1. Introduction

Oxygen XML Editor plugin is a cross-platform application designed to accommodate all of your XML editing, authoring, developing, and publishing needs. It is the best XML editor available for document development using structured mark-up languages such as XML, XSD, Relax NG, XSL, DTD. It is a comprehensive solution for authors who want to edit XML documents visually, with or without extensive knowledge about XML and XML-related technologies. The WYSIWYG-like editor is driven by CSS stylesheets associated with the XML documents and offers many innovative, user-friendly authoring features that make XML authoring easy and powerful.

It offers developers and authors a powerful Integrated Development Environment and the intuitive Graphical User Interface of Oxygen XML Editor plugin is easy to use and provides robust functionality for content editing, project management, and validation of structured mark-up sources. Coupled with XSLT and FOP transformation technologies, Oxygen XML Editor plugin offers support for generating output to multiple target formats, including: PDF, PS, TXT, HTML, JavaHelp, WebHelp, and XML.

This user guide is focused on describing features, functionality, the application interface, and to help you quickly get started. It also includes a vast amount of advanced technical information and instructional topics that are designed to teach you how to use Oxygen XML Editor plugin to accomplish your tasks. It is assumed that you are familiar with the use of your operating system and the concepts related to XML technologies and structured mark-up.
2. Getting Started

This section provides a variety of resources to help you get the most out of the application. Typically, the first step of getting started with Oxygen XML Editor plugin would be to install the software. For detailed information about that process, see the Installation chapter (page 26).

After installation, when you launch Oxygen XML Editor plugin for the first time, you are greeted with a Welcome dialog box. It presents upcoming events, useful video demonstrations, helpful resources, the tip of the day, and also gives you easy access to recently used files and projects and to create new ones.

What is Oxygen XML Editor plugin

Oxygen XML Editor plugin is the best XML editor available and is a complete XML development and authoring solution. It is designed to accommodate a large number of users, ranging from beginners to XML experts. It is the only XML tool that supports all of the XML schema languages and provides a large variety of powerful tools for editing and publishing XML documents.

You can use Oxygen XML Editor plugin to work with most XML-based standards and technologies. It is a cross-platform application available on all the major operating systems (Windows, Mac OS X, Linux, Solaris) and can be used either as a standalone application or as an Eclipse plugin.

For a list of many of the features and technologies that are included in Oxygen XML Editor plugin, see the Oxygen Website.

Getting Familiar with the Interface

Oxygen XML Editor plugin includes several perspectives (page 2709) and editing modes (page 223) to help you accomplish a wide range of tasks. Each perspective and editing mode also includes a large variety of helper view, menu actions, toolbars, and contextual menu functions.

Regardless of the perspective (page 2709) or editing mode (page 223) that you are working with, the default layout consists of the following areas:

Menus
Menu driven access to all the features and functions available in Oxygen XML Editor plugin. Most of the menus are common for all types of documents, but Oxygen XML Editor plugin also includes some context-sensitive and framework-specific menus and actions that are only available for a specific context or type of document.

**Toolbars**

Easy access to common and frequently used functions. Each icon is a button that acts as a shortcut to a related function. Some of the toolbars are common for all perspectives, editing modes, and types of documents, while others are specific to the particular perspective or mode. Some toolbars are also framework-specific, depending on the type of document that is being edited.

**Helper Views**

Oxygen XML Editor plugin includes a large variety of dockable views to assist you with editing, viewing, searching, validating, transforming, and organizing your documents. Many of the views also contain useful contextual menu actions, toolbar buttons, or menus. The most commonly used views for each perspective and editing mode are displayed by default and you can choose to display others to suit your specific needs.

**Editor Pane**

The main editing area in the center of the application. Each editing mode provides a main editor pane where you spend most of your time reading, editing, applying markup, and validating your documents. The editor pane in each editing mode also includes a variety of contextual menu actions and other features to help streamline your editing tasks. Each file that has been opened has a tab at the top of the editing pane.

**Perspectives**

Oxygen XML Editor plugin includes several different perspectives that you can use to work with your documents. The Oxygen XML perspective is the most commonly used perspective used for displaying and editing the content of your XML documents, and it is the default perspective when you start Oxygen XML Editor plugin for the first time. Oxygen XML Editor plugin also includes a Database perspective that allows you to manage databases and their connections and a few debugging perspectives that allow you to detect problems in XSLT or XQuery transformations.

**Supported Document Types**
You can use the main editing pane in Oxygen XML Editor plugin to edit a large variety of document types. You can see the type of document association by the special icons displayed in the tabs of the editor title bar.

The supported document types include the following:

- XML documents
- XSLT stylesheets
- XML Schema
- DTD (Document Type Definition) schemas
- RELAX NG full syntax schemas
- RELAX NG compact syntax schemas
- NVDL (Namespace-based Validation Dispatching Language) schemas
- XSL:FO documents
- XQuery documents
- WSDL documents
- Schematron documents
- JavaScript documents
- Python documents
- CSS documents
- XProc scripts
- SQL documents
- JSON documents
- Ant build scripts
- Markdown documents

**Configuring Oxygen XML Editor plugin**

There are numerous ways that you can configure Oxygen XML Editor plugin to accommodate your specific needs.

See the Configuring Oxygen section (page 55) for details on the various ways that you can configure the application and its features.
Video Tutorials

The Oxygen XML Editor plugin website includes numerous video demonstrations and webinars that present many of the features that are available in Oxygen XML Editor plugin and show you how to complete specific tasks or how to use the various features.

Go to the Oxygen XML Editor plugin Videos Page to see the list of video tutorials and webinars.

Oxygen XML Editor plugin Documentation

The Oxygen XML Editor plugin documentation includes a plethora of sections and topics to provide you with a variety of information, ranging from basic authoring tasks to advanced developer techniques. You can, of course, search through the documentation using standard search mechanisms, but you can also place the cursor in any particular position in the interface and use the F1 key to open a dialog box that presents a section in the documentation that is appropriate for the context of the current cursor position. Aside from the other topics in this Getting Started section, the following are links to other sections of the documentation that might be helpful for your specific needs:

- **Text Editing Mode Section (page 223)** - Provides information about the Text editor.
- **Author Editing Mode Section (page 303)** - Provides information about the visual WYSIWYG-like Author editing mode.
- **XML Schema Diagram Editor (page 505)** - Provides information about the schema design mode.
- **Editing Specific Document Types Chapter (page 614)** - Includes information about editing numerous different types of documents.
- **DITA Authoring Chapter (page 2390)** - Provides information about using DITA to edit and structure your content.
- **Publishing Chapter (page 1381)** - Provides information about the various ways that you can publish content.
- **Importing Data Chapter (page 1993)** - Provides information about importing data from text files, MS Excel files, database data, and HTML files.
- **Tools Chapter (page 2298)** - Details about the various built-in tools that are available in Oxygen XML Editor plugin.

Sample Documents

Your installation of Oxygen XML Editor plugin includes a large variety of sample documents and projects that you can use as templates to get started and to experiment with the various features and technologies. They are located in the samples folder that is located in the installation directory of
Oxygen XML Editor plugin. You will find files and folders for various types of documents, including the following:

- **Sample project file (sample.xpr)** - A sample project file that will allow you to experiment with how projects can be structured and used. When you open this project file, you will be able to see all the sample files and folders in the **Navigator view (page 250)**.

- **Sample files (personal.xml, etc.)** - A collection of interrelated sample files that will allow you to experiment with the structure and relationship between XML files, stylesheets, and schemas.

- **Various document type folders** - The various folders contain sample files for numerous document types, such as CSS, DITA, DocBook, ePub, TEI, XHTML, and many others.

**Other Resources**

The following list includes links to various other resources that will help you get started using the features of Oxygen XML Editor plugin:

- See the [Oxygen XML Editor plugin Blog Site](#) for a large variety of current and archived blogs regarding numerous features, requests, and instructional topics.

- Take advantage of the [Oxygen XML Editor plugin Forum](#) to see various announcements and learn more about specific issues that other users have experienced.

- If you are using DITA, see the incredibly helpful [DITA Style Guide Best Practices for Authors](#).

- To learn about the WebHelp features in Oxygen XML Editor plugin, see the [Publishing DITA and DocBook to WebHelp](#) section of the website.

- For more information about various additional tools that are integrated into Oxygen XML Editor plugin, see the [Tools section (page 2298)](#).

- See the [External Resource Page](#) for links to various other helpful resources, such as discussion lists, external tutorials, and more.

- See the [Oxygen SDK](#) section for details about the SDK that allows you to extend and develop Oxygen XML Editor plugin frameworks (page 2706) and plugins (page 2709), and to integrate Eclipse plugins.

- For a list of new features that were implemented in the latest version of Oxygen XML Editor plugin, see the [What's New Section of the Website](#)

**Your First Document or Project**

This section includes several topics that will help you get started with your first document or project.

**Your First XML Document**
To create your first XML document, select File > New > Other > Oxygen or click the New button on the toolbar. The New document wizard (page 550) is displayed:

You can either create a new XML document from scratch by choosing one of the available types in the wizard. You can also create one from a template by selecting File > New > New from Templates and choosing a template from the Global templates or Framework templates folders. If you are looking for a common document type, such as DITA or DocBook, you can find templates for these document types in the Framework templates folder. If your company has created its own templates, you can also find them there.

For some document types, you may find a lot of different templates. For example, there are numerous templates for DocBook documents, and DITA topic types and maps. Choose the template that best meets your needs.

**Writing Your First Document**

Depending on the type of document you choose, the Oxygen XML Editor plugin interface changes to support editing that document type. This may include new menus, toolbar buttons, and items in the contextual menus.

Also, depending on the type of document you choose, Oxygen XML Editor plugin may open your document in Text (page 223) or Author (page 303) mode. Text mode shows the raw XML source file, while Author mode shows a graphical view of the document.

The availability of Author mode for your document type depends on the type you choose and if there is a CSS stylesheet available to create the Author mode. Oxygen XML Editor plugin includes default Author mode views for most of the document types it supports. If your company has created its own document types, Author mode stylesheets may have also been created for that type. However, if you create a plain XML file, or one based on a schema that is not included in the Oxygen XML Editor plugin built-in support, you need to edit it in Text mode or create your own Author mode CSS (page 2192) for it.

You can switch back and forth between Author mode and Text mode at any time by clicking the buttons at the bottom left of the editor window. You do not lose any formatting when switching from Author to Text mode. Text and Author modes are just different views for the same XML document.

There is also a Grid mode (page 292) available that displays all content in an XML document as a structured grid of nested tables. This is useful for certain kinds of documents, particularly those that are structured like databases. You can also use it when you want to display XML content in a table-like manner (for example, if you need to extract XML content to a spreadsheet (page 671)).
If you use **Author** mode, you might find that it is similar to word processors that you are used to. Likewise, the **Text** mode is similar to many typical text editors. If you are new to XML, the biggest difference is that XML documents have a particular structure that you have to follow. **Oxygen XML Editor** plugin assists you with a continuous validation of the XML markup.

**Structuring Your First Document**

Each XML document type has a particular structure that you have to follow as you write and edit the document. Some document types give you a lot of choices, while others give you very few. In either case, you need to make sure that your document follows the particular structure for the document type you are creating. This means:

- At any given location in the document, there are only certain XML elements allowed. **Oxygen XML Editor** plugin helps you determine which elements are allowed. In **Author** mode, when you press **Enter**, **Oxygen XML Editor** plugin assumes that you want to enter a new element and shows you a list of elements that can be created in this location. Keep typing until the element you want is highlighted and press **Enter** to insert the element. If you want to view the overall structure of a document and see what is allowed (and where), you can use the **Model view** (page 263) (**Window > Show View > Model**).

- When you create certain elements, you may find that your text gets a jagged red underline and you get a warning that your content is invalid. This is usually because the element you have just created requires certain other elements inside of it. Your document will be invalid until you create those elements. **Oxygen XML Editor** plugin does its best to help you with this. If there is only one possible element that can go inside the element you just created, **Oxygen XML Editor** plugin creates it for you. However, if there is more than one possibility, you have to create the appropriate elements yourself. In many cases, **Oxygen XML Editor** plugin presents **XML Quick Fixes (page 884)** that help you resolve errors by offering proposals to quickly fix problems such as missing required attributes or invalid elements.

**Editing Your First Document**

Once you have completed the first draft of your document, you may need to edit it. As with any editor, **Oxygen XML Editor** plugin provides the normal cut, copy, and paste options as well as drag and drop editing. However, when you are editing an XML document, you have to make sure that your edits respect the structure of the XML document type. In fact, you are often editing the structure as well as the content of your document.

**Oxygen XML Editor** plugin provides many tools to help you edit your structure and to keep your structure valid while editing text.
The Document Breadcrumbs

Across the top of the editor window (in **Text** mode), there is a set of breadcrumbs that shows you exactly were the insertion point is in the structure of the document. You can click any element in the breadcrumbs to select that entire element in the document.

**Showing Tags**

To see exactly where you are in the structure of the document, you can show the tags graphically in the **Author** view. There are several levels of tag visibility that you can choose using the **Tags Display Mode** drop-down menu (**page 331**) on the toolbar (the button may look a little different than this, as it changes to reflect the level of tags currently displayed).

**Outline View**

The **Outline view** (**page 316**) shows you the structure of your document in outline format. You can use it to select elements, or to move elements around in the document.

**Figure 1: Outline View**

You can configure the **Outline** view to determine what is shown, such as element names, attributes, and comments. Certain choices may work better for particular document types. You can also filter the **Outline** view to show only elements with a certain name.

**Figure 2: Outline View Filtered to only Show Element Names**
Cut and Paste, Drag and Drop

You can cut and paste or drag and drop text, just as you would in any other editor. However, when you do this in Author view, it is important to remember that you are actually moving blocks of XML. When you cut and paste or drag and drop a block of XML, the result has to be valid both where the content is inserted, and where it is removed from.

A big part of doing this correctly is to make sure that you pick up the right block of text in the first place. Using the breadcrumbs or Outline view, or showing tags and using them to select content, can help ensure that you are selecting the right chunk of XML.

If you do try to paste or drop a chunk of XML somewhere that is not valid, Oxygen XML Editor plugin warns you and tries to suggest actions that make it valid (such as by removing surrounding elements from the chunk you are moving, by creating a new element at the destination, or by inserting it in a nearby location).

If you are using Author mode, you can also switch to Text mode to see exactly which bits of XML you are selecting and moving.

Refactoring actions

You can perform many common structure edits, such as renaming an element or wrapping text in an element, using the actions in the Refactoring menu of the contextual menu. More advanced refactoring operations are also available using the XML Refactoring tool (page 913) that is available in the XML Tools menu.

Validating Your First Document

Validation is the process of making sure that an XML document abides by the rules of its schema. If Oxygen XML Editor plugin knows how to find the schema, it validates the document for you as you type. Oxygen XML Editor plugin finds the schema automatically for most of the document types created from templates. However, in some cases you may have to tell it how to find the schema (page 856).
When Oxygen XML Editor plugin validates as you type, there is a small bar at the right edge of the editor that shows you if the document is invalid and where errors are found. If the indicator at the top of that bar is green, your document is valid. If the document is invalid, the indicator turns red and a red flag shows you where the errors are found. Click that flag to jump to the error. Remember that sometimes your document is invalid simply because the structure you are creating is not yet complete.

In addition to problems with the validity of the XML document itself, Oxygen XML Editor plugin also reports warnings for a number of conditions, such as if your document contains a cross reference that cannot be resolved, or if Oxygen XML Editor plugin cannot find the schema specified by the document. The location of these warnings is marked in yellow on the validation bar. If the document contains warnings, but no errors, the validity indicator turns yellow.

You can also validate your document at any time by selecting the Validate action from the Validation toolbar drop-down menu or the XML menu. When you validate in this manner, if errors are found, the validation result opens in a new pane at the bottom of the editor that shows each validation error on a separate line. Clicking the error takes you to the location in your document where the error was detected.

Note: Be aware that the problem is sometimes in a different location from where the validator detects the error. To get more information about a validation error, right-click a validation error message, and select Show Message.

Proofing Your First Document

Oxygen XML Editor plugin includes an automatic (as-you-type) spell checking feature (page 596), as well as a manual spell checking action. To check the spelling of your document manually, use the Check Spelling action on the toolbar.

Transforming Your First Document

An XML document must be transformed to be published. Transformations are specific to the particular type of document you have created. For example, a DITA transformation cannot be used on a DocBook file, or vice versa. A single document type may have many multiple transformations that produce different kinds of outputs. For some document types, such as DITA, many different content files may be combined together by a transformation. You need to locate and launch a transformation that is appropriate for your document type and the kind of output you want to generate.

Oxygen XML Editor plugin uses transformation scenarios (page 1381) to control the transformation process. Depending on the document type you have created, there may be several transformation
scenarios already configured for your use. This may include the default transformation scenarios supplied by Oxygen XML Editor plugin or ones created by your organization.

To see the list of transformations available for your document, select the 💡 Apply Transformation Scenario(s) action from the toolbar or the XML menu. A list of available transformation scenarios are displayed. Choose one or more scenarios to apply, and click Apply associated. Exactly how your transformed content appears depends on how the transformation scenario is configured.

Getting Started with DITA

The information in this topic is meant to be a very basic starting point for those who are just getting started using DITA in Oxygen XML Editor plugin. Oxygen XML Editor plugin makes it easy to create, edit, manage, and publish DITA content, but it requires at least some basic DITA knowledge. To truly get the most out of Oxygen XML Editor plugin and all of its DITA-related features, you should explore resources in the online DITA community to acquire knowledge of its concepts and uses.

Understanding DITA Topics

It is important to understand the role that a DITA topic plays in a DITA project. A DITA topic is not associated with a single published document. It is a separate entity that can potentially be included in many different books, help systems, or websites. Therefore, when you write a DITA topic you are not writing a book, a help system, or a website. You are writing an individual piece of content. This affects how you approach the writing task and how Oxygen XML Editor plugin works to support you as you write.

Most of your topics are actually related to other topics, and those relationships can affect how you write and handle things such as links and content reuse. Oxygen XML Editor plugin helps you manage those relationships. Depending on how your topics are related, you can use the tools provided in Oxygen XML Editor plugin, along with the features of DITA, in a variety of ways.

Creating a DITA Topic in Oxygen XML Editor plugin

To create a DITA topic (page 2459):

1. Select File > New > Other > Oxygen XML Editor plugin, or click the ☒ New button on the toolbar, and select New from Templates.

   **Step Result:** The New from Templates Wizard (page 550) is displayed:

   *Figure 3: New DITA Document from Templates Wizard*
2. Go to Framework templates > DITA > topic and select the type of topic that you want to create, then click Next.

Note: If your organization has created DITA customizations, the appropriate template files may be in another location, and various types of topics may be provided for your use. Check with the person who manages your DITA system to see if you should be using templates from another directory.

3. Select a file path where it will be saved.
4. Click Finish.

Result: Your document is opened in the editor. Eventually you will need to add a reference to it in your DITA map (page 14).

Your DITA topic is an XML document, thus all the editing features that Oxygen XML Editor plugin provides for editing XML documents (page 6) also apply to DITA topics. Oxygen XML Editor plugin also provides additional specific DITA-related support for working with DITA topics (page 2457), their associated DITA maps (page 2398), and for creating DITA output (page 2580).
Role of Maps

The basic method that DITA uses to express the relationship between topics is through a DITA map (page 2705). Other relationships between topics, such as cross references, generally need to be made between topics in the same root map. DITA uses maps to determine which topics are part of any output that you create. While customized DITA solutions can use other mechanisms, generally DITA is not used as a way to publish individual topics. Output is created from a map and includes all the topics referenced by the map.

A publication is not always represented by a single map. For instance, if you are writing a book, you might use a submap to create each chapter and then organize the chapters in a main root map to create the book. This helps you to manage your content, offers the possibility of reusing submaps, and segregates content to support multiple people working on the same project.

Creating a Map in Oxygen XML Editor plugin

To create a map (page 2416):

1. Select File > New > Other > Oxygen XML Editor plugin, or click the New button on the toolbar, and select New from Templates.
2. Go to Framework templates > DITA > map and select the type of map you want to create.
3. Choose whether you want to open the map in the Editor or in the DITA Maps Manager (page 2400). Usually, opening it in the DITA Maps Manager is the best choice. The DITA Maps Manager presents a view of the DITA map that is similar to a table of contents.

Figure 4: DITA Maps Manager View
Adding Existing Topics to a Map in Oxygen XML Editor plugin

There are several ways to add a topic reference to a map (page 2419). Perhaps the easiest method is to add a reference to a topic that is already open in the editor:

1. Open the DITA topic in the main editing window.
2. Right-click the DITA map in the DITA Maps Manager view (page 2400) and choose Reference to the currently edited file from the Append Child, Insert Before, or Insert After submenu.

   **Step Result:** This opens the Insert Reference dialog box (page 2426) with all of the required fields already filled in for you.

   **Figure 5: Insert Reference Dialog Box**

   ![Insert Reference Dialog Box](image)

3. You can fill in additional information in the various tabs in this dialog box or add it to the map later.
4. Select Insert and close to add a reference to your topic in the map.
5. Save the DITA map.

Adding New Topics to a Map in Oxygen XML Editor plugin

As you add topics to your map, you may want to create a new topic as a child or sibling of another topic. This is usually done at the map level.

To add a new topic to a map (page 2419), follow these steps:
1. In the **DITA Maps Manager** *(page 2400)*, right-click the node in the current map where you want to add the new topic.

2. Select one of the following actions:

   - **Append Child > New** - Select this action to insert the new topic as a child of the selected node. This action opens a **New file dialog box** *(page 2460)* that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.
   
   - **Insert Before > New** - Select this action to insert the new topic as a sibling to the current node, before it. This action opens a **New file dialog box** *(page 2460)* that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.
   
   - **Insert After > New** - Select this action to insert the new topic as a sibling to the current node, after it. This action opens a **New file dialog box** *(page 2460)* that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.
   
   - **Duplicate** - Select this action to create a copy of the selected topic and insert it as a sibling. This action opens a dialog box that allows you to choose the file name and location for the newly created copy of the topic. After you have selected the name and path for your new topic, click **OK**.

   **Step Result:** The new topic is now referenced (as a `topicref`) in the **DITA map** at the location where you inserted it and the new topic is opened in the editor.

3. Save the **DITA map**.

You can also change the order and nesting of topics in the **DITA Maps Manager** view by doing either of the following:

   - Select the topic to move while holding down the **Alt** key and use the arrow keys to move it around.
   - Use the mouse to drag and drop the topic to the desired location.

The way your parent and child topics are organized in any particular output depends on both the configuration of those topics in the map and the rules of the output transformation that is applied to them. Do not assume that your topics must have the same organization for all output types. The map defines the organization of the topics, not the topics themselves. It is possible to create a variety of maps, each with different organization and configuration options to produce a variety of outputs.

### Adding Submaps in Oxygen XML Editor plugin

If you have a large set of information, such as a long book or extensive help system, a single map can become long and difficult to manage. To make it easier to manage, you can **break up the content into**
smaller submaps (page 2417). A submap might represent a chapter of a book, a section of a user manual, or a page on a website. To build a publication out of these smaller maps, you must add them to a map that represents the overall publication.

To add a child map to the current map (page 2417):

1. Right-click the parent DITA map in the DITA Maps Manager view (page 2400) and choose Append child > Map reference.

   **Step Result:** This opens the Insert Reference dialog box (page 2426) with all of the required fields already filled in for you.

2. You can fill in additional information in the various tabs in this dialog box or add it to the map later.
3. Select Insert and close to add a reference to your submap in the main map.
4. Save the main DITA map.

**Validating a Map in Oxygen XML Editor plugin**

Just as it is with your individual topics, it is important to validate your maps (page 2446). Oxygen XML Editor plugin provides a validation function for DITA maps that does more than simply validating that the XML is well formed. It also does the following:

- Validates all of the relationships defined in the maps.
- Validates all of the files that are included in the map.
- Validates all of the links that are expressed in the files.

Validating the map that describes your entire publication validates all the files that make up the publication and all of the relationships between them.

To validate a map:

1. Click the Validate and Check for Completeness button in the DITA Maps Manager view (page 2400).

   **Step Result:** This opens the DITA Map Completeness Check dialog box (page 2447).

2. Select any of the various options you want to check.
3. Click Check to run the validation process.

**Publishing Your Topics in Oxygen XML Editor plugin**

As noted previously, in DITA standards you usually do not publish output from an individual topic. Instead, you create published output (page 2580) by running a DITA transformation on a map.
This collects all the topics that are referenced in the map, organizes them, and produces output in a particular format. By default, Oxygen XML Editor plugin uses the transformations provided by the DITA Open Toolkit for publishing to various output formats (such as PDF, WebHelp or EPUB). Your organization may have created various custom transformations or modified the built-in DITA Open Toolkit transformations. In either case, Oxygen XML Editor plugin manages them by using transformation scenarios.

To publish output for a map:

1. Click the Configure Transformation Scenario(s) button in the DITA Maps Manager view (page 2400).

   **Step Result:** This opens the Configure Transformation Scenario(s) dialog box (page 1502).

   **Figure 6: Configure Transformation Scenarios Dialog Box**

   ![Configure Transformation Scenarios Dialog Box]

2. Select the appropriate transformation depending on the type of output you desire.
3. To change or view the configuration or storage options for a transformation scenario, select the transformation and click Edit.
4. Click **Apply associated**.

   **Result:** Depending on the configuration of the transformation scenario, when the transformation is finished, your output may automatically be opened in the appropriate application.
Creating a New Project

Oxygen XML Editor plugin allows you to organize your XML-related files into projects. This helps you manage and organize your files and also allows you to perform batch operations (such as validation and transformation) over multiple files. Use the Navigator view (page 250) to manage projects, and the files and folders contained within.

Creating a New Project

To create a new project, select New > XML Project or New > Sample XML Project from the contextual menu or File menu. This opens a dialog box that allows you to create and customize a new project and adds it to the structure of the project in the Navigator view (page 250).

Adding Items to the Project

To add items to the project, select the desired document type or folder from the New menu of the contextual menu, when invoked from the Navigator view (or from the File menu). You can also create a document from a template by selecting New > New from Templates from the contextual menu.

Using Linked Folders (Shortcuts)

Another easy way to organize your XML working files is to place them in a directory and then to create a corresponding linked folder in your project. If you add new files to that folder, you can simply use the Refresh (F5) action from the toolbar or contextual menu and the Navigator view (page 250) will display the existing files and subdirectories. If your files are scattered amongst several folders, but represent the same class of files, you might find it useful to combine them in a logical folder.

You can create linked folders (shortcuts) by dragging and dropping folders from the Windows Explorer (Mac OS X Finder) to the project tree, or by using the contextual menu from the location in the project tree where you want it added and selecting New > Folder > Advanced. The linked folders presented in the Navigator view (page 250) are marked with a special icon. To create a file inside a linked folder,
use the contextual menu and select **New > File** (you can use the **Advanced** button to link to a file in the local file system).

**Note:** Files may have multiple instances within the folder system, but cannot appear twice within the same folder.

For more information on managing projects and their content, see **Navigator View** *(page 250).*

## Getting Help

If you run into specific problems while using Oxygen XML Editor plugin you can take advantage of a variety of support related resources. Those resources include the following:

- **The Oxygen XML Editor plugin Support Section of the Website**
- **The Oxygen XML Editor plugin Forum**
- **The Oxygen XML Editor plugin Video Tutorials**
- **The Common Problems and Solutions Section of the User Manual** *(page 2367)*
- **The Online Technical Support Form**

The application also includes various specific help-related resources in the **Help** menu.

### Help Menu

The Oxygen XML Editor plugin **Help** menu provides various resources to assist you with your tasks.

This menu includes the following actions or options:

**Welcome**

This option opens the **Welcome** screen that includes some resources to assist you with using Oxygen XML Editor plugin.

**Help Contents**

Use this action to open a dialog box that presents Eclipse help topics and it includes a section that is specific to Oxygen XML Editor plugin. Also, you can use the **F1** key to open a **Help** view that presents a section in the User Manual that is appropriate for the context of the current cursor position.
Report Oxygen problem

You can use this option to open a dialog box that allows you to write the description of a problem that was encountered while using the application. You can also select additional information to be sent to the technical support team in the five tabs:

- **General info** - You can edit your contact details in case you want to be contacted for further details or to be notified of a resolution.
- **Class Loader URLs** - You can choose whether or not to include the listed *Class Loader URLs* with your report.
- **System properties** - You can choose whether or not to include the listed system property details with your report.

**Tip:** You are able to change the URL where the reported problem is sent by using the `com.oxygenxml.report.problems.url` system property. The report is sent in XML format through the `report` parameter of the POST HTTP method.

- **Plugins** - You can choose whether or not to include details about your installed plugins (page 2709) with your report.
- **Frameworks** - You can choose whether or not to include details about your installed frameworks (page 2706) with your report.

Support Tools > Randomize XML text content

Use this action when you need to send samples to the Oxygen support team and you want to keep the text content confidential. It opens a dialog box that allows you to select the resources for which the text content will be randomized. You can then save the resources and send them to the Oxygen support team without fear of compromising sensitive or private data. For more information, see Randomize XML Text Content (page 22).

**Warning:** Before using this action, it is highly recommended that you copy the XML resources to be processed, save them in a separate folder, and then process this operation on the copies instead of the original files. Otherwise, you may lose your original content.

About Eclipse

Use this option and then click the Oxygen XML Editor plugin icon to open a dialog box that contains information about Oxygen XML Editor plugin and the installed version.

Related Information:
Randomize XML Text Content

Oxygen XML Editor plugin includes an action that randomizes the text content of an XML document. This action is available in the Help > Support Tools menu. It is helpful if you need to send XML samples to the Oxygen support team and you want to keep the text content confidential. It opens a dialog box that allows you to select the resources for which the text content will be randomized. You can then save the resources and send them to the Oxygen support team without fear of compromising sensitive or private data.

⚠️ Warning: Before using this action, it is highly recommended that you copy the XML resources to be processed, save them in a separate folder, and then perform this operation on the copies instead of the original files. Otherwise, you may lose your original content.

Figure 7: Randomize XML Text Content Dialog Box

The Randomize XML Text Content dialog box includes the following options:

**Scope**

Allows you to select the set of files whose text content will be randomized by the operation. You can select from predefined resource sets (such as the current file, your whole project, the current DITA map (page 2705) hierarchy for DITA projects, etc.) or you can define your own set of resources by creating a working set (page 2712).
Filters

This section includes the following options:

- **Include files** - Allows you to filter the selected resources by using a file pattern. For example, to restrict the operation to only analyze build files you could use `build*.xml` for the file pattern.
- **Restrict only to known XML file types** - When selected, only resources with a known XML file type will be affected by the operation.

Accessibility Support in Oxygen

The Oxygen team is dedicated to developing software products that are usable for everyone, including those with physical challenges and disabilities. Oxygen XML Editor plugin was designed to adhere to the U.S. Government Section 508 accessibility standards: https://www.oxygenxml.com/xml_editor/section508.html

Adjusting Fonts and Colors

If you have low vision, go to Options > Preferences > Appearance > Fonts where you can adjust the font styles and sizes used in the entire application, both for the editing areas and UI labels. If you have color blindness, you can also adjust most of the colors used in Oxygen XML Editor plugin by going to Options > Preferences > Appearance and changing the current color theme. You can also search for other color-related setting in the Preferences dialog box.

Text to Speech Narrators (JAWS)

If you are using a text to speech narrator, Oxygen XML Editor plugin support this since it is a Java application and it is periodically tested on Windows using the JAWS screen reader: http://www.freedomscientific.com/Products/Blindness/JAWS.

For JAWS to work, you need to enable the Java access bridge in Oxygen XML Editor plugin: http://docs.oracle.com/javase/7/docs/technotes/guides/access/enable_and_test.html

Since Oxygen XML Editor plugin comes bundled with its own Java VM, you need to open a console in the jre folder bundled with Oxygen XML Editor plugin and run the following command:

```
D:\PATH\TO\OXYGEN_INSTALLATION_FOLDER\jre\bin\jabswitch -enable
```

You will receive a notification in the console that the access bridge has been enabled.
Once the Java access bridge is enabled and if the JAWS narrator is active, when Oxygen XML Editor plugin starts, the narrator will start reading content from Oxygen XML Editor plugin and you can interact with the application, read menus, content from opened XML documents, and UI components from dialog boxes and side views.

**Hints for the Visually Impaired**

Here are a few hints for using Oxygen XML Editor plugin if you are visually impaired:

- The top main menu should contain most of the actions that you need to open, save, and close documents, switch between opened documents, or switch between the various editing modes for XML documents that are already opened.
  - The **File** menu contains actions to open, save, or close the currently edited XML document.
  - The **Edit** menu contains actions to undo/redo or cut/copy/paste content. They also have the usual shortcuts that can be used instead of directly invoking the actions from the menu.
  - The **Find** menu contains an action to show the **Find/Replace** dialog box. Sometimes the JAWS narrator overloads the CTRL-F shortcut and presents its own find/replace window but the Oxygen XML Editor plugin **Find/Replace** dialog box provides the ability to perform complex find/replace operations in the opened file.
  - In the **Options** menu, you have access to the **Preferences** dialog box that contains global application settings and access to the **Menu Shortcut Keys** table where you can configure shortcuts for the most commonly used actions.
  - The **Window** menu includes actions to switch between opened XML documents. Also, you can use the **Show view** submenu open a particular side view and move the focus to that view.

- An opened XML document can be edited with accessibility support either in the **Text** editing mode (where the XML tags are accessible in the edited content) or in the visual **Author** editing mode (where the XML tags are hidden and only the text content is shown). You can switch between these editing modes by using the **Document > Edit Mode** menu.
  - **Text** mode provides access to the entire source document with all of its XML content, just like you have in any text editing application. In addition, using the **Window > Show view** submenu, you can change focus to the **Attributes**, **Elements**, or **Outline** view. The **Attributes** view presents the existing and possible attributes that can be inserted in an XML tag. The **Elements** view shows you the list of XML elements that can be inserted at cursor position (also, pressing F2 on a selected element presents its annotation). The **Outline** view shows the current path in the XML structure.
  - **Author** mode is useful for reviewing written XML content because it has support for change tracking and for adding comments. Editing in the **Author** visual editing mode, you have access only to the text content in the XML document. Pressing **Shift-F2** will read to you the location in the XML structure. Again, you can also use the **Outline** view for this. In the **Author**
editing mode, you can also use the Attributes and Elements views similar to using them in the Text editing mode. Pressing ENTER in the Author visual editing mode can also be used to present a list of allowed elements at the current position.
3. Installation

Oxygen XML Editor plugin is available on Windows, Linux, and Mac OS X and there are a variety of methods and options for installing and running Oxygen XML Editor plugin on your system or server. This section also includes information about registering, transferring, or releasing licenses, upgrading, installing add-ons, and uninstalling.

Choosing How Oxygen XML Editor plugin Runs

You can install Oxygen XML Editor plugin to run in several ways:

- As a desktop application (running standalone or as an Eclipse plugin) on Windows, Linux, or Mac OS X.
- As a desktop application (running standalone or as an Eclipse plugin) on a Unix or Linux server or on Windows Terminal Server.

Choosing an Installer

You also have a choice of several different installers:

- The native installer for your platform (Windows, Linux, or Mac OS X).
- On Windows and Linux, the native installer can also run in unattended mode.
- The Update Site installer (page 28).
- The Zip archive installer (page 28).

Choosing a License Option

You must obtain and register a license key (page 29) to run Oxygen XML Editor plugin.

You can choose from two types of licenses:

- A named-user license, which can be used by a single person on multiple computers.
- A floating license, which can be used by different people at different times. Only one person can use a floating license at a time.
Upgrading, transferring, and uninstalling.

You can also upgrade (page 51) Oxygen XML Editor plugin, transfer a license (page 35), or uninstall (page 53) Oxygen XML Editor plugin.

Getting help with installation

If you need help, email support at: support@oxygenxml.com.

Installing Oxygen as an Eclipse Plugin

System Requirements

Operating Systems

- OS X version 10.8 64-bit or later
- Any Unix/Linux distribution with an available Java SE Runtime Environment version 1.8 from Oracle

CPU

- Minimum - 1 GHz processor
- Recommended - Dual Core class processor

Memory

- Minimum - 2 GB of RAM
- Recommended - 4 GB of RAM

Storage

- Minimum - 400 MB free disk space
- Recommended - 1 GB free disk space

Java

Java 1.8 from Oracle
On Eclipse, Oxygen XML Editor plugin uses the same Java Virtual Machine as the copy of Eclipse it is running in.

**Eclipse**

The following Eclipse versions are officially supported: 3.6-3.8, 4.2-4.10.

**Update Site Method**

To install the Eclipse plugin using the *Update Site* method, follow this procedure:

1. Start Eclipse.
2. Go to Help > Install New Software > Available Software.
3. Click Add in the Available Software dialog box.
4. Enter https://www.oxygenxml.com/InstData/Editor/Eclipse/site.xml into the Location field of the Add Site dialog box.
5. Click OK.
6. Select the Oxygen XML Editor plugin checkbox.
7. Click Next and continue with the rest of the installation wizard.
8. Restart Eclipse when prompted.
9. Verify that Oxygen XML Editor plugin is installed correctly by creating a new XML Project. Go to File > New > Other and choose Oxygen XML Editor plugin > XML Project.
10. When prompted for a license key, enter the license information received in the registration email.

**Note:** If you already have a native version of Oxygen XML Editor plugin installed on your computer, you will not be prompted for a license key for the Eclipse version. The existing license key will be used automatically.

**Zip Archive Method**

To install the Eclipse plugin using the *Zip Archive* method, follow this procedure:

1. Download the zip archive with the Eclipse plugin.
2. Unzip the downloaded zip archive in the dropins subdirectory of the Eclipse installation directory.
3. Restart Eclipse.
4. Verify that Oxygen XML Editor plugin is installed correctly by creating a new XML Project. Go to File > New > Other and choose Oxygen XML Editor plugin > XML Project.
5. When prompted for a license key, enter the license information received in the registration email.
Note: If you already have a native version of Oxygen XML Editor plugin installed on your computer, you will not be prompted for a license key for the Eclipse version. The existing license key will be used automatically.

Site-Wide Deployment

If you are deploying Oxygen XML Editor plugin for a group, there are various things you can do to customize Oxygen XML Editor plugin for your users and to make the deployment more efficient.

Creating custom default options

You can create a custom set of default options (page 198) for Oxygen XML Editor plugin. These will become the default options for each of your users, replacing the normal default settings. Users can still set options to suit themselves in their own copies of Oxygen XML Editor plugin, but if they choose to reset their options to defaults, the custom defaults that you set will be used.

Creating default project files

Oxygen XML Editor plugin project files (page 571) are used to configure a project. You can create and deploy default project files (page 19) for your projects so that your users will have a preconfigured project file to begin work with.

Using floating licenses

If you have a number of people using Oxygen XML Editor plugin on a part-time basis or in different time zones, you can use a floating license (page 32) so that multiple people can share a license.

Licensing

Oxygen XML Editor plugin is not free software. To activate and use Oxygen XML Editor plugin, you need a license.

For demonstration and evaluation purposes, a time limited license is available upon request at https://www.oxygenxml.com/register.html. This license is supplied at no cost for a period of 30 days from the date of issue. During this period, the software is fully functional, enabling you to test all its functionality. To continue using the software after the trial period, you must purchase a permanent license.
Choosing a License Type

You can use one of the following license types with Oxygen XML Editor plugin:

1. A **Named-User License** *(page 31)* may be used by a single *Named User* *(page 2708)* on one or more computers. Named-user licenses are not transferable to a new *Named User*. If you order multiple named-user licenses, you will receive a single license key good for a specified number of *named users*. It is your responsibility to keep track of the *named users* that each license is assigned to.

2. A **Floating License** *(page 32)* may be used by any user on any machine. However, the total number of copies of Oxygen XML Editor plugin in use at one time must not be more than the number of floating licenses available. A user who runs two different distributions of Oxygen XML Editor plugin (for example, Standalone and Eclipse Plugin) at the same time on the same computer, consumes a single floating license.

3. A **Subscription license** *(page 31)* that allows you to use the application for a specific period of time (either 6 months or 1 year). This type of license is user-based and is covered by a Support and Maintenance Pack, which means that during the subscription period you will get free upgrades to all major and minor releases and priority technical support.

4. A special **Academic Group License** *(Classroom, Department, or Site license)* may be used by students and teachers in academic institutions. These licenses provide a cost effective way of getting access to Oxygen XML Editor plugin for learning purposes.

For definitions and legal details of the license types, consult the End User License Agreement available at [https://www.oxygenxml.com/eula.html](https://www.oxygenxml.com/eula.html).

Obtaining a License Key

You can obtain a license key for Oxygen XML Editor plugin in one of the following ways:

- You can purchase one or more licenses from the Oxygen XML Editor plugin website at [https://www.oxygenxml.com/buy.html](https://www.oxygenxml.com/buy.html). A license key will be sent to you by email.
- If your company or organization has already purchased licenses, contact your license administrator to obtain a license key.
- If you purchased a subscription and you received a registration code, you can use it to obtain a license key from [https://www.oxygenxml.com/registerCode.html](https://www.oxygenxml.com/registerCode.html). A license key will be sent to you by email.
- If you want to evaluate the product, you can obtain a trial license key for 30 days from the Oxygen XML Editor plugin website at [https://www.oxygenxml.com/register.html](https://www.oxygenxml.com/register.html).
Register a Named-User or Subscription License

To register a *Named-User License or Subscription License* on a machine owned by the *Named User (page 2708)*, follow these steps:

1. Purchase a license from the *Oxygen XML Editor plugin website*. You will receive an email that contains your license key.

2. Save a backup copy of your email message that contains the new license key.

3. Open an XML document in the Oxygen XML Editor plugin. If this is a new install of Oxygen XML Editor plugin, the registration dialog box is displayed. If the registration dialog box is not displayed, go to *Window (Eclipse on Mac OSX)* and choose *Preferences > Oxygen XML Editor plugin* and click the *Register* button.

4. Select **Use a license key** as the licensing method.

   ![License Registration Dialog Box](image)

   **Note**: If your license key has 20 or more licenses, you must use a **license server (page 36)** instead.

5. Paste your license key into the registration dialog box. The license key is composed of nine lines of text between two text markers.

6. Press **OK**.
Floating Licenses

The floating license type is commonly used by organizations that have a large number of infrequent users who do not need to use Oxygen XML Editor plugin all at the same time. Instead of each user having their own individual license key to use at their discretion, there are a pool of licenses that are used one at a time by various users upon request.

To use floating licenses, a license server is required and the license key needs to be activated. Your system administrator will most likely be responsible for setting up the license server (page 36). Then you will need to request a floating license from the server (page 32). This process is designed to help you comply with the Oxygen End User License Agreement. This means that the license key will be locked to a particular license server deployment, and the same license key cannot be used with any other license server.

For information about releasing and returning a floating license to the pool for other users, see Releasing a Floating License (page 34).

For information about reserving (or locking) a floating license so that it does not get returned to the pool, see Reserving a Floating License (page 35).

Requesting a Floating License from an HTTP License Server

To request a floating license from an HTTP license server, follow this procedure:

1. Contact your server administrator to make sure the license server has already been set up and get network address and login details for the license server.

2. Start the Eclipse platform.

3. Open the Preferences dialog box (page 55) and click the Register button. The license registration dialog box is displayed.

4. Choose Use a license server as licensing method.

5. Select HTTP/HTTPS Server as server type.

6. In the URL field, enter the address of the license server.
The URL address has the following format: http://hostName:port/oXygenLicenseServlet/license-servlet.

7. Complete the User and Password fields.

8. Click the OK button.

If a floating license is available, it is registered in Oxygen XML Editor plugin. To display the license details, open the Preferences dialog box (page 55). If a floating license is not available, you will get a message listing the users currently using floating licenses.

Related Information:

- Setting up an HTTP License Server (Floating or Named-User Licenses) (page 36)

Requesting a Floating License from a TCP License Server (Deprecated)

Use this procedure if your company uses an Oxygen XML Editor plugin TCP license server and the license server has already been set up by your server administrator:

1. Contact your server administrator to get network address and login details for the license server.

2. Start the Eclipse platform.

3. Open the Preferences dialog box (page 55) and click the Register button. The license registration dialog box is displayed.

4. Choose Use a license server as licensing method.

5. Select TCP server as server type.

6. In the Host field, enter the host name or IP address of the license server.

7. In the Port field, enter the port number used to communicate with the license server.

8. Click the OK button.

If a floating license is available, it is registered in Oxygen XML Editor plugin. To display the license details, open the Preferences dialog box (page 55). If a floating license is not available, you will get a message listing the users currently using floating licenses.

Related Information:
Releasing a Floating License

The floating license you are using will be released and returned to the pool if any of the following occur:

- The connection with the license server is lost.
- The Oxygen XML Editor plugin will consume one license from the server’s pool of licenses if at least one Oxygen editor window is opened (not necessarily focused). In other words, if a user wants to release a license, all Oxygen editor windows must be closed.
- You exit the application running on your machine, and no other copies of Oxygen XML Editor plugin running on your machine are using your floating license.
- You register a Named User (page 2708) license with your copy of Oxygen XML Editor plugin, and no other copies of Oxygen XML Editor plugin running on your machine are using your floating license.
- Your computer idles for more than 2 hours.
- Your system administrator manually revokes the license (page 40).

Tip: To prevent your floating license from being released, you can use the Lock floating license action available in the Preferences dialog box (go to Window (Eclipse on Mac OSX) and choose Preferences > Oxygen XML Editor plugin. You can use the same action to unlock the license. Note that your system administrator also has the ability to unlock your license (page 41).

To release a floating license on demand, follow these steps:

1. Open the Preferences dialog box (page 55) and click Register.
   The license registration dialog box is displayed.

2. The license key field should be empty (this is normal). If it is not empty, delete any text in the field.

3. Make sure the Use a license key option is selected.

4. Click OK.
   A dialog box is displayed asking if you want to reset your license key.

5. Select between:
• **Use the last one** - Falls back to your previous license key. Use this option if you want to release a floating license and revert to a *Named User (page 2708)* license.

• **Reset** - Removes your license key from your user account on the current computer. The Reset button erases all the licensing information. To complete the reset operation, close and restart Oxygen XML Editor plugin.

Reserving a Floating License

There are instances where you might want to reserve or lock a floating license. For example, you could lock a floating license if you want to use your floating license offline while traveling.

To reserve/lock a floating license, follow these steps:

1. Select **Lock floating license** from the Preferences dialog box (go to Window (Eclipse on Mac OSX) and choose Preferences > Oxygen XML Editor plugin.

2. Click OK.

   Your floating license is now locked. You can use the same action to unlock the license or you can contact your system administrator to unlock it.

Transferring a License Key

If you want to transfer your Oxygen XML Editor plugin license key to another computer (for example, if you are disposing of your old computer or transferring it to another person), you must first unregister your license. You can then register your license (page 29) on the new computer in the normal way.

To unregister a license, prior to transferring it, follow this procedure:

1. **Open the Preferences dialog box** (page 55) and click Register.

   The license registration dialog box is displayed.

2. The license key field should be empty (this is normal). If it is not empty, delete any text in the field.

3. Make sure the **Use a license key** option is selected.

4. Click OK.

   A dialog box is displayed asking if you want to reset your license key.

5. Select between:

   • **Use the last one** - Falls back to your previous license key, if applicable.

   • **Reset** - Removes your license key from your user account on the current computer.
The Reset button erases all the licensing information. To complete the reset operation, close and restart Oxygen XML Editor plugin.

License Servers

Installing a License Server to Manage Licenses

If you are using floating licenses or large number of user-based licenses (20 or more) for Oxygen XML Editor plugin, you must set up an Oxygen XML Editor plugin license server. A license server can be installed as one of the following:

- An HTTP server (page 36). This is the recommended method.
- A TCP server (page 45) (deprecated).

Note: Oxygen XML Editor plugin version 17 or higher requires a license server version 17 or higher. License servers version 20.1 or higher can be used with any version of a floating or named-user license key.

Activating License Keys

To help you comply with the Oxygen XML Editor plugin EULA (terms of licensing), all floating or named-user licenses require activation. This means that the license key will be locked to a particular license server deployment and no multiple uses of the same license key are possible.

During the activation process, a code that uniquely identifies your license server deployment is sent to the Oxygen XML Editor plugin servers, which in turn will sign the license key.

Split or Combine License Keys to Work with Your License Servers

A license server can only manage one license key. If you have multiple license keys for the same Oxygen XML Editor plugin version and you want to have all of them managed by the same server, or if you have a multiple-user floating license and you want to split it between two or more license servers, contact the Oxygen support team and ask for a new license key.

Setting up an HTTP License Server (Floating or Named-User Licenses)

The HTTP License Server is available in several distributions, tailored for covering a variety of deployment configurations:
• **Windows installer (page 37)** - Easy-to-use Windows installation wizard. Requires elevated permissions to run it.

• **All-platform distribution (page 37)** - Script-based deployment that does not require elevated permissions to run it. Provides scripts for Windows, Mac, and Linux.

• **Web Archive (WAR) distribution (page 38)** - Provides more flexibility in your deployment configuration, but it requires an existing HTTP server (such as Apache Tomcat).

**Installation Steps for the HTTP License Server Installer Distribution for Windows**

1. Download the HTTP license server installer from the [HTTP License Server website](#).
2. Run the installer and follow the on-screen instructions.
3. You need to configure two sets of credentials:
   a. **Administrator credentials** - Used for accessing the Oxygen XML Editor plugin license server administrative interface.
   b. **Standard user credentials** - Used by an Oxygen XML Editor plugin application to connect to the license server.
4. You can choose to change the default 8080 port the server will run on. If you need to change the port after the installation, you can do it by editing the following `vmoptions` file: `oXygen HTTP License Server\Windows Service\oXygenHTTPLicenseServer.vmoptions`.
5. Optionally, you can choose to install the server as a Windows service. In this case, you can choose the name of the Windows service.

**Installation Steps for the HTTP License Server All-Platform Distribution**

1. Download the HTTP license server all-platform archive from the [HTTP License Server website](#).
2. Unpack the archive.
3. Run the license server scripts suitable for your operating system (`licenseServer.bat` for Windows or `licenseServer.sh` for Linux and Mac).

   **Note:** To specify a different port (other than the default 8080), you can pass the new port number as an argument to the scripts (for example, `licenseServer.bat 8082`). You can also change the port by editing the following `vmoptions` file: `oXygen HTTP License Server\Windows Service\oXygenHTTPLicenseServer.vmoptions`.
4. On the first run, you will be prompted to set two sets of credentials:
   a. **Administrator credentials** - Used for accessing the Oxygen XML Editor plugin license server administrative interface.
   b. **Standard user credentials** - Used by an Oxygen XML Editor plugin application to connect to the license server.
Tip: If you want to manually install, start, stop, or uninstall the server as a Windows service, run the following scripts from a command line as an Administrator:

- `installWindowsService.bat [serviceName]` - Installs the server as a Windows service with the name `serviceName`. The parameters for the license key folder and the server port can be set in the `oXygenLicenseServer.vmoptions` file.
- `startWindowsService.bat [serviceName]` - Starts the Windows service.
- `stopWindowsService.bat [serviceName]` - Stops the Windows service.
- `uninstallWindowsService.bat [serviceName]` - Uninstalls the Windows service.

If you do not provide the `serviceName` argument, the default name `oXygenLicenseServer` is used.

If the license server is installed as a Windows service, the output and error messages are automatically redirected to the following log files that are created in the install folder:

- `outLicenseServer.log` - Standard output stream of the server.
- `errLicenseServer.log` - Standard error stream of the server.

Installation Steps for the HTTP License Server WAR Distribution

1. Make sure that Apache Tomcat 5.5 or higher is running on the machine you have selected to be the license server (http://tomcat.apache.org).
2. Download the HTTP license server Web Archive (.war) from the HTTP License Server website.
3. Configure two Tomcat users:
   a. One user with the role `user`, used by an Oxygen XML Editor plugin application to connect to the license server. In the subsequent example, this user name is `John`.
   b. Another user with the roles `admin` and `manager-gui`, used for accessing the HTTP License Server administrative interface and the Tomcat management interface. In the subsequent example, this user name is `Mary`.

A typical way to achieve this is to edit the `tomcat-users.xml` file from your Tomcat installation (if using a Tomcat `zip/tar.gz` distribution, by default this configuration file is found in the `/TomcatInstallFolder/conf/` directory). After adding the two users, the configuration file might look like this:

```
<tomcat-users xmlns="http://tomcat.apache.org/xml"
               xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
               xsi:schemaLocation="http://tomcat.apache.org/xml tomcat-users.xsd"
               version="1.0">

  <!-- ... other user and role definitions ... -->

  <role rolename="user"/>
```

```xml
```
4. Go to the Tomcat Web Application Manager page and log-in with the user you configured with the `manager-gui` role (Mary in the example above). In the WAR file to deploy section, choose the WAR file and click the Deploy button. The oXygenLicenseServlet application is now up and running, but the license key is not yet registered.

5. Go to the HTTP License Server administration page by clicking the oXygenLicenseServlet link in the manager page. You will need to authenticate with the user configured with the admin role (Mary in the example above).

6. **Activate the license key**. This process involves binding your license key to your license server deployment. The browser used in the activation process needs to have Internet access. Once the process is completed you cannot activate the license on another license server. Follow these steps to activate the license:
   - a. Paste your license key into the form and press Register/Activate.

     **Result:** You will be redirected to an online form hosted on the Oxygen XML Editor plugin website. This form is pre-filled with an activation code that uniquely identifies your license server deployment, and your license key.

     **Note:** If, for some reason, your browser does not take you to this activation form, refer to the Manual Activation Procedure (page 39).

   - b. Press Register/Activate.

     If the activation process is successfully completed, your license server is running. Follow the on-screen instructions to configure the Oxygen XML Editor plugin client applications.

7. By default, the license server logs its activity in the TomcatInstallDir/logs/oxygenLicenseServlet.log file. To change the log file location, edit the log4j.appender.R2.File property from the TomcatInstallDir/webapps/oXygenLicenseServlet/WEB-INF/lib/log4j.properties configuration file.

### Manual License Activation Procedure

1. Access the HTTP license server by following the link provided by the Tomcat Web Application Manager page. You will be taken to the license registration page.
2. Copy the license server activation code.
4. Paste the license server activation code and license key in the displayed form, then click **Register/Activate**.

5. The activated license key is displayed on-screen. Copy the activated license key and paste it in the license registration page of the HTTP server.

**Backup License Server Information**

If you want to use a backup license server, the setup instructions are the same as the procedures for a main license server, but it will require its own separate license key. You do not need to purchase the separate license if it is to be used for a backup server, but you will need to request a separate license key by contacting the Oxygen support team.

**Related Information:**

- [Troubleshooting: Machine Signature Mismatch Errors](#) (page 49)

**License Server Management and Statistics Pages**

A system administrator can manage and access information about the license server at: `http://hostName:port/oXygenLicenseServlet`.

This page provides access to several statistics reports and management tasks. It also shows the current status of the server and provides additional instructions for using the license server with Oxygen XML Editor plugin.

This page includes the following links for accessing statistics or managing tasks:

- **Current Allocated Licenses** - Opens the Allocated License Report page (page 40).
- **Usage Statistics** - Available only for floating licenses. Opens the License Usage Statistics page (page 41).
- **View License Key** - Use this link to view details about the license key.
- **Replace/Remove License Key** - Use this link if you need to replace or remove the current license key (page 43).
- **Configuration** - Opens a page where you can configure notification settings and specify whether or not users are allowed to lock licenses. This page can be used for setting up the mail server used for sending emails whenever license requests from users are rejected.
- **Users management** - Available only for named-user licenses. Opens a page where you can manage the list of users who are entitled to use the license key.
Allocated License Report Page

This report page provides a system administrator the ability to revoke or unlock current running instances of licenses and includes the following information:

- **License load** - A graphical indicator that shows how many licenses are available.
- **License server status** - General information about the license server status, such as start time, license counts, rejected and acknowledged requests, average usage time, license refresh and timeout intervals, location of the license key, and the server version.
- **Current running instances** - Lists all currently acknowledged users, including user name, date and time when the license was granted, IP and MAC address of the computer where Oxygen XML Editor plugin runs, and lock status.
  - **Revoke** - A system administrator can click on the Revoke icon next to a user name to release that particular license and return it to the pool.
  - **Unlock** - If a user has locked their license, the system administrator can also unlock it from this page.

