inline links:

**Cross Reference**

Opens the Cross Reference (xref) dialog box (page 2574) that allows you to insert a cross reference link to a target DITA resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. Once the target resource has been selected, you can also target specific elements within that resource. Depending on the context where it is invoked, the action inserts one of the following two elements:

- **xref** - Used to link to other topics or another location within the same topic and points to the target using the href or keyref attribute.
- **fragref** - A logical reference to a fragment element within a syntax diagram and points to the target using the href or keyref attribute.

**File Reference**

Opens a dialog box that allows you to insert a link to a target non-DITA file resource at the current location within a document. The target resource can be the location of a file.
or a key that is already defined in your DITA map structure. It inserts an `xref` element with either an `href` attribute or a `keyref` attribute. If you select Location for the target, the link is expressed in an `href` attribute. If you select Key for the target, keys will be used to express the link in a `keyref` attribute. You can select a key from the drop-down list or click the Choose Key Reference button to use the Choose Key dialog box.

Web Link

Opens a dialog box that allows you to insert a link to a target web-related resource at the current location within a document. The target resource can be a URL or a key that is already defined in your DITA map structure. It inserts an `xref` element with either an `href` attribute or a `keyref` attribute. If you select URL for the target resource, the link is expressed in an `href` attribute. If you select Key for the target, keys will be used to express the link in a `keyref` attribute. You can select a key from the drop-down list or click the Choose Key Reference button to use the Choose Key dialog box.

Related Link to Topic

Opens the Cross Reference (xref) dialog box (page 2574) that allows you to insert a link to a target DITA resource in a related links section that is typically at the bottom of your topic (although this depends on the behavior of the output transformation). The target resource can be the location of a file or a key that is already defined in your DITA map structure. Once the target resource has been selected, you can also target specific elements within that resource. If a related links section does not already exist, this action creates one. Specifically, it inserts a `link` element inside a related-links element.

Related Link to File

Opens a dialog box that allows you to insert a link to a target non-DITA file resource in a related links section that is typically at the bottom of your topic (although this depends on the behavior of the output transformation). The target resource can be the location of a file or a key that is already defined in your DITA map structure. If a related links section does not already exist, this action creates one. Specifically, it inserts a `link` element inside a related-links element. If you select Location for the target, the link is expressed in an `href` attribute. If you select Key for the target, keys will be used to express the link in a `keyref` attribute. You can select a key from the drop-down list or click the Choose Key Reference button to use the Choose Key dialog box.

Related Link to Web Page

Opens the Web Link dialog box that allows you to insert a link to a target web-related resource in a related links section that is typically at the bottom of your topic (although this depends on the behavior of the output transformation). The target resource can
be a URL or a key that is already defined in your DITA map structure. If a related links section does not already exist, this action creates one. Specifically, it inserts a link element inside a related-links element. If you select URL for the target resource, the link is expressed in an href attribute. If you select Key for the target, keys will be used to express the link in a keyref attribute. You can select a key from the drop-down list or click the Choose Key Reference button to use the Choose Key dialog box (page 2575).

Cross Reference (xref) Dialog Box

The Cross Reference (xref) dialog box is displayed when you insert a Cross Reference or Related Link to Topic (from the Link drop-down menu). It allows you to insert a link to a target resource at the current location within a document (for a Cross Reference link) or in a related links section (for a Related Link to Topic). The target resource can be the location of a file or a key that is already defined in your DITA map structure. Once the target resource has been selected, you can also target specific elements within that resource.

Figure 752: Cross Reference (xref) Dialog Box
This dialog box includes the following sections and fields:

**Choose the Target Resource Section**

**Location**

If you select **Location** for the target, the link is expressed in an `href` attribute.

**Key**

If you select **Key** for the target, keys will be used to express the link in a `keyref` attribute. You can use the **Choose Key Reference** button to open the **Choose Key** dialog box that allows you to select one from a list of all the keys that are gathered from the **root map (page 2711)** (you can also select one from the drop-down list in the **Key** field).

![Choose Key Dialog Box](image)

**Tip:** You can also use the **DITA Reusable Components view (page 2562)** for similar purposes.

*Figure 753: Choose Key Dialog Box*
The Choose Key dialog box includes the following:

- **Change Root Map** - Opens a small dialog box that allows you to select a root map (page 2416).
- **Search Filter** - You can enter text in the filter field at the top of the dialog box to filter the list and search for specific keys.
- **Sortable Columns** - The dialog box includes the following columns that can be sorted by clicking on the heading:
  - **Key** - The name of the key (the value of the keys attribute).
  - **Description** - The description of the key that is obtained from its definition. Keys that are defined with a text value in the navtitle or keyword element have that value listed in this column.
  - **Href** - Keys that are defined with a value in an href attribute have that href value listed in this column.
  - **Definition Location** - The name of the DITA map (page 2705) where the key is defined.
- **Group by Definition Location** - A contextual menu action that can be used to group (and sort) all the keys based upon the value in the Definition Location column.

Select the Target Element Section

This section can be used to target a specific element inside the target resource.

**Show elements of type**

You can use this drop-down list to select specific types of elements to be displayed in the subsequent table. This can help you narrow down the list of possible source elements that you can select.

**Text Filter Field**
You can also use the text filter field to narrow down the list of possible source elements to be displayed in the subsequent table.

**Element Table**

Presents all the element IDs defined in the source topic. Use this table to select the **Target ID** of the element that you want to reference.

**Preview Pane**

Displays the content that will be references.

**Source Pane**

Displays the XML source code of the element to be referenced.

Once you click **Insert** or **Insert and close**, the configured cross reference is inserted into your document.

**Tip:** You can easily insert multiple cross references by keeping the dialog box opened, using the **Insert** button.

**Using Copy/Paste Actions to Insert a Cross Reference**

Oxygen XML Editor plugin also includes support for inserting cross references with simple copy/paste actions. The copied content must be an entire DITA XML element with an ID attribute or a `topicref`.

Also, the location in the document where you paste the link must be valid, although as long as the Smart paste and drag and drop option (page 129) is selected in the **Schema Aware** preferences page, if you try to paste it in an invalid location, Oxygen XML Editor plugin will attempt to place it in a valid location, and may prompt you with one or more choices for where to place it. You can paste the link as a cross reference with the link expressed in an `href` attribute or in a `keyref` attribute.

To insert a cross reference link (expressed in an `href` attribute) using copy/paste actions, follow these steps:

1. Copy an entire DITA element that has an ID attribute assigned to it or a `topicref`.
2. Place the cursor at a location, where you want to insert the link.
3. Select the **Paste as Link** action from the **Paste Special** submenu from the contextual menu.

To insert a cross reference link (expressed in a `keyref` attribute) using copy/paste actions, follow these steps:

1. In the **DITA Maps Manager** view (page 2400), make sure that the **Root map** combo box (page 2405) points to the correct map that stores the keys.
2. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the DITA Maps Manager (page 2400), select Edit Properties, and enter a value in the Keys field.

3. Copy an entire DITA element that has an ID attribute assigned to it from a topic with an assigned key, or a topicref from a DITA map.

4. Place the cursor at a location, where you want to insert the link.

5. Select the Paste as Link (keyref) action from the Paste Special submenu from the contextual menu.

Linking with Relationship Tables in DITA

A relationship table is used to express relationships between topics outside of the topics themselves. The DITA publishing scripts can then create links between related topics when the content is published.

The reason for using a relationship table is to help make topics easier to reuse. If a topic links directly to another topic, this creates a dependency between the topics. If one topic is reused in a publication where the other is not used, the link is broken. By defining relationships between topics in a relationship table, you avoid creating this dependency.

To create an appropriate set of links between topics in multiple publications, you can create a separate relationship table for each publication. If you are creating multiple publications by applying profiling conditions to a single map, you can also profile your relationship table.

To create a relationship table, follow these steps:

1. If the map is currently open in the DITA Maps Manager (page 2400), double-click the map icon (ające) to open the map in Author mode. If it opens in Text mode, click Author at the bottom left to switch to Author mode.

2. Move the insertion point inside the map root element (usually map, but it might be bookmap, or another specialization of the map element). The easiest way to do this is to click below the title of the map in the editor and then press the up arrow once. Confirm that you are inside the map...
root element by checking the breadcrumbs at the top left of the editor window. You should only see the name of the map root element.

3. Select the Insert Relationship Table action on the toolbar or from the Relationship Table submenu of the contextual menu.

The Insert Relationship Table dialog box is displayed.

4. Set the number of rows, the number of columns, a table title (optional), and select whether or not you want a table header. Click Insert.

5. Enter the type of the topics in the header of each column.

The header of the table (the relheader element) already contains a relcolspec element for each table column. You should set the value of the attribute type of each relcolspec element to a value such as concept, task, or reference. When you click in the header cell of a column (that is a relcolspec element), you can see all the attributes of that relcolspec element, including the type attribute in the Attributes view (page 319). You can edit the attribute type in this view.

6. To insert a topic reference in a cell, place the cursor in a table cell and select Insert Reference (page 2459) from the contextual menu or the DITA Map toolbar.

7. To add a new row to the table or remove an existing row use Insert Relationship Row/Delete Relationship Row from the contextual menu or the DITA Map toolbar.

8. To add a new column to the table or remove an existing column, use Insert Relationship Column/Delete Relationship Column contextual menu or the DITA Map toolbar. If you double-click the relationship table (or select it and press Enter, or choose Open from the contextual menu) the DITA map is opened in the editor with the cursor positioned inside the corresponding relationship table.

9. To add topic references to your relationship table, drag and drop topics from the DITA Maps Manager (page 2400) or the Navigator (page 250) view into the appropriate cell in the relationship table.

See the DITA documentation for a full explanation of the relationship table format and its options. Note that you can change all the selections that you make here later by using the actions on the toolbar (or in the Relationship Table submenu of the contextual menu) or by editing the underlying XML in Text mode.

10. Save the DITA map.

Relationship tables are also displayed in the DITA Maps Manager view (page 2400), along with the other elements in its DITA map.

Figure 754: Relationship Table
You can open the DITA map to edit the relationship table by doing one of the following:

- Double-click the appropriate relationship table in the DITA Maps Manager (page 2400).
- Select the relationship table in the DITA Maps Manager (page 2400) and press Enter.
- Select Open from the contextual menu of the relationship table in the DITA Maps Manager (page 2400).

Publishing DITA Output

As a structured writing format, DITA produces structured content (content that is annotated with specific structural and semantic information rather than with formatting information). To create a publication, your DITA map (page 2705) and its associated topics must be processed by a transformation script. That script is responsible for how the structural and semantic information in the DITA files is converted into formatting information for display.

Oxygen XML Editor plugin publishes DITA content to various output sources using a bundled version of the DITA Open Toolkit. The DITA OT is an open-source publishing engine that can publish DITA content to various output sources such as XHTML, PDF, or Windows Help (CHM). Since it has a plugin-based architecture, it can be extended with extra plugins that either define new formats for conversion or customize an existing conversion format. You can run the DITA-OT from Oxygen XML Editor plugin using a transformation scenario or you can run it directly from a command line: http://www.dita-ot.org/dev/topics/building-output.html.

The DITA-OT that comes bundled with Oxygen XML Editor plugin contains more plugins than the standard DITA-OT that can be downloaded from their official website. For example, it contains pre-installed plugins for converting DITA content to Word, EPUB, WebHelp, or to publish to PDF using CSS to customize the output: http://blog.oxygenxml.com/2017/03/useful-dita-ot-plugins.html.

DITA Map Transformation Scenarios

Built-in transformation scenarios allow you to transform DITA maps (page 2705) to a variety of outputs, such as WebHelp, PDF, ODF, XHTML, EPUB, CHM, Kindle, and MS Word. Oxygen XML Editor
A variety of transformations scenarios are available for DITA maps (page 2705):

- Built-in transformation scenarios allow you to transform a DITA map to a variety of outputs, such as WebHelp, PDF, ODF, XHTML, EPUB, CHM, Kindle, and MS Word.
- Run DITA-OT Integrator (page 1407) - Use this transformation scenario if you want to integrate a DITA-OT plugin (page 2665). This scenario runs an Ant task that integrates all the plugins from the DITA-OT/plugins directory.
- DITA Map Metrics Report - Use this type of transformation scenario if you want to generate a DITA map statistics report. It contains information such as:
  - The number of processed maps and topics.
  - Content reuse percentage.
  - Number of elements, attributes, words, and characters used in the entire DITA map structure.
  - DITA conditional processing attributes used in the DITA maps.
  - Processing instructions.
  - External links.
  - All @outputclass attribute values gathered from the DITA project.

⚠️ Important: If you have cross references that point to content outside the scope of the DITA map, that referenced content will not be counted. For example, if you have links to topics that are not included in the DITA map hierarchy, the content in those topics is ignored when generating the statistics.

Related Information:

- Editing a Transformation Scenario (page 1498)

- Configure Transformation Scenario(s) Dialog Box (page 1502)

- Applying Associated Transformation Scenarios (page 1501)
to any device and screen size to provide an optimal viewing and interaction experience. Oxygen XML Editor plugin also provides numerous possibilities for customizing the WebHelp Responsive output (page 1675).

WebHelp Responsive Transformation Scenario

To publish a DITA map (page 2705) as WebHelp Responsive output, follow these steps:

1. Select the Configure Transformation Scenario(s) action from the DITA Maps Manager (page 2400) toolbar.
2. Select the DITA Map WebHelp Responsive scenario from the DITA Map section.
3. If you want to configure the transformation, click the Edit button.

Step Result: This opens an Edit scenario configuration dialog box that allows you to configure various options in the following tabs:

- **Templates Tab (page 2607)** - This tab contains a set of built-in publishing templates (page 1632) that you can use for the layout of your WebHelp system output. You can also create your own publishing templates or edit existing ones (page 1675).
- **Parameters Tab (page 2614)** - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the Parameters section (page 1386) below for details about the most commonly used parameters for WebHelp Responsive transformations.
- **Filters Tab (page 2616)** - This tab allows you to filter certain content elements from the generated output.
- **Advanced Tab (page 2617)** - This tab allows you to specify some advanced options for the transformation scenario.
- **Output Tab (page 2619)** - This tab allows you to configure options that are related to the location where the output is generated.
4. Click Apply associated to process the transformation.

When the DITA Map WebHelp Responsive transformation is complete, the output is automatically opened in your default browser.

WebHelp Responsive with Feedback Transformation Scenario

To publish a DITA map (page 2705) as a WebHelp Responsive with Feedback system, follow these steps:

1. Select the Configure Transformation Scenario(s) action from the DITA Maps Manager (page 2400) toolbar.
2. Select the DITA Map WebHelp Responsive with Feedback scenario from the DITA Map section.
3. If you want to configure the transformation, click the **Edit** button.

**Step Result:** This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:

- **Templates Tab (page 2607)** - This tab contains a set of built-in **publishing templates (page 1632)** that you can use for the layout of your WebHelp system output. You can also **create your own publishing templates or edit existing ones (page 1675)**.

- **Parameters Tab (page 2614)** - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the **Parameters section (page 1386)** below for details about the most commonly used parameters for WebHelp Responsive transformations.

- **Filters Tab (page 2616)** - This tab allows you to filter certain content elements from the generated output.

- **Advanced Tab (page 2617)** - This tab allows you to specify some advanced options for the transformation scenario.

- **Output Tab (page 2619)** - This tab allows you to configure options that are related to the location where the output is generated.

4. Click **Apply associated** to begin the transformation.

5. Enter the documentation product ID (value for the `webhelp.product.id` parameter) and the documentation version (value for the `webhelp.product.version` parameter).

When the **DITA Map WebHelp Responsive with Feedback** transformation is complete, your default browser opens the **installation.html** file. This file contains information about the output location, system requirements, installation instructions, and deployment of the output. Follow the **instructions to complete the system deployment (page 1614)**.

### Parameters for Customizing WebHelp Responsive Output

To customize a transformation scenario, you can edit various parameters, including the following most commonly used ones:

- **default.language**
  
  This parameter is used if the language is not detected in the **DITA map**. The default value is **en-us**.

- **clean.output**
  
  Deletes all files from the output folder before the transformation is performed (only **no** and **yes** values are valid and the default value is **no**).

- **editlink.remote.ditamap.url**
  
  Use this parameter in conjunction with **editlink.web.author.url** to add an **Edit** link next to the topic title in the WebHelp output. When a user clicks the link, the topic is
opened in Oxygen XML Web Author where they can make changes that can be saved to a file server. The value should be set as the custom URL of the main DITA map. For example, a GitHub custom URL might look like this: https://getFileContent/oxyengxml/userguide/master/UserGuide.ditamap.

**editlink.web.author.url**

This parameter needs to be used in conjunction with `editlink.remote.ditamap.url` to add an Edit link next to the topic title in the WebHelp output. When a user clicks the link, the topic is opened in Oxygen XML Web Author where they can make changes that can be saved to a file server. The value should be set as the URL of the Web Author installation. For example: https://www.oxygenxml.com/oxygen-xml-web-author/.

**editlink.present.only.path.to.topic**

When this parameter is set to "true", the DITA topic path is displayed to the right of each topic title in the WebHelp Responsive output. Also, when this parameter is used, the `editlink.remote.ditamap.url` and `editlink.web.author.url` parameters are ignored.

**fix.external.refs.com.oxygenxml** (Only supported when the DITA OT transformation process is started from Oxygen XML Editor plugin)

The DITA Open Toolkit usually has problems processing references that point to locations outside of the directory of the processed DITA map. This parameter is used to specify whether or not the application should try to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content. Allowed values: true or false (default).

**force.unique**

When set to true (default value), the transformation will be forced to create unique output files for each instance of a resource when a map contains multiple references to a single topic.

**use.stemming**

Controls whether or not you want to include stemming search algorithms into the published output (default setting is false).

**webhelp.custom.resources**

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

**webhelp.favicon**

The file path that points to an image to be used as a favicon in the WebHelp output.

**webhelp.reload.stylesheet**
Set this parameter to `true` if you have out of memory problems when generating WebHelp. It will increase processing time but decrease the memory footprint. The default value is `false`.

**webhelp.search.custom.excludes.file**

The path of the file that contains name patterns for HTML files that should not be indexed by the WebHelp search engine. Each exclude pattern must be on a new line. The patterns are considered to be relative to the output directory, and they accept wildcards such as `'*'` (matches zero or more characters) or `'? '` (matches one character). For more information about the patterns, see [https://ant.apache.org/manual/dirtasks.html#patterns](https://ant.apache.org/manual/dirtasks.html#patterns).

**webhelp.search.japanese.dictionary**

The file path of the dictionary that will be used by the *Kuromoji* morphological engine for indexing Japanese content in the WebHelp pages. The encoding for the dictionary must be `UTF8`.

**webhelp.search.enable.pagination**

Specifies whether or not search results will be displayed on multiple pages. Allowed values are `yes` or `no`.

**webhelp.search.page.numberOfItems**

Specifies the number of search results items displayed on each page. This parameter is only used when the `webhelp.search.enable.pagination` parameter is enabled.

**webhelp.search.ranking**

If this parameter is set to `false` then the 5-star rating mechanism is no longer included in the search results that are displayed on the Search tab (default setting is `true`).

**webhelp.show.changes.and.comments**

When set to `yes`, user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is `no`.

**webhelp.sitemap.base.url**

Base URL for all the `loc` elements in the generated `sitemap.xml` file. The value of a `loc` element is computed as the relative file path from the `href` attribute of a `topicref` element from the *DITA map*, appended to this base URL value. The `loc` element is mandatory in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `sitemap.xml` file is not generated.

**webhelp.sitemap.change.frequency**

The value of the `changefreq` element in the generated `sitemap.xml` file. The `changefreq` element is optional in `sitemap.xml`. If you leave this parameter set to
its default empty value, then the `changefreq` element is not added in `sitemap.xml`. Allowed values: "<empty string>" (default), `always`, `hourly`, `daily`, `weekly`, `monthly`, `yearly`, `never`.

**webhelp.sitemap.priority**

The value of the `priority` element in the generated `sitemap.xml` file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The `priority` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `priority` element is not added in `sitemap.xml`.

**Parameters Specific to WebHelp Responsive Output**

**webhelp.default.collection.type.sequence**

Specifies if the `sequence` value will be used by default when the `collection-type` attribute is not specified. This option is helpful if you want to have `Next` and `Previous` navigational buttons generated for all HTML pages. Allowed values are `no` (default) and `yes`.

**webhelp.enable.search.autocomplete**

Specifies if the `Autocomplete` feature is enabled in the WebHelp search text field. The default value is `yes`.

**webhelp.fragment.after.body**

In the generated output it displays a given XHTML fragment after the page body. The value of the parameter can be either a `well-formed` XHTML fragment or a path to a file that contains a `well-formed` XHTML fragment.

**webhelp.fragment.after.logo_and_title**

In the generated output it displays a given XHTML fragment after the logo and title. The value of the parameter can be either a `well-formed` XHTML fragment or a path to a file that contains a `well-formed` XHTML fragment.

**webhelp.fragment.after.main.page.search**

In the generated output it displays a given XHTML fragment after the search field. The value of the parameter can be either a `well-formed` XHTML fragment or a path to a file that contains a `well-formed` XHTML fragment.

**webhelp.fragment.after.toc_or_tiles**

In the generated output it displays a given XHTML fragment after the table of contents or tiles in the main page. The value of the parameter can be either a `well-formed` XHTML fragment or a path to a file that contains a `well-formed` XHTML fragment.

**webhelp.fragment.after.top_menu**
In the generated output it displays a given XHTML fragment after the top menu. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.body
In the generated output it displays a given XHTML fragment before the page body. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.logo_and_title
In the generated output it displays a given XHTML fragment before the logo and title. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.main.page.search
In the generated output it displays a given XHTML fragment before the search field. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.toc_or_tiles
In the generated output it displays a given XHTML fragment before the table of contents or tiles in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.top_menu
In the generated output it displays a given XHTML fragment before the top menu. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.footer
In the generated output it displays a given XHTML fragment as the page footer. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.head
In the generated output it inserts a given XHTML fragment in the `<head>` element. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.welcome
In the generated output it displays a given XHTML fragment as a welcome message (or title). The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.
webhelp.merge.nested.topics.related.links

Specifies if the related links from nested topics will be merged with the links in the parent topic. Thus the links will be moved from the topic content to the related links component and all of the links from the same group (for example, Related Tasks, Related References, Related Information) are merged into a single group. The default value is yes.

webhelp.search.stop.words.exclude

Specifies a list of words that will be excluded from the default list of stop words that are filtered out before the search processing. Use comma separators to specify more than one word (for example: if, for, is).

webhelp.show.breadcrumb

Specifies if the breadcrumb component will be presented in the output. The default value is yes.

webhelp.show.child.links

Specifies if child links will be generated in the output for all topics that have subtopics. The default value is no.

webhelp.show.indexterms.link

Specifies if an icon that links to the index will be presented in the output. The default value is yes.

webhelp.show.main.page.tiles

Specifies if the tiles component will be presented in the main page of the output. For a tree style layout, this parameter should be set to no.

webhelp.show.main.page.toc

Specifies if the table of contents will be presented in the main page of the output. The default value is yes.

webhelp.show.navigation.links

Specifies if navigation links will be presented in the output. The default value is yes.

webhelp.show.print.link

Specifies if a print link or icon will be presented within each topic in the output. The default value is yes.

webhelp.show.related.links

Specifies if the related links component will be presented in the WebHelp Responsive output. The default value is yes. The webhelp.merge.nested.topics.related.links parameter controls whether related links from nested topics are merged with the links in the parent topic.
parameter can be used in conjunction with this one to merge the related links from nested topics into the links in the parent topic.