**Note:** This report is also available in XML format at: [http://hostName:port/oXygenLicenseServlet/license-servlet/report-xml](http://hostName:port/oXygenLicenseServlet/license-servlet/report-xml).

License Usage Statistics Page (Floating License Only)

This report page provides some usage statistics for the floating licenses. It is helpful for determining the number of licenses that are needed and monitoring times when licenses are consumed. It includes the following information:

- **Maximum number of concurrent licenses** - Shows the maximum number of floating licenses that can be consumed at any given time.
- **Concurrent license consumption per day** - A chart that shows the peak number of licenses that were consumed and the total number of users that were rejected, on a daily basis. This chart can be used to detect the amount of concurrent licenses that are needed to avoid having rejected users.

**Tip:** You can click on any bar to see the license consumption per hour for that particular day.

*Figure 9: Concurrent License Consumption per Day Chart*
• **Concurrent license consumption per hour** - A chart that shows the peak number of licenses that were consumed per hour throughout that particular month. This is useful for identifying the time of day when the most licenses were consumed.

*Figure 10: Concurrent License Consumption per Hour Chart*

**Users Management Page (Named-User License Only)**

When using a named-user license key, the license server allocates available licenses on a *first come first served* basis until the maximum number is reached. Further users attempting to get a license key will be rejected.

This page provides access to the list of registered users and allows the server admin to:

• Revoke a user's right to use a license.
• Reactivate a previously deactivated user.

Replacing or Removing a License Key in an HTTP License Server

The following procedure assumes that your Oxygen XML Editor plugin HTTP license server contains a previously activated license key (page 39) and provides instructions for replacing it with another one or removing it completely.

This is useful if, for instance, you want to upgrade your existing license to the latest version or if you receive a new license key that accommodates a different number of users (page 36).

Replacing a License Key

To replace a license key that is activated on your HTTP license server with a new one, follow these steps:

1. Access the license server by following the link provided by the Tomcat Web Application Manager page.
2. Click the Replace/Remove license key link. This will open a page that contains details about the license currently in use.
3. Click the **Replace** button to begin the replacement procedure.

4. Paste the new license key in the displayed form, then click **Register/Activate**. The browser used in the process needs to have Internet access.

   You will be redirected to an online form hosted on the Oxygen XML Editor plugin website. This form is pre-filled with an activation code that uniquely identifies your license server deployment and your license key.

   **Note:** If for some reason your browser does not take you to this activation form, refer to the Manual Activation Procedure (page 39).

5. Press **Register/Activate**.

   If the activation process is completed successfully, your license server is now running using the new license key. You can click **View license key** to inspect the key currently used by the license server.

### Removing a License Key

To remove a license key that is activated on your HTTP license server, follow these steps:

1. Access the license server by following the link provided by the Tomcat Web Application Manager page.
2. Click the **Replace/Remove license key** link. This will open a page that contains details about the license currently in use.
3. Click the **Remove** button to begin the license deletion procedure.
4. Click the **Remove** button in the confirmation page.

   **Important:** The removal process is irreversible. Once the process is complete, you cannot restore the license key.

### Upgrading Your HTTP License Server

The goal of the following procedure is to help you minimize the downtime when you upgrade the HTTP License Server to its latest version.

Follow this procedure:

1. Access the license server by following the link provided by the Tomcat Web Application Manager page. If prompted for authentication, use the **admin** or **manager** credentials.
2. Click the **View license key** link and copy the displayed license key to a file for later use.
3. Go to the Tomcat Web Application Manager page, log in with the user you configured with the manager role, and Undeploy the license server.

4. Download the Web Archive (WAR) distribution of HTTP license server.

5. Deploy the downloaded license server.

6. Access the license server by following the link provided by the Tomcat Web Application Manager page. If prompted for authentication, use the credentials configured for the admin or manager users.

7. Paste the license key into the form and register it.

Setting up TCP Floating License Server (Deprecated) in 32-bit Windows

This section contains information about setting up the TCP floating license server as a Windows process.

Figure 12: TCP Floating License Server (Process in Windows)

![TCP Floating License Server (Process in Windows)](image)

Installation Steps

1. Download the license server installation kit for Windows from the Oxygen XML Editor plugin website.

2. Run the downloaded installer and follow the on-screen instructions.

   By default, the installer installs the license server as a Windows service. Optionally, you have the ability to start the Windows service automatically at Windows startup or create shortcuts on the Start menu for starting and stopping the Windows service manually.

   Tip: If you want to manually install, start, stop, or uninstall the server as a Windows service, run the following scripts from a command line as an Administrator:
   
   • `installWindowsService.bat [serviceName]` - Installs the server as a Windows service with the name `serviceName`. The parameters for the license key folder and the server port can be set in the `oXygenLicenseServer.vmoptions` file.
• startWindowsService.bat [serviceName] - Starts the Windows service.
• stopWindowsService.bat [serviceName] - Stops the Windows service.
• uninstallWindowsService.bat [serviceName] - Uninstalls the Windows service.

If you do not provide the serviceName argument, the default name oXygenLicenseServer is used.

If the license server is installed as a Windows service, the output and error messages are automatically redirected to the following log files that are created in the install folder:
• outLicenseServer.log - Standard output stream of the server.
• errLicenseServer.log - Standard error stream of the server.

3. Manually add the oXygenLicenseServer.exe file in the Windows Firewall list of exceptions. Go to Control Panel > System and Security > Windows Firewall > Allow a program or feature through Windows Firewall > Allow another program and browse for oXygenLicenseServer.exe from the Oxygen XML Editor plugin License Server installation folder.

4. Floating licenses require activation prior to use. More details are available either on-screen (if the license server is started in a command-line interface) or in the outLicenseServer.log log file.

Note: A license server can only manage one license key. If you have multiple license keys for the same Oxygen XML Editor plugin version and you want to have all of them managed by the same server, or if you have a multiple-user floating license and you want to split it between two or more license servers, contact the Oxygen support team and ask for a new license key.

Replacing Floating License Key in TCP Floating License Server (Deprecated)

The following procedure assumes that your Oxygen XML Editor plugin TCP floating license server contains a previously activated license key (page 39) and provides instructions for replacing the activated license key with another one. The goal of the procedure is to minimize the license server downtime during the activation step of the new license key.

This is useful if, for instance, you want to upgrade your existing license to the latest version or if you receive a new license key that accommodates a different number of users (page 36).

To replace a floating license key that is activated on your floating license server with a new one, follow these steps:

1. Stop the service that runs the floating license server.
2. Locate the folder that holds the previous activated license key (by default, it is named license and it is located in the installation directory of the license server).
3. Remove the license.txt file and try to restart the server. Since the file that stores the license key is missing, the server will fail to start (page 51).

4. Find the license activation procedure in the on-screen instructions (if the license server is started in a command-line interface) or in the outLicenseServer.log log file.

5. After you copy the activated license key in the license.txt file, restart the license server.

Upgrading Your TCP Floating License Server (Deprecated)

The goal of the following procedure is to help you minimize the downtime generated when you upgrade the Oxygen XML Editor plugin floating license server to its newest version.

Follow this procedure:

1. Go to the Oxygen XML Editor plugin website and download the latest floating license server.
2. Run the installation kit.
3. Leave the default Update the existing installation option selected. This will ensure that some options set in the previous version (namely the installation folder, port number, and the floating license key in use) of the license server will be preserved.
4. Follow the on-screen instructions to complete the installation process.

Setting up TCP Floating License Server (Deprecated) All-Platforms

This installation method can be used for running the TCP license server on any platform where a Java virtual machine can run (OS X, Linux/Unix, Windows).

Figure 13: TCP Floating License Server (All-Platforms Distribution)

Installation Steps

1. Ensure that a Java runtime version 6 or later is installed on the server machine.
2. Download the license server installation kit for your platform from the Oxygen XML Editor plugin website.

3. Unzip the installation kit into a new folder.

4. Start the server using the startup script from a command-line console.
   The startup script is called `licenseServer.sh` for OS X and Unix/Linux or `licenseServer.bat` for Windows. The following parameters are accepted:
   - `licenseDir` - The path of the directory where the license files will be placed. The default value is `license`.
   - `port` - The TCP port number used to communicate with Oxygen XML Editor plugin instances. The default value is `12346`.

   **Example:** The following is an example of the command line for starting the license server on Unix/Linux and OS X:
   ```bash
   sh licenseServer.sh myLicenseDir 54321
   ```

5. Floating licenses require activation prior to use. Follow the on-screen instruction to complete the license activation process.

Replacing Floating License Key in TCP Floating License Server (Deprecated)

The following procedure assumes that your Oxygen XML Editor plugin TCP floating license server contains a previously activated license key (page 39) and provides instructions for replacing the activated license key with another one. The goal of the procedure is to minimize the HTTP license server downtime during the activation step of the new license key.

This is useful if, for instance, you want to upgrade your existing license to the latest version or if you receive a new license key that accommodates a different number of users (page 36).

To replace a floating license key that is activated on your floating license server with a new one, follow these steps:

1. Stop the process that runs the floating license server.
2. Locate the folder that holds the previous activated license key (by default, it is named `license` and it is located in the installation directory of the license server).
3. Remove the `license.txt` file and try to restart the server. Since the file that stores the license key is missing, the server will fail to start.
4. Find the license activation procedure in the on-screen instructions.
5. After you copy the activated license key in the `license.txt` file, restart the license server.
Upgrading Your TCP Floating License Server (Deprecated)

The goal of the following procedure is to help you minimize the downtime generated when you upgrade the Oxygen XML Editor plugin TCP floating license server to its newest version.

Follow this procedure:

1. Stop the current license server process.
2. Locate and open the floating server startup script. It should look like this:
   
   ```
   sh licenseServer.sh pathToLicenseDir 54321
   ```

3. Make a note of the path to the license directory (in the example above, it is `pathToLicenseDir`) and the port number (in the example above, it is `54321`).
4. Go to the license directory and copy the license key file (`license.txt`) for later use.
5. Go to the Oxygen XML Editor plugin website and download the all-platforms floating license server installation kit.
6. Unzip the archive and overwrite the content of your current floating license server installation.
7. Copy the license key file (`license.txt`) saved in step 4 to `license` directory of the floating license server installation.
8. Edit the floating server startup script and configure with the info you made note of in step 3.
9. Start the floating license server process.

Common Problems: License Server Errors

This section includes some common problems that may appear when setting up a floating license server.

**Machine Signature Mismatch Error**

**Problem**

I receive an error indicating that the current license was already activated on a License Server or that the License Server's Machine Signature does not match.

During the license activation process, the license key becomes bound to a particular license server deployment. This means that a code that uniquely identifies your license server deployment (called Machine Signature) is sent to the Oxygen XML Editor plugin servers, which in turn will sign the license key. The Machine Signature is computed from the list of network interfaces of the machine where you deployed the license.
When starting the license server, if you receive an error stating that your server’s Machine Signature does not match, there are several possible causes:

**Possible Cause 1**

The license key was moved to a new machine that hosts your license server.

**Solution**

Revert to your previous configuration.

**Possible Cause 2**

A new network interface was changed, added, or activated in the machine that hosts your license server.

**Note:** A specific example of when this could happen is if the Bluetooth or the WiFi module is activated/deactivated.

**Solution**

If reverting is not possible, contact the Oxygen support team.

**Possible Cause 3**

The license server was restarted from a different location as the previous restart. For example, some server configurations will have the Apache Tomcat server installed in a versioned folder (`/usr/local/apache-tomcat-V.V.V`) with a symbolic link to the typical folder (`/usr/local/tomcat`). The server can be restarted from either location, but it is recommended to always restart from the typical folder (`/usr/local/tomcat`) and always restart from the same location.

**Solution**

The server simply needs to always be restarted from the same location.

Windows Service Reports Incorrect Function Error When Starting (TCP Server)
Problem
My TCP floating license server reports an "Incorrect Function" error message when starting the Windows service.

Cause
This usually appears because the Windows service launcher cannot locate a Java virtual machine on your system.

Solution
Make sure that you have installed a 32-bit Java SE from Oracle (or Sun) on the system: http://www.oracle.com/technetwork/java/javase/downloads/index.html.

Windows Service Reports Process Terminated Unexpectedly Error (TCP Server)

Problem
My TCP floating license server reports a "Process Terminated Unexpectedly" error message for the Windows service.

Cause
This error message appears if the Windows service launcher quits immediately after being started. This problem usually happens because the license key has not been correctly deployed (license.txt file in the license folder).

Solution
Re-deploy your license key. For more information, see the Setting up a Floating License Server section (page 45).

Upgrading
From time to time, upgrades and patch versions of Oxygen XML Editor plugin are released to provide enhancements that fix problems and add new features.
Upgrading Oxygen XML Editor plugin on Windows/Linux

What is Preserved During an Upgrade?

When you install a new version of Oxygen XML Editor plugin, some data is preserved and some is overwritten. If there is a previous version of Oxygen XML Editor plugin already installed on your computer, it can coexist with the new one, which means you do not have to uninstall it.

If you install over a previously installed version:

- All the files from its install directory will be removed, including any modification in framework (page 2706) files, XSLT stylesheets, XML Catalogs (page 2712), and templates.
- All global user preferences are preserved in the new version.
- All project preferences will be preserved in their project files.
- Any custom frameworks (page 2706) that were stored outside the installation directory (as configured in Document type associations > Locations (page 71)) will be preserved and will be found by the new installation.

If you install in a new directory:

- All the files from the old install directory will be preserved, including any modification in framework (page 2706) files, XSLT stylesheets, XML Catalogs (page 2712), and templates.
  However, these modifications will not be automatically imported into the new installation.
- All global user preferences are preserved in the new version.
- All project preferences will be preserved in their project files.
- Any custom frameworks (page 2706) that were stored outside the installation directory (as configured in Document type associations > Locations (page 71)) will be preserved and will be found by the new installation.

How to Upgrade Oxygen XML Editor plugin on Windows or Linux

1. Uninstall the current version of Oxygen XML Editor plugin (page 53).
2. Download and install the new version according to the instructions for your platform and the type of installer you selected.
3. Restart Oxygen XML Editor plugin.
4. If you are upgrading from a minor version to a major version (for example, from 16.1 to 17.0) and you did not purchase a Maintenance Pack that covers the new major version, you will need to enter a new license for the new version into the registration dialog box that is displayed when the plugin is started.
Upgrading Oxygen XML Editor plugin on OS X

What is Preserved During an Upgrade?

When you install a new version of Oxygen XML Editor plugin, first you need to remove or rename the old installation directory. By renaming the directory, it can coexist with the new installation and the following data will be preserved:

- All the files from the old install directory will be preserved, including any modification in framework (page 2706) files, XSLT stylesheets, XML Catalogs (page 2712), and templates. However, these modifications will not be automatically imported into the new installation.
- All global user preferences are preserved in the new version.
- All project preferences will be preserved in their project files.
- Any custom frameworks (page 2706) that were stored outside the installation directory (as configured in Document type associations > Locations (page 71)) will be preserved and will be found by the new installation.

How to Upgrade Oxygen XML Editor plugin on OS X

1. Uninstall the current version of Oxygen XML Editor plugin (page 53) or rename the installation directory (for example, Oxygen XML Editor.old).
2. Download and install the new version according to the instructions for your platform and the type of installer you selected.
3. Restart Oxygen XML Editor plugin.
4. If you are upgrading from a minor version to a major version (for example, from 16.1 to 17.0) and you did not purchase a Maintenance Pack that covers the new major version, you will need to enter a new license for the new version into the registration dialog box that is displayed when the plugin is started.

Uninstalling

How to Uninstall Oxygen XML Editor plugin

⚠️ CAUTION: ⚠️ The following procedure will remove Oxygen XML Editor plugin from your system. It will not remove the Eclipse platform. If you want to uninstall Eclipse, refer to its uninstall instructions.

1. Choose the menu option Help > About > Installation Details.
2. Select Oxygen XML Editor plugin from the list of plugins.
3. Choose **Uninstall**.
4. Accept the Eclipse restart.
5. If you want to remove the user preferences:
   - **Windows** - Remove the directory: %APPDATA%\com.oxygenxml (usually %APPDATA% has the value: [user-home-dir]\Application Data). Note that this directory is hidden.
   - **OS X** - Remove the directory: Library/Preferences/com.oxygenxml of the user home folder.
   - **On Linux**, remove the directory: .com.oxygenxml from the user home directory.
4.

Configuring Oxygen XML Editor plugin

This chapter presents all the user preferences and options that allow you to configure various features and aspects of the application itself. It also includes information about storing and sharing options, importing and exporting options or scenarios, customizing system properties, setting startup parameters, and the editor variables (page 201) that are available for customizing user-defined commands.

Preferences

You can configure Oxygen XML Editor plugin options using the Preferences dialog box.

To open the preferences dialog box, go to Window (Eclipse on Mac OSX) and choose Preferences > Oxygen XML Editor plugin.

Figure 14: Eclipse Preferences Dialog Box
Press ⌘ or F1 for help on any preferences page.

You can restore options to their default values by pressing the Restore Defaults button, available in each preferences page.

A filtered version of the Preferences dialog box is available by selecting Options from the contextual menu in the editor. It displays an appropriate preferences page according to the context where the action was invoked and filters the tree on the left according to where the preference page is located in the hierarchy.

Figure 15: Eclipse Preferences Dialog Box - Filtered Version
Preferences Directory Location

A variety of resources (such as global options, license information, and history files) are stored in a preferences directory (`com.oxygenxml`) that is in the following locations:

- **Windows (Vista, 7, 8, 10)** - `{user_home_directory}\AppData\Roaming\com.oxygenxml`
- **Windows XP** - `{user_home_directory}\Application Data\com.oxygenxml`
- **Mac OS X** - `{user_home_directory}/Library/Preferences/com.oxygenxml`
- **Linux/Unix** - `{user_home_directory}/.com.oxygenxml`

**Oxygen XML Editor plugin License**

To configure the license options, open the Preferences dialog box (page 55). This preferences page presents the details of the license key that enables the Oxygen XML Editor plugin, such as registration name, category and number of purchased licenses, encrypted signature of the license key. Clicking the Register button opens the Oxygen XML Editor plugin License dialog box that allows you to insert a new license key.

**Archive Preferences**

To configure Archive options, open the Preferences dialog box (page 55) and go to Archive.

The following options are available in the Archive preferences page:

**Archive backup options**

Controls if the application makes backup copies of the modified archives. The following options are available:

- **Always create backup copies of modified archives** - When you modify an archive, its content is backed up.
- **Never create backup copies of modified archives** - No backup copy is created.
- **Ask for each archive once per session** - Once per application session for each modified archive, user confirmation is required to create the backup. This is the default setting.

**Note:** Backup files have the name `originalArchiveFileName.bak` and are located in the same folder as the original archive.

**Show archive backup dialog box**
Select this option if you want to be notified for backup when modifying in archives. The last backup option you chose will always be used as the default one.

**Archive types**

This table contains all known archive extensions mapped to known archive formats. Each row maps a list of extensions to an archive type supported in Oxygen XML Editor plugin. You can use the Edit button at the bottom of the table to edit an existing mapping or the New button to create a new one and associate your own list of extensions to an archive format.

![Edit Archive Extension Mappings](image)

**Important:** You have to restart Oxygen XML Editor plugin after removing an extension from the table for that extension to not be recognized as an archive extension.

**Store Unicode file names in Zip archives**

Use this option when you archive files that contain international (non-English) characters in file names or file comments. If this option is selected and an archive is modified in any way, UTF-8 characters are used in the names of all files in the archive.

**CSS Validator Preferences**

To configure the CSS Validator preferences, open the Preferences dialog box (page 55) and go to CSS Validator.

You can configure the following options for the built-in CSS Validator of Oxygen XML Editor plugin:

- **Profile** - Selects one of the available validation profiles: **CSS 1**, **CSS 2**, **CSS 2.1**, **CSS 3**, **CSS 3 with Oxygen extensions**, **SVG**, **SVG Basic**, **SVG Tiny**, **Mobile**, **TV Profile**, **ATSC TV Profile**. The **CSS 3 with Oxygen extensions** profile includes all the CSS 3 standard properties plus the CSS extensions specific for Oxygen (page 2215) that can be used in Author mode (page 303). That means all Oxygen specific extensions are accepted in a CSS stylesheet by the built-in CSS validator (page 1145) when this profile is selected.
• **Media type** - Selects one of the available mediums: all, aural, braille, embossed, handheld, print, projection, screen, tty, tv, presentation, oxygen.

• **Warning level** - Sets the minimum severity level for reported validation warnings. Can be one of: All, Normal, Most Important, No Warnings.

• **Ignore properties** - You can type comma separated patterns that match the names of CSS properties that will be ignored at validation. The following vendor extensions are specified as ignored by default: -ro-* (PDFreactor), -ah-* (Antenna House), prince-* (Prince). As wildcards you can use:
  - * to match any string.
  - ? to match any character.

• **Recognize browser CSS extensions (also applies to content completion)** - If selected, Oxygen XML Editor plugin recognizes browser-specific CSS properties (no validation is performed). The Content Completion Assistant (page 2704) lists these properties at the end of its list, prefixed with the following particles:
  - -moz- for Mozilla.
  - -ms- for Internet Explorer or Edge.
  - -o- for Opera.
  - -webkit- for Safari/Webkit.

### Custom Editor Variables Preferences

An editor variable (page 201) is useful for making a transformation scenario, validation scenario, or other tool independent of its file path. An editor variable is specified as a parameter in a transformation scenario, validation scenario, or command line of an external tool. Such a variable is defined by a name, a string value, and a text description. A custom editor variable is defined by the user and can be used in the same expressions as the built-in editor variables (page 201).

Custom editor variables are created and configured in the Custom Editor Variables preferences page. To access this page, open the Preferences dialog box (page 55) and go to Custom Editor Variables.

This preferences page displays a table of all the custom editor variables that have been defined. The table includes three columns for the editor variable **Name**, its **Value**, and its **Description**. The create a new variable, click the + New button at the bottom of the table and define your custom editor variable in the subsequent dialog box. To edit an existing custom editor variable, click the Edit button and configure the variable in the subsequent dialog box. You can also use the X Delete button to remove custom editor variables that are no longer needed.

*Figure 17: Custom Editor Variables Table*
Data Sources Preferences

To configure the Data Sources preferences, open the Preferences dialog box (page 55) and go to Data Sources. This preferences page allows you to configure data sources and connections to relational and native XML databases. For a list of drivers that are available for the major database servers, see Download Links for Database Drivers (page 65).

Connection Wizards Section

Create eXist-db XML connection

Click this link to open the dedicated Create eXist-db XML connection dialog box (page 1949) that provides a quick way to create an eXist connection.

Data Sources Section

This section allows you to add and configure data sources.

Figure 18: Data Sources Preferences Panel
The following buttons are available at the bottom of the **Data Sources** panel:

- **New**

  Opens the **Data Sources Drivers** dialog box that allows you to configure a new database driver.

*Figure 19: Data Sources Drivers Dialog Box*

The following options are available in the **Data Source Drivers** dialog box:

- **Name** - The name of the new data source driver that will be used for creating connections to the database.
- **Type** - Selects the data source type from the supported driver types.
- **Help button** - Opens the User Manual at the list of sections (*page 65*) where the configuration of supported data sources is explained and the URLs for downloading the database drivers are specified.
- **Driver files (JAR, ZIP)** - Lists download links for database drivers (*page 65*) that are necessary for accessing databases in Oxygen XML Editor plugin.
- **Add Files** - Adds the driver class library.
- **Add Recursively** - Adds driver files recursively.
- **Remove** - Removes the selected driver class library from the list.
- **Detect** - Detects driver file candidates.
- **Stop** - Stops the detection of the driver candidates.
• **Driver class** - Specifies the driver class for the data source driver.

**Edit**

Opens the Data Sources Drivers dialog box for editing the selected driver. See above the specifications for the Data Sources Drivers dialog box. To edit a data source, there must be no connections using that data source driver.

**Duplicate**

Creates a copy of the selected data source.

**Delete**

Deletes the selected driver. To delete a data source, there must be no connections using that data source driver.

**Connections Section**

This section allows you to add and configure data source connections.

*Figure 20: Connections Preferences Panel*

The following buttons and options are available at the bottom of the Connections panel:

**New**

Opens the Connection dialog box that allows you to configure a new database connection.

*Figure 21: Connection Dialog Box*
The following options are available in the Connection dialog box:

- **Name** - The name of the new connection that will be used in transformation scenarios and validation scenarios.
- **Data Source** - Allows selecting a data source defined in the Data Source Drivers dialog box.

Depending upon the selected data source, you can set some of the following parameters in the Connection details area:

- **URL** - The URL for connecting to the database server.
- **User** - The user name for connecting to the database server.
- **Password** - The password of the specified user name.
- **Host** - The host address of the server.
- **Port** - The port where the server accepts the connection.
- **XML DB URI** - The database URI.
- **Database** - The initial database name.
- **Collection** - One of the available collections for the specified data source.
- **Environment home directory** - Specifies the home directory (only for a Berkeley database).
- **Verbosity** - Sets the verbosity level for output messages (only for a Berkeley database).
- **Use a secure HTTPS connection (SSL)** - Allows you to establish a secure connection to an eXist database through the SSL protocol.
**Edit**

Opens the **Connection** dialog box, allowing you to edit the selected connection. See above the specifications for the **Connection** dialog box.

**Duplicate**

Creates a copy of the selected connection.

**Delete**

Deletes the selected connection.

**Move Up**

Moves the selected connection up one row in the list.

**Move Down**

Moves the selected connection down one row in the list.

**Limit the number of cells**

For performance issues, you can set the maximum number of cells that will be displayed in the **Table Explorer view** *(page 1918)* for a database table. Leave this field empty if you want the entire content of the table to be displayed. By default, this field is set to 2000. If a table that has more cells than the value set here is displayed in the **Table Explorer view** *(page 1918)*, a warning dialog box will inform you that the table is only partially shown.

**Maximum number of children for container nodes**

In Oracle XML, a container can hold millions of resources. If the node corresponding to such a container in the **Data Source Explorer view** *(page 1917)* would display all the contained resources at the same time, the performance of the view would be very slow. To prevent this, only a limited number of the contained resources is displayed as child nodes of the container node. You can navigate to other contained resources from the same container by using the **Up** and **Down** buttons in the **Data Source Explorer view** *(page 1917)*. This limited number is set in the field. The default value is 200 nodes.

**Show warning when expanding other database schema**

Controls if a warning message will be displayed when expanding another database schema and there are tables selected in the current expanded one. This applies to the **Select database table** dialog box in the **Import Database Data wizard** *(page 1999)* and the **Select database table** section of the **Convert DB Structure to XML Schema** dialog box *(page 1091)*.
Table Filters Preferences

The Table Filters preferences page allows you to choose the types of tables to be shown in the Data Source Explorer view (page 1917). To open this preferences page, open the Preferences dialog box (page 55) and go to Data Sources > Table Filters.

You can choose to display the following types of tables:

- Alias
- Global Temporary
- Local Temporary
- Synonym
- System Table
- Table
- View

Download Links for Database Drivers

For a list of major relational databases and the drivers that are available for them, see https://www.oxygenxml.com/database_drivers.html.

In addition, the following is a list of other popular databases along with instructions for getting the drivers that are necessary to access the databases in Oxygen XML Editor plugin:

- **Berkeley DB XML database** - Copy the jar files from the Berkeley database install directory into the Oxygen XML Editor plugin install directory as described in the procedure for configuring a Berkeley DB data source (page 1942).
- **IBM DB2 Pure XML database** - Go to the IBM website and in the DB2 Clients and Development Tools category select the DB2 Driver for JDBC and SQLJ download link. Fill out the download form and download the zip file. Unzip the zip file and use the db2jcc.jar and db2jcc_license_cu.jar files in Oxygen XML Editor plugin for configuring a DB2 data source (page 1924).
- **eXist database** - Copy the jar files from the eXist database install directory to the Oxygen XML Editor plugin install directory as described in the procedure for configuring an eXist data source (page 1949).
- **MarkLogic database** - Download the MarkLogic driver from MarkLogic Community site.
- **Microsoft SQL Server 2005 / 2008 database** - Download the appropriate MS SQL JDBC driver from the Microsoft website.
- **Oracle 11g database** - Go to http://www.oracle.com/technetwork/database/enterprise-edition/jdbc-112010-090769.html and download the Oracle 11g JDBC driver called ojdbc6.jar.
• **PostgreSQL 8.3 database** - Go to [http://jdbc.postgresql.org/download.html](http://jdbc.postgresql.org/download.html) and download the PostgreSQL 8.3 JDBC3 driver.

**DITA Preferences**

To access the DITA Preferences page, open the *Preferences* dialog box (page 55) and go to DITA. This preferences page includes the following sections and options:

**DITA Open Toolkit section**

This section allows you to specify the default directory of the DITA Open Toolkit distribution (bundled with the Oxygen XML Editor plugin installation) to be used for validating and publishing DITA content. You can select from the following:

**Built-in DITA-OT 3.x**

Oxygen XML Editor plugin comes bundled with DITA-OT 3.2.1. By default, all defined DITA transformation/validation scenarios will run with this version. This also provides access to DITA 1.3 features (including document templates). The default DITA OT 3.2.1 directory is: `{OXYGEN_INSTALL_DIR}/frameworks/dita/DITA-OT3.x`.

**Custom**

Allows you to specify a custom directory for your DITA-OT distribution.

**Location**

You can either provide a new file path for the specific DITA OT that you want to use or select a previously used one from the drop-down list. You can specify the path by using the text field, the ![Insert Editor Variables](page 201) button, or the ![Browse](button).

**Prefer navigation title for topicref rendering**

If selected and there is a `navtitle` attribute set on a `topicref`, then the `navtitle` is used to render the title of the topic in the DITA Maps Manager (page 2400).

**Insert topic reference section**

Allows you to specify that when inserting a topic reference (using the Insert Reference dialog box (page 2426) and Edit Properties dialog box (page 2436)), the values for certain attributes will always be automatically populated with a detected value (based on the specifications), even if it is the same as the default value. You can choose to always populate the values for the following attributes:
- **Format** - If selected, the `format` attribute will always be automatically populated with a detected value.

- **Scope** - If selected, the `scope` attribute will always be automatically populated with a detected value.

- **Type** - If selected, the `type` attribute will always be automatically populated with a detected value.

- **Navigation title** - If selected, the `navtitle` attribute will always be automatically populated with a detected value.

**Insert link section**

Allows you to specify that when a link reference is inserted (using actions in the `Link` drop-down menu), the values for certain attributes will always be automatically populated with a detected value (based on the specifications), even if it is the same as the default value. You can choose to always populate the values for the following attributes:

- **Format** - If selected, the `format` attribute will always be automatically populated with a detected value.

- **Scope** - If selected, the `scope` attribute will always be automatically populated with a detected value.

- **Type** - If selected, the `type` attribute will always be automatically populated with a detected value.

**Use `:` instead of the ID of the parent topic (DITA 1.3)**

When addressing a non-topic element within the topic that contains the URI reference, the URI reference can use an abbreviated fragment-identifier syntax that replaces the topic ID with `:` ( `#./elementId` ). For more information, see https://www.oxygenxml.com/dita/1.3/specs/index.html#archSpec/base/uri-based-addressing.html.

**Profiling Attributes link**

Opens the Profiling/Conditional Text preferences page (page 119) where you can configure profiling attributes and condition sets.

**DITA New Topics Preferences**

To access the DITA New Topics preferences page, open the Preferences dialog box (page 55) and go to DITA > New topics. This preferences page includes the following options:

**Use the title to generate the file name**
This option (and its sub-options) pertain to the rules that will be used to generate file names in the New DITA File dialog box (page 2459). Select this option to use the text entered in the Title field to automatically generate a file name (the generated name can be seen in the Save as field). By default, the generated name will replace spaces with underscores (_), all illegal characters will be removed, and all upper case characters changed to lower case, but you can use the sub-options to change this.

**Replace spaces with**

If selected, the file name generation mechanism will replace spaces in the title with the character entered in this option.

**Lower case only**

If selected, the file name generation mechanism will only use lower case letters.

**Use camel case**

If selected, the file name generation mechanism will convert the title to a file name using the camel case convention where the first word starts with a lower case letter and all subsequent words begin with upper case (for example, myFileName).

**Upper case first letter**

Select this option if you want the file name generation mechanism to convert the title to a file name using the camel case convention but with an upper case letter for the first word (for example, MyFileName).

**Use the file name as the value of the root ID attribute**

Select this option to use the file name (as seen in the Save as field but without the file extension) as the value of the root id attribute for the new topic.

**DITA Publishing Preferences**

To access the DITA Publishing preferences page, open the Preferences dialog box (page 55) and go to DITA > Publishing. You can also open this page by clicking the Configure Publishing Templates Gallery link in the Templates tab of the transformation scenario dialog box for WebHelp Responsive transformations.

You can use this preferences page to specify additional directories where custom publishing templates are stored. The templates stored in these directories will appear in the preview pane in the Templates tab of the transformation scenario dialog box, along with all the built-in templates.
DITA Logging Preferences

To access the DITA Logging preferences page, open the Preferences dialog box (page 55) and go to DITA > Logging. This preferences page includes the following sections and options:

Show console output

Allows you to specify when to display the console output log in the message panel at the bottom of the editor. The following options are available:

- **When build fails** - Displays the console output log only if the build fails.
- **Always** - Displays the console output log, regardless of whether or not the build fails.

Show the following types of messages in a new tab

This section allows you to specify which types of messages will be displayed in separate tabs in the message panel at the bottom of the editor if a DITA transformation results in errors or warnings. You can choose whether or not to display the following types of messages:

- DITA-OT errors
- DITA-OT warnings
- DITA-OT info
- FOP errors
- FOP warnings
- FOP info
- XSLT problems

Document Type Association Preferences

Oxygen XML Editor plugin uses document type associations (page 2705) to associate a document type (page 1277) with a set of functionality provided by a framework (page 2706). To configure the Document Type Association options, open the Preferences dialog box (page 55) and go to Document Type Association.

The following actions are available in this preferences page:

Discover more frameworks by using add-ons update sites

Click on this link to specify URLs for framework add-on update sites.

Document Type Table
This table presents the currently defined frameworks (page 2706) (document type associations (page 2705)), sorted by priority and alphabetically. Each edited document type has a set of association rules (page 73) (used by the application to detect the proper document type association to use for an opened XML document).

**New**

Opens a Document type configuration dialog box (page 72) that allows you to add a new framework.

**Edit**

Opens a Document type configuration dialog box (page 72) that allows you to edit an existing framework.

⚠️ **Note:** If you try to edit an existing framework when you do not have write permissions to its storage location, a dialog box will be shown asking if you want to extend it.

**Duplicate**

Opens a Document type configuration dialog box (page 72) that allows you to duplicate the configuration of an existing framework. This will create a snapshot of the framework in its current form. It is merely a copy of the document type and will not evolve along with the base document type like the Extend action does.

**Extend**

Opens a Document type configuration dialog box (page 72) that allows you to extend an existing framework. You can add or remove functionality starting from a base document type. All of these changes will be saved as a patch. When the base document type is modified and evolves (for example, from one application version to another) the extension will evolve along with the base document type, allowing it to use the new actions added in the base document type.

**Delete**

Deletes the selected framework (document type).

**Enable DTD/XML Schema processing in document type detection**

When this option is selected (default value), the matching process also examines the DTD/XML Schema associated with the document. For example, the fixed attributes declared in the DTD for the root element are also analyzed, if this is specified in the association rules. This is especially useful if you are writing DITA customizations. DITA topics and maps are also matched by looking for the DITAArchVersion attribute of the root element. This attribute is specified as default in the DTD and it is detected
in the root element, helping Oxygen XML Editor plugin to correctly match the DITA customization.

**Only for local DTDs/XML Schemas**

When this option is selected (default value), only the local DTDs / XML Schemas will be processed.

**Enable DTD/XML Schema caching**

When this option is selected (default value), the associated DTDs or XML Schema are cached when parsed for the first time, improving performance when opening new documents with similar schema associations.

Locations Preferences

Oxygen XML Editor plugin allows you to change the location where frameworks *(page 2706)* (document types) are stored, and to specify additional framework directories. The Locations preferences page allows you to specify the main frameworks folder location. You can choose between the Default directory (`[OXYGEN_INSTALL_DIR]/frameworks`) or a Custom specified directory. You can also change the current frameworks folder location value using the `com.oxygenxml.editor.frameworks.url` system property.

A list of additional frameworks directories can also be specified. The application will look in each of those folders for additional document type configurations to load. Use the Add, Edit and Delete buttons to manage the list of folders.

A document type configuration *(framework)* can be loaded from the following locations:

- **Internal preferences** - The document type configuration is stored in the application Internal preferences *(page 73).*
- **Additional framework directories** - The document type configuration is loaded from one of the specified Additional frameworks directories list.
- **The frameworks folder** - The main folder containing framework configurations.

All loaded document type configurations are first sorted by priority, then by document type name and then by load location (in the exact order specified above). When an XML document is opened, the application chooses the first document type configuration from the sorted list that matches the specific document.
All loaded document type configurations are first sorted by priority, then by document type.

Document Type Configuration Dialog Box

The **Document Type** Configuration dialog box allows you to create or edit a *framework (page 2706)* (document type). It is displayed when you use the **New, Edit, Duplicate, or Extend** buttons in the **Document Type Association preferences page (page 69)** (open the **Preferences** dialog box (page 55) and go to **Document Type Association**).

![Document Type Configuration Dialog Box](image)

The configuration dialog box includes the following fields and sections:

**Name**

The name of the *framework*. This will be displayed as its name in the **Document Type** column in the **Document Type Association preferences page (page 69)**.

**Priority**

Depending on the priority level, Oxygen XML Editor plugin establishes the order in which the existing *frameworks* are evaluated to determine the type of a document you are opening. It can be one of the following: Lowest, Low, Normal, High, or Highest. You can set a higher priority for *frameworks* you want to be evaluated first.

**Note:** The built-in document types are set to Low priority by default. *Frameworks* that have the same priority are sorted alphabetically.

**Description**
The document type description displayed as a tool tip in the Document Type Association preferences page (page 69).

Storage

The location where the document type is saved. If you select the External storage option, the document type is saved in the specified file with a mandatory framework extension, located in a subdirectory of the current frameworks directory. If you select the Internal storage option, the document type data is saved in the Oxygen XML Editor plugin internal options file.

Initial edit mode

Sets the default edit mode when you open a document for the first time: Editor specific, Text, Author, Grid and Design (available only for the W3C XML Schema editor). If the Editor specific option is selected, the initial editing mode is determined based upon the editor type. You can find the mapping between editors and edit modes in the Edit modes preferences page. (page 109) You can impose an initial mode for opening files that match the association rules of the document type. For example, if the files are usually edited in the Author mode you can set it in the Initial edit mode combo box.

Note: You can also customize the initial mode for a document type in the Edit modes preferences page. Open the Preferences dialog box (page 55) and go to Editor > Edit modes.

Configuration Tabs

The bottom section of the dialog box includes various tabs where you can configure numerous options for the framework.

Related Information:

- Creating and Configuring Custom Frameworks (page 2037)
- Sharing a Custom Framework (page 2086)

Association Rules Tab

To open the Association Rules tab of the Document type configuration dialog box, open the Preferences dialog box (page 55), go to Document Type Association, use the New, Edit, Duplicate, or Extend button (page 69), and click on the Association Rules tab.

In the Association rules tab, you can perform the following actions:
New
Opens the Document type rule dialog box allowing you to create association rules.

Edit
Opens the Document type rule dialog box allowing you to edit the properties of the currently selected association rule.

Delete
Deletes the currently selected association rules from the list.

Move Up
Moves the selected association rule up one spot in the list.

Move Down
Moves the selected association rule down one spot in the list.

By combining multiple association rules you can instruct Oxygen XML Editor plugin to identify the type of a document. Oxygen XML Editor plugin identifies the type of a document when the document matches at least one of the association rules. This tab give you access to a Document type rule dialog box that you can use to create association rules that activate on any document matching all the criteria defined in the dialog box.

To create a new association rule, click the New button at the bottom of the Association Rules tab, or to edit an existing rule, click the Edit button.

Figure 23: Document Type Rule Dialog Box

The Document type rule dialog box includes the following fields and options:

Namespace
Specifies the namespace of the root element from the association rules set (* (any) by default). If you want to apply the rule only when the root element has no namespace, leave this field empty (remove the **ANY_VALUE** string).

**Root local name**

Specifies the local name of the root element (* (any) by default).

**File name**

Specifies the name of the file (* (any) by default).

**Public ID**

Represents the Public ID of the matched document.

**Attribute Local name**

Specifies the local name of the attributes for the root element (* (any) by default).

**Attribute Namespace**

Specifies the namespace of the attributes for the root element (* (any) by default).

**Attribute Value**

Specifies the value of the attributes for the root element (* (any) by default).

**Java class**

Presents the name of the Java class that is used to determine if a document matches the rule. This Java class should implement the `ro.sync.ecss.extensions.api.DocumentTypeCustomRuleMatcher` interface.

**Tip:** You can use wildcards (?) and * or editor variables (page 201) in the Document Type Rule dialog box, and you can enter multiple values by separating them with a comma.

**Schema Tab**

In the **Schema** tab, you can specify a default schema for Oxygen XML Editor plugin to use if an XML document does not contain a schema declaration and no default validation scenario is associated with it.

To open the **Schema** tab of the Document type configuration dialog box, open the Preferences dialog box (page 55), go to **Document Type Association**, use the **New, Edit, Duplicate**, or **Extend** button (page 69), and click on the **Schema** tab.

This tab includes the following options for defining a schema to be used if no schema is detected in the XML file:

**Schema type**
Use this drop-down list to select the type of schema.

**Schema URI**

You can specify the URI of the schema file. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (page 201) button, or the browsing actions in the Browse drop-down list.

ℹ️ Tip: It is a good practice to store all resources in the framework directory and use the $\{framework\}$ editor variable (page 206) to reference them. This is a recommended approach to designing a self-contained document type that can be easily maintained and shared between multiple users.

**Classpath Tab**

The Classpath tab displays a list of folders and JAR (page 2707) libraries that hold implementations for API extensions, implementations for custom Author mode operations, various resources (such as stylesheets), and framework (page 2706) translation files. Oxygen XML Editor plugin loads the resources looking in the folders in the order they appear in the list.

To open the Classpath tab of the Document type configuration dialog box, open the Preferences dialog box (page 55), go to Document Type Association, use the New, Edit, Duplicate, or Extend button (page 69), and click on the Classpath tab.

The Classpath tab includes the following actions:

️ **New**

Opens a dialog box that allows you to add a resource to the table in the Classpath tab. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (page 201) button, or the browsing actions in the Browse drop-down list.

ℹ️ Tip: The path can also contain wildcards (for example, $\{framework\}/lib/*.jar).

🔍 **Edit**

Opens a dialog box that allows you to edit a resource in the Classpath tab. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (page 201) button, or the browsing actions in the Browse drop-down list.

ℹ️ Tip: The path can also contain wildcards (for example, $\{framework\}/lib/*.jar).

✗ **Delete**
Deletes the currently selected resource from the list.

肠胃

Moves the selected resource up one spot in the list.

肠胃

Moves the selected resource down one spot in the list.

Author Tab

The Author tab is a container that holds information regarding the CSS file used to render a document in the Author mode, and regarding framework (page 2706)-specific actions, menus, contextual menus, toolbars, and content completion list of proposals.

To open the Author tab of the Document type configuration dialog box, open the Preferences dialog box (page 55), go to Document Type Association, use the New, Edit, Duplicate, or Extend button (page 69), and click on the Author tab.

The options that you configure in the Author tab are grouped in subtabs.

CSS Subtab

The CSS subtab contains the CSS files that Oxygen XML Editor plugin uses to render a document in the Author mode. In this subtab, you can set main and alternate CSS files. When you are editing a document in the Author mode, you can switch between these CSS files from the Styles drop-down menu on the Author Styles toolbar.

To open the CSS subtab, open the Preferences dialog box (page 55), go to Document Type Association, use the New, Edit, Duplicate, or Extend button (page 69), click on the Author tab, and then the CSS subtab.

The following actions are available in the CSS subtab:

+ New
Opens a dialog box that allows you to add a CSS file. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (page 201) button, or the browsing actions in the Browse drop-down list.

Edit

Opens a dialog box that allows you to edit the current selection.

Delete

Deletes the currently selected CSS file.

Move Up

Moves the selected CSS file up in the list.

Move Down

Moves the selected CSS file down in the list.

Enable multiple selection of alternate CSSs

Allows users to apply multiple alternate styles, as layers, over the main CSS style. This option is selected by default for DITA document types.

If there are CSSs specified in the document then

You can choose between the following options for controlling how the CSS files that are set in this subtab will be handled if a CSS is specified in the document itself:

- Ignore CSSs from the associated document type - The CSS files set in this CSS subtab are overwritten by the CSS files specified in the document itself.
- Merge them with CSSs from the associated document type - The CSS files set in this CSS subtab are merged with the CSS files specified in the document itself.

Actions Subtab

The Actions subtab contains a sortable table that includes all the framework (page 2706)-specific actions. Each action has a unique ID, a name, a description, and a shortcut key.
To open the Actions subtab, open the Preferences dialog box (page 55), go to Document Type Association, use the New, Edit, Duplicate, or Extend button (page 69), click on the Author tab, and then the Actions subtab.

The following actions are available in this subtab:

- **New**
  
  Opens the Action dialog box (page 79) that allows you to add an action.

- **Duplicate**

  Duplicates the currently selected action.

- **Edit**

  Opens the Action dialog box (page 79) that allows you to edit the existing action.

- **Delete**

  Deletes the currently selected action.

**Author Action Dialog Box**

To edit an existing document type action or create a new one, open the Preferences dialog box (page 55), go to Document Type Association, use the New, Edit, Duplicate, or Extend button (page 69), click on the Author tab, and then the Actions subtab. At the bottom of this subtab, click **New** to create a new action, or **Edit** to modify an existing one.

*Figure 24: Action Dialog Box*
The following options are available in the **Action** dialog box:

**ID**

Specifies a unique action identifier.

**Name**

Specifies the name of the action. This name is displayed as a tooltip or as a menu item.

**Tip:** You can use the `${i18n('key')}` editor variable *(page 206)* to allow for multiple translations of the name.

**Menu access key**

In Windows, you can access menus by holding down **Alt** and pressing the keyboard key that corresponds to the **Letter** that is underlined in the name of the menu. Then, while still holding down **Alt**, you can select submenus and menu action the same way by pressing subsequent corresponding keys. You can use this option to specify the **Letter** in the name of the action that can be used to access the action.

**Description**

A description of the action. This description is displayed as a tooltip when hovering over the action.

**Tip:** You can use the `${i18n('key')}` editor variable *(page 206)* to allow for multiple translations of the description.

**How to translate frameworks link**

Use this link to see more information about *Localizing Frameworks *(page 2047)*.

**Large icon**

Allows you to select an image for the icon that Oxygen XML Editor plugin uses for the toolbar action.

**Tip:** A good practice is to store the image files inside the **framework** directory and use the `${frameworks}` editor variable *(page 206)* to make the image relative to the **framework** location. If the images are bundled in a **jar** archive (for instance, along with some Java operations implementation), it is convenient to reference the images by their relative path location in the **class-path**.

**Small icon**

Allows you to select an image for the icon that Oxygen XML Editor plugin uses for the contextual menu action.
Note: If you are using a Retina or HiDPI display, Oxygen XML Editor plugin automatically searches for higher resolution icons in the path specified in both the Large icon and Small icon options. For more information, see Adding Retina/HiDPI Icons in a Framework (page 2047).

Shortcut key

This field allows you to configure a shortcut key for the action that you are editing. The + character separates the keys.

Enable platform-independent shortcut keys

If this checkbox is selected, the shortcut that you specify in this field is platform-independent and the following modifiers are used:

- \texttt{M1} represents the \texttt{Command} key on MacOS X, and the \texttt{Ctrl} key on other platforms.
- \texttt{M2} represents the \texttt{Shift} key.
- \texttt{M3} represents the \texttt{Option} key on MacOS X, and the \texttt{Alt} key on other platforms.
- \texttt{M4} represents the \texttt{Ctrl} key on MacOS X, and is undefined on other platforms.

Operations section

In this section of the Action dialog box, you configure the functionality of the action that you are editing. An action has one or more operation modes. The evaluation of an XPath expression activates an operation mode. The first selected operation mode is activated when you trigger the action. The scope of the XPath expression must consist only of element nodes and attribute nodes of the edited document. Otherwise, the XPath expression does not return a match and does not fire the action. For more details see: Activate Multiple Functions for Actions using XPath Expressions (page 82).

The following options are available in this section:

Activation XPath

An XPath 2.0 expression that applies to elements and attributes. For more details see: Activate Multiple Functions for Actions using XPath Expressions (page 82).

Operation

 Specifies the invoked operation.

Arguments
Specifies the arguments of the invoked operation. The Edit at the bottom of the table allows you to edit the arguments of the operation.

**Operation priority**

Increases or decreases the priority of an operation. The operations are invoked in the order of their priority. If multiple XPath expressions are true, the operation with the highest priority is invoked.

- **Add** - Adds an operation.
- **Remove** - Removes an operation.
- **Duplicate** - Duplicates an operation.

**Evaluate activation XPath expressions even in read-only contexts**

If this checkbox is selected, the action can be invoked even when the cursor is placed in a read-only location.

**Activate Multiple Functions for Actions using XPath Expressions**

An Author mode action can have multiple functions, each function invoking an Author mode operation with certain configured parameters. Each function of an action has an XPath 2.0 expression for activating it.

For each function of an action, the application will check if the XPath expression is fulfilled (when it returns a not empty nodes set or a true result). If it is fulfilled, the operation defined in the function will be executed.

The following special XPath extension functions are provided:

- **oxy:allows-child-element() (page 82)** - Use this function to check whether or not an element is valid child element in the current context, according to the associated schema.
- **oxy:allows-global-element() (page 84)** - Use this function to check whether or not an element is a valid global element for the current framework (page 2706), according to the associated schema.
- **oxy:current-selected-element() (page 86)** - Use this function to get the currently selected element.
- **oxy:is-required-element() (page 86)** - Use this function to check if the element returned by the given XPath expression is required (based on the rules declared in the schema).

**oxy:allows-child-element()** Function
The **oxy:allows-child-element()** function allows you to check whether or not an element that matches the arguments of the function is valid as a child of the element at the current cursor position, according to the associated schema. It is evaluated at the cursor position and has the following signature:

```xml
oxy:allows-child-element($childName, ($attributeName, $defaultAttributeValue, $contains?)?)
```

The following parameters are supported:

- **childName**
  
  The name of the element that you want to check if it is valid in the current context. Its value is a string that supports the following forms:

  - The child element with the specified local name that belongs to the default namespace.
    ```xml
    oxy:allows-child-element("para")
    ```

    The above example verifies if the **para** element (of the default namespace) is allowed in the current context.

  - The child element with the local name specified by any namespace.
    ```xml
    oxy:allows-child-element("*:para")
    ```

    The above example verifies if the **para** element (of any namespace) is allowed in the current context.

  - A prefix-qualified name of an element.
    ```xml
    oxy:allows-child-element("prefix:para")
    ```

    The prefix is resolved in the context of the element where the cursor is located. The function matches on the element with the **para** local name from the previous resolved namespace. If the prefix is not resolved to a namespace, the function returns a value of **false**.

  - A specified namespace-URI-qualified name of an element.
    ```xml
    oxy:allows-child-element("{namespaceURI}para")
    ```

    The **namespaceURI** is the namespace of the element. The above example verifies if the **para** element (of the specified namespace) is allowed in the current context.

  - Any element.
    ```xml
    oxy:allows-child-element("*")
    ```

    The above function verifies if any element is allowed in the current context.
Note: A common use case of oxygen:allows-child-element("*") is in combination with the attributeName parameter.

attributeName

The attribute of an element that you want to check if it is valid in the current context. Its value is a string that supports the following forms:

- The attribute with the specified name from no namespace.
  
  oxygen:allows-child-element("*", "class", " topic/topic ")

  The above example verifies if an element with the class attribute and the default value of this attribute (that contains the topic/topic string) is allowed in the current context.

- The attribute with the local name specified by any namespace.
  
  oxygen:allows-child-element("*", "*:localname", " topic/topic ")

- A qualified name of an attribute.
  
  oxygen:allows-child-element("*", "prefix:localname", " topic/topic ")

  The prefix is resolved in the context of the element where the cursor is located. If the prefix is not resolved to a namespace, the function returns a value of false.

defaultAttributeValue

A string that represents the default value of the attribute. Depending on the value of the next parameter, the default value of the attribute must either contain this value or be equal with it.

contains

An optional boolean. The default value is true. For the true value, the default value of the attribute must contain the defaultAttributeValue parameter. If the value is false, the two values must be the same.

oxy:allows-global-element() Function

The oxy:allows-global-element() function allows you to check whether or not an element that matches the arguments of the function is valid for the current framework (page 2706), according to the associated schema. It has the following signature:

oxy:allows-global-element($elementName, ($attributeName, $defaultAttributeValue, $contains?)?)
The following parameters are supported:

**elementName**

The name of the element that you want to check if it is valid in the current framework. Its value is a string that supports the following forms:

- The element with the specified local name that belongs to the default namespace.
  
  `oxy:allows-global-element("para")`

  The above example verifies if the `para` element (of the default namespace) is allowed in the current framework.

- The element with the local name specified by any namespace.
  
  `oxy:allows-global-element("*:para")`

  The above example verifies if the `para` element (of any namespace) is allowed in the current framework.

- A prefix-qualified name of an element.
  
  `oxy:allows-global-element("prefix:para")`

  The prefix is resolved in the context of the framework. The function matches on the element with the `para` local name from the previous resolved namespace. If the prefix is not resolved to a namespace, the function returns a value of `false`.

- A specified namespace-URI-qualified name of an element.
  
  `oxy:allows-global-element("{namespaceURI}para")`

  The `namespaceURI` is the namespace of the element. The above example verifies if the `para` element (of the specified namespace) is allowed in the current framework.

- Any element.
  
  `oxy:allows-global-element("*")`

  The above function verifies if any element is allowed in the current framework.

**attributeName**

The attribute of an element that you want to check if it is valid in the current framework. Its value is a string that supports the following forms:

- The attribute with the specified name from no namespace.
  
  `oxy:allows-global-element("***", "class", " topic/topic ")`
The above example verifies if an element with the `class` attribute and the default value of this attribute (that contains the `topic/topic` string) is allowed in the current framework.

- The attribute with the local name specified by any namespace.

  ```xml
  <oxy:allows-global-element("*", "*:localname", " topic/topic ">
  </oxy:allows-global-element>
  ```

- A qualified name of an attribute.

  ```xml
  <oxy:allows-global-element("*", "prefix:localname", " topic/topic ">
  </oxy:allows-global-element>
  ```

The prefix is resolved in the context of the framework. If the prefix is not resolved to a namespace, the function returns a value of `false`.

**defaultAttributeValue**

A string that represents the default value of the attribute. Depending on the value of the next parameter, the default value of the attribute must either contain this value or be equal with it.

**contains**

An optional boolean. The default value is `true`. For the `true` value, the default value of the attribute must contain the `defaultAttributeValue` parameter. If the value is `false`, the two values must be the same.

**oxy:current-selected-element()** Function

This function returns the fully selected element. If no element is selected, the function returns an empty sequence.

**Example: oxy:current-selected-element Function**

```xml
<oxy:current-selected-element()>[self::p]/b
```

This example returns the `b` elements that are children of the currently selected `p` element.

**oxy:is-required-element()** Function

This function checks if the element returned by the given XPath expression is required (based on the rules declared in the schema). It has only one argument, an XPath expression, and the XPath expression must be written in such a way that it returns a single element.

**Example: oxy:is-required-element Function**

```xml
<oxy:is-required-element(.)>
```
This example would check to see if the current element is required by the schema.

**oxy:is-editable-element()**  
Function

This function checks if the element returned by the given XPath expression is editable (content can be inserted in it), meaning both that the entire XML file is editable and that the current context where the element is placed is editable. For example, if the element is inside an `xi:included` section, it is not editable.

It only has one argument, an XPath expression, and the XPath expression must be written in such a way that it returns a single element.

**Example: oxy:is-editable-element Function**

```
oxy:is-editable-element(ancestor-or-self::table)
```

This example would return `true` if the cursor is placed inside a table and it is editable or `false` if it is not editable.

**Localizing Frameworks**

Oxygen XML Editor plugin supports framework localization (translating framework actions, buttons, and menu entries to various languages). This lets you develop and distribute a framework to users that speak other languages without changing the distributed framework.

To localize the content of a framework, create a `translation.xml` file that contains all the translation (key, value) mappings. The `translation.xml` has the following format:

```xml
<translation>
  <languageList>
    <language description="English" lang="en_US"/>
    <language description="German" lang="de_DE"/>
    <language description="French" lang="fr_FR"/>
  </languageList>
  <key value="list">
    <comment>List menu item name.</comment>
    <val lang="en_US">List</val>
    <val lang="de_DE">Liste</val>
    <val lang="fr_FR">Liste</val>
  </key>
  .................
</translation>
```
Oxygen XML Editor plugin matches the GUI language with the language set in the translation.xml file. If this language is not found, the first available language declared in the languagelist tag for the corresponding framework is used.

Add the directory where this file is located to the Classpath list corresponding to the edited document type.

After you create this file, you can use the keys defined in it to customize the name and description of the following:

- Actions
- Menu entries
- Contextual menus
- Toolbars
- Static CSS content

For example, if you want to localize the bold action, open the Preferences dialog box (page 55) and go to Document Type Association. Use the New or Edit button to open the Document type configuration dialog box (page 72), go to Author > Actions, and rename the bold action to ${i18n(translation_key)}. Actions with a name format other than ${i18n(translation_key)} are not localized. Translation_key corresponds to the key from the translation.xml file.

Now open the translation.xml file and edit the translation entry if it exists or create one if it does not exist. This example presents an entry in the translation.xml file:

```xml
<key value="translation_key">
    <comment>Bold action name.</comment>
    <val lang="en_US">Bold</val>
    <val lang="de_DE">Bold</val>
    <val lang="fr_FR">Bold</val>
</key>
```

To use a description from the translation.xml file in the Java code used by your custom framework, use the new ro.sync.ecss.extensions.api.AuthorAccess.getAuthorResourceBundle() API method to request the associated value for a certain key. This allows all the dialog boxes that you present from your custom operations to have labels translated in multiple languages.

You can also reference a key directly in the CSS content:

```css
title:before{
    content:${i18n(title.key)} : ;
}
```
**Note:** You can enter any language you want in the `languageList` tag and any number of keys.

The `translation.xml` file for the DocBook framework is located here: `[OXYGEN_INSTALL_DIR]/frameworks/docbook/i18n/translation.xml`. In the Classpath list corresponding to the DocBook document type the following entry was added: `${framework}/i18n/`.

To see how the DocBook actions are defined to use these keys for their name and description, open the Preferences dialog box (page 55) and go to Document Type Association > Author > Actions. If you look in the Java class `ro.sync.ecss.extensions.docbook.table.SADocbookTableCustomizerDialog` available in the `oxygen-sample-framework` module of the Oxygen SDK Maven archetype, you can see how the new `ro.sync.ecss.extensions.api.AuthorResourceBundle` API is used to retrieve localized descriptions for various keys.

**Menu Subtab**

In the Menu subtab, you can configure which actions will appear in the framework (page 2706)-specific menu. The subtab is divided in two sections: Available actions and Current actions.

To open the Menu subtab, open the Preferences dialog box (page 55), go to Document Type Association, use the New, Edit, Duplicate, or Extend button (page 69), click on the Author tab, and then the Menu subtab.

The Available actions section presents a table that displays the actions defined in the Actions subtab, along with their icon, ID, and name. The Current actions section holds the actions that are displayed in the Oxygen XML Editor plugin menu. To add an action in this section as a sibling of the currently selected action, use the Add as sibling button. To add an image in this section as a child of the currently selected action use the Add as child button.

The following actions are available in the Current actions section:

- **Edit**
  Edits an item.

- **Remove**
  Removes an item.

- **Move Up**
  Moves an item up.

- **Move Down**
  Moves an item down.

**Contextual Menu Subtab**
In the **Contextual menu** subtab you configure what framework (page 2706)-specific action the Content Completion Assistant (page 2704) proposes. The subtab is divided in two sections: **Available actions** and **Current actions**.

To open the **Contextual Menu** subtab, open the **Preferences** dialog box (page 55), go to **Document Type Association**, use the **New**, **Edit**, **Duplicate**, or **Extend** button (page 69), click on the **Author** tab, and then the **Contextual Menu** subtab.

**Figure 25: Contextual Menu Subtab**

The **Available actions** section presents a table that displays the actions defined in the **Actions** subtab, along with their icon, ID, and name. The **Current actions** section contains the actions that are displayed in the contextual menu for documents that belong to the edited framework.

The following actions are available in this subtab:

1. **Add as sibling**
   
   Adds the selected action or submenu from the **Available actions** section to the **Current actions** section as a sibling of the selected action.

2. **Add as child**
   
   Adds the selected action or submenu from the **Available actions** section to the **Current actions** section as a child of the selected action.

3. **Edit**
   
   This option is available for container (submenu) items that are listed in the **Current actions** section. It opens a configuration dialog box that allows you to edit the selected container (submenu).

**Figure 26: Menu Action Configuration Dialog Box**
The following options are available in this dialog box:

**Name**

Specifies the name of the action. This name is displayed as a tooltip or as a menu item.

*Tip:* You can use the ${i18n('key')} editor variable (page 206) to allow for multiple translations of the name.

**Menu access key**

In Windows, you can access menus by holding down Alt and pressing the keyboard key that corresponds to the Letter that is underlined in the name of the menu. Then, while still holding down Alt, you can select submenus and menu action the same way by pressing subsequent corresponding keys. You can use this option to specify the Letter in the name of the action that can be used to access the action.

**Menu icon**

Allows you to select an image for the icon that Oxygen XML Editor plugin uses for the container (submenu).

**Promote items when in a table context**

If this option is selected, when invoking the contextual menu from within a table, all the actions in this container (submenu) will be promoted to the main level in the contextual menu. Actions and submenus that are not promoted are still available in the Other actions submenu when invoking the contextual menu within a table.

**Remove**

Removes the selected action or submenu from the Current actions section.

**Move Up**

Moves the selected item up in the list.

**Move Down**
Moves the selected item down in the list.

**Toolbar Subtab**

In the Toolbar subtab you configure what framework-specific action the Oxygen XML Editor plugin toolbar holds. The subtab is divided in two sections: Available actions and Current actions.

To open the Toolbar subtab, open the Preferences dialog box (page 55), go to Document Type Association, use the New, Edit, Duplicate, or Extend button (page 69), click on the Author tab, and then the Toolbar subtab.

The Available actions section presents a table that displays the actions defined in the Actions subtab, along with their icon, ID, and name. The Current actions section holds the actions that are displayed in the Oxygen XML Editor plugin toolbar when you work with a document belonging to the edited framework. To add an action in this section as a sibling of the currently selected action, use the Add as sibling button. To add an action in this section as a child of the currently selected action use the Add as child button.

The following actions are available in the Current actions section:

- **Edit**
  Edits an item.

- **Remove**
  Removes an item.

- **Move Up**
  Moves an item up.

- **Move Down**
  Moves an item down.

**Content Completion Subtab**

In the Content Completion subtab you configure what framework-specific the Content Completion Assistant proposes. The subtab is divided in two sections: Available actions and Current actions.

To open the Content Completion subtab, open the Preferences dialog box (page 55), go to Document Type Association, use the New, Edit, Duplicate, or Extend button (page 69), click on the Author tab, and then the Content Completion subtab.
Available and Current Actions

The Available actions section presents a table that displays the actions defined in the Actions subtab, along with their icon, ID, and name. The Current actions section holds the actions that the Content Completion Assistant proposes when you work with a document belonging to the edited framework.

To add an action in this section as a sibling of the currently selected action, use the Add as sibling button. To add an action in this section as a child of the currently selected action use the Add as child button.

The following actions are available in the Current actions section:

- Edit
  Edits an item.
- Remove
  Removes an item.
- Move Up
  Moves an item up.
- Move Down
  Moves an item down.

Filter Table

The Filter section presents a table that allows you to add elements to be filtered from the Content Completion Assistant or from some specific helper views or menus. Use the Add button to add more filters to the table, the Edit button to modify an existing item in the table, or the Remove button to remove a filtered item. The Add and Edit buttons open a Remove item dialog box.

Figure 27: Remove Item Dialog Box

Use this dialog box to add or configure the elements that will be filtered:
Item name

Use this text field to enter the name of the element to be filtered. The drop-down list also includes a few special content completion actions that can be filtered (<SPLIT> and <ENTER>).

Remove item from

You can choose to filter the element from any of the following:

- **Content Completion Window** - The element will not appear in the Content Completion Assistant (page 2704).
- **Elements View** - The element will not appear in the Elements view (page 265).
- **Element Insert Menus** - The element will not appear in the Append Child, Insert Before, or Insert After menus that are available in certain contextual menus (for example, the contextual menu of the Outline view (page 257)).
- **Entities View** - The element will not appear in the Entities view (page 266).

Templates Tab

The Templates tab specifies a list of directories where new document templates are located for this particular framework. These directories, along with the document templates that are saved inside them, will appear in the New from templates wizard (page 554) inside the Framework templates category according to your framework and the directory path you specify in this tab.

To open the Templates tab of the Document type configuration dialog box, open the Preferences dialog box (page 55), go to Document Type Association, use the New, Edit, Duplicate, or Extend button (page 69), and click on the Templates tab.

The Templates tab includes the following actions:

- **New**

  Opens a dialog box that allows you to specify the path to a directory that contains document templates for this framework. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (page 201) button, or the browsing actions in the · Browse drop-down list.
Tip: The path can also contain wildcards. For example, using `${frameworkDir}/templates/*` would add all the template folders found inside the templates directory.

**Edit**

Opens a dialog box that allows you to edit the path of a directory that contains document templates for this framework. You can specify the path by using the text field, its history drop-down, the ![Insert Editor Variables](page 201) button, or the browsing actions in the ![Browse](page 55) drop-down list.

Tip: The path can also contain wildcards. For example, using `${frameworkDir}/templates/*` would add all the template folders found inside the templates directory.

**Delete**

Deletes the currently selected template directory from the list.

**Move Up**

Moves the selected template directory up one spot in the list.

**Move Down**

Moves the selected template directory down one spot in the list.

### Catalogs Tab

The **Catalogs** tab specifies a list of XML Catalogs (page 897), specifically for the edited framework (page 2706), that are added to list of catalogs that Oxygen XML Editor plugin uses to resolve resources.

To open the **Catalogs** tab of the Document type configuration dialog box, open the Preferences dialog box (page 55), go to Document Type Association, use the New, Edit, Duplicate, or Extend button (page 69), and click on the Catalogs tab.

You can perform the following actions:
Add

Opens a dialog box that allows you to add a catalog to the list. You can specify the path by using the text field, its history drop-down, the \( \text{Insert Editor Variables} \) button, or the browsing actions in the \( \text{Browse} \) drop-down list.

Edit

Opens a dialog box that allows you to edit the path of an existing catalog.

Delete

Deletes the currently selected catalog from the list.

Move Up

Moves the selected catalog up one spot in the list.

Move Down

Moves the selected catalog down one spot in the list.

Transformation Tab

In the Transformation tab, you can configure the transformation scenarios associated with the particular framework (page 2706) you are editing. These transformation scenarios are presented in the Configure Transformation Scenarios dialog box (page 1502) when transforming a document and you can specify which scenarios will be used by default for a particular document type.

To open the Transformation tab of the Document type configuration dialog box, open the Preferences dialog box (page 55), go to Document Type Association, use the New, Edit, Duplicate, or Extend button (page 69), and click on the Transformation tab.

The Transformation tab offers the following options:

Default checkbox

You can set one or more of the scenarios listed in this tab to be used as the default transformation scenario when another specific scenario is not specified. The scenarios that are set as default are rendered bold in the Configure Transformation Scenarios dialog box (page 1502).

New

Opens the New scenario dialog box allowing you to create a new transformation scenario for the particular document type (page 1415).

Duplicate
Allows you to duplicate the configuration of an existing transformation scenario. It opens the **Edit scenario** dialog box where you can configure the properties of the duplicated scenario *(page 1500)*.

**Edit**

Opens the **Edit scenario** dialog box allowing you to edit the properties of the currently selected transformation scenario *(page 1498)*.

**Delete**

Deletes the currently selected transformation scenario.

**Import scenarios**

Imports transformation scenarios.

**Export selected scenarios**

Exports transformation scenarios.

**Move Up**

Moves the selection to the previous scenario.

**Move Down**

Moves the selection to the next scenario.

**Validation Tab**

In the **Validation** tab, you can configure the validation scenarios associated with the particular framework *(page 2706)* you are editing. These validation scenarios are presented in the **Configure Validation Scenarios** dialog box when validating a document and you can specify which scenarios will be used by default for a particular document type.

**Note:** If a master file is associated with the current file, the validation scenarios defined in the master file, along with any Schematron schema defined in the default scenarios for that particular framework, are used for the validation. These take precedence over other types of validation units defined in the default scenarios for the particular framework. For more information on master files, see Master Files Support *(page 581)* or Working with Modular XML Files in the Master Files Context *(page 901)*.

To open the **Validation** tab of the **Document type** configuration dialog box, open the **Preferences** dialog box *(page 55)*, go to **Document Type Association**, use the **New**, **Edit**, **Duplicate**, or **Extend** button *(page 69)*, and click on the **Validation** tab.

**Validation Tab**

The **Validation** tab offers the following options:

- **Default checkbox**
You can set one or more of the scenarios listed in this tab to be used as the default validation scenario when another specific scenario is not specified in the validation process. The scenarios that are set as default are rendered bold in the Configure Validation Scenarios dialog box.

- **New**
  Opens the New scenario dialog box allowing you to create a new validation scenario (page 869).

- **Duplicate**
  Allows you to duplicate the configuration of an existing validation scenario. It opens the Edit scenario dialog box where you can configure the properties of the duplicated scenario (page 875).

- **Edit**
  Opens the Edit scenario dialog box allowing you to edit the properties of the currently selected validation scenario (page 875).

- **Delete**
  Deletes the currently selected validation scenario.

- **Import scenarios**
  Imports validation scenarios.

- **Export selected scenarios**
  Export validation scenarios.

- **Move Up**
  Moves the selected scenario up one spot in the list.

- **Move Down**
  Moves the selected scenario down one spot in the list.

**Extensions Tab**

The Extensions tab specifies implementations of Java interfaces used to provide advanced functionality to the document type.

To open the Extensions tab of the Document type configuration dialog box, open the Preferences dialog box (page 55), go to Document Type Association, use the New, Edit, Duplicate, or Extend button (page 69), and click on the Extensions tab.
Libraries containing the implementations must be present in the classpath (page 76) of your document type. The Javadoc available at https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ contains details about how each API implementation functions.

Editor Preferences

Oxygen XML Editor plugin lets you configure the appearance of various components and features of the main editor. To access these options, open the Preferences dialog box (page 55) and go to Editor (or right-click in the editor window and choose Preferences).

The following options are available:

**Editor background**
Allows you to set the background color for text editors.

**Completion proposal background**
Allows you to set the background color of the Content Completion Assistant (page 2704).

**Completion proposal foreground**
Allows you to set the color of the text in the Content Completion Assistant (page 2704).

**Documentation window background**
Allows you to set the background color of the documentation of elements suggested by the Content Completion Assistant (page 2704).

**Documentation window foreground**
Allows you to set the color of the text for the documentation of elements suggested by the Content Completion Assistant (page 2704).

**Line wrap**
If selected, long lines are automatically wrapped in edited documents. The line wrap does not alter the document content since the application does not use new-line characters to break long lines.

**Enable folding when opening a new editor**
If selected (default value), the vertical stripe that holds the folding markers (page 625) is displayed in Text mode.

**Beep on operation finished**
Oxygen XML Editor plugin emits a short beep when a validation, check well-formedness, or transformation action has ended.
**Note:** When the validation or the transformation process of a document is successful, the beep signal has a higher audio frequency, as opposed to when the validation fails, and the beep signal has a lower audio frequency. On the Windows platform, for other operations, the default system sound (Asterisk) is used. You can configure it by changing the sound theme.

**Display quick-assist and quick-fix side hints**

Displays the *Quick Assist* (page 2710) icon (⁺) and *Quick Fix* (page 2710) icon (⁻) in the line number stripe on the left side of the editor.

**Highlight matching tag**

If you place the cursor on a start or end tag, Oxygen XML Editor plugin highlights the corresponding member of the pair.

**Tip:** You can configure the colors and how various types of highlights are shown from the Eclipse *Annotations* preferences page *(Window > Preferences > General > Editors > Text Editors > Annotations)*.

**Minimum fold range**

You can specify the minimum number of lines in a block for which the *folding* (page 2706) support becomes active. If you modify this value, the change takes effect next time you open the editor.

**Content Completion Preferences**

Oxygen XML Editor plugin provides a *Content Completion Assistant* (page 2704) that provides a list of available options at any point in a document and can auto-complete structures, elements, and attributes. To configure the *Content Completion* preferences, open the *Preferences* dialog box *(page 55)* and go to *Editor > Content Completion*. These options control how the *Content Completion Assistant* works.

The following options are available:

**Auto close the last opened tag**

When selected, Oxygen XML Editor plugin automatically closes the last open tag when you type `</`.  

**Automatically rename/delete/comment matching tags**

If you rename, delete, or comment out a start tag, Oxygen XML Editor plugin automatically renames, deletes, or comments out the matching end tag.
**Note:** If you select **Toggle comment** for multiple starting tags and the matching end tags are on the same line as other start tags, the end tags are not commented.

**Enable content completion**

Toggles the content completion feature on or off.

**Close the inserted element**

When you choose an entry from the *Content Completion Assistant* list of proposals, Oxygen XML Editor plugin inserts both start and end tags. The following additional options are available with regards to closing the element:

- **If it has no matching tag** - The end tag of the inserted element is automatically added only if it is not already present in the document.
- **Add element content** - Oxygen XML Editor plugin inserts the required elements specified in the DTD, XML Schema, or RELAX NG schema that is associated with the edited XML document (page 887).
  - **Add optional content** - If selected, Oxygen XML Editor plugin inserts the optional elements specified in the DTD, XML Schema, or RELAX NG schema.
  - **Add first Choice particle** - If selected, Oxygen XML Editor plugin inserts the first choice particle specified in the DTD, XML Schema, or RELAX NG schema.

**Case sensitive search**

When selected, the search in the *Content Completion Assistant* is case-sensitive when you type a character (‘a’ and ‘A’ are different characters).

**Note:** This option is ignored when the current language itself is not case-sensitive. For example, the case is ignored in the CSS language.

**Position cursor between tags**

When selected, Oxygen XML Editor plugin automatically moves the cursor between the start and end tag after inserting the element. This only applies to:

- Elements with only optional attributes or no attributes at all.
- Elements with required attributes, but only when the **Insert the required attributes option** (page 101) is not selected.

**Show all entities**

Oxygen XML Editor plugin displays a list with all the internal and external entities declared in the current document when you type the start character of an entity reference (for example, `&`).
Insert the required attributes

Oxygen XML Editor plugin inserts automatically the required attributes taken from the DTD or XML Schema.

Insert the fixed attributes

If selected, Oxygen XML Editor plugin automatically inserts any fixed attributes from the DTD or XML Schema for an element inserted with the help of the Content Completion Assistant.

Show recently used items

When selected, Oxygen XML Editor plugin remembers the last inserted items from the Content Completion Assistant window. The number of items to be remembered is limited by the Maximum number of recent items shown list box. These most frequently used items are displayed on the top of the content completion window and their icons are decorated with a small red square.

Maximum number of recent items shown

Specifies the limit for the number of recently used items presented at the top of the Content Completion Assistant window.

Learn attributes values

When selected, Oxygen XML Editor plugin learns the attribute values used in a document.

Learn on open document

Oxygen XML Editor plugin automatically learns the document structure when the document is opened.

Learn words (Dynamic Abbreviations, available on Ctrl+Space (Command+Space on OS X))

When selected, Oxygen XML Editor plugin learns the typed words and makes them available in a content completion fashion by pressing Ctrl + Space (Command + Space on OS X) on your keyboard;

Note: For the words to be learned, they need to be separated by space characters.

Activation delay of the proposals window (ms)

Delay in milliseconds from last key press until the Content Completion Assistant is displayed.

Related Information:
Annotations Preferences

Certain types of schemas (XML Schema, DTDs, Relax NG) can include annotations that document the various elements and attributes that they define. Oxygen XML Editor plugin can display these annotations when offering content completion suggestions. To configure the Annotations preferences, open the Preferences dialog box (page 55) and go to Editor > Content Completion > Annotations.

The following options are available:

**Show annotations in Content Completion Assistant**

If selected, Oxygen XML Editor plugin displays the schema annotations of an element, attribute, or attribute value currently selected in the Content Completion Assistant (page 2704) proposals list.

**Show annotations in tooltip**

If selected, Oxygen XML Editor plugin displays the annotation of elements and attributes as a tooltip when you hover over them with the cursor in the editing area or in the Elements view (page 265). If not selected, tooltips are disabled in all modes.

**Show annotation in HTML format, if possible**

This option allows you to view the annotations associated with an element or attribute in HTML format. It is available when editing XML documents that have associated an XML Schema or Relax NG schema. If this option is not selected, the annotations are converted and displayed as plain text.

**Prefer DTD comments that start with "doc:" as annotations**

To address the lack of dedicated annotation support in DTD documents, Oxygen XML Editor plugin recommends prefixing with the doc: particle all comments intended to be shown to the developer who writes an XML validated against a DTD schema.

If this option is selected, Oxygen XML Editor plugin uses the following mechanism to collect annotations:

- If at least one doc: comment is found in the entire DTD, only comments of this type are displayed as annotations.
- If no doc: comment is found in the entire DTD, all comments are considered annotations and displayed as such.
If not selected, all comments, regardless of their type, are considered annotations and displayed as such.

**Use all Relax NG annotations as documentation**

If selected, any element outside the Relax NG namespace, that is http://relaxng.org/ns/structure/1.0, is considered annotation and is displayed in the annotation window next to the Content Completion Assistant (page 2704) window and in the Model view (page 263). When this option is not selected, only elements from the Relax NG annotations namespace, that is http://relaxng.org/ns/compatibility/annotations/1.0 are considered annotations.

**XPath Preferences**

Oxygen XML Editor plugin provides content-completion support for XPath expressions. To configure the options for the content completion in XPath expressions, open the Preferences dialog box (page 55) and go to Editor > Content Completion > XPath.

The following options are available:

- **Enable content completion for XPath expressions** - Enables the Content Completion Assistant in XPath expressions (page 966) that you enter in the match, select, and test XSL attributes.
  - **Include XPath functions** - When this option is selected, XPath functions are included in the content completion suggestions.
  - **Include XSLT functions** - When this option is selected, XSLT functions are included in the content completion suggestions.
  - **Include axes** - When this option is selected, XSLT axes are included in the content completion suggestions.

- **Show signatures of XSLT / XPath functions** - Makes the editor indicate the signature of the XPath function located at the cursor position in a tooltip. See the XPath Tooltip Helper (page 970) section for more information.

**XSD Preferences**

Oxygen XML Editor plugin provides content completion assistance when you are writing XML Schema (XSD). To configure XSD preferences, open the Preferences dialog box (page 55) and go to Editor > Content Completion > XSD. The option in this preferences page allows you to define additional
elements to be suggested by the *Content Completion Assistant (page 2704)* in `xs:appinfo` elements (in addition to the elements defined in the XML Schema).

The following option is available:

**When in "xs:appinfo" context, also include elements declared in the schema**

You can choose between the following:

- **None** - The *Content Completion Assistant* offers only the XML Schema schema information.
- **ISO Schematron** - The *Content Completion Assistant* also includes ISO Schematron elements in `xs:appinfo`.
- **Schematron 1.5** - The *Content Completion Assistant* also includes Schematron 1.5 elements in `xs:appinfo`.
- **Other** - The *Content Completion Assistant* also includes elements from an XML Schema identified by a URL in `xs:appinfo` elements.

**XSLT Preferences**

XSLT stylesheets are often used to create output in XHTML or XSL-FO. In addition to suggesting content completion options for XSLT stylesheet elements, Oxygen XML Editor plugin can suggest elements from these vocabularies. To configure the XSLT content completion options, open the Preferences dialog box *(page 55)* and go to *Editor > Content Completion > XSLT*.

The following options are available:

**Include elements declared in the schema section**

This section includes options with regards to detecting elements from the declared schema.

- **Automatically detect HTML or Formatting Objects**

  Detects if the output being generated is HTML or FO and provides content completion for those vocabularies. Oxygen XML Editor plugin analyzes the namespaces declared in the root element to find an appropriate schema.

  If the detection fails, Oxygen XML Editor plugin uses one of the following options:

- **None** - The *Content Completion Assistant (page 2704)* suggests only XSLT elements.
- **HTML** - The *Content Completion Assistant (page 2704)* includes HTML elements, including HTML5 elements (such as `video`, `canvas`, etc.).
- **Formatting objects** - The *Content Completion Assistant (page 2704)* includes Formatting Objects (XSL-FO) elements as substitutes for `xsl:element`.
• **Custom schema** - If you want content completion hints for another output vocabulary, you can use this option to specify the path to the schema for that vocabulary. The supported schema types are DTD, XML Schema, RNG schema, or NVDL schema for inserting elements from the target language of the stylesheet.

**Documentation schema section**

This section specifies an additional schema that will be used for documenting XSL stylesheets. You can choose between the following:

- **Built-in schema** - Uses the built-in schema for documentation.
- **Custom schema** - Allows you to specify a custom schema for documentation. The supported schema types are XSD, RNG, RNC, DTD, and NVDL.

**Custom Validation Engines Preferences**

As the name implies, the **Custom Validation Engines** preferences page displays the list of custom validation engines that can be associated to a particular editor and used for validating documents. To access this page, open the Preferences dialog box (page 55) and go to Editor > Document Validation > Custom Validation Engines.

If you want to add a new custom validation tool or edit the properties of an existing one, you can use the **Custom Validator** dialog box displayed by pressing the **New** or **Edit** button.

*Figure 28: Custom Validator Dialog Box*
The **Custom Validator** dialog box allows you to configure the following parameters:

**Name**

Name of the custom validation engine that will be displayed in the  
Validation toolbar drop-down menu.

**Executable path**

Path to the executable file of the custom validation tool. You can specify the path by using the text field, the  
Insert Editor Variables (page 201) button, or the  
Browse button.

**Working directory**

The working directory of the custom validation tool. You can specify the path by using the text field, the  
Insert Editor Variables (page 201) button, or the  
Browse button.

**Associated editors**

The editors that can perform validation with the external tool (XML editor, XSL editor, 
XSD editor, etc.)

**Command-line arguments for detected schemas**

Command-line arguments used in the commands that validate the currently edited file 
against various types of schema (XML Schema, Relax NG full syntax, Relax NG compact
syntax, NVDL, Schematron, DTD, etc.) The arguments can include any custom switch (such as -rng) and the following editor variables (page 201):

- `${cf}` - Current file as file path, that is the absolute file path of the current edited document.
- `${currentFileURL}` - Current file as URL, that is the absolute file path of the current edited document represented as URL.
- `${ds}` - The path of the detected schema as a local file path for the current validated XML document.
- `${dsu}` - The path of the detected schema as a URL for the current validated XML document.

Increasing the Stack Size for Validation Engines

To prevent the appearance of a StackOverflowException error, use one of the following methods:

- Use the `com.oxygenxml.stack.size.validation.threads` property to increase the size of the stack for validation engines. The value of this property is specified in bytes. For example, to set a value of one megabyte specify 1x1024x1024=1048576.
- Increase the value of the `-Xss` parameter.

**Note:** Increasing the value of the `-Xss` parameter affects all the threads of the application.

Document Validation Preferences

To configure document validation options, open the Preferences dialog box (page 55) and go to Editor > Document Validation. This page contains preferences for configuring how a document is checked for both well-formedness and validation errors.

The following options are available:

**Maximum number of validation highlights**

If a validation generates more errors than the number specified in this option, only the errors up to this number are highlighted in the editor panel and on the stripe that is
displayed at the right side of the editor panel. This option applies to both automatic validation (page 856) and manual validation (page 857).

Clear validation markers on close

If this option is selected, all the error markers added in the Problems view for that document are removed when the Oxygen XML Editor plugin is closed.

Enable automatic validation

This causes the validation to be automatically executed in the background as the document is modified in Oxygen XML Editor plugin.

Delay after the last key event (s)

The period of keyboard inactivity before starting a new validation (in seconds).

Edit Modes Preferences

Oxygen XML Editor plugin lets you configure which edit mode (page 223) a file is opened in the first time it is opened. This setting only applies the first time a file is opened. The current editing mode of each file is saved when the file is closed and restored the next time it is opened. To configure the options for editing modes, open the Preferences dialog box (page 55) and go to Editor > Edit Modes.

Allow Document Type specific edit mode setting to override the general mode setting

If selected, the initial edit mode setting set in the Document Type configuration dialog box (page 72) overrides the general edit mode setting from the table below.

Select the initial edit mode (page) for each editor

This table specifies the default editing mode that will be opened for each type of document when the Allow Document Type specific edit mode setting to override the general mode setting option is not selected. Use the Edit button to change the initial edit mode for each type of document (editor). The initial edit mode can be one of the following:

- Text (page 223)
- Author (page 303)
- Grid (page 292)
- Design (available only for the XSD editor).

Figure 29: Edit Modes Preferences Page
Author Preferences

Oxygen XML Editor plugin provides an Author editing mode (page 303) that provides a configurable graphical interface for editing XML documents. To configure the options for the Author mode, open the Preferences dialog box (page 55) and go to Editor > Edit modes > Author.

The following options are available:

**Author default background color**

Sets the default background color of the Author editing mode. The `background-color` property set in the CSS file associated with the currently edited document overwrites this option.

**Author default foreground color**

Sets the default foreground color of the Author editing mode. The `color` property set in the CSS file associated with the current edited document overwrites this option.

**Show XML comments**

When this option is selected, XML comments are displayed in Author mode. Otherwise, they are hidden.

**Show placeholders for empty elements**

When this option is selected, placeholders are displayed for elements with no content to make them clearly visible. The placeholder is rendered as a light gray box and displays the element name.

**Show processing instructions**

When this option is selected, XML processing instructions are displayed in Author mode. Otherwise they are hidden.

**Show Author layout messages**
When this option is selected, all errors reported while rendering the document in Author mode are presented in the Results view (page 267) at the bottom of the editor.

Show doctype
When this option is selected, the doctype declaration is displayed in Author mode. Otherwise it is hidden.

Display referenced content (entities, XInclude, DITA conref, etc.)
When selected, the references (such as entities, XInclude, DITA conrefs) also display the content of the resources they reference. If you toggle this option while editing, you need to reload the file for the modification to take effect.

Fast text layout
In certain cases (combinations of fonts and characters), the widths computed in the Author visual editing mode for lines of text may be larger than expected, leading to an incorrect visual layout. Deactivating this option will improve the computation quality for character widths in the visual editing mode, but it may hinder overall performance for very large documents.

Images Section
The following options regarding images in Author mode are available in this section:

Auto-scale images wider than (pixels)
Sets the maximum width that an image will be displayed. Wider images will be scaled to fit.

Show very large images
When this option is selected, images larger than 6 megapixels are displayed in Author mode. Otherwise, they are not displayed.

⚠️ Important: If you select this option and your document contains many such images, Oxygen XML Editor plugin may consume all available memory, throwing an OutOfMemory error. To resolve this, increase the available memory limit. and restart the application.

Tags Section
In this section you can configure the following options regarding tags that are displayed in Author mode:

Tags display mode
Sets the default display mode for element tags presented in Author mode.
You can choose between the following:
• **Full Tags with Attributes** - All XML tags are displayed, with attribute names and values, making it easier to transition from a Text-based editing to **Author** mode editing.

• **Full Tags** - All XML tags are displayed, but without attributes.

• **Block Tags** - The XML tags that enclose *block elements* *(page 2703)* are displayed in full. Compact tags (no element names) are displayed for *inline elements*.

• **Inline Tags** - The XML tags that enclose *inline elements* *(page 2707)* are displayed in full. **Block** *(page 2703)* tags are not displayed.

• **Partial Tags** - Partial tags (no names) are displayed for all elements.

• **No Tags** - No tags are displayed. This representation is as close as possible to a word-processor view.

**Sort attributes alphabetically for "Full Tags with Attributes"**

When selected, if you choose **Full Tags with Attributes** for the **Tags Display Mode** *(page 331)*, the attributes will be displayed in alphabetical order. Otherwise, they are displayed in the order that they appear in the XML source code.

**Tags background color**

Sets the **Author** mode tags background color.

**Tags foreground color**

Sets the **Author** mode tags foreground color.

**Tags font**

Allows you to change the font used to display tags text in the **Author** visual editing mode. The *default* font is computed based on the setting of the **Author** option in the **Fonts** preferences page *(page 158)*.

**Compact tag layout**

If this option is not selected, the **Author** mode displays the tags in a more decompressed layout, where block tags are displayed on separate lines.

**Whitespaces Section**

The following option is available in this section:

**Foreground color**

Sets the foreground color of the white spaces in the **Author** mode. To enable this option, open the **Preferences** dialog box *(page 55)*, go to **General > Editors > Text Editors** and select **Show whitespaces characters**.
Serialization Section

In this section you can configure options regarding the formatting and indenting that is applied when a document is saved in Author mode, or when switching the editing mode from Author to Text. The following options are available:

Format and indent

Use this option to specify what should be formatted and indented when you save a document (or switch from Author to Text mode). You can choose between the following two options:

Only the modified content

The Save operation only formats the nodes that were modified in the Author mode. The rest of the document preserves its original formatting.

Note: This option also applies to the DITA maps opened in the DITA Maps Manager (page 2400).

The entire document

The Save operation applies the formatting to the entire document regardless of the nodes that were modified in Author mode.

Also apply the format and indent options that are set for Text mode

If this option is selected, the result of the Format and indent operation will be the same as when it is applied in Text editing mode. Thus, the content of the document is formatted by applying the Format and Indent rules from the Editor/Format (page 135) and Editor/Format/XML (page 139) preference pages. You can use the Format and indent options link to navigate to those options.

Compatibility with other tools

Use this option to control how line breaks are handled when a document is serialized. This will help to obtain better compatibility with other tools. You can choose one of the following:
• **None** - Choose this option if compatibility with other tools can be ignored.

• **Do not break lines, do not indent** - Choose this option to avoid breaking lines after element start or end tags and indenting will not be used.

  **Note:** New lines that are added by the user in elements where the `xml:space` attribute is set to `preserve` (such as `pre` elements in HTML, or `codeblock` elements in DITA) are still inserted. Also, selecting this option automatically disables the **Also apply the format and indent options that are set for Text mode** option (page 113), since the formatting from Text mode does not take the CSS styles into account.

• **Break lines only after elements displayed as blocks, do not indent** - Choose this option to instruct Oxygen XML Editor plugin to insert new lines only after elements that have a CSS display property set to anything other than `inline` or `none` (for example, `block`, `list-item`, `table`, etc.) and indenting will not be used. When selecting this option, the formatting is dictated by the CSS.

  **Note:** New lines that are added by the user in elements where the `xml:space` attribute is set to `preserve` (such as `pre` elements in HTML, or `codeblock` elements in DITA) are still inserted. Also, selecting this option automatically disables the **Also apply the format and indent options that are set for Text mode** option (page 113), since the formatting from Text mode does not take the CSS styles into account.

**Enable mouse-wheel zooming**

If selected, you can use **Ctrl + MouseWheelForward (Command + MouseWheelForward on OS X)** to increase the editor font (zoom in) or **Ctrl + MouseWheelBackwards (Command + MouseWheelBackwards on OS X)** to decrease the editor font (zoom out). It is enabled by default on Windows and Linux, while it is disabled by default on Mac OS X, due to the way inertia affects the mouse wheel on this operating system.

**Configure annotation tooltip**

Click this link to open the **Annotations Preferences** (page 103) page.

**For advanced Author configuration see the Document Type Association settings**

Click this link to open the **Document Type Association** preferences page (page 69).
AutoCorrect Preferences

Oxygen XML Editor plugin includes an option to automatically correct misspelled words as you type in Author mode. To enable and configure this AutoCorrect feature (page 599), open the Preferences dialog box (page 55) and go to Editor > Edit Modes > Author > AutoCorrect.

The following options are available:

Enable AutoCorrect

When selected (default state), while editing in Author mode, if you type anything that is listed in the Replace column of the Replacements table displayed in this preferences page, Oxygen XML Editor plugin will automatically replace it with the value listed in the With column.

Use additional suggestions from the spell checker

If selected, in addition to anything listed in the Replacements table displayed in this preferences page, Oxygen XML Editor plugin will also use suggestions from the Spell Checker to automatically correct misspelled words. Suggestions from the Spell Checker will only be used if the misspelled word is not found in the Replacements table.

Note: The AutoCorrect feature shares the same options configured in the Language options (page 146) and Ignore elements (page 147) sections in the Spell Check preferences page.

Spell Check options link

Use this link to navigate to the Spell Check Preferences page (page 145).

Replacements Table section

The AutoCorrect feature uses the Replacements table to automatically replace anything that is listed in the Replace column with the value listed in the With column for each language.

Replacements for language drop-down menu

You can specify the language for the Replacements table, and for each language, you can configure the items listed in the table. The language selected in this page is not the language that will be used by the AutoCorrect feature. It is simply the language for the Replacements table.

Replacements Table

You can double-click on cells in either column to edit the listed items. Use the Add button to insert new items and the Remove button to delete rows from the table.
Note: Any changes, additions, or deletions you make to this table are saved to a path that is specified in the AutoCorrect Dictionaries preferences page (page 117).

Smart quotes section

You can also choose to automatically convert double and single quotes to a quotation characters of your choice by using the following options in the Smart quotes section:

- **Replace "Single quotes"** - Replaces single quotes with the quotation symbols you select with the Start quote and End quote buttons.
- **Replace "Double quotes"** - Replaces double quotes with the quotation symbols you select with the Start quote and End quote buttons.

Note: These Smart quotes options are ignored for content inside any element listed in the Ignore elements section of the Spell Check preferences page (page 147).

Restore Defaults

Restores the options in this preferences page to their default values and also deletes any changes you have made to the Replacements table (page 115).

AutoCorrect Dictionaries Preferences

To set the Dictionaries preferences for the AutoCorrect feature (page 599), open the Preferences dialog box (page 55) and go to Editor > Edit Modes > Author > AutoCorrect > Dictionaries. This page allows you to specify the location of the dictionaries that Oxygen XML Editor plugin uses for the AutoCorrect feature and the location for saving user-defined replacements.

The following options are available in this preferences page:

**Dictionaries default folder**

Displays the default location where the dictionaries that Oxygen XML Editor plugin uses for the AutoCorrect feature are stored.

**Include dictionaries from**

Selecting this option allows you to specify a location where you have stored AutoCorrect dictionaries that you want to include, along with the default ones.

Important: Consider the following notes regarding this option:

- The AutoCorrect mechanism takes into account AutoCorrect dictionaries collected both from the default and custom locations and multiple dictionaries from the same
language are merged (for example, en_UK.dat from the default location is merged with en_US.dat from a custom location).

- If you have a generic AutoCorrect dictionary file (one that just has a two letter language code for its file name, such as en.dat) saved in either the default or custom location, the other more specific dictionaries (for example, en_UK.dat and en_US.dat) will not be merged and the existing generic dictionary will simply be used instead.
- If the additional location contains a file with the same name as one from the default location, the file in the additional location takes precedence over the file from the default location.

How to add more dictionaries link

Use this link to open a topic in the Oxygen XML Editor plugin User Guide that explains how to add dictionaries for the AutoCorrect feature (page 600).

Save user-defined replacements in the following location

Specifies the target where added, edited, or deleted replacements are saved. By default, the target is the application preferences folder, but you can also choose a custom location.

Cursor Navigation Preferences

Oxygen XML Editor plugin allows you to configure the appearance and behavior of the cursor in the Author mode editor (page 303). To set cursor navigation preferences, open the Preferences dialog box (page 55) and go to Author > Cursor Navigation.

The following options are available:

Highlight elements near cursor

When this option is selected, the element containing the cursor is highlighted. You can use the color picker to choose the color of the highlight.

Show cursor position tooltip

Oxygen XML Editor plugin uses tool tips in Author mode to indicate the position of the cursor in the element structure (page 679) of the underlying document. Depending on context, the tool tips may show the current element name or the names of the elements before and after the current cursor position.
Show location tooltip on mouse move

When this option is selected, Oxygen XML Editor plugin displays Location Tooltips (page 680) when you are editing the document in certain tags display modes (Inline Tags, Partial Tags, No Tags) or when the mouse pointer is moved between block elements (page 2703).

Quick up/down navigation

This option is deselected by default and this means that when you navigate using the up and down arrow keys in Author mode, the cursor is placed within each of the underlying XML elements between two blocks of text (the cursor changes to a horizontal line when it is between blocks of text). This allows you to easily insert elements and manage the structure of your XML content. However, if this option is selected, the cursor ignores the XML structure and jumps from one line of text to another, similar to how the cursor behaves in a word processor.

Quick navigation in tables

This option is selected by default and this means that when navigating between table cells with the arrow keys, the cursor jumps from one cell to another. If this option is not selected, the cursor navigates between XML nodes when navigating between table cells with the arrow keys.

Arrow keys move the cursor in the writing direction

This setting determines how the left and right arrow keys behave in Author mode for bidirectional (BIDI) text. When this option is selected (default value), the right arrow key advances the cursor in the reading direction and the left arrow moves it in the opposite direction. When this option is not selected, pressing the right arrow will simply move the cursor to the right (and the left arrow moves it to the left), regardless of the text direction.

MathML Preferences

Oxygen XML Editor plugin allows you to edit MathML (page 832) equations and displays the results in a preview window. For a more specialized MathML editor, you can install Design Science MathFlow (page 833), which is a commercial product that requires a separate license.

To configure the MathML editor or to enter your MathFlow license information, open the Preferences dialog box (page 55) and go to Editor > Edit Modes/Pages > Author > MathML.

You can configure the following options:

Equation minimum font size
The minimum size of the font used for rendering mathematical symbols when editing in the Author mode.

**MathFlow installation directory**

The installation folder for the MathFlow components product (MathFlow SDK).

**MathFlow license file**

The license file for the MathFlow components product (MathFlow SDK).

**MathFlow preferred editor**

A MathML formula can be edited in one of three editors of MathFlow components product (MathFlow SDK).

- **Structure Editor** (default selection) - Targets professional XML workflow users.
- **Style Editor** - Tailored to the needs of content authors.
- **Simple Editor** - Designed for applications where end-users can enter mathematical equations without prior training and only the meaning of the math matters.

**Save special characters**

Specifies how special characters are saved in the XML file.

- **As entity names** - Saves the characters in &name; format. It refers to a character by the name of the entity that has the desired character as its replacement text. For example, the Greek Omega character is saved as &Omega;.
- **As character entities** (default selection) - Saves the characters in a hexadecimal value, using the &#xNNN format. For example, the Greek Omega character is saved as Ω.
- **As character values** - Saves the characters as the actual symbol. For example, the Greek Omega character is saved as Ω.

More documentation is available on the Design Science MathFlow website.

**Profiling/Conditional Text Preferences**

Oxygen XML Editor plugin lets you configure how profiling and conditional text (page 746) is displayed in Author mode. It has built-in support for the standard conditional text features of DITA and DocBook that you can customize for your own projects. You can also add conditional support for other XML vocabularies, including your custom vocabularies.

To configure Profiling/Conditional Text options, open the Preferences dialog box (page 55) and go to Editor > Edit modes > Author > Profiling/Conditional Text.

**Note:** Note the following when configuring these settings:
• This preferences page is used to define how profiled elements are treated in Author mode. It does not create profiling or conditional text attributes or values in the underlying XML vocabulary. It just changes how the editor displays them.

• This preferences page should be used for profiling / conditional text elements only. To change how other types of attributes are displayed in the text, use a CSS file.

• If you are using the DITA XML vocabulary and a DITA subject scheme map (page 2711) is defined in the root map (page 2711) of your document, it will be used in place of anything defined using this dialog box.

This preferences page contains the following options and sections:

**Import from DITAVAL**

This button allows you to import profiling attributes from DITAVAL files (page 2656). You can merge these new profiling attributes with the existing ones, or replace them completely. If the imported attributes conflict with the existing ones, Oxygen XML Editor plugin displays a dialog box that contains two tables. The first one previews the imported attributes and the second one previews the already defined attributes. You can choose to either keep the existing attributes or replace them with the imported ones.

**Note:** When importing profiling attributes from DITAVAL files, Oxygen XML Editor plugin automatically creates condition sets based on these files.

**Profiling Attributes section**

Allows you to specify a set of allowable values for each profiling or conditional attribute. You can use the ✪ New button at the bottom of the table to add profiling attributes (page 747), the ✈ Edit button to edit existing ones, or the ✗ Delete button to delete entries from the table. Use the ✧ Up and ✪ Down buttons to change the priority of the entries. If you have multiple entries with identical names that match the same document type, Oxygen XML Editor plugin uses the one that is positioned highest in the table.

**Report invalid profiling attribute values (DITA only)**

If selected, it means the following:

• In DITA, the automatic validation will display a warning when a value that is not defined is found in the document.

• In the DITA ✕ Validate and Check for Completeness dialog box, the Report attributes and values that conflict with profiling preferences option (page 2451) is not displayed. This means that the validation
will behave the same as if that option was selected and it will always report such values.

**Allow contributing extra profiling attribute values**

This option is selected by default, which means that users are allowed to add values that are not defined in preferences to profiling attributes. If a user inserts such a value, when invoking the Edit Profiling Attributes action from the contextual menu in Author mode (or for DITA topics, the Edit Properties action in the DITA Maps Manager (page 2400)), the Profiling Values Conflict dialog box (page 749) will appear and it includes an Add these values to the configuration action that will automatically add the new value to the particular profiling attribute. If deselected, Oxygen XML Editor plugin behaves as if the Preserve the configuration option has been chose in the Profiling Values Conflict dialog box (page 749) and that dialog box will never appear.

**Configure profiling colors and styles link**

Use this link to open the profiling Colors and Styles preference page (page 122).

**Profiling Condition Sets section**

Allows you to specify a specific set of profiling attributes to be used to specify a particular build configuration for your content. You can use the New button at the bottom of the table to add condition sets (page 752), the Edit button to edit existing ones, or the Delete button to delete entries from the table. Use the Up and Down buttons to change the priority of the entries. If you have multiple entries with identical names that match the same document type, Oxygen XML Editor plugin uses the one that is positioned highest in the table.

**Show excluded content**

Toggles whether or not the Show Excluded Content option (page 757) in the Profiling / Conditional Text drop-down menu is enabled by default.

Attributes Rendering Preferences

Oxygen XML Editor plugin lets you display the profiling attributes applied to your content (page 756) in the Author mode editor. To configure how the profiling attributes appear, open the Preferences dialog box (page 55) and go to Editor > Edit modes > Author > Profiling/Conditional Text > Attributes Rendering. When the Show Profiling Attributes option (page 756) is selected, the Author
mode displays conditional text markers at the end of conditional text blocks. Use the options in this page to customize the rendering of these text markers.

The following options are available:

**Show profiling attributes**

Toggles whether or not the Show Profiling Attributes option (page 756) in the Profiling / Conditional Text drop-down menu is enabled by default.

**Show profiling attribute name**

If selected, the names of the profiling attributes are displayed with their values. If unchecked, only the values are displayed.

**Background color**

Sets the background color used to display the profiling attributes.

**Attribute name foreground color**

Sets the foreground color used to display the names of the profiling attributes.

**Attribute values foreground color**

Sets the foreground color used to display values of the profiling attributes.

**Border color**

Sets the color of the border of the block that displays the profiling attributes.

**Colors and Styles Preferences**

Oxygen XML Editor plugin lets you set the colors and styles used to display profiling / conditional text (page 119) in the Author mode editor (page 303). To set Colors and Styles preferences, open the Preferences dialog box (page 55) and go to Editor > Edit modes > Author > Profiling/Conditional Text > Colors and Styles.

The preference page includes the following options and sections:

**Show profiling colors and styles**

Toggles whether or not the Show Profiling Colors and Styles option (page 756) in the Profiling / Conditional Text drop-down menu is enabled by default.

**Import from DITAVAL**

Allows you to import profiling styles from .ditaval files. You can merge these new profiling styles with the existing ones, or replace them completely. If the imported styles conflict with the existing ones, Oxygen XML Editor plugin displays a dialog box containing two tables: the first one previews the imported styles and the second one
previews the already defined styles. You can choose to either keep the existing styles or replace them with the imported ones.

**Profiling Colors and Styles Table**

You can use buttons below this table to set specific colors and styles for the listed profiling attribute values. The table includes two categories:

- **Defined attributes values** - Contains the styles for profiling attribute values defined in the *Profiling / Conditional Text* (page 119) preferences page. Each profiling attribute value has an associated style. To ease the process of customizing styles, the *Defined attributes values* category contains by default the list of empty styles. All you have to do is to adjust the colors and decorations, thus skipping the process of manually defining the association rules (document type, attribute name and value). This is the reason why a style from this category can only be reset (page 123), not deleted.

- **Other** - This category contains styles for attribute values that are not marked as profiling values, in the *Profiling / Conditional Text* (page 119) preferences page. In this category are listed:
  - All the styles that were defined in other projects (with other profiling attribute value sets).
  - All the styles set for the profiling attributes defined in a *subject scheme map* (page 2652).

**Automatic styling button**

If you click this button, Oxygen XML Editor plugin will apply automatic styling to the profiling attribute values that do not have a style defined.

**New button**

Opens the *Add Profiling Style* dialog box that allows you to associate a set of coloring and styling properties to a profiling value.

**Note:** You can define a default style for a specific attribute by setting the *Attribute value* field to `<ANY>`. This style is applied for attribute values that do not have a specific style associated with it.

**Edit button**

Open the *Edit Profiling Style* dialog box that allows you to edit the colors or style for an existing profiling value. You can also double-click the value to open this dialog box.

**Clear style button**

Resets the style for the selected value to its default setting (no color or decoration).

**Delete button**
Delete the selected style from the **Other** category.

**Review Preferences**

Oxygen XML Editor plugin allows you to **add review comments and track changes** *(page 719)* in your documents. The **Review** preferences page allows you to control how the Oxygen XML Editor plugin review features work. To configure these options, open the **Preferences** dialog box *(page 55)* and go to **Editor > Edit modes > Author > Review**.

The available options are as follows:

**Author**

Specifies the name to be attached to all comments and to changes made while **Track Changes** is active. By default, Oxygen XML Editor plugin uses the system user name.

**Track Changes section (applies for all authors)**

**Initial State**

Specifies whether or not the **Track Changes feature** *(page 2711)* is enabled when you open a document. You may have the **Track Changes** feature enabled in some documents and disabled in others, or you can choose to always enable or disable the feature for all documents. You can choose between the following options:

- **Stored in document** - The current state of the **Track Changes feature** is stored in the document itself, meaning that it is on or off depending on the state the last time the document was saved. This is the recommended setting when multiple authors work on the same set of documents as it will make it obvious to other authors that changes have been made in the document.
- **Always On** - The **Track Changes** feature is always on when you open a document. You can turn it off for an opened document, but it will be turned on for the next document you open.
• **Always Off** - The *Track Changes* feature is always off when you open a document. You can turn it on for an opened document, but it will be turned off for the next document you open.

**Display changed lines marker**

A changed line marker is a vertical line on the left side of the editor window indicating where changes have been made in the document. To hide the changed lines marker, deselect this option.

**Inserted content color**

When the *Track Changes feature (page 2711)* is on, the newly inserted content is highlighted with an *insertion marker* that uses a color to adjust the following display properties of the inserted content: *foreground, background*, and *underline*. This section allows you to customize the following color options:

- **Automatic** - If this option is selected, Oxygen XML Editor plugin automatically assigns a color to each user who inserted content in the current document. The colors are picked from the *Colors for automatic assignment list (page 126)*, the priority being established by the type of change (deletion, insertion, or comment) and in the order that you see in the list.
- **Fixed** - If this option is selected, Oxygen XML Editor plugin uses the specified color for all insertion markers, regardless of who the author is.
- **Use same color for text foreground** - If selected, Oxygen XML Editor plugin uses the color defined above (Automatic or Fixed) to render the foreground of the inserted content.
- **Use same color for background** - If selected, Oxygen XML Editor plugin uses the color defined above (Automatic or Fixed) to render the background of the inserted content. A slider control allows you to set the transparency level of the background.

**Deleted content color**

When the *Track Changes feature (page 2711)* is on, the deleted content is highlighted with a *deletion marker* that uses a color to adjust the following display properties of the deleted content: *foreground, background*, and *strikethrough*. This section allows you to customize the following color options:
• **Automatic** - If this option is selected, Oxygen XML Editor plugin automatically assigns a color to each user who deleted content in the current document. The colors are picked from the Colors for automatic assignment list *(page 126)*, the priority being established by the type of change (deletion, insertion, or comment) and in the order that you see in the list.

• **Fixed** - If this option is selected, Oxygen XML Editor plugin uses the specified color for all deletion markers, regardless of who the author is.

• **Use same color for text foreground** - If selected, Oxygen XML Editor plugin uses the color defined above *(Automatic or Fixed)* to render the foreground of the deleted content.

• **Use same color for background** - If selected, Oxygen XML Editor plugin uses the color defined above *(Automatic or Fixed)* to render the background of the deleted content. A slider control allows you to set the transparency level of the background.

**Comments color section (applies for all authors)**

Sets the background color of the text that is commented on. The options are:

• **Automatic** - If this option is selected, Oxygen XML Editor plugin automatically assigns a color to each user who adds a comment in the current document. The colors are picked from the Colors for automatic assignment list *(page 126)*, the priority being established by the type of change (deletion, insertion, or comment) and in the order that you see in the list.

• **Fixed** - If this option is selected, Oxygen XML Editor plugin uses the specified color for all changes, regardless of who the author is. A slider control allows you to set the transparency level of the background.

**Colors for automatic assignment list**

These are the colors that will be automatically assigned for tracked insertion changes, tracked deletion changes, and comments if the **Automatic** option is selected in any of the sections in this preferences page. The colors are assigned in the order that you see in this list. You can use the ✤ Add, ✏ Edit, or ✗ Remove buttons to modify the list of colors.