**webhelp.show.publication.toc**

Specifies if a table of contents will be presented on the left side of each topic in the output. The default value is `yes`.

**webhelp.show.topic.toc**

Specifies if a topic table of contents will be presented on the right side of each topic in the output. This table of contents contains links to each `<section>` within the current topic that contains an `@id` attribute and the section corresponding to the current scroll position is highlighted. The default value is `yes`.

**webhelp.show.top.menu**

Specifies if a menu will be presented at the topic of the main page in the output. The default value is `yes`.

**webhelp.publication.toc.hide.chunked.topics**

Specifies if the table of contents will contain links for chunked topics. The default value is `yes`.

**webhelp.publication.toc.links**

Specifies which links will be included in the table of contents. The possible values are:

- **chapter** (default) - The TOC will include links for the current topic, its children, its siblings, and its direct ancestor (including the direct ancestor's siblings), and the parent chapter.
- **topic** - The TOC will only include links for the current topic and its direct children.
- **all** - The TOC will include all links.

**webhelp.publication.toc.tooltip.position**

By default, if a topic contains a `shortdesc` element, its content is displayed in a tooltip when the user hovers over its link in the table of contents. This parameter controls whether or not this tooltip is displayed and its position relative to the link. The possible values are:

- **left** (default)
- **right**
- **top**
- **bottom**
- **hidden** - The tooltip will not be displayed.

**webhelp.top.menu.depth**
Specifies the maximum depth level of the topics that will be included in the top menu. The default value is 3. A value of 0 means that the menu has unlimited depth.

**webhelp.topic.collapsible.elements.initial.state**

Specifies the initial state of collapsible elements (tables with titles, nested topics with titles, sections with titles, index term groups). The possible values are collapsed or expanded (default value).

- WebHelp Responsive Output Layout and Features *(page 1598)*

DITA Map to WebHelp Classic Transformation

DITA content can be transformed into several types of WebHelp Classic systems (with or without a feedback section). The WebHelp Classic layout and features *(page 1512)* are designed for desktop systems and include a familiar classical style. Oxygen XML Editor plugin also provides numerous possibilities for customizing the WebHelp Classic output *(page 1545)*.

**WebHelp Classic Transformation Scenario**

To publish a *DITA map* *(page 2705)* as a WebHelp Classic system, follow these steps:

1. Select the Configure Transformation Scenario(s) action from the DITA Maps Manager *(page 2400)* toolbar.
2. Select the DITA Map WebHelp Classic scenario from the DITA Map section.
3. If you want to configure the transformation, click the Edit button.

**Step Result:** This opens an Edit scenario configuration dialog box that allows you to configure various options in the following tabs:

- **Skins Tab** *(page 2606)* - This tab contains a set of built-in skins that you can use for the layout of your WebHelp system output.
- **Parameters Tab** *(page 2614)* - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the Parameters section *(page 1395)* below for details about the most commonly used parameters for WebHelp Responsive transformations.
- **Filters Tab** *(page 2616)* - This tab allows you to filter certain content elements from the generated output.
- **Advanced Tab (page 2617)** - This tab allows you to specify some advanced options for the transformation scenario.
- **Output Tab (page 2619)** - This tab allows you to configure options that are related to the location where the output is generated.

4. Click **Apply associated** to process the transformation.

When the DITA Map WebHelp Classic transformation is complete, the output is automatically opened in your default browser.

**WebHelp Classic with Feedback Transformation Scenario**

To publish a DITA map (page 2705) as a WebHelp Classic with Feedback system, follow these steps:

1. Select the **Configure Transformation Scenario(s)** action from the DITA Maps Manager (page 2400) toolbar.
2. Select the DITA Map WebHelp Classic with Feedback scenario from the DITA Map section.
3. If you want to configure the transformation, click the **Edit** button.

**Step Result:** This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:

- **Skins Tab (page 2606)** - This tab contains a set of built-in skins that you can use for the layout of your WebHelp system output.
- **Parameters Tab (page 2614)** - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the Parameters section (page 1395) below for details about the most commonly used parameters for WebHelp Responsive transformations.
- **Filters Tab (page 2616)** - This tab allows you to filter certain content elements from the generated output.
- **Advanced Tab (page 2617)** - This tab allows you to specify some advanced options for the transformation scenario.
- **Output Tab (page 2619)** - This tab allows you to configure options that are related to the location where the output is generated.

4. Click **Apply associated** to begin the transformation.

5. Enter the documentation product ID (value for the webhelp.product.id parameter) and the documentation version (value for the webhelp.product.version parameter).

When the DITA Map WebHelp Classic with Feedback transformation is complete, your default browser opens the installation.html file. This file contains information about the output location, system requirements, installation instructions, and deployment of the output. Follow the instructions to complete the system deployment (page 1614).
For more information about the feedback-enabled WebHelp system, watch our video demonstration:

https://www.youtube.com/embed/eoQ2uxHvppE

Parameters for Customizing WebHelp Classic Output

To customize a transformation scenario, you can edit various parameters, including the following most commonly used ones:

**default.language**

This parameter is used if the language is not detected in the DITA map. The default value is en-us.

**clean.output**

Deletes all files from the output folder before the transformation is performed (only no and yes values are valid and the default value is no).

**fix.external.refs.com.oxygenxml** (Only supported when the DITA OT transformation process is started from Oxygen XML Editor plugin)

The DITA Open Toolkit usually has problems processing references that point to locations outside of the directory of the processed DITA map. This parameter is used to specify whether or not the application should try to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content. Allowed values: true or false (default).

**force.unique**

When set to true (default value), the transformation will be forced to create unique output files for each instance of a resource when a map contains multiple references to a single topic.

**use.stemming**

Controls whether or not you want to include stemming search algorithms into the published output (default setting is false).

**webhelp.body.script**

URL value that specifies the location of a well-formed XHTML file containing the custom script that will be copied in the <body> section of every WebHelp page.

**webhelp.copyright**

Adds a small copyright text that appears at the end of the Table of Contents pane.

**webhelp.custom.resources**

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.
webhelp.favicon

The file path that points to an image to be used as a favicon in the WebHelp output.

webhelp.footer.file

Path to an XML file that includes the footer content for your WebHelp output pages. You can use this parameter to integrate social media features (such as widgets for Facebook™, Twitter™, Google Analytics, or Google+™). The file must be well-formed, each widget must be in separate div or span element, and the code for each script element is included in an XML comment (also, the start and end tags for the XML comment must be on a separate line). The following code exert is an example for adding a Facebook™ widget:

```xml
<div id="facebook">
  <div id="fb-root"/>
  <script>
    -- (function(d, s, id) { var js, fjs = d.getElementsByTagName(s)[0];
      if (d.getElementById(id)) return;
      js = d.createElement(s); js.id = id;
      js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
      fjs.parentNode.insertBefore(js, fjs); };
    (document, 'script', 'facebook-jssdk')); -->
  </script>
  <div data-share="true" data-show-faces="true" data-action="like"
    data-layout="standard" class="fb-like"/>
</div>
```

webhelp.footer.include

Specifies whether or not to include footer in each WebHelp page. Possible values: yes, no. If set to no, no footer is added to the WebHelp pages. If set to yes and the webhelp.footer.file parameter has a value, then the content of that file is used as footer. If the webhelp.footer.file has no value then a default Oxygen footer is inserted in each WebHelp page.

webhelp.google.search.results

A file path that specifies the location of a well-formed XHTML file containing the Google Custom Search Engine element gcse:searchresults-only. You can use all supported attributes for this element. It is recommend to set the linkTarget attribute to frm for frameless (iframe) version of WebHelp or to contentWin for the frameset version of WebHelp. The default value for this attribute is _blank and the search results will be loaded in a new window. If this parameter is not specified, the following code will be used:

```xml
<gcse:searchresults-only linkTarget="frm"></gcse:searchresults-only>
```
**webhelp.google.search.script**

A file path that specifies the location of a well-formed XHTML file containing the Custom Search Engine script from Google.

**webhelp.head.script**

URL value that specifies the location of a well-formed XHTML file containing the custom script that will be copied in the `<head>` section of every WebHelp page.

**webhelp.logo.image.target.url**

Specifies a target URL that is set on the logo image. When you click the logo image, you will be redirected to this address.

**webhelp.logo.image**

Specifies a path to an image displayed as a logo in the left side of the output header.

**webhelp.reload.stylesheet**

Set this parameter to `true` if you have out of memory problems when generating WebHelp. It will increase processing time but decrease the memory footprint. The default value is `false`.

**webhelp.search.custom.excludes.file**

The path of the file that contains name patterns for HTML files that should not be indexed by the WebHelp search engine. Each exclude pattern must be on a new line. The patterns are considered to be relative to the output directory, and they accept wildcards such as `*` (matches zero or more characters) or `?` (matches one character). For more information about the patterns, see [https://ant.apache.org/manual/dirtasks.html#patterns](https://ant.apache.org/manual/dirtasks.html#patterns).

**webhelp.search.japanese.dictionary**

The file path of the dictionary that will be used by the Kuromoji morphological engine for indexing Japanese content in the WebHelp pages. The encoding for the dictionary must be UTF8.

**webhelp.search.ranking**

If this parameter is set to `false` then the 5-star rating mechanism is no longer included in the search results that are displayed on the Search tab (default setting is `true`).

**webhelp.show.changes.and.comments**

When set to `yes`, user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is `no`.

**webhelp.sitemap.base.url**
Base URL for all the `loc` elements in the generated `sitemap.xml` file. The value of a `loc` element is computed as the relative file path from the `href` attribute of a `topicref` element from the DITA map, appended to this base URL value. The `loc` element is mandatory in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `sitemap.xml` file is not generated.

`webhelp.sitemap.change.frequency`

The value of the `changefreq` element in the generated `sitemap.xml` file. The `changefreq` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `changefreq` element is not added in `sitemap.xml`. Allowed values: `<empty string>` (default), `always`, `hourly`, `daily`, `weekly`, `monthly`, `yearly`, `never`.

`webhelp.sitemap.priority`

The value of the `priority` element in the generated `sitemap.xml` file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The `priority` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `priority` element is not added in `sitemap.xml`.

DITA Map to PDF - based on HTML5 and CSS Transformation

Oxygen XML Editor plugin includes a built-in DITA Map PDF - based on HTML5 & CSS transformation scenario based on a DITA-OT CSS-based PDF Publishing plugin that converts DITA maps to PDF using a CSS-based processing engine and an HTML5 intermediate format. Oxygen XML Editor plugin comes bundled with a built-in CSS-based PDF processing engine called Oxygen PDF Chemistry. Oxygen XML Editor plugin also supports a few third-party processors.

For those who are familiar with CSS, this makes it very easy to style and customize the PDF output of your DITA projects without having to work with xsl:fo customizations. This transformation also includes some built-in publishing templates that you can use for the layout of your PDF output and you can create your own templates or edit existing ones.

The following CSS-based PDF processors can be used:
How to Create the Transformation Scenario

To create a DITA Map PDF - based on HTML5 & CSS transformation scenario, follow these steps:

1. Click the Configure Transformation Scenario(s) button from the DITA Maps Manager toolbar.
2. Select DITA Map PDF - based on HTML5 & CSS.
3. If you want to configure the transformation, click the Edit button.

**Step Result:** This opens an Edit scenario configuration dialog box that allows you to configure various options in the following tabs:

- **Templates Tab** *(page 2607)* - This tab contains a set of built-in publishing templates that you can use for the layout of your WebHelp system output. You can also create your own publishing templates by saving one from the gallery and changing it.
- **CSS Processor Tab** - This is where you choose the processor type. You can select between Oxygen PDF Chemistry, Prince XML, or Antenna House.
- **Parameters Tab** *(page 2614)* - This tab includes numerous parameters that can be set to customize your WebHelp system output.
- **Filters Tab** *(page 2616)* - This tab allows you to filter certain content elements from the generated output.
- **Advanced Tab** *(page 2617)* - This tab allows you to specify some advanced options for the transformation scenario.
- **Output Tab** *(page 2619)* - This tab allows you to configure options that are related to the location where the output is generated.

4. In the Parameters tab, configure any of the following parameters (if applicable):

   - **args.css** - Specifies a path to a custom CSS to be used in addition to those specified in the publishing template. The files must have URL syntax and be separated using semicolons. Also, the *dita.css.list* parameter must be left empty to use these files in addition to the selection in the Styles drop-down menu.

   - **css.processor.path.chemistry** *(if you are using the Oxygen PDF Chemistry processor)* - Specifies the path to the Oxygen PDF Chemistry executable file that will be run to generate
the PDF. If this parameter is not set, your system's PATH environment variable will be used to find and start the Oxygen PDF Chemistry processor.

- **css.processor.path.prince** (if you are using the Prince Print with CSS processor) - Specifies the path to the Prince executable file that will be run to produce the PDF. If you installed Prince using its default settings, you can leave this blank.

- **css.processor.path.antenna-house** (if you are using the Antenna House Formatter processor) - Specifies the path to the Antenna House executable file that will be run to produce the PDF. If you installed Antenna House using its default settings, you can leave this blank.

- **show.changes.and.comments** - When set to `yes`, user comments, replies to comments, and tracked changes are published in the PDF output. The default value is `no`.

- **figure.title.placement** - Controls the position of the figure title relative to the image. Allowed values are "top" and "bottom", "top" is the default

5. Click **OK** and run the transformation scenario.

### Customizing the Output

For information about customizing the output, see **CSS-based DITA to PDF Customization (page 1755)**.

**Related Information:**

- **Editing a Transformation Scenario (page 1498)**

- **Configure Transformation Scenario(s) Dialog Box (page 1502)**

- **Oxygen PDF Chemistry User Guide**

- **CSS-based DITA to PDF Customization (page 1755)**

### DITA Map to PDF - based on DITA and CSS (WYSIWYG) (Deprecated)

⚠️ **Attention:** This transformation scenario was deprecated starting with version 21.0. If you have configured scenarios associated to your project based on this transformation scenario, you will still be able to use them, but for new transformations, it is recommended to use the **DITA Map PDF - based on HTML5 & CSS** transformation scenario (page 1398) instead.

Oxygen XML Editor plugin includes a built-in **DITA Map to PDF - based on DITA & CSS (WYSIWYG)** transformation scenario based on a **DITA-OT CSS-based PDF Publishing plugin** that convert DITA
maps to PDF using a CSS-based processing engine. Oxygen XML Editor plugin also comes bundled with a built-in CSS-based PDF processing engine called Oxygen PDF Chemistry. For those who are familiar with CSS, this makes it very easy to style and customize the PDF output of your DITA projects without having to work with xsl:fo customizations. Oxygen XML Editor plugin also supports a few third-party processors.

The following processors are supported:

- **Oxygen PDF Chemistry** - A built-in processor that is bundled with Oxygen XML Editor plugin. For more information, see the Oxygen PDF Chemistry User Guide.
- **Prince XML** (not included in the Oxygen XML Editor plugin installation kit) - A third-party component that needs to be purchased from http://www.princexml.com.
- **Antenna House Formatter** (not included in the Oxygen XML Editor plugin installation kit) - A third-party component that needs to be purchased from http://www.antennahouse.com/antenna1/formatter/.

DITA Map to PDF - based on DITA and CSS (WYSIWYG) Transformation Scenario

To create a DITA Map to PDF - based on DITA & CSS (WYSIWYG) transformation scenario, follow these steps:

1. Click the Configure Transformation Scenario(s) button from the DITA Maps Manager (page 2400) toolbar.
2. Select DITA Map to PDF - based on DITA & CSS (WYSIWYG).
3. If you want to configure the transformation, click the Edit button.

**Step Result:** This opens an Edit scenario configuration dialog box that allows you to configure various options in the following tabs:

- **CSS Processor** Tab - This is where you choose the processor type. You can select between Oxygen PDF Chemistry, Prince XML, or Antenna House.
- **Parameters** Tab (page 2614) - This tab includes numerous parameters that can be set to customize your WebHelp system output.
- **Filters** Tab (page 2616) - This tab allows you to filter certain content elements from the generated output.
- **Advanced** Tab (page 2617) - This tab allows you to specify some advanced options for the transformation scenario.
- **Output** Tab (page 2619) - This tab allows you to configure options that are related to the location where the output is generated.

4. In the Parameters tab, configure any of the following parameters (if applicable):

   - **args.css** - Specifies a path to a custom CSS (page 1782) to be used in addition to those specified in the dita.css.list parameter OR in addition to the CSS that is currently
selected in the Styles drop-down menu. The files must have URL syntax and be separated using semicolons. Also, the dita.css.list parameter must be left empty to use these files in addition to the selection in the Styles drop-down menu.

- **dita.css.list** - Specifies a list of CSS URLs to be used by the PDF processor (instead of the default CSS files). The files must have URL syntax and be separated using semicolons. If the value is empty, the CSS associated with the current selection from the Styles drop-down menu is used.

- **css.processor.path.chemistry** (if you are using the Oxygen PDF Chemistry processor) - Specifies the path to the Oxygen PDF Chemistry executable file that will be run to generate the PDF. If this parameter is not set, your system's PATH environment variable will be used to find and start the Oxygen PDF Chemistry processor.

- **css.processor.path.prince** (if you are using the Prince Print with CSS processor) - Specifies the path to the Prince executable file that will be run to produce the PDF. If you installed Prince using its default settings, you can leave this blank.

- **css.processor.path.antenna-house** (if you are using the Antenna House Formatter processor) - Specifies the path to the Antenna House executable file that will be run to produce the PDF. If you installed Antenna House using its default settings, you can leave this blank.

- **show.changes.and.comments** - When set to yes, user comments, replies to comments, and tracked changes are published in the PDF output. The default value is no.

- **figure.title.placement** - Controls the position of the figure title relative to the image. Allowed values are "top" and "bottom". "top" is the default.

5. Click OK and run the transformation scenario.

**Customizing the Output**

The DITA-OT CSS-based PDF Publishing plugin makes it very easy to style and customize the PDF output of your DITA projects without having to work with xsl:fo customizations. You can style the PDF output by simply using a custom CSS to change the styling and then re-running the transformation scenario until you get the desired result.

For more information about customizing the output, see: CSS-based DITA to PDF Customization (page 1755).

**Changing the Style of an Element**

To change the style of a particular element, you need to create an additional CSS file that will store the customization rules. Once you have created this file, you need to instruct the editor how to use this additional CSS. This can be done in two ways:

- Specify the path to your custom CSS using the args.css parameter:
1. Edit a DITA Map to PDF - based on DITA & CSS (WYSIWYG) transformation scenario.
2. In the Parameters tab, specify the path to your custom CSS files in the \texttt{args.css} parameter.
3. Click OK and run the transformation scenario.

This method is appropriate if you just want to apply the styling customization to the output.

- Create an alternate CSS for the DITA document type:
  1. Follow the procedure for adding an alternate CSS file in Customizing Author Mode Using CSS Files Associated with a Framework (page 2061).
  2. Once you have configured your CSS as an additional layer, you can select it from the Styles drop-down menu (on the toolbar) (page 2063).
  3. Run the DITA Map to PDF - based on DITA & CSS (WYSIWYG) transformation scenario and the customization rules from the additional CSS will be visible in the produced PDF.

This method allows you to have many customization CSS files and simply select the one that you need at any time for both the output and the rendering in Author mode.

**DITA Map to PDF - based on XSL-FO Transformation**

Oxygen XML Editor plugin comes bundled with the DITA Open Toolkit that provides a mechanism for converting DITA maps (page 2705) to PDF output.

**Creating a DITA Map to PDF - based on XSL-FO Transformation Scenario**

To create a DITA Map to PDF - based on XSL-FO transformation scenario, follow these steps:
1. Click the 

Configure Transformation Scenario(s) button from the DITA Maps Manager (page 2400) toolbar.

2. Select DITA Map PDF - based on XSL-FO and click the Edit button (or use the Duplicate button if your framework (page 2706) is read-only).

3. Use the various tabs to configure the transformation scenario. In the Parameters tab, you can use a variety of parameters to customize the output. For example, the following parameters are just a few of the most commonly used ones:
   - **show.changes.and.comments** - If set to yes, user comments, replies to comments, and tracked changes are published in the PDF output.
   - **customization.dir** - Specifies the path to a customization directory.
   - **editlink.remote.ditamap.url** - When this parameter is set to “true”, the DITA topic path is displayed to the right of each topic title in the PDF output.

4. Click OK and then the Apply Associated button to run the transformation scenario.

**Related Information:**

- XSL FO-based DITA to PDF Customization (page 1887)

**DITA Map to MS Office Word Transformation**

Oxygen XML Editor plugin comes bundled with a transformation scenario that allows you to convert DITA maps (page 2705) to Microsoft Office Word documents. It utilizes the DITA to Word plugin created by Jarno Elovirta. This plugin contains a Word document named Normal.docx (located in: 

[OXYGEN_INSTALL_DIR]/frameworks/dita/DITA-OT3.x/plugins/com.elovirta.ooxml/resources) that is used by the transformation scenario as a template to generate the final Word document.

**Tip:** You can make general modifications to the Normal.docx template file to alter the published output.

**Configuring the Transformation Scenario**

To configure an DITA Map to MS Office Word transformation scenario, follow these steps:

1. Open the DITA map in the DITA Maps Manager (page 2400).
2. Click the 

Configure Transformation Scenario(s) button from the DITA Maps Manager (page 2400) toolbar.
3. Select DITA Map MS Office Word.
4. For advanced customizations, in the **Parameters** tab you can use any of the following parameters that are unique to this transformation scenario to specify paths to files that affect the output in various ways:

- **dotx.file** - Specifies the path to a Word template file (.docx) that will be used in the transformation to generate the final Word document. Set this parameter if you want to use a different template file other than the **Normal.docx** file that is used by default.
- **document.flat.xsl** - Specifies the path to a pre-process clean-up stylesheet.
- **core.xsl** - Specifies the path to a core metadata stylesheet.
- **custom.xsl** - Specifies the path to a custom metadata stylesheet.
- **document.xsl** - Specifies the path to a main document stylesheet.
- **comments.xsl** - Specifies the path to a comments stylesheet.
- **numbering.xsl** - Specifies the path to a list and title numbering stylesheet.
- **footnotes.xsl** - Specifies the path to a footnote stylesheet.
- **document.xml.xsl** - Specifies the path to a document relations metadata stylesheet.
- **inkscape.exec** - Specifies the path to an Inkscape (open-source vector graphics editor) executable file.

5. Click **OK** and run the transformation scenario.

**Result:** The result of the transformation will automatically be opened in your system's default word processing application (such as Microsoft Word).

**Related Information:**

- [Editing a Transformation Scenario](page 1498)
- [Configure Transformation Scenario(s) Dialog Box](page 1502)
- [Migrating MS Office Documents to DITA](page 2677)

**DITA Map to CHM (Compiled HTML Help) Transformation**

To perform a **Compiled HTML Help (CHM)** transformation, Oxygen XML Editor plugin needs **Microsoft HTML Help Workshop** to be installed on your computer. Oxygen XML Editor plugin automatically detects **HTML Help Workshop** and uses it.

**Note:** **HTML Help Workshop** might fail if the files used for transformation contain accents in their names, due to different encodings used when writing the .hhp and .hhc files. If the transformation fails to produce the CHM output but the .hhp (HTML Help Project) file is already generated, you can manually try to build the CHM output using **HTML Help Workshop**.
Changing the Output Encoding

Oxygen XML Editor plugin uses the `htmlhelp.locale` parameter to correctly display specific characters of different languages in the output of the Compiled HTML Help (CHM) transformation. By default, the DITA Map CHM transformation scenario that comes bundled with Oxygen XML Editor plugin has the `htmlhelp.locale` parameter set to `en-US`.