**Related Information:**
Callouts Preferences

Oxygen XML Editor plugin can display callouts (page 2704) for review items such as comments and tracked changes (page 719). To customize options for review callouts, open the Preferences dialog box (page 55) and go to Editor > Edit modes > Author > Review > Callouts.

The available options are as follows:

Show Review Callouts section

Comments
If selected, callouts are displayed for comments, including comments that are added to tracked changes (page 2711). This option is selected by default.

Track Changes deletions
If selected, callouts are displayed for tracked change (page 2711) deletions and the following additional option becomes available:

Show deleted content in callout
If selected, the deleted content is also displayed in the callout.

Track Changes insertions
If selected, callouts are displayed for tracked change (page 2711) insertions and the following additional option becomes available:

Show inserted content in callout
If selected, the inserted content is also displayed in the callout.

Rendering section

Show review time
When selected, timestamp information is displayed in callouts.

Show all connecting lines
When selected, lines are shown that connect the callout to the location of the change.
Initial width (px)

Specifies the initial width of the callouts each time the document is opened. The default is 250 pixels.

Text lines count limit

Specifies the maximum number of lines to be shown in the callouts. The default is 5 lines. Note that this does not limit the number of lines in the actual comment. It only limits the number of lines shown without opening or editing it. To see the full comment, right-click on the callout and select Edit Comment or Show Comment.

Schema Aware Preferences

Oxygen XML Editor plugin can use the schema of your XML language to improve the way the Author (page 303) mode editor handles your content. To configure the Schema Aware options, open the Preferences dialog box (page 55) and go to Editor > Edit modes > Author > Schema Aware.

The following options are available:

Schema aware normalization, format, and indent

When you open or save a document in Author mode, white space is normalized using the display property of the current CSS stylesheet and the values of the settings (page 139) for Preserve space elements, Default space elements, and Mixed content elements. When this option is selected, the schema will also be used to normalize white space, based on the content model (element-only, simple-content, or mixed). Note that the schema information takes precedence.

Indent blocks-only content

To avoid accidentally introducing inappropriate white space around inline elements (page 2707), Oxygen XML Editor plugin does not normally apply indenting to the source of an element with mixed content. If this option is selected, Oxygen XML Editor plugin will apply indenting to the source of mixed content elements that only contain block elements (page 2703).

Schema Aware Editing

The options in this section determine how Oxygen XML Editor plugin will use the schema of a document to control the behavior of the Author mode.

• On - Enables all schema-aware editing options.
• Off - Disables all schema-aware editing options.
Custom - Allows you to select custom schema-aware editing options from the following:

Schema Aware Actions section

Delete element tags with backspace and delete

Controls what happens when you attempt to delete an element tag. The two options are:

• Smart delete - If deleting the tag would make the document invalid, Oxygen XML Editor plugin will attempt to make the document valid by unwrapping the current element or by appending it to an adjacent element where the result would be valid. For instance, if you delete a bold tag, the content can be unwrapped and become part of the surrounding paragraph, but if you delete a list item tag, the list item content cannot become part of the list container. However, the content could be appended to a preceding list items.

• Reject action when its result is invalid - A deletion that would leave the document in an invalid state is rejected.

Paste and Drag and Drop

Controls the behavior for paste and drag and drop actions. Available options are:

• Smart paste and drag and drop - If the content inserted by a paste or drop action is not valid at the cursor position, according to the schema, Oxygen XML Editor plugin tries to find an appropriate insert position. The possibilities include:
  ◦ Creating a sibling element that can accept the content (for example, if you tried to paste a paragraph into an existing paragraph).
  ◦ Inserting the content into a parent or child element (for example, if you tried to paste a list item into an existing list item, or into the space above or below and existing list).
  ◦ Inserting the content into an ancestor element where it would be valid.

• Reject action when its result is invalid - If selected, Oxygen XML Editor plugin will not let you paste content into a position where it would be invalid.

Typing
Controls the behavior that takes place when typing. Available options are:

- **Smart typing** - If typed characters are not allowed in the element at the cursor position, but the previous element does allow text, then a similar element will be inserted, along with your content.

- **Reject action when its result is invalid** - If selected, and the result of the typing action is invalid, the action will not be performed.

**Content Completion**

Controls the behavior that takes place when inserting elements using the *Content Completion Assistant in Author mode* *(page 699)*. Available options are:

- **Press ENTER to show available content completion proposals** - If selected, pressing Enter will open the *Content Completion Assistant*. If deselected, there are three possibilities:
  - The current element will be split (if possible).
  - A new element with the same name will be inserted (if possible).
  - Otherwise, a new paragraph will be inserted.

- **Show all possible elements in the content completion list** - If selected, the content completion list will show all the elements in the schema, even those that cannot be entered validly at the current position. If you select an element that is not valid at the current position, Oxygen XML Editor plugin will attempt to find a valid location to insert it and may present you with several options.

- **Allow only insertion of valid elements and attributes** - If selected, you can only select elements in the content completion list that are valid (according to the schema) at the current position.

- **Allow only insertion of valid attribute values** - If selected, you cannot enter an attribute value that is not valid (according to the schema) in the *Attributes view* *(page 319)* or *In-place Attributes Editor* *(page 692)*. If the attribute has a choice of values, you can select a possible value from a drop-down list in the combo box, but you cannot enter a value manually.

**Warn on invalid content when performing action**

A warning message will be displayed when performing an action that will result in invalid content. Available options are:
• **Delete Element Tags** - If selected, a warning message will be displayed if the Delete Element Tags (page 840) action will result in an invalid document. You will be asked to confirm the deletion.

• **Join Elements** - If selected, a warning message will be displayed if the Join Elements (page 840) action will result in an invalid document. You will be asked to confirm the join.

**Automatically apply the best schema-aware insertion operation**

If selected, Oxygen XML Editor plugin automatically uses what it considers to be the best insertion solution, when there is an attempt to insert content that is not valid in a specific context. If not selected, Oxygen XML Editor plugin will ask the user to choose from a list of proposed solutions.

**Convert external content on paste**

If selected, the Smart Paste feature (page 696) is enabled when external content is pasted in Author mode.

**Convert even when pasting inside space-preserve elements**

If selected, the Smart Paste feature (page 696) will be used even when external content is pasted inside a space-preserve element (such as a codeblock).

**Convert pasted URLs to links**

If selected, when a URL is pasted into Author mode, a link will be inserted (the type of link depends on the type of document). For example, in DITA documents, an `xref` is inserted.

**Related Information:**

- Smart Paste Mechanism (page 696)
- Customizing Smart Paste Support (page 2058)

**Grid Preferences**

Oxygen XML Editor plugin provides a Grid view (page 292) of an XML document. To configure the Grid options, open the Preferences dialog box (page 55) and go to Editor > Edit modes > Grid.

The following options are available:
Compact representation

If selected, the *compact representation* of the grid is used: a child element is displayed beside the parent element. In the *non-compact representation*, a child element is nested below the parent.

Format and indent when passing from grid to text or on save

If selected, the content of the document is formatted and indented *(page 645)* each time you switch from the Grid view to the Text view.

Default column width (characters)

Sets the default width (in characters) of a table column of the grid. A column may contain the following:

- Element names
- Element text content
- Attribute names
- Attribute values

If the total width of the grid structure is too large you can resize any column by dragging the column margins with the mouse pointer, but the change is not persistent. To make it persistent, set the new column width with this option.

Active cell color

Allows you to set the background color for the *active cell* *(page 2703)* of the grid. The keyboard input always goes to the active cell and the selection always contains it.

Selection color

Allows you to set the background color for the selected cells of the grid except the active cell *(page 2703)*.

Border color

Allows you to set the color used for the lines that separate the grid cells.

Background color

Allows you to set the background color of grid cells that are not selected.

Foreground color

Allows you to set the text color of the information displayed in the grid cells.

Row header colors

**Background color**

Allows you to set the background color of row headers that are not selected.
Active cell color

Allows you to set the background color of the row header cell that is currently active.

Selection color

Allows you to set the background color of the header cells corresponding to the currently selected rows.

Column header colors

The column headers are painted with two color gradients, one for the upper 1/3 part of the header and the other for the lower 2/3 part. The start and end colors of the first gradient are set with the first two color buttons. The start and end colors of the second gradient are set with the last two color buttons.

Background color

Allows you to set the background color of column headers that are not selected.

Active cell color

Allows you to set the background color of the column header cell that is currently active.

Selection color

Allows you to set the background color of the header cells corresponding to the currently selected columns.

Schema Design Preferences

Oxygen XML Editor plugin provides a graphical schema design editor (page 505) to make editing XML Schema easier. To configure the Schema Design options, open the Preferences dialog box (page 55) and go to Editor > Edit modes > Schema Design.

The following options are available in the Schema Design preferences page:

Show annotation in the diagram

When selected, Oxygen XML Editor plugin displays the content of xs:documentation elements in schema diagrams.

When trying to edit components from another schema

The schema diagram editor will combine schemas imported by the current schema file into a single schema diagram. You can choose what happens if you try to edit a component from an imported schema. The options are:
• **Always go to its definition** - Oxygen XML Editor plugin opens the imported schema file so that you can edit it.

• **Never go to its definition** - The imported schema file is not opened and the component cannot be edited in place.

• **Always ask** - Oxygen XML Editor plugin asks if you want to open the imported schema file.

Properties Preferences

Oxygen XML Editor plugin lets you control which properties to display for XML Schema components in the XML Schema Design view (page 505). To configure the schema design properties displayed, open the Preferences dialog box (page 55) and go to Editor > Edit modes > Schema Design > Properties.

This preferences page contains the following:

**Show additional properties in the diagram**

If this option is selected, the properties selected in the property table are shown in the XML Schema Design mode. This option is selected by default.

**Properties Table**

**Show**

Use this column in the table to select the properties that you want to be displayed in the XML Schema Design mode.

**Only if specified**

Use this column to select if you want the property to be displayed only if it is defined in the schema.

Text Diagram Preferences

For certain XML languages, Oxygen XML Editor plugin provides a diagram view as part of the text mode editor. To configure the Diagram preferences, open the Preferences dialog box (page 55) and go to Editor > Edit modes / Pages > Text Diagram.

The following options are available in this preference page:

**Show Full Model XML Schema diagram**

When this option is selected, the Text mode editor for XML Schemas includes a split screen view that shows a diagram of the schema structure. This is useful for seeing the effects of schema changes you make. For editing a the schema using a diagram instead of text, use the schema Design view (page 505).
Note: When handling very large schemas, displaying the schema diagram might affect the performance of your system. In such cases, disabling the schema diagram view improves the speed of navigation through the edited schema.

Enable Relax NG diagram and related views

Enables the Relax NG schema diagram and synchronization with the related views (Attributes (page 261), Model (page 263), Elements (page 265), Outline (page 1159)).

Show Relax NG diagram

Displays the Relax NG schema diagram in the split screen views (Full Model View (page 1151) and Logical Model View (page 1152)).

Enable NVDL diagram and related views

Enables the NVDL schema diagram and synchronization with the related views (Attributes (page 261), Model (page 263), Elements (page 265), Outline (page 1175)).

Show NVDL diagram

Displays the NVDL schema diagram in the split screen views (Full Model View (page 1171) and Logical Model View (page 1172)).

Location relative to editor

Allows you to specify the location of the schema diagram panel relative to the diagram Text editor.

Show/Hide Annotations link

Use this link to navigate to the Schema Design preferences page (page 133) where you can choose to show or hide annotations in schema diagrams.

Format Preferences

This preferences page contains various formatting options that influence editing and formatting in both the Text (page 223) and Author (page 303) editing modes. To control additional options specifically for the Author mode editor, see Whitespace Handling in Author Mode (page 681).

Note: These settings apply to the formatting of source documents. The formatting of output documents is determined by the transformation scenarios that create them (page 1381).

To configure the Format options, open the Preferences dialog box (page 55) and go to Editor > Format.

The following options are available:
Detect indent on open

If selected, Oxygen XML Editor plugin detects how a document is indented when it is opened. Oxygen XML Editor plugin uses a heuristic method of detection by computing a weighted average indent value from the initial document content. You can deselect this setting if the detected value does not work for your particular case and you want to use a fixed-size indent for all the edited documents. If this option is selected, Oxygen XML Editor plugin detects the following:

- When TAB characters are used to indent content, the size of the TAB characters is used for the indent size.
- Otherwise, the detected size of SPACE characters is used for the indent size.

Tip: If you want to minimize the formatting differences created by the Format and Indent operation in a document edited in the Text edited mode, make sure that both the Detect indent on open and Detect line width on open (page 137) options are selected.

Use zero-indent, if detected

By default, if no indent was detected in the document, the fixed-size indent is used. Select this option if all your document have no indentation and you want to keep them that way.

Indent with tabs

If selected, indents are created using TAB characters. If unchecked, lines are indented using space characters. Selecting this option automatically disables the Detect indent on open (page 136) option.

Indent size

The meaning of this setting depends on the following:

- If the Detect indent on open option (page 136) is selected and TAB characters are detected at the beginning of the line, the indent size is the width of a TAB character. Otherwise, the indent size value is ignored and Oxygen XML Editor plugin uses the number of detected SPACE characters.
- If the Indent with tabs option (page 136) is selected, the indent size is the width of a TAB character.
- If neither of these options are selected, the indent size is the number of SPACE characters used for indenting the text lines.

For additional information about changing the indent size, see Setting an Indent Size to Zero (page 651).
For information about when this setting is used, see Where Indent Size and Line Width Settings are Used in Oxygen XML Editor plugin (page 138).

**Indent on enter**

If selected, when you press Enter to insert a line break in the Text editing mode, an indentation will be added to the new line.

**Enable smart enter**

If selected, when you press the Enter key between a start and an end XML tag in the Text editing mode, the cursor is placed in an indented position on the empty line formed between the start and end tag.

**Format and indent the document on open**

If selected, an XML document is formatted and indented before opening it in Oxygen XML Editor plugin.

**Note:** Some specialized types of XML documents do not benefit from this feature, including Relax NG, XSD, XSL, and Ant. However, the feature is available for some non-XML types of documents, such as CSS and JSON.

**Detect line width on open**

If selected, Oxygen XML Editor plugin automatically detects the line width when the document is opened.

**Hard line wrap (Limit to "Line width - Format and Indent")**

If selected, when typing content in the Text editing mode and the maximum line width is reached, a line break is automatically inserted.

**Line width - Format and Indent**

Defines the number of characters after which the Format and Indent (pretty-print) action performs hard line-wrapping. For example, if set to 100, after a Format and Indent action, the longest line will have a maximum of 100 characters.

**Note:** To avoid having an indent that is longer than the line width setting and without having sufficient space available for the text content, the indent limit is actually set at half the value of the Line width - Format and Indent setting. The remaining space is reserved for text.

For information about when this setting is used, see Where Indent Size and Line Width Settings are Used in Oxygen XML Editor (page 138).

**Clear undo buffer before Format and Indent**
The **Format and Indent** operation can be **undone**, but if used intensively, a considerable amount of the memory allocated for Oxygen XML Editor plugin will be used for storing the undo states. If this option is selected, Oxygen XML Editor plugin empties the undo buffer before doing a **Format and Indent** operation. This means you will not be able to undo any changes you made before the format and indent operation. Select this option if you encounter out of memory problems (**OutOfMemoryError**) when performing the **Format and Indent** operation.

**Where Indent Size and Line Width Settings are Used in Oxygen XML Editor plugin**

The values set in the **Indent Size** and **Line Width - Format and Indent** options are used in various places in the application, including the following:

- When the **Format and Indent** action is used in the **Text** editing mode.
- When you press **ENTER** to break a line in the **Text** editing mode.
- When the **Hard line wrap (Limit to “Line width - Format and Indent”)** option is selected and the maximum line width is reached while editing in the **Text** mode.
- When the XML is serialized by saving content in the **Author** editing mode.

For more information about the formatting options offered by Oxygen XML Editor plugin, watch our video demonstration:

**CSS Preferences**

Oxygen XML Editor plugin can format and indent your CSS files. To configure the **CSS** formatting options, open the **Preferences** dialog box (page 55) and go to **Editor > Format > CSS**.

The following options control how your CSS files are formatted and indented:

**Class body on new line**

If selected, the **class** body (including the curly brackets) is placed on a new line. This option is not selected by default.

**Indent class content**

When selected (default state), the **class** content is indented.

**Add space before the value of a CSS property**

When selected (default state), whitespaces are added between the **:** (colon) and the value of a style property.

**Add new line between classes**
If selected, an empty line is added between two classes. This option is not selected by default.

**Preserve empty lines**

When selected (default state), the empty lines from the CSS content are preserved.

**Allow formatting embedded CSS**

When selected (default state), CSS content that is embedded in XML is also formatted when the XML content is formatted.

**JavaScript Preferences**

To configure the JavaScript format options, open the Preferences dialog box (page 55) and go to Editor > Format > JavaScript.

The following options control the behavior of the **Format and Indent** action:

- **Start curly brace on new line** - Opening curly braces start on a new line.
- **Preserve empty lines** - Empty lines in the JavaScript code are preserved. This option is selected by default.
- **Allow formatting embedded JavaScript** - Applied only to XHTML documents, this option allows Oxygen XML Editor plugin to format embedded JavaScript code, taking precedence over the Schema aware format and indent (page 142) option. This option is selected by default.

**XML Preferences**

To configure the XML Formatting options, open the Preferences dialog box (page 55) and go to Editor > Format > XML.

The following options are available:

**Format and Indent Section**

This section includes the following drop-down boxes:

**Preserve empty lines**

The **Format and Indent** operation preserves all empty lines found in the document.

**Preserve text as it is**

The **Format and Indent** operation preserves text content as it is, without removing or adding any white space.

**Preserve line breaks in attributes**
Line breaks found in attribute values are preserved.

Note: When this option is selected, the Break long attributes option (page 140) is automatically disabled.

Break long attributes

The Format and Indent operation breaks long attribute values.

Indent inline elements

The inline elements are indented on separate lines if they are preceded by white spaces and they follow another element start or end tag. For example:

Original XML:

```
<root>
  text <parent> <child/></child> </parent>
</root>
```

Indent inline elements selected:

```
<root> text <parent>
  <child/>
  </parent>
</root>
```

Indent inline elements not selected:

```
<root> text <parent> <child/></parent> </parent> </root>
```

Expand empty elements

If not selected (default), the Format and Indent operation results in an empty XML element being serialized in a compact form ( `<a atr1="v1"/>`). If selected, the same operation results in empty XML elements being serialized in expanded form (for example, `<a atr1="v1"></a>`).

Notes:

• When using the Format and Indent operation in Text mode, if the Schema aware format and indent option (page 142) is enabled, Oxygen XML Editor plugin will use information from the associated schema and avoid expanding tags for elements that are defined as empty in the schema.
• When saving a document in **Author** mode, if the **Schema aware normalization, format, and indent** option in the **Schema-Aware preferences page** *(page 128)* is enabled, Oxygen XML Editor plugin will use information from the associated schema and avoid expanding tags for elements that are defined as **empty** in the schema (therefore, text or other elements are not allowed inside them).

**Sort attributes**

The **Format and Indent** operation sorts the attributes of an element lexicographically.

**Add space before slash in empty elements**

Inserts a space character before the trailing / and > of empty elements.

**Break line before an attribute name**

The **Format and Indent** operation breaks the line before the attribute name.

**Element Spacing Section**

This section controls how the application handles whitespaces found in XML content. You can **Add** or **Remove** element names or simplified XPath expressions in the various tabs.

The XPath expressions can accept multiple attribute conditions and inside each condition you can use **AND/OR** boolean operators and parentheses to override the priority.

You can use one or more of the following attribute conditions (default attribute values are not taken into account):

- **element[@attr]** - Matches all instances of the specified element that include the specified attribute.
- **element[not(@attr)]** - Matches all instances of the specified element that do not include the specified attribute.
- **element[@attr = "value"]** - Matches all instances of the specified element that include the specified attribute with the given value.
- **element[@attr != "value"]** - Matches all instances of the specified element that include the specified attribute and its value is different than the one given.

**Example:** The following is an example of how you could use multiple boolean operators and parentheses inside an attribute condition:

```
* [a and b or c and d]
* [a and (b or c) and d]
```
The following are just examples of how simplified XPath expressions might look like:

- `elementName`
- `//elementName`
- `/elementName1/elementName2/elementName3`
- `//xs:localName` Note: The namespace prefixes (such as `xs`) are treated as part of the element name without taking its binding to a namespace into account.
- `//xs:documentation[@lang="en"]`

The tabs are as follows:

**Preserve space**

List of elements for which the Format and Indent operation preserves the whitespaces (such as blanks, tabs, and newlines).

**Default space**

List of elements for which the content is normalized (multiple contiguous whitespaces are replaced by a single space), before applying the Format and Indent operation.

**Mixed content**

The elements from this list are treated as mixed content when applying the Format and Indent operation. The lines are split only when whitespaces are encountered.

**Line break**

List of elements for which line breaks will be inserted, regardless of their content. You can choose to break the line before the element, after, or both.

**Schema aware format and indent**

The Format and Indent operation takes the schema information into account with regards to the space preserve, mixed, or element only properties of an element.

**Indent Section**

Includes the following options:

**Indent (when typing) in preserve space elements**

Normally, the Preserve space elements (identified by the `xml:space` attribute set to preserve or by their presence in the Preserve space tab of the Element Spacing list (page 141)) are ignored by the Format and Indent operation. When this option is selected and you edit one of these elements, its content is formatted.
Indent on paste - sections with number of lines less than 300

When you paste a chunk of text that has fewer than 300 lines, the inserted content is indented. To keep the original indent style of the document you copy content from, deselect this option.

Whitespaces Preferences

When Oxygen XML Editor plugin formats and indents XML documents, a whitespace normalization process is applied, thus replacing whitespace sequences with single space characters. Oxygen XML Editor plugin allows you to configure which Unicode characters are treated as spaces during the normalization process.

To configure the Whitespace preferences, open the Preferences dialog box (page 55) and go to Editor > Format > XML > Whitespaces.

This table lists the Unicode whitespace characters. Select any that you want to have treated as whitespace when formatting and indenting an XML document.

The whitespaces are normalized when:

- The Format and Indent action is applied on an XML document.
- You switch from Text mode to Author mode.
- You switch from Author mode to Text mode.

Note: The whitespace normalization process replaces any sequence of characters declared as whitespaces in the Whitespaces table with a single space character (U+0020). If you want to be sure that a certain whitespace character will not be removed in the normalization process, deselect it in the Whitespaces table.

Important: The characters with the codes U+0009 (TAB), U+000A (LF), U+000D (CR) and U+0020 (SPACE) are always considered to be whitespace characters and cannot be deselected.

XPath Preferences

To configure the XPath Formatting options, open the Preferences dialog box (page 55) and go to Editor > Format > XPath.

The following option is available:

Format XPath code embedded in XSLT, XSD and Schematron files

If selected, the Format and Indent action applied on an XSD, XSLT, or Schematron document will perform an XPath-specific formatting on the values of the attributes that accept XPath expressions.
**Note:** For XSLT documents, the formatting is not applied to *attribute value templates*.

### XQuery Preferences

To configure the XQuery Formatting options, open the Preferences dialog box (page 55) and go to Editor > Format > XQuery.

The following options are available:

- **Preserve line breaks** - All initial line breaks are preserved.
- **Break line before an attribute name** - Each attribute of an XML element is written on a new line and properly indented.

### Mark Occurrences Preferences

This preferences page specifies which types of files will have the Highlight IDs Occurrences (page 654) feature activated. To configure these options, open the Preferences dialog box (page 55) and go to Editor > Mark Occurrences:

The following options are available in this preferences page:

**Highlight component occurrences in the current file for:**

- **XML files** - Activates the Highlight IDs Occurrences (page 654) feature in XML files.
- **XSLT files** - Activates the Highlight Component Occurrences (page 985) feature in XSLT files.
- **XML Schema files** - Activates the Highlight Component Occurrences (page 1066) feature in XSD files.
- **WSDL files** - Activates the Highlight Component Occurrences (page 1066) feature in WSDL files.
- **RNG files** - Activates the highlight component occurrences feature in RNG files.
- **Schematron files** - Activates the Highlight Component Occurrences (page 1226) feature in Schematron files.

### Open/Save Preferences
Oxygen XML Editor plugin lets you control how files are opened and saved. To configure the options for opening and saving documents, open the Preferences dialog box (page 55) and go to Editor > Open/Save.

The following options are available:

**Open section**

**Format document when longest line exceeds**

Oxygen XML Editor plugin will create line breaks if the characters in a line exceed the specified value. You can choose one of the following:

- Always format
- Never format
- Always ask

**Save section**

**Check errors on save**

If selected, Oxygen XML Editor plugin runs a validation that checks your document for errors before saving it.

**Save all files before transformation or validation**

Saves all opened files before validating or transforming an XML document. This ensures that any dependencies are resolved when modifying the XML document and its XML Schema.

**Performance section**

**Clear undo buffer on save**

If selected, Oxygen XML Editor plugin clears its undo buffer when you save a document. Thus, modifications made prior to saving the document cannot be undone. Select this option if you frequently encounter out of memory errors when editing large documents.

**Spell Check Preferences**

Oxygen XML Editor plugin provides support for spell checking in the Text (page 223) and Author (page 303) editing modes. To configure the Spell Check options, open the Preferences dialog box (page 55) and go to Editor > Spell Check.

The following options are available:

**Automatic spell check**
This option is not selected by default. When selected, Oxygen XML Editor plugin automatically checks the spelling as you type and highlights misspelled words in the document.

Select editors

You can select which editors (and therefore which file types) will automatically be spell checked. File types (such as CSS and DTD), in which automatic spell checking is not usually helpful, are excluded by default.

Language options section

This section includes the following language options:

Default language

The default language list allows you to choose the language used by the spell check engine when the language is not specified in the source file. You can add additional dictionaries to the spell check engines (page 587).

Use "lang" and "xml:lang" attributes

When this option is selected, the contents of an element with one of the lang or xml:lang attributes is checked in that language. Choose between the following two options for instances when these attributes are missing:

- Use the default language - If the lang and xml:lang attributes are missing, the selection in the Default language list (page 146) is used.
- Do not check - If the lang and xml:lang attributes are missing, the element is not checked.

XML spell checking in section

You can choose to check the spelling inside the following XML items:

- Comments
- Attribute values
- Text
- CDATA

Options section

This section includes the following other options:

Check capitalization
When selected, the spell checker reports detected capitalization errors.

**Note:** This option will not have any effect on words stored in dictionaries, term lists, and the list of learned words because they are not handled as case-sensitive.

**Check punctuation**

When selected, the spell checker checks punctuation. Misplaced white space and unusual sequences, such as a period following a comma, are highlighted as errors.

**Ignore mixed case words**

When selected, the spell checker does not check words containing mixed case characters (for example, *SpellChecker*).

**Ignore acronyms**

Available only for the Hunspell Spell Checker. When selected, acronyms are not reported as errors.

**Ignore words with digits**

When selected, the spell checker does not check words containing digits (for example, *b2b*).

**Ignore duplicates**

When selected, the spell checker does not signal two successive identical words as an error.

**Ignore URL**

When selected, the spell checker ignores words recognized as URLs or file names (for example, *www.oxygenxml.com* or *c:\boot.ini*).

**Allow compounds words**

When selected, all words formed by concatenating two legal words with a hyphen (hyphenated compounds) are accepted. If recognized by the language, two words concatenated without hyphen (closed compounds) are also accepted.

**Allow file extensions**

When selected, the spell checker accepts any word ending with recognized file extensions (for example, *myfile.txt* or *index.html*).

**Ignore elements section**
You can use the **Add** and **Remove** buttons to configure a list of element names or XPath expressions to be ignored by the spell checker. The following restricted set of XPath expressions are supported:

- `/' and '//' separators
- `*` wildcard

An example of an allowed XPath expression is: `/a/*`.  

**AutoCorrect options link**

Use this link to navigate to the [AutoCorrect preferences page](page115) (page 115).

To change the color used by the spell check engine to highlight spelling errors, go to **Window (Eclipse on Mac OSX)** and choose **Preferences**. Then go to **General > Editors > Text Editors > Annotations** and change the color in the **Spell Check Annotation** option.

**Spell Check Dictionaries Preferences**

To set the Dictionaries preferences, open the [Preferences dialog box](page55) and go to **Editor > Spell Check > Dictionaries**. This page allows you to configure the dictionaries (.dic files) and term lists (.tdi files) that Oxygen XML Editor plugin uses and to choose where to save new learned words.

The following options are valid when Oxygen XML Editor plugin uses the Hunspell spell checking engine:

**Dictionaries and term lists default folder**

Displays the default location where the dictionaries and term lists that Oxygen XML Editor plugin uses are stored.

**Include dictionaries and term list from**

Selecting this option allows you to specify a location where you have stored dictionaries and term lists that you want to include, along with the default ones.

⚠️ **Important**: Consider the following notes regarding this option:

- The spell checker takes into account dictionaries and term lists collected both from the default and custom locations and multiple dictionaries and term lists from the same language are merged (for example, `en_UK.dic` from the default location is merged with `en_US.dic` from a custom location).
- If you have a generic dictionary file (one that just has a two letter language code for its file name, such as `en.dic`) saved in either the default or custom location, the other more specific dictionaries (for example, `en_UK.dic` and `en_US.dic`) will not be merged and the existing generic dictionary will simply be used instead.
• If the additional location contains a file with the same name as one from the default location, the file in the additional location takes precedence over the file from the default location.

How to add more dictionaries and term lists link

Use this link to open a topic in the Oxygen XML Editor plugin User Guide that explains how to add more dictionaries and term lists (page 590).

Save learned words in the following location

Specifies the target where the newly learned words are saved. By default, the target is the application preferences folder, but you can also choose a custom location.

Delete learned words

Opens the list of learned words, allowing you to select the items you want to remove, without deleting the dictionaries and term lists.

Note: Words stored in dictionaries, term lists, and the list of learned words are not handled as case-sensitive. Therefore, you do not need to include both uppercase and lowercase versions of the words.

Syntax Highlight Preferences

Oxygen XML Editor plugin supports syntax highlighting in the Text mode editors for numerous types of documents, including XML, XHTML, JavaScript, XQuery, XPath, PHP, CSS, LESS, Markdown, Text, DTD, RNC, Java, JSON, and more.

To configure syntax highlighting, open the Preferences dialog box (page 55) and go to Editor > Syntax Highlight.

To set syntax colors for a language, expand the listing for that language in the top panel to show the list of syntax items for that type of document. Use the color and style selectors to change how each syntax item is displayed. The results of your changes are displayed in the Preview panel. If you do not know the name of the syntax token that you want to configure, click that token in the Preview area to select it.
**Note:** All default color sets come with a high-contrast variant that is automatically used when you switch to a black-background or white-background high-contrast theme in your Windows operating system settings. The high-contrast theme will not overwrite any default color you set in **Editor > Syntax Highlight** preferences page.

The settings for XML documents are also used in XSD, XSL, RNG documents and the **Preview** area has a separate tab for each of them when **XML** is selected in the top pane.

The **Enable nested syntax highlight** option controls whether or not content types that are nested in the same file (such as PHP, JS, or CSS scripts inside an HTML file) are highlighted according to the color schemes defined for each content type.

**Elements/Attributes by Prefix Preferences**

Oxygen XML Editor plugin allows you to specify syntax highlighting colors for XML elements and attributes with specific namespace prefixes. To configure the **Elements/Attributes by Prefix** preferences, open the **Preferences** dialog box  *(page 55)* and go to **Editor > Syntax Highlight > Elements/Attributes by Prefix**.

To change the syntax coloring for a specific namespace prefix, choose the prefix from the list, or add a new one using the **New** button, and use the color and style selectors to set the syntax highlighting style for that namespace prefix.

**Note:** Syntax highlighting is based on the literal namespace prefix, not the namespace that the prefix is bound to in the document.

If you only want the prefix (and not the whole element or attribute name) to be styled with a particular color, select the **Draw only the prefix with a separate color** option.

**Templates Preferences**

This page simply allows you to navigate to the preference pages for code templates or document templates.

**Code Templates Preferences**

**Code templates** *(page 639)* are code fragments that can be inserted at the current editing position. Oxygen XML Editor plugin includes a set of built-in templates for CSS, Schematron, XSL, XQuery, and XML Schema document types. You can also define your own code templates *(page 639)* for any type of file and share them with your colleagues *(page 640)* using the template export and import functions.
To configure Code Templates, open the Preferences dialog box (page 55) and go to Editor > Templates > Code Templates.

This preferences page contains a list of all the available code templates (both built-in and custom created ones) and a code preview area. You can disable any code template by deselected it.

The following actions are available:

**New**

Opens the Code template dialog box that allows you to define a new code template. You can define the following fields:

- **Name** - The name of the code template.
- **Description** - [Optional] The description of the code template that will appear in the Code Templates preferences page and in the tooltip message when selecting it from the Content Completion Assistant (page 2704). HTML markup can be used for better rendering.
- **Associate with** - You can choose to set the code template to be associated with a specific type of editor or for all editor types.
- **Shortcut key** - [Optional] If you want to assign a shortcut key that can be used to insert the code template, place the cursor in the Shortcut key field and press the desired key combination on your keyboard. Use the Clear button if you make a mistake. If the Enable platform-independent shortcut keys checkbox is selected, the shortcut is platform-independent and the following modifiers are used:
  - M1 represents the Command key on MacOS X, and the Ctrl key on other platforms.
  - M2 represents the Shift key.
  - M3 represents the Option key on MacOS X, and the Alt key on other platforms.
  - M4 represents the Ctrl key on MacOS X, and is undefined on other platforms.
- **Content** - Text box where you define the content that is used when the code template is inserted. An editor variable (page 201) can be inserted in the text box using the Insert Editor Variables button.

**Edit**

Opens the Code template dialog box and allows you to edit an existing code template. You can edit the following fields:

- **Description** - [Optional] The description of the code template that will appear in the Code Templates preferences page and in the tooltip message when selecting it from the Content Completion Assistant (page 2704). HTML markup can be used for better rendering.

• **Shortcut key** - [Optional] If you want to assign a shortcut key that can be used to insert the code template, place the cursor in the **Shortcut key** field and press the desired key combination on your keyboard. Use the Clear button if you make a mistake. If the **Enable platform-independent shortcut keys** checkbox is selected, the shortcut is platform-independent and the following modifiers are used:
  ◦ $\text{M1}$ represents the **Command** key on MacOS X, and the **Ctrl** key on other platforms.
  ◦ $\text{M2}$ represents the **Shift** key.
  ◦ $\text{M3}$ represents the **Option** key on MacOS X, and the **Alt** key on other platforms.
  ◦ $\text{M4}$ represents the **Ctrl** key on MacOS X, and is undefined on other platforms.

• **Content** - Text box where you define the content that is used when the code template is inserted. An editor variable (page 201) can be inserted in the text box using the ➿ **Insert Editor Variables** button.

**Duplicate**

Creates a duplicate of the currently selected code template.

**Delete**

Deletes the currently selected code template. This action is not available for the built-in code templates.

**Export**

Exports a file with code templates.

**Import**

Imports a file with code templates that was created by the **Export** action.

You can use the following editor variables (page 201) when you define a code template in the **Content** text box:

- **${caret}** - The position where the cursor is located. This variable can be used in a code template, in **Author** mode operations, or in a selection plugin.

  **Note:** The **${caret}** editor variable is available only for parameters that take XML content as values. It is replaced with the **${UNIQUE_CARET_MARKER_FOR_AUTHOR}** macro. The default Author operations process this macro and position the cursor at the designated offset.

- **${selection}** - The current selected text content in the current edited document. This variable can be used in a code template, in **Author** mode operations, or in a selection plugin.

- **${ask('message', type, ('real_value1':'rendered_value1'; 'real_value2':'rendered_value2'; ...), 'default_value'), @id}** - To prompt for values at runtime, use the ask('message', type, ('real_value1':'rendered_value1'; 'real_value2':'rendered_value2'; ...), 'default_value') editor variable. You can set the following parameters:
- "message" - The displayed message. Note the quotes that enclose the message.
- "default-value" - Optional parameter. Provides a default value.
- @id - Optional parameter. Used for identifying the variable to reuse the answer using the $\{answer(@id)\}$ editor variable.
- type - Optional parameter, with one of the following values:

**Note:** The title of the dialog box will be determined by the type of parameter and as follows:
- For url and relative_url parameters, the title will be the name of the parameter and the value of the 'message'.
- For the other parameters listed below, the title will be the name of that respective parameter.
- If no parameter is used, the title will be "Input".

### Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| **relative_url** | **Format:** `${ask('message', relative_url, 'default')}`  
**Description:** Input is considered a URL. Oxygen XML Editor plugin tries to make the URL relative to that of the document you are editing.  
**Note:** If the `${ask}` editor variable is expanded in content that is not yet saved (such as an *untitled* file, whose path cannot be determined), then Oxygen XML Editor plugin will transform it into an absolute URL.  
**Example:**

`${ask('File location', relative_url, 'C:/example.txt')}` - The dialog box has the name 'File location'. The URL inserted in the input box is made relative to the current edited document location. |
| **combobox** | **Format:** `${ask('message', combobox, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'), 'default')}`  
**Description:** Displays a dialog box that offers a drop-down menu. The drop-down menu is populated with the given `rendered_value` values. Choosing such a value will return its associated value (`real_value`).  
**Note:** The 'default' parameter specifies the default selected value and can match either a key or a value.  
**Example:**

`${ask('Operating System', combobox, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'osx')}` - The dialog box has the name 'Operating System'. The drop-down menu displays the three given operating systems. The associated value will be returned based upon your selection.  
**Note:** In this example, the default value is indicated by the `osx` key. However, the same result could be obtained if the default value is indicated by *Mac OS X*, as in the following example: `${ask('Operating System', combobox, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'Mac OS X')}` |

</tbody>
</table>
• **${timeStamp}** - Time stamp, that is the current time in Unix format. For example, it can be used to save transformation results in multiple output files on each transformation.

• **${uuid}** - Universally unique identifier, a unique sequence of 32 hexadecimal digits generated by the Java UUID class.

• **${id}** - Application-level unique identifier. It is a short sequence of 10-12 letters and digits that is not guaranteed to be universally unique.

• **${cfne}** - Current file name with extension. The current file is the one currently opened and selected.

• **${cf}** - Current file as file path, that is the absolute file path of the current edited document.

• **${cfd}** - Current file folder as file path, that is the path of the current edited document up to the name of the parent folder.

• **${frameworksDir}** - The path (as file path) of the frameworks directory.

• **${pd}** - The file path to the folder that contains the current project file (.xpr).

• **${oxygenInstallDir}** - Oxygen XML Editor plugin installation folder as file path.

• **${homeDir}** - The path (as file path) of the user home folder.

• **${pn}** - Current project name.

• **${env(VAR_NAME)}** - Value of the VAR_NAME environment variable. The environment variables are managed by the operating system. If you are looking for Java System Properties, use the **${system(var.name)}** editor variable.

• **${system(var.name)}** - Value of the var.name Java System Property. The Java system properties can be specified in the command-line arguments of the Java runtime as -Dvar.name=var.value. If you are looking for operating system environment variables, use the **${env(VAR_NAME)}** editor variable instead.

• **${date(pattern)}** - Current date. The allowed patterns are equivalent to the ones in the Java SimpleDateFormat class. Example: yyyy-MM-dd;

  Note: This editor variable supports both the xs:date and xs:datetime parameters. For details about xs:date, go to: http://www.w3.org/TR/xmlschema-2/#date. For details about xs:datetime, go to: http://www.w3.org/TR/xmlschema-2/#dateTime.

**Related Information:**

- Code Templates (page 639)
Oxygen XML Editor plugin provides a variety of built-in document templates that make it easier to create new documents in various formats. The list of available templates is presented in the New Document wizard (page 550) when you create a new document (File > New > New from Templates).

You can also create your own templates (page 555) and share them with others. You can store your custom document templates in the existing templates folder in the Oxygen XML Editor plugin installation directory or store them in a custom directory. If you store them in a custom directory, you need to use this Document Templates preferences page to add that directory to the list of template directories that Oxygen XML Editor plugin makes available in the New Document wizard.

To add a template directory, follow these steps:

1. open the Preferences dialog box (page 55) and go to Editor > Templates > Document Templates.
2. Use the + New button to select a location of the new document template folder.
3. You can also use the Edit or Delete buttons to manage folders in the list, and you can alter the order in which Oxygen XML Editor plugin looks in these directories by using the Up and Down buttons.

Result: This will add the folder to the list in this preferences page and it will now appear in the New from templates wizard (page 554) in a category based upon the folder path you specified.

Note: For DITA templates, they will also appear in the dialog box for creating new DITA topics from the DITA Maps Manager, but if you customize the template (page 557), you need to set the type property to dita in the corresponding properties file.

Fonts Preferences

Oxygen XML Editor plugin allows you to choose the fonts to be used in the Text, Design, and Grid editor modes, and fonts for the Author mode that are not specified in the associated CSS stylesheet. To configure the font options, open the Preferences dialog box (page 55) and go to Fonts.

The following font options are available:

Text

This option allows you to choose the font used in Text mode. There are two options available:

- **Map to text font** - Uses the same font for the basic text editor as the one set in General > Appearance > Colors and Fonts.

- **Customize** - Allows you to configure various font-related options.

**Author**

Allows you to configure various font-related options that will be used in Author mode. However, these font-related options will be overridden by rules specified in any CSS file associated with the opened document.

**Schema**

Allows you to configure various font-related options that will be used in:

- The Design mode of the XML Schema editor (page 1012).
- Images with schema diagram fragments that are included in the HTML documentation generated from an XML Schema.

**Note:** You must restart the application for your changes to be applied.

**Network Connection Settings Preferences**

This section presents the options available in the Network Connection Settings preferences pages.

**(S)FTP Preferences**

To configure the (S)FTP options, open the Preferences dialog box (page 55) and go to Network Connection Settings > (S)FTP. You can customize the following options:

**Figure 30: (S)FTP Configuration Preferences Panel**

- **Encoding for FTP control connection** - The encoding used to communicate with FTP servers: either ISO-8859-1 or UTF-8. If the server supports the UTF-8 encoding Oxygen XML Editor plugin will use it for communication. Otherwise, it will use ISO-8859-1.
- **Public known hosts file** - File containing the list of all SSH server host keys that you have determined are accurate. The default value is ${homeDir}/.ssh/known_hosts.
• **Private key file** - The path to the file containing the private key used for the private key method of authentication of the secure FTP (SFTP) protocol.

• **Passphrase** - The passphrase used for the private key method of authentication of the secure FTP (SFTP) protocol.

• **Show SFTP certificate warning dialog** - If selected, a warning dialog box will be displayed each time when the authenticity of the host cannot be established.

**HTTP(S)/WebDAV Preferences**

To set the **HTTP(S)/WebDAV** preferences, open the **Preferences** dialog box  *(page 55)* and go to **Network Connection Settings > HTTP(S)/WebDAV**. The following options are available:

**Enable the HTTP(S)/WebDAV Protocols**

Activates the HTTP(S)/WebDAV protocols bundled with Oxygen XML Editor plugin. Any adjustment to this option requires a restart of the application.

**Read Timeout (seconds)**

The period (in seconds) after which the application considers that an HTTP server is unreachable if it does not receive any response from that server.

**Automatically accept a security certificate, even if invalid**

When selected, the HTTPS connections that Oxygen XML Editor plugin attempts to establish with will accept all security certificates, even if they are invalid.

⚠️ **Important**: By accepting an invalid certificate, you accept (at your own risk) a potential security threat, since you cannot verify the integrity of the certificate's issuer.

**Lock WebDAV files on open**

If selected, the files opened through WebDAV are locked on the server so that they cannot be edited by other users while the lock placed by the current user still exists on the server.

**Trusted Hosts Preferences**

This preferences page contains a list of domains that have been identified as trusted. You can add or remove domains from the list and Oxygen XML Editor plugin will allow connections to the listed hosts without requesting user confirmation.

To configure the **Trusted Hosts** options, open the **Preferences** dialog box  *(page 55)* and go to **Network Connection Settings > Trusted Hosts**. The following options are available:

• **New** - Allows you to manually add a new entry to the list of trusted hosts.
**Tip:** You can specify a specific port at the end of the URL (for instance, www.example.com:8080). Otherwise, if no port is specified, connections will be allowed on all ports for the particular host.

- **Delete** - Allows you to remove an entry from the list of trusted hosts.

### Scenarios Management Preferences

To configure Scenarios Management options, open the Preferences dialog box (page 55) and go to **Scenarios Management**. This allows you to share the global transformation scenarios with other users by exporting them to an external file that can also be imported in this preferences panel.

*Figure 31: Scenarios Management Preferences Panel*

The actions available in this panel are as follows:

- **Import Global Transformation Scenarios** - Allows you to import all transformation scenarios from a file created with the export scenario action. The names of the imported scenarios will appear in the **Configure Transformation Scenario** dialog box followed by *(import)*. This way there are no scenario name conflicts.

- **Export Global Transformation Scenarios** - Allows you to export all global transformation scenarios available in the **Configure Transformation Scenario** dialog box.

- **Import Global Validation Scenarios** - Allows you to import all validation scenarios from a file created with the export scenario action. The names of the imported scenarios will appear in the **Configure Validation Scenario** dialog box followed by *(import)*. This way there are no scenario name conflicts.

- **Export Global Validation Scenarios** - Allows you to export all global validation scenarios available in the **Configure Validation Scenario** dialog box.

### View Preferences

The **View** preferences page allows you to configure some options regarding certain views. To edit these options, open the Preferences dialog box (page 55) and go to **View**.
The following options are available:

**Console section**

**Enable Oxygen consoles**

If selected, various messages will be contributed to the Console view (page 612) when certain events are triggered (such as schema detection, validation, or transformation events).

**Fixed width console**

If selected, a line in the Console view (page 612) will be hard wrapped after the specified maximum numbers of characters allowed on a line is reached.

**Limit console output**

If selected, the content of the Console view (page 612) will be limited to a configurable number of characters.

**Console buffer**

If the Limit console output option is selected, this specifies the maximum number of characters that can be written in the Console view (page 612).

**Tab width**

Specifies the number of spaces used for depicting a tab character.

**Elements view section**

**Show only items allowed at cursor position**

If selected, when editing in Author mode, only the elements that are allowed at the current cursor position will be listed in the Elements view (page 325). If not selected, two additional tabs (Before and After) will be displayed at the bottom of the view (in Author mode only). These tabs list the elements that are allowed before or after the element at the current cursor position.

**XML Preferences**

This section describes the panels that contain the user preferences related with XML.

**Import Preferences**
To configure importing options, open the Preferences dialog box (page 55) and go to XML > Import. This page allows you to configure how empty values and null values are handled when they are encountered in imported database tables or Excel sheets. Also you can configure the format of date / time values recognized in the imported database tables or Excel sheets.

The following options are available:

**Create empty elements for empty values**

If selected, an empty value from a database column or from a text file is imported as an empty element.

**Create empty elements for null values**

If selected, null values from a database column are imported as empty elements.

**Escape XML content**

Selected by default, this option instructs Oxygen XML Editor plugin to escape the imported content to an XML-safe form.

**Add annotations for generated XML Schema**

If selected, the generated XML Schema contains an annotation for each of the imported table columns. The documentation inside the annotation tag contains the remarks of the database columns (if available) and also information about the conversion between the column type and the generated XML Schema type.

**Date / Time Format section**

Specifies the format used for importing date and time values from Excel spreadsheets or database tables, and in the generated XML schemas. You can choose from the following format types:

- **Unformatted** - The date and time formats specific to the database are used for import. When importing data from Excel a string representation of date or time values are used. The type used in the generated XML Schema is `xs:string`.
- **XML Schema date format** - The XML Schema-specific format ISO8601 is used for imported date / time data ( `yyyyMMdd-MM-dd'YYYY-MM-dd'T'HH:mm:ss` for datetime, `yyyyMMdd-MM-dd` for date and `HH:mm:ss` for time ). The types used in the generated XML Schema are `xs:datetime`, `xs:date` and `xs:time`.
- **Custom format** - If selected, you can define a custom format for timestamp, date, and time values or choose one of the predefined formats. A preview of the values is presented when a format is used. The type used in the generated XML Schema is `xs:string`.

Pattern letters are usually repeated, as their number determines the exact presentation:

- **Text** - If the number of pattern letters is 4 or more, the full form is used. Otherwise, a short or abbreviated form is used if available.
- **Number** - The number of pattern letters is the minimum number of digits, and shorter numbers are zero-padded to this amount.
- **Year** - If the number of pattern letters is 2, the year is truncated to 2 digits. Otherwise, it is interpreted as a number.
- **Month** - If the number of pattern letters is 3 or more, the month is interpreted as text. Otherwise, it is interpreted as a number.
- **General time zone** - Time zones are interpreted as text if they have names. For time zones representing a GMT offset value, the following syntax is used:
  - **GMTOffsetTimeZone** - GMT Sign Hours : Minutes
  - **Sign** - one of + or -
  - **Hours** - one or two digits
  - **Minutes** - two digits
  - **Digit** - one of 0 1 2 3 4 5 6 7 8 9
Hours must be between 0 and 23, and Minutes must be between 00 and 59. The format is locale independent and digits must be taken from the Basic Latin block of the Unicode standard.

• **RFC 822 time zone**: The RFC 822 4-digit time zone format is used:
  ◦ **RFC822TimeZone**
  ◦ **TwoDigitHours** (must be between 00 and 23)

**PDF Output Preferences**

The **PDF Output** preferences page simply includes links to sub-pages for configuring PDF output options.

**FO Processors Preferences**

Oxygen XML Editor plugin includes a built-in formatting objects processor (Apache FOP), but you can also configure other external processors and use them in the transformation scenarios for processing XSL-FO documents.

Oxygen XML Editor plugin provides an easy way to add two of the most commonly used commercial FO processors: **RenderX XEP** and **Antenna House Formatter**. You can easily add **RenderX XEP** as an external FO processor if you have the XEP installed. Also, if you have the **Antenna House Formatter**, Oxygen XML Editor plugin uses the environment variables set by the XSL formatter installation to detect and use it for XSL-FO transformations. If the environment variables are not set for the XSL formatter installation, you can browse and choose the executable file just as you would for XEP. You can use these two external FO processors for DITA OT transformations scenarios (page 1444) and XML with XSLT transformation scenarios (page 1416).

To configure the options for the FO Processors, open the **Preferences** dialog box (page 55) and go to **XML > PDF Output > FO Processors**. This preferences page includes the following options:

**Apache FOP Section**

In this section you can configure options for the built-in Apache processor. The following options are available:

**Use built-in Apache FOP**

Instructs Oxygen XML Editor plugin to use the built-in Apache FO processor. To see the version of the built-in XSL-FO processor for your installation, go to **Help > About > Libraries** and search for **Apache FOP**.

**Use other Apache FOP**
Instructs Oxygen XML Editor plugin to use another Apache FO processor that is installed on your computer. You can specify the path by using the text field, the Insert Editor Variables (page 201) button, or the Browse button.

Enable the output of the built-in FOP

All Apache FOP output is displayed in a results pane at the bottom of the Oxygen XML Editor plugin window, including warning messages about FO instructions not supported by Apache FOP.

Memory available to the built-in FOP

If your Apache FOP transformations fail with an Out of Memory error (OutOfMemoryError), use this combo box to select a bigger value for the amount of memory reserved for FOP transformations.

Configuration file for the built-in FOP

Use this option to specify the path to an Apache FOP configuration file (for example, to render to PDF a document containing Unicode content using a special true type font). You can specify the path by using the text field, the Insert Editor Variables (page 201) button, or the Browse button.

Generates PDF/A-1b output

When selected, PDF/A-1b output is generated.

Note: All fonts have to be embedded, even the implicit ones. More information about configuring metrics files for the embedded fonts can be found in Add a font to the built-in FOP (page 1481).

Note: You cannot use the <filterList> key in the configuration file since the FOP would generate the following error: The Filter key is prohibited when PDF/A-1 is active.

External FO Processors Section

In this section you can manage the external FO processors you want to use in transformation scenarios. You can use the two options at the bottom of the section to use the RenderX XEP or Antenna House Formatter commercial FO processors.

Add ‘XEP’ FO processor (executable file is needed)

If RenderX XEP is already installed on your computer, you can use this button to choose the XEP executable script (xep.bat for Windows, xep for Linux).

Add ‘Antenna House’ FO processor (executable file is needed)
If Antenna House Formatter is already installed on your computer, you can use this button to choose the Antenna House executable script (AHFCmd.exe or XSLCmd.exe for Windows, and run.sh for Linux/Mac OS).

Note: The built-in Antenna House Formatter GUI transformation scenario requires that you configure an external FO processor that runs AHFormatter.exe (Windows only). In the external FO Processor configuration dialog box (page 166), you could use "${env(AHF63_64_HOME)}\AHFormatter.exe" -d ${fo} -s for the value in the Command line field, although the environment variable name changes for each version of the AH Formatter and for each system architecture (you can install multiple versions side-by-side). For more information, see https://github.com/AntennaHouse/focheck/wiki/focheck.

You can also add external processors or configure existing ones. Press the New button to open a configuration dialog box that allows you to add a new external FO processor. Use the other buttons (Edit, Duplicate, Delete) to configure existing external processors.

Figure 32: External FO Processor Configuration Dialog Box

The external FO Processor configuration dialog box includes the following options:

Name
The name that will be displayed in the list of available FO processors on the FOP tab of the transformation scenario dialog box.

Description
A textual description of the FO processor that will be displayed in the FO processors table and in tooltips of UI components where the processor is selected.
Working directory

The directory where the intermediate and final results of the processing is stored. You can specify the path by using the text field, the Insert Editor Variables button, or the Browse button. You can use one of the following editor variables (page 201):

- \$(homeDir) - The path to the user home directory.
- \$(cfd) - The path of the current file directory. If the current file is not a local file, the target is the user desktop directory.
- \$(pd) - The project directory.
- \$(oxygenInstallDir) - The Oxygen XML Editor plugin installation directory.

Command line

The command line that starts the FO processor, specific to each processor. You can specify the path by using the text field, the Insert Editor Variables button, or the Browse button. You can use one of the following editor variables (page 201):

- \$(method) - The FOP transformation method: pdf, ps, or txt.
- \$(fo) - The input FO file.
- \$(out) - The output file.
- \$(pd) - The project directory.
- \$(frameworksDir) - The path of the frameworks subdirectory of the Oxygen XML Editor plugin installation directory.
- \$(oxygenInstallDir) - The Oxygen XML Editor plugin installation directory.
- \$(ps) - The platform-specific path separator. It is used between the library files specified in the class path of the command line.

Output Encoding

The encoding of the FO processor output stream that is displayed in a Results panel (page 267) at the bottom of the Oxygen XML Editor plugin window.

Error Encoding

The encoding of the FO processor error stream that is displayed in a Results panel (page 267) at the bottom of the Oxygen XML Editor plugin window.

CSS-based Processors Preferences

Oxygen XML Editor plugin includes a built-in XML to PDF transformation with CSS scenario type for generating PDF output using a CSS-based processor.
To configure the options for the CSS-based processors, open the Preferences dialog box (page 55) and go to XML > PDF Output > CSS-based Processors. This preferences page includes the following options:

**Oxygen PDF Chemistry Section**

**Auto-detect**

If selected, the directory of the Chemistry processor will be automatically detected. This is based on the system's PATH environmental variable. If none is detected, it will use the path of the built-in distribution.

**Custom installation directory**

Use this option to select an external directory of a custom installation of the Chemistry processor.

**Memory available to the processor (MB)**

Specifies the maximum amount of memory that is available for the transformation. If your transformations fail with an Out of Memory error (OutOfMemoryError), you can use this option to select a bigger value for the amount of memory reserved for the process.

**Generates PDF/UA-1 output**

Use this option to produce output that conforms with the PDF/UA-1 accessibility standards.

![Note: This mode has some special requirements. For example, all fonts have to be embedded and the title of documents must be marked using the metadata. For more information, see Oxygen PDF Chemistry User Guide: Fully Accessible PDF (PDF/UA1).](image)

**Show console output**

Allows you to specify when to display the console output log in the message panel at the bottom of the editor. The following options are available:

- **When build fails** - Displays the console output log only if the build fails.
- **Always** - Displays the console output log, regardless of whether or not the build fails.

**Sample XML Files Generator Preferences**

The Generate Sample XML Files tool (page 1070) (available on the XML Tools menu) allows you to generate XML instance documents based on an XML Schema. There are various options that can be configured within the tool and these options are also available in the Sample XML Files Generator
preferences page. This allows you to set default values for these options. To configure the options for generating the XML files, open the Preferences dialog box (page 55) and go to XML > Sample XML Files Generator.

The following options are available:

**Generate optional elements**

When selected, all elements are generated, including the optional ones (having the minOccurs attribute set to 0 in the schema).

**Generate optional attributes**

When selected, all attributes are generated, including the optional ones (having the use attribute set to optional in the schema).

**Values of elements and attributes**

Controls the content of generated attribute and element values. The following choices are available:

- **None** - No content is inserted.
- **Default** - Inserts a default value depending on data type descriptor of the particular element or attribute. The default value can be either the data type name or an incremental name of the attribute or element (according to the global option from the Sample XML Files Generator preferences page). Note that type restrictions are ignored when this option is selected. For example, if an element is of a type that restricts an xs:string with the xs:maxLength facet to allow strings with a maximum length of 3, the XML instance generator tool may generate string element values longer than 3 characters.
- **Random** - Inserts a random value depending on data type descriptor of the particular element or attribute.

⚠️ **Important**: If all of the following are true, the Generate Sample XML Files tool outputs invalid values:

- At least one of the restrictions is a regexp.
- The value generated after applying the regexp does not match the restrictions imposed by one of the facets.

**Preferred number of repetitions**

Allows you to set the preferred number of repeating elements related to minOccurs and maxOccurs facets defined in the XML Schema.

- If the value set here is between minOccurs and maxOccurs, then that value is used.
- If the value set here is less than minOccurs, then the minOccurs value is used.
• If the value set here is greater than maxOccurs, then maxOccurs is used.

**Maximum recursion level**

If a recursion is found, this option controls the maximum allowed depth of the same element.

**Type alternative strategy**

Used for the `xs:alternative` element from XML Schema 1.1. The possible strategies are:

- **First** - The first valid alternative type is always used.
- **Random** - A random alternative type is used.

**Choice strategy**

Used for `xs:choice` or `substitutionGroup` elements. The possible strategies are:

- **First** - The first branch of `xs:choice` or the head element of `substitutionGroup` is always used.
- **Random** - A random branch of `xs:choice` or a substitute element or the head element of a `substitutionGroup` is used.

**Generate the other options as comments**

If selected, generates the other possible choices or substitutions (for `xs:choice` and `substitutionGroup`). These alternatives are generated inside comments groups so you can uncomment and use them later. Use this option with care (for example, on a restricted namespace and element) as it may generate large result files.

**Use incremental attribute / element names as default**

If selected, the value of an element or attribute starts with the name of that element or attribute. For example, for an `a` element the generated values are: `a1`, `a2`, `a3`, and so on. If not selected, the value is the name of the type of that element / attribute (for example: `string`, `decimal`, etc.)

**Maximum length**

The maximum length of string values generated for elements and attributes.

**Discard optional elements after nested level**

The optional elements that exceed the specified nested level are discarded. This option is useful for limiting deeply nested element definitions that can quickly result in very large XML documents.

**Related Information:**
XML Catalog Preferences

To configure options that pertain to *XML Catalogs (page 2712)*, open the Preferences dialog box *(page 55)* and go to XML > XML Catalog.

The following options are available:

**Prefer**

Determines whether public identifiers specified in the catalog are used in favor of system identifiers supplied in the document. Suppose you have an entity in your document for which both a public identifier and a system identifier has been specified, and the catalog only contains a mapping for the public identifier (for example, a matching public catalog entry). You can choose between the following:

- **system** - If selected, the system identifier in the document is used.
- **public** - If selected, the URI supplied in the matching public catalog entry is used.

Generally, the purpose of catalogs is to override the system identifiers in XML documents, so **public** should usually be used for your catalogs.

**Note:** If the catalog contains a matching system catalog entry giving a mapping for the system identifier, that mapping would have been used, the public identifier would never have been considered, and this setting would be irrelevant.

**Verbosity**

When using catalogs, it is sometimes useful to see what catalog files are parsed, if they are valid, and what identifiers are resolved by the catalogs. This option selects the detail level of such logging messages of the *XML catalog resolver* that will be displayed in the Catalogs table at the bottom of the window. You can choose between the following:

- **None** - No message is displayed by the catalog resolver when it tries to resolve a URI reference, a SYSTEM one or a PUBLIC one with the XML catalogs specified in this panel.
- **Unresolved entities** - Only the logging messages that track the failed attempts to resolve references are displayed.
- **All messages** - The messages of both failed attempts and successful ones are displayed.

**Resolve schema locations also through system mappings**
If selected, Oxygen XML Editor plugin analyzes both uri and system mappings to resolve the location of schema.

**Note:** This option is not applicable for DTD schemas since the public and system catalog mappings are always considered.

**Process "schemaLocation" namespaces through URI mappings for XML Schema**

If selected, the target namespace of the imported XML Schema is resolved through the uri mappings. The namespace is taken into account only when the schema specified in the schemaLocation attribute was not resolved successfully. If not selected, the system IDs are used to resolve the schema location.

**Use default catalog**

If this option is selected and Oxygen XML Editor plugin cannot resolve the catalog mapping with any other means, the default global catalog (listed below this checkbox) is used. For more information, see How Oxygen XML Editor plugin Determines which Catalog to Use (page 900).

**Catalogs table**

You can use this table to add or manage global user-defined catalogs. The following actions are available at the bottom of the table:

- **Add**
  
  Opens a dialog box that allows you to add a catalog to the list. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (page 201) button, or the browsing actions in the Browse drop-down list.

- **Edit**
  
  Opens a dialog box that allows you to edit an existing catalog. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (page 201) button, or the browsing actions in the Browse drop-down list.

- **Delete**
  
  Deletes the currently selected catalog from the list.

- **Up**
  
  Moves the selection to the previous resource.

- **Down**
Moves the selection to the following resource.

**Note:** When you add, delete, or edit a catalog in this table, you need to reopen the currently edited files that use the modified catalog or run a manual Validate action *(page 857)* so that the changes take full effect.

You can also add or configure catalogs at framework level from the Catalogs tab *(page 95)* in the Document Type configuration dialog box *(page 72)*.

**XML Parser Preferences**

To configure the **XML Parser** options, open the Preferences dialog box *(page 55)* and go to XML > XML Parser.

The configurable options of the built-in XML parser are as follows:

**Enable parser caching (validation and content completion)**

Enables re-use of internal models when validating and provides content completion in opened XML files that reference the same schemas (grammars) such as DTD, XML Schema, or RelaxNG.

**Ignore the DTD for validation if a schema is specified**

Forces validation against a referenced schema (XML Schema, Relax NG schema) even if the document includes also a DTD DOCTYPE declaration. This option is useful when the DTD declaration is used only to declare DTD entities and the schema reference is used for validation against an XML Schema or a Relax NG schema.

**Note:** Schematron schemas are treated as additional schemas. The validation of a document associated with a DTD and referencing a Schematron schema is executed against both the DTD and the Schematron schema, regardless of the value of the Ignore the DTD for validation if a schema is specified option.

**Enable XInclude processing**
Enables XInclude processing. If selected, the XInclude support in Oxygen XML Editor plugin is turned on for validation, rendering in Author mode and transformation of XML documents.

**Base URI fix-up**

According to the specification for XInclude, processors must add an xml:base attribute to elements included from locations with a different base URI. Without these attributes, the resulting infoset information would be incorrect.

Unfortunately, these attributes make XInclude processing to not be transparent to Schema validation. One solution to this is to modify your schema to allow xml:base attributes to appear on elements that might be included from different base URIs.

If the addition of xml:base and / or xml:lang is not desired by your application, you can deselect this option.

**Language fix-up**

The processor will preserve language information on a top-level included element by adding an xml:lang attribute if its included parent has a different [language] property.

If the addition of xml:lang is not allowed by your application, you can deselect this option.

**DTD post-validation**

Select this option to validate an XML file against the associated DTD, after all the content merged to the current XML file using XInclude was resolved. If you deselect this option, the current XML file is validated against the associated DTD before all the content merged to the current XML file using XInclude is resolved.

**Relax NG Preferences**

To configure options regarding Relax NG, open the Preferences dialog box (page 55) and go to XML > XML Parser > Relax NG.

The following options are available in this page:

**Check feasibly valid**

Checks if Relax NG documents can be transformed into valid documents by inserting any number of attributes and child elements anywhere in the tree.

**Note:** Selecting this option disables the Check ID/IDREF option.

**Check ID/IDREF**

Checks the ID/IDREF matches when a Relax NG document is validated.
Add default attribute values

Default values are given to the attributes of documents validated using Relax NG. These values are defined in the Relax NG schema.

Ignore "data-" attributes in XHTML

This option is selected by default, which means that when XHTML documents are validated with an RNG schema, any data- attributes detected in the document will not be taken into account by the validation engine.

Schematron Preferences

To configure options regarding Schematron, open the Preferences dialog box (page 55) and go to XML > XML Parser > Schematron.

The following options are available in this preferences page:

ISO Schematron Section

Optimize (visit-no-attributes)

If your ISO Schematron assertion tests do not contain the attributes axis, you should select this option for faster ISO Schematron validation.

Allow foreign elements (allow-foreign)

Enables support for allow-foreign on ISO Schematron. This option is used to pass non-Schematron elements to the generated stylesheet.

Use associated XML Schema to expand default attribute values

When selected (default value), if the validated XML document has an XML Schema associated that contains default values for attributes defined in the XML content, the Schematron will be able to match on those default attributes.

Use Saxon EE (schema aware) for xslt2/xslt3 query language binding

When selected, Saxon EE is used for xslt2 / xslt3 query binding. If this option is not selected, Saxon PE is used.

Enable Schematron Quick Fixes (SQF) support

Allows you to enable or disable the support for Quick Fixes (page 2710) in Schematron files. This option is selected by default.

Embedded rules query language binding

You can control the query language binding used by the ISO Schematron embedded rules. You can choose between: xslt1, xslt2, or xslt3.
Note: To control the query language binding for standalone ISO Schematron, you need to set the query language to be used with a `queryBinding` attribute on the schema root element.

**Message language**

This option allows you to specify the language to be used in Schematron validation messages. You can choose between the following:

- **Use the language defined in the application** - The language that is specified in the application (page 213) will be used and only the validation messages that match that language will be presented. You can use the Change application language link to navigate to the preferences page where you can specify the language to be used in the application.
- **Use the "xml:lang" attribute set on the Schematron root** - The language specified in the `xml:lang` attribute from the Schematron root will be used and only the validation message that match that language will be presented.
- **Ignore the language and show all message** - All messages are displayed in whatever language is defined within the Schematron schema.
- **Custom** - Use this option to specify a custom language to be used and only the messages that match the specified language will be presented.

Note: In all cases, if the selected language is not available for a validation error or warning, all messages will be displayed in whatever language is defined within the Schematron schema.

**Schematron 1.5 Section**

**XPath Version**

Allows you to select the version of XPath for the expressions that are allowed in Schematron assertion tests. You can choose between: 1.0, 2.0, or 3.0. This option is applied in both standalone Schematron 1.5 schemas and embedded Schematron 1.5 rules.

**XML Schema Preferences**

To configure options regarding XML Schema, open the Preferences dialog box (page 55) and go to XML > XML Parser > XML Schema.
This preferences page allows you to configure the following options:

**Default XML Schema version**

Allows you to select the version of XML Schema to be used as the default. You can choose XML Schema **1.0** or XML Schema **1.1**.

*Note:* You are also able to set the XML Schema version using the **Customize** option in the New document wizard (page 550).

**Default XML Schema validation engine**

Allows you to select the default validation engine to be used for XML Schema. You can choose **Xerces** or **Saxon EE**.

**Xerces validation features section**

- **Enable full schema constraint checking**
  
  Sets the `schema-full-checking` feature to `true`. This enables a validation of the parsed XML document against a schema (XML Schema or DTD) while the document is parsed.

- **Enable honour all schema location feature**
  
  Sets the `honour-all-schema-location` feature to `true`. All the files that declare XML Schema components from the same namespace are used to compose the validation model. If this option is not selected, only the first XML Schema file that is encountered in the XML Schema import tree is taken into account.

- **Enable full XPath 2.0 for alternative types**
  
  When selected (default value), you can use the full XPath support in assertions and alternative types. Otherwise, only the XPath support offered by the Xerces engine is available.

- **Assertions can see comments and processing instructions**
  
  Controls whether or not comments and processing instructions are visible to the XPath expression used for defining an assertion in XSD 1.1.

**Saxon EE validation features section**

- **Multiple schema imports**
  
  Forces `xs:import` to fetch the referenced schema document. By default, the `xs:import` fetches the document only if no schema document for the given namespace has already been loaded. With this option in effect,
the referenced schema document is loaded unless the absolute URI is the same as a schema document already loaded.

**Assertions can see comments and processing instructions**

Controls whether or not comments and processing instructions are visible to the XPath expression used to define an assertion. By default, they are not made visible (unlike Saxon 9.3).

### XML Refactoring Preferences

To specify a folder for loading the custom XML refactoring operations, open the Preferences dialog box (page 55) and go to XML > XML Refactoring. The following option is available in this preferences page:

**Load additional refactoring operations from**

Use this text box to specify a folder for loading custom XML refactoring operations. You can specify the path by using the text field, the Insert Editor Variables (page 201) button, or the Browse button. Oxygen XML Editor plugin looks for XML refactoring operations recursively in the specified folder, so they can be stored in descendant folders.

### XML Signing Certificates Preferences

Oxygen XML Editor plugin provides two types of keystores (page 2707) for certificates that are used for digital signatures of XML documents: Java Keystore (JKS) and Public-Key Cryptography Standards version 12 (PKCS-12). A keystore file is protected by a password. To configure a certificate keystore, open the Preferences dialog box (page 55) and go to XML > XML Signing Certificates. You can customize the following parameters of a keystore:

**Figure 33: Certificates Preferences Panel**

- **Keystore type** - The type of keystore (page 2707) that Oxygen XML Editor plugin uses (JKS or PKCS-12).
- **Keystore file** - The location of the imported file.
• **Keystore password** - The password that is used for protecting the privacy of the stored keys.

• **Certificate alias** - The alias used for storing the key entry (the certificate or the private key) inside the keystore (page 2707).

• **Private key password** - The private key password of the certificate (required only for JKS keystores (page 2707)).

• **Validate** - Press this button to verify the configured keystore (page 2707) and the validity of the certificate.

**XProc Preferences**

Oxygen XML Editor plugin includes a bundled version of the *Calabash* XProc engine that can be used for XProc transformations and validation, but you also have several ways to integrate other external XProc engines.

If the external engine is Java-based, or it has validation support, or it has the ability to receive parameters or ports passed from the transformation, you need to integrate the external XProc engine using a plugin extension procedure (page 1488).

If you do not need the engine to be used for automatic validation or pass parameters/ports and it is not Java-based, you can add an external XProc engine by using the XProc preferences page. Open the Preferences dialog box (page 55) and go to XML > XProc.

To add an external engine, click the New button. To configure an existing engine, click the Edit button. This opens the Custom Engine dialog box that allows you to configure an external engine.

*Figure 34: Creating an XProc external engine*
The following options can be configured in this custom engine configuration dialog box:

- **Name** - The value of this field will be displayed in the XProc transformation scenario and in the command line that will start it.
- **Description** - A textual description that will appear as a tooltip where the XProc engine will be used.
- **Working directory** - The working directory for resolving relative paths. You can specify the path by using the text field, the **Insert Editor Variables** button, or the **Browse** button.
- **Command line** - The command line that will run the XProc engine as an external process. You can specify the path by using the text field, the **Insert Editor Variables** button, or the **Browse** button.
- **Output encoding** - The encoding for the output stream of the XProc engine, used for reading and displaying the output messages.
- **Error encoding** - The encoding for the error stream of the XProc engine, used for reading and displaying the messages from the error stream.

**Note:** You can configure the built-in Calabash processor by using the `calabash.config` file. This file is located in `[OXYGEN_INSTALL_DIR]\lib\xproc\calabash\lib`. If that file does not exist, you have to create it.

The **Show XProc messages** option at the bottom of the XProc preferences page can be selected if you want all messages emitted by the XProc processor during a transformation to be presented in dedicated XProc Results view (page 267).

**XSLT-XQuery Preferences**

To configure options regarding XSLT and XQuery processors, open the Preferences dialog box (page 55) and go to XML > XSLT-XQuery. This panel contains only the most generic options for working with XSLT or XQuery processors. The more specific options are grouped in other panels linked as child nodes of this panel in the tree of this Preferences page.

There is only one generic option available:

**Create transformation temporary files in system temporary directory**

It should be selected only when the temporary files necessary for performing transformations are created in the same folder as the source of the transformation (the default behavior when this option is not selected) and this breaks the transformation. An example of breaking the transformation is when the transformation processes all the files located in the same folder as the source of the transformation (including the temporary files) and the result is incorrect or the transformation fails because of this.
**Custom Engines Preferences**

Oxygen XML Editor plugin allows you to configure custom processors to be used for running XSLT and XQuery transformations.

**Note:** You can not use these custom engines in the Debugger perspective (page 2007).

To configure the Custom Engines preferences, open the Preferences dialog box (page 55) and go to XML > XSLT-XQuery > Custom Engines.

The table in this preferences page displays the custom engines that have been defined. Use the **New** or **Edit** button at the bottom of the table to open a dialog box that allows you to add or configure a custom engine.

**Figure 35: Parameters of a Custom Engine**

![Custom Engine Dialog Box](image)

The following parameters can be configured for a custom engine:

**Engine type**

- Specifies the transformer type. You can choose between XSLT and XQuery engines.

**Name**

- The name of the transformer displayed in the dialog box for editing transformation scenarios.

**Description**

- A textual description of the transformer.

**Working directory**
The start directory of the executable program for the transformer. The following *editor variables* (page 201) are available for making the path to the working directory independent of the location of the input files:

- **${homeDir}** - The user home directory in the operating system.
- **${cfd}** - The path to the directory of the current file.
- **${pd}** - The path to the directory of the current project.
- **${oxygenInstallDir}** - The Oxygen XML Editor plugin install directory.

**Command line**

The command line that must be executed by Oxygen XML Editor plugin to perform a transformation with the engine. The following *editor variables* (page 201) are available for making the parameters in the command line (the transformer executable, the input files) independent of the location of the input files:

- **${xml}** - The XML input document as a file path.
- **${xmlu}** - The XML input document as a URL.
- **${xsl}** - The XSL / XQuery input document as a file path.
- **${xslu}** - The XSL / XQuery input document as a URL.
- **${out}** - The output document as a file path.
- **${outu}** - The output document as a URL.
- **${ps}** - The platform separator that is used between library file names specified in the class path.

**Output Encoding**

The encoding of the transformer output stream.

**Error Encoding**

The encoding of the transformer error stream.

**Debugger Preferences**

To configure the *Debugger* preferences, open the *Preferences* dialog box (page 55) and go to **XML > XSLT-XQuery > Debugger**.

The following options are available:

**Show xsl:result-document output**

If selected, the debugger presents the output of *xsl:result-document* instructions into the debugger output view.

**Infinite loop detection**
Select this option to receive notifications when an infinite loop occurs during transformation.

**Enable Saxon optimizations**

This option is not selected by default and this means that the optimization for the debugging process is suppressed. This is helpful when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

**Maximum depth in templates stack**

Allows you to set how many `xsl:template` instructions can appear on the current stack. This setting is used by the infinite loop detection.

**Debugger layout**

If you select the Horizontal layout, the stack of XML editors is presented on the left half of the editing area while the stack of XSL editors is on the right half. If you select the Vertical layout, the stack of XML editors is presented on the upper half of the editing area while the stack of XSL editors is on the lower half.

**XWatch evaluation timeout (seconds)**

Allows you to specify the maximum time that Oxygen XML Editor plugin allocates to the evaluation of XPath expressions while debugging.

**Profiler Preferences**

This section explains the settings available for the XSLT/XQuery Profiler. To access and modify these settings, open the Preferences dialog box (page 55) and go to XML > XSLT-XQuery > Profiler (see Debugger Preferences (page 182)).

The following profiler settings are available:

**Show time**

Shows the total time that was spent in the call.

**Show inherent time**

Shows the inherent time that was spent in the call. The inherent time is defined as the total time of a call minus the time of its child calls.

**Show invocation count**

Shows how many times the call was called in this particular call sequence.

**Time scale**

Determines the unit of time measurement. You can choose between milliseconds or microseconds.
Hotspot threshold

Hotspots are ignored below this specified amount (in milliseconds). For more information, see Hotspots View (page 2033).

Ignore invocation less than

Invocations are ignored below this specified amount (in microseconds). For more information, see Invocation Tree View (page 2032).

Percentage calculation

The percentage base that determines what time span percentages are calculated against. You can choose between the following:

- **Absolute** - Percentage values show the contribution to the total time.
- **Relative** - Percentage values show the contribution to the calling call.

XPath Preferences

To configure XPath options, open the Preferences dialog box (page 55) and go to XML > XSLT-XQuery > XPath.

Oxygen XML Editor plugin allows you to customize the following options:

**Unescape XPath expression**

If selected, the entities of an XPath expression that you type in the XPath/XQuery Builder (page 1902) are unescaped during their execution. For example, the expression:

```
//varlistentry[starts-with(@os,'##x73;')]
```

is equivalent to:

```
//varlistentry[starts-with(@os,'s')]
```

**XPath Default Namespace (only for XPath version 2.0)**

Specifies the default namespace to be used for unprefixed element names. You can choose between the following four options:

- **No namespace** - If selected, Oxygen XML Editor plugin considers unprefixed element names of the evaluated XPath expressions as belonging to no namespace.
- **Use the default namespace from the root element** (default selection) - Oxygen XML Editor plugin considers unprefixed element names of the evaluated XPath expressions as belonging to the default namespace declared on the root element of the XML document you are querying.
• **Use the namespace of the root** - If selected, Oxygen XML Editor plugin considers unprefixed element names of the evaluated XPath expressions as belonging to the same namespace as the root element of the XML document you are querying.

• **This namespace** - If selected, you can use the corresponding text field to enter the namespace of the unprefixed elements.

**Default prefix-namespace mappings**

You can use this table to associate prefixes with namespaces. Use these mappings when you want to define them globally (not for each document). Use the **New** button to add mappings to the list and the **Delete** button to remove mappings.

**XQuery Preferences**

To configure the **XQuery** options, open the **Preferences** dialog box  (page 55) and go to **XML > XSLT-XQuery > XQuery**.

The following generic XQuery preferences are available:

**Validation engine**

Allows you to select the processor that will be used to validate XQuery documents. If you are validating an XQuery file that has an associated validation scenario, Oxygen XML Editor plugin uses the processor specified in the scenario. If no validation scenario is associated, but the file has an associated transformation scenario, the processor specified in the scenario is used. If the processor does not support validation or if no scenario is associated, then the value from this combo box will be used as validation processor.

**Size limit of Sequence view (MB)**

When the result of an XQuery transformation is set as a sequence (**Present as a sequence option** (page 1440)) in the transformation scenario, the size of one chunk of the result that is fetched from the database in lazy mode in one step is set in this option. If this limit is exceeded, go to the **Sequence view** (page 1115) and click **More results available** to extract more data from the database.

**Format transformer output**

Specifies whether or not the output of the transformer is formatted and indented (**pretty-print** (page 2709)).

**Note:** This option is ignored if you choose **Present as a sequence** (page 1440) (lazy extract data from a database) from the associated transformation scenario.

**Create structure indicating the type nodes**
If selected, Oxygen XML Editor plugin takes the results of a query and creates an XML
document containing copies of all items in the sequence, suitably wrapped.

**Note:** This option is ignored if you choose Present as a sequence (page 1440) (lazy
extract data from a database) from the associated transformation scenario.

### Saxon-HE/PE/EE Preferences

To configure global options for XQuery transformation and validation scenarios that use the Saxon
HE/PE/EE engine, open the Preferences dialog box (page 55) and go to XML > XSLT-XQuery >
XQuery > Saxon-HE/PE/EE.

Oxygen XML Editor plugin allows you to configure the following XQuery options for the Saxon 9.8.0.12
Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE):

**Use a configuration file ("-config")**

Sets a Saxon 9.8.0.12 configuration file that is used for XQuery transformation and
validation scenarios.

**Enable Optimizations ("-opt")**

This option is selected by default, which means that optimization is enabled. If not
selected, the optimization is suppressed, which is helpful when reducing the compiling
time is important, optimization conflicts with debugging, or optimization causes
extension functions with side-effects to behave unpredictably.

**Use linked tree model ("-tree:linked")**

This option activates the linked tree model.

**Recoverable errors ("-warnings")**

Specifies how dynamic errors are handled. The following options can be selected:

- **Recover silently ("silent")** - Continues processing without reporting the error.
- **Recover with warnings ("recover")** - Issues a warning but continues processing.
- **Signal the error and do not attempt recovery ("fatal")** - Issues an error and stops
  processing.

**Strip whitespaces ("-strip")**

Specifies how the strip whitespaces operation is handled. You can choose one of the
following values:

- **All ("all")** - Strips all whitespace text nodes from source documents before any
  further processing, regardless of any xml:space attributes in the source document.
• **Ignore** ("ignorable") - Strips all *ignorable* whitespace text nodes from source documents before any further processing, regardless of any `xml:space` attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.

• **None** ("none") - Strips *no* whitespace before further processing.

The following option is available for Saxon 9.8.0.12 Professional Edition (PE) and Enterprise Edition (EE) only:

**Allow calls on extension functions** ("-ext")

If selected, calls on external functions are allowed. Selecting this option is recommended in an environment where untrusted stylesheets may be executed. It also disables user-defined extension elements and the writing of multiple output files, both of which carry similar security risks.

The options available specifically for Saxon 9.8.0.12 Enterprise Edition (EE) are as follows:

**Validation of the source file** ("-val")

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

• **Schema validation** ("strict") - This mode requires an XML Schema and allows for parsing the source documents with strict schema-validation enabled.

• **Lax schema validation** ("lax") - If an XML Schema is provided, this mode allows for parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.

• **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

**Validation errors in the result tree treated as warnings** ("-outval")

Normally, if validation of result documents is requested, a validation error is fatal. Selecting this option causes such validation failures to be treated as warnings.

**Write comments for non-fatal validation errors of the result document**

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

**Enable XQuery update** ("-update:(on|off)")

This option controls whether or not XQuery update syntax is accepted. The default value is off.

**Backup files updated by XQuery** ("-backup:(on|off)")
If selected, backup versions for any XML files updated with an XQuery Update are generated. This option is available when the Enable XQuery update option is selected.

Saxon HE/PE/EE Advanced Preferences

To configure Saxon HE/PE/EE Advanced preferences, open the Preferences dialog box (page 55) and go to XML > XSLT-XQuery > XQuery > Saxon-HE/PE/EE > Advanced.

The advanced XQuery options that can be configured for the Saxon 9.8.0.12 XQuery transformer (all editions: Home Edition, Professional Edition, Enterprise Edition) are as follows:

- **URI Resolver class name** - Allows you to specify a custom implementation for the URI resolver used by the XQuery Saxon 9.8.0.12 transformer (the -r option when run from the command line). The class name must be fully specified and the corresponding JAR or class extension must be configured from the dialog box for configuring the XQuery extension (page 1419) for the particular transformation scenario.

  **Note:** If your URIResolver implementation does not recognize the given resource, the resolve(String href, String base) method should return a null value. Otherwise, the given resource will not be resolved through the XML Catalog (page 897).

- **Collection URI Resolver class name** - Allows you to specify a custom implementation for the Collection URI resolver used by the XQuery Saxon 9.8.0.12 transformer (the -cr option when run from the command line). The class name must be fully specified and the corresponding JAR or class extension must be configured from the dialog box for configuring the XQuery extension (page 1419) for the particular transformation scenario.

XSLT Preferences

To configure the XSLT options, open the Preferences dialog box (page 55) and go to XML > XSLT-XQuery > XSLT.

Oxygen XML Editor plugin offers the possibility of using an XSLT transformer implemented in Java (other than the XSLT transformers that come bundled with Oxygen XML Editor plugin). To use another XSLT transformer, specify the name of the transformer factory class. Oxygen XML Editor plugin sets this transformer factory class as the value of the Java property: `javax.xml.transform.TransformerFactory`.

The XSLT preferences page allows you to customize the following options:

- **JAXP XSLT Transformer - Value**

  Allows you to set the value of the TransformerFactory Java class.
Validation engine - XSLT 1.0

Allows you to select the XSLT engine to be used for validation of XSLT 1.0 documents.

Validation engine - XSLT 2.0

Allows you to select the XSLT engine to be used for validation of XSLT 2.0 documents.

Validation engine - XSLT 3.0

Allows you to select the XSLT engine to be used for validation of XSLT 3.0 documents.

Note: Saxon-HE does not implement any XSLT 3.0 features. Saxon-PE implements a selection of XSLT 3.0 (and XPath 3.0) features, with the exception of schema-awareness and streaming. Saxon-EE implements additional features relating to streaming (processing of a source document without constructing a tree in memory. For further details about XSLT 3.0 conformance, go to http://www.saxonica.com/documentation/index.html#!conformance/xslt30.

Use this link to switch to the XSLT Content Completion preferences page (page 105), where you can configure the XSLT content completion options.

MSXML Preferences

To configure the MSXML options, open the Preferences dialog box (page 55) and go to XML > XSLT-XQuery > XSLT > MSXML.

The options in this preferences page for the MSXML 3.0 and 4.0 processors are as follows:

Validate documents during parse phase

If selected, and either the source or stylesheet document has a DTD or schema that its content can be checked against, validation is performed.

Do not resolve external definitions during parse phase

By default, MSXML instructs the parser to resolve external definitions such as document type definition (DTD), external subsets or external entity references when parsing the source and style sheet documents. If this option is selected, the resolution is disabled.

Strip non-significant whitespaces

If selected, strips non-significant white space from the input XML document during the load phase. Selecting this option can lower memory usage and improve transformation performance while, in most cases, creating equivalent output.

Show time information
If selected, the relative speed of various transformation steps can be measured, including:

- The time to load, parse, and build the input document.
- The time to load, parse, and build the stylesheet document.
- The time to compile the stylesheet in preparation for the transformation.
- The time to execute the stylesheet.

**Start transformation in this mode**

Although stylesheet execution usually begins in the empty mode, this default behavior may be changed by specifying another mode. Changing the start mode allows execution to jump directly to an alternate group of templates.

**MSXML.NET Preferences**

To configure the MSXML.NET options, open the Preferences dialog box (page 55) and go to XML > XSLT-XQuery > XSLT > MSXML.NET.

The options in this preferences page for the MSXML.NET processor are as follows:

**Enable XInclude processing**

If selected, XInclude references will be resolved when MSXML.NET is used as the transformer in the XSLT transformation scenario (page 1381).

**Validate documents during parse phase**

If selected, and either the source or stylesheet document has a DTD or schema that its content can be checked against, validation is performed.

**Do not resolve external definitions during parse phase**

By default, MSXML instructs the parser to resolve external definitions such as document type definition (DTD), external subsets or external entity references when parsing the source and style sheet documents. If this option is selected, the resolution is disabled.

**Strip non-significant whitespaces**

If selected, strips non-significant white space from the input XML document during the load phase. Selecting this option can lower memory usage and improve transformation performance while, in most cases, creating equivalent output.

**Show time information**

If selected, the relative speed of various transformation steps can be measured, including:

- The time to load, parse, and build the input document.
• The time to load, parse, and build the stylesheet document.
• The time to compile the stylesheet in preparation for the transformation.
• The time to execute the stylesheet.

Forces ASCII output encoding

There is a known problem with the .NET 1.X XSLT processor (System.Xml.Xsl.XslTransform class). It does not support escaping of characters as XML character references when they cannot be represented in the output encoding. This means that it will be outputted as ‘?’. Usually this happens when output encoding is set to ASCII. If this option is selected, the output is forced to be ASCII encoded and all non-ASCII characters get escaped as XML character references (&#nnnn; form).

Allow multiple output documents

This option allows you to create multiple result documents using the exsl:document extension element.

Use named URI resolver class

This option allows you to specify a custom URI resolver class to resolve URI references in xsl:import and xsl:include instructions (during XSLT stylesheet loading phase) and in document() functions (during XSL transformation phase).

Assembly file name for URI resolver class

This option specifies a file name of the assembly where the specified resolver class can be found. The Use named URI resolver class option (page 191) specifies a partially or fully qualified URI resolver class name (for example, Acme.Resolvers.CacheResolver). Such a name requires additional assembly specification using this option or the Assembly GAC name for URI resolver class option (page 191), but fully qualified class name (which always includes an assembly specifier) is all-sufficient. See MSDN for more info about fully qualified class names.

Assembly GAC name for URI resolver class

This option specifies partially or fully qualified name of the assembly in the global assembly cache (GAC) where the specified resolver class can be found. See MSDN for more info about partial assembly names.

List of extension object class names

This option allows to specify extension object classes, whose public methods then can be used as extension functions in an XSLT stylesheet. It is a comma-separated list of namespace-qualified extension object class names. Each class name must be bound to a namespace URI using prefixes, similar to providing XSLT parameters.

Use specified EXSLT assembly
MSXML.NET supports a rich library of the EXSLT and EXSLT.NET extension functions embedded or in a plugin EXSLT.NET library. EXSLT support is enabled by default and cannot be disabled in this version. Use this option if you want to use an external EXSLT.NET implementation instead of a built-in one.

Credential loading source xml
This option allows you to specify user credentials to be used when loading XML source documents. The credentials should be provided in the username:password@domain format (all parts are optional).

Credential loading stylesheet
This option allows you to specify user credentials to be used when loading XSLT stylesheet documents. The credentials should be provided in the username:password@domain format (all parts are optional).

Saxon-HE/PE/EE Preferences
To configure global options for XSLT transformation and validation scenarios that use the Saxon HE/PE/EE engine, open the Preferences dialog box (page 55) and go to XML > XSLT-XQuery > XSLT > Saxon > Saxon-HE/PE/EE.

Saxon-HE/PE/EE Options
Oxygen XML Editor plugin allows you to configure the following XSLT options for the Saxon 9.8.0.12 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE):

Use a configuration file ("-config")
Select this option if you want to use a Saxon 9.8.0.12 configuration file that will be executed for the XSLT transformation and validation processes. You can specify the path to the configuration file by entering it in the URL field, or by using the Insert Editor Variables button, or using the browsing actions in the Browse drop-down list.

Debugger trace into XPath expressions (applies to debugging sessions)
Instructs the XSLT Debugger (page 2025) to step into XPath expressions.

Enable Optimizations ("-opt")
This option is selected by default, which means that optimization is enabled. If not selected, the optimization is suppressed, which is helpful when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

Line numbering ("-l")
Line numbers where errors occur are included in the output messages.

**Expand attributes defaults ("-expand")**

Specifies whether or not the attributes defined in the associated DTD or XML Schema are expanded in the output of the transformation you are executing.

**DTD validation of the source ("-dtd")**

Specifies whether or not the source document will be validated against their associated DTD. You can choose from the following:

- **On** - Requests DTD validation of the source file and of any files read using the `document()` function.
- **Off** - (default setting) Suppresses DTD validation.
- **Recover** - Performs DTD validation but treats the errors as non-fatal.

**Note:** Any external DTD is likely to be read even if not used for validation, since DTDs can contain definitions of entities.

**Recoverable errors ("-warnings")**

 Specifies how dynamic errors are handled. The following options can be selected:

- **Recover silently ("silent")** - Continues processing without reporting the error.
- **Recover with warnings ("recover")** - Issues a warning but continues processing.
- **Signal the error and do not attempt recovery ("fatal")** - Issues an error and stops processing.

**Strip whitespaces ("-strip")**

Specifies how the *strip whitespaces* operation is handled. You can choose one of the following values:

- **All ("all")** - Strips all whitespace text nodes from source documents before any further processing, regardless of any `xml:space` attributes in the source document.
- **Ignore ("ignorable")** - Strips all ignorable whitespace text nodes from source documents before any further processing, regardless of any `xml:space` attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
- **None ("none")** - Strips no whitespace before further processing.
Saxon-PE/EE Options

The following options are available for Saxon 9.8.0.12 Professional Edition (PE) and Enterprise Edition (EE) only:

Register Saxon-JS extension functions and instructions

Registers the Saxon-CE extension functions and instructions when compiling a stylesheet using the Saxon 9.8.0.12 processors.

Note: Saxon-CE, being JavaScript-based, was designed to run inside a web browser. This means that you will use Oxygen XML Editor plugin only for developing the Saxon-CE stylesheet, leaving the execution part to a web browser. See more details about executing such a stylesheet on Saxonica's website.

Allow calls on extension functions ("-ext")

If selected, the stylesheet is allowed to call external Java functions. This does not affect calls on integrated extension functions, including Saxon and EXSLT extension functions. This option is useful when loading an untrusted stylesheet (such as from a remote site using http://[URL]). It ensures that the stylesheet cannot call arbitrary Java methods and thus gain privileged access to resources on your machine.

Enable assertions ("-ea")

In XSLT 3.0, you can use the xsl:assert element to make assertions in the form of XPath expressions, causing a dynamic error if the assertion turns out to be false. If this option is selected, XSLT 3.0 xsl:assert instructions are enabled. If it is not selected (default), the assertions are ignored.

Saxon-EE Options

The options available specifically for Saxon 9.8.0.12 Enterprise Edition (EE) are as follows:

Validation of the source file ("-val")

Requests schema-based validation of the source file and of any files read using document() or similar functions. It can have the following values:

- Schema validation ("strict") - This mode requires an XML Schema and allows for parsing the source documents with strict schema-validation enabled.
- Lax schema validation ("lax") - If an XML Schema is provided, this mode allows for parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
• **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

**Validation errors in the result tree treated as warnings ("-outval")**

Normally, if validation of result documents is requested, a validation error is fatal. Selecting this option causes such validation failures to be treated as warnings.

**Write comments for non-fatal validation errors of the result document**

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

---

**Saxon-HE/PE/EE Advanced Preferences**

To configure the Saxon HE/PE/EE Advanced preferences, open the Preferences dialog box (page 55) and go to XML > XSLT-XQuery > XSLT > Saxon > Saxon-HE/PE/EE > Advanced.

• **URI Resolver class name ("-r")** - Specifies a custom implementation for the URI resolver used by the XSLT Saxon 9.8.0.12 transformer (the -r option when run from the command line). The class name must be fully specified and the corresponding jar or class extension must be configured from the dialog box for configuring the XSLT extension (page 1419) for the particular transformation scenario.

• **Collection URI Resolver class name ("-cr")** - Specifies a custom implementation for the Collection URI resolver used by the XSLT Saxon 9.8.0.12 transformer (the -cr option when run from the command line). The class name must be fully specified and the corresponding jar or class extension must be configured from the dialog box for configuring the XSLT extension (page 1419) for the particular transformation scenario.

---

**Saxon6 Preferences**

To configure the Saxon 6 options, open the Preferences dialog box (page 55) and go to XML > XSLT-XQuery > XSLT > Saxon > Saxon6.

The built-in Saxon 6 XSLT processor can be configured with the following options:

• **Line numbering** - Specifies whether or not line numbers are maintained and reported in error messages for the XML source document.

• **Disable calls on extension functions** - If selected, external function calls are not allowed. Selecting this option is recommended in an environment where untrusted stylesheets may be
executed. It also disables user-defined extension elements and the writing of multiple output files, since they carry similar security risks.

- **Handling of recoverable stylesheet errors** - Allows you to choose how dynamic errors are handled. One of the following options can be selected:
  - **recover silently** - Continue processing without reporting the error.
  - **recover with warnings** - Issue a warning but continue processing.
  - **signal the error and do not attempt recovery** - Issue an error and stop processing.

**XSLTProc Preferences**

To configure XSLTProc options, open the Preferences dialog box *(page 55)* and go to **XML > XSLT-XQuery > XSLT > XSLTProc**.

The following options are available in this preferences page:

- **Enable XInclude processing** - If selected, XInclude references will be resolved when XSLTProc is used as transformer in XSLT transformation scenarios *(page 1381)*.
- **Skip loading the document's DTD** - If selected, the DTD specified in the DOCTYPE declaration will not be loaded.
- **Do not apply default attributes from document's DTD** - If selected, the default attributes declared in the DTD and not specified in the document are not included in the transformed document.
- **Do not use Internet to fetch DTD's, entities or docs** - If selected, the remote references to DTD's and entities are not followed.
- **Maximum depth in templates stack** - If this limit of maximum templates depth is reached the transformation ends with an error.
- **Verbosity** - If selected, the transformation will output detailed status messages about the transformation process in the **Warnings** view.
- **Show version of libxml and libxslt used** - If selected, Oxygen XML Editor plugin will display in the **Warnings** view the version of the libxml and libxslt libraries invoked by XSLTProc.
- **Show time information** - If selected, the **Warnings** view will display the time necessary for running the transformation.
- **Show debug information** - If selected, the **Warnings** view will display debug information about what templates are matched, parameter values, and so on.
- **Show all documents loaded during processing** - If selected, Oxygen XML Editor plugin will display in the **Warnings** view the URL of all the files loaded during transformation.
- **Show profile information** - If selected, Oxygen XML Editor plugin will display in the **Warnings** view a table with all the matched templates, and for each template will display: the match XPath expression, the template name, the number of template modes, the number of calls, the execution time.
• **Show the list of registered extensions** - If selected, Oxygen XML Editor plugin will display in the **Warnings** view a list with all the registered extension functions, extension elements and extension modules.

• **Refuses to write to any file or resource** - If selected, the XSLTProc processor will not write any part of the transformation result to an external file on disk. If such an operation is requested by the processed XSLT stylesheet the transformation ends with a runtime error.

• **Refuses to create directories** - If selected, the XSLTProc processor will not create any directory during the transformation process. If such an operation is requested by the processed XSLT stylesheet the transformation ends with a runtime error.

**XML Structure Outline Preferences**

To configure options regarding the **Outline view** ([page 257](#)), open the **Preferences** dialog box ([page 55](#)) and go to **XML Structure Outline**. It contains the following options:

**Preferred attribute names for display**

The preferred attribute names when displaying the attributes of an element in the **Outline** view. If there is no preferred attribute name specified, the first attribute of an element is displayed.

**Enable outline drag and drop**

Drag and drop is disabled for the tree displayed in the **Outline** view only if there is a possibility to accidentally change the structure of the document by such operations.

**Configuring Options**

A set of options controls the behavior of Oxygen XML Editor plugin, allowing you to configure most of the features. To offer you the highest degree of flexibility in customizing the application to fit the needs of your organization, Oxygen XML Editor plugin includes several distinct layers of option values.

The option layers are as follows (sorted from high priority to low):

• **Global Options** ([page 55](#))

  Allows individual users to personalize Oxygen XML Editor plugin according to their specific needs.

• **Customized Default Options** ([page 198](#))

  Designed to customize the initial option values for a group of users, this layer allows an administrator to deploy the application preconfigured with a standardized set of option values.
Note: Once this layer is set, it represents the initial state of Oxygen XML Editor plugin when an end-user uses the Restore defaults (page 56) or Reset Global Options (page 199) actions.

• Default Options

The predefined default values, tuned so that Oxygen XML Editor plugin behaves optimally in most working environments.

Important: If you set a specific option in one of the layers, but it is not applied in the application, make sure that one of the higher priority layers does not overwrite it.

Customizing Default Options

Oxygen XML Editor plugin has an extensive set of options that you can configure. When Oxygen XML Editor plugin in installed, these options are set to default values. You can provide a different set of default values for an installation using an XML options file.

Creating an XML Options File

To create an options file, follow these steps:

1. It is recommended that you use a fresh install for this procedure, to make sure that you do not copy personal or local preferences.
2. Open Oxygen XML Editor plugin and open the Preferences dialog box (page 55).
3. Go through the options and set them to the desired defaults.
4. Go to back to the main preferences page and click Export Global Options to create an XML options file.

Configuring an Installation to Use Customized Default Options

There are several methods that you can use to configure an Oxygen XML Editor plugin installation to use the customized default options from the created XML options file.

The possible methods for using customized default options during an installation include:

• Copy the XML Options File to the Installation Directory

In the {OXYGEN_INSTALL_DIR}, create a folder called preferences and copy the created XML options file into it (for example: {ECLIPSE-INSTALL-DIR}/plugins/com.oxygenxml.editor/preferences/default.xml, or if the plugin was installed as a

**Specify a Path to the XML Options File in a Startup Parameter**

Set the path to the XML options file as the value of the `com.oxygenxml.default.options` system property in the Eclipse configuration file (\[ECLIPSE-INSTALL-DIR]/configuration/config.ini). The path can be specified with any of the following:

- A URL or file path relative to the application installation folder. For example:

  ```
  com.oxygenxml.default.options=file:\default.xml
  ```

  This will make Oxygen XML Editor plugin look for `default.xml` inside the installation folder (for example: \[ECLIPSE-INSTALL-DIR]/plugins/com.oxygenxml.editor/preferences/default.xml, or if the plugin was installed as a drop-in: \[ECLIPSE-INSTALL-DIR]/dropins/com.oxygenxml.editor/preferences/default.xml).

- A system variable that specifies the file path. For example:

  ```
  com.oxygenxml.default.options=file:{$system(CONFIG)}/default.xml
  ```

- An environmental variable that specifies the file path. For example:

  ```
  com.oxygenxml.default.options=file:{$env(CONFIG)}/default.xml
  ```

**Note:** In the Eclipse configuration file, the backslash (\) is considered a special character. Therefore, use forward slashes for separators inside the file path.

**Importing/Exporting/Resetting Global Options**

Actions for importing, exporting, and resetting global options are available in the preferences page of the Oxygen XML Editor plugin. To open this page, open the Preferences dialog box (page 55). The export operation allows you to save global preferences as an XML options file and the import operation allows you to load the options file. You can use this file to reload the options on your computer or to share with others.

The following buttons are available at the bottom of the preferences page:

**Reset Global Options**

Restores the preference to the factory defaults or to customized defaults (page 198). This action also resets the transformation and validation scenarios to the default scenarios and clears recently used document templates.

**Import Global Options**
Allows you to import a set of Global Options from an exported XML properties file. You can also select a project file (.xpr) to import all the Global Options that are set in that project file. After you select a file, the Import Global Options dialog box is displayed, and it informs you that the operation will only override the options that are included in the imported file. You can select the Reset all other options to their default values option to reset all options to the default values before the file is imported.

Export Global Options

Allows you to export Global Options to an XML properties file. Some user-specific options that are private are not included. For example, passwords and the name of the Review Author is not included in the export operation.

Import/Export Transformation or Validation Scenarios

You can export global transformation and validation scenarios into specialized scenarios files. You can import transformation and validation scenarios from various sources (such as project files, framework (page 2706) option files, or exported scenario files). To access these import and export actions, open the Preferences dialog box (page 55) and go to Scenarios Management. The following actions are available:

Import Global Transformation Scenarios

Loads a set of transformation scenarios from a project file, framework options file, or exported scenarios file.

Export Global Transformation Scenarios

Stores a set of global transformation scenarios in a specialized scenarios file.

Import Global Validation Scenarios

Loads a set of validation scenarios from a project file, framework options file, or exported scenarios file.

Export Global Validation Scenarios

Stores a set of global validation scenarios in a specialized scenarios file.

The Export Global Transformation Scenarios and Export Global Validation Scenarios options are used to store all the scenarios in a separate file. Associations between document URLs and scenarios are also saved in this file. You can load the saved scenarios using the Import Global Transformation...
Scenarios and Import Global Validation Scenarios actions. To distinguish the existing scenarios and the imported ones, the names of the imported scenarios contain the word import.

Editor Variables

An editor variable is a shorthand notation for context-dependent information, such as a file or folder path, a time-stamp, or a date. It is used in the definition of a command (for example, the input URL of a transformation, the output file path of a transformation, or the command line of an external tool) to make a command or a parameter generic and re-usable with other input files. When the same command is applied to multiple files, the notation is expanded at the execution of the command so that the same command has different effects depending on the actual file.

Oxygen XML Editor plugin includes a variety of built-in editor variables. You can also create your own custom editor variables (page 208) by using the Custom Editor Variables preferences page (page 59).

You can use the following editor variables in Oxygen XML Editor plugin commands of external engines or other external tools, and in various places in the application, such as in transformation scenarios, and validation scenarios:

- **$(@activeConditionSet)** - Current active profiling condition set (page 752) name. If there is no active condition set, the variable will be replaced with an empty string.
- **$(@af)** - The local file path of the ZIP archive that includes the current edited document.
- **$(@afd)** - The local directory path of the ZIP archive that includes the current edited document.
- **$(@afdu)** - The URL path of the directory of the ZIP archive that includes the current edited document.
- **$(@afn)** - The file name (without parent directory and without file extension) of the zip archive that includes the current edited file.
- **$(@afne)** - The file name (with file extension, for example .zip or .epub, but without parent directory) of the zip archive that includes the current edited file.
- **$(@afu)** - The URL path of the ZIP archive that includes the current edited document.
- **$(@answer(@id))** - Used in conjunction with the $(@ask) editor variable. The @id parameter is required and identifies the answer from the $(@ask) editor variable with the same ID.

Example:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE topic PUBLIC "-//OASIS//DTD DITA Topic//EN" "topic.dtd">
<topic id="topic_lcf_1c4_tdb">
  <title></title>
  <body>
```

• **${ask('message', type, ('real_value1':'rendered_value1'; 'real_value2':'rendered_value2'; ...), 'default_value'), @id)** - To prompt for values at runtime, use the `ask('message', type, ('real_value1':'rendered_value1'; 'real_value2':'rendered_value2'; ...), 'default_value')` editor variable. You can set the following parameters:
  
  - `'message'` - The displayed message. Note the quotes that enclose the message.
  - `'default-value'` - Optional parameter. Provides a default value.
  - `@id` - Optional parameter. Used for identifying the variable to reuse the answer using the `${answer(@id)}` editor variable.
  - `type` - Optional parameter, with one of the following values:

  - **Note:** The title of the dialog box will be determined by the type of parameter and as follows:

    - For `url` and `relative_url` parameters, the title will be the name of the parameter and the value of the `'message'`.
    - For the other parameters listed below, the title will be the name of that respective parameter.
    - If no parameter is used, the title will be "Input".

<table>

</table>
| `url`     | `${ask('message', 'url', 'default_value')}` | Input is considered a URL. Oxygen XML Editor plugin checks that the provided URL is valid. | ```
- `${ask('Input URL', 'url')}` - The displayed dialog box has the name 'Input URL'. The expected input type is URL.
- `${ask('Input URL', 'url', 'http://www.example.com')}` - The displayed dialog box has the name 'Input URL'. The expected input type is URL. The input field displays the default value 'http://www.example.com'.
``` |
| `password`|`${ask('message', 'password', 'default')}` | The input is hidden with bullet characters. | ```
- `${ask('Input password', 'password')}` - The displayed dialog box has the name 'Input password' and the input is hidden with bullet symbols.

<tbody>
<tr>
<td><code>${ask('Input password', password, 'abcd')}</code></td>
<td>The displayed dialog box has the name 'Input password' and the input hidden with bullet symbols. The input field already contains the default <code>abcd</code> value.</td>
</tr>
</tbody>
</table>
| `generic` | Format: `{ask('message', generic, 'default')}`  
**Description:** The input is considered to be generic text that requires no special handling.  
**Example:**  
- `{ask('Hello world!')}` - The dialog box has a `Hello world!` message displayed.  
- `{ask('Hello world!', generic, 'Hello again!')}` - The dialog box has a `Hello world!` message displayed and the value displayed in the input box is 'Hello again!'. |
| `relative_url` | Format: `{ask('message', relative_url, 'default')}`  
**Description:** Input is considered a URL. Oxygen XML Editor plugin tries to make the URL relative to that of the document you are editing.  
**Note:** If the `{ask}` editor variable is expanded in content that is not yet saved (such as an `untitled` file, whose path cannot be determined), then Oxygen XML Editor plugin will transform it into an absolute URL.  
**Example:**  
- `{ask('File location', relative_url, 'C:/example.txt')}` - The dialog box has the name 'File location'. The URL inserted in the input box is made relative to the current edited document location. |
| `combobox` | Format: `{ask('message', combobox, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'), 'default')}`  
**Description:** Displays a dialog box that offers a drop-down menu. The drop-down menu is populated with the given `rendered_value` values. Choosing such a value will return its associated value `real_value`.  
**Note:** The 'default' parameter specifies the default selected value and can match either a key or a value.  
**Example:**  
- `{ask('Operating System', combobox, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'osx')}` - The dialog box has the name 'Operating System'. The drop-down menu displays
Parameter | the three given operating systems. The associated value will be returned based upon your selection.
---|---
**Note:** In this example, the default value is indicated by the *osx* key. However, the same result could be obtained if the default value is indicated by *Mac OS X*, as in the following example: ${ask('Operating System', combobox, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'Mac OS X')}

- ${ask('Mobile OS', combobox, ('win':'Windows Mobile';'ios':'iOS';'and':'Android'), 'Android')}

**editable_combobox** Format: ${ask('message', editable_combobox, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'), 'default')}

**Description:** Displays a dialog box that offers a drop-down menu with editable elements. The drop-down menu is populated with the given rendered_value values. Choosing such a value will return its associated real value (real_value) or the value inserted when you edit a list entry.

- **Note:** The 'default' parameter specifies the default selected value and can match either a key or a value.

**Example:**

${ask('Operating System', editable_combobox, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'osx')}

- The dialog box has the name 'Operating System'. The drop-down menu displays the three given operating systems and also allows you to edit the entry. The associated value will be returned based upon your selection or the text you input.

**radio** Format: ${ask('message', radio, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'), 'default')}

**Description:** Displays a dialog box that offers a series of radio buttons. Each radio button displays a rendered_value and will return an associated real_value.

- **Note:** The 'default' parameter specifies the default selected value and can match either a key or a value.

**Example:**
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>${ask('Operating System', radio, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'osx')}</td>
<td>The dialog box has the name 'Operating System'. The radio button group allows you to choose between the three operating systems.</td>
</tr>
<tr>
<td><strong>Note:</strong> In this example, Mac OS X is the default selected value and if selected, it would return osx for the output.</td>
<td></td>
</tr>
</tbody>
</table>

- **${author.name}** - Expands to the current author name that is set in the Review preferences page (page 124).
- **${caret}** - The position where the cursor is located. This variable can be used in a code template, in Author mode operations, or in a selection plugin.

**Note:** The ${caret} editor variable is available only for parameters that take XML content as values. It is replaced with the ${UNIQUE_CARET_MARKER_FOR_AUTHOR} macro. The default Author operations process this macro and position the cursor at the designated offset.