To customize this parameter, follow this procedure:

1. Use the Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Alt + T, C on OS X)) action from the toolbar or the XML menu.
2. Select the DITA Map CHM transformation scenario and click the Edit button.
3. In the Parameter tab, search for the `htmlhelp.locale` parameter and change its value to the desired language tag.

Note: The format of the `htmlhelp.locale` parameter is `LL-CC`, where `LL` represents the language code (`en`, for example) and `CC` represents the country code (`us`, for example). The language codes are contained in the ISO 639-1 standard and the country codes are contained in the ISO 3166-1 standard. For further details about language tags, go to http://www.rfc-editor.org/rfc/rfc5646.txt.

DITA Map to Kindle Transformation

Oxygen XML Editor plugin requires KindleGen to generate Kindle output from DITA maps (page 2705). To install KindleGen for use by Oxygen XML Editor plugin, follow these steps:

1. Go to www.amazon.com/kindleformat/kindlegen and download the zip file that matches your operating system.
2. Unzip the file on your local disk.
3. Start Oxygen XML Editor plugin and open a DITA map in the DITA Maps Manager view (page 2400).
4. Click the Configure Transformation Scenario(s) button.
5. Select the DITA Map Kindle transformation and press the Edit button to edit it.
6. Go to Parameters tab and set the `kindlegen.executable` parameter as the path to the KindleGen directory.
7. Accept the changes.

Running a DITA Transformation Scenario

To select and run a transformation scenario on your DITA map, follow these steps:
1. Click the 
Configure Transformation Scenario(s) button on the DITA Maps Manager toolbar (page 2402). The Configure Transformation Scenario(s) dialog box (page 1502) appears. This dialog box lists all the transformation scenarios that have been configured in your project. Oxygen XML Editor plugin provides a default set of transformation scenarios, but the people in charge of your DITA system may have provided others that are specifically configured for your needs.

2. Select the transformation scenario you want to run and click Apply Associated. The transformation scenario runs in the background. You can continue to work in Oxygen XML Editor plugin while the transformation is running. If there are errors or warnings, Oxygen XML Editor plugin displays them when the transformation is complete. If the transformation is successful, Oxygen XML Editor plugin opens the output in the appropriate application.

3. To rerun the same scenario again, click the Apply Transformation Scenario(s) button.

Creating or Editing a DITA OT Transformation

Creating a DITA OT Transformation Scenario

To create a DITA OT Transformation scenario, use one of the following methods:

- Use the Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Alt + T, C on OS X)) action from the DITA Maps Manager toolbar, main toolbar, or the XML menu. Then click the New button and select DITA OT Transformation.
- Go to Window > Show View and select Transformation Scenarios to display this view. Click the New Scenario drop-down menu button and select DITA OT Transformation.

Both methods open the DITA Transformation Type dialog box that presents the list of possible outputs.

Figure 755: DITA Transformation Type Dialog Box
Select the desired type of output and click OK. This opens the New Scenario dialog box.

The upper part of the dialog box allows you to specify the Name of the transformation scenario.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation. Some of these tabs are only available for certain output types (for example, a Skins tab is only available for WebHelp Classic and WebHelp Classic with Feedback output types, a Templates tab is available only for WebHelp Responsive and WebHelp Responsive with Feedback, and a FO Processor tab is available for PDF output).

**Editing a DITA OT Transformation Scenario**

Editing a transformation scenario is useful if you need to configure some of its parameters.

To configure an existing transformation scenario, follow these steps:

1. Select the Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Alt + T, C on OS X)) action from the DITA Maps Manager toolbar, main toolbar, or the XML menu.

   **Step Result:** The Configure Transformation Scenario(s) dialog box (page 1502) is opened.

2. Select the particular transformation scenario and click the Edit button at the bottom of the dialog box or from the contextual menu.

   **Note:** Since transformation scenarios that are associated with built-in frameworks (page 2706) are read-only, these scenarios will prompt you to use the Duplicate button and then edit the duplicated scenario (page 1500).

**Result:** This will open an Edit scenario configuration dialog box (page 1498) that contains several tabs that allow you to configure the options that control the transformation. Some of these tabs are only available for certain output types (for example, a Skins tab is only available for WebHelp Classic and WebHelp Classic with Feedback output types, a Templates tab is available only for WebHelp
Responsive and WebHelp Responsive with Feedback, and a FO Processor tab is available for PDF output).

Related Information:

- Creating a DITA OT Plugin (page 2661)
- Installing a DITA-OT Plugin (page 2665)
- DITA Open Toolkit Documentation

Skins Tab (DITA OT Transformations)

When you create a new transformation scenario (page 1415) or edit an existing one (page 1498), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The Skins tab is available for DITA OT transformations with WebHelp Classic or WebHelp Classic with Feedback output types and it provides a set of built-in skins that you can use as a base for your WebHelp system output.

A skin is a collection of CSS properties that can alter the look of the output by changing colors, font types, borders, margins, and paddings. This allows you to rapidly adapt the look and feel of your output.

Figure 756: Skins Tab
The Skins tab includes the following sections:

**Built-in Skins**

This section presents the built-in skins that are included in Oxygen XML Editor plugin. The built-in skins cover a wide range of chromatic themes, ranging from a very light one to a high-contrast variant. To see how the skin looks when applied on a sample documentation project that is stored on the Oxygen XML Editor plugin website, press the Online preview link.

**Custom Skins**

You can use this section to customize the look of the output.

**CSS File**

You can set this field to point to a custom CSS stylesheets or customized skin. A custom CSS file will overwrite a skin selection.

**Note:** The output can also be styled by setting the `args.css` parameter in the Parameters tab. The properties taken from the stylesheet referenced in this parameter take precedence over the properties declared in the skin set in the Skins tab.

**Create custom skin**

Use this link to open the WebHelp Skin Builder (page 1545) tool.

Templates Tab (DITA OT Transformations)
When you create a new transformation scenario (page 1415) or edit an existing one (page 1498), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The Templates tab is available for DITA OT transformations with WebHelp Responsive, WebHelp Responsive with Feedback, or PDF - based on HTML5 & CSS output types and it provides a set of built-in publishing templates (page 1632). You can use one of them to publish your documentation or as a starting point for a new publishing template.

Figure 757: Templates Tab

Filtering and Previewing Templates

You can click on the tags at the top of the pane to filter the templates and narrow your search. Each built-in template also includes an Online preview icon in the bottom-right corner that opens a webpage in your default browser providing a sample of how the main page will look when that particular template is used to generate the output.

Built-in Templates Locations

Oxygen XML Editor plugin scans the following locations to find the built-in templates to display in the dialog box:
• **WebHelp Responsive Templates** - All built-in WebHelp Responsive publishing templates are stored in the following directory: `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/templates`.

• **PDF - based on HTML5 & CSS** - All built-in PDF publishing templates are stored in the following directories:
  
  ◦ `DITA-OT-DIR/plugins/com.oxygenxml.pdf.css/templates`
  ◦ `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/templates`

**Custom Templates Locations**

Oxygen XML Editor plugin scans the locations specified in the [DITA > Publishing preferences page](page 68) to find custom templates to display in the dialog box. You can access that preferences page directly from the Template tab by clicking on the Configure Publishing Templates Gallery link.

**Selecting Custom Templates**

Once you are finished configuring your template, you can click the Choose Custom Publishing Template link to select your template.

You can also add your custom templates (page 1678) to the list of templates displayed in the Templates tab. To do this, store them in a directory, then click the Configure Publishing Templates Gallery link to open the DITA > Publishing preferences page (page 68) where you can add that directory to the list. All the templates contained in your template directory will be displayed in the preview pane along with all the built-in templates.

**Save Template As Button**

You can use the Save template as button (at the bottom-left of the transformation dialog box) to export the currently selected template into a new template package that can be used as a starting point to create your own custom template (page 1770). Clicking this button will open a template package configuration dialog box (page 1449) that contains some options and displays the parameters that will be exported to your template package.

**Template Errors**

When the Templates tab is opened, all templates (built-in and custom) are loaded and validated. Specifically, certain elements in the template descriptor file are checked for validity. If errors are encountered that prevents the template from loading, the following message will be displayed toward the bottom of the dialog box:
If you click the More details link, a window will open with more information about the encountered error. For example, it might offer a hint for which element is missing from the expected descriptor file structure.

Also, if a template could be loaded, but certain elements could not be found in the descriptor file, a warning icon (⚠️) will be displayed on the template’s image (in the Templates tab of the transformation dialog box). For example, this happens if a valid preview-image element cannot be found.

**Sharing Publishing Template**

To share a publishing template with others, following these steps:

1. Copy your template in a new folder.
2. Go to Options > Preferences > DITA > Publishing (page 68) and add that new folder to the list.
3. Switch the option as the bottom of that preferences page to Project Options.
4. Share your project file (.xpr).

For more information about customizing publishing templates, watch our video demonstration:

https://www.youtube.com/embed/zNmXfKWXwO8

**Related Information:**

- Publishing Templates (page 1632)
- Publishing Template Package Contents for PDF Customizations (page 1764)
- Publishing Template Package Contents for WebHelp Responsive Customizations (page 1635)

**Template Package Configuration Dialog Box**

The Save template as button (at the bottom-left of the transformation dialog box for WebHelp Responsive or PDF - based on HTML5 & CSS transformations) can be used to export the currently selected template into a new template package that can be used as a starting point to create your
own custom template *(page 1770).* The result will be a ZIP archive that contains a template descriptor file and other resources (such as CSS files) that were attached to the selected template.

Clicking the **Save template as** button opens a template package configuration dialog box contains the following options and components:

**Name**

Required field used to specify the name for the new template. This will become the text value of the `name` element in the template descriptor file. This information is displayed as the name of the template in the transformation scenario dialog box.

**Description**

Optional field used to specify a template description. This will become the text value of the `description` element in the template descriptor file. This information is displayed when the user hovers over the template in the transformation scenario dialog box.

**Parameter Table**

This table displays the parameters that will be exported. Only relevant parameters are exported. The parameters and their values will be inserted in the `parameters` section of the template descriptor file. If any of the parameter values point to a file path that references a template resource (such as CSS files, custom HTML fragments, images), those resources will automatically be copied to the new template package and their references will be changed accordingly.

**Note:** Additional resources that are referenced in CSS files or other resources will not be copied to the new template package, so you will need to copy them manually and update their references in the template descriptor file.

**Include WebHelp Customization**

The same publishing template package can contain both a WebHelp Responsive and PDF customization and you can use the same template in both types of transformations *(DITA Map WebHelp Responsive *(page 1384)* or DITA Map to PDF - based on HTML5 & CSS *(page 1398)*). This option specifies that the custom template will include a WebHelp Responsive customization.

**Include HTML Page Layout Files**

For **WebHelp Responsive** customizations, select this option if you want to copy the default **HTML Page Layout Files *(page 1649)*** into your template package. They are helpful if you want to change the structure of the generated HTML pages.
The same publishing template package can contain both a WebHelp Responsive and PDF customization and you can use the same template in both types of transformations (DITA Map WebHelp Responsive (page 1384) or DITA Map to PDF - based on HTML5 & CSS (page 1398)). This option specifies that the custom template will include a PDF customization.

**Save as**

Use this field to specify the name and path of the ZIP file where the template will be saved.

**Figure 758: Template Package Configuration Dialog Box**

![Save Template As dialog box](image)

**Related Information:**

- Publishing Template Package Contents for PDF Customizations (page 1764)

Published Template Package Contents for WebHelp Responsive Customizations (page 1635)

FO Processor Tab (DITA OT Transformations)
When you create a new transformation scenario (page 1415) or edit an existing one (page 1498), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The FO Processor tab is available for DITA OT transformations with a PDF output type.

This tab allows you to select an FO Processor to be used for the transformation.

You can choose one of the following processors:

**Apache FOP**

The default processor that comes bundled with Oxygen XML Editor plugin.

**XEP**

The RenderX XEP processor. If XEP is already installed, Oxygen XML Editor plugin displays the detected installation path under the drop-down menu. XEP is considered installed if it was detected in one of the following sources:

- XEP was configured as an external FO Processor in the FO Processors option page (page 164).
- The system property com.oxygenxml.xep.location was set to point to the XEP executable file for the platform (for example: xep.bat on Windows).
- XEP was installed in the DITA-OT-DIR/plugins/org.dita.pdf2/lib directory of the Oxygen XML Editor plugin installation directory.

**Antenna House**

The Antenna House (AH Formatter) processor. If Antenna House is already installed, Oxygen XML Editor plugin displays the detected installation path under the drop-down
menu. Antenna House is considered installed if it was detected in one of the following sources:

- Environment variable set by Antenna House installation (the newest installation version will be used).
- Antenna House was added as an external FO Processor in the Oxygen XML Editor plugin preferences pages.

To further customize the PDF output obtained from the Antenna House processor, follow these steps:

1. **Edit** the transformation scenario.
2. Open the **Parameters** tab (page 2614).
3. Add the `env.AXF_OPT` parameter and point to the Antenna House configuration file.

**Related Information:**

- FO Processors Preferences (page 164)
- XSL-FO (Apache FOP) Processor for Generating PDF Output (page 1479)

**Parameters Tab (DITA OT Transformations)**

When you **create a new transformation scenario** (page 1415) or **edit an existing one** (page 1498), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Parameters** tab allows you to configure the parameters sent to the DITA-OT build file.

The table in this tab displays all the parameters that the DITA-OT documentation specifies as available for each chosen type of transformation (for example, XHTML or PDF), along with their description and current values. You can find more information about each parameter in the DITA OT Documentation. You can also add, edit, and remove parameters, and you can use the text box to filter or search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

Depending on the type of a parameter, its value can be one of the following:

- A simple text field for simple parameter values.
- A combo box with some predefined values.
• A file chooser and an editor variable (page 201) selector to simplify setting a file path as the value of a parameter.

**Note:** To input parameter values at runtime, use the ask editor variable (page 202) in the Value column.

Below the table, the following actions are available for managing parameters:

**New**

Opens the **Add Parameter** dialog box that allows you to add a new parameter to the list. You can specify the **Value** of the parameter by using the ↓. **Insert Editor Variables** (page 201) button or the **Browse** button.

**Unset**

Resets the selected parameter to its default value. Available only for edited parameters with set values.

**Edit**

Opens the **Edit Parameter** dialog box that allows you to change the value of the selected parameter or its description.

**Delete**

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

**Parameters Contributed by an Oxygen Publishing Template**

Transformation parameters that are defined in an Oxygen Publishing Template (page 1762) descriptor file are displayed in italics. After creating a publishing template (page 1770) and adding it to the templates gallery (page 1678), when you select the template in the Templates tab (page 2607), the Parameters tab will automatically be updated to include the parameters defined in the template descriptor file.

**Related Information:**

• DITA Open Toolkit Documentation
When you create a new transformation scenario (page 1415) or edit an existing one (page 1498), a configuration dialog box allows you to customize the transformation with various options in several tabs.

⚠️ **Attention:** This tab is for a feature that has not yet been implemented. To check the progress of the feature, see https://feedback.oxygenxml.com/.

The **Feedback** tab is available for the **WebHelp Responsive** transformation type and can be used to connect the published WebHelp Responsive output to an **Oxygen Feedback** server to provide a comment section in the output where users can offer feedback and ask questions.

When you configure the **Oxygen Feedback** server, you will retrieve an HTML fragment during site creation procedure. Click the **Edit** button at the bottom-right of this tab to open a dialog box where you will paste the HTML fragment (using keyboard shortcut keys or contextual menu actions).

Filters Tab (DITA Transformations)

When you create a new transformation scenario (page 1415) or edit an existing one (page 1498), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Filters** tab allows you to add filters to remove certain content elements from the generated output.

*Figure 760: Edit Filters Tab*
You can choose one of the following options to define filters:

**Use DITAVAL file**

If you already have a DITAVAL file associated with the [DITA map](page 2705), you can specify the file to be used when filtering content. You can specify the path by using the text field, its history drop-down, the [Insert Editor Variables](page 201) button, or the browsing actions in the [Browse] drop-down list. You can find out more about constructing a DITAVAL file in the [DITA Documentation].

⚠️ **Attention:** If a filter file is specified in the args.filter parameter (in the [Parameters](page 2614) tab), that file takes precedence over a DITAVAL file specified here.

**Use profiling condition set**

Sets the profiling condition set (page 2643) that will be applied to your transformation.

**Exclude from output all elements with any of the following attributes**

By using the ✦ New, ✎ Edit, or ✗ Delete buttons at the bottom of the pane, you can configure a list of attributes (name and value) to exclude all elements that contain any of these attributes from the output.

**Advanced Tab (DITA OT Transformations)**

When you create a new transformation scenario (page 1415) or edit an existing one (page 1498), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The [Advanced](page 2617) tab allows you to specify advanced options for the transformation scenario.

*Figure 761: Advanced Settings Tab*
You can specify the following parameters:

**Custom build file**

If you use a custom DITA-OT build file, you can specify the path to the customized build file. If empty, the `build.xml` file from the `dita.dir` parameter that is configured in the **Parameters** tab (page 2614) is used. You can specify the path by using the text field, the **Insert Editor Variables** (page 201) button, or the **Browse** button.

**Build target**

Optionally, you can specify a build target for the build file. If no target is specified, the default `-init` target is used.

**Additional arguments**

You can specify additional command-line arguments to be passed to the transformation (such as `-verbose`).

**Ant Home**

You can choose between the default or custom Ant installation to run the transformation.

**Java Home**
You can choose between the default or custom Java installation to run the transformation. The default path is the Java installation that is used by Oxygen XML Editor plugin.

**Note:** It may be possible that the used Java version is incompatible with the DITA Open Toolkit engine. For example, DITA-OT 2.0 and newer requires Java 1.7 or newer. Thus, if you encounter related errors running the transformation, consider installing a Java VM that is supported by the DITA OT publishing engine and using it in the Java Home text field.

**JVM Arguments**

This parameter allows you to set specific parameters for the Java Virtual Machine used by Ant. For example, if it is set to `-Xmx384m`, the transformation process is allowed to use 384 megabytes of memory. When performing a large transformation, you may want to increase the memory allocated to the Java Virtual Machine. This will help avoid Out of Memory error messages (`OutOfMemoryError`).

**Libraries**

By default, Oxygen XML Editor plugin adds libraries (as high priority) that are not transformation-dependent and also patches for certain DITA Open Toolkit bugs. You can use this button to specify additional libraries (`JAR (page 2707)` files or additional class paths) to be used by the transformer.

**Tip:** You can specify the path to the additional libraries using wildcards (for example, `${oxygenHome}/lib/*.`).

Output Tab (DITA OT Transformations)

When you create a new transformation scenario (page 1415) or edit an existing one (page 1498), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The Output tab allows you to configure options that are related to the location where the output is generated.

Figure 762: Output Settings Tab
You can specify the following parameters:

**Base directory**

All the relative paths that appear as values in parameters are considered relative to the base directory. The default value is the directory where the transformed map is located. You can specify the path by using the text field, the Insert Editor Variables button, or the Browse button.

**Temporary files directory**

This directory is used to store pre-processed temporary files until the final output is obtained. You can specify the path by using the text field, the Insert Editor Variables button, or the Browse button.

**Output directory**

The folder where the content of the final output is stored. You can specify the path by using the text field, the Insert Editor Variables button, or the Browse button.

Note: If the DITA map or topic is opened from a remote location or a ZIP file, the parameters must specify absolute paths.

**Open in Browser/System Application**
If selected, Oxygen XML Editor plugin automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows PDF files are often opened in Acrobat Reader).

**Note:** To set the web browser that is used for displaying HTML/XHTML pages, go to Window > Preferences > General > Web Browser and specify it there.

- **Output file** - When Open in Browser/System Application is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When Open in Browser/System Application is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the Insert Editor Variables (page 201) button, or the Browse button.

**Open in editor**

When this option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

**Customizing DITA Transformations**

You can customize the appearance of any of the output types by customizing the output transformations. There are several ways to do this:

- **Most transformations are configurable by passing parameters to the transformation script.** Oxygen XML Editor plugin allows you to set parameters (page 2614) on a transformation scenario and you can save and share them with others (page 1507). You can also use the $(ask) editor variable (page 202) in the Parameters tab to instruct Oxygen XML Editor plugin to prompt you for a particular parameter whenever a transformation scenario is run. You can set up multiple transformation scenarios for a given output type, allowing you to maintain several customized transformation scenarios for multiple types of output configurations.
- If you want to customize an output in a way not supported by the built-in customization options, you can create a modified version of the transformation code and execute it using a custom build file (page 2623). Sometimes the transformation code exports specific forms of extensions or customizations. You should consult the DITA Open Toolkit for the transformation type that you are interested in to see what customization options are supported. Oxygen XML Editor plugin provides full editing and debugging support from XSLT and CSS stylesheets (page 2007), which you can use to modify transformation code.
• You can also write your own transformation code (and execute it using a custom build file (page 2623)) to produce a type of output not supported by the DITA Open Toolkit. Oxygen XML Editor plugin provides a full source editing environment for developing such transformations. You can create Oxygen XML Editor plugin transformation scenarios to run these scripts once they are complete.

There are also many other ways to customize specific types of output generated from DITA transformations:

- **WebHelp** - For information about customizing WebHelp output, see the WebHelp Output section (page 1511).
- **PDF** - For information about customizing PDF output generated from DITA content, see XSL FO-based DITA to PDF Customization (page 1887).

**Publishing Customizations**

Some customizations (usually for HTML-based output), can be made simply by creating a custom CSS and they do not involve modifying the DITA-OT engine in any way. Instead, most customizations involve adding a new plugin to the DITA-OT. Here are some best practices to follow before beginning your customization:

1. Copy the bundled DITA-OT folder (usually OXYGEN_INSTALL_DIR\frameworks\dita\DITA-OT3.x) to a location where you have full write access so that you have the ability to install new DITA-OT plugins (page 2665).
2. Go to Options > Preferences > DITA, select Custom for the DITA Open Toolkit option and set the Location to be the path to the location where you copied the bundled DITA-OT folder. This will allow you to upgrade the version of Oxygen XML Editor plugin at anytime without affecting the publishing system.
3. Share that external DITA-OT folder with the rest of the team. If you are using a repository (such as Subversion or Git), you can commit the entire modified DITA-OT publishing engine as part of your project. This will allow everyone in your team to use the official changes that you made. This will also allow you to set up some kind of automatic publishing system using an open-source integration server (such as Travis CI or Jenkins).

**Customizing XHTML-based Output**

XHTML-based output can be modified by using a custom CSS stylesheet to override various styles. If you edit an XHTML transformation scenario (page 2604), there is a parameter called args.css that can be set to point to your custom CSS and a parameter called args.copy.css that can be set to yes to copy the CSS to the output folder.
You can also create plugins to customize the XHTML-based output by adding an extra XSLT stylesheet. For more information, see: http://blog.oxygenxml.com/2013/12/creating-simple-dita-open-toolkit.html. A list with all DITA-OT XSLT extension points can be found here: http://www.dita-ot.org/dev/extension-points/plugin-extension-points-xslt-import.html.

**Customizing WebHelp-based Output**

The DITA-OT that comes bundled in Oxygen XML Editor plugin includes specific plugins that provide the ability to publish DITA content to WebHelp Classic (page 1512) and WebHelp Responsive (page 1597) output.