- **${cf}** - Current file as file path, that is the absolute file path of the current edited document.
- **${cfd}** - Current file folder as file path, that is the path of the current edited document up to the name of the parent folder.
- **${cfdu}** - Current file folder as URL, that is the path of the current edited document up to the name of the parent folder, represented as a URL.
- **${cfn}** - Current file name without extension and without parent folder. The current file is the one currently opened and selected.
- **${cfne}** - Current file name with extension. The current file is the one currently opened and selected.
- **${comma}** - Used to display a comma when the actual comma symbol would be considered part of some sort of instruction or delimiter.
- **${configured.ditaot.dir}** - The default directory of the DITA Open Toolkit distribution, as configured in the DITA preferences page (page 66).
- **${cp}** - Current page number. Used to display the current page number on each printed page in the Editor / Print Preferences page.
- **${currentFileURL}** - Current file as URL, that is the absolute file path of the current edited document represented as URL.
- **${date(pattern)}** - Current date. The allowed patterns are equivalent to the ones in the Java SimpleDateFormat class. Example: yyyy-MM-dd,

**Note:** This editor variable supports both the xs:date and xs:datetime parameters. For details about xs:date, go to: http://www.w3.org/TR/xmlschema-2/#date. For details about xs:dateTime, go to: http://www.w3.org/TR/xmlschema-2/#dateTime.
• **${dbgXML}** - The local file path to the XML document that is current selected in the Debugger source combo box (for tools started from the XSLT/XQuery Debugger).

• **${dbgXSL}** - The local file path to the XSL/XQuery document that is current selected in the Debugger stylesheet combo box (for tools started from the XSLT/XQuery Debugger).

• **${dita.dir.url}** - A special local contextual editor variable that gets expanded only in the Libraries dialog box that is accessible from the Advanced tab of DITA transformation scenarios. The Libraries dialog box allows you to specify additional libraries (JAR (page 2707) files or additional class paths) to be used by the transformer. This ${dita.dir.url} editor variable gets expanded to the value of the dita.dir parameter from the Parameters tab of the DITA transformation scenario.

• **${ds}** - The path of the detected schema as a local file path for the current validated XML document.

• **${dsu}** - The path of the detected schema as a URL for the current validated XML document.

• **${env(VAR_NAME)}** - Value of the VAR_NAME environment variable. The environment variables are managed by the operating system. If you are looking for Java System Properties, use the ${system(var.name)} editor variable.

• **${framework(fr_name)}** - The path (as URL) of the fr_name framework.

• **${framework}** - The path (as URL) of the current framework directory.

• **${frameworkDir(fr_name)}** - The path (as file path) of the fr_name framework.

**Note:** Since multiple frameworks might have the same name (although it is not recommended), for both **${framework(fr_name)}** and **${frameworkDir(fr_name)}** editor variables Oxygen XML Editor plugin employs the following algorithm when searching for a given framework name:

- All frameworks are sorted, from high to low, according to their Priority (page 72) setting from the Document Type configuration dialog box (page 72). Only frameworks that have the Enabled checkbox selected are taken into account.

- Next, if the two or more frameworks have the same name and priority, a further sorting based on the Storage setting is made, in the exact following order:
  - Frameworks stored in the internal Oxygen XML Editor plugin options.
  - Additional frameworks added in the Locations preferences page (page 71).
  - Frameworks installed using the add-ons support.
  - Frameworks found in the main framework location (page 71) (Default or Custom).

• **${frameworkDir}** - The path (as file path) of the current framework directory.

• **${frameworks}** - The path (as URL) of the frameworks directory.

• **${frameworksDir}** - The path (as file path) of the frameworks directory.

• **${home}** - The path (as URL) of the user home folder.

• **${homeDir}** - The path (as file path) of the user home folder.

• **${i18n(key)}** - Editor variable used only at framework-level to allow translating names and descriptions of Author mode actions in multiple actions. For more details, see Localizing Frameworks (page 2047).
• ${id} - Application-level unique identifier. It is a short sequence of 10-12 letters and digits that is not guaranteed to be universally unique.

• ${makeRelative(base,location)} - Takes two URL-like paths as parameters and tries to return a relative path. A use-case would be to insert content references to a certain reusable component when defining code templates.

Example:

${makeRelative(${currentFileURL}, ${dictionaryURL}#gogu)}

• ${oxygenHome} - Oxygen XML Editor plugin installation folder as URL.

• ${oxygenInstallDir} - Oxygen XML Editor plugin installation folder as file path.

• ${pd} - The file path to the folder that contains the current project file (.xpr).

• ${pdu} - The URL path to the folder that contains the current project file (.xpr).

• ${pluginDir(pluginID)} - Each plugin has an ID specified in its plugin.xml file. This editor variable expands to the file path of the folder that contains the plugin.xml file where that specific plugin ID is located.

• ${pluginDirURL(pluginID)} - Each plugin has an ID specified in its plugin.xml file. This editor variable expands to the URL path of the folder that contains the plugin.xml file where that specific plugin ID is located.

• ${pn} - Current project name.

• ${ps} - Path separator, which is the separator that can be used on the current platform (Windows, OS X, Linux) between library files specified in the class path.

• ${rootMapDir} - Will be expanded to the current root map parent directory file path.

• ${rootMapDirURL} - Will be expanded to the current root map parent directory URL.

• ${rootMapFile} - Will be expanded to the current root map file path.

• ${rootMapURL} - Will be expanded to the current root map URL.

• ${selection} - The current selected text content in the current edited document. This variable can be used in a code template, in Author mode operations, or in a selection plugin.

• ${system(var.name)} - Value of the var.name Java System Property. The Java system properties can be specified in the command-line arguments of the Java runtime as -Dvar.name=var.value. If you are looking for operating system environment variables, use the ${env(VAR_NAME)} editor variable instead.

• ${timeStamp} - Time stamp, that is the current time in Unix format. For example, it can be used to save transformation results in multiple output files on each transformation.

• ${tp} - Total number of pages in the document. Used to display the total number of pages on each printed page in the Editor / Print Preferences page.

• ${tsf} - The transformation result file path. If the current opened file has an associated scenario that specifies a transformation output file, this variable expands to it.

• ${uuid} - Universally unique identifier, a unique sequence of 32 hexadecimal digits generated by the Java UUID class.
• ${xmlCatalogFilesList} - A list of file paths that point to all known XML catalog files, separated by semi-colons (;).
• ${xpath_eval(expression)} - Evaluates an XPath 3.0 expression. Depending on the context, the expression can be:
  - **static** - When executed in a non-XML context. For example, you can use such static expressions to perform string operations on other editor variables for composing the name of the output file in a transformation scenario's Output tab.

  **Example:**

  ```
  ${xpath_eval(upper-case(substring(${cfn}, 1, 4)))}
  ```

  - **dynamic** - When executed in an XML context. For example, you can use such dynamic expression in a code template or as a value of a parameter of an Author mode operation.

  **Example:**

  ```
  ${ask('Set new ID attribute', generic, '${xpath_eval(@id)})')}
  ```

**Custom Editor Variables**

An editor variable (page 201) can be created and included in any user-defined expression where a built-in editor variable is also allowed. For example, a custom editor variable may be necessary for configuring the command line of an external tool, the working directory of a custom validator, the command line of a custom XSLT engine, or a custom FO processor.

You can create or configure custom editor variables in the Custom Editor Variables preferences page (page 59). To create a custom editor variable, follow these steps:

1. Open the Preferences dialog box (page 55) and go to Custom Editor Variables.
2. Click the + New button at the bottom of the table.
3. Use the subsequent dialog box to specify the Name, Value, and Description for the new editor variable.
4. Click OK to save your configuration.

**Related Information:**

• Editor Variables (page 201)
Custom System Properties

A variety of Java system properties can be set in the application to influence its behavior.

**com.oxygenxml.disable.http.protocol.handlers**

- **Allowed Values:** true or false
- **Default Value:** false
- **Purpose:** By default, Oxygen XML Editor plugin uses the open source Apache HTTP Client software for HTTP(S) connections. If set to True, the default Java Sun HTTP(S) will be used instead. You will also lose WebDAV support and possibly other related features.

**com.oxygenxml.present.license.reminders**

- **Allowed Values:** true or false
- **Default Value:** true
- **Purpose:** When set to false, Oxygen XML Editor plugin will not display the messages that remind you to renew your Support and Maintenance Pack that covers your current license.

**com.oxygenxml.enable.content.reference.caching**

- **Allowed Values:** true or false
- **Default Value:** true
- **Purpose:** Enables content reference caching.

**com.oxygenxml.eclipse.remove.grid.editing.mode**

- **Allowed Values:** true or false
- **Default Value:** false
- **Purpose:** When set to false, Oxygen XML Editor plugin does not show the Grid editing mode when opening an XML document.

**com.oxygenxml.default.java.accessibility**

- **Allowed Values:** true or false
- **Default Value:** false
• **Purpose:** System property that can be set to `true` to force the default detection of Java accessibility. If `com.sun.java.accessibility.AccessBridge` cannot be loaded, Oxygen XML Editor plugin forces the Java accessibility to be disabled.

**com.oxygenxml.floating.license.timeout**

• **Allowed Values:** An integer (minutes)
• **Default Value:** 120
• **Purpose:** Stores the time interval (in minutes) before floating licenses are released in case of application's inactivity.

**com.oxygenxml.language**

• **Allowed Values:** Language code (for example, `en-us`)
• **Default Value:** N/A
• **Purpose:** Property that holds the language code set during installation.

**com.oxygenxml.default.options**

• **Allowed Values:** A URL-type relative or absolute path.
• **Default Value:** N/A
• **Purpose:** Provides the path to an XML file containing default application options. For more details, see Customizing Default Options (page 198).

**com.oxygenxml.customOptionsDir**

• **Allowed Values:** A file system absolute path pointing to a folder.
• **Default Value:** N/A
• **Purpose:** Sets a folder to be used by the application to load and save preference files. The default location where the options are saved varies according to the operating system. See Importing/Exporting/Resetting Global Options (page 199).

**com.oxygenxml.ApplicationDataFolder** (Windows only)

• **Allowed Values:** A file system absolute path pointing to a folder.
• **Default Value:** `%APPDATA%`
• **Purpose:** When the application runs on Windows, you can set this property to change the location where the application considers that the `APPDATA` folder is located.

**com.oxygenxml.editor.frameworks.url**

• **Allowed Values:** A URL-type absolute path.
• **Default Value:** OXYGEN_DIR \frameworks
• **Purpose:** Changes the folder where the application considers that the main
  frameworks are installed. It has the same effect as changing the custom
  frameworks directory value in the Location preferences page ([page 71](#)).

**com.oxygenxml.MultipleInstances**

• **Allowed Values:** true or false
• **Default Value:** false
• **Purpose:** If set to true, multiple instances of the application are allowed to be started.

**com.oxygenxml.xep.location**

• **Allowed Values:** A file system absolute path pointing to a folder.
• **Default Value:** N/A
• **Purpose:** Points to a folder where RenderX XEP is installed. Has the same effect as
  configuring XEP in the FO Processors preferences page ([page 164](#)).

**com.oxygenxml.additional.classpath**

• **Allowed Values:** A list of JAR ([page 2707](#))-type resources separated by a classpath
  separator.
• **Default Value:** N/A
• **Purpose:** An additional list of libraries to be used in the application's internal class
  loader in addition to the libraries specified in the lib folder.

**com.oxygenxml.user.home** (Windows only)

• **Allowed Values:** A file system absolute path pointing to a folder.
• **Default Value:** %USERPROFILE%\folder
• **Purpose:** Overwrites the user home directory that was implicitly detected for the
  application.

**com.oxygenxml.use.late.delegation.for.author.extensions**

• **Allowed Values:** true or false
• **Default Value:** true
• **Purpose:** All Java extensions in a framework configuration are instantiated in a
  separate class loader. When true, the JAR libraries used in a certain document type
  will have priority to resolve classes before delegating to the parent class loader.
  When false, the parent class loader will take precedence.
**com.oxygenxml.stack.size.validation.threads**

- **Allowed Values:** The number of bytes used for validation threads.
- **Default Value:** 5*1024*1024
- **Purpose:** Some parts of the application (validation, content completion) that use the Relax NG parser sometimes require a larger *Thread* stack size to parse complex schemas. The default value should be more than enough.

**com.oxygenxml.jing.skip.validation.xhtml.data.attrs**

- **Allowed Values:** true or false
- **Default Value:** true
- **Purpose:** By default, the Relax NG validation was configured to skip validation for XHTML attributes that start with "data-", which should be skipped from validation according to the XHTML 5 specification.

**com.oxygenxml.report.problems.url**

- **Allowed Values:** User-defined URL
- **Default Value:** N/A
- **Purpose:** The URL where a problem reported through the Report Problem dialog box is sent. The report is sent in XML format using the report parameter with the POST HTTP method.

**com.oxygenxml.parallel.title.computing.threads**

- **Allowed Values:** Integers
- **Default Value:** 4
- **Purpose:** The number of parallel threads that will be used to compute referenced topic titles. Increasing this value reduces the amount of time it takes to compute topic titles in the DITA Maps Manager view.

**com.oxygenxml.hidpi.scaling**

- **Allowed Values:** Numerical values between 1 and 2 (1, 1.5, and 2 have been tested, and for example, 1.5 is for 150% scaling)
- **Default Value:** N/A
- **Purpose:** Used to override the HiDPI scaling detection to force a specific scaling setting. This is helpful if you encounter scaling detection issues in Windows or Linux.
Attention: This property was implemented and test for Java 8. If you run Oxygen XML Editor plugin with Java 11, this property is completely ignored. In such cases, you can use the sun.java2d.uiScale standard property for the same purposes.

com.oxygenxml.prefer.plugin.classloader.context.loader

• Allowed Values: true Or false
• Default Value: true
• Purpose: Used to instruct the application to use the plugin class loader when there is code that loads content (usually Xerces code) using the thread's class loader. For instance, if you have a plugin that specifies a certain Xerces version and you want to load that version instead of the one from Oxygen's lib directory.

Localizing of the User Interface

To localize the Oxygen XML Editor plugin, you can use one of the following methods:

• Localization through the update site:

• Localization through the zip archive:

  Go to https://www.oxygenxml.com/download.html and download the zip archive with the plugin language pack. Unzip the downloaded zip archive in the dropins subdirectory of the Eclipse install directory. Restart Eclipse.

If your operating system is running in the language you want to start Eclipse in (for example, you are using Japanese version of Windows, and you want to start Eclipse in Japanese), Oxygen XML Editor plugin matches the appropriate language from the language pack. However, if your operating system is running in a language other than the one you want to start Eclipse in (for example, you are using the English version of Windows, and you want to start Eclipse in Japanese, if you have the required operating system language support including the keyboard layouts and input method editors installed), specify the -nl <locale> command-line argument when you launch Eclipse. Oxygen XML Editor plugin uses the translation file that matches the specified <locale>.
You can also localize the Eclipse plugin to a different language than the initial languages in the language pack. Duplicate the `plugin.properties` file from the Oxygen XML Editor plugin plugin installation directory, translate all the keys in the file and change its name to `plugin_<locale>.properties`. 
5. Perspectives

An Oxygen XML Editor plugin perspective is an interface layout geared towards a specific use. The Oxygen XML Editor plugin interface uses standard interface conventions and components to provide a familiar and intuitive editing environment across all operating systems. There are several perspectives that you can use to work with documents in Oxygen XML Editor plugin. You can change the perspective by selecting the perspective from the Window > Open Perspective menu.

Oxygen XML Perspective

The Oxygen XML perspective is the most commonly used perspective and it is the default perspective when you start Oxygen XML Editor plugin for the first time. It is the perspective that you will use to edit the content of your XML documents.

To switch the focus to this perspective, select Oxygen XML from the Window > Open Perspective menu.

The layout of this perspective is composed of the following components:

- **Menus**
  Provides menu driven access to all the features and functions available in Oxygen XML Editor plugin. Most of the menus are common for all types of documents. However, Oxygen XML Editor plugin also includes some context-sensitive and framework-specific menus that are only available for a specific context or type of document.

- **Toolbars**
  Provides easy access to common and frequently used functions. Each icon is a button that acts as a shortcut to a related function. Most of the toolbars are common for all types of documents. However, Author mode also includes framework-specific toolbars, depending on the type of document that is being edited (for example, if you are editing a DITA document, a DITA Author Custom Actions toolbar is available that includes operations that are specific to DITA documents).

- **Editor Pane**
The main editing pane where you spend most of your time reading, editing, applying markup, and validating your documents.

Views

Oxygen XML Editor plugin includes a large variety of dockable (page 2705) views to assist you with editing, viewing, searching, validating, transforming, and organizing your documents. The most commonly used views are displayed by default and you can choose to display others by selecting them from the Window > Show View menu.

When two or more views are displayed, the application provides divider bars. Divider bars can be dragged to a new position increasing the space occupied by one panel while decreasing it for the other.

As the majority of the work process centers around the Editor area, other views can be hidden using the toggle controls located on the top corner of the view (−).

Some of the most helpful views in the Oxygen XML perspective include the following:

- **Navigator view** (page 250) - Enables the definition of projects and logical management of the documents they contain.
- **DITA Maps Manager view** (page 2400) - For DITA document types, this view helps you organize, manage, and edit DITA topics and maps.
- **Outline view** (page 257) - It provides an XML tag overview and offers a variety of functions, such as modifications follow-up, document structure change, document tag selection, and elements filtering.
- **Results view** (page 267) - Displays the messages generated as a result of user actions such as validations (page 854), transformation scenarios (page 1381), spell checking in multiple files (page 598), search operations, and others. Each message is a link to the location related to the event that triggered the message.
- **Attributes view** (page 261) - Presents all possible attributes of the current element and allows you to edit attribute values. You can also use this view to insert attributes in Text mode. Author mode also includes an in-place attribute editor (page 322).
- **Model view** (page 263) - Presents the current edited element structure model and additional documentation as defined in the schema.
- **Elements view** (page 265) - Presents a list of all defined elements that you can insert at the current cursor position according to the document's schema. In Author mode this view (page 325) includes tabs that present additional information relative to the cursor location.
- **Entities view** (page 266) - Displays a list with all entities declared in the current document as well as built-in ones.
• **Transformation Scenarios view (page 1507)** - Displays a list with all currently configured transformation scenarios.
• **XPath/XQuery Builder view (page 1902)** - Displays the results from running an XPath expression.
• **Text view (page 1428)** - Displays the text output that is produced in XSLT transformations.
• **Browser view (page 1427)** - Displays HTML output from XSLT transformations.
• **Problems view** - A general Eclipse view that displays system-generated errors, warnings, or information associated with a resource.
• **Console view (page 612)** - Status information generated by the Schema detection, validation, and transformation threads.
• **WSDL SOAP Analyzer view (page 1141)** - Provides a tool that helps you test if the messages defined in a Web Service Descriptor (WSDL) are accepted by a Web Services server.

Oxygen XSLT Debugger Perspective

The **XSLT Debugger perspective (page 2709)** allows you to detect problems in an XSLT transformation by executing the process step by step in a controlled environment. To switch the focus to this perspective, select **Window > Open Perspective > Other > Oxygen XSLT Debugger**.

The workspace in this perspective is organized as an editing area assisted by special helper views. The editing area contains editor panels that you can split horizontally or vertically (page 182) in a stack of XML editor panels and a stack of XSLT editor panels. The XML files and XSL files can be edited in **Text mode (page 223)** only.

The layout of this perspective is composed of the following components:

**Menus**

Provides menu driven access to all the features and functions available in the XSLT Debugger.

**Toolbars**
Contains all actions needed to configure and control the debugging process.

**XML Source Pane**

The editing pane where you can display and edit data or document-oriented XML documents.

**XSL Source Pane**

The editing pane where you can display and edit XSL stylesheets.

**Output View**

Displays the transformed output that results from the input of a selected document (XML) and selected stylesheet (XSL) to the transformer. The result of transformation is dynamically written as the transformation is processed. There are three types of views for the output: a text view (with XML syntax highlight), an XHTML view, and one text view for each `xsl:result-document` element used in the stylesheet (if it is an XSLT 2.0 / 3.0 stylesheets).

**Debugging Information Views (page 2012)**

Presented in two panes, they display various types of information that can be used to understand the transformation process. For each information type there is a corresponding tab. While running a transformation, relevant events are displayed in the various information views. This allows you to obtain a clear view of the transformation progress. See the Debugging Information Views (page 2012) topic for a list of all the information views (and links to more details on each view).

**Note:** You can add XPath expression automatically in the XWatch view using the Watch expression action from the contextual menu. In case you select an expression or a fragment of it and then click Watch expression in the contextual menu, the entire selection is presented in the XWatch view. Using Watch expression without selecting an expression displays the value of the attribute from the cursor position in the XWatch view. Variables detected at the cursor position are also displayed. Expressions displayed in the XWatch view are normalized (unnecessary white spaces are removed from the expression).

Oxygen XQuery Debugger Perspective

The XQuery Debugger perspective (page 2709) allows you to detect problems in an XQuery transformation process by executing the process step by step in a controlled environment and inspecting the information provided in the special views. To switch the focus to this perspective, select Window > Open Perspective > Other > Oxygen XQuery Debugger.

The workspace in this perspective is organized as an editing area assisted by special helper views. The editing area contains editor panels that you can split horizontally or vertically (page 182) in a stack of XML editor panels and a stack of XQuery editor panels. The XML files and XQuery files can be edited in Text mode (page 223) only.

The layout of this perspective is composed of the following components:

**Menus**

Provides menu driven access to all the features and functions available in the XQuery Debugger.

**Toolbars**

Contains all actions needed to configure and control the debugging process.

**XML Source Pane**

The editing pane where you can display and edit data or document-oriented XML documents.

**XQuery Source Pane**

The editing pane where you can display and edit XQuery files.

**Output View**

Displays the transformed output that results from the input of a selected document (XML) and selected XQuery document to the XQuery transformer. The result of transformation is dynamically written as the transformation is processed. There are two types of views for the output: a text view (with XML syntax highlight) and an XHTML view.

**Debugging Information Views (page 2012)**

Presented in two panes, they display various types of information that can be used to understand the transformation process. For each information type there is a corresponding tab. While running a transformation, relevant events are displayed in the
various information views. This allows you to obtain a clear view of the transformation progress. See the Debugging Information Views (page 2012) topic for a list of all the information views (and links to more details on each view).

Note: You can add XPath expression automatically in the XWatch view using the Watch expression action from the contextual menu. If you select an expression, or a fragment of it, and then click Watch expression in the contextual menu, the entire selection is presented in the XWatch view. Expressions displayed in the XWatch view are normalized (unnecessary white spaces are removed from the expression).

Oxygen DB Perspective

The Database perspective (page 2709) allows you to manage databases. To switch the focus to this perspective, select Oxygen DB from the Window > Open perspective menu.

The Database perspective offers various helpful features, including:

• Support for browsing multiple connections at the same time.
• Support for both Relational and Native XML databases.
• Browsing the structure of databases.
• Viewing tables from databases.
• Inspecting or modifying data.
• Specifying XML Schemas for XML fields.
• SQL execution.
• XQuery execution.
• Data export to XML.
Supported Databases

Oxygen XML Editor plugin supports numerous types of databases, including:

- Oracle Berkeley DB XML Database
- eXist XML Database
- IBM DB2 (Enterprise edition only)
- JDBC-ODBC Bridge
- MarkLogic (Enterprise edition only)
- Microsoft SQL Server 2005 and Microsoft SQL Server 2008 (Enterprise edition only)
- MySQL
- Oracle 11g (Enterprise edition only)
- PostgreSQL 8.3 (Enterprise edition only)
- SharePoint (CMS)

**Note:** For the databases marked with "Enterprise edition only", the XML capabilities are only available in the Enterprise edition of Oxygen XML Editor plugin. For a detailed feature matrix that compares the Academic, Professional, and Enterprise editions of Oxygen XML Editor plugin go to the Oxygen XML Editor plugin website.

Supported Capabilities

The supported non-XML capabilities are as follows:

- Browsing the structure of the database instance.
- Opening a database table in the **Table Explorer** view (page 1918).
- Handling the values from **XML Type** columns as String values.

**Note:** The non-XML capabilities are available in the Enterprise, Academic, and Professional editions of Oxygen XML Editor plugin by registering the database driver as a **Generic JDBC** type driver when defining the data source for accessing the database. For more information, see Database Connection Support (page 1921).

The supported XML capabilities are as follows:

- Displaying an XML Schema node in the tree of the database structure (for databases with an XML-specific structure) with actions for opening, editing, and validating the schemas in an Oxygen XML Editor plugin editor panel.
- Handling the values from **XML Type** columns as XML instance documents that can be opened and edited in an Oxygen XML Editor plugin editor panel.
- Validating an XML instance document added to an XML Type (column of a table, etc.)
Tip: Connections configured on relational data sources can be used to import data to XML or to generate XML schemas.

Layout of the Database Perspective

The layout of this perspective is composed of the following components:

**Menus**

Provides menu driven access to all the features and functions available in the XQuery Debugger.

**Toolbars**

Contains all actions needed to configure and control the debugging process.

**Editor Pane**

The main editing pane where you spend most of your time reading, editing, applying markup, and validating your documents.

**Data Source Explorer View (page 1917)**

Provides browsing support for the configured connections.

**Table Explorer View (page 1918)**

Provides table content editing support for inserting new rows, deleting table rows, editing cell values, exporting to an XML file, and more.

6. Editing Modes

The main editing area in Oxygen XML Editor plugin includes several editing modes to suit the type of editing that you want to perform. You can easily switch between modes by clicking on the desired mode at the bottom of the main editing pane. Oxygen XML Editor plugin offers the following editing modes:

- **Text** *(page 223)* - This mode presents the source of an XML document.
- **Grid** *(page 292)* - This mode displays an XML document as a structured grid of nested tables.
- **Author** *(page 303)* - This mode enables you to edit in a WYSIWYG-like editor.
- **Design** *(page 505)* - This mode is found in the schema editor and represents the schema as a diagram.

The default editing mode that will be initially opened for each type of document can be set in two ways:

- If the **Allow Document Type specific edit mode setting to override the general mode setting option** *(page 109)* is selected in the Edit Modes preferences page, then the edit mode specified in the Document Type configuration dialog box *(page 72)* is used when that particular type of document is initially opened.
- If the **Allow Document Type specific edit mode setting to override the general mode setting option** *(page 109)* is not selected, then the edit mode specified in the table in the Edit Modes preferences page *(page 109)* is used when that particular type of document is initially opened.

Text Editing Mode

The **Text** mode editor in Oxygen XML Editor plugin is designed to be a simple, yet powerful, XML source editor. It provides support to help you edit, transform, and debug XML-based documents. It is similar to other common text editors, but Oxygen XML Editor plugin also includes specialized editing actions, a powerful Content Completion Assistant *(page 627)*, a helpful Outline view *(page 257)*, and many other unique features.

To switch to this mode, select **Text** at the bottom of the editing area.
Navigating the Document Content in Text Mode

Oxygen XML Editor plugin includes some useful features to help you navigate XML documents in Text mode.

**Navigation Keyboard Shortcuts**

- **Ctrl + CloseBracket (Command + CloseBracket on OS X)**
  Navigate to the next XML node.

- **Ctrl + OpenBracket (Command + OpenBracket on OS X)**
  Navigate to the previous XML node.

- **Ctrl + RightArrow (Command + RightArrow on OS X)**
  Navigate one word forward.

- **Ctrl + LeftArrow (Command + LeftArrow on OS X)**
  Navigate one word backward.

- **Ctrl + Home (Command + Home on OS X)**
  Position the cursor at the beginning of the document.

- **Ctrl + End (Command + End on OS X)**
  Position the cursor at the end of the document.

**Navigating to a Modification**

Oxygen XML Editor plugin includes some actions to help you quickly navigate to a particular modification. They can be invoked using keyboards shortcuts or from the Navigation menu:

- **Last Edit Location (Ctrl+Q)**
  Moves the cursor to the last modification in any opened document.

- **Back (Alt+LeftArrow (Command+OpenBracket on OS X))**
  Moves the cursor to the previous modification.

- **Forward (Alt+RightArrow (Command+CloseBracket on OS X))**
Moves the cursor to the next modification.

Navigating with the Outline View

Oxygen XML Editor plugin includes an Outline view (page 257) that displays a hierarchical tag overview of the currently edited XML Document.

You can use this view to quickly navigate through the current document by selecting nodes in the outline tree. It is synchronized with the editor area, so when you make a selection in the Outline view, the corresponding nodes are highlighted in the editor area.

Figure 36: Outline View Navigation in Text Mode

Using the Breadcrumb to Navigate

A breadcrumb on the top stripe indicates the path from the document root element to the current element. It can also be used as a helpful tool to navigate to specific elements throughout the structure of the document.

Figure 37: Breadcrumb in Text Mode

The last element listed in the breadcrumb is the element at the current cursor position. Clicking an element from the breadcrumb selects the entire element and navigates to it in the editor area.

Navigating with the Go To Dialog Box

In Text mode, you can navigate precisely to a location in the document you are editing by pressing Ctrl +L (Command+L on OS X) or selecting Go To Line from the Navigation menu.

Navigating with Bookmarks

By using bookmarks, you can mark positions in an edited document so that you can return to it later. This is especially helpful for navigating through large documents or while editing multiple documents.
To insert a bookmark in **Text** mode, right-click the desired location in the vertical stripe on the left side of the editor and select **Add Bookmark** (you can remove it by selecting **Remove Bookmark** from the same contextual menu).

To navigate to any of the bookmarks, click their corresponding markers in the vertical stripe on the right side of the editor.

ℹ️ **Tip:** You can configure the color and how the bookmarks are shown from the Eclipse **Annotations** preferences page (Window ('Eclipse' on Mac OSX) > Preferences > General > Editors > Text Editors > Annotations).

### Smart Editing in Text Mode

Oxygen XML Editor plugin includes **smart editing** features to help you edit XML documents in **Text** mode. The following smart editing features are included:

- **Closing tag auto-expansion** - This feature helps save some keystrokes by automatically inserting a closing tag when you insert a complete start tag and the cursor is automatically placed in between the start and end tags. For instance, after entering a start `<tag>`, the corresponding closing `</tag>` is automatically inserted and the cursor is placed between the two (`<tag> | </tag>`).

- **Auto-rename matching tag** - When you edit the name of a start tag, Oxygen XML Editor plugin will mirror-edit the name of the matching end tag. This feature can be controlled from the **Content Completion** option page (page 100).

- **Auto-breaking the edited line** - The **Hard line wrap** option (page 137) automatically breaks the edited line when its length exceeds the maximum line length defined for the format and indent operation (page 137).

- **Indent on Enter** - The **Indent on Enter** option (page 137) indents the new line inserted when you press **Enter**.

- **Smart Enter** - The **Smart Enter** option (page 137) inserts an empty line between the start and end tags. If you press **Enter** between a start and end tag, the action places the cursor in an indented position on the empty line between the lines that contain the start and end tag.

- **Double-click** - A double-click selects certain text, depending on the position of the click in the document:
  - If the click position is on a start tag or end tag, then the element name is selected.
  - If the click position is after a start tag or before an end tag, then the entire content of the element without the start and end tags is selected.
  - If the click position is before a start tag or after an end tag, then the entire tag is selected, including the start and end tags, and the content in between.
If the click position is immediately before an attribute, then the entire attribute and its value is selected.

If the click position is immediately after the opening quote or immediately before the closing quote of an attribute value, then the entire attribute value is selected.

Otherwise, a double-click selects contiguous text.

- **Triple-click** - A triple-click selects the entire current line of text.

### Shortcut Actions in Text Mode

Oxygen XML Editor plugin includes numerous shortcut actions to help you edit content in the **Text** editing mode.

#### Undo/Redo Actions

The typical undo and redo actions are available with shortcuts or in the **Edit** menu:

- **Undo** (*Ctrl + Z (Command + Z on OS X)*)
  
  Reverses a maximum of 200 editing actions to return to the preceding state.

  **Note:** Complex operations such as **Replace All** or **Indent selection** count as single undo events.

- **Redo** (*Ctrl + Y (Command + Shift + Z on OS X, Ctrl + Shift + Z on Linux/Unix)*)
  
  Recreates a maximum of 100 editing actions that were undone by the **Undo** function.

#### Copy and Paste Actions

The typical copying and pasting actions are available with shortcuts or in the contextual menu (or the **Edit** menu):

- **Cut** (*Ctrl + X (Command + X on OS X)*)
  
  Removes the current selected content from the document and places it in the clipboard.

- **Copy** (*Ctrl + C (Command + C on OS X)*)
  
  Places a copy of the current selected content in the clipboard.

- **Paste** (*Ctrl + V (Command + V on OS X)*)
  
  Inserts the current clipboard content into the document at the cursor position.

- **Select All** (*Ctrl + A (Command + A on OS X)*)
  
  Selects the entire content of the current document.
Moving XML Nodes

You can use the following shortcuts to move XML elements or XSLT variables up or down in **Text** mode:

- **Ctrl + Alt + UpArrow** (**Command + Alt + UpArrow on OS X**)
  - Moves the node up one line.
- **Ctrl + Alt + DownArrow** (**Command + Alt + DownArrow on OS X**)
  - Moves the node down one line.

**Note:** The requirements for these node moving actions to work are as follows:

- The mechanism is designed to work without a selection. If you use these actions on a selection of content, it moves the entire selection. To make this mechanism work as intended, simply position the cursor somewhere on the line that you want to move.
- A start tag must be the first text occurrence on the line where the cursor is positioned.
- On the line where the element ends, only whitespaces are allowed after the end tag.

Miscellaneous Shortcut Actions in Text Mode

Oxygen XML Editor plugin also includes the following other miscellaneous shortcut actions in **Text** mode:

- **Ctrl + Delete** (**Command + Delete on OS X**)
  - Deletes the next word.
- **Ctrl + Backspace** (**Command + Backspace on OS X**)
  - Deletes the previous word.
- **Ctrl + W** (**Command + W on OS X**)
  - Cuts the previous word.
- **Ctrl + K** (**Command + K on OS X**)
  - Cuts to end of line.
- **Ctrl + Single-Click** (**Command + Single-Click on OS X**)
  - Use this shortcut to open any of the following:
    - Any absolute URL (URLs that have a protocol), regardless of their location in the document.
    - URI attributes such as: `schemaLocation`, `noNamespaceSchemaLocation`, `href` and others.
• Processing instructions used for associating resources, xml-models, xml-stylesheets.

**Ctrl + Shift + Y (Command + Shift + Y on OS X) (Document > Edit > Toggle Line Wrap)**

Enables or disables line wrapping. When enabled, if text exceeds the width of the displayed editor, content is wrapped so that you do not have to scroll horizontally.

**Editing XML Markup in Text Mode**

Oxygen XML Editor plugin includes some useful actions that allow you to easily edit XML markup in Text mode. These actions are available in the **Refactoring** submenu of the contextual menu, and many of the actions can also be done with simple keyboard shortcuts.

**Using the Breadcrumb**

A breadcrumb on the top stripe indicates the path from the document root element to the current element. It can also be used as a helpful tool to insert and edit specific elements in the document structure.

*Figure 38: Breadcrumb in Text Mode*

The last element listed in the breadcrumb is the element at the current cursor position. Clicking an element in the breadcrumb selects the entire element in the editor area. Also, each element provides a contextual menu with access to the following actions:

- **Append Child**
  
  Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it as a child of the current element.

- **Insert Before**
  
  Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it immediately before the current element, as a sibling.

- **Insert After**
  
  Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it immediately after the current element, as a sibling.

- **Edit Attributes**
  
  Opens an editing window that allows you to edit the attributes of the currently selected element.
Toggle Comment

Encloses the currently selected element in an XML comment, if the element is not already commented. If it is already commented, this action will remove the comment.

Cut

Removes the selected element and copies it to the clipboard.

Copy

Copies the selected element to the clipboard.

Delete

Deletes the currently selected element.

Move Nodes

You can easily move XML nodes in the current document by using the following shortcut keys:

Alt + UpArrow

Moves the current node or selected nodes in front of the previous node.

Alt + DownArrow

Moves the current node or selected nodes after the subsequent node.

Rename Elements

You can rename elements by using the following actions in the Refactoring submenu of the contextual menu:

 Rename Element

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the Rename dialog box.

 Rename Prefix (Alt + Shift + P (Command + Shift + P on OS X))

The prefix of the element from the cursor position, and any elements with the same prefix, can be renamed according with the options from the Rename dialog box.

• If you select the Rename current element prefix option, the application will recursively traverse the current element and all its children. For example, to change the xmlns:p1="ns1" association in the current element to xmlns:p5="ns1", if the xmlns:p1="ns1" association is applied on the parent element, then Oxygen XML Editor plugin will introduce xmlns:p5="ns1" as a new declaration in the current element and will change the prefix from p1 to p5. If p5 is already associated with
another namespace in the current element, then the conflict will be displayed in a
dialog box. By pressing OK, the prefix is modified from \texttt{p1} to \texttt{p5} without inserting
a new declaration.

• If you select the \textbf{Rename current prefix in all document} option, the application will
apply the change on the entire document.
• To also apply the action inside attribute values, select the \textbf{Rename also attribute
values that start with the same prefix} checkbox.

\textbf{Surround Content with Tags (Wrap)}

You can surround a selection of content with tags (wrap the content) by using the following action in the \textit{Refactoring} submenu of the contextual menu:

\textbullet \textbf{Surround with Tags (Alt + Shift + E)}

Allows you to choose a tag that encloses a selected portion of content. If there is no
selection, the start and end tags are inserted at the cursor position.

• If the \textbf{Position cursor between tags} option (page 101) is selected in the \textit{Content
Completion} preferences page, the cursor is placed between the start and end tag.
• If the \textbf{Position cursor between tags} option (page 101) is not selected in the \textit{Content
Completion} preferences page, the cursor is placed at the end of the start tag, in an
insert-attribute position.

\textbullet \textbf{Surround with \texttt{[tag]}} (Alt + Shift + ForwardSlash)

Surround the selected content with the last tag used.

\textbf{Surround with \texttt{ <![CDATA[ ]>}} (Alt + Shift + C (Command + Alt + C on OS X))

Surround the selected content with a \texttt{CDATA} tag so that the parser will interpret it as
textual data rather than markup.

\textbf{Unwrap the Content of Elements}

You can unwrap the content of an element by using the following action in the \textit{Refactoring} submenu
of the contextual menu:

\textbullet \textbf{Delete element tags (Alt + Shift + Comma)}

Deletes the start and end tag of the current element.
Join or Split Elements

You can join or split elements in the current document by using the following actions in the Refactoring submenu of the contextual menu:

- **Join elements (Alt + Shift + F (Command + Alt + F on OS X))**
  
  Joins the left and right elements relative to the current cursor position. The elements must have the same name, attributes, and attributes values.

- **Split element**
  
  Split the element from the cursor position into two identical elements. The cursor must be inside the element.

Other Refactoring Actions

You can also manage the structure of the markup by using the other specific XML refactoring actions that are available in the Refactoring submenu of the contextual menu:

**Attributes Refactoring Actions**

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

- **Add/Change attribute**
  
  Allows you to change the value of an attribute or insert a new one.

- **Convert attribute to element**
  
  Allows you to change an attribute into an element.

- **Delete attribute**
  
  Allows you to remove one or more attributes.

- **Rename attribute**
  
  Allows you to rename an attribute.

- **Replace in attribute value**
  
  Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

**Comments Refactoring Actions**

Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

- **Delete comments**
Allows you to delete comments found inside one or more elements.

**Elements Refactoring Actions**

Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

**Delete element**

Allows you to delete elements.

**Delete element content**

Allows you to delete the content of elements.

**Insert element**

Allows you to insert new elements.

**Rename element**

Allows you to rename elements.

**Unwrap element**

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

**Wrap element**

Allows you to surround elements with element tags.

**Wrap element content**

Allows you to surround the content of elements with element tags.

**Fragments Refactoring Actions**

Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

**Insert XML fragment**

Allows you to insert an XML fragment.

**Replace element content with XML fragment**

Allows you to replace the content of elements with an XML fragment.

**Replace element with XML fragment**

Allows you to replace elements with an XML fragment.

Folding XML Elements in Text Mode

When working with a large document, the folding (page 2706) support in Oxygen XML Editor plugin can be used to collapse some element content leaving only those that you need to edit in focus. Expanding and collapsing works on individual elements. Expanding an element leaves the child elements unchanged.

**Figure 39: Folding of XML Elements in Text Mode**

Folding Actions in Text Mode

Element folds are marked with a small icon (≡/≡) in the left stripe. To toggle the fold, simply click the icon. Also, if you right-click the icon, the following actions are available in the Folding sub-menu:

- **Toggle Fold**
  Toggles the state of the current fold.

- **Collapse Other Folds (Ctrl + NumPad/ (Command + NumPad/ on OS X))**
  Folds all the elements except the current element.

- **Collapse Child Folds (Ctrl + NumPad- (Command + NumPad- on OS X))**
  Folds the child elements that are indented one level inside the current element.
Expand Child Folds (Ctrl + NumPad+ (Command + NumPad+ on OS X))

Unfolds all child elements of the currently selected element.

Expand All (Ctrl + NumPad* (Command + NumPad* on OS X))

Unfolds all elements in the current document.

For more information about the folding support in Oxygen XML Editor plugin, watch our video demonstration:

https://www.youtube.com/embed/eR9HfN_peAE

Drag and Drop in Text Mode

To move a whole region of text to other location in the same edited document, just select the text, drag the selection by holding down the left mouse button and drop it to the target location.

You can also copy content from other applications and paste it into the document.

Selecting Content in Text Mode

Oxygen XML Editor plugin includes a variety of keyboard shortcuts that allow you to select content in Text mode. These include numerous standard continuous selection possibilities that are common to many text editors.

Standard Continuous Selection Shortcuts

Ctrl + A (Meta + A on Mac OS X)

Selects all content in the document.

Shift + Left/Right Arrow Keys

Begins a continuous selection at the cursor position and extends it one character at a time in the direction that you press the arrow keys.

Shift + Up/Down Arrow Keys

Begins a continuous selection at the cursor position and extends it one line at a time in the direction that you press the arrow keys.

Ctrl + Shift + Left/Right Arrow Keys (Meta + Shift + Left/Right Arrow Keys on Mac OS X)

Begins a continuous selection at the cursor position and extends it one word at a time in the direction that you press the arrow keys.

Shift + Home
Begins a continuous selection at the cursor position and extends it to the beginning of the current line (on Mac OS X, it extends to the beginning of the document).

**Shift + End**

Begins a continuous selection at the cursor position and extends it to the end of the current line (on Mac OS X, it extends to the end of the document).

**Ctrl + Shift + Home**

Begins a continuous selection at the cursor position and extends it to the beginning of the document.

**Ctrl + Shift + End**

Begins a continuous selection at the cursor position and extends it to the end of the document.

**Shift + PageUp**

Begins a continuous selection at the cursor position and extends it up one screen page.

**Shift + PageDown**

Begins a continuous selection at the cursor position and extends it down one screen page.

**Double-Click**

Selects certain text, depending on the position of the click in the document. See Smart Editing: Double-Click *(page 617)* for the specifics.

**Triple-Click**

Selects entire regions of text, depending on the position of the click in the document. See the Smart Editing: Triple-Click *(page 618)* for the specifics.

**Right-Click > Select > Element**

Selects the entire element at the current cursor position.

**Right-Click > Select > Content**

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

**Right-Click > Select > Attributes**

Selects all the attributes of the element at the current cursor position.

**Right-Click > Select > Parent**

Selects the entire parent element at the current cursor position.
Content Completion Assistant in Text Mode

Oxygen XML Editor plugin includes an intelligent Content Completion Assistant (page 2704) that offers rapid, inline identification and insertion of structured language elements, attributes, and attribute values. Oxygen XML Editor plugin shows the available entries that are valid in the current editing context.

The Content Completion Assistant is enabled by default. To disable it, open the Preferences dialog box (page 55), go to Editor > Content Completion, and deselect the Enable content completion option (page 101).

Using the Content Completion Assistant in Text Mode

The feature is activated in Text mode in the following situations:

- After you press the `<` character when inserting an element, it is automatically activated after a short delay. You can adjust the activation delay with the Activation delay of the proposals window (ms) option (page 102) from the Content Completion preferences page.
- After typing a partial element or attribute name, you can manually activate it by pressing Ctrl + Space (Command + Space on OS X) or Alt + ForwardSlash (Command + Alt + ForwardSlash on...
OS X). If there is only one valid proposal at the current location, it is inserted without displaying the list of proposals.

You can navigate through the list of proposals by using the Up and Down keys on your keyboard. In some cases, the Content Completion Assistant displays a documentation window with information about the particular proposal and some of them have links to additional information (for example, DITA elements might have a link to the DITA Style Guide). You can also change the size of the documentation window by dragging its top, right, and bottom borders.

To insert the selected proposal in Text mode, do one of the following:

- Press Enter or Tab to insert both the start and end tags and position the cursor inside the start tag in a position suitable for inserting attributes.
- Press Ctrl + Enter (Command + Enter on OS X) to insert both the start and end tags and position the cursor between the tags in a position where you can start typing content.

Note: When the DTD, XML Schema or RELAX NG schema specifies required child elements for the newly added element, they are inserted automatically only if the Add Element Content option (page 101) (in the Content Completion preferences page) is selected. The Content Completion Assistant can also add optional content and first choice particle, as specified in the DTD, XML Schema, or RELAX NG schema. To activate these features, select the Add optional content (page 101) and Add first Choice particle (page 101) options in the Content Completion preferences page.

After inserting an element, the cursor is positioned:

- Before the > character of the start tag, if the element allows attributes, to allow rapid insertion of any of the attributes supported by the element. Pressing the space bar displays the Content Completion list once again. This time it contains the list of allowed attribute names.
  
  If the attribute supports a fixed set of parameters, the assistant list displays the list of valid parameters. If the parameter setting is user-defined and therefore variable, the assistant is closed to allow manual insertion. The values of the attributes can be learned from the same elements in the current document.
- After the > character of the start tag, if the element has no attributes.

Where the Content Completion Assistant is Displayed

The Content Completion Assistant is displayed:

- Anywhere within a tag name or at the beginning of a tag name in an XML document, XML Schema, DTD, or Relax NG (full or compact syntax) schema.
- Anywhere within an attribute name or at the beginning of an attribute name in any XML document with an associated schema.
• Within attribute values or at the beginning of attribute values in XML documents where lists of possible values have been defined for that element in the schema associated with the document.

Types of Proposals Listed in the Content Completion Assistant

The following things are considered for determining the proposals that are listed in the content completion window:

Element Structure Specified in DTD or Schema

The proposals that populate the Content Completion Assistant depend on the element structure specified in the DTD, XML Schema, Relax NG (full or compact syntax) schema, or NVDL schema associated with the edited document.

Note: The Content Completion Assistant is able to offer elements defined both by XML Schemas version 1.0 and 1.1.

Current Cursor Position

The number and type of elements displayed by the Content Completion Assistant is dependent on the cursor's current position in the structured document. The child elements displayed within a given element are defined by the structure of the specified DTD, XML Schema, Relax NG (full or compact syntax) schema, or NVDL schema.

Unique ID Attribute Values

A schema may declare certain attributes as ID or IDREF/IDREFS. When the document is validated, Oxygen XML Editor plugin checks the uniqueness and correctness of the ID attributes. It also collects the attribute values declared in the document to prepare the list of proposals. This is available for documents that use DTD, XML Schema, and Relax NG schemas.

Values for xml:id Attributes

Values of all the xml:id attributes are handled as ID attributes. They are collected and displayed by the Content Completion Assistant as possible values for anyURI attributes defined in the schema of the edited document. This works only for XML Schema and Relax NG schemas.

Links/References in DITA

When entering values for the various types of links and references in DITA (for example, values for href or conref elements), the Content Completion Assistant will propose potential targets when you use the forward slash key (/).

ID Values for DITA Key References

In DITA, when inserting key references (keyref) or content key references (conkeyref), the ID values that are defined in the key reference are presented as possible targets.
The Content Completion Assistant will only propose targets that are valid in the current context.

**Element and Attribute Values**

For documents that use an XML Schema or Relax NG schema, the Content Completion Assistant offers proposals for attribute and element values as long as the allowed values are defined in the schema. Also, if a default value or fixed value is defined in the schema, then that value is offered in the Content Completion Assistant.

Related Information:

- Customizing the Content Completion Assistant (page 2067)

**Schema Annotations in Text Mode**

A schema annotation is a documentation snippet associated with the definition of an element or attribute in a schema. If such a schema is associated with an XML document, the annotations are displayed in:

- The Content Completion Assistant (page 2704).
- A small tooltip window shown when the mouse hovers over an element or attribute.

The schema annotations support is available if the schema type is one of the following:

- XML Schema
- Relax NG
- NVDL schema
- DTD

This feature is enabled by default, but you can disable it by deselecting the Show annotations in Content Completion Assistant (page 103) option in the Annotations preferences page.

**Styling Annotations with HTML**

You can use HTML format in the annotations you add in an XML Schema or Relax NG schema. This improves the visual appearance and readability of the documentation window displayed when editing XML documents validated against such a schema. An annotation is recognized and displayed as HTML if it contains at least one HTML element (such as div, body, p, br, table, ul, or ol).

The HTML rendering is controlled by the Show annotations using HTML format, if possible (page 103) option in the Annotations preferences page. When this option is deselected, the annotations are
converted and displayed as plain text and if the annotation contains one or more HTML tags (p, br, ul, li), they are rendered as an HTML document loaded in a web browser. For example, p begins a new paragraph, br breaks the current line, ul encloses a list of items, and li encloses an item of the list.

Collecting Annotations from XML Schemas

In an XML Schema, the annotations are specified in an <xs:annotation> element like this:

```xml
<xs:annotation>
  <xs:documentation>
    Description of the element.
  </xs:documentation>
</xs:annotation>
```

If an element or attribute does not have a specific annotation, then Oxygen XML Editor plugin looks for an annotation in the type definition of that element or attribute.

Collecting Annotations from Relax NG Schemas

For Relax NG schema, element and attribute annotations are made using the <documentation> element from the http://relaxng.org/ns/compatibility/annotations/1.0 namespace like this:

```xml
<define name="person" >
  <element name="person">
    <a:documentation xmlns:a="http://relaxng.org/ns/compatibility/annotations/1.0">
      Information about a person.
    </a:documentation>
    <ref name="name"/>
    <zeroOrMore>
      <ref name="email"/>
    </zeroOrMore>
  </element>
</define>
```

However, any element outside the Relax NG namespace (http://relaxng.org/ns/structure/1.0) is handled as annotation and the text content is displayed in the annotation window. To activate this behavior, select the Use all Relax NG annotations as documentation (page 104) option in the Annotations preferences page.

Collecting Annotations from Relax NG Compact Syntax Schemas

For Relax NG Compact Syntax schema, annotations are made using comments like this:
Collecting Annotation from DTDs

For DTD, Oxygen XML Editor plugin defines a custom mechanism for annotations using comments enabled by the Prefer DTD comments that start with "doc:" as annotations (page 103) option in the Annotations preferences page. The following is an example of a DTD annotation:

```xml
<!--doc:Description of the element. -->
```

Content Completion Helper Views

Information about the current element being edited is also available in various dockable views, such as the Model view (page 263), Attributes view (page 261), Elements view (page 265), and Entities view (page 266). By default, they are located on the right-hand side of the main editor window. These views, along with the powerful Outline view (page 257), provide spatial and insight information about the edited document and the current element. If any particular view is not displayed, it can be opened by selecting it from the Window > Show View menu.

Model View

The Model view presents the structure of the currently selected tag, and its documentation, defined as annotation in the schema of the current document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

Figure 41: Model View
The Model view is comprised of two sections, an element structure panel and an annotations panel.

**Element Structure Panel**

The element structure panel displays the structure of the currently edited or selected tag in a tree-like format. The information includes the name, model, and attributes of the current tag. The allowed attributes are shown along with imposed restrictions, if any.

*Figure 42: Element Structure Panel*
Annotation Panel

The Annotation panel displays the annotation information for the currently selected element. This information is collected from the XML schema.

Figure 43: Annotation panel

Attributes View in Text Mode

The Attributes view presents all the attributes of the current element determined by the schema of the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the Window > Show View menu.

You can use the Attributes view to insert attributes, edit their values, or add values to existing attributes.

The attributes are rendered differently depending on their state:

- The names of the attributes are rendered with a bold font, and their values with a plain font.
- Default values are rendered with a plain font, painted gray.
- Empty values display the text “[empty]”, painted gray.
- Invalid attributes and values are painted red.
To edit the value of the corresponding attribute, double-click a cell in the **Value** column. If the possible values of the attribute are specified as **list** in the schema of the edited document, the **Value** column acts as a combo box that allows you to either select the value from a list or manually enter it.

You can sort the attributes table by clicking the **Attribute** column header. The table contents can be sorted as follows:

- By attribute name in ascending order.
- By attribute name in descending order.
- Custom order, where the used attributes are displayed at the beginning of the table sorted in ascending order, followed by the rest of the allowed elements sorted in ascending order.

**Figure 44: Attributes View**

![Attributes View](image)

**Contextual Menu Actions in the Attributes View**

The following actions are available in the contextual menu of the **Attributes** view when editing in **Text** mode:

**Add**

Allows you to insert a new attribute. Adding an attribute that is not in the list of all defined attributes is not possible when the **Allow only insertion of valid elements and attributes** (*page 128*) schema-aware option is selected.

**Set empty value**

Specifies the current attribute value as empty.

**Remove**

Removes the attribute (action available only if the attribute is specified). You can invoke this action by pressing the **(Delete)** or **(Backspace)** keys.
Copy

Copies the `attrName="attrValue"` pair to the clipboard. The `attrValue` can be:

- The value of the attribute.
- The value of the default attribute, if the attribute does not appear in the edited document.
- Empty, if the attribute does not appear in the edited document and has no default value set.

Paste

Depending on the content of the clipboard, the following cases are possible:

- If the clipboard contains an attribute and its value, both of them are introduced in the **Attributes** view. The attribute is selected and its value is changed if they exist in the **Attributes** view.
- If the clipboard contains an attribute name with an empty value, the attribute is introduced in the **Attributes** view and you can start editing it. The attribute is selected and you can start editing it if it exists in the **Attributes** view.
- If the clipboard only contains text, the value of the selected attribute is modified.

Elements View in Text Mode

The **Elements** view presents a list of all defined elements that are valid at the current cursor position according to the schema associated to the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Double-clicking any of the listed elements inserts that element into the edited document, at the current cursor position. Pressing **F2** with an element selected will display information about that particular element.

*Figure 45: Elements View in Text Mode*
Entities provide abbreviated entries that can be used in XML files when there is a need of repeatedly inserting certain characters or large blocks of information. An entity is defined using the ENTITY statement either in the DOCTYPE declaration or in a DTD file associated with the current XML file.

There are three types of entities:

- **Predefined** - Entities that are part of the predefined XML markup (`&lt`, `&gt`, `&amp`, `&apos`, `&quot`).
- **Internal** - Defined in the DOCTYPE declaration header of the current XML.
- **External** - Defined in an external DTD module included in the DTD referenced in the XML DOCTYPE declaration.

**Note**: If you want to add internal entities, you would need to switch to the Text editing mode and manually modify the DOCTYPE declaration. If you want to add external entities, you need to open the DTD module file and modify it directly.

The Entities view displays a list with all entities declared in the current document, as well as built-in ones. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Double-clicking one of the entities will insert it at the current cursor position in the XML document. You can also sort entities by name and value by clicking the column headers.

*Figure 46: Entities View*
The view features a filtering capability that allows you to search an entity by name, value, or both. Also, you can choose to display the internal or external entities.

**Note:** When entering filters, you can use the `?` and `*` wildcards. Also, you can enter multiple filters by separating them with a comma.

### Code Templates

Code templates are code fragments that can be inserted quickly at the current editing position. Oxygen XML Editor plugin includes a set of built-in code templates for CSS, Schematron, XSL, XQuery, JSON, and XML Schema document types. You can also define your own code templates for any type of file and share them with others.

Code templates are displayed with a `••` symbol in the content completion list (Enter in Author mode or Ctrl + Space (Command + Space on OS X) in Text mode). Also, in Text mode you can press Ctrl + Shift + Space to see a complete list of the available code templates. To enter the code template at the cursor position, select it from the content completion list or type its code and press Enter. If a shortcut key has been assigned to the code template, you can also use the shortcut key to enter it.

### How to Create Code Templates

To create a code template, follow these steps:

1. Open the Preferences dialog box  (page 55) and go to Editor > Templates > Code Templates.
2. Click New to open a code template configuration dialog box.
Tip: You can use one of the existing code templates as a starting point by selecting that template and clicking **Duplicate**.

Figure 47: Code Template Configuration Dialog Box

3. Configure your template using the fields in the code template configuration dialog box:
   - **Name** - The name of the code template.
   - **Description** - [Optional] The description of the code template that will appear in the Code Templates preferences page and in the tooltip message when selecting it from the Content Completion Assistant (page 2704). HTML markup can be used for better rendering.
   - **Associate with** - You can choose to set the code template to be associated with a specific type of editor or for all editor types.
   - **Shortcut key** - [Optional] If you want to assign a shortcut key that can be used to insert the code template, place the cursor in the Shortcut key field and press the desired key combination on your keyboard. Use the Clear button if you make a mistake. If the Enable platform-independent shortcut keys checkbox is selected, the shortcut is platform-independent and the following modifiers are used:
     - $\text{M}_1$ represents the Command key on MacOS X, and the Ctrl key on other platforms.
     - $\text{M}_2$ represents the Shift key.
     - $\text{M}_3$ represents the Option key on MacOS X, and the Alt key on other platforms.
     - $\text{M}_4$ represents the Ctrl key on MacOS X, and is undefined on other platforms.
   - **Content** - Text box where you define the content that is used when the code template is inserted. An editor variable (page 201) can be inserted in the text box using the Insert Editor Variables button.

4. Click **OK** to save your new code template.

Result: Your code template can now be selected using the Content Completion Assistant (page 2704) (Enter in Author mode or Ctrl + Space (Command + Space on OS X) in Text mode). The code templates are displayed with a .tm symbol.
How to Share Code Templates

There are two ways to easily share all of your code templates with other members of your team:

Method 1: Export/Import

1. Open the Preferences dialog box (page 55) and go to Editor > Templates > Code Templates.
2. Click the Export button to export all of your code templates into an XML file.
3. Save the XML file.
4. Share the XML file with other members of your team.
5. Instruct them to open the Preferences dialog box (page 55), go to Editor > Templates > Code Templates, click the Import button, and select the file you sent them.

Result: The code templates will be now available in their content completion list.

Method 2: Share Project

1. Open the Preferences dialog box (page 55) and go to Editor > Templates > Code Templates.
2. Select Project Options at the bottom of the dialog box. This stores the preferences in the project file (.xpr).
3. Share the project file with the other members of your team. For example, you can commit it to your version control system and have them update their working copy.

Result: When they open the updated project file in their Navigator view (page 250), the code templates will be available in their content completion list.

Tip: It is also possible to configure certain actions that function similar to code templates and add them to the content completion list (page 2067) for a particular framework. You could then share the whole framework (page 2086) with other members of your team.

Text Mode Views

There is a variety of dockable (page 2705) helper views that are displayed by default in Text mode. There are also a large selection of additional views available in the Window > Show View menu. This section presents some of the most helpful views for editing in Text mode.

Navigator View

The Navigator view is designed to assist you with organizing and managing related files grouped in the same XML project. The actions available in the contextual menu and on the toolbar associated
to this panel allows you to create XML projects and provide shortcuts to various operations for the project documents.

**Tip:** You can also use the Project Explorer view for many of the same purposes as the Navigator view.

![Navigator View](image)

By default, the view is positioned on the left side of the Oxygen XML Editor plugin window, above the Outline view. If the view has been closed, it can be reopened at any time from the Window > Show View menu (the Project Explorer view is in the Other submenu).

### Project View Toolbar

The following actions are grouped in the upper right corner:

- **Collapse All**

  Collapses all project tree folders. You can also collapse/expand a project tree folder if you select it and press the Enter key or Left Arrow to collapse and Right Arrow to expand.

- **Link with Editor**

  When selected, the project tree highlights the currently edited file, if it is found in the project files.

  **Note:** This button is disabled automatically when you move to the Debugger perspective.

### View Menu
Drop-down menu that contains various settings contributed by the Eclipse plugin.

File Explorer Area

The rest of the view is basically a file explorer similar to most other commonly used file explorers. The XML project (.xpr file) is a logical container with a collection of resources (folders and files). The types of resources displayed include:

- **Logical folders with Linked folders/files** - This folder type is used as containers for linked resources (shortcuts). The icons for file shortcuts include a shortcut symbol (🔗). The linked folders/files are added using **New > Folder > Advanced** or **New > File > Advanced**, or by dragging and dropping files/folders from the view or the system file explorer. ✗ **Delete** can be used to remove them from the project.

- **Physical folders and files** - Marked with the operating system-specific icon for folders (usually a yellow icon on Windows and a blue icon on Mac OS X). These folders and files are mirrors of real folders or files that exist in the local file system. They are created or added to the project by using contextual menu actions (such as **New > File**, **New > Folder**, **Copy**, and **Paste**) or by dragging and dropping files/folders from the view or the system file explorer. Also, the contextual menu action ✗ **Delete** can be used to remove them from the project and local file system.

![Figure 49: Navigator View with Both Types of Resources](image)

Creating New Projects

The following actions are available from the **New** menu when right-clicking any item, or the **File > New** menu:

- **XML Project**
Opens the **New XML Project** dialog box that allows you to create a new project and adds it to the project structure in the **Navigator** view.

**Sample XML Project**

Opens the **New sample XML project** dialog box that allows you to customize sample resources in a new project and adds it to the project structure in the **Navigator** view.

**Managing Project Contents**

There are various contextual menu actions, shortcuts, and ways to organize the folders and files inside the project:

**Creating New Folders and Files**

- **Right-click any item > New > File**
  
  Opens a **New Document Wizard** *(page 550)* that helps you create a new file and adds it to the project structure.

- **Right-click any item > New > New from Templates**
  
  Opens a wizard where you can **create a new document based on a template** *(page 554)* and adds it to the project structure.

- **Right-click any item > New > Folder**
  
  Opens a **New Folder** dialog box that allows you to specify a name for a new folder and adds it to the structure of the project.

**Adding Resources**

You can add resources by using drag and drop (or **Copy** and **Paste**) actions from within the **Navigator** view or dragging them from the system file explorer. Files may have multiple instances within the folder system, but cannot appear twice within the same folder.

**Removing Folders and Files**

To remove logical folders or the linked resources inside them from the project, use **Delete** from the contextual menu (or press **Delete** on your keyboard) and confirm by clicking **OK** in the resulting dialog box.

To remove folders or files from both the project and the local file system, use **Delete** from the contextual menu (or press **Delete** on your keyboard) and confirm by clicking **OK** in the resulting dialog box.

**Moving Folders and Files**
You can move the resources by using drag and drop actions from within the **Navigator** view.

You can also use the usual ⌁ Copy and ⌘ Paste actions (or the Move action) from the contextual menu to move resources in the project.

You can also move certain types of files (such as XML, XML Schema, Relax NG, WSDL, and XSLT) by using the Refactoring > Move resource action from the contextual menu. This action opens the **Move resource** dialog box that includes the following options:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - Select this option to update the references to the resource you are moving, based upon the selected scope. You can select or configure the scope (page 904) by using the button.

### Renaming Folders and Files

There are several ways to rename a folder or file in the project (this works for both physical and linked resources):

- Select Rename from the contextual menu.
- Press F2 on your keyboard.

You also can rename certain types of files (such as XML, XML Schema, Relax NG, WSDL, and XSLT) by using the Refactoring > Rename resource action from the contextual menu. This action opens the **Rename resource** dialog box that includes the following options:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references of the renamed resource** - Select this option to update the references to the resource you are renaming. You can select or configure the scope (page 904) by using the button.

### Opening Files

There are several ways to open a file:

- Double-click the file.
- Select it and press Enter on your keyboard.
• Right-click the file and select Open.
• Drag the file from the project tree and drop it in the editor area.
• If you want to choose the application or location where to open it, you can right-click the file and select Open with.

Saving the Project

The project file is automatically saved every time the content of the Navigator view is saved or modified by actions such as adding or removing files and drag and drop.

Other Contextual Menu Actions

Numerous other actions are available in the contextual menu, depending on the type of file or folder where it is invoked from (some actions are available for multiple selected files):

Refactoring submenu

Oxygen XML Editor plugin includes some refactoring operations that help you manage the structure of your documents. The following actions are available from the contextual menu in the Refactoring submenu:

rename resource (Available for certain types of XML documents)

Opens the Rename resource dialog box (page 579) where you can change the name of a resource. It also includes an option to update the references to the renamed resource and you can choose between various scopes for the operation.

move resource (Available for certain types of XML documents)

Opens the Move resource dialog box (page 579) where you can choose a destination and change the name of a resource. It also includes an option to update the references to the moved resource and you can choose between various scopes for the operation.

XML Refactoring

Opens the XML Refactoring tool wizard (page 913) that presents refactoring operations to assist you with managing the structure of your XML documents.

Show Resource Hierarchy

Opens the Resource Hierarchy/Dependencies view (page 904) that allows you to see the resource hierarchy for an XML document.

Show Resource Dependencies
Opens the Resource Hierarchy/Dependencies view (page 904) that allows you to see the resource dependencies for an XML document.

Refresh

Refreshes the content and the dependencies between the resources in the Master Files directory (page 581).

 XPath in Files

Opens the XPath/XQuery Builder view (page 1902) that allows you to compose XPath and XQuery expressions and execute them over the currently edited XML document.

Check Spelling in Files

Allows you to check the spelling of multiple files. (page 598)

Format and Indent Files

Opens the Format and Indent Files dialog box (page 652) that allows you to configure the format and indent (pretty-print (page 2709)) action that will be applied on the selected documents.

Transform submenu

The currently selected files associated with the Oxygen XML Editor plugin in the Package Explorer view or in the Navigator view can be transformed in one step with one of the following actions available from contextual menu in the Transform submenu:

Apply Transformation Scenario(s)

Obtains the output with one of the built-in scenarios (page 1382).

Configure Transformation Scenario(s)

Opens a dialog box (page 1502) that allows you to configure pre-defined transformation scenarios.

Transform with

Allows you to select a transformation scenario to be applied to the currently selected files.

Validate submenu

The currently selected files associated with the Oxygen XML Editor plugin in the Package Explorer view or in the Navigator view can be checked to be XML well-formed or validated against a schema (DTD, XML Schema, Relax NG, Schematron or NVDL) with one of the following contextual menu actions found in the Validate submenu:

Check Well-Formedness
Checks if the selected file or files are well-formed.

**Validate**

Validates the selected file or files against their associated schema. For EPUB files, this action triggers an EPUB Validate and Check for Completeness (page 1912) operation.

**Validate with Schema**

Validates the selected file of files against a specified schema.

**Configure Validation Scenario(s)**

Allows you to configure and run a validation scenario (page 868).

**Clear Validation Markers**

Clears all the error markers from the main editor and Problems view.

**Generate XML Schema Documentation**

Opens the XML Schema Documentation Dialog Box (page 1076).

**Generate Stylesheet Documentation**

Opens the XSLT Stylesheet Documentation Dialog Box (page 1000).

**Generate XQuery Documentation**

Opens the XQuery Documentation Dialog Box (page 1113).

**Generate WSDL Documentation**

Opens the WSDL Documentation Dialog Box (page 1135).

**Properties**

Displays the properties of the current file in a Properties dialog box.

**Enable Master Files Support (Available from the project container)**

Allows you to enable the Master Files Support (page 582) for each project you are working on.

**Detect Master Files (Available from the project container when Master Files Support is enabled)**

Opens the Detect Master Files wizard (page 582) that enables the automatic detection of master files.

**Add to Master Files (Available when Master Files Support is enabled)**

Adds the selected files to the Master Files folder (page 584).

Outline View in Text Mode
The **Outline** view in **Text** mode displays a general tag overview of the currently edited XML Document. When you edit a document, the **Outline** view dynamically follows the changes that you make, displaying the node that you modify. This functionality gives you great insight on the location of your modifications in the current document. It also shows the correct hierarchical dependencies between elements. This makes it easy for you to be aware of the document structure and the way element tags are nested.

### Outline View Features

The **Outline** view allows you to:

- Quickly navigate through the document by selecting nodes in the **Outline** tree.
- Insert or delete nodes using contextual menu actions.
- Move elements by dragging them to a new position in the tree structure.
- Highlight elements in the editor area. It is synchronized with the editor area, so when you make a selection in the editor area, the corresponding nodes are highlighted in the **Outline** view, and vice versa.
- View document errors, as they are highlighted in the **Outline** view. A tooltip also provides more information about the nature of the error when you hover over the faulted element.

### Outline View Interface

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (such as `*`, `?`) and separate multiple patterns with commas.

It also includes a **View menu** in the top-right corner that presents a variety of options to help you filter the view even further.

### Drop and Drop Actions in the Outline View

Entire XML elements can be moved or copied in the edited document using only the mouse in the **Outline** view with drag-and-drop operations. Several drag and drop actions are possible:

- If you drag an XML element in the **Outline** view and drop it on another node, then the dragged element will be moved after the drop target element.
• If you hold the mouse pointer over the drop target for a short time before the drop then the drop target element will be expanded first and the dragged element will be moved inside the drop target element after its opening tag.

• You can also drop an element before or after another element if you hold the mouse pointer towards the upper or lower part of the targeted element. A marker will indicate whether the drop will be performed before or after the target element.

• If you hold down the (Ctrl (Command on OS X)) key after dragging, a copy operation will be performed instead of a move.

Outline View Filters in Text Mode

The upper part of the Outline view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (such as *, ?) and separate multiple patterns with commas.

The following actions are available in the View menu of the Outline view when editing in Text mode:

Filter returns exact matches

The text filter of the Outline view returns only exact matches.
**Selection update on cursor move**

Controls the synchronization between Outline view and source document. The selection in the Outline view can be synchronized with the cursor moves or the changes in the editor. Selecting one of the components from the Outline view also selects the corresponding item in the source document.

**Flat presentation mode of the filtered results**

When active, the application flattens the filtered result elements to a single level.

**Show comments and processing instructions**

Show/hide comments and processing instructions in the Outline view.

**Show element name**

Show/hide element name.

**Show text**

Show/hide additional text content for the displayed elements.

**Show attributes**

Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from the Outline preferences panel (page 197).

**Configure displayed attributes**

Displays the XML Structured Outline preferences page (page 197).

---

**Outline View Contextual Menu Actions in Text Mode**

The following actions are available from the contextual menu in the Outline view in Text mode:

**Append Child**

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it as a child of the current element.

**Insert Before**

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it immediately before the current element, as a sibling.

**Insert After**

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it immediately after the current element, as a sibling.

**Edit Attributes**
Opens a dialog box that allows you to edit the attributes of the currently selected component.

**Toggle Comment**
Encloses the currently selected element in an XML comment, if the element is not already commented. If it is already commented, this action will remove the comment.

**Cut**
Cuts the currently selected component.

**Copy**
Copies the currently selected component.

**Paste**
Pastes the copied component.

**Delete**
Deletes the currently selected component.

**Expand All**
Expands the structure of a component in the Outline view.

**Collapse All**
Collapses the structure of all the component in the Outline view.

Attributes View in Text Mode

The Attributes view presents all the attributes of the current element determined by the schema of the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the Window > Show View menu.

You can use the Attributes view to insert attributes, edit their values, or add values to existing attributes.

The attributes are rendered differently depending on their state:

- The names of the attributes are rendered with a bold font, and their values with a plain font.
- Default values are rendered with a plain font, painted gray.
- Empty values display the text "[empty]", painted gray.
- Invalid attributes and values are painted red.

To edit the value of the corresponding attribute, double-click a cell in the Value column. If the possible values of the attribute are specified as list in the schema of the edited document, the Value column acts as a combo box that allows you to either select the value from a list or manually enter it.
You can sort the attributes table by clicking the Attribute column header. The table contents can be sorted as follows:

- By attribute name in ascending order.
- By attribute name in descending order.
- Custom order, where the used attributes are displayed at the beginning of the table sorted in ascending order, followed by the rest of the allowed elements sorted in ascending order.

![Attributes View](image)

**Figure 51: Attributes View**

**Contextual Menu Actions in the Attributes View**

The following actions are available in the contextual menu of the Attributes view when editing in Text mode:

**Add**

Allows you to insert a new attribute. Adding an attribute that is not in the list of all defined attributes is not possible when the [Allow only insertion of valid elements and attributes](page 128) schema-aware option is selected.

**Set empty value**

Specifies the current attribute value as empty.

**Remove**

Removes the attribute (action available only if the attribute is specified). You can invoke this action by pressing the **(Delete)** or **(Backspace)** keys.

**Copy**

Copies the `attrName="attrValue"` pair to the clipboard. The `attrValue` can be:
The value of the attribute.
- The value of the default attribute, if the attribute does not appear in the edited document.
- Empty, if the attribute does not appear in the edited document and has no default value set.

**Paste**

Depending on the content of the clipboard, the following cases are possible:

- If the clipboard contains an attribute and its value, both of them are introduced in the **Attributes** view. The attribute is selected and its value is changed if they exist in the **Attributes** view.
- If the clipboard contains an attribute name with an empty value, the attribute is introduced in the **Attributes** view and you can start editing it. The attribute is selected and you can start editing it if it exists in the **Attributes** view.
- If the clipboard only contains text, the value of the selected attribute is modified.

**Model View**

The **Model** view presents the structure of the currently selected tag, and its documentation, defined as annotation in the schema of the current document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

*Figure 52: Model View*
The **Model** view is comprised of two sections, an element structure panel and an annotations panel.

**Element Structure Panel**

The element structure panel displays the structure of the currently edited or selected tag in a tree-like format. The information includes the name, model, and attributes of the current tag. The allowed attributes are shown along with imposed restrictions, if any.

*Figure 53: Element Structure Panel*
Annotation Panel

The Annotation panel displays the annotation information for the currently selected element. This information is collected from the XML schema.

Figure 54: Annotation panel

Elements View in Text Mode

The Elements view presents a list of all defined elements that are valid at the current cursor position according to the schema associated to the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

Double-clicking any of the listed elements inserts that element into the edited document, at the current cursor position. Pressing F2 with an element selected will display information about that particular element.

Figure 55: Elements View in Text Mode
Entities provide abbreviated entries that can be used in XML files when there is a need of repeatedly inserting certain characters or large blocks of information. An entity is defined using the ENTITY statement either in the DOCTYPE declaration or in a DTD file associated with the current XML file.

There are three types of entities:

- **Predefined** - Entities that are part of the predefined XML markup (`, `, `, `, `).
- **Internal** - Defined in the DOCTYPE declaration header of the current XML.
- **External** - Defined in an external DTD module included in the DTD referenced in the XML DOCTYPE declaration.

**Note:** If you want to add internal entities, you would need to switch to the Text editing mode and manually modify the DOCTYPE declaration. If you want to add external entities, you need to open the DTD module file and modify it directly.

The Entities view displays a list with all entities declared in the current document, as well as built-in ones. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

Double-clicking one of the entities will insert it at the current cursor position in the XML document. You can also sort entities by name and value by clicking the column headers.

*Figure 56: Entities View*
The view features a filtering capability that allows you to search an entity by name, value, or both. Also, you can choose to display the internal or external entities.

Note: When entering filters, you can use the ? and * wildcards. Also, you can enter multiple filters by separating them with a comma.

Results View

The Results view displays the messages generated as a result of user actions such as validations, transformations, search operations, and others. Each message is a link to the location related to the event that triggered the message. Double-clicking a message opens the file containing the location and positions the cursor at the location offset. The Results view is automatically opened when certain actions generate result messages.

The actions that contribute messages to this view include:

- **Validation** actions (page 857)
- **Transformation** actions (page 1381)
- **Check Spelling in Files** action (page 598)
- **Search References** action (page 985)
- SQL results (page 1979)

Figure 57: Results View
Results View Toolbar Actions

The view includes a toolbar with the following actions:

- **Grouping Mode toggle options**
  You can choose to group the result messages in a **Hierarchical** or **Flat** arrangement.

- **Next**
  Navigates to the message below the current selection.

- **Previous**
  Navigates to the message above the current selection.

- **Remove selected**
  Removes the current selection from the view. This can be helpful if you want to reduce the number of messages, or remove those that have already been addressed or not relevant to your task.

- **Remove all**
  Removes all messages from the view.

Results View Contextual Menu Actions

The following actions are available when the contextual menu is invoked in this view:

- **Learn Word(s) (Available when spelling errors are reported in the Results view)**
  Adds the word(s) to a list of learned words to instruct the spell checker engine to not report the word(s) as spelling errors in the future.

- **Remove**
  Removes selected messages from the view.

- **Remove all**
Removes all messages from the view.

Copy

Copies information associated with the selected messages. For example:

- The file path of the document that triggered the output message.
- Error severity (error, warning, info message, etc.)
- Name of validating processor.
- The line and column in the file that triggered the message.

Copy Description

Copies the description values for all selected items.

Show message

Opens a dialog box that displays the details of the message.

Save Results

Saves the complete list of messages in a file in text format. For each message, the included details are the same as the ones for the Copy action (page 269).

Save Results as XML

Saves the complete list of messages in a file in XML format. For each message, the included details are the same as the ones for the Copy action (page 269).

Save Results as HTML

Saves the complete list of messages in a file in HTML format. For each message, the included details are the same as the ones for the Copy action (page 269).

Expand All

Available when Hierarchical mode is selected. Expands all the nodes of the tree, which is useful when the messages are presented in a hierarchical mode.

Collapse All

Available when Hierarchical mode is selected. Collapses all the nodes of the tree, which is useful when the messages are presented in a hierarchical mode.

Syntax Highlighting in XML Documents

Oxygen XML Editor plugin supports syntax highlighting in Text mode to make it easier to read the semantics of the structured content by displaying each type of code in different colors and fonts.

To customize the colors or styles used for the syntax highlighting colors for XML files, follow these steps:
1. Open the Preferences dialog box  (page 55).
2. Go to Editor > Syntax Highlight (page 149).
3. Select and expand the XML section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.
5. Select the XML tab in the Preview pane to see the effects of your changes.

**Tip:** Oxygen XML Editor plugin also allows you to specify syntax highlighting colors for specific XML elements and attributes with specific namespace prefixes. This can be done in the Editor > Syntax Highlight > Elements/Attributes by Prefix preferences page (page 150).

### Related Information:
- Customize Syntax Highlight colors (page 149)

## Syntax Highlight Depending on Namespace Prefix

The syntax highlight scheme of an XML file type (page 149) allows the configuration of a color per each type of token that can appear in an XML file. Distinguishing between the XML tag tokens based on the namespace prefix brings additional visual help in editing some XML file types. For example, in XSLT stylesheets, elements from various namespaces (such as XSLT, XHTML, XSL:FO, or XForms) are inserted in the same document and the editor panel can become cluttered. Marking tags with different colors based on the namespace prefix (page 150) allows easier identification of the tags.

**Figure 58: Example of Coloring XML Tags by Prefix**

```xml
<xsl:template match="name">
  <fo:list-item>
    <fo:list-item-label end-indent="label-end()">
      <fo:block text-align="end" font-weight="bold">Full Name:</fo:block>
    </fo:list-item-label>
    <fo:list-item-body start-indent="body-start()">
      <fo:block text-align="start" color="red">
        <xsl:apply-templates select="*"/>
      </fo:block>
    </fo:list-item-body>
  </fo:list-item>
</xsl:template>
```

Presenting Validation Errors in Text Mode

By default, Oxygen XML Editor plugin automatically validates documents (page 856) while editing in the Text mode, and actions are also available to manually validate documents (page 857) on-request.

**Figure 59: Presenting Validation Errors in Text Mode**

![Validation Errors](image)

**Validation Marker Locations**

In Text mode, validation issues are marked in the following locations:

- In the main editing pane, with the issue underlined in a color according to the type of issue.
- In the right-side vertical stripe, with a marker that is colored according to the type of issue.
- For attributes with detected issues, in the Attributes view (page 261), with the attribute and its value colored according to the type of issue.

**Validation Marker Colors**

The colors for each type of issue are as follows:

- **Validation Errors** [Red] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the Attributes view are colored in red.
- **Validation Warnings** [Yellow] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the Attributes view are colored in yellow.
• **Validation Info** [Blue] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the **Attributes** view are colored in blue.

You can configure the colors and how the various types of validation problems are rendered from the Eclipse **Annotations** preferences page (**Window** ('Eclipse' on Mac OSX) > **Preferences** > **General** > **Editors** > **Text Editors** > **Annotations**).

**Validation Markers in the Right-Side Stripe**

Also, the stripe on the right side of the editor panel is designed to display the issues found during the validation process and to help you locate them in the document. The stripe contains the following:

**Upper Part of the Stripe**

A success indicator square will turn green if the validation is successful or only info messages are found, red if validation errors are found, or yellow if only validation warnings are found. More details about the issues are displayed in a tool tip when you hover over indicator square. If there are numerous problems, only the first three are presented in the tool tip.

**Middle Part of the Stripe**

Errors are presented with red markers, warnings with yellow markers, and info message with blue markers. If you want to limit the number of markers that are displayed, open the **Preferences** dialog box (page 55), go to **Editor** > **Document checking**, and specify the desired limit in the **Maximum number of validation highlights** option (page 108).

Clicking a marker will highlight the corresponding text area in the editor. The validation message is also displayed both in a tool tip (when hovering over the marker) and in the message area on the bottom of the application.

**Bottom Part of the Stripe**

Two navigation arrows (←) allow you to jump to the next or previous issue. The same actions can be triggered from **Document** > **Automatic validation** > **Next error** (**Ctrl + Period** (Command + Period on OS X)) and **Document** > **Automatic validation** > **Previous error** (**Ctrl + Comma** (Command + Comma on OS X)).

**Hovering Over Validation Issues**

Hovering over a validation issue presents a tooltip message with more details about the problem and **possible quick fixes** (page 884) (if available for that issue). Also, when hovering over an issue, pressing **F2** will change the focus to the tooltip where you can use **Tab** and **Shift + Tab** to navigate between quick fixes and **Space** to trigger them.
Details About Validation Issues

- Information about the issue is also displayed in the message area on the bottom of the editor panel (clicking the Document checking options button opens the Document Checking preferences page (page 108) where you can configure some validation options.
- Status messages from every validation action are logged in the Console view (page 612) (the Enable Oxygen consoles option (page 161) must be selected in the View preferences page).
- If you want to see all the validation messages grouped in the Results view (page 267), you should use the Validate action from the toolbar or XML menu. This action also collects the validation messages and displays them in the Problems view if the validated file is in the current workspace or in a custom Errors view if the validated file is outside the workspace.

Formatting and Indenting XML Documents

Oxygen XML Editor plugin creates XML documents using several edit modes (page 223). In Text mode (page 223), you as the author decide how the XML file is formatted and indented. In the other modes, and when you switch between modes, Oxygen XML Editor plugin must decide how to format and indent the XML. Oxygen XML Editor plugin will also format and indent your XML for you in Text mode if you use one of the Format and Indent options:

- Document > Source > Format and Indent - Formats and indents the whole document.
- Document > Source > Indent Selection - Indents the current selection (but does not add line breaks). This action is also available in the Source submenu of the contextual menu.
- Document > Source > Format and Indent Element - Formats and indents the current element (the inmost nested element that currently contains the cursor) and its child-elements. This action is also available in the Source submenu of the contextual menu.

A number of settings affect how Oxygen XML Editor plugin formats and indents XML. Many of these settings have to do with how whitespace is handled.
Significant and insignificant whitespace in XML

XML documents are text files that describe complex documents. Some of the white space (spaces, tabs, line feeds, etc.) in the XML document belongs to the document it describes (such as the space between words in a paragraph) and some of it belongs to the XML document (such as a line break between two XML elements). Whitespace belonging to the XML file is called insignificant whitespace. The meaning of the XML would be the same if the insignificant whitespace were removed. Whitespace belonging to the document being described is called significant whitespace.

Knowing when whitespace is significant or insignificant is not always easy. For instance, a paragraph in an XML document might be laid out like this:

```xml
<p>NO Free man shall be taken or imprisoned, or be stripped of his Freedom,
or Liberties, or free Customs, or be outlawed, or exiled, or any otherwise
destroyed; nor will we not pass upon him, nor condemn him, but by lawful
judgment of his Peers, or by the <xref href="http://en.wikipedia.org/wiki/Law_of_the_land" format="html" scope="external">Law of the land</xref>. We will sell to no man, we will not deny to any man either Justice or Right.</p>
```

By default, XML considers a single whitespace between words to be significant, and all other whitespace to be insignificant. The paragraph above could have been written on one line because the XML parser would see it as exactly the same paragraph since all multiple consecutive whitespaces will be replaced with a single whitespace. Removing the insignificant space in markup like this is called normalizing space.

In some cases, all the spaces inside an element should be treated as significant. For example, in a code sample:

```xml
<codeblock>
class HelloWorld
{
    public static void main(String args[])
    {
        System.out.println("Hello World");
    }
}
</codeblock>
```

Here every whitespace character between the codeblock tags should be treated as significant.
How Oxygen XML Editor plugin determines when whitespace is significant

When Oxygen XML Editor plugin formats and indents an XML document, it introduces or removes insignificant whitespace to produce a layout with reasonable line lengths and elements indented to show their place in the hierarchy of the document. To correctly format and indent the XML source, Oxygen XML Editor plugin needs to know when to treat whitespace as significant and when to treat it as insignificant. However it is not always possible to tell this from the XML source file alone. To determine what whitespace is significant, Oxygen XML Editor plugin assigns each element in the document to one of four categories:

**Ignore space**

In the ignore space category, all whitespace is considered insignificant. This generally applies to content that consists only of elements nested inside other elements, with no text content.

**Normalize space**

In the normalize space category, a single whitespace character between character strings is considered significant and all other spaces are considered insignificant. Therefore, all consecutive whitespaces will be replaced with a single space. This generally applies to elements that contain text content only.

**Mixed content**

In the mixed content category, a single whitespace between text characters is considered significant and all other spaces are considered insignificant. However,:

- Whitespace between two child elements embedded in the text is normalized to a single space (rather than to zero spaces as would normally be the case for a text node with only whitespace characters, or the space between elements generally).
- The lack of whitespace between a child element embedded in the text and either adjacent text or another child element is considered significant. That is, no whitespace can be introduced here when formatting and indenting the file.

For example:

```xml
<p>The file is located in <i>HOME</i>/USER/hello.
   This is a <strong>big</strong> deal.</p>
```
In this example, whitespace should not be introduced around the i tags as it would introduce extra significant whitespace into the document. The space between the end \textit{\textless;}/\textit{\textgreater;} tag and the beginning \textit{\textless;emphasize\textgreater;} tag should be normalized to a single space, not zero spaces.

**Preserve space**

In the preserve space category, all whitespace in the element is regarded as significant. No changes are made to the spaces in elements in this category. However, child elements may be in another category, and may be treated differently.

Attribute values are always in the preserve space category. The spaces between attributes in an element tag are always in the default space category.

Oxygen XML Editor plugin consults several pieces of information to assign an element to one of these categories. An element is always assigned to the most restrictive category (from Ignore to Preserve) that it is assigned to by any of the sources Oxygen XML Editor plugin consults. For instance, if the element is named on the Default elements list (as described below) but it has an xml:space="preserve" attribute in the source file, it will be assigned to the preserve space category. If an element has the xml:space="default" attribute in the source, but is listed on the Mixed content elements list, it will be assigned to the mixed content category.

To assign elements to these categories, Oxygen XML Editor plugin consults information from the following sources:

- **xml:space**
  
  If the XML element contains the xml:space attribute, the element is promoted to the appropriate category based on the value of the attribute.

- **CSS whitespace property**
  
  If the CSS stylesheet controlling the Author mode editor applies the \texttt{whitespace: pre} setting to an element, it is promoted to the preserve space category.

- **CSS display property**
  
  If a text node contains only white-spaces:

  - If the node has a parent element with the CSS \texttt{display} property set to \texttt{inline} then the node is promoted to the mixed content category.
  - If the left or right sibling is an element with the CSS \texttt{display} property set to \texttt{inline} then the node is promoted to the mixed content category.
  - If one of its ancestors is an element with the CSS \texttt{display} property set to \texttt{table} then the node is assigned to the ignore space category.
Schema aware formatting

If a schema is available for the XML document, Oxygen XML Editor plugin can use information from the schema to promote the element to the appropriate category. For example:

- If the schema declares an element to be of type `xs:string`, the element will be promoted to the preserve space category because the string built-in type has the whitespace facet with the value preserve.
- If the schema declares an element to be mixed content, it will be promoted to the mixed content category.

Schema aware formatting can be turned on and off.

- To turn it on or off for Author mode, open the Preferences dialog box on page 55, go to Editor > Edit modes > Author > Schema aware, and select/deselect the Schema aware normalization, format and indent option on page 128.
- To turn it on or off for the Text editing mode, open the Preferences dialog box on page 55, go to Editor > Format > XML, and select/deselect the Schema aware format and indent option on page 142.

Preserve space elements list

If an element is listed in the Preserve space tab of the Element Spacing list on page 141 in the XML formatting preferences on page 139, it is promoted to the preserve space category.

Default space elements list

If an element is listed in the Default space tab of the Element Spacing list on page 141 in the XML formatting preferences on page 139, it is promoted to the default space category.

Mixed content elements list

If an element is listed in the Mixed content tab of the Element Spacing list on page 141 in the XML formatting preferences on page 139, it is promoted to the mixed content category.

Element content

If an element contains mixed content, that is, a mix of text and other elements, it is promoted to the mixed content category. (Note that, in accordance with these rules, this happens even if the schema declares the element to have element only content.)

If an element contains text content, it is promoted to the default space category.
Text node content

If a text node contains any non-whitespace characters then the text node is promoted to the normalize space category.

Exception to the Rule

In general, a element can only be promoted to a more restrictive category (one that treats more whitespace as significant). However, there is one exception. In Author mode, if an element is marked as mixed content in the schema, but the actual element contains no text content, it can be demoted to the space ignore category if all of its child elements are displayed as blocks by the associated CSS (that is, they have a CSS property of `display: block`). For example, in some schemas, a section or a table entry can be defined as having mixed content but in many cases they contain only block elements (page 2703). In these cases, any whitespace they contain cannot be significant and they can be treated as space ignore elements. This exception can be turned on or off using the Schema Aware Editing option (page 128) in the Schema-Aware preferences page.

How Oxygen XML Editor plugin formats and indents XML

You can control how Oxygen XML Editor plugin formats and indents XML documents. This can be particularly important if you store your XML document in a version control system, as it allows you to limit the number of trivial changes in spacing between versions of an XML document. The following preference pages include options that control how XML documents are formatted:

- Format preferences page (page 135)
- XML Formatting preferences page (page 139)
- Whitespaces preferences page (page 143)

When Oxygen XML Editor plugin formats and indents XML

Oxygen XML Editor plugin formats and indents a document, or part of it, on the following occasions:

- In Text mode when you select one of the format and indent actions (Document > Source > Format and Indent, Document > Source > Indent Selection, or Document > Source > Format and Indent Element).
- When saving documents in Author mode.
- When switching from Author mode to another mode.
- When saving documents in Design mode.
- When switching from Design mode to another mode.
• When saving or switching to **Text** mode from **Grid** mode, if the **Format and indent when passing from grid to text or on save** option (page 132) is selected in the **Grid** preferences page.

Setting an Indent Size to Zero

Oxygen XML Editor plugin will automatically **format and indent** (page 645) documents at certain times. This includes indenting the content from the margin to reflect its structure. In some cases, you may not want your content indented. To avoid your content being indented, you can set an indent size of zero.

**Note:** Changing the indent size does not override the rules that Oxygen XML Editor plugin uses for handling whitespace when formatting and indenting XML documents. Therefore, changing the indent size will have no effect on elements that require whitespaces to be maintained.

There are two cases to consider.

**Maintaining zero indent in documents with zero indent**

If you have existing documents with zero indent and you want Oxygen XML Editor plugin to maintain a zero indent when editing or formatting those documents:

1. Open the **Preferences** dialog box (page 55) and go to **Editor > Format** (page 135).
2. Select **Detect indent on open**.
3. Select **Use zero-indent if detected**.

Oxygen XML Editor plugin will examine the indent of each document as it is opened and if the indent is zero for all lines, or for nearly all lines, a zero indent will be used when formatting and indenting the document. Otherwise, Oxygen XML Editor plugin will use the indent closest to what it detects in the document.

**Enforcing zero indent for all documents**

If you want all documents to be formatted with zero indent, regardless of their current indenting:

1. Open the **Preferences** dialog box (page 55) and go to **Editor > Format** (page 135).
2. Deselect **Detect indent on open**.
3. Set **Indent size** to 0.

All documents will be formatted and indented with an indent of zero.

**Warning:** Setting the indent size to zero can change the meaning of some file types, such as Python source files.
Format and Indent (Pretty-Print) Multiple Files

Oxygen XML Editor plugin provides support for formatting and indenting (pretty-print) multiple files at once. This action is available for any document in XML format, as well as for XQuery, CSS, JavaScript, and JSON documents.

To format and indent multiple files, use the Format and Indent Files action that is available in the contextual menu of the Navigator view. This opens the Format and Indent Files dialog box that allows you to configure options for the action.

Figure 60: Format and Indent Files Dialog Box

The Scope section allows you choose from the following scopes:

- **All opened files** - The pretty-print is performed in all opened files.
- **Directory of the current file** - All the files in the folder of the current edited file.
- **Project files** - All files from the current project.
- **Selected project files** - The selected files from the current project.
- **Specified path** - The pretty-print is performed in the files located at a specified path.

The Options section includes the following options:

- **File filter** - Allow you to filter the files from the selected scope.
- **Recurse subdirectories** - When selected, the pretty-print is performed recursively for the specified scope. The one exception is that this option is ignored if the scope is set to All opened files.
- **Include hidden files** - When selected, the pretty-print is also performed in the hidden files.
• **Make backup files with extension** - When selected, Oxygen XML Editor plugin makes backup files of the modified files. The default extension is .bak, but you can change the extension as you prefer.

**Quick Assist Support for IDs and IDREFS**

The *Quick Assist support* ([page 2710]) is activated automatically when you place the cursor inside an ID or IDREF in Text mode. To access it, click the yellow bulb help marker placed on the current line, in the line number stripe of the editor. You can also invoke the Quick Assist menu from the contextual menu or by pressing **Ctrl+1** (*Command+1* on Mac OS X) on your keyboard.

The following actions are available:

- **Rename in**
  
  Renames the ID and all its occurrences. Selecting this action opens the Rename XML ID dialog box. This dialog box lets you insert the new ID value and choose the scope of the rename operation ([page 904]). For a preview of the changes you are about to make, click **Preview**. This opens the **Preview** dialog box, which presents a list with the files that contain changes and a preview zone of these changes.

- **Search Declarations**
  
  Searches for the declaration of the ID reference. By default, the scope of this action is the current project. If you configure a scope using the Select the scope for the Search and Refactor operations ([page 904]) dialog box, this scope will be used instead.

- **Search References**
  
  Searches for the references of the ID. By default, the scope of this action is the current project. If you configure a scope using the Select the scope for the Search and Refactor operations ([page 904]) dialog box, this scope will be used instead.

- **Change scope**
  
  Opens the Select the scope for the Search and Refactor operations ([page 904]) dialog box.

- **Rename in File**
  
  Renames the ID you are editing and all its occurrences from the current file.

- **Search Occurrences**
  
  Searches for the declaration an references of the ID located at the cursor position in the current document.

**Related Information:**
Highlight ID Occurrences in Text Mode

To see the occurrences of an ID in an XML document in the Text mode, place the cursor inside the ID declaration or reference. The occurrences are marked in the vertical side bar at the right of the editor. Click a marker on the side bar to jump to the occurrence that it corresponds to. The occurrences are also highlighted in the editing area.

**Note:** Highlighted ID declarations are rendered with a different color than highlighted ID references. To customize these colors or disable this feature, open the Preferences dialog box (page 55) and go to Editor > Mark Occurrences (page 144).

Contextual Menu Actions in Text Mode

When editing XML documents in Text mode, Oxygen XML Editor plugin provides the following actions in the contextual menu (many of them also appear in the submenus of the Document menu):

- **Cut, Copy, Paste**
  
  Executes the typical editing actions on the currently selected content.

- **Copy XPath**
  
  Copies the XPath expression of the current element or attribute (or property for JSON documents) from the current editor to the clipboard.

- **Toggle Comment (Ctrl + Shift + Comma (Command + Shift + Comma on OS X))**
  
  Comments the current selection of the current editor. If the selection already contains a comment the action removes the comment from around the selection. If there is no selection in the current editor and the cursor is not positioned inside a comment the current line is commented. If the cursor is positioned inside a comment then the commented text is uncommented.

**Go to submenu**

This submenu includes the following actions:

- **Go to Matching Tag (Ctrl + Shift + G)**
  
  Moves the cursor to the end tag that matches the start tag, or vice versa.

- **Go after Next Tag (Ctrl + CloseBracket (Command + CloseBracket on OS X))**
Moves the cursor to the end of the next tag.

**Go after Previous Tag (Ctrl + OpenBracket (Command + OpenBracket on OS X))**

Moves the cursor to the end of the previous tag.

**Select submenu**

This submenu allows you to select the following:

- **Element**
  Selects the entire element at the current cursor position.

- **Content**
  Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

- **Attributes**
  Selects all the attributes of the element at the current cursor position.

- **Parent**
  Selects the parent element at the current cursor position.

**Source submenu**

This submenu includes the following actions:

- **Shift Right**
  Shifts the currently selected block to the right.

- **Shift Left**
  Shifts the currently selected block to the left.

- **Indent selection (Ctrl + I (Command + I on OS X))**
  Corrects the indentation of the selected block of lines if it does not follow the current **indenting preferences (page 135)**.

- **Escape Selection**
  Escapes a range of characters by replacing them with the corresponding character entities.

- **Unescape Selection**
  Replaces the character entities with the corresponding characters.

- **Format and Indent Element (Ctrl + Shift + I (Command + Shift + I on OS X))**
Pretty-prints (page 2709) the element that surrounds the current cursor position.

Convert Hexadecimal Sequence to Character (Ctrl + Shift + H (Command + Shift + H on OS X))

Converts a sequence of hexadecimal characters to the corresponding Unicode character (page 602). The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the 0x or 0X prefix. Examples of valid sequences and the characters they will be converted to:

- 0x0045 will be converted to E
- 0x0125 to #
- 265 to #
- 2190 to #

Note: For more information about finding the hexadecimal value of a character, see Finding the Decimal, Hexadecimal, or Character Entity Equivalent (page 609).

Base64 Encode/Decode submenu

This submenu include the following actions for encoding or decoding base 64 schemes:

Import File to Encode and Insert

    Encodes a file and then inserts the encoded content into the current document at the cursor position.

Decode Selection and Export to File

    Decodes a selection of text from the current document and then exports (saves) the result to another file.

Encode Selection

    Replaces a selection of text with the result of encoding that selection.

Decode Selection
Replaces a selection of text with the result of decoding that selection.

**Modify All Matches**

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

**Base32 Encode/Decode submenu**

This submenu include the following actions for encoding or decoding *base32* schemes:

**Import File to Encode and Insert**

Encodes a file and then inserts the encoded content into the current document at the cursor position.

**Decode Selection and Export to File**

Decodes a selection of text from the current document and then exports (saves) the result to another file.

**Encode Selection**

Replaces a selection of text with the result of encoding that selection.

**Decode Selection**

Replaces a selection of text with the result of decoding that selection.

**Modify All Matches**

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.
Hex Encode/Decode submenu

This submenu include the following actions for encoding or decoding hex schemes:

Import File to Encode and Insert

Encodes a file and then inserts the encoded content into the current document at the cursor position.

Decode Selection and Export to File

Decodes a selection of text from the current document and then exports (saves) the result to another file.

Encode Selection

Replaces a selection of text with the result of encoding that selection.

Decode Selection

Replaces a selection of text with the result of decoding that selection.

Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Join and Normalize Lines

For the current selection, this action joins the lines by replacing the line separator with a single space character. It also normalizes the whitespaces by replacing a sequence of such characters with a single space.

Insert XInclude

Displays a dialog box that allows you to browse and select the content to be included and automatically generates the corresponding XInclude instruction.
**Note:** In the **Author** mode, this dialog box presents a preview of the inserted document as an author page in the **Preview** tab and as a text page in the **Source** tab. In the **Text** mode, the **Source** tab is presented.

**Import entities list**

Displays a dialog box that allows you to select a list of files as sources for external DTD entities. The internal subset of the DOCTYPE declaration of your document will be updated with the chosen entities. For instance, choosing the files `chapter1.xml` and `chapter2.xml` inserts the following section in the DOCTYPE:

```xml
<!ENTITY chapter1 SYSTEM "chapter1.xml">
<!ENTITY chapter2 SYSTEM "chapter2.xml">
```

**Canonicalize**

Opens the **Canonicalize** dialog box that allows you to select a canonicalization (page 2704) algorithm to standardize the format of the document.

**Sign**

Opens the **Sign** dialog box that allows you to configure a digital signature for the document.

**Verify Signature**

Allows you to specify the location of a file to verify its digital signature.

**Manage Highlighted Content submenu**

This submenu is available from the contextual menu when it is invoked from a highlight after you perform a search operation or apply an XPath expression that highlights more than one result. The following options are available in this submenu:

**Modify All**

Allows you to modify (in-place) all the occurrences of the selected content. A thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

**Surround All**

Surround the highlighted content with a specific tag. This option opens the **Tag** dialog box. The **Specify the tag** drop-down menu presents all the available elements that you can choose from.
Remove All

Removes all the highlighted content.

Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Go to Definition (Ctrl + Shift + Enter)

Navigates to the definition of the current element or attribute in the schema (DTD, XML Schema, Relax NG schema) associated with the edited XML document. If the current attribute is a ‘type’ belonging to the ‘http://www.w3.org/2001/XMLSchema-instance’ namespace, the cursor is moved in the XML schema to the definition of the type referenced in the value of the attribute. For JSON documents, it navigates to the definition of the current JSON property in the associated JSON Schema.

Refactoring submenu

This submenu includes the following actions:

 Rename Element

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the Rename dialog box.

 Rename Prefix (Alt + Shift + P (Command + Shift + P on OS X))

The prefix of the element from the cursor position, and any elements with the same prefix, can be renamed according with the options from the Rename dialog box.

• If you select the Rename current element prefix option, the application will recursively traverse the current element and all its children. For example, to change the xmlns:p1="ns1" association in the current element to xmlns:p5="ns1", if the xmlns:p1="ns1" association is applied on the parent element, then Oxygen XML Editor plugin will introduce xmlns:p5="ns1" as a new declaration in the current element and will change the prefix from p1 to p5. If p5 is already associated with another namespace in the current element, then the conflict will be displayed in a dialog box. By pressing OK, the prefix is modified from p1 to p5 without inserting a new declaration.
• If you select the **Rename current prefix in all document** option, the application will apply the change on the entire document.
• To also apply the action inside attribute values, select the **Rename also attribute values that start with the same prefix** checkbox.

mişg Hei, Surround with Tags (Alt + Shift + E)

Allows you to choose a tag that encloses a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

• If the **Position cursor between tags** option *(page 101)* is selected in the Content Completion preferences page, the cursor is placed between the start and end tag.
• If the **Position cursor between tags** option *(page 101)* is not selected in the Content Completion preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

mişg Hei, Surround with [tag] (Alt + Shift + ForwardSlash)

Surround the selected content with the last tag used.

 mushi, Surround with <![CDATA]]> (Alt + Shift + C (Command + Alt + C on OS X))

Surround the selected content with a CDATA tag so that the parser will interpret it as textual data rather than markup.

mişg Hei, Delete element tags (Alt + Shift + Comma)

Deletes the start and end tag of the current element.

mişg Hei, Split element

Split the element from the cursor position into two identical elements. The cursor must be inside the element.

mişg Hei, Join elements (Alt + Shift + F (Command + Alt + F on OS X))

Joins the left and right elements relative to the current cursor position. The elements must have the same name, attributes, and attributes values.

**Attributes Refactoring Actions**

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

mişg Hei, Add/Change attribute

Allows you to change the value of an attribute or insert a new one.
Convert attribute to element
   Allows you to change an attribute into an element.

Delete attribute
   Allows you to remove one or more attributes.

Rename attribute
   Allows you to rename an attribute.

Replace in attribute value
   Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

Comments Refactoring Actions
Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

Delete comments
   Allows you to delete comments found inside one or more elements.

Elements Refactoring Actions
Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

Delete element
   Allows you to delete elements.

Delete element content
   Allows you to delete the content of elements.

Insert element
   Allows you to insert new elements.

Rename element
   Allows you to rename elements.

Unwrap element
   Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

Wrap element
   Allows you to surround elements with element tags.
Wrap element content

Allows you to surround the content of elements with element tags.

Fragments Refactoring Actions

Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

Insert XML fragment

Allows you to insert an XML fragment.

Replace element content with XML fragment

Allows you to replace the content of elements with an XML fragment.

Replace element with XML fragment

Allows you to replace elements with an XML fragment.

Manage IDs submenu

This submenu is available for XML documents that have an associated DTD, XML Schema, or Relax NG schema (not available for DITA). It includes the following actions:

 Rename in

Renames the ID and all its occurrences. Selecting this action opens the Rename XML ID dialog box. This dialog box lets you insert the new ID value and choose the scope of the rename operation (page 904). For a preview of the changes you are about to make, click Preview. This opens the Preview dialog box, which presents a list with the files that contain changes and a preview zone of these changes.

 Rename in File

Renames the ID you are editing and all its occurrences from the current file.

 Search References

Searches for the references of the ID. By default, the scope of this action is the current project. If you configure a scope using the Select the scope for the Search and Refactor operations (page 904) dialog box, this scope will be used instead.

 Search References in
Searches for the references of the ID. Selecting this action opens the
*Select the scope for the Search and Refactor operations* (page 904).

**Search Declarations**

Searches for the declaration of the ID reference. By default, the scope of
this action is the current project. If you configure a scope using the *Select
the scope for the Search and Refactor operations* (page 904) dialog box,
this scope will be used instead.

**Search Declarations in**

Searches for the declaration of the ID reference. Selecting this action
opens the *Select the scope for the Search and Refactor operations* (page
904).

**Search Occurrences in file**

Searches for the declaration and references of the ID in the current
document.

**Quick Assist (Ctrl + 1 (Command + 1 on OS X))**

Available when the cursor is inside an ID or IDREF, this action opens the *Quick Assist
(page 2710)* window that allows you to select some search and refactoring actions for
the selected ID or IDREF.

**Open File at Cursor**

Opens the file at the cursor position in a new panel. If the file path represents a directory
path, it will be opened in system file browser. If the file at the specified location does not
exist, an error dialog box is displayed and it includes a *Create new file* button that starts
the *New document* wizard. This allows you to choose the type or the template for the
file. If the action succeeds, the file is created with the referenced location and name and
is opened in a new editor panel.

**Resource Hierarchy**

Opens the *Resource Hierarchy/Dependencies view* (page 904) that allows you to see
the resource hierarchy for an XML document.

**Resource Dependencies**

Opens the *Resource Hierarchy/Dependencies view* (page 904) that allows you to see
the resource dependencies for an XML document.

**Grid Editing Mode**
The Oxygen XML Editor plugin Grid editing mode displays the XML document as a structured grid of nested tables where the text content can be modified without directly interacting with the XML markup. This is helpful for non-technical users who want to edit text content without modifying the XML markup. You can easily expand or collapse elements within the table and the document structure can be changed with simple drag/drop or copy/paste operations.

To switch to this mode, select Grid at the bottom of the editing area.

Layouts: Grid and Tree

The Grid editor offers two layout modes. The default one is the grid layout. This smart layout detects the recurring elements in the XML document and creates tables having the children (including the attributes) of these elements as columns. This way, it is possible to have tables nested in other tables, reflecting the structure of your document.

Figure 62: Grid Layout
The other layout mode is tree-like. It does not create any tables and it only presents the structure of the document.

**Figure 63: Tree Layout**

To switch between the two modes, select **Grid mode/Tree mode** from the contextual menu.

**Grid Mode Navigation**

When you first open a document in **Grid** mode, the content is collapsed. Only the root element and its attributes are displayed. An arrow sign (↑) displayed at the left of the node name indicates that this node has child nodes. To display the children, click this arrow sign. To collapse a node, click the reverse arrow sign (↓). The expand/collapse actions can also be invoked with the **NumPad+** and **NumPad-** keys, or from the **Expand/Collapse** submenu of the contextual menu.

**Expand/Collapse Submenu**

The following actions are available on the **Expand/Collapse** submenu:

- **Expand All**
  
  Expands the selection and all its children.

- **Collapse All**
  
  Collapses the selection and all its children.

- **Expand Children**
  
  Expands all the children of the selection but not the selection.
Collapses all the children of the selection but not the selection.

**Collapse Others**

Collapses all the siblings of the current selection but not the selection.

## Keyboard Shortcuts

A variety of other keyboard shortcuts are also available in Grid mode:

<table>
<thead>
<tr>
<th>Key</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tab</td>
<td>Moves the cursor to the next editable value in a table row.</td>
</tr>
<tr>
<td>Shift + Tab</td>
<td>Moves the cursor to the previous editable value in a table row.</td>
</tr>
<tr>
<td>Enter</td>
<td>Begins editing and lets you insert a new value. Also commits the changes after you finish editing.</td>
</tr>
<tr>
<td>UpArrow/PageUp</td>
<td>Navigates toward the beginning of the document.</td>
</tr>
<tr>

<td>Used in conjunction with the navigation keys to create a continuous selection area.</td>
</tr>
<tr>
<td>Ctrl (Command on OS X) key</td>
<td>Used in conjunction with the mouse cursor to create discontinuous selection areas.</td>
</tr>
</tbody>
</table>

The following key combinations can be used to scroll the grid:

- **Ctrl + UpArrow (Command + UpArrow on OS X)** - scrolls the grid upwards.
- **Ctrl + DownArrow (Command + DownArrow on OS X)** - scrolls the grid downwards.
- **Ctrl + LeftArrow (Command + LeftArrow on OS X)** - scrolls the grid to the left.
- **Ctrl + RightArrow (Command + RightArrow on OS X)** - scrolls the grid to the right.

## Special Character Support in Grid Mode

If you are editing documents with a bidirectional text orientation or other special characters (such as combining characters), you can change the way the text is rendered and edited in the grid cells by using the **Change Text Orientation** (Ctrl + Shift + O (Command + Shift + O on OS X)) action that is
available from the Edit menu in the Grid editing mode. Use this action to switch from the default left to right text orientation to the right to left orientation, and vice versa.

**Note:** This change applies only to the text from the cells, and not to the layout of the grid editor.

**Figure 64: Default left to right text orientation**

**Editing Actions in Grid Mode**

Since Grid mode presents XML content in a structured grid of nested tables, editing content in this mode can be done with a combination of the Content Completion Assistant (*page 671*) and actions that allow you to work with the structure or content of the nested tables much like you would with any table. Oxygen XML Editor plugin provides ways to edit content in the cells of the nested tables or to edit the structure of the tables.
Tip: There are two different types of layouts available in Grid mode. Most people prefer to leave it on the default Grid mode layout, but there is also a Tree mode layout that presents the structure of the document in more of a vertical tree-like manner. You can switch between the two layouts to see which one works best for you particular situation from the Document > Grid Layout menu.

**Expanding/Collapsing Nodes**

An arrow sign (▷) displayed at the left of a node indicates that it has child nodes. To display the children, click this arrow sign. To collapse a node, click the reverse arrow sign (ulares). The expand/collapse actions can also be invoked with the NumPad+ and NumPad- keys, or from the Expand/Collapse submenu of the contextual menu.