For information about customizing WebHelp Classic output, see Customizing WebHelp Classic Output (page 1545).

For information about customizing WebHelp Responsive output, see Customizing the WebHelp Responsive Output (page 1675).

**Customizing PDF-based Output**

DITA to PDF output can be customized either by creating a PDF customization folder (in this case, the DITA OT folder will not be modified at all) or by creating a PDF customization plugin. For information about customizing DITA to PDF output, see XSL FO-based DITA to PDF Customization (page 1887).

There is also a book called DITA For Print that contains details about how to customize various aspects.

**Customizing PDF Output with CSS**

Oxygen XML Editor plugin also includes a transformation scenario called DITA Map PDF - based on HTML5 and CSS (page 1398) that is based on a DITA-OT CSS-based PDF Publishing plugin that allows you to convert DITA maps (page 2705) to PDF using a CSS layout processor. For those who are familiar with CSS, this makes it very easy to style and customize the PDF output of your DITA projects without having to work with xsl:fo customizations. For more information about customizing PDF output using this transformation scenario, see Customization CSS (page 1782).

**Related Information:**

- DITA Open Toolkit Documentation

**Using a Custom Build File**
You can use a **Custom Build File** to customize transformation scenarios.

To use a custom build file in a DITA-OT transformation, follow these steps:

1. Use the **Configure Transformation Scenario(s)** action to open the **Configure Transformation Scenario(s)** dialog box (page 1502).
2. Select the transformation scenario and click **Edit**.
3. Go to the **Advanced** (page 2617) tab and change the **Custom build file** path to point to the custom build file.

As an example, if you want to call a custom script before running the DITA OT, your custom build file would have the following content:

```xml
<project basedir="." default="dist">
 <import file="build.xml"/>
 <target name="dist">
  <!-- You could run your script here -->
  <!--Call the DITA OT default target-->
  <antcall target="init"/>
 </target>
</project>
```

**Note:** If you use the built-in Ant 1.9.8 build tool that comes bundled with Oxygen XML Editor plugin, it is located in the `[OXYGEN_INSTALL_DIR]/tools/ant` directory. Any additional libraries for Ant must be copied to the Oxygen XML Editor plugin Ant lib directory.

**Adding a Watermark in DITA Map to XHTML Output**

To add a watermark to the XHTML output of a **DITA map (page 2705)** transformation, follow these steps:

1. Create a custom CSS stylesheet that includes the watermark image, as in the following example:

```css
body {
  background-image: url(MyWatermarkImage.png);
}
```
2. Edit a DITA Map XHTML transformation scenario and in the **Parameters** tab set the value of the `args.css` parameter as the path to your watermark image.

3. Set the value of the `args.copycss` parameter to **yes**.

4. Apply the transformation scenario.

5. Copy the watermark image in the output directory of the transformation scenario, next to the CSS file created in step 1.

**Related Information:**

- Adding a Watermark to PDF Output *(page 1891)*

---

**Adding Syntax Highlights for Codeblocks in the Output**

*Syntax Highlighting* makes it easier to read the semantics of the structured content by displaying each type of code (language) in different colors and fonts. Oxygen XML Editor plugin provides the ability to add syntax highlights in codeblocks for DITA to PDF or HTML-based output through the use of the `@outputclass` attribute and a variety of predefined values are available.

To provide syntax highlighting in the codeblocks that appear in the output, add the `@outputclass` attribute on the `<codeblock>` element and set its value to one of the predefined language values. The **Content Completion Assistant** offers a list of the possible values when adding the `@outputclass` attribute in **Text** mode but there are also two very simple ways to set the value in **Author** mode:

- Select the `<codeblock>` element in the editor and in the **Attributes** view, click on the **Value** cell for the `outputclass` attribute and select one of the predefined values (for example, `language-xml`).
- Select the `<codeblock>` element in the editor and use the **Alt + Enter** keyboard shortcut to open the in-place attributes editor window. Then select one of the predefined values from the **Value** drop-down menu.

The predefined values that can be selected are:

- `language-bourne`
- `language-c`
- `language-cpp`
- `language-csharp`
- `language-css`
- `language-ini`
• language-java
• language-javascript
• language-json
• language-lua
• language-perl
• language-php
• language-python
• language-ruby
• language-sql
• language-xml

⚠️ **Attention:** It is recommended that you do not add inline elements in the codeblocks when using this `@outputclass` attribute, as it may lead to improper highlighting.

**Example:**

This codeblock:

```xml
<codeblock outputclass="language-xml">
  <p>This code is an example of how to use a coderef.</p>
  <codeblock><coderef href="MyExternalCode.xsl"/></codeblock>
</codeblock>
```

would look like this in the output:

```
<p>This code is an example of how to use a coderef.</p>
<codeblock><coderef href="MyExternalCode.xsl"/></codeblock>
```

### Troubleshooting DITA Transformation Problems

This section contains some topics to help you troubleshoot DITA transformation issues.

### DITA Map Transformation Fails (Cannot Connect to External Location)

**Problem**

*DITA map (page 2705)* transformation fails because it cannot connect to an external location.

**Solution**

The transformation is run as an external Ant process so you can continue using the application as the transformation unfolds. All output from the process appears in the DITA Transformation tab.
The HTTP proxy settings are used for the Ant transformation, so if the transformation fails because it cannot connect to an external location, you can check the Network Connections.

### DITA Map WebHelp Transformation Fails (Duplicate Topic References Found)

**Problem**

DITA Map WebHelp transformation fails with a message that indicates duplicate topic references were found.

**Cause**

By default the WebHelp transformation uses the `force-unique` parameter set to **true** to force the transformation to create unique output files for each instance of a resource when a map contains multiple references to a single topic. However, there are cases when this feature does not work as expected and the duplicate topic references are not handled properly.

**Solution**

To solve this issue, you should manually set a unique `copy-to` attribute on any duplicate topic reference that was not handled automatically by DITA-OT:

```xml
<map>
  ...
  <topicref href="../topics/MyTopic.dita"/>
  ...
  <topicref href="../topics/MyTopic.dita" copy-to="../topics/MyTopic-2.dita"/>
</map>
```

### DITA OT Transformation Takes a Long Time to Process

**Problem**

A DITA transformation takes an extremely long time to process (over an hour, for example).

**Cause**

Large delays in DITA OT processing are usually caused by intensive disk operations, CPU usage, or connections to remote websites. The DITA OT processing is very disk-intensive, each stage takes the
entire content from the transformation temporary files folder, reads it, modifies it, and then writes it back.

Solution

There are several things you can try to troubleshoot this problem:

- If you are using a shared or remote drive, it is recommended to specify a local drive for the output and temporary files directory (edit the transformation scenario and in the Output tab, select a local directory for Temporary files directory and Output directory).
- If you want to test if the publishing has a problem downloading remote resources, you could disable the network adapter on the computer and then try to publish. The purpose is to see if the publishing finishes without any reported error about obtaining a certain HTTP resource.
- Using DTDs instead of XML Schemas is faster. This is because of a default transformation parameter called args.grammar.cache that only works for DTD-based DITA topics.
- You can increase the memory available to Oxygen XML Editor plugin (page 2368). Sometimes, just increasing the amount of memory available to the DITA OT process may be enough to lower the time necessary for the publishing to run.
- You can enable some logging to help you determine which stage in the process is taking a long time. Edit the transformation scenario and in the Advanced tab, enter logger org.apache.tools.ant.listener.ProfileLogger in the Additional arguments field. Then go to Options > Preferences > DITA > Logging and select Always for the Show console output option.
- You could try disabling antivirus applications since the publishing process is very disk intensive and certain antivirus application might slow down the process.
- If the published DITA map is part of a larger DITA project with lots of maps and topics, references from topics in the current map to topics in other sub-projects might result in problems resolving those references. You could look in the output folder to see if the number of HTML documents match the number of DITA topics in your map.

DITA PDF Transformation Fails

Problem

The DITA to PDF transformation fails.

Cause

To generate the PDF output, Oxygen XML Editor plugin uses the DITA Open Toolkit. This process sometimes results in errors. For information about some of the most common errors, see DITA PDF Processing Common Errors (page 2375).
Solution

If your transformation fails, you can detect some of the problems that caused the errors by running the Validate and Check for Completeness action (page 2446). Depending on the options you select when you run it, this action reports errors such as topics referenced in other topics but not in the DITA map (page 2705), broken links, and missing external resources.

You can analyze the Results tab of the DITA transformation and search for messages that contain text similar to [fop] [ERROR]. If you encounter this type of error message, edit the transformation scenario you are using and set the clean.temp parameter to no and the retain.topic.fo parameter to yes. Run the transformation, go to the temporary directory of the transformation, open the topic.fo file and go to the line indicated by the error. Depending on the XSL FO context try to find the DITA topic that contains the text that generates the error.

If none of the above methods helps you, go to Help > About > Components > Frameworks and check what version of the DITA Open Toolkit you are using. Copy the whole output from the DITA OT console output and either report the problem on the DITA User List or send it to support@oxygenxml.com.

Related Information:

• How to Enable Debugging for FO Processor Transformations (page 1482)

DITA PDF Processing Common Errors

There are cases when the PDF processing fails when trying to publish DITA content to a PDF file. This topic lists some of the common problems and possible solutions.

Problem: Cannot Save PDF

The FO processor cannot save the PDF at the specified target. The console output contains messages like this:

[fop] [ERROR] Anttask - Error rendering fo file:
C:\samples\dita\temp\pdf\oxygen_dita_temp\topic.fo
<Failed to open C:\samples\dita\out\pdf\test.pdf>
Failed to open samples\dita\out\pdf\test.pdf
.............
[fop] Caused by: java.io.FileNotFoundException:
C:\Users\default\Desktop\bev\out\pdf\test.pdf
Solution: Cannot Save PDF

Such an error message usually means that the PDF file is already opened in a PDF reader application. The solution is to close the open PDF before running the transformation.

Problem: Table Contains More Cells Than Defined in Colspec

One of the DITA tables contains more cells in a table row than the defined number of `colspec` elements. The console output contains messages like this:

```plaintext
[fop] [ERROR] Anttask - Error rendering fo file:
D:\projects\eXml\samples\dita\flowers\temp\pdf\oxygen_dita_temp\topic.fo
<net.sf.saxon.trans.XPathException: org.apache.fop.fo.ValidationException: The column-number or number of cells in the row overflows the number of fo:table-columns specified for the table.
(See position 179:-1)>net.sf.saxon.trans.XPathException:
org.apache.fop.fo.ValidationException: The column-number or number of cells in the row overflows the number of fo:table-columns specified for the table.
(See position 179:-1)
[fop] at org.apache.fop.tools.anttasks.FOPTaskStarter.renderInputHandler
(Fop.java:657)
[fop] at net.sf.saxon.event.ContentHandlerProxy.startContent
(ContentHandlerProxy.java:375)
............
[fop] D:\projects\samples\dita\flowers\temp\pdf\oxygen_dita_temp\topic.fo ->
D:\projects\samples\dita\flowers\out\pdf\flowers.pdf
```

Solution: Table Contains More Cells Than Defined in Colspec

To resolve this issue, correct the `colspec` attribute on the table that caused the issue. To locate the table that caused the issue:

1. Edit the transformation scenario and set the parameter `clean.temp` to `no`.
2. Run the transformation, open the `topic.fo` file in Oxygen XML Editor plugin, and look in it at the line specified in the error message (See position 179:-1).
3. Look around that line in the XSL-FO file to find relevant text content that you can use (for example, with the Find/Replace in Files action in the DITA Maps Manager view (page 2400)) to find the original DITA topic for which the table was generated.
Problem: Broken Link

There is a broken link in the generated XSL-FO file. The PDF is generated but contains a link that is not working. The console output contains messages like this:

```plaintext
[fop] 1248 WARN [ main ] org.apache.fop.apps.FOUserAgent -
Page 6: Unresolved ID reference "unique_4_Connect_42_wrongID" found.
```

Solution: Broken Link

To resolve this issue:

1. Use the Validate and Check for Completeness action available in the DITA Maps Manager view (page 2400) to find such problems.
2. If you publish to PDF using a DITAVAL filter, select the same DITAVAL file in the DITA Map Completeness Check dialog box.
3. If the Validate and Check for Completeness action does not discover any issues, edit the transformation scenario and set the clean.temp parameter to no.
4. Run the transformation, open the topic.fo file in Oxygen XML Editor plugin, and search for the unresolved ID references (for example: unique_4_Connect_42_wrongID).
5. Look in the XSL-FO file to find relevant text content that you can use (for example, with the Find/Replace in Files action in the DITA Maps Manager view (page 2400)) to find the original DITA topic for which the table was generated.

Related Information:

- How to Enable Debugging for FO Processor Transformations (page 1482)

DITA to CHM Transformation Fails - Cannot Open File

Problem

The DITA to CHM transformation fails with the following error: [exec] HHC5010: Error: Cannot open "fileName.chm". Compilation stopped.
**Cause**

This error occurs when the CHM output file is opened and the transformation scenario cannot rewrite its content.

**Solution**

To solve this issue, close the CHM help file and run the transformation scenario again.

ℹ️ **Tip:** It is a good practice to validate the [DITA map](page 2705) before executing the transformation scenario. To do so, run the Validate and Check for Completeness action (page 2446). Depending on the selected options, this action reports errors, such as topics referenced in other topics (but not in the DITA map), broken links, and missing external resources.

**Related Information:**

- DITA Map to CHM (Compiled HTML Help) Transformation (page 1405)

**DITA to CHM Transformation Fails - Compilation Failed**

**Problem**

The DITA to CHM transformation fails with the following error: `[exec] HHC5003: Error: Compilation failed while compiling file Name .`

**Cause 1**

One possible cause for this error is that the processed file does not exist.

**Solution 1**

To solve this issue, fix the file reference before executing the transformation scenario again.

**Cause 2**

Another possible cause for this error is that the processed file has a name that contains space characters.
Solution 2

To solve the issue, remove any spacing from the file name and run the transformation scenario again.

Tip: It is a good practice to validate the DITA map (page 2705) before executing the transformation scenario. To do so, run the Validate and Check for Completeness action (page 2446). Depending on the selected options, this action reports errors, such as topics referenced in other topics (but not in the DITA map), broken links, and missing external resources.

- DITA Map to CHM (Compiled HTML Help) Transformation (page 1405)

Solving DITA Transformation Errors

If a DITA transformation results in errors or warnings, the information is displayed in the message panel at the bottom of the editor. The information includes the severity, description of the problem, the name of the resource, and the path of the resource.

To help prevent and solve DITA transformation problems, follow these steps:

1. Validate the DITA map (page 2446) by using the Validate and Check for Completeness action that is available on the DITA Maps Manager (page 2400) toolbar and in the DITA Maps menu.
2. If this action results in validation errors, solve them prior to executing the transformation. Also, you should pay attention to the warning messages because they may identify problems in the transformation.
3. Run the DITA transformation scenario (page 1444).
4. If the transformation results in errors or warnings, they are displayed in the Results panel (page 267) at the bottom of the editor. The following information is presented to help you troubleshoot the problems:
   - **Severity** - The first column displays the following icons that indicate the severity of the problem:
     - Informational - The transformation encountered a condition of which you should be aware.
     - Warning - The transformation encountered a problem that should be corrected.
     - Error - The transformation encountered a more severe problem, and the output is affected or cannot be generated.
   - Info - You can click the See More icon to open a web page that contains details about DITA-OT error messages.
   - Description - A description of the problem.
• **Resource** - The name of the transformation resource.
• **System ID** - The path of the transformation resource.

5. Use this information or other resources from the online DITA-OT community to solve the transformation problems before re-executing the transformation scenario.

6. If you need to contact the Oxygen technical support team, they will need you to send the entire transformation scenario execution log. To obtain it:
   a. Go to the **Options > Preferences > DITA** preferences page and set the **Show console output** option to **Always**.
   b. Execute the transformation scenario again. The console output messages are displayed in the DITA OT view.
   c. Copy the entire log, save it in a text file, then send it to the Oxygen technical support team.
   d. After your issue has been solved, go back to the **Options > Preferences > DITA** preferences page and set the **Show console output** option to **When build fails**.

**Related Information:**

**DITA Profiling / Conditional Text**

DITA offers support for conditionally profiling content by using profiling attributes. With Oxygen XML Editor plugin, you can define values for the DITA profiling attributes and they can be easily managed to filter content in the published output. You can switch between profile sets to see how the edited content looks like before publishing.

Oxygen XML Editor plugin includes a **Profiling/Conditional Text** preferences page (*page 119*) where you can create and manage profiling attributes and condition sets. Oxygen XML Editor plugin also offers convenient support for customizing and controlling profiling attribute values with a subject scheme (*page 2652*) or DITAVAL file (*page 2656*).

**Profiling Attributes**

You can profile content elements or map elements by adding one or more of the default DITA profiling attributes (**product**, **platform**, **audience**, **rev**, **props**, and **otherprops**). You can also create your own custom profiling attributes and profiling condition sets. The profiling attributes may contain one or more tokens that represent conditions to be applied to the content when a publication is built.
For example, you could define a section of a topic that would only be included for a publication related to the Windows platform by adding the `platform` profiling attribute:

```xml
<section platform="windows">
```

For information about creating and editing profiling attributes, see Creating and Editing Profiling Attributes in DITA (page 2635).

Profiling Conditions

DITA allows you to conditionally profile parts of a topic so that certain parts of the topic are displayed when certain profiling conditions are set. Profiling conditions can be set both within topics and in maps. When set in a topic, they allow you to suppress an element (such as paragraph), step in a procedure, item in a list, or even a phrase within a sentence. When set in a map, they allow you to suppress an entire topic or group of topics. You can then create a variety of publications from a single map by applying profiling conditions to the build.

For information about creating and editing condition sets, see Creating and Editing Profiling Condition Sets in DITA (page 2641).

For more information about DITA profiling, watch our video demonstration:

https://www.youtube.com/embed/Gfyd4TkRQAw

Creating and Editing Profiling Attributes in DITA

You can filter DITA content or the structure of a document by using profiling attributes or profiling conditions sets (page 2641).

Defining Profiling Attributes for DITA Content

To create or edit profiling attributes for filtering DITA content, follow these steps:

1. Open the Preferences dialog box (page 55) and go to Editor > Edit modes > Author > Profiling / Conditional Text.

   Information: The Profiling Attributes section (page 120) is used to define the attributes and their values. For DITA documents, the default attributes are included (`audience`, `platform`, `product`, `props`, `otherprops`, and `rev`), but if a Subject Scheme Map (page 2652) is used for profiling your content, you will see the attributes defined in your subject scheme map instead.
2. To add new attributes and values, click the **New** button at the bottom of the **Profiling Attributes** table. To customize existing attributes and their values, select an attribute and click the **Edit** button.

**Step Result:** In either case, this opens a **Profiling Attribute** configuration dialog box where you can define attributes that exist in your schema.

*Figure 763: Profiling Attribute Dialog Box*

The following options are available in this dialog box:

**Document type**

Select the document type (*framework (page 2706)*).

*Tip:* You can use the * or ? wildcards in this combo box. For example, DITA* would match any document type that starts with "DITA". You can also specify multiple document types by using commas to separate them.

**Attribute name**

The name of the profiling attribute.

**Display name**

This optional field is used for descriptive rendering in profiling dialog boxes.

**Attribute Values Table**
This table displays information about the values for the profiling attribute. You can configure them by using the buttons at the bottom of the table (➕ New, ✎ Edit, ✕ Delete).

The columns are as follows:

- **Value** - The attribute value. You can also define profiling attribute groups using the following format: `ParentAttrValue(SubAttrValue1 SubAttrValue2)` . For more information, see Conditional Profiling Attribute Groups (page 2650).
- **Label** - You can specify a label for the attribute value that will be rendered as its name in various components in **Author** mode (Edit Profiling Attributes dialog box (page 2638), Condition Set dialog box (page 2641), Profiling tab in the Edit Properties dialog box (page 2442), DITA Maps Manager (page 2400)). If the **Label** is not specified, the **Value** will be used as its rendered name.
- **Description** - A description for the attribute value that will be displayed in this table.

### Single value

Select this option if you want the attribute to only accept a single value.

### Multiple values separated by

Select this option if you want the attribute to accept multiple values, and you can choose the type of delimiter to use. You can choose between `space`, `comma`, and `semicolon`, or you can enter a custom delimiter in the text field. A custom delimiter must be supported by the specified document type. For example, the DITA document type only accepts spaces as delimiters for attribute values.

3. After defining or configuring the attributes and their values according to your needs, click **OK** to confirm your selections and close the **Profiling Attributes** configuration dialog box.

4. Click **Apply** to save the changes.

**Result:** You should see your changes in the **Profiling Attribute** table.

You can also use the **Profiling Condition Sets** section to apply more complex filters on your DITA content.

### Adding Profiling Attribute Values Directly in a Document

You can add values directly to the existing profiling attributes in a document using the In-Place Attributes Editor (page 692) in **Author** mode, the Attributes view (page 319), or in the source code in **Text** mode. However, this just adds them to the document and does not change the conditional text configuration. If you invoke the Edit Profiling Attributes action (from the contextual menu in **Author** mode) on the new value, the **Profiling Values Conflict** dialog box will appear and it includes an **Add these values to the configuration** action that will automatically add the new value to the
particular profiling attribute. It also includes an **Edit the configuration** action that opens the Profiling / Conditional Text preferences page (page 119) where you can edit the profiling configuration.

**Note:** If the **Allow contributing extra profiling attribute values** (page 121) option is not selected in the Profiling / Conditional Text preferences page, the Profiling Values Conflict dialog box will never appear, so this automatically adding value not be possible.

**Figure 764: Profiling Values Conflict Dialog Box**

![Profiling Values Conflict Dialog Box](image)

Applying Profiling Attributes in DITA

Profiling attributes are applied on element nodes. You can apply profiling attributes on a text fragment (it will automatically be wrapped into a phrase-type element), on a single element, or on multiple
elements at the same time. If there is no selection in your document, the profiling attributes are applied on the element at the cursor position.

You can apply defined DITA profiling attributes (page 2635) as follows:

**DITA Topics**

To profile DITA topics, right-click a topic reference in the DITA Maps Manager (page 2400), select Edit Properties from the contextual menu, go to the Profiling tab, and select the appropriate values.

**DITA Content**

To profile DITA content in Author mode, highlight the content and select Edit Profiling Attributes from the contextual menu and select the appropriate values in the Edit Profiling Attributes dialog box.

**DITA Elements**

To profile specific XML elements in Author mode, position the cursor inside the element, right-click, select Edit Profiling Attributes (you can also right-click the element in the breadcrumb (page 684) or Outline (page 316) view), and select the appropriate values in the Edit Profiling Attributes dialog box. You can also use the Attributes view (page 319) to set the profiling attributes on the element at the current cursor position.

---

**Figure 765: Edit Profiling Attributes Dialog Box**

The profiling attributes, and their potential values, that appear in this dialog box depend on what has been configured in Oxygen XML Editor plugin. If you have a large list of profiling attributes, you can use the text filter field to search for attributes or values, and you can expand or collapse attributes by...
using the Expand All/ Collapse All buttons to the right of the text filter or the arrow button to the left of the profiling attribute name.

The attributes and values that appear in the dialog box are determined as follows:

- If your root map (page 2711) references a DITA subject scheme map (page 2711) that defines values for the profiling attributes (page 2652), those values are used. Oxygen XML Editor plugin collects all the profiling values from the subject scheme map that is referenced in the map that is currently opened in the DITA Maps Manager (page 2400) (or set as the root map (page 2416)). In the image above (page 2639) (taken from the Oxygen XML Editor plugin documentation project), you see values for eight products. They are the only values that are defined in the subject scheme map and thus, are the only ones that appear in the dialog box.
- If you have defined profiling attribute values (page 2635) for the DITA document type in the Profiling/Conditional Text preferences page (page 119), those values are displayed in the dialog box.
- Otherwise, a generic default set of profiling attributes and values are available.

The attribute names and values selected in the Edit Profiling Attributes dialog box are set on the elements contained in the profiled fragment. If you only select a fragment of content (rather than the entire element), this fragment is wrapped in phrase-type elements in which the profiling attributes are set.

If the Show Profiling Attributes option (page 756) (available in the Profiling / Conditional Text toolbar menu) is selected, a green border is painted around profiled text in the Author mode and all profiling attributes set on the current element are listed at the end of the highlighted block. To edit the attributes of a profiled fragment, click one of the listed attribute values. A form control pops up and allows you to add or remove attribute values.

Figure 766: Profiling Attribute Value Form Control Pop Up

Related Information:
Creating and Editing Profiling Condition Sets in DITA

Multiple profiling attributes can be aggregated into a profiling condition set that allows you to apply more complex filters on the document content. In DITA, profiling conditions can be set within both topics and in maps. When set in a topic, you can filter an element (such as paragraph), step in a procedure, item in a list, or even a phrase within a sentence. When set in a map, you can filter an entire topic or group of topics.

Creating Profiling Condition Sets

To create a new profiling condition set, follow these steps:

1. Open the Preferences dialog box (page 55) and go to Editor > Edit modes > Author > Profiling/Conditional Text.

   **Information:** The Profiling Condition Sets section (page 121) is used to define condition sets.

2. To add new condition set, click the ✗ New button at the bottom of the Profiling Condition Sets table. To customize existing condition sets, select an existing condition set and click the 📝 Edit button.

   **Step Result:** In either case, this opens a Condition Set configuration dialog box where you can define attributes that exist in your schema.

   *Figure 767: Condition Set Configuration Dialog Box*
The following options are available in this dialog box:

**Name**

The name of the new condition set.

**Document type**

Select the document type ([framework (page 2706)](page 2706)) for which you have defined profiling attributes.

**Use DITAVAL file**

For DITA projects, select this option if you want the Profiling Condition Set to reference a DITAVAL file ([page 2656](page 2656)). You can specify the path by using the text field, its history drop-down, the ![Insert Editor Variables (page 201)](page 201) button, or the browsing actions in the ![Browse drop-down list](page 201).

**Include the content matching the following conditions**

You can select this option to define the combination of attribute values for your condition set by selecting the appropriate checkboxes for the values you want to be included in this particular condition set. If you have defined a lot of profiling attributes, you can use the ![filter text field](page 201) to search for specific conditions.

3. After defining or configuring the condition sets according to your needs, click **OK** to confirm your selections and close the **Condition Set** configuration dialog box.
4. Click **Apply** to save the condition set.

**Result:** All saved profiling condition sets are available in the **Profiling / Conditional Text** toolbar drop-down menu (*page 756*).

**Related Information:**

- Applying Profiling Condition Sets in DITA (*page 2643*)
- Creating and Editing Profiling Attributes in DITA (*page 2635*)
- Applying Profiling Attributes in DITA (*page 2638*)
- Showing and Filtering Profiled Content in DITA (*page 2645*)
- Customizing Colors and Styles for Rendering Profiling in Author Mode (*page 2648*)

### Applying Profiling Condition Sets in DITA

All defined Profiling Condition Sets (*page 2641*) are available as shortcuts in the **Profiling / Conditional Text** toolbar menu (*page 756*). Select a menu entry to apply the condition set. The filtered content is then grayed-out in the Author mode, Outline view (*page 316*), and DITA Maps Manager view (*page 2400*). Your selection will also be used as the default condition set (*page 2660*) in transformation scenarios (this can be changed in the Filters tab). An element is filtered-out when one of its attributes is part of the condition set and its value does not match any of the values covered by the condition set.

**EXAMPLE:**

Suppose that you have the following document:
If you apply the following condition set, it means that you want to filter out the content to only include content profiled with the `expert` value for the `@audience` attribute and content that has the `prop1` value for the `@other` attribute.

This is how the document looks in **Author** mode after you apply the condition set:
You can visualize the effect of profiling content by using the profiling tools in the Profiling/Conditional Text drop-down menu that is located on the DITA Maps Manager toolbar and on the main toolbar. This drop-down menu includes the following filtering options:

**Show Profiling Colors and Styles**

Select this option to show colors and styles for profiled content in Author mode and the DITA Maps Manager. You can configure the colors and styles or specify whether or not this option is selected by default in the Profiling/Conditional Text > Colors and Styles preferences page.
Show Profiling Attributes

Select this option to display the values of the profiling attributes at the end of profiled content in Author mode and next to the nodes in the DITA Maps Manager (page 2400). You can specify whether or not this option is selected by default in the Profiling/Conditional Text > Attributes Rendering preferences page (page 122).

Show Excluded Content

Controls whether the content filtered out by a particular condition set is hidden or grayed-out in Author mode, the DITA Maps Manager (page 2400), and the Outline (page 316) view. When this option is selected and a condition set is selected in this drop-down menu (page 2646), the filtered content is grayed-out. If this option is not selected and a condition set is selected in this drop-down menu (page 2646), the filtered content is hidden. You can specify whether or not this option is selected by default in the Profiling/Conditional Text preferences page (page 121).

Choose Condition Set (Available if more than 15 condition sets are defined)

This option is available if you have more than 15 conditions sets defined. It opens a dialog box that makes it easier to find and select condition sets that are not displayed in this drop-down menu.

List of Defined Condition Sets

Up to 15 defined condition sets are listed and you can toggle each one of them on to filter the content in Author mode and the DITA Maps Manager (page 2400) to only show content that will appear in the output for that particular condition set. If there are more than 15 defined condition sets, the rest of them can be accessed in the More submenu or by using the Choose Condition Set option (page 2646) to access a dialog box that presents all of them.

Profiling Settings

Opens the Profiling/Conditional Text preferences page (page 119) where you can add and edit profiling attributes and condition sets.

Figure 768: Example: Profiling Controls in Author Mode
If the **Show Profiling Attributes** option is selected, a green border is painted around profiled text in the **Author** mode. Also, all profiling attributes set on the current element are listed at the end of the highlighted block and in its tooltip message. To edit the attributes of a profiled fragment, click one of the listed attribute values. A form control pops up and allows you to add or remove attribute values.

*Figure 769: Profiling Attribute Value Form Control Pop Up*

Also, the following icons are used to mark profiled and non-profiled topics in the **DITA Maps Manager**:  

- ■ - The topic contains profiling attributes.  
- □ - The topic inherits profiling attribute from its ancestors.  
- △ - The topic contains and inherits profiling attributes.  
- -(dash) - The topic neither contains, nor inherits profiling attributes.

*Figure 770: Rendering Profiled Topics in DITA Maps Manager*
Customizing Colors and Styles for Rendering Profiling in Author Mode

By applying profiling colors and styles, you can mark profiled content in Author mode and the DITA Maps Manager (page 2400) so that you can instantly spot differences between multiple variants of the output. This allows you to preview the content that will go into the published output. The excluded
text is grayed-out or hidden in **Author** mode and excluded nodes are grayed-out or hidden in the **DITA Maps Manager (page 2400)**.

**Figure 771: Example: Profiling Colors and Styles in Author Mode**

<table>
<thead>
<tr>
<th>Mowing equipment needs regular checks and maintenance. Monthly, you should:</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Refill the oil:</td>
</tr>
<tr>
<td>o Remove the oil fill cap;</td>
</tr>
<tr>
<td>o Pour new oil gradually. Regularly check the dipstick to see if the oil level reached the maximum mark;</td>
</tr>
<tr>
<td>product [Gasoline]</td>
</tr>
<tr>
<td>• Sharpen the blades:</td>
</tr>
<tr>
<td>o Clamp the blade to a vice or to the edge of a solid surface;</td>
</tr>
<tr>
<td>o Using an electric grinder or a file, grind the length of the blade until it is sharp;</td>
</tr>
<tr>
<td>• Check the electric cable for any signs of wear. Replace if worn; product [Electric]</td>
</tr>
<tr>
<td>• Clean the mower’s underside for debris; product [Electric, Gasoline]</td>
</tr>
<tr>
<td>• Inspect the general state of the mower. Use a ratchet to tighten any loose bolts;</td>
</tr>
<tr>
<td>• Lubricate the gears of the manual lawn mower; product [Manual]</td>
</tr>
</tbody>
</table>

Choosing the right style for a specific profiling attribute is a matter of personal taste, but be aware of the following:

- If the same block of text is profiled with two or more profiling attributes, their associated styles combine. Depending on the styling, this might result in an excessively styled content that may prove difficult to read or work with.
- It is recommended that you only profile the differences. There is no need to profile common content, since excessive profiling can visually pollute the document.
- A mnemonic associated with a style will help you instantly spot differences in the types of content.

**Styling Profiling Attribute Values**

To set colors and styles for profiling attribute values, follow these steps:

1. Select the **Show Profiling Colors and Styles option (page 756)** from the **Profiling / Conditional Text** toolbar drop-down menu.
2. Select **Profiling Settings (page 757)** from the **Profiling / Conditional Text** toolbar drop-down menu. This is a shortcut to the **Profiling/Conditional Text** preferences page (page 119).
3. Go to the **Colors and Styles preferences page (page 122)** to configure the colors and styling for the profiling attributes.
4. Go to the Attributes Rendering preferences page (page 121) to configure how you want the profiling attributes to appear in Oxygen XML Editor plugin.

Result: The styling is now applied in the Author editing mode, the Outline view (page 316), and in the DITA Maps Manager view (page 2400). Also, to help you more easily identify the profiling you want to apply in the current context, the styling is applied in the Edit Profiling Attributes dialog box (page 747) and in the inline form control pop-up that allows you to quickly set the profiling attributes.

Figure 772: Profiling Attribute Value Form Control Pop Up

Alternate Method with a DITAVAL File: If you are using a DITAVAL filter file to control the filtering of profiled content in DITA topics, you can use a flag filter to define the colors and styles that will be used when rendering the profiling. For detailed information about this alternate method, see the procedure in the Styling the Rendering of Profiled Content Using a DITAVAL File (page 2659) topic.

- Showing and Filtering Profiled Content in DITA (page 2645)

Conditional Profiling Attribute Groups
Overview

Conditional processing attributes can be specified using grouped values. Groups organize the attributes into subcategories. This is intended to support situations where an attribute applies to multiple specialized subcategories. For example, suppose a company needs to filter content for several internal teams (operations and support) and they use the @audience attribute with the values ops and support, but the Support team has several levels of personnel (L1, L2, and L3). They could use a group to define the levels (L1, L2, and L3) as subcategories for the support value. Using groups for these subcategories allows each category to be processed independently.

A major advantage is that you do not need to add new profiling attributes using a DTD specialization. You can re-use existing DITA profiling attributes (such as @product, @audience, @otherprops) and specify multiple attribute subcategories.

Creating a Conditional Profiling Attribute Group

To create a group in Oxygen XML Editor plugin:

1. Open the Preferences dialog box (page 55) and go to Editor > Edit modes > Author > Profiling / Conditional Text.
2. To add new attributes and values, click the New button at the bottom of the Profiling Attributes table. To customize existing attributes and their values, select an attribute and click the Edit button.
   
   **Step Result:** In either case, this opens a Profiling Attribute configuration dialog box where you can define attributes that exist in your schema.

3. Specify the appropriate values for the Document type, Attribute name, and Display name.
   
   For information about the Profiling Attribute configuration dialog box, see Defining Profiling Attributes for DITA Content (page 2635).

4. Click the New button at the bottom of the attribute values table.
5. In the Value field of the resulting dialog box, define groups using the following format: ParentAttrValue(SubAttrValue1 SubAttrValue2). For example:

   ```plaintext
   support(L1 L2 L3)
   ```

6. Click OK and Apply to save and apply the changes.

Using Conditional Groups in Conjunction with a DITAVAL File

You can use groups to customize a hierarchy of profiling attribute values and then use it in conjunction with a DITAVAL file to filter or flag (page 2656) the values. For example, suppose the
company described in the example in the Overview section (page 2650) needed to generate content for the Support team, but only for L1 and L2 support personnel. The DITAVAL file could look like this:

```xml
<val>
  <prop action="include" att="support" val="L1"/>
  <prop action="include" att="support" val="L2"/>
  <prop action="exclude" att="support" val="L3"/>
</val>
```

That DITAVAL file could then be used for a condition set (page 2641) to filter content in Author mode or during the transformation stage to filter content in the output (page 2660) and content profiled with the L1 and L2 values would be included while content with the L3 value would be excluded.

This example company could also have another DITAVAL file for filtering out all content profiled for any of the three subcategories (L1, L2, L3) by simply excluding the support value (since L1, L2, and L3 are subcategories of it).

```xml
<val>
  <prop action="exclude" att="support"/>
</val>
```

For more information about creating conditional profiling attribute groups, watch our video demonstration:

https://www.youtube.com/embed/YRi9XP6CcY

- DITA 1.3 Specifications: Conditional Processing Values and Groups

Customizing Profiling Values with a Subject Scheme Map

**Overview**

A subject scheme map (page 2711) allows you to create and manage custom profiling values in DITA documents without having to write a DITA specialization. Ultimately, this allows you to filter and flag content in Author mode or in transformed output.

Subject scheme maps use key definitions to define a collection of profiling values. You can also use subject scheme maps to filter out (reject) the values for certain attributes so that you only see the attributes or values that you want to use in Author mode or the transformed output.
The highest level of map (main DITA map (page 2711)) that uses the set of profiling values must reference the subject scheme map where the profiling values are defined and the type attribute needs to be set to subjectScheme for the reference, as in the following example:

```
<topicref href="test.ditamap" format="ditamap" type="subjectScheme"/>
```

Advantages of Using a Subject Scheme Map

The advantages of using a subject scheme to control profiling attribute values include:

- You can create a hierarchy of profiling attribute values and use a DITAVAL file to filter or flag the tree of values.
- You can share the subject scheme files with others without having to share preferences or the entire project.
- The subject scheme offers validation support so you are notified if an undefined value is used.

Creating a Subject Scheme Map

To create and configure a subject scheme map, follow this procedure:

1. Use the New Document wizard (page 550) to create a new Subject Scheme document (New from Templates > Framework templates > DITA Map > map > Subject Scheme).
2. Use the controls in Author mode to define the hierarchical tree of values for your subject scheme (see the Author mode example below (page 2654)) or switch to Text mode and define it there if you prefer (see the Text mode example below (page 2655)).

   Note: The pre-defined subject scheme template includes Navigation Titles (navtitle element). This element is not required, but if you use it, the text that you enter for the navtitle will be used (instead of the name of the value) in the various places where profiling attributes are presented in Oxygen XML Editor plugin (page 2656). An example of when this might be helpful is if you want to use abbreviations for the name of a value, but you want to see its full name in Oxygen XML Editor plugin.

3. Bind the particular attribute to the key you define for the tree of values. Notice that in the examples below (page 2654), the audience attribute is bound to the audienceKey value.
4. If you want to filter out (reject) values for certain attributes, bind the attributes to a blank value (as you see for the props and otherprops attributes in the examples below (page 2654)). This means that those attributes will not appear in the various places where profiling attributes are presented in Oxygen XML Editor plugin (page 2656).
5. Save your subject scheme file.
6. Reference your subject scheme in the highest level of map (main DITA map (page 2711)) that will use the set of profiling values and set its type to subjectScheme. The easiest way to do this is:
   a. With your subject scheme file opened in the editor, go to the DITA Maps Manager view, right-click the main DITA map, and select Append Child > Reference to the currently edited file.
   b. In the Insert Topic Reference dialog box, go to the Attributes tab and in the Type field, enter or select subjectScheme.
   c. Click the Insert and Close button and save your main DITA map.

Using a Subject Scheme in Conjunction with a DITAVAL File

You can use a subject scheme to customize a hierarchy of profiling attribute values and then use it in conjunction with a DITAVAL file to filter or flag (page 2656) the entire tree of values. For example, suppose one of the values for the audience attribute in a hierarchical subject scheme is surgeon and it has two subordinate values of neuro-surgeon and plastic-surgeon (see the examples below (page 2654)). You could create a DITAVAL file with the following content:

```xml
<val>
  <prop action="exclude" att="audience" val="surgeon"/>
</val>
```

That DITAVAL file could then be used for a condition set (page 2641) to filter content in Author mode or during the transformation stage to filter content in the output (page 2660) and the neuro-surgeon and plastic-surgeon values would be excluded by the filter since the subject scheme defines them as subordinate values of the surgeon value.

Example: Subject Scheme Map that Defines Custom Values for the Audience Attribute

This example uses typical audience values for medical personnel (therapist, oncologist, physicist, radiologist, surgeon, and so on). The audience attribute is bound to the audienceKey value (which defines the tree of values). You can also see that it filters out all possible values for other attributes (props and otherprops) so that they won't be available in the various places where profiling attributes are presented in Oxygen XML Editor plugin (page 2656).

Example using Author mode controls:

Figure 773: Subject Scheme Author Mode Controls
Example code in Text mode:

```xml
<subjectScheme>
  <!-- A scheme that defines audience user values -->
  <subjectdef keys="audienceKey">
    <subjectdef keys="therapist"/>
    <subjectdef keys="oncologist"/>
    <subjectdef keys="physiciant"/>
    <subjectdef keys="radiologist"/>
    <subjectdef keys="surgeon">
      <subjectdef keys="neuro-surgeon"/>
      <subjectdef keys="plastic-surgeon"/>
    </subjectdef>
  </subjectdef>
  <!-- Binding the audience attribute to the values defined in the key -->
  <enumerationdef>
    <attributedef name="audience"/>
  </enumerationdef>
</subjectScheme>
```
<subjectdef keyref="audienceKey"/>
</enumerationdef>

<!--Reject all possible values for other profiling attributes-->
<enumerationdef>
    <attributedef name="props"/>
    <subjectdef/>
</enumerationdef>
<enumerationdef>
    <attributedef name="otherprops"/>
    <subjectdef/>
</enumerationdef>
</subjectScheme>

Where the Profiling Attributes are Available in Oxygen XML Editor plugin

When you edit a DITA topic in the Text or Author mode, Oxygen XML Editor plugin collects all the profiling values from the subject scheme map (page 2711) that is referenced in the map that is currently opened in the DITA Maps Manager (page 2400) (or set as the root map (page 2416)). The values of profiling attributes defined in a Subject Scheme Map are available in the following places in Oxygen XML Editor plugin (regardless of their mapping in the Profiling/Conditional Text preferences page (page 119)):

- The Profiling tab of the Edit Properties dialog box (page 2442).
- The Edit Profiling Attribute dialog box (page 2639).
- The inline profiling controls in Author mode (page 2646).
- The proposals for the attribute values in the Content Completion Assistant (page 2704).

For more information about using a DITA subject scheme map, watch our video demonstration:

https://www.youtube.com/embed/RgkVRg6k6zo

Related Information:

- Filtering Profiling Values with a DITAVAL File (page 2656)
- DITA 1.3 Specifications: Subject Scheme Maps

Filtering Profiling Values with a DITAVAL File
You can use a DITAVAL filter file to control the filtering or flagging of profiled content or to identify which values are to be used for conditional processing during a particular output.

**DITAVAL Filtering Use-Case**

Suppose that a medical publication uses the `audience` attribute to profile the content for the following types of users: therapist, physician, and surgeon. Suppose that in the output, you want to exclude any content that is profiled as surgeon value for the audience attribute.

You could use a DITAVAL filter file to exclude anything that is profiled as surgeon:

```xml
<val>
  <prop action="exclude" att="audience" val="surgeon"/>
</val>
```

If you then transform the main DITA map (page 2705) and specify the DITAVAL filter file in the transformation scenario, the output will exclude anything that is profiled as surgeon.

**DITAVAL Filter File Editor in Author Mode**

The **Author** editing mode in Oxygen XML Editor plugin offer a simple and intuitive editor for creating or modifying DITAVAL files. It provides a series of drop-down menus and text fields that allow you to easily define the filters.

*Figure 774: DITAVAL File Editor in Author Mode*

Use the +... button to display a drop-down list that contains elements that you can add at that particular location in the DITAVAL file. Clicking this button at the top (next to the **DITAVAL FILTER File** title, allows you to insert the following elements:
• **Style Conflict** - Inserts a *style-conflict element* that declares behavior to be used when one or more flagging methods collide on a single content element. You can use the simple drop-down menus to select values for the *foreground-conflict-color* and *background-conflict-color* attributes.

• **Filter** - Inserts a *prop element* that identifies an attribute to apply a filtering action on. The possible actions that you can select are *include*, *exclude*, *passthrough*, and *flag*. If you select the *flag* action, you can use the drop-down menus to select values for the *style*, *color*, and *background* attributes.

• **Flag** - Inserts a *revprop element* that identifies a value in the *rev* attribute that should be flagged in some manner. The allows actions are *include*, *passthrough*, and *flag*. If you select the *flag* action, you can use the drop-down menus to select values for the *style*, *color*, *background*, and *changebar* attributes.

See the **DITAVAL Element Specifications** for more details about the allowed filters and flags.

## How to Create a DITAVAL Filter File

To create a DITAVAL filter file, follow these steps:

1. Go to **File > New**.
2. Scroll to the **Framework templates > DITAVAL** folder.
3. Select the **Filter** template file and click **Create**.
4. Define your filters in the DITAVAL file (in **Text** or **Author** mode).
5. Save the DITAVAL file.

**Result:** The DITAVAL filter file can now be used for all of the following:

- To apply a reference to the DITAVAL file in a **Profiling Condition Set** using the **Use DITAVAL File** option in the **Condition Set** configuration dialog box (page 2641).
- You can use the **Import from DITAVAL option** (page 120) in the **Profiling/Conditional Text preferences page** (page 119) to use the DITAVAL file to define profiling attributes.
- You can use the DITAVAL file to apply the filters to the output by specifying the **DITAVAL file in the transformation scenario** (page 2617).
- You can use the filter file in the **DITA Map Completeness Check** dialog box (page 2447) when validating your **DITA map** (page 2705).
- DITAVAL files are also used when working with the DITA 1.3 **Branch Filtering** mechanism. For more details, see: Working with DITA 1.3 Branch Filtering (page 2560).
- You can define the colors and styles to be used for rendering profiled condition sets (page 2659) in **Author** mode and the **DITA Maps Manager** (page 2400) view by using a **Flag** filter in the DITAVAL file.
Related Information:

- DITAVAL Element Specifications
- Working with DITA 1.3 Branch Filtering (page 2560)
- Customizing Profiling Values with a Subject Scheme Map (page 2652)
- Styling the Rendering of Profiled Content Using a DITAVAL File (page 2659)
- Conditional Profiling Attribute Groups (page 2650)

Styling the Rendering of Profiled Content Using a DITAVAL File

If you are using a DITAVAL filter file to control the filtering of profiled content, you can define the colors and styles to be used for rendering profiled condition sets in Author mode and the DITA Maps Manager (page 2400) by defining the styles in a flag filter that is set in a DITAVAL filter file.

How to Define a Flag for a Condition Set in a DITAVAL Filter File

To define the colors and styles to be used for rendering profiled condition sets by using a flag filter in a DITAVAL filter file, follow these steps:

1. Create or edit your DITAVAL file (page 2658) to define your profiling condition set (page 2641).
2. In Author mode, define the filters for your condition set (page 2657).
3. Select Flag from the drop-down menu on in a particular Filter or Flag Revision to present additional drop-down menus that allow you to configure the colors and styles for the particular condition set.
4. Save the DITAVAL file.

Result: Test your changes by opening profiled content in Author mode or the DITA Maps Manager (page 2400) and use the options in the Profiling / Conditional Text drop-down menu to see how the changes in your DITAVAL flag are rendered.

EXAMPLE:

Using a Flag on a Filter to define the styling for a condition set like this:
will render the styling of the profiled content in **Author** mode to look like this:

```
<code>Shortcut Keys - Many of the shortcut keys
Markdown editor: *product [editor]*</code>
```

and will render the styling in the **DITA Maps Manager** view *(page 2400)* to look like this:

```
<code>Editing Schematron Quick Fixes: *product [developer developer]*
Editing SVG Files: *product [author developer editor]*
Editing XHTML Documents: *product [author author author Eclipse developer]*
*Markdown Editor: *product [author author author Eclipse developer]*
Creating New Markdown Documents: *product [author author]*</code>
```

**Related Information:**

- Filtering Profiling Values with a DITAVAL File *(page 2656)*

**Publishing Profiled DITA Content**

You can create a variety of publications or versions of your documentation from a single map by applying profiling conditions to the build.

Oxygen XML Editor plugin includes preconfigured transformation scenarios for DITA. By default, these scenarios take the current **profiling condition set** *(page 2643)* into account during the transformation, as defined in the **Filters** tab *(page 2616)* when creating a DITA transformation *(page 1444)*. You can also specify a **DITAVAL file** *(page 2656)* that defines filters for your profiled content.

*Figure 775: Profiling Option in the Filters Tab (DITA OT Transformations)*
DITA Open Toolkit Support

The DITA Open Toolkit is an open-source publishing engine that can generate various output formats (for example, HTML, PDF, CHM) from DITA content. Oxygen XML Editor plugin includes support for the DITA Open Toolkit. This section includes information about how to install and create a DITA OT plugin (page 2709), and how to use an external instance of the DITA Open Toolkit.

Related Information:

- DITA Open Toolkit Documentation

DITA-OT Plugins

The architecture of the DITA Open Toolkit's publishing engine is plugin-based. A plugin can add support for publishing DITA content as a new format or for customizing an existing output format. The DITA Open Toolkit bundled with Oxygen XML Editor plugin already has lots of plugins pre-installed but you can also install additional plugins (page 2709) or create your own.

Creating a DITA OT Plugin

Oxygen XML Editor plugin provides the ability to install additional DITA Open Toolkit plugins (page 2665) that can be found from various sources (for example, Oxygen's public GitHub repository includes some DITA-OT plugins). It is also possible to create your own plugin.

To create a DITA-OT plugin, follow these steps:

1. Create a new folder in the plugins folder located in your DITA OT directory (for example, if you are using DITA 3.2.1, the path would look like this: [OXYGEN_INSTALL_DIR]/frameworks/dita/DITA-OT3.x/plugins/MyNewPlugin).
2. Create a plugin.xml file in that same folder. This file will contain the extension points for the plugin. For example, references to the XSLT stylesheets that will be used to style the output.
**Note:** You can easily create this file by using the [DITA OT Plugin](http://www.dita-ot.org/dev/extension-points/) new document template that is included in Oxygen XML Editor plugin (from the [New from templates wizard](#) you can find this template in Framework templates > DITA > plugin.

**Example:**

```xml
<plugin id="org.metadita.specialization.music">
  <feature extension="dita.specialization.catalog.relative"
    file="catalog-dita.xml"/>
  <feature extension="dita.xsl.xhtml" file="xsl/music2xhtml.xsl"/>
</plugin>
```

**Tip:** Oxygen XML Editor plugin includes special editing support when adding extension points in the plugin.xml file. If you place the cursor in the value of the @extension attribute and press `Ctrl+Space`, a list of possible extension points is presented with links to the DITA-OT documentation. For more information about extension points that are available to use in the plugin.xml file, see: [http://www.dita-ot.org/dev/extension-points/exten](http://www.dita-ot.org/dev/extension-points/extension-points-by-plugin.html).

### 3. Install the newly created DITA-OT plugin (page 2665) by running the built-in transformation scenario called [Run DITA-OT Integrator](http://www.dita-ot.org/dev/) (page 1407) from the [Apply Transformation Scenario(s)](http://www.dita-ot.org/dev/apply-translation-scenario.html) (page 1382) or [Configure Transformation Scenario(s)](http://www.dita-ot.org/dev/configure-translation-scenario.html) (page 1502).

**Note:** If the integrator is not visible, select the Show all scenarios option in the Settings drop-down menu.

You can share your new plugin with other users who have the same DITA-OT distribution by sending them your newly created folder along with the [installation instructions](#).

**Related Information:**

- DITA Open Toolkit Documentation
- Defining the Transformation Type and Allowed Parameters in a DITA-OT Plugin (page 2666)

**Example: Creating a DITA OT Plugin for Embedding Video Resources**

To offer a detailed example of the steps required to create a new [DITA Open Toolkit](http://www.dita-ot.org/dev/) plugin (page 2709), this topic uses an example of creating an [XSLT](http://www.dita-ot.org/dev/) customization plugin that provides support for referencing video and audio content using the DITA object element and then publishing to HTML and PDF output formats. This plugin (com.oxygenxml.media) is available in the DITA Open...
The following procedure is meant to help you with creating the plugin:

1. Create a folder for your plugin in the DITA OT plugins folder (`DITA-OT-DIR/plugins/`).
2. Create a plugin.xml file (in the same plugin folder) that contains the extension points of the plugin.

**Note:** You can easily create this file by using the DITA OT Plugin template that is included in Oxygen XML Editor plugin (from the New from templates wizard (page 554) you can find this template in Framework templates > DITA > plugin).

**Example: Media Plugin File**

```xml
<plugin id="com.oxygenxml.media">
  <feature extension="package.support.name" value="Oxygen XML Editor Support"/>
  <feature extension="package.support.email" value="support@oxygenxml.com"/>
  <feature extension="package.version" value="21.0"/>
  <feature extension="dita.xsl.xhtml" value="xhtmlMedia.xsl" type="file"/>
  <feature extension="dita.xsl.xslfo" value="pdfMedia.xsl" type="file"/>
</plugin>
```

The most important extensions in it are the references to the XSLT stylesheets that will be used to style the HTML and PDF outputs.

You can find other DITA OT plugin extension points here: [http://www.dita-ot.org/dev/extension-points/extension-points-by-plugin.html](http://www.dita-ot.org/dev/extension-points/extension-points-by-plugin.html).

3. Create an XSLT stylesheet to customize the output types. In this example, to customize the HTML output, it is necessary to create an XSLT stylesheet called `xhtmlMedia.xsl` (in the same plugin folder).

**Tip:** You can find an XSLT stylesheet with content that is similar to the desired output and use it as a template to overwrite parts of your stylesheet. For example, suppose you want to overwrite HTML content produced from a DITA codeblock element. Since a DITA object element has the class attribute value - `topic/object`, you can take part of the class attribute value (topic/object) and search the DITA OT resources for a similar stylesheet. The search might find the XSLT stylesheet `DITA-OT-DIR/plugins/org.dita.xhtml/xsl/xhtml/dita2htmlImpl.xsl`.

You can use it as a starting point to overwrite the `xhtmlMedia.xsl` stylesheet. For example, the results might be:
4. Create additional XSLT stylesheets to customize all other desired output types. In this example, to customize the PDF output it is necessary to create an XSLT stylesheet called `pdfMedia.xsl` (in the same plugin folder).

In this case, you might find an appropriate XSLT stylesheet called `DITA-OT-DIR/plugins/org.dita.pdf2/xsl/fo/topic.xsl` to use as a starting point to overwrite the `pdfMedia.xsl` stylesheet, with results looking something like this:

```xml
<!--Treat video, audio or iframe objects as links-->
<xsl:template
    match="*[contains(@class, ' topic/object ')][@outputclass = 'video']">

    <xsl:variable name="target" select="@data" />
    <xsl:variable name="baseDir">
        <xsl:call-template name="substring-before-last">
            <xsl:with-param name="text" select="@xtrf" />
            <xsl:with-param name="delim" select="'/'"></xsl:with-param>
        </xsl:call-template>
    </xsl:variable>

    <fo:inline xsl:use-attribute-sets="object">
        <xsl:call-template name="commonattributes" />
        <xsl:if test="exists($target)">
            <fo:basic-link external-destination="url({$target})" xsl:use-attribute-sets="xref">
                <xsl:value-of select="$target" />
            </fo:basic-link>
        </xsl:if>
    </fo:inline>
</xsl:template>
```

5. To install the created plugin in the DITA OT, run the built-in transformation scenario called `Run DITA-OT Integrator (page 1407)` by executing it from the `Apply Transformation Scenario(s)`
dialog box (page 1382). If the integrator is not visible, select the Show all scenarios option that is available in the 🕵️‍♂️ Settings drop-down menu. For more information, see Installing a DITA-OT Plugin (page 2665).

Results of running the integrator using the media plugin example:

XSLT content is applied with priority when publishing to both HTML and PDF outputs.

a. For the HTML output, in the XSLT stylesheet DITA-OT-DIR/plugins/org.dita.xhtml/xsl/dita2html-base.xsl, a new import automatically appeared:

```xml
<xsl:import href="../plugins/com.oxygenxml.media/xhtmlMedia.xsl"/>
```

This import is placed after all base imports and thus has a higher priority. For more information about imported template precedence, see: http://www.w3.org/TR/xslt#import.

b. Likewise, for the PDF output, in the top-level stylesheet DITA-OT-DIR/plugins/org.dita.pdf2/xsl/fo/topic2fo_shell_fop.xsl, a new import statement appeared:

```xml
<xsl:import href="../../../com.oxygenxml.media/pdfMedia.xsl"/>
```

Now, you can distribute your plugin folder to anyone that has a DITA OT installation along with some simple installation notes. Your customization will work provided the templates you are overwriting have not changed from one DITA OT distribution to the other.

Related Information:

• DITA Open Toolkit Documentation

Installing a DITA-OT Plugin

Oxygen XML Editor plugin comes bundled with various DITA-OT plugins (page 2709), but the architecture of the DITA Open Toolkit also allows you to install additional plugins that can be found from various sources (for example, Oxygen’s public GitHub repository includes some DITA-OT plugins).

Installing a DITA-OT Plugin

To install a DITA-OT plugin, following this procedure:

1. Copy the additional plugin to the location of the DITA OT version you are using (by default, DITA-OT-DIR\plugins directory).
Note: If the plugin is only supported in DITA-OT 3.2.1 version, make sure that you copy the plugin to the \*[OXYGEN_INSTALL_DIR]/frameworks/dita/DITA-OT3.x directory.

2. Select the Configure Transformation Scenario(s) (page 1502) action from the DITA Maps Manager toolbar (you could also use the same action on the main toolbar or open the Transformation Scenarios view (page 1507)).

3. Select the Run DITA-OT Integrator transformation scenario (page 1407). If the integrator is not visible, select the Show all scenarios option that is available in the Settings drop-down menu.

Important: The folder where the DITA OT is located needs to have full write access permissions set to it. For example, in Windows, if you are integrating plugins in the DITA OT folder bundled with Oxygen XML Editor plugin and your application is installed in the Program Files folder, you can start the Oxygen XML Editor plugin main executable with administrative rights for the integrator process to be able to modify resources in the DITA OT folder.

4. Apply the scenario (page 1501).
5. Check the Results panel at the bottom of the application to make sure the build was successful.

Note: Starting with version 17.0, if the DITA-OT plugin declares a transtype (transformation type), Oxygen XML Editor plugin detects that transformation type declaration from the DITA OT plugin and presents descriptions in the DITA Transformation Type dialog box (page 1444). Oxygen XML Editor plugin also shows the contributed parameters from the plugin in the transformation scenario’s Parameters tab (page 2614).

Tip: You can declare the transformation type and allowed parameters by following the procedure found in: Defining the Transformation Type and Allowed Parameters in a DITA-OT Plugin (page 2666).

Related Information:

- Creating a DITA OT Plugin (page 2681)
- Installing the DITA For Publishers Package
- DITA Open Toolkit Documentation
- Defining the Transformation Type and Allowed Parameters in a DITA-OT Plugin (page 2666)
Custom **DITA-OT plugins** may contribute new transformation types (transtypes) and each transtype may have a set of allowed configuration parameters. If a DITA-OT plugin declares a **transtype**, Oxygen XML Editor plugin detects that transformation type declaration and presents descriptions in the **DITA Transformation Type** dialog box (page 1444) and the contributed parameters in the **transformation scenario's Parameters** tab (page 2614).

To define a transformation type and its contributed parameters in a DITA-OT plugin, follow this procedure:

1. If you have not already done so, create a DITA-OT **plugin.xml** file (page 2661) (you can easily create this file by using the DITA OT Plugin new document template in the New from templates wizard (page 554)).
2. In the **plugin.xml** file, define the transformation type details by using the `<transtype>` element to specify a name, description, and the transtype it extends.

   ```xml
   <transtype name="xhtml" extends="base-html" desc="HTML">
   
   </transtype>
   ```

3. Define allowed parameters by using the `<param>` element to specify the name, description, and information about the default and allowed set of values. For more information, see: [https://www.dita-ot.org/3.1/topics/plugin-configfile.html](https://www.dita-ot.org/3.1/topics/plugin-configfile.html).

   ```xml
   <param name="args.indexshow" desc="Specifies whether to show the index" type="enum">
   <val>yes</val>
   <val default="true">no</val>
   </param>
   ```

   Depending on the type declared for a parameter, Oxygen XML Editor plugin will help you pick values for each parameter edited in the **Parameters** tab of the transformation scenario dialog box. For example, for parameters of type "enum", Oxygen XML Editor plugin will present a combo box for choosing the proper value for the parameter.

4. Extend various extension points in your **plugin.xml**. For more information, see: [https://www.dita-ot.org/3.1/extension-points/plugin-extension-points.html](https://www.dita-ot.org/3.1/extension-points/plugin-extension-points.html).

5. Install the plugin (page 2665).

   **Note:** If the plugin is installed using an external command line, you may need to restart Oxygen XML Editor plugin to properly re-detect the newly contributed transtypes and parameters.

**Complete plugin.xml example:**

```xml
<plugin id="com.oxygenxml.pdf.prince">
   <!-- extensions -->
   <feature extension="dita.conductor.transtype.check" value="pdf-prince" type="txt"/>
</plugin>
```
<feature extension="dita.conductor.target.relative" value="integrator.xml" type="file"/>
<feature extension="dita.transtype.print" value="pdf-prince"/>
<transtype name="pdf-prince" extends="commons" desc="PDF (Prince XML)">
  <param name="princeExecPath" type="file" desc="Path to the Prince executable"/>
</transtype>
</plugin>

For more information, watch this DITA-OT Day 2015 presentation:

https://www.youtube.com/embed/LcrR0YUFIQ4

Built-in Third-Party DITA Open Toolkit Plugins

The DITA Open Toolkit 3.2.1 distribution that is bundled with Oxygen XML Editor plugin includes some pre-installed third-party open-source plugins (page 2709) that add extra publishing formats and functionality.

The plugins that come bundled with Oxygen XML Editor plugin include:

- **DITA For Publishers** - These plugins allow DITA content to be published to additional formats, such as EPUB 2.0 and Kindle.
- **DITA to Word** - This plugin allows users to publish DITA content to MS Word.
- **DITA Community** - These plugins allow support for DITA 1.3 with embedded or referenced MathML and SVG images.

Using an External DITA Open Toolkit in Oxygen XML Editor plugin

Oxygen XML Editor plugin comes bundled with a DITA Open Toolkit, located in the DITA-OT-DIR directory. Starting with Oxygen XML Editor plugin version 17, if you want to use an external DITA OT for all transformations and validations, you can open the Preferences dialog box (page 55) and go to the DITA page (page 66), where you can specify the DITA OT to be used. Otherwise, to use an external DITA Open Toolkit, follow these steps:

1. Edit your transformation scenarios and in the Parameters tab change the value for the dita.dir parameter to point to the new directory.
2. To make changes in the libraries that come with the DITA Open Toolkit and are used by the Ant process, go to the Advanced tab, click the Libraries button and deselect Allow Oxygen to add high priority libraries to classpath.
3. If there are also changes in the DTDs and you want to use the new versions for content completion and validation, go to the Document Type Association preferences page (page 69),
edit the **DITA** and **DITA Map** document types and modify the catalog entry in the **Catalogs** tab to point to the custom catalog file `catalog-dita.xml`.

Related Information:

- Editing a Transformation Scenario *(page 1498)*

- Creating New Transformation Scenarios *(page 1415)*

- DITA Open Toolkit Documentation

**DITA Specialization Support**

DITA is designed to let you design new markup and new document types that allow any general-purpose DITA processor to process documents that use the new markup. This in turn enables blind interchange of DITA documents from any source. In particular, in the context of a map, you can combine topics of any type and get usable results from any general-purpose DITA processor. Specialization is the one truly unique and distinguishing aspect of DITA. Even if you have no use for any aspect of DITA modularity or reuse, you still have a use for specialization simply because it enables reliable interchange in a way that no other XML application does.

For detailed information and step-by-step tutorials about DITA specializations, see **DITA 4 Practitioners: DITA Configuration and Specialization Tutorials**.

In addition, the topics in this section contain information about using DITA specializations in Oxygen XML Editor plugin.

**Integrating a DITA Specialization**

A DITA specialization can have its document type defined with any of the following:

- **DTD** - For configuration and specialization tutorials, see [http://dita4practitioners.github.io/dita-specialization-tutorials/](http://dita4practitioners.github.io/dita-specialization-tutorials/).

- **XSD** - For configuration and specialization tutorials, see [http://dita4practitioners.github.io/dita-specialization-tutorials/](http://dita4practitioners.github.io/dita-specialization-tutorials/).
A DITA specialization may optionally include specialized processing, that is new XSLT template rules that match the extension part of the class attribute values of the new elements, and thus extend the default processing available in the DITA Open Toolkit.

To integrate a DITA specialization into Oxygen XML Editor plugin, use one of the following methods:

**DITA-OT Plugin Method**

If the DITA specialization is available as a DITA Open Toolkit plugin, follow this procedure:

1. Copy the additional plugin to the location of the DITA OT version you are using (by default, DITA-OT-DIR\plugins directory).

   **Important:** The application needs to have full write access permissions to the DITA OT directory.

2. If Oxygen XML Editor plugin was installed in the default location, you may need to restart and run it as an administrator.

3. Select the Configure Transformation Scenario(s) (page 1502) action from the DITA Maps Manager toolbar (you could also use the same action on the main toolbar or open the Transformation Scenarios view (page 1507)).

4. Select the Run DITA-OT Integrator transformation scenario (page 1407).

   **Tip:** If you don't see that scenario in the Configure Transformation Scenario(s) (page 1502) dialog box or Transformation Scenarios view (page 1507), click the Settings button and select the Show all scenarios option, but don't forget to change it back to Show only the scenarios available for the editor after you are finished with this procedure.

5. Apply the scenario (page 1501).

6. Check the Results panel at the bottom of the application to make sure the build was successful.

7. Restart Oxygen XML Editor plugin with your normal permissions.

   **Tip:** Oxygen XML Editor plugin detects new document templates (page 555) contributed by the DITA OT plugin as long as you do the following:

   1. Create a new folder called template_folders inside the DITA-OT-DIR\plugins directory.
2. Create one or more subfolders inside the template_folders directory that contain the new document templates. The new document templates found in those subfolders will be available in the New document wizard.

**Alternative Methods**

If the DITA specialization is not available as a DITA OT plugin, you have the following options:

- If the DTDs that define the extension elements are located in a folder outside the DITA Open Toolkit folder, add new rules to the DITA OT catalog file. These rules are meant for resolving the DTD references from the DITA files that use the specialized elements to that folder. This allows for correct resolution of DTD references to your local DTD files and is needed for both validation and transformation of the DITA maps or topics. The DITA OT catalog file is called catalog-dita.xml and is located in the root folder of the DITA Open Toolkit.

- If there is specialized processing provided by XSLT stylesheets that override the default stylesheets from DITA OT, these new stylesheets must be called from the DITA OT Ant build scripts.

**Important:** If you are using DITA specialization elements in your DITA files, it is recommended that you activate the Enable DTD/XML Schema processing in document type detection option in the Document Type Association preferences page (page 69).

- You could create your own document templates (page 555), store them in a custom directory, then add that directory to the list of template directories that Oxygen XML Editor plugin uses by adding the directory to the list in the Document Templates Preferences (page 156) page.

**Related Information:**

**Editing DITA Map Specializations**

In addition to recognizing the default DITA map (page 2705) formats (map and bookmap), the DITA Maps Manager view (page 2400) can also be used to open and edit specializations of DITA maps.

All advanced editing actions available for the map (such as insertion actions or editing properties) allow you to specify the element in an editable combo box. The elements that initially appear in the combo box are all the elements that are allowed to appear at the insert position for the given specialization.
The topic titles rendered in the DITA Maps Manager view (page 2400) are collected from the target files by matching the `class` attribute and not a specific element name.

When editing DITA specializations of maps in the main editor, the insertions of topic reference, topic heading, topic group and conref actions should work without modification. For the table actions, you have to modify each action manually to insert the correct element name at the cursor position. You can go to the DITA Map document type from the Document Type Association preferences page (page 69) and edit the table actions to insert the element names as specified in your specialization. See Creating/Extending a Custom Framework (page 2037) for more details.

Related Information:

- DITA Configuration and Specialization Tutorials
- Integrating a DITA Specialization (page 2669)

Editing DITA Topic Specializations

In addition to recognizing the default DITA topic formats, topic specializations can also be edited in Author mode.

The content completion should work without additional modifications and you can choose the tags that are allowed at the cursor position.

The CSS styles used for rendering the elements should also work on the specialized topics without additional modifications.

The toolbar/menu actions should be customized to insert the correct element names. You can go to the DITA document type from the Document Type Association preferences page (page 69) and edit the actions to insert the element names, as specified in your specialization. See Creating/Extending a Custom Framework (page 2037) for more details.

Translating DITA Projects Overview

This topic contains some general information about translating DITA content and is meant to help those who do not store their DITA projects through a Content Management System (CMS) or other type of service that already includes their own translation support.

Choosing a Translation Agency

To minimize translation costs, it is recommended to choose a translation agency that is able to handle DITA content directly, without requiring you to convert the content to some intermediary format. This means that you benefit from the DITA reusable content features (page 2529).

If you plan to translate your DITA project, it is also recommended that you contact a DITA-aware translation agency as early in your process as possible because translation agencies who translate DITA content directly usually need to have a preliminary discussion about how your project is structured, which terms need to be skipped when translating, how various measuring units are translated, how content is reused, your metadata strategy, and how screenshots are handled. Those discussions may influence the way that you organize and write your DITA content.

Note: If your translation agency does not directly handle DITA content, there are commercial tools that can be used to convert DITA to XLiff (for example, https://www.maxprograms.com/products/fluenta.html).

Optimizing Content for Translation

In general, there are three main principles to take into account when writing DITA content that will be translated:

1. Use a controlled vocabulary (for example, the Simplified Technical English vocabulary).
2. Avoid reusing inline elements other than product names. The following DITA Users List discussion describes the reasons for this: https://lists.oasis-open.org/archives/dita/201301/msg00029.html.
3. Avoid profiling/filtering content at inline level, for similar reasons.

General DITA Project Structure

It is usually considered best practice to organize your DITA maps/topics in a separate folder for each language. One folder that contains the English version of all of your DITA resources and a separate
folder for each of the other languages you will translate with equivalent DITA resources translated in that specific language.

General Translation Workflow

When translating DITA content, the most common workflow involves these steps:

1. Create your content in the primary language.
2. Before each release, you gather all the DITA files that have been changed and need to be translated. The Oxygen Translation Package Builder Add-on could be handy for this.
3. Send a copy of the relevant DITA files to the translation agency (known also as "localization service provider").
4. Receive translated DITA content back from the translation agency and integrate it in each language-specific project folder (page 2673).

Publishing Translated Content

All of your translated DITA maps and topics should have the xml:lang attribute set with the appropriate value on the root element. Along with the actual translated content, the published output may also contain various static text (such as the word Table followed by the table number, Figure following by the number, or Note appearing before the content of each DITA <note> element). The DITA Open Toolkit includes support for various languages for HTML-based output and PDF-based output. You can also add support for other languages: Globalizing DITA Content: Customizing Generated Text. For information about how to add a new language to the Oxygen WebHelp Responsive output, see Adding a New Language (page 1716).

Liability

Translation agencies usually do not assume any liability for incorrectly translated content. If possible, it is recommended to have someone who is familiar with the particular language be responsible for reviewing and accepting the translated content. For example, if your company has regional headquarters located in various countries, perhaps someone from each headquarters could review the translated content.

Other Resources

Here are some links to other resources that might help you with translating DITA projects:

- CIDM Best Practices: Successful Localization in DITA
- DITA Translation: Organizing Your DITA Files
Master Files Support in DITA

Oxygen XML Editor plugin includes a feature that allows you to define Master Files (page 2708) at project level. This feature is typically used in Oxygen XML Editor plugin for XML documents to determine the context for operations such as validation, content completion, refactoring, searches, or displaying components collected from various modules. For DITA projects, this feature has a more limited purpose in Oxygen XML Editor plugin since it is mainly used to provide the means for updating references to moved or renamed resources.

Since you can move or rename DITA resources (such as topics and maps) in the DITA Maps Manager (page 2400), the root map (page 2711) is used as the scope to update all the references to the moved or renamed resources. However, you do not have this option for non-DITA resources (such as folders, images, HTML files, audio, video, text files, Markdown documents) since they do not appear in the DITA Maps Manager. Also, when moving DITA resources in the DITA Maps Manager, you have to do it one at a time.

You can use the Master Files support in DITA to update all the references to moved or renamed resources in the scope of the Master Files, and since the root map (page 2711) will be set as the Master File, you achieve the same result as if you were moving or renaming them in the DITA Maps Manager. It also allows you to move multiple DITA resources (or entire folders) at once in the Navigator view (page 250), instead of the DITA Maps Manager, while still giving you the option of updating all the references.

How to Enable Master Files Support in DITA

To use the Master Files support in DITA, follow these steps:

1. Go to the Navigator view (page 250) and select Enable Master Files Support from the contextual menu of the project root folder.
2. Add the main DITA map (root map) (page 2711) to the Master Files folder by doing one of the following:
   • Right-click the project root folder or the Master Files folder and select Detect Master Files from Project.
   • Manually add the root map (page 2711) to the Master Files folder by right-clicking a file from your project and selecting Add to Master Files from the contextual menu (or simply drag and drop it into the Master Files folder).
Tip: You can set multiple maps in the Master Files folder and all of them will automatically be added to the list of root maps you can select from the drop-down menu in the DITA Maps Manager toolbar (page 2405).

Moving or Renaming Non-DITA Resources and Updating the References to Them

With the Master Files support enabled, you can move or rename non-DITA resources (such as folders, images, HTML files, audio, video, text files, Markdown documents) or move multiple normal DITA resources (or entire folders) in the Navigator view (page 250) and Oxygen XML Editor plugin will offer the option of updating all the references to the moved or renamed resources in the scope of the Master Files (in this case, the main DITA map (root map) (page 2711)).

To move or rename non-DITA resources (or move multiple DITA resources) and update the references to them, follow these steps:

1. Enable Master Files support and add your root DITA map (page 2711) to the Master Files folder as described in the How to Enable Master Files Support in DITA (page 2675) section above.
2. Go to the Navigator view (page 250), and use one of the following methods to move or rename the resources:

   Moving Resources
   
   To move resources in the Navigator view (page 250), do one of the following:
   
   • Simply drag and drop the resource to the new location in the tree structure.
   • Use the Move action (or Copy and Paste actions) from the contextual menu.
   • Right-click the resource and select Refactoring > Move resource action from the contextual menu. Note that this method also allows you to specify a new name and destination path in the Move resource dialog box.

   Result: In all cases, a Move resource dialog box will be presented.

   Renaming Resources
   
   To rename resources in the Navigator view (page 250), do one of the following:
   
   • Select the resource and press F2, or simply left-click again, until the in-place editor allows you to change the file name.
   • Right-click the resource and select Rename or Refactoring > Rename resource.

   Result: In all cases, a Rename resource dialog box will be presented.
3. Make sure the **Update references of the moved resource(s)** option is selected in the resulting **Move** or **Rename** dialog box and keep the scope as **master files** to make sure all the references to the moved or renamed resource are updated.

**Metadata**

Metadata is a broad concept that describes data that explains or identifies other data. Metadata can be used for many purposes, from driving automation of document builds to enabling authors and readers to find content more easily. DITA provides numerous types of metadata, each of which is used and created differently. Some of the most important forms of metadata in DITA are topic and taxonomy.

**Topic Metadata**

Topic metadata describes the topic and what it is about. Topic metadata can be inserted in the `prolog` element of a topic or inside the `topicref` element that points to a topic from a map. In other words, metadata about the topic can be asserted by the topic itself, or can be assigned to it by the map that includes it in the build. This allows multiple maps to assign different metadata to the same topic. This may be appropriate when you want to describe a topic differently in various documents.

**Taxonomy and Subject Scheme**

A taxonomy is a controlled vocabulary. It can be used to standardize how many things in your content and metadata are named. This consistency in naming can help ensure that automated processes work correctly, and that consistent terminology is used in content, and in metadata. In DITA, taxonomies are created using **subject scheme maps (page 2711)**. When you are authoring, many of the values you choose from have been defined in **subject scheme maps**.

**Migrating MS Office Documents to DITA**

Oxygen XML Editor plugin integrates the entire **DITA for Publishers plugins suite** and includes some helpful tools that allows you to migrate content from Microsoft Office® Word (and other similar types of documents) to DITA. Migration from proprietary formats to XML is rarely perfect and manual changes may need to be made to the converted content, but the methods described below should help you find the best approach for your particular case:
Method 1 (Single Document)

1. Open the document in MS Office (or other similar application), select all the content, and copy it.
2. Open Oxygen XML Editor plugin and create a new DITA topic.
3. Paste the selected content in Author mode. The Smart Paste functionality (page 696) will attempt to convert the content to DITA.

Method 2 (Single Document)

1. Save your document as HTML.
2. Once you have converted it to HTML, you have several possibilities:
   - In Oxygen XML Editor plugin, select File > Import > HTML File to import it as XHTML. Then, open the XHTML in Oxygen XML Editor plugin and use one of the XHTML to DITA Transformation Scenarios (page 1345) to convert the content to DITA.
   - Open the HTML file in any Web browser, select all of its content, and copy it. Then, open Oxygen XML Editor plugin, create a new DITA topic and paste the selected content in Author mode. The Smart Paste functionality (page 696) will attempt to convert the HTML content to DITA.

Method 3 (Single Document)

1. Open the document in the free Libre Office application and save it as DocBook.
2. Open the DocBook document in Oxygen XML Editor plugin.
3. Run the built-in transformation scenario called DocBook to DITA (page 1413).
4. You may need to make some manual adjustments for elements that couldn't be mapped.

Method 4 (Single Document)

1. Save the document in the MS Word DOCX format.
2. Open it in the Archive Browser view (page 1910) in Oxygen XML Editor plugin and then open the document.xml file contained in the archive.
3. Run the built-in transformation scenario (page 2604) called DOCX DITA. This scenario runs a build file over the DOCX archive and should produce a DITA project that contains a DITA map and multiple topics.
4. You may need to do some manual reconfiguration to map DOCX styles to DITA content.
Method 5 (Multiple Documents)

1. Use a tool to convert the documents to DocBook. For example, Pandoc is a free document converter engine that can convert DOCX documents to DocBook and according to Pandoc’s manual, you can specify multiple input files and use wildcards in the commands.
2. Save the newly converted DocBook documents somewhere in your project.
3. Perform a batch transformation (page 1506) on all the newly converted DocBook documents:
   a. Select all the DocBook documents in the Navigator view (page 250).
   b. Right-click the selected files and choose Transform > Configure Transformation Scenario(s).
   c. Apply the built-in transformation scenario called DocBook to DITA (page 1413).
4. You may need to make some manual adjustments in the resulting documents for elements that couldn't be mapped.

DITA 1.3 Support

Starting with version 17.1, Oxygen XML Editor plugin includes support for some DITA 1.3 features.

The Oxygen XML Editor plugin publication of the full DITA 1.3 specifications can be found at https://www.oxygenxml.com/dita/1.3/specs/index.html#introduction/dita-release-overview.html.

The following table is a list of DITA 1.3 features and their implementation status in Oxygen XML Editor plugin:
Table 78. DITA 1.3 Features Implementation Status

<table>
<thead>
<tr>
<th>Feature</th>
<th>Editing</th>
<th>Publishing [DITA Open Toolkit 3.2.1 is used]</th>

**DITA Topic Author Mode Actions**

A variety of actions are available for the DITA framework *(page 2706)* that can be found on the toolbar, the contextual menu, or the DITA menu.
DITA Toolbar Actions

The following default actions are readily available on the DITA (Author Custom Actions) toolbar when editing in Author mode (by default, most of them are also available in the DITA menu and in various submenus of the contextual menu):

**Bold**
Surrounds the selected text with a `b` tag. You can use this action on multiple non-contiguous selections.

**Italic**
Surrounds the selected text with an `i` tag. You can use this action on multiple non-contiguous selections.

**Underline**
Surrounds the selected text with a `u` tag. You can use this action on multiple non-contiguous selections.

**Link Actions Drop-Down Menu**

The following link actions are available from this menu:

**Cross Reference**
Opens the Cross Reference (xref) dialog box (page 2572) that allows you to insert a link to a target DITA resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map (page 2705) structure. Once the target resource has been selected, you can also target specific elements within that resource. For more information, see Linking in DITA Topics (page 2571).

**File Reference**
Opens the File Reference dialog box (page 2572) that allows you to insert a link to a target non-DITA file resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. For more information, see Linking in DITA Topics (page 2571).

**Web Link**
Opens the Web Link dialog box (page 2573) that allows you to insert a link to a target web-related resource at the current location within a document. The target resource can be a URL or a key that is already defined in your
A DITA map structure. For more information, see Linking in DITA Topics (page 2571).

Related Link to Topic

Opens the Cross Reference (xref) dialog box (page 2573) that allows you to insert a link to a target DITA resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. Once the target resource has been selected, you can also target specific elements within that resource. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics (page 2571).

Related Link to File

Opens the File Reference dialog box (page 2573) that allows you to insert a link to a target non-DITA file resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics (page 2571).

Related Link to Web Page

Opens the Web Link dialog box (page 2573) that allows you to insert a link to a target web-related resource in a related links section at the bottom of the current document. The target resource can be a URL or a key that is already defined in your DITA map structure. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics (page 2571).

Insert Image

Opens the Insert Image dialog box (page 2471) that allows you to configure the properties of an image to be inserted into a DITA document at the cursor position.

Insert Media Resource

Opens the Insert Media dialog box (page 2475) that allows you to select and configure the properties of a media object to be inserted into a DITA document at the cursor position. The result will be that a reference to the specified video, audio, or embedded HTML frame is inserted in an object element and it is rendered in Author mode so that it can be played directly from there.

Insert Section Drop-Down Menu

The following insert actions are available from this menu:
Insert Section
Inserts a new section element in the document, depending on the current context.

Insert Concept
Inserts a new concept element, depending on the current context. Concepts provide background information that users must know before they can successfully work with a product or interface.

Insert Task
Inserts a new task element, depending on the current context. Tasks are the main building blocks for task-oriented user assistance. They generally provide step-by-step instructions that will help a user to perform a task.

Insert Topic
Inserts a new topic element, depending on the current context. Topics are the basic units of DITA content and are usually organized around a single subject.

Insert Reference
Inserts a new reference element, depending on the current context. A reference is a top-level container for a reference topic.

Insert Paragraph
Inserts a new paragraph at current cursor position.

Reuse Content
This action provides a mechanism for reusing content fragments. It opens the Reuse Content dialog box (page 2542) that allows you to insert several types of references to reusable content at the cursor position. The types of references that you can insert using this dialog box include content references (conref) (page 2543), content key references (conkeyref) (page 2545), or key references to metadata (keyref) (page 2548).

Insert step or list item
Inserts a new list or step item in the current list type.

Insert Unordered List
Inserts an unordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an unordered list.
Insert Ordered List

Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

Sort

Sorts cells or list items in a table.

Insert Table

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a block element on page 2703) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

Note: If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that Only lists, paragraphs, or inline content can be converted to tables.

Insert Row Below

Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

Delete Row(s)

Deletes the table row located at cursor position or multiple rows in a selection.

Insert Column After

Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

Delete Column(s)

Deletes the table column located at cursor position or multiple columns in a selection.

Table Properties

Opens the Table properties dialog box that allows you to configure properties of a table (such as frame borders).

Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell
Splits the cell at the cursor location. If Oxygen XML Editor plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

DITA Contextual Menu Actions

In addition to many of the DITA toolbar actions (page 1315) and the general Author mode contextual menu actions (page 840), there are numerous DITA-specific actions that are available in the contextual menu when editing DITA documents in Author mode (most of them are also available in the DITA menu at the top of the interface):

1. **Edit Attributes**
   Displays an in-place attributes editor (page 322) that allows you to manage the attributes of an element.

2. **Edit Profiling Attributes**
   Allows you to change the profiling attributes (page 746) defined on all selected elements.

3. **Cut (Ctrl + X (Command + X on OS X))**
   Removes the current selected content from the document and places it in the clipboard.

4. **Copy (Ctrl + C (Command + C on OS X))**
   Places a copy of the current selected content in the clipboard.

5. **Paste (Ctrl + V (Command + V on OS X))**
   Inserts the current clipboard content into the document at the cursor position.

   **Paste special submenu**
   This submenu includes the following special paste actions that are specific to the DITA framework:

   - **Paste as content reference**
     Inserts a content reference (a DITA element with a `conref` attribute) to the DITA XML element from the clipboard. An entire DITA XML element with an ID attribute must be present in the clipboard when the action is invoked. The `conref` attribute will point to this ID value.

   - **Paste as content key reference**
     Allows you to indirectly reference content using the `conkeyref` attribute. When the DITA content is processed, the key references are resolved using
key definitions from DITA maps (page 2705). To use this action, you must first do the following:

1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
2. In the DITA Maps Manager view, make sure that the Root map combo box (page 2405) points to the correct map that stores the keys.
3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the DITA Maps Manager, select Edit Properties, and enter a value in the Keys field.

Paste as link

Looks for the first element with an ID value in the clipboard and inserts an xref that points to that element. If no elements with an ID value are found, a message will appear that informs you that to use this action, the clipboard contents must include at least one element with a declared ID.

Paste as link (keyref)

Inserts a link to the element that you want to reference. To use this action, you must first do the following:

1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
2. In the DITA Maps Manager view, make sure that the Root map combo box (page 2405) points to the correct map that stores the keys.
3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the DITA Maps Manager, select Edit Properties, and enter a value in the Keys field.

Insert submenu

This submenu includes the following insert actions that are specific to the DITA framework:

- Insert Table

  Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a block element (page 2703)) into a
table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

**Note:** If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that *Only lists, paragraphs, or inline content can be converted to tables.*

**Insert Image**

Inserts an image reference *(page 798)* at the cursor position. Depending on the current location, an image-type element is inserted.

**Insert Media Resource**

Opens a *Choose Media dialog box (page 830)* that allows you to select the URL of a media object to be inserted into a document at the cursor position. The result will be that a reference to the specified video, audio, or embedded HTML frame is inserted and rendered in **Author** mode so that it can be played directly from there.

**Insert Equation**

Opens the *XML Fragment Editor* that allows you to insert and edit MathML notations *(page 832).*

**Insert Paragraph**

Inserts a new paragraph at current cursor position.

**Insert Section**

Inserts a new *section* element in the document, depending on the current context.

**Insert Topic**

Inserts a new *topic* element, depending on the current context. Topics are the basic units of DITA content and are usually organized around a single subject.

**Insert Entity**

Allows you to insert a predefined entity or character entity. Surrogate character entities (range #x10000 to #x10FFFF) are also accepted. Character entities can be entered in one of the following forms:

- `#<decimal value>` - e. g. #65
- `&#<decimal value>;` - e. g. &#65
- `#x<hexadecimal value>` - e. g. #x41
• &lt;hexadecimal value&gt; - e.g. &amp;#x41

**Image Map Editor**

This action is available in the contextual menu when it is invoked on an image. This action applies an image map to the current image (if one does not already exist) and opens the Image Map Editor dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.

**Table Actions**

The following table editing actions are available in the contextual menu when it is invoked on a table:

- **Insert Rows**
  
  Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (Above or Below the current row).

- **Delete Row(s)**
  
  Deletes the table row located at cursor position or multiple rows in a selection.

- **Insert Columns**
  
  Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (Above or Below the current column).

- **Delete Column(s)**
  
  Deletes the table column located at cursor position or multiple columns in a selection.

- **Join Cells**
  
  Joins the content of the selected cells (both horizontally and vertically).

- **Split Cell**
  
  Splits the cell at the cursor location. If Oxygen XML Editor plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

- **Sort**
  
  Sorts cells or list items in a table.
Opens the **Table properties** dialog box that allows you to configure properties of a table (such as frame borders).

**Other Actions submenu**

This submenu give you access to all the usual contextual menu actions.

🔗 **Link submenu**

The following link actions are available from this submenu:

**Cross Reference**

Opens the **Cross Reference (xref)** dialog box *(page 2572)* that allows you to insert a link to a target DITA resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your **DITA map (page 2705)** structure. Once the target resource has been selected, you can also target specific elements within that resource. For more information, see **Linking in DITA Topics (page 2571)**.

**File Reference**

Opens the **File Reference** dialog box *(page 2572)* that allows you to insert a link to a target non-DITA file resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your **DITA map** structure. For more information, see **Linking in DITA Topics (page 2571)**.

**Web Link**

Opens the **Web Link** dialog box *(page 2573)* that allows you to insert a link to a target web-related resource at the current location within a document. The target resource can be a URL or a key that is already defined in your **DITA map** structure. For more information, see **Linking in DITA Topics (page 2571)**.

**Related Link to Topic**

Opens the **Cross Reference (xref)** dialog box *(page 2573)* that allows you to insert a link to a target DITA resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your **DITA map** structure. Once the target resource has been selected, you can also target specific elements within that resource. If a related links section does not already exist, this action creates one. For more information, see **Linking in DITA Topics (page 2571)**.
Related Link to File

Opens the File Reference dialog box (page 2573) that allows you to insert a link to a target non-DITA file resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics (page 2571).

Related Link to Web Page

Opens the Web Link dialog box (page 2573) that allows you to insert a link to a target web-related resource in a related links section at the bottom of the current document. The target resource can be a URL or a key that is already defined in your DITA map structure. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics (page 2571).

Sort

Available when invoked on a list, it opens a dialog box where you can configure a sorting operation for an entire list or a selection of list items.

Generate IDs

Oxygen XML Editor plugin generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the ID Options dialog box that are found in the current selection.

Note: The Generate IDs action does not overwrite existing ID values. It only affects elements that do not already have an id attribute.

Reuse submenu

This submenu includes the following actions regarding reusing content in DITA:

Reuse Content

This action provides a mechanism for reusing content fragments. It opens the Reuse Content dialog box (page 2542) that allows you to insert several types of references to reusable content at the cursor position. The types of references that you can insert using this dialog box
include content references (*conref*) *(page 2543)*, content key references (*conkeyref*) *(page 2545)*, or key references to metadata (*keyref*) *(page 2548)*.

**Push Current Element**

Opens the **Push current element** dialog box *(page 2552)* that allows content from a source topic to be inserted into another topic without any special coding in the topic where the content will be re-used.

**Edit Content Reference**

This action is available for elements with a *conref* or *conkeyref* attribute. It opens the **Edit Content Reference** dialog box that allows you to edit the source location (or key) and source element of a content reference (or content key reference), and the reference details (*conref*/*conkeyref* and *conrefend* attributes). For more information, see **Reuse Content Dialog Box** *(page 2542)*.

**Replace Reference with Content**

Replaces the referenced fragment (*conref* or *conkeyref*) at the cursor position with its content from it source. This action is useful if you want to make changes to the content in the currently edited document without changing the referenced fragment in its source location. If the source content includes references to other topics/resources (*hrefs*), the operation also resolves those references relative to the new location. Attributes are preserved according to the following priority:

1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a `-dita-use-conref-target` value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for `id` attributes.

**Replace All References with Content**

Replaces all referenced fragments (*keyref*, *conref*, or *conkeyref*) in the current document with the content. Attributes are preserved according to the following priority:

1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a `-dita-use-conref-target` value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for id attributes.

For keyrefs inside xref or link elements, the keyref attribute is changed to an href attribute, while the rest of the content for the keyref is replaced with its source content.

If the source content includes references to other topics/resources (hrefs), the operation also resolves those references relative to the new location.

**Remove Content Reference**

Removes the content reference (conref or conkeyref) inside the element at the cursor position.

**Create Reusable Component**

Creates a reusable component from the selected fragment of text. For more information, see [Creating a Reusable Content Component](page 2555).

**Insert Reusable Component**

Inserts a reusable component at cursor location. For more information, see [Inserting a Reusable Content Component](page 2556).

**Search References (Ctrl + Shift + G)**

Finds the references to the id attribute value for the element at the current cursor position, in all the topics contained in the current DITA map (page 2705) (opened in the DITA Maps Manager view (page 2400)). If no references are found for the current element, a dialog box will be displayed that offers you the option of searching for references to its ancestor elements.

**Figure 776: Search References to Ancestors Dialog Box**

![Search References to Ancestors Dialog Box](image)

**Show Key Definition**

Available for elements that have a conkeyref or keyref attribute set (or elements with an ancestor element that has a conkeyref or keyref attribute). It computes the key name and opens the DITA map (page 2705) that contains the definition of the key with the element that defines that key selected.
About Element submenu

This submenu includes the following actions:

**Style Guide**

Opens the [DITA Style Guide Best Practices for Authors](#) in your browser and displays a topic that is relevant to the element at the cursor position. When editing DITA documents, this action is available in the contextual menu of the editing area (under the About Element sub-menu), in the DITA menu, and in some of the documentation tips that are displayed by the *Content Completion Assistant*(page 2704).

**Browse reference manual**

Opens a reference to the documentation of the XML element closest to the cursor position in a web browser.

**Go to Definition**

Moves the cursor to the definition of the current element.

Select submenu

This submenu allows you to select the following:

**Element**

Selects the entire element at the current cursor position.

**Content**

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

**Parent**

Selects the entire parent element at the current cursor position.

Text submenu

This submenu contains the following actions:

**To Lower Case**

Converts the selected content to lower case characters.

**To Upper Case**

Converts the selected content to upper case characters.

**Capitalize Sentences**
Converts to upper case the first character of every selected sentence.

**Capitalize Words**
Converts to upper case the first character of every selected word. 0034

**Count Words**
Counts the number of words and characters (no spaces) in the entire document or in the selection for regular content and read-only content.

*Note:* The content marked as deleted with change tracking (page 2711) is ignored when counting words.

**Convert Hexadecimal Sequence to Character (Ctrl + Shift + H (Command + Shift + H on OS X))**
Converts a sequence of hexadecimal characters to the corresponding Unicode character (page 602). The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the 0x or 0X prefix. Examples of valid sequences and the characters they will be converted to:

- 0x0045 will be converted to E
- 0x0125 to #
- 265 to #
- 2190 to #

*Note:* For more information about finding the hexadecimal value of a character, see Finding the Decimal, Hexadecimal, or Character Entity Equivalent (page 609).

**Refactoring submenu**
Contains a series of actions designed to alter the XML structure of the document:

**†† Toggle Comment**
Encloses the currently selected text in an XML comment, or removes the comment if it is commented.

**Move Up (Alt + UpArrow)**
Moves the current node or selected nodes in front of the previous node.

**Move Down (Alt + DownArrow)**
Moves the current node or selected nodes after the subsequent node.

**Split Element**

Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

**Join Elements**

Joins two adjacent *block elements (page 2703)* that have the same name. The action is available only when the cursor position is between the two adjacent *block elements*. Also, joining two *block elements* can be done by pressing the **Delete** or **Backspace** keys and the cursor is positioned between the boundaries of these two elements.

**Surround with Tags (Alt + Shift + E)**

Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

- If the **Position cursor between tags** option *(page 101)* is selected in the **Content Completion** preferences page, the cursor is placed between the start and end tag.
- If the **Position cursor between tags** option *(page 101)* is not selected in the **Content Completion** preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

**Surround with ['tag'] (Alt + Shift + ForwardSlash)**

Surround the selected content with the last tag used.

**Rename Element**

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the **Rename** dialog box.

**Delete Element Tags**

Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the **Delete** or **Backspace** keys.

**Remove All Markup**
Removes all the XML markup inside the selected block of content and keeps only the text content.

Remove Text

Removes the text content of the selected block of content and keeps the markup intact with empty elements.

DITA Refactoring Actions

A variety of built-in XML refactoring operations that pertain to DITA documents with some of the information preconfigured based upon the current context.

Change Topic ID to File Name

Use this operation to change the ID of a topic to be the same as its file name.

Convert CALS Tables to Simple Tables

Use this operation to convert DITA CALS tables to simple tables. If you invoke this operation from a nested table (a table inside a table), only the nested table will be affected. If it is invoked on a parent table that contains nested tables, all of the contained tables will be converted.

Convert conrefs to conkeyrefs

Use this operation to convert conref attributes to conkeyref attributes.

Convert Simple Tables to CALS Tables

Use this operation to convert DITA simple tables to CALS tables. If you invoke this operation from a nested table (a table inside a table), only the nested table will be affected. If it is invoked on a parent table that contains nested tables, all of the contained tables will be converted.

Convert to Concept

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

Convert to General Task

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA General Task is a less restrictive alternative to the Strict Task information type.
Convert to Reference
Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

Convert to Task
Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

Convert to Topic
Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

Convert to Troubleshooting
Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

Rename Key
Available when invoked on a key, and can be used to quickly rename a key. It also updates all references to it. Note that it does not work on DITA 1.3 key scopes.

Attributes Refactoring Actions
Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

Add/Change attribute
Allows you to change the value of an attribute or insert a new one.

Convert attribute to element
Allows you to change an attribute into an element.

Delete attribute
Allows you to remove one or more attributes.

Rename attribute
Allows you to rename an attribute.

Replace in attribute value
Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

Comments Refactoring Actions
Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

**Delete comments**

  Allows you to delete comments found inside one or more elements.

**Elements Refactoring Actions**

Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

**Delete element**

  Allows you to delete elements.

**Delete element content**

  Allows you to delete the content of elements.

**Insert element**

  Allows you to insert new elements.

**Rename element**

  Allows you to rename elements.

**Unwrap element**

  Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

**Wrap element**

  Allows you to surround elements with element tags.

**Wrap element content**

  Allows you to surround the content of elements with element tags.

**Fragments Refactoring Actions**

Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

**Insert XML fragment**

  Allows you to insert an XML fragment.

**Replace element content with XML fragment**
Allows you to replace the content of elements with an XML fragment.

**Replace element with XML fragment**

Allows you to replace elements with an XML fragment.

**Review submenu**

This submenu includes the following actions:

- **Track Changes**
  Enables or disables the Track Changes (page 2711) support for the current document.

- **Accept Change(s) and Move to Next**
  Accepts the Tracked Change (page 2711) located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is accepted.

- **Accept All Changes**
  Accepts all Tracked Changes (page 2711) in the current document.

- **Reject Change(s) and Move to Next**
  Rejects the Tracked Change (page 2711) located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is rejected.

- **Reject All Changes**
  Rejects all Tracked Changes (page 2711) in the current document.

- **Comment Change**
  Opens a dialog box that allows you to add a comment to an existing Tracked Change (page 2711). The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

- **Highlight**
  Enables the highlighting tool that allows you to mark text in your document.

**Colors**
Allows you to select the color for highlighting text.

**Stop highlighting**

Use this action to deactivate the highlighting tool.

**Remove highlight(s)**

Use this action to remove highlighting from the document.

**Add Comment**

Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).

**Show/Edit Comment**

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

**Remove Comment**

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

**Manage Reviews**

Opens the Review view (page 742).

**Folding submenu**

This submenu includes the following actions:

- **Toggle Fold**
  
  Toggles the state of the current fold.

- **Collapse Other Folds** (Ctrl + NumPad/ (Command + NumPad/ on OS X))
  
  Folds all the elements except the current element.

- **Collapse Child Folds** (Ctrl + NumPad- (Command + NumPad- on OS X))
  
  Folds the elements indented with one level inside the current element.

- **Expand Child Folds** (Ctrl + NumPad+ (Command + NumPad+ on OS X))
  
  Unfolds all child elements of the currently selected element.

- **Expand All** (Ctrl + NumPad* (Command + NumPad* on OS X))
  
  Unfolds all elements in the current document.

**Inspect Styles**
Opens the **CSS Inspector view** ([page 329](#)) that allows you to examine the CSS rules that match the currently selected element.

**Options**

Opens the **Author mode options page** ([page 110](#)).

**DITA Drag/Drop (or Copy/Paste) Actions**

Dragging a file from the **Navigator view** ([page 250](#)) or **DITA Maps Manager view** ([page 2400](#)) and dropping it into a DITA document that is edited in **Author** mode, creates a link to the dragged file (the xref DITA element with the href attribute) at the drop location. Copy and paste actions work the same.

You can also drag images or media files from your system explorer or the **Navigator view** ([page 250](#)) and drop them into a DITA document (or copy and paste). This will insert the appropriate element at the drop or paste location (for example, dropping/pasting an image will insert the DITA image element with an href attribute).

**Tip:** For information about customizing **Author** mode actions for a particular **framework** ([page 2706](#)) (document type), see the **Configuring Actions, Menus, Toolbars, Content Completion for a Framework** ([page 2038](#)) section.

**Related Information:**

- **Configuring Actions, Menus, Toolbars, Content Completion for a Framework** ([page 2038](#))
21. Glossary

Active Cell

*Active cell* refers to the selected cell where data is entered when you begin typing. Only one cell is active at a time. The *active cell* is bounded by a heavy border.

Alternate CSS Style

The *Alternate CSS Style* refers to the choices in the bottom half of *Styles* drop-down menu (on the toolbar) that makes it easy to apply style changes to your documents as they appear in *Author* mode and the output without having to edit the CSS stylesheets. By default, the *alternate styles* are applied like layers, they are merged sequentially with the *main CSS style* (page 2707), and you can activate any number of them. However, if you deselect the *Enable multiple selection of alternate CSSs option* (page 78) in the *CSS* subtab of the *Document Type* configuration dialog box (page 72), the *alternate styles* are treated like *main CSS styles* (page 2707) and you can only select one at a time.

For more information, see Configuring and Managing Multiple CSS Styles for a Framework (page 2063).

Anchor

An *Anchor* is used in various types of links to take the user to a specific location within the target document. It is designated in a URL or in the value of the *href* attribute with a # symbol followed by the anchor that is defined in a target ID (for example *href*="MyTopic.dita#anchor").

Apache Ant

*Apache Ant* (Another Neat Tool) is a software tool for automating software build processes.

Block Element

A *block element* is intended to be visually separated from its siblings, usually vertically. For instance, paragraphs and list items are *block elements*. It is distinct from a *inline element*, which has no such separation.
Bookmap

A **bookmap** is a specialized DITA map used for creating books. A bookmap supports book divisions such as chapters and book lists such as indexes.

Callout

A **callout** is a string of text inside a graphic and is connected to a specific location in a document by a line. Oxygen XML Editor plugin uses callouts to present comments and other types of review modifications.

Canonicalize

To **canonicalize** something means to convert it to a standard format that everyone generally uses. When using the term with regards to XML, it refers to the process of converting data that has more than one possible representations into a standardization that conforms to the specification of an XML document or document subset. It is helpful for applications that require the ability to test whether or not the content of an XML document or subset has been changed.

Content Completion Assistant

The **Content Completion Assistant** refers to a very helpful mechanism in Oxygen XML Editor plugin that offers a list of proposed items that could be inserted at the current location, depending on the current context, editing mode, and type of document. It also tries to determine the most logical choice in the current editing context and displays that proposal at the beginning of the list.

For more information about this feature and how to invoke it, depending on your editing context, see the following:

- Content Completion Assistant in Author Mode *(page 699)*
- Content Completion Assistant in Text Mode *(page 627)*
- Content Completion Assistant in Grid Mode *(page 671)*
- Content Completion in XSLT Stylesheets *(page 964)*
- Content Completion in XML Schema *(page 1052)*
- Content Completion in XQuery *(page 1101)*
- Content Completion Assistance in WSDL Documents *(page 1121)*
- Content Completion in CSS Stylesheets *(page 1146)*
- Content Completion in Relax NG Schemas *(page 1156)*
- Content Completion in NVDL Schemas *(page 1173)*
- Content Completion in JavaScript Documents *(page 1208)*
Dockable

A Dockable window is one that can be moved and resized, and either floated or pinned to a location, allowing you to configure the workspace according to your preferences.

Document Fragment

A document fragment represents a portion of an XML document’s tree of nodes or content.

Document Type Association

In general terms, a Document Type Association is a set of rules that associate a document type with a framework (page 2706). In Oxygen XML Editor plugin, Document Type Association also specifically refers to a preferences page (page 69) where you can create new custom frameworks or edit existing ones. Note that frameworks (document types) that come built-in with Oxygen XML Editor plugin are read-only, but you can Extend (page 70) or Duplicate (page 70) them to configure them as custom frameworks.

DITA Map

A DITA map is a component of the DITA framework (page 2706) that provides the means for a hierarchical collection of DITA topics that can be processed to form an output. Maps do not contain the content of topics, but only references to them. These are known as topic references. Usually the maps are saved on disk or in a CMS with the extension .ditamap.

Maps can also contain relationship tables that establish relationships between the topics contained within the map. Relationship tables are also used to generate links in your published document.

You can use your map or bookmap (page 2704) to generate a deliverable using an output type such as XHTML, PDF, HTML Help, or Eclipse Help.

DITA Open Toolkit

DITA Open Toolkit is an open-source publishing engine for content authored in the Darwin Information Typing Architecture. It is a vendor-independent, open-source implementation of the DITA standard, released under the Apache License, Version 2.0.
The toolkit supports all versions of the OASIS DITA specification, including 1.0, 1.1, 1.2, and 1.3.

**DITA-OT**

**Related Information:**

**DITA-OT-DIR**

*DITA_OT_DIR* refers to the default directory that is specified for your DITA Open Toolkit distribution in the **Window > Preferences > Oxygen XML Editor plugin > DITA preferences page** *(page 66).*

For example, if you are using DITA OT 3.2.1 that comes bundled with Oxygen XML Editor plugin, the default directory is: `{OXYGEN_INSTALL_DIR}/frameworks/dita/DITA-OT3.x`. You can also specify a custom directory.

**Foldable Element**

A **foldable element** refers to elements that can be collapsed and expanded in Oxygen XML Editor plugin. Foldable elements are marked with a small triangle (.fold/ unfold) on the left side of the editor panel and you can use that triangle to quickly collapse or expand them. This feature is helpful when you are working with large documents and you want to temporarily hide blocks of content. You can right-click the triangle to access additional collapse and expand actions *(Collapse Other Folds, Collapse Child Folds, Expand Child Folds, Expand All).*

**Framework**

A **framework** refers to a package that contains resources and configuration information to provide ready-to-use support for an XML vocabulary or document type. A framework is associated to an XML document type according to a set of rules. It also includes a variety of settings that improve editing capabilities for its particular file type. Oxygen XML Editor plugin includes a **Document Type Configuration Dialog Box** *(page 72)* that allows you to define the set of rules and customize various authoring mechanisms for new or existing frameworks.

For advanced details about customizing your own framework, see the Creating and Configuring Custom Frameworks *(page 2037)* section.
IDML

IDML is an abbreviation for Adobe InDesign Markup files.

Inline Element

An inline element is intended to be displayed in the same line of text as its siblings or the surrounding text. For instance, strong and emphasis in HTML are inline elements. It is distinct from a block element, which is visually separated from its siblings.

Java Archive

Java Archive (JAR) is an archive file format. JAR files are built on the ZIP file format and have the .jar file extension. Computer users can create or extract JAR files using the jar command or an archive tool.

Key Space

The concept of a Key Space in DITA refers to a set of all possible keys that can be used in a DITA map structure. A Key Space is established when a root map defines a set of effective key bindings. When Oxygen XML Editor plugin processes key references, it determines the effective binding of a given key to a resource in the context of the specified root map.

Keystore

A Keystore is an encrypted file that contains private keys and certificates. There are two types of keystores that are supported in Oxygen XML Editor plugin:

- Java Key Store (JKS)
- Public-Key Cryptography Standards version 12 (PKCS-12)

Main CSS Style

The Main CSS Style refers to the selection in the top half of the Styles drop-down menu (on the toolbar) that makes it easy to quickly change the look of your documents as they appear in Author mode and the output without having to edit the CSS stylesheets. The main CSS applies to the whole document and you can also select one or more alternate styles (listed in the bottom half of the drop-down menu) that behave like layers and are merged sequentially with the main CSS style.
For more information, see Configuring and Managing Multiple CSS Styles for a Framework (page 2063).

Master File

A **Master File** typically refers to the root of an imported or included tree of modules and this support helps you simplify the configuration and development of XML projects. For more information, see the Master Files Support (page 581) section.

Named User

**Named User** is defined as an individual full or part-time employee who is authorized by You (the individual or entity who owns the rights to Oxygen XML Editor plugin) to use the software regardless of whether or not the individual is actively using the software at any given time. To avoid any doubt, Named User licenses cannot be shared amongst multiple individuals and separate Named User licenses must be purchased for each individual user.

A Named User license may not be reassigned to another employee except in the following circumstances:

- (a) Upon termination of the Named User's employment with your company.
- (b) Permanent reassignment of a Named User to a position that does not involve the use of the Software.

For example, suppose Jane has been assigned an Oxygen license and she leaves your company. When she leaves, you can simply reassign her license to John, her replacement. In the event that you do reassign the Named User license in accordance with the restrictions above, you do not need to notify Syncro of such a reassignment.

**Note:** This definition is taken from the Oxygen XML Editor plugin End User License Agreement.

Oxygen Publishing Template

**Oxygen Publishing Template** defines all the aspects related with the look and feel (layout and styles) for the WebHelp Responsive output.

The template is self-contained and packed as a ZIP archive making it easy to share with others. It represents the main method for customizing the WebHelp Responsive output.

Related Information:
Perspective

In Oxygen XML Editor plugin, a **perspective** refers to an interface layout geared towards a specific editing environment. Each perspective includes a unique set of interface objects, toolbars, views, and features. You can change the perspective by selecting the perspective from the **Window > Open Perspective** menu.

The **perspectives** that are available in Oxygen XML Editor plugin are:

- **Editor ([page 215])** - The most commonly used perspective and it is used to edit XML documents.
- **XSLT Debugger ([page 217])** - Used to detect problems in an XSLT transformation by executing the process step by step in a controlled environment.
- **XQuery Debugger ([page 219])** - Used to detect problems in an XQuery transformation process by executing the process step by step in a controlled environment.
- **Database ([page 220])** - Used to browse and manage databases.

Plugin

A **plugin** (also referred to as *add-on or extension*) is a component that adds specific features to an existing application. Oxygen XML Editor plugin supports **plugins** to enable numerous customizations.

Pretty-Print

**Pretty-print** refers to formatting and indenting the source code in **Text** mode to make the content easier to view and analyze. The formatting actions that are available in Oxygen XML Editor plugin include:

- **Format and Indent Element** - Available in the **Source** submenu of the contextual menu for the current element.
- **Format and Indent** - Available on the toolbar for the entire currently opened document.
- **Format and Indent** - Available in the contextual menu of the **Text view ([page 1428])** and applies to all the content in that view.
Format and Indent Files - Available in the contextual menu of the Navigator view (page 250) for one or more selected files.

QName

QName stands for "qualified name" and defines a valid identifier for elements and attributes. QNames are used as URI references to reference particular elements or attributes within XML documents.

Quick Assist

The Quick Assist feature gives you easy access to some of the most commonly used actions for the specific type of document you are editing. If one or more actions are available in the current context, they are accessible via a yellow bulb help (💡) placed at the current line in the stripe on the left side of the editor in Text mode. You can also invoke the quick assist menu by using the Ctrl + 1 (Meta 1 on Mac OS X) keyboard shortcuts.

Quick Fix

The Quick Fix support in Oxygen XML Editor plugin helps you resolve errors that appear in an XML document by offering proposals to fix problems such as missing required attributes or invalid elements. Quick Fixes are available in Text mode and Author mode and they can be presented and activated in several ways.

- When hovering over an area of text where a validation error or warning occurs, the Quick Fix proposals can be presented as links in a tooltip pop-up window.
- When hovering over an error or warning in Author mode, the Quick Fix proposals are presented in a small drop-down menu.
- If you place the cursor in the highlighted area where a validation error or warning occurs, a Quick Fix icon (💡) is displayed in the stripe on the left side of the editor. Clicking that icon will allow you select from the available proposals.
- If you place the cursor in the highlighted area where a validation error or warning occurs, you can also access the Quick Fix menu by pressing Ctrl + 1 (Command + 1 on OS X) on your keyboard.

Oxygen XML Editor plugin also provides support for defining and customizing a library of Quick Fixes using the Schematron language (page 1233).
Root Map

A **Root Map** (or master map) specifies a [DITA map (page 2705)](#) that defines a hierarchical structure of submaps that are contained within the root map. Essentially, the root map defines a scope and provides the mechanism to allow your defined keys to be propagated throughout the entire map structure (this mechanism is also known as a [key space (page 2707)](#)).

In Oxygen XML Editor plugin, the **DITA Maps Manager** includes an option on its toolbar where you can easily specify the root map (page 2405), but there are also several other ways to select or change the root map (page 2416).

Space-Preserved Element

A **spaced-preserved element** refers to elements that require white spaces and line endings to be preserved (for example, DITA codeblock and pre elements).

Subject Scheme Map

A **Subject Scheme Map** allows you to create custom controlled attribute values and to manage metadata. Subject scheme maps use a key definition to define a collection of controlled values rather than a collection of topics. The highest level of map that uses the set of controlled values must reference the subject scheme map in which those controlled values are defined.

A controlled value is a keyword that can be used as a value in a metadata attribute. For example, the @audience metadata attribute may take a value that identifies the user group associated with a particular content unit (for medical equipment, that might include therapist, oncologist, surgeon, radiologist, and so on). In a subject scheme map, you can define a list of these audience values and you can then use these values to profile your content. For more information, see [Customizing Profiling Values with a Subject Scheme Map (page 2652)](#).

Track Changes

The **Track Changes** feature allows you to review changes that you or other authors have made and then accept or reject them. You can also manage the visualization mode of the tracked changes, add comments to changes, and mark them as being done. These actions are easily accessible from contextual menus, the toolbar, or the **Review view (page 742)**.

For more information about this feature, see [Managing Tracked Changes (page 720)](#).
WebHelp Output Directory

`WebHelp_OUTPUT_DIR` refers to the output directory where WebHelp transformation files will be generated.

The output directory can be specified using the `Output Directory` text field in the `Output` tab of the transformation scenario dialog box.

When running the WebHelp transformation from a command line, the output directory can be specified using the `-o` or `--output` option.

Working Set

A `Working Set` refers to a set of files that will be used for the scope of search and refactoring operations. Many of the search and refactoring wizards include a step where you can specify the scope for the operation and you can choose one or more `working sets` to restrict the scope to that specified set of files.

XML Catalog

An `XML Catalog` maps a system ID or a URI reference for a resource (stored either remotely or locally) to a local copy of the same resource. Whenever XML processing relies on external resources (such as referenced schemas and stylesheets), the use of an `XML Catalog` becomes a necessity when Internet access is not available or the connection is slow.

Oxygen XML Editor plugin includes default global catalogs as well as default catalogs for each of the built-in frameworks (page 2706), and you can also create your own. Oxygen XML Editor plugin uses these `XML Catalogs` to resolve references for document validation and transformations. For more information, see Working with XML Catalogs (page 897).

Trademarks. Many of the designations used by manufacturers and sellers to distinguish their products are claimed as trademarks. Where those designations appear in this document, and Syncro Soft SRL was aware of a trademark claim, the designations have been rendered in caps or initial caps.

Notice. While every precaution has been taken in the preparation of this document, the publisher and the author assume no responsibility for errors or omissions, or for damages resulting from the use of information contained in this document or from the use of programs and source code that may accompany it. In no event shall the publisher and the author be liable for any loss of profit or any other commercial damage caused or alleged to have been caused directly or indirectly by this document.

Link disclaimer. Syncro Soft SRL is not responsible for the contents or reliability of any linked Websites referenced elsewhere within this documentation, and Syncro Soft SRL does not necessarily endorse the products, services, or information described or offered within them. Syncro Soft cannot guarantee that these links will work all the time and has no control over the availability of the linked pages.

Warranty. Syncro Soft SRL provides a limited warranty on this product. Refer to your sales agreement to establish the terms of the limited warranty. In addition, Oxygen XML Editor plugin End User License Agreement, as well as information regarding support for this product, while under warranty, is available through the Oxygen XML Editor plugin website.

Third-party components. Certain software programs or portions thereof included in the Product may contain software distributed under third party agreements ("Third Party Components"), which may contain terms that expand or limit rights to use certain portions of the Product ("Third Party Terms"). Information identifying Third Party Components and the Third Party Terms that apply to them is available on the Oxygen XML Editor plugin website.

Documentation. For the most current versions of documentation, see the Oxygen XML Editor plugin website.
Contact Syncro Soft SRL. Syncro Soft SRL provides telephone numbers and e-mail addresses for you to report problems or to ask questions about your product, see the Oxygen XML Editor plugin website.