To expand all child nodes, right-click the cell that contains the parent node and select Expand All from the Expand/Collapse submenu. To collapse all node, right-click any cell and select Collapse All from the Expand/Collapse submenu.

**Editing Elements or Attributes**

To edit elements or attributes in Grid mode, simply double-click the cell that contains the element or attribute (or select the cell and press Enter) to invoke the Content Completion Assistant (page 671). This opens a pop-up window that offers a list of proposals that are valid for that particular node.

**Editing Text Content in Cells**

To edit the text value of a cell, simply select the grid cell and press Enter (or double-click the cell), and start editing.

To stop editing a cell value, press Enter again.

To cancel the editing without saving the current changes in the document, press the Esc key.

**Editing the Structure of the Nested Tables**

To edit the structure of the nested tables in Grid mode, Oxygen XML Editor plugin provides the following actions in the contextual menu (many of them also appear in the submenus of the Document menu, or the toolbar):

- Cut, Copy, Paste, Delete common editing actions
  - Executes the typical editing actions on the currently selected elements. The Cut and Copy operations preserve the styles of the copied content.
Paste as Child

Pastes the copied content as the last child of the current selection.

Duplicate

Creates a new node by duplicating the currently selected one.

Insert Before

Offers a list of valid nodes, depending on the context, and inserts your selection before the currently selected node, as a sibling.

Insert After

Offers a list of valid nodes, depending on the context, and inserts your selection after the currently selected node, as a sibling.

Append Child

Offers a list of valid nodes, depending on the context, and appends your selection as a child of the currently selected node.

Sort Ascending, Sort Descending

The sorting result depends on the data type of the column content. It could be a numerical sorting for numbers or an alphabetical sorting for text information. The editor automatically analyzes the content and decides what type of sorting to apply. When a mixed set of values is present in the sorted column, a dialog box is displayed that allows you to choose the desired type of sorting between numerical and alphabetical.

Insert Row

Inserts a new row below the current selection. To insert a new row, you could also select the row header (the zone to the left of the row that holds the row number) and press Enter.

Insert Column

Inserts a column after the current selection.

Clear Content

Removes all content from the current cell.

Expand/Collapse > Expand All

Expands the selection and all its children.

Expand/Collapse > Collapse All

Collapses the selection and all its children.

Expand/Collapse > Expand Children
Expands all the children of the selection but not the selection.

**Expand/Collapse > Collapse Children**

Collapses all the children of the selection but not the selection.

**Expand/Collapse > Collapse Others**

Collapses all the siblings of the current selection but not the selection.

**Refresh Selected**

Forces the layout to be recomputed.

---

Drag and Drop in the Grid Editing Mode

You can easily arrange sections in your XML document in the Grid mode by using drag and drop actions.

You can do the following with drag and drop:

- Copy or move a set of nodes.
- Change the order of columns in the tables.
- Move the rows from the tables.

These operations are available for both single and multiple selections. To deselect one of the selected fragments, use `Ctrl + Single-Click (Command + Single-Click on OS X)`.

While dragging, the editor paints guide-lines showing the locations where you can drop the nodes. You can also drag nodes outside the Grid editor and text from other applications into the Grid.

**Tip:** When using drag and drop to reorganize the document, the resulting layout can be different from what you expected. For instance, the layout can contain a set of sibling tables that can be joined...
together. To force the layout to be recomputed, you can use the **Refresh Selected** action that is available in the contextual menu and in the **Document > Grid Edit** menu.

**Copy and Paste in the Grid Editing Mode**

Selecting content in the **Grid** mode is similar to working with any table with a little more complexity. Specifically, depending on the type of node, when you select a cell, the selection may automatically include additional cells that are implied by the currently selected node. For example, if you click a node that contains any child nodes, all cells that contain the parent and child nodes will be selected. In this case, the currently selected cell is painted with a color that is different from the rest of the selection.

You can also select discontinuous regions of nodes and place them in the clipboard with the copy action. To deselect one of the selected fragments, use **Ctrl + Single-Click (Command + Single-Click on OS X)**.

**Pasting Content Within Grid Mode**

You can paste copied nodes relative to the currently selected cell using one of the following actions (available in the contextual menu):

- ![Paste](paste.png) **Paste (Ctrl + V (Command + V on OS X))** - Pastes copied content, as a sibling, just below (after) the current selection.
- **Paste as Child** - Pastes copied content as the last child of the current selection.

**Pasting Content from Grid Mode to Other Editors**

Nodes that are copied from the **Grid** editor can also be pasted into **Text** mode or other external applications. When pasting copied content from **Grid** mode, the inserted string represents the nodes serialization. The nodes from tables can be copied using HTML or RTF in table format. The resulting cells contain only the concatenated values of the text nodes.

*Figure 66: Copying from Grid to Other Editors*
Pasting Content from Other Editors into Grid Mode

You can also paste well-formed XML content or tab-separated values from other editors into the Grid editor. If you paste XML content, the result will be the insertion of the nodes obtained by parsing this content.

Figure 67: Pasting XML Data into Grid

If the pasted text contains multiple lines of tab-separated values, it can be considered as a matrix of values. By pasting this matrix of values into the Grid editor, the result will be a matrix of cells. If the operation is performed inside existing cells, the existing values will be overwritten and new cells will be created when needed.

Figure 68: Pasting Tab-Separated Values into Grid
If you need to add copied content to your existing content (rather than overwriting existing cells), you need to first insert new cells by using the *Insert row* or *Insert column* actions from the contextual menu. This is useful, for example, when trying to transfer data from spreadsheet-like editors to the Grid editor.

**Content Completion Assistant in Grid Mode**

If the edited document is associated with a schema (DTD, XML Schema, Relax NG, etc.), the Grid editing mode offers a Content Completion Assistant (page 2704) for the names and values of elements and attributes. If you choose to insert an element that has required content, the sub-tree of needed elements and attributes are also automatically included.

To display the content completion pop-up menu, simply double-click a cell that contains an element or attribute (or press Enter on your keyboard).

**Figure 69: Content Completion in Grid Editing Mode**

Exporting XML Content to Excel

For use-cases where you have XML content that needs to be exported to Excel (or any other spreadsheet application) but the content is not already in some sort of table format, Grid mode offers you a way to display the content of an XML document as a structured grid of nested tables and you can work with the cells in those tables much like you would with any spreadsheet application. This makes it possible to export content to Excel by copying cells that contain the specific content and then pasting the copied cells in Excel the same as you would when working with any table or spreadsheet.
To export XML content from Grid mode to Excel or other spreadsheet applications, follow this procedure:

1. Open the XML document in Oxygen XML Editor plugin and switch to Grid mode.
2. Expand the nodes (page 666) to gain access to the particular nested table that contains the content you want to export.
3. Copy the cells that contain the content you want to export (Copy from the contextual menu or Ctrl+C).
4. Switch to your spreadsheet application and paste the copied cells.
5. You may need to make some manual adjustments depending on the complexity of the structure in the original XML document.

Note that Oxygen XML Editor plugin also supports the reverse scenario (copying cells from a spreadsheet application and pasting them in Grid mode). For more information, see Import from MS Excel Files – Grid Mode Method (page 1995).

Author Editing Mode

The Author editing mode in Oxygen XML Editor plugin allows you to visually edit XML documents in a user-friendly interface that is similar to a WYSIWYG word processor. Oxygen XML Editor plugin provides support for visually editing the most commonly used XML vocabularies in Author mode, including DITA, DocBook, TEI, and XHTML. Adding text content is as simple as doing so in a standard text editor but the content is rendered similar to how you will see it in the output. Tables, images, and media objects (such as videos) are also rendered comparable to the output.

To switch to this mode, click the Author button at the bottom of the editing area.

Author Mode User Roles

There are two main types of users for the Author mode: framework developers and content authors.

Framework Developers

A framework developer is a technical person with advanced XML knowledge who defines the framework (page 2706) for authoring XML documents in the visual editor. Once the framework is created or edited by the developer, it is distributed as a deliverable component ready to plug into the application for the content authors.

The framework (document type) configuration defines a type of XML document by specifying all the details needed for editing the content of XML documents in Author mode.

The framework details that are created and customized by the developer include:

- The CSS stylesheet that drives the visual rendering of the document.
- The rules for associating an XML schema with the document, which is needed for the content completion assistance and validation of the document.
- Transformation scenarios for the document.
- Configuration of XML Catalogs (page 2712).
- Custom actions available as buttons on the toolbar or in menus.

Oxygen XML Editor plugin includes some ready-to-use built-in document types for XML frameworks, such as DocBook, DITA, TEI, JATS, and XHTML.

Content Authors

A content author does not need to have advanced knowledge about XML markup, operations such as validation of XML documents, or applying XPath expressions to an XML document. The content
author just uses the framework set up by the developer in the application and starts editing the content of XML documents without editing the XML tags directly.

Styling XML Documents in Author Mode

The Author mode renders the content of the XML documents visually, based on CSS stylesheets associated with the document.

**Selecting and Combining Multiple CSS Styles**

Oxygen XML Editor plugin provides a Styles drop-down menu on the toolbar that allows you to select one main (non-alternate) CSS style (page 2707) and multiple alternate CSS styles (page 2703). This makes it easy to change the look of the document as it appears in Author mode and the output without having to continually edit the CSS stylesheets.

**Tip:** For information about configuring the Styles drop-down menu, see Configuring and Managing Multiple CSS Styles for a Framework (page 2063).

You can select a main CSS style that applies to the whole document and then alternate styles that are applied as layers to specific parts of the document. For example, in the subsequent figure, a DITA document has the Century style selected for the main CSS and the alternate styles Full width, Show table column specification, Hints, and Inline actions are combined for additive styling to specific parts of the document.

The selections from the Styles drop-down menu are persistent, meaning that Oxygen XML Editor plugin will remember the selections when subsequent documents are opened.

*Figure 70: Styles Drop-down Menu in a DITA Document*
Navigating the Document Content in Author Mode

Oxygen XML Editor plugin includes some useful features to help you navigate XML documents.

**Navigation Keyboard Shortcuts**

**Tab**

Navigate to the next XML node.

**Tip:** If you encounter a space-preserved element (page 2711) when you navigate through a document and you do not press another key, pressing the Tab key will
continue the navigation. However, if the cursor is positioned in a *space-preserved element* and you press another key or you position the cursor inside such an element using the mouse, the **Tab** key can be used to arrange the text.

**Shift + Tab**

Navigate to the previous XML node.

**Ctrl + RightArrow (Command + RightArrow on OS X)**

Navigate one word forward.

**Ctrl + LeftArrow (Command + LeftArrow on OS X)**

Navigate one word backward.

**Ctrl + Home (Command + Home on OS X)**

Position the cursor at the beginning of the document.

**Ctrl + End (Command + End on OS X)**

Position the cursor at the end of the document.

### Navigating to a Modification

Oxygen XML Editor plugin includes some actions to help you quickly navigate to a particular modification. They can be invoked using keyboards shortcuts or from the **Navigation** menu:

**Last Edit Location (Ctrl+Q)**

Moves the cursor to the last modification in any opened document.

**Back (Alt+LeftArrow (Command+OpenBracket on OS X))**

Moves the cursor to the previous modification.

**Forward (Alt+RightArrow (Command+CloseBracket on OS X))**

Moves the cursor to the next modification.

### Navigating with the Outline View

Oxygen XML Editor plugin includes an **Outline view** ([page 316](#)) that displays a hierarchical tag overview of the currently edited XML Document.

You can use this view to quickly navigate through the current document by selecting nodes in the outline tree. It is synchronized with the editor area, so when you make a selection in the **Outline view**, the corresponding nodes are highlighted in the editor area.

*Figure 71: Outline View Navigation in Author Mode*
Using the Breadcrumb to Navigate

A *breadcrumb* in the toolbar area at the top of the document indicates the path from document root to the current element. It can also be used as a helpful tool to navigate to specific elements throughout the structure of the document.

*Figure 72: Breadcrumb in Author Mode*

The last element listed in the *breadcrumb* is the element at the current cursor position. Clicking an element from the *breadcrumb* selects the entire element and navigates to it in the editor area.

Using the Linking Support

When working on multiple documents that reference each other (references, external entities, XInclude, DITA conref, etc.), the *linking support* is useful for navigating between the documents. In the built-in frameworks that are bundled with Oxygen XML Editor plugin, links are marked with an icon representing a chain link (🔗). When hovering over the icon, the mouse pointer changes its shape to indicate that the link can be accessed and a tooltip presents the destination location. Click the link to open the referenced resource in the editor or system browser. The same effect can be obtained by pressing the F3 key when the cursor is in a link element.

*Note:* Depending on the referenced file type, the target link will either be opened in the Oxygen XML Editor plugin or in the default system application. If the target file does not exist, Oxygen XML Editor plugin prompts you to create it.

Author Mode Views

The content author is supported by a variety of *dockable* (page 2705) helper views that are displayed by default when editing in *Author* mode. These views are automatically synchronized with the current editing context of the editor panel. They present additional information about this context thus helping the author to see quickly the current location in the overall document structure and the available editing options.
There is also a large selection of additional useful views available in the Window > Show View menu. This section presents some of the most helpful views for editing in Author mode.

Navigator View

The Navigator view is designed to assist you with organizing and managing related files grouped in the same XML project. The actions available in the contextual menu and on the toolbar associated to this panel allows you to create XML projects and provide shortcuts to various operations for the project documents.

Tip: You can also use the Project Explorer view for many of the same purposes as the Navigator view.

Figure 73: Navigator View

By default, the view is positioned on the left side of the Oxygen XML Editor plugin window, above the Outline view (page 257). If the view has been closed, it can be reopened at any time from the Window > Show View menu (the Project Explorer view is in the Other submenu).

Project View Toolbar

The following actions are grouped in the upper right corner:

- **Collapse All**

  Collapses all project tree folders. You can also collapse/expand a project tree folder if you select it and press the Enter key or Left Arrow to collapse and Right Arrow to expand.

- **Link with Editor**
When selected, the project tree highlights the currently edited file, if it is found in the project files.

Note: This button is disabled automatically when you move to the Debugger perspective (page 2709).

View Menu

Drop-down menu that contains various settings contributed by the Eclipse plugin.

File Explorer Area

The rest of the view is basically a file explorer similar to most other commonly used file explorers. The XML project (.xpr file) is a logical container with a collection of resources (folders and files). The types of resources displayed include:

- Logical folders with Linked folders/files - This folder type is used as containers for linked resources (shortcuts). The icons for file shortcuts include a shortcut symbol (🔗). The linked folders/files are added using New > Folder > Advanced or New > File > Advanced, or by dragging and dropping files/folders from the view or the system file explorer. ✖ Delete can be used to remove them from the project.

- Physical folders and files - Marked with the operating system-specific icon for folders (usually a yellow icon on Windows and a blue icon on Mac OS X). These folders and files are mirrors of real folders or files that exist in the local file system. They are created or added to the project by using contextual menu actions (such as New > File, New > Folder, ✨ Copy, and ✨ Paste) or by dragging and dropping files/folders from the view or the system file explorer. Also, the contextual menu action ✖ Delete can be used to remove them from the project and local file system.

Figure 74: Navigator View with Both Types of Resources
Creating New Projects

The following actions are available from the New menu when right-clicking any item, or the File > New menu:

**XML Project**

Opens the New XML Project dialog box that allows you to create a new project and adds it to the project structure in the Navigator view.

**Sample XML Project**

Opens the New sample XML project dialog box that allows you to customize sample resources in a new project and adds it to the project structure in the Navigator view.

Managing Project Contents

There are various contextual menu actions, shortcuts, and ways to organize the folders and files inside the project:

**Creating New Folders and Files**

- **Right-click any item > New > 📁 File**
  
  Opens a New Document Wizard (page 550) that helps you create a new file and adds it to the project structure.

- **Right-click any item > New > 📁 New from Templates**
  
  Opens a wizard where you can create a new document based on a template (page 554) and adds it to the project structure.

- **Right-click any item > New > 📁 Folder**
  
  Opens a New Folder dialog box that allows you to specify a name for a new folder and adds it to the structure of the project.

**Adding Resources**

You can add resources by using drag and drop (or Copy and Paste) actions from within the Navigator view or dragging them from the system file explorer. Files may have multiple instances within the folder system, but cannot appear twice within the same folder.

**Removing Folders and Files**

To remove logical folders or the linked resources inside them from the project, use ✗ Delete from the contextual menu (or press Delete on your keyboard) and confirm by clicking OK in the resulting dialog box.
To remove folders or files from both the project and the local file system, use **Delete** from the contextual menu (or press **Delete** on your keyboard) and confirm by clicking **OK** in the resulting dialog box.

**Moving Folders and Files**

You can move the resources by using drag and drop actions from within the **Navigator** view.

You can also use the usual **Copy** and **Paste** actions (or the **Move** action) from the contextual menu to move resources in the project.

You can also move certain types of files (such as XML, XML Schema, Relax NG, WSDL, and XSLT) by using the **Refactoring > Move resource** action from the contextual menu. This action opens the **Move resource** dialog box that includes the following options:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - Select this option to update the references to the resource you are moving, based upon the selected scope. You can select or configure the scope ([page 904](#)) by using the button.

**Renaming Folders and Files**

There are several ways to rename a folder or file in the project (this works for both physical and linked resources):  

- Select **Rename** from the contextual menu.
- Press **F2** on your keyboard.

You also can rename certain types of files (such as XML, XML Schema, Relax NG, WSDL, and XSLT) by using the **Refactoring > Rename resource** action from the contextual menu. This action opens the **Rename resource** dialog box that includes the following options:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references of the renamed resource** - Select this option to update the references to the resource you are renaming. You can select or configure the scope ([page 904](#)) by using the button.
Opening Files

There are several ways to open a file:

- Double-click the file.
- Select it and press Enter on your keyboard.
- Right-click the file and select Open.
- Drag the file from the project tree and drop it in the editor area.
- If you want to choose the application or location where to open it, you can right-click the file and select Open with.

Saving the Project

The project file is automatically saved every time the content of the Navigator view is saved or modified by actions such as adding or removing files and drag and drop.

Other Contextual Menu Actions

Numerous other actions are available in the contextual menu, depending on the type of file or folder where it is invoked from (some actions are available for multiple selected files):

Refactoring submenu

Oxygen XML Editor plugin includes some refactoring operations that help you manage the structure of your documents. The following actions are available from the contextual menu in the Refactoring submenu:

Rename resource (Available for certain types of XML documents)

Opens the Rename resource dialog box (page 579) where you can change the name of a resource. It also includes an option to update the references to the renamed resource and you can choose between various scopes for the operation.

Move resource (Available for certain types of XML documents)

Opens the Move resource dialog box (page 579) where you can choose a destination and change the name of a resource. It also includes an option to update the references to the moved resource and you can choose between various scopes for the operation.

XML Refactoring

Opens the XML Refactoring tool wizard (page 913) that presents refactoring operations to assist you with managing the structure of your XML documents.

Show Resource Hierarchy
Opens the Resource Hierarchy/Dependencies view (page 904) that allows you to see the resource hierarchy for an XML document.

**Show Resource Dependencies**

Opens the Resource Hierarchy/Dependencies view (page 904) that allows you to see the resource dependencies for an XML document.

**Refresh**

Refreshes the content and the dependencies between the resources in the Master Files directory (page 581).

**XPath in Files**

Opens the XPath/XQuery Builder view (page 1902) that allows you to compose XPath and XQuery expressions and execute them over the currently edited XML document.

**Check Spelling in Files**

Allows you to check the spelling of multiple files. (page 598)

**Format and Indent Files**

Opens the Format and Indent Files dialog box (page 652) that allows you to configure the format and indent (pretty-print (page 2709)) action that will be applied on the selected documents.

**Transform submenu**

The currently selected files associated with the Oxygen XML Editor plugin in the Package Explorer view or in the Navigator view can be transformed in one step with one of the following actions available from contextual menu in the Transform submenu:

- **Apply Transformation Scenario(s)**
  
  Obtains the output with one of the built-in scenarios (page 1382).

- **Configure Transformation Scenario(s)**
  
  Opens a dialog box (page 1502) that allows you to configure pre-defined transformation scenarios.

- **Transform with**
  
  Allows you to select a transformation scenario to be applied to the currently selected files.

**Validate submenu**

The currently selected files associated with the Oxygen XML Editor plugin in the Package Explorer view or in the Navigator view can be checked to be XML well-formed
or validated against a schema (DTD, XML Schema, Relax NG, Schematron or NVDL) with one of the following contextual menu actions found in the Validate submenu:

- **Check Well-Formedness**
  Checks if the selected file or files are well-formed.

- **Validate**
  Validates the selected file or files against their associated schema.
  For EPUB files, this action triggers an **EPUB Validate and Check for Completeness** (page 1912) operation.

- **Validate with Schema**
  Validates the selected file of files against a specified schema.

- **Configure Validation Scenario(s)**
  Allows you to configure and run a validation scenario (page 868).

- **Clear Validation Markers**
  Clears all the error markers from the main editor and Problems view.

**Generate XML Schema Documentation**
Opens the XML Schema Documentation Dialog Box (page 1076).

**Generate Stylesheet Documentation**
Opens the XSLT Stylesheet Documentation Dialog Box (page 1000).

**Generate XQuery Documentation**
Opens the XQuery Documentation Dialog Box (page 1113).

**Generate WSDL Documentation**
Opens the WSDL Documentation Dialog Box (page 1135).

**Properties**
Displays the properties of the current file in a Properties dialog box.

**Enable Master Files Support (Available from the project container)**
Allows you to enable the Master Files Support (page 582) for each project you are working on.

**Detect Master Files (Available from the project container when Master Files Support is enabled)**
Opens the Detect Master Files wizard (page 582) that enables the automatic detection of master files.
Outline View in Author Mode

The *Outline* view in **Author** mode displays a general tag overview of the currently edited XML Document. When you edit a document, the *Outline* view dynamically follows the changes that you make, displaying the node that you modify. This functionality gives you great insight on the location of your modifications in the current document. It also shows the correct hierarchical dependencies between elements. This makes it easy for you to be aware of the document structure and the way element tags are nested.

**Outline View Features**

The *Outline* view allows you to:

- Quickly navigate through the document by selecting nodes in the *Outline* tree.
- Insert or delete nodes using contextual menu actions.
- Move elements by dragging them to a new position in the tree structure.
- Highlight elements in the editor area. It is synchronized with the editor area, so when you make a selection in the editor area, the corresponding nodes are highlighted in the *Outline* view, and vice versa.
- View document errors, as they are highlighted in the *Outline* view. A tooltip also provides more information about the nature of the error when you hover over the faulted element.

**Outline View Interface**

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

The upper part of the *Outline* view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (such as `*`, `?`) and separate multiple patterns with commas.

It also includes a **View menu** in the top-right corner that presents a variety of options to help you filter the view even further.
Drop and Drop Actions in the Outline View

Entire XML elements can be moved or copied in the edited document using only the mouse in the Outline view with drag-and-drop operations. Several drag and drop actions are possible:

- If you drag an XML element in the Outline view and drop it on another node, then the dragged element will be moved after the drop target element.
- If you hold the mouse pointer over the drop target for a short time before the drop then the drop target element will be expanded first and the dragged element will be moved inside the drop target element after its opening tag.
- You can also drop an element before or after another element if you hold the mouse pointer towards the upper or lower part of the targeted element. A marker will indicate whether the drop will be performed before or after the target element.
- If you hold down the Control (Command on OS X) key after dragging, a copy operation will be performed instead of a move.

Tip: You can select and drag multiple nodes in the Outline view when editing in Author mode.

Figure 75: Outline View

Outline View Filters in Author Mode

The upper part of the Outline view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (such as *, ?) and separate multiple patterns with commas.
The following actions are available in the View menu of the Outline view when editing in Author mode:

**Filter returns exact matches**

The text filter of the Outline view returns only exact matches.

**Flat presentation mode of the filtered results**

When active, the application flattens the filtered result elements to a single level.

**Show comments and processing instructions**

Show/hide comments and processing instructions in the Outline view.

**Show element name**

Show/hide element name.

**Show text**

Show/hide additional text content for the displayed elements.

**Show attributes**

Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from the Outline preferences panel (page 197).

**Configure displayed attributes**

Displays the XML Structured Outline preferences page (page 197).

Outline View Contextual Menu Actions in Author Mode

The contextual menu of the Outline view in Author mode contains the following actions:

**Edit Attributes**

Displays an in-place attributes editor (page 322) that allows you to edit the attributes of a selected node.

**Edit Profiling Attributes**

Allows you to change the profiling attributes (page 746) defined on all selected elements.

**Append Child**

Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection as a child of the current element.

**Insert Before**

Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection immediately before the current element, as a sibling.
Insert After

Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection immediately after the current element, as a sibling.

Cut, Copy, Paste, Delete common editing actions

Executes the typical editing actions on the currently selected elements. The Cut and Copy operations preserve the styles of the copied content.

Paste before

Inserts a well-formed copied element before the currently selected element.

Paste after

Inserts a well-formed copied element after the currently selected element.

Paste as XML

Pastes copied content that is considered to be valid XML, preserving its XML structure.

Toggle Comment

Encloses the currently selected element in an XML comment, if the element is not already commented. If it is already commented, this action will remove the comment.

Rename Element

Invokes a Rename dialog box that allows you to rename the currently selected element, siblings with the same name, or all elements with the same name.

Expand All

Expands the structure tree of the currently selected element.

Collapse All

Collapses all of the structure tree of the currently selected node.

Tip: You can copy, cut or delete multiple nodes in the Outline by using the contextual menu after selecting multiple nodes in the tree.

Related Information:

- Attributes View in Author Mode (page 319)

Attributes View in Author Mode
The **Attributes** view presents all the attributes of the current element determined by the schema of the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

You can use this view to edit or add attribute values. The attributes of an element are editable if any one of the following is true:

- The CSS stylesheet associated with the document does not specify a `false` value for the `-oxy-editable (page 2229)` property associated with the element.
- The element is entirely included in a deleted **Track Changes (page 719)** marker.
- The element is part of a content fragment that is referenced in **Author** mode from another document.

The attributes are rendered differently depending on their state:

- The names of the attributes are rendered with a bold font, and their values with a plain font.
- Default values are rendered with a plain font, painted gray.
- Empty values display the text "[empty]", painted gray.
- Invalid attributes and values are painted red.

To edit the value of the corresponding attribute, double-click a cell in the **Value** column. If the possible values of the attribute are specified as `list` in the schema of the edited document, the **Value** column acts as a combo box that allows you to either select the value from a list or manually enter it.

**Note:** If the cursor is located inside read-only content, the attribute names and values are faded and you cannot add, edit, or remove values.

You can sort the attributes table by clicking the **Attribute** column header. The table contents can be sorted as follows:

- By attribute name in ascending order.
- By attribute name in descending order.
- Custom order, where the used attributes are displayed at the beginning of the table sorted in ascending order, followed by the rest of the allowed elements sorted in ascending order.

*Figure 76: Attributes View*
A drop-down list located in the upper part of the view allows you to select the current element or its ancestors.

**Contextual Menu Actions in the Attributes View**

The following actions are available in the contextual menu of the Attributes view when editing in Author mode:

- **Set empty value**
  
  Specifies the current attribute value as empty.

- **Remove**
  
  Removes the attribute (action available only if the attribute is specified). You can invoke this action by pressing the (Delete) or (Backspace) keys.

- **Copy**
  
  Copies the `attrName="attrValue"` pair to the clipboard. The `attrValue` can be:
  
  - The value of the attribute.
  - The value of the default attribute, if the attribute does not appear in the edited document.
  - Empty, if the attribute does not appear in the edited document and has no default value set.

- **Paste**
  
  Depending on the content of the clipboard, the following cases are possible:
  
  - If the clipboard contains an attribute and its value, both of them are introduced in the Attributes view. The attribute is selected and its value is changed if they exist in the Attributes view.
• If the clipboard contains an attribute name with an empty value, the attribute is introduced in the Attributes view and you can start editing it. The attribute is selected and you can start editing it if it exists in the Attributes view.
• If the clipboard only contains text, the value of the selected attribute is modified.

In-place Attributes Editor

Oxygen XML Editor plugin includes an in-place attributes editor in Author mode. To edit the attributes of an XML element in-place, do one of the following:

• Select an element or place the cursor inside it and then press the Alt + Enter keyboard shortcut.
• Double-click any named start tag when the document is edited in one of the following display modes. (page 331): Full Tags with Attributes, Full Tags, Block Tags, or Inline Tags.

This opens an in-place attributes editor that contains the same content as the Attributes view. By default, this editor presents the Name and Value fields, with the list of all the possible attributes collapsed.

![Figure 77: In-place Attributes Editor](image)

**Name Combo Box**

Use this combo box to select an attribute. The drop-down list displays the list of possible attributes allowed by the schema of the document, as in the Attributes view.

**Value Combo Box**

Use this combo box to add, edit, or select the value of an attribute. If the selected attribute has predefined values in the schema, the drop-down list displays those possible values. You can use the Browse button to select a URL for the value of an attribute. You can also press Ctrl + Space to open a content completion window that offers a list of possible choices and allows you to select multiple values.

**Note:** For built-in frameworks, if the selected attribute in the Name field is an @id attribute, the Browse button is replaced by a Generate Unique ID Value button. Clicking this button will automatically generate a unique ID for the selected element.
If you click More while in the collapsed version, it is expanded to the full version of the in-place attribute editor.

Figure 78: In-place Attributes Editor (Full Version)

The full version includes a table grid, similar to the Attributes view, that presents all the attributes for the selected element.

Model View

The Model view presents the structure of the currently selected tag, and its documentation, defined as annotation in the schema of the current document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

Figure 79: Model View
The **Model** view is comprised of two sections, an element structure panel and an annotations panel.

**Element Structure Panel**

The element structure panel displays the structure of the currently edited or selected tag in a tree-like format. The information includes the name, model, and attributes of the current tag. The allowed attributes are shown along with imposed restrictions, if any.

*Figure 80: Element Structure Panel*
Annotation Panel

The **Annotation** panel displays the annotation information for the currently selected element. This information is collected from the XML schema.

![Annotation panel](image)

**Figure 81: Annotation panel**

Elements View in Author Mode

The **Elements** view presents a list of all defined elements that are valid at the current cursor position according to the schema associated to the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

The upper part of the view features a combo box that contains the ordered ancestors of the current element. Selecting a new element in this combo box updates the list of the allowed elements. By default, only the elements that are allowed at the current cursor position are listed. However, if the **Show only items allowed at cursor position** option (page 161) is not selected in the **View preferences page** (page 160), two additional tabs (**Before** and **After**) will be displayed at the bottom of the view and they list elements that are allowed before or after the element at the current cursor position.

Double-clicking any of the listed elements inserts that element into the edited document and its position depends on the tab.
• **Cursor** tab - Double-clicking an element inserts it at the current cursor position.
• **Before** tab - Double-clicking an element inserts it before the element at the cursor position.
• **After** tab - Double-clicking an element inserts it after the element at the cursor position.

Pressing **F2** with an element selected will display information about that particular element.

*Figure 82: Elements View in Author Mode*

Entities View

*Entities* provide abbreviated entries that can be used in XML files when there is a need of repeatedly inserting certain characters or large blocks of information. An *entity* is defined using the `ENTITY` statement either in the DOCTYPE declaration or in a DTD file associated with the current XML file.

There are three types of entities:

• **Predefined** - Entities that are part of the predefined XML markup (`&lt;`, `&gt;`, `&amp;`, `&apos;`, `&quot;`).
• **Internal** - Defined in the DOCTYPE declaration header of the current XML.
• **External** - Defined in an external DTD module included in the DTD referenced in the XML DOCTYPE declaration.

**Note:** If you want to add internal entities, you would need to switch to the Text editing mode and manually modify the DOCTYPE declaration. If you want to add external entities, you need to open the DTD module file and modify it directly.

The *Entities* view displays a list with all entities declared in the current document, as well as built-in ones. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Double-clicking one of the entities will insert it at the current cursor position in the XML document. You can also sort entities by name and value by clicking the column headers.
The view features a filtering capability that allows you to search an entity by name, value, or both. Also, you can choose to display the internal or external entities.

**Note:** When entering filters, you can use the `?` and `*` wildcards. Also, you can enter multiple filters by separating them with a comma.

Results View

The **Results** view displays the messages generated as a result of user actions such as validations, transformations, search operations, and others. Each message is a link to the location related to the event that triggered the message. Double-clicking a message opens the file containing the location and positions the cursor at the location offset. The **Results** view is automatically opened when certain actions generate result messages.

The actions that contribute messages to this view include:

- **Validation** actions *(page 857)*
- **Transformation** actions *(page 1381)*
- **Check Spelling in Files** action *(page 598)*
- **Search References** action *(page 985)*
- **SQL results** *(page 1979)*
Results View Toolbar Actions

The view includes a toolbar with the following actions:

- **Grouping Mode toggle options**
  
  You can choose to group the result messages in a **Hierarchical** or **Flat** arrangement.

- **Next**
  
  Navigates to the message below the current selection.

- **Previous**
  
  Navigates to the message above the current selection.

- **Remove selected**
  
  Removes the current selection from the view. This can be helpful if you want to reduce the number of messages, or remove those that have already been addressed or not relevant to your task.

- **Remove all**
  
  Removes all messages from the view.

Results View Contextual Menu Actions

The following actions are available when the contextual menu is invoked in this view:

- **Learn Word(s) (Available when spelling errors are reported in the Results view)**
  
  Adds the word(s) to a list of learned words to instruct the spell checker engine to not report the word(s) as spelling errors in the future.

- **Remove**
  
  Removes selected messages from the view.

- **Remove all**
Removes all messages from the view.

**Copy**

Copies information associated with the selected messages. For example:

- The file path of the document that triggered the output message.
- Error severity (error, warning, info message, etc.)
- Name of validating processor.
- The line and column in the file that triggered the message.

**Copy Description**

Copies the description values for all selected items.

**Show message**

Opens a dialog box that displays the details of the message.

**Save Results**

Saves the complete list of messages in a file in text format. For each message, the included details are the same as the ones for the **Copy** action (page 269).

**Save Results as XML**

Saves the complete list of messages in a file in XML format. For each message, the included details are the same as the ones for the **Copy** action (page 269).

**Save Results as HTML**

Saves the complete list of messages in a file in HTML format. For each message, the included details are the same as the ones for the **Copy** action (page 269).

**Expand All**

Available when **Hierarchical** mode is selected. Expands all the nodes of the tree, which is useful when the messages are presented in a hierarchical mode.

**Collapse All**

Available when **Hierarchical** mode is selected. Collapses all the nodes of the tree, which is useful when the messages are presented in a hierarchical mode.

**CSS Inspector View**

The purpose of the **CSS Inspector** view is to display information about the styles applied to the currently selected element. You can use this view to examine the structure and layout of the CSS rules that match the element. The matching rules displayed in this view include a link to the line in
the CSS file that defines the styles. With this tool you can see how the CSS rules were applied and the properties defined, and use the link to open the associated CSS for editing purposes.

*Figure 85: CSS Inspector View*

*Figure 86: CSS Inspector View*

---

**Displaying the CSS Inspector View**

You can open this view by selecting the **Inspect Styles** action from the contextual menu in **Author** mode, or selecting the **CSS Inspector** view in the **Window > Show View** menu. This action makes the view visible and also initializes it for the currently selected element.

**Displaying Rules**

All rules that apply to the current element are displayed in sections, which are listed in order of importance (from most specific to least specific). Rules that are overridden by other rules are crossed out. If you click the link in the top-right corner of a rule **Oxygen XML Editor plugin** opens the associated CSS file at the line number where the properties of the rule are defined.

*Figure 87: CSS Inspector View - Displaying Rules*
The **CSS Inspector** view contains five tabs:

- **Element** - Displays the CSS rules matching the currently selected element in the **Author** page (ordered from most-specific to least-specific).
- **:before** - Displays the rules matching the `:before` pseudo-element.
- **:after** - Displays the rules matching the `:after` pseudo-element.
- **Computed** - Displays all the styling properties that apply to the current element, as a result of all the CSS rules matching the element.
- **Path** - Displays the path for the current element, and its attributes, allowing you to quickly see the attributes on all parent elements, and allows you to copy fragments from this view and paste it into the associated CSS to easily create new rules.

The information displayed in each of the five tabs is updated when you click other elements in the **Author** editing view. The first three tabs include the link to the associated CSS source, while the other two tabs simply display the style properties that match the current element.

Each of the tabbed panes include a contextual menu with the following actions:

- **Copy** - copies the current selection
- **Select all** - selects all information listed in the pane

Also, a **Show empty rules** action is available from a drop-down menu in the toolbar of the view. This action forces the view to show all the matching rules, even if they do not declare any CSS properties. By default, the empty rules are not displayed.

**Displaying the Markup**

You can control the amount of markup that is displayed in the **Author** mode with various levels of tag modes for both **block** and **in-line** elements.

The following dedicated tag modes are available from the **Tags Display Mode** drop-down menu (available on the toolbar):

- **Full Tags with Attributes**
Displays full tag names with attributes for both block and inline elements.

- **Full Tags**
  Displays full tag names without attributes for both block and inline elements.

- **Block Tags**
  Displays full tag names for block elements and simple tags without names for inline elements.

- **Inline Tags**
  Displays full tag names for inline elements, while block elements are not displayed.

- **Partial Tags**
  Displays simple tags without names for inline elements, while block elements are not displayed.

- **No Tags**
  No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

**Configure Tags Display Mode**

Opens the Author preferences page (page 110) where you can configure options regarding tags, such as the default Tags Display Mode, Tags Background Color, Tags Foreground Color, Tags Font, and whether or not Oxygen XML Editor plugin will use a Compact Tag Layout for displaying the tags (this option tries to group consecutive block tags on the same line).

**Note:** The associated CSS information is used to determine whether a tag should be considered inline or block. If the current document does not have an associated CSS stylesheet, then the Full Tags mode will be used.

**Displaying Referenced Content**

The references to entities, XInclude, DITA conrefs, and constructs in other vocabularies with displayable referenced content (page 2116) are expanded by default in Author mode and the referenced content is displayed. You can control this behavior from the Author preferences page (page 110). The referenced resources are loaded and displayed inside the element or entity that references them, but the displayed content cannot be modified directly in current document.

When the referenced resource cannot be resolved, an error will be presented inside the element that refers them instead of the content.
If you want to make modifications to the referenced content, you must open the source where the referenced resource resides. The referenced resource can be opened quickly by clicking the link (marked with the 🌐 icon) that is displayed before the referenced content or by using the **Edit Reference** action from the contextual menu (in this case, the cursor is placed at the precise location where the action was invoked). The referenced resource is resolved through the [XML Catalog](page 2712) set in the XML Catalog preferences page (page 171).

The referenced content is refreshed as follows:

- Automatically, when it is modified and saved from Oxygen XML Editor plugin.
- On demand, by using the **Refresh references** action (page 835). This is useful when the referenced content is modified outside the Oxygen XML Editor plugin scope.

Related Information:

- Configuring a Reference Resolver (page 2116)

### Visual Hints for the Cursor Position

When the cursor is positioned inside a new context, a tooltip will be shown for a couple of seconds displaying the position of the cursor relative to the context of the current element.

Here are some of the common situations that can be encountered:

- **Before first block** - The cursor is positioned before the first *block* (page 2703) child of the current node.

- **Between two block elements** - The cursor is positioned between two *block elements* (page 2703).

- **After last block** - The cursor is positioned after the last *block element* (page 2703) child of the current node.
• **Inside a node** - The cursor is positioned inside a node.

• **Before an inline element** - The cursor is positioned inside an element, before a child *inline element* (page 2707).

• **Between two inline elements** - The cursor is positioned between two *inline elements* (page 2707).

• **After an inline element** - The cursor is positioned inside an element, after an child *inline element* (page 2707).

The nodes in these cases are displayed in the tooltip window using the element names.

To deactivate this feature, open the **Preferences** dialog box *(page 55)*, go to **Author > Cursor Navigation**, and deselect the **Show cursor position tooltip** option *(page 117)*. Even if this option is deselected, you can still display the position tooltip by pressing **Shift+F2**.

**Note:** The position information tooltip is not displayed if **Full Tags with Attributes** or **Full Tags** is selected in the **Tags display mode** drop-down menu *(page 331)*.

**Location Tooltip**

When editing XML documents in a visual environment, you might find it difficult to position the cursor between certain tags that do not have a visual representation. To counterbalance this, Oxygen XML Editor plugin displays a transparent preview of the position information, called the **Location Tooltip**:

*Figure 88: Location Tooltip*
Oxygen XML Editor plugin displays a Location Tooltip when the following conditions are met:

- You are editing the document in one of the following tags display modes (page 331): Inline Tags, Partial Tags, No Tags.
- The mouse pointer is moved between block elements (page 2703).

To activate or deactivate this feature, use the Show location tooltip on mouse move option (page 117) in the Cursor Navigation preferences page (page 117).

Presenting Validation Errors in Author Mode

By default, Oxygen XML Editor plugin automatically validates documents (page 856) while editing in the Author mode, and actions are also available to manually validate documents (page 857) on-request.

Figure 89: Presenting Validation Errors in Author Mode

Validation Marker Locations

In Author mode, validation issues are marked in the following locations:

- In the main editing pane, with the issue underlined in a color according to the type of issue.
- In the right-side vertical stripe, with a marker that is colored according to the type of issue.
- For attributes with detected issues, in the Attributes view (page 319), with the attribute and its value colored according to the type of issue.
Validation Marker Colors

The colors for each type of issue are as follows:

- **Validation Errors** [Red] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the Attributes view are colored in red.
- **Validation Warnings** [Yellow] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the Attributes view are colored in yellow.
- **Validation Info** [Blue] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the Attributes view are colored in blue.

Validation Markers in the Right-Side Stripe

Also, the stripe on the right side of the editor panel is designed to display the issues found during the validation process and to help you locate them in the document. The stripe contains the following:

**Upper Part of the Stripe**

A success indicator square will turn green if the validation is successful or only info messages are found, red if validation errors are found, or yellow if only validation warnings are found. More details about the issues are displayed in a tool tip when you hover over indicator square. If there are numerous problems, only the first three are presented in the tool tip.

**Middle Part of the Stripe**

Errors are presented with red markers, warnings with yellow markers, and info messages with blue markers. If you want to limit the number of markers that are displayed, open the Preferences dialog box (page 55), go to Editor > Document checking, and specify the desired limit in the Maximum number of validation highlights option (page 108).

Clicking a marker will highlight the corresponding text area in the editor. The validation message is also displayed both in a tool tip (when hovering over the marker) and in the message area on the bottom of the application.

**Bottom Part of the Stripe**

Two navigation arrows (↩) allow you to jump to the next or previous issue. The same actions can be triggered from Document > Automatic validation > Next error (Ctrl + Period (Command + Period on OS X)) and Document > Automatic validation > Previous error (Ctrl + Comma (Command + Comma on OS X)).
Hovering Over Validation Issues

Hovering over a validation issue presents a tooltip message with more details about the problem and possible quick fixes (page 884) (if available for that issue). Also, when hovering over an issue, pressing F2 will change the focus to the tooltip where you can use Tab and Shift + Tab to navigate between quick fixes and Space to trigger them.

Details About Validation Issues

• Information about the issue is also displayed in the message area on the bottom of the editor panel (clicking the Document checking options button opens the Document Checking preferences page (page 108) where you can configure some validation options.
• Status messages from every validation action are logged in the Console view (page 612) (the Enable Oxygen consoles option (page 161) must be selected in the View preferences page).
• If you want to see all the validation messages grouped in the Results view (page 267), you should use the Validate action from the toolbar or XML menu. This action also collects the validation messages and displays them in the Problems view if the validated file is in the current workspace or in a custom Errors view if the validated file is outside the workspace.

Whitespace Handling in Author Mode

When you edit a document in Author mode, Oxygen XML Editor plugin must serialize the resulting document as XML. Oxygen XML Editor plugin serializes the document when you save it or switch to another editing mode. When the document is serialized, Oxygen XML Editor plugin formats and indents the XML document (page 645) according to the current format and indent settings (page 135).

Minimizing Whitespace Differences Between Versions

When serializing a document to XML, Author mode will only format and indent those elements of the document that have been edited. Any element that has not been edited will be serialized exactly as it was loaded from disk. This is useful when your content is managed in a version control systems, as
it avoids introducing insignificant whitespace differences between version, which in turn makes diff output easier to read.

**Entering Whitespace in Author Mode**

Oxygen XML Editor plugin controls the entry of whitespace characters in **Author** mode according the [XML whitespace rules (page 645)](#), which means it will not let you insert insignificant whitespace. This means that it will not let you insert extra line-breaks or spaces inside a typical paragraph element, for instance. (Any such whitespace would be normalized away when the document was serialized to XML, so Oxygen XML Editor plugin is saving you from any surprises when this happens.)

Of course, you will legitimately want to enter additional spaces and returns in some cases, such as code samples. Oxygen XML Editor plugin will allow this in elements that are configured as preserve space elements according to the XML whitespace rules. For all of its [built-in document types (page 1277)](#), Oxygen XML Editor plugin is correctly configured to recognize preserve space elements ([page 139]) and to allow you to enter additional spaces in them.

If you are using a built-in document type and you are unable to enter additional whitespace, make sure that you are using an element from that document type that is intended to be a preserve-space element.

If you are using a custom document type, make sure that it is configured correctly ([page 2037]) so that Oxygen XML Editor plugin recognizes that the current element is a preserve-space element.

**Serialization Options for Author Mode**

The **Author** preferences page ([page 110]) ([open the Preferences dialog box (page 55)](#) and go to **Editor > Edit modes > Author**) includes a Serialization section ([page 112]) that contains some options that control how the formatting and indenting is applied when a document is saved in **Author** mode or when switching from **Author** to **Text** mode. It also includes a Compatibility with other tools option ([page 113]) that controls how line breaks are handled when a document is serialized to help obtain better compatibility with other applications.

**Editing Content in Author Mode**

The **Author** mode includes a large variety of user-friendly authoring features to help you work with XML content, including numerous toolbar, menu, and shortcut actions and some specialized content editing features.
Undo/Redo Actions

The typical undo and redo actions are available with shortcuts or in the Edit menu:

**Undo (Ctrl + Z (Command + Z on OS X))**

Reverses a maximum of 200 editing actions to return to the preceding state.

*Note:* Complex operations such as Replace All or Indent selection count as single undo events.

**Redo (Ctrl + Y (Command + Shift + Z on OS X, Ctrl + Shift + Z on Linux/Unix))**

Recreates a maximum of 100 editing actions that were undone by the Undo function.

Copy and Paste Actions

The typical copying and pasting actions are available with shortcuts or in the contextual menu (or the Edit menu):

**Cut (Ctrl + X (Command + X on OS X))**

Removes the current selected content from the document and places it in the clipboard.

**Copy (Ctrl + C (Command + C on OS X))**

Places a copy of the current selected content in the clipboard.

**Paste (Ctrl + V (Command + V on OS X))**

Inserts the current clipboard content into the document at the cursor position.

**Select All (Ctrl + A (Command + A on OS X))**

Selects the entire content of the current document.

Entering Text in Elements

By default, you can only enter text in elements that accept text content. If the element is declared as empty or element only in the associated schema, you are not allowed to insert text in it. Instead, a warning message is displayed.

*Figure 90: Editing in empty element warning*
To allow text to be inserted in these instances, go to the Schema-Aware preferences page and deselect the **Reject action when its result is invalid** option in the Typing actions section (page 130).

### Editing Text Content Without Modifying the XML Markup

You can use the options in the Tags Display Mode drop-down menu (page 331) (available on the toolbar) to control how tags are displayed in Author mode. This can help you to clearly see where the current cursor position is within the tag structure so that you can avoid making unintended modifications to the XML markup. You can also switch to the Grid editing mode (page 665) to modify text content without affecting the XML tags.

### Editing XML Markup in Author Mode

Oxygen XML Editor plugin includes some useful actions that allow you to easily edit XML markup in Author mode. Most of these actions are available in the contextual menu and some of them have simple keyboard shortcuts.

### Selecting XML Markup in Author Mode

Selecting XML tags in Oxygen XML Editor plugin is very simple with several methods for selecting entire elements:

- **Breadcrumb** - Click the element (XML tag) on the breadcrumb (page 684) displayed at the top of the editing window.
- **Outline View** - Click the element name in the Outline view (page 316).
• **Full Tags Mode** - While editing in **Full Tags mode (page 331)**, click the start or end tag of the element in the editor.

• **Mouse Selection** - While editing in **Full Tags mode (page 331)**, click before the start tag of the element, drag the selection, and release the mouse button after the end tag.

• **Shift + Arrow Keys** - While editing in **Full Tags mode (page 331)**, place the cursor before the start tag of the element, press and hold **Shift**, and use the arrow keys to make the selection (including the end tag).

**Note:** If the selection does not include the entire element (for example you do not include the end tag of the element), Oxygen XML Editor plugin will automatically close the appropriate tags when pasting the copied selection. This ensures that the pasted content will always result in well-formed **XML (page 854)**.

### Using the Breadcrumb in Author Mode

A **breadcrumb** on the top stripe indicates the path from document root to the current element. It can also be used as a helpful tool to insert and edit specific elements in the document structure.

**Figure 91: Breadcrumb in Author Mode**

The last element listed in the breadcrumb is the element at the current cursor position. The last element is also highlighted by a thin light blue bar for easier identification. Clicking an element from the breadcrumb selects the entire element in the editor area and each element provides a contextual menu with access to the following actions:

- **Edit Attributes**

  Opens the **in-place attributes editor (page 322)** that allows you to easily edit the attributes of an element.

- **Edit Profiling Attributes**

  Allows you to select the **profiling attributes (page 746)** that apply to a certain element.

- **Append child**

  Opens a content completion list that allows you to select an element to be inserted as a child of the selected element.

- **Insert before**

  Opens a content completion list that allows you to select an element to be inserted (as a sibling) before the selected element.

- **Insert after**
Opens a content completion list that allows you to select an element to be inserted (as a sibling) after the selected element.

Cut

Removes the selected element and copies it to the clipboard, while preserving the styles of the content.

Copy

Copies the selected element to the clipboard, while preserving the styles of the copied content.

Paste

Pastes a well-formed element from the clipboard at currently selected position in the breadcrumb.

Paste before

Insert a well-formed element (from the clipboard) before the currently selected element.

Paste after

Insert a well-formed element (from the clipboard) after the currently selected element.

Paste as XML

Inserts clipboard content that is considered to be well-formed XML content, preserving its XML structure.

Delete

Deletes the currently selected element.

Toggle Comment

Encloses the currently selected element in an XML comment, if the element is not commented, or removes the comment if it is commented.

Rename Element

Opens the Rename dialog box that allows you to rename the currently selected element and other elements with the same name.

Tip: The tag names displayed in the breadcrumb can be customized with an Author mode extension class that implements the AuthorBreadCrumbCustomizer API. See the Oxygen SDK for more details.
Move Nodes

You can move XML nodes in the current document by using the following actions in the Refactoring submenu of the contextual menu:

Move Up (Alt + UpArrow)

Moves the current node or selected nodes in front of the previous node.

Move Down (Alt + DownArrow)

Moves the current node or selected nodes after the subsequent node.

Tip: The easiest way to move nodes is to use the Alt + UpArrow and Alt + DownArrow shortcut keys.

Promote/Demote List Item Nodes

You can easily promote or demote selected list item nodes within ordered lists or unordered lists by using the following keyboard shortcuts:

Promote (Shift + Tab)

Promotes an entirely selected list item node to be a sibling of its parent node (the list item is moved to the left). It also works for selections of multiple list item nodes as long as all the selected nodes are siblings (on the same hierarchical level).

Demote (Tab)

Demotes an entirely selected list item node (the list item is moved to the right). It also works for selections of multiple list item nodes as long as all the selected nodes are siblings (on the same hierarchical level).

Join or Split Elements

You can join or split elements in the current document by using the following actions in the Refactoring submenu of the contextual menu:

Join Elements

Joins two adjacent block elements (page 2703) that have the same name. The action is available only when the cursor position is between the two adjacent block elements. Also, joining two block elements can be done by pressing the Delete or Backspace keys and the cursor is positioned between the boundaries of these two elements.

Tip: Specifically, the Delete or Backspace keys can be used to join block elements in the following situations:
• The cursor is located before the end position of the first element and **(Delete)** key is pressed.
• The cursor is located after the end position of the first element and **(Backspace)** key is pressed.
• The cursor is located before the start position of the second element and **(Delete)** key is pressed.
• The cursor is located after the start position of the second element and **(Backspace)** key is pressed.

If the element has no sibling or the sibling element has a different name, an **Unwrap** operation will be performed.

**Split Element**

Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

**Rename Elements**

You can rename elements by using the following action in the **Refactoring** submenu of the contextual menu:

**Rename Element**

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the **Rename** dialog box.

**Surround Content with Tags (Wrap)**

You can surround a selection of content with tags (**wrap** the content) by using the following action in the **Refactoring** submenu of the contextual menu:

**Surround with Tags (Alt + Shift + E)**

Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

• If the **Position cursor between tags option (page 101)** is selected in the **Content Completion** preferences page, the cursor is placed between the start and end tag.
• If the **Position cursor between tags option (page 101)** is not selected in the **Content Completion** preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

**Surround with `[tag]` (Alt + Shift + ForwardSlash)**
Surround the selected content with the last tag used.

**Unwrap the Content of Elements**

You can unwrap the content of an element by using the following action in the *Refactoring* submenu of the contextual menu:

- **Delete Element Tags**
  
  Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the *Delete* or *Backspace* keys.

  **Tip:** Specifically, the *Delete* or *Backspace* keys can be used to unwrap the content of an element in the following situations:

  - The cursor is located before the start position of the element and *(Delete)* key is pressed.
  - The cursor is located after the start position of the element and *(Backspace)* key is pressed.
  - The cursor is located before the end position of the element and *(Delete)* key is pressed.
  - The cursor is located after the end position of the element and *(Backspace)* key is pressed.

If the element has no sibling or the sibling element has a different name, an *Unwrap* operation will be performed.

**Remove Markup from Blocks of Content**

You can remove the markup from the current element by highlighting the appropriate block of content and using the following action in the *Refactoring* submenu of the contextual menu:

- **Remove All Markup**
  
  Removes all the XML markup inside the selected block of content and keeps only the text content.

  **Tip:** You can use the *(Delete)* or *(Backspace)* keys to remove markup, in which case the elements in the selected block will be unwrapped or joined with their sibling, or if the current element is empty, the element tags will be deleted.

**Remove Text from Selected Markup**

You can remove the text from elements by highlighting the appropriate block of content and using the following action in the *Refactoring* submenu of the contextual menu:

- **Remove Text**
Removes the text content of the selected block of content and keeps the markup intact with empty elements.

**Other Refactoring Actions**

You can also manage the structure of the markup by using the other specific XML refactoring actions that are available in the **Refactoring** submenu of the contextual menu:

**DITA Refactoring Actions**

A variety of built-in XML refactoring operations that pertain to DITA documents with some of the information preconfigured based upon the current context.

**Change Topic ID to File Name**

Use this operation to change the ID of a topic to be the same as its file name.

**Convert CALS Tables to Simple Tables**

Use this operation to convert DITA CALS tables to simple tables. If you invoke this operation from a nested table (a table inside a table), only the nested table will be affected. If it is invoked on a parent table that contains nested tables, all of the contained tables will be converted.

**Convert conrefs to conkeyrefs**

Use this operation to convert `conref` attributes to `conkeyref` attributes.

**Convert Simple Tables to CALS Tables**

Use this operation to convert DITA simple tables to CALS tables. If you invoke this operation from a nested table (a table inside a table), only the nested table will be affected. If it is invoked on a parent table that contains nested tables, all of the contained tables will be converted.

**Convert to Concept**

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

**Convert to General Task**

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA General Task is a less restrictive alternative to the Strict Task information type.

**Convert to Reference**

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).
Convert to Task
Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

Convert to Topic
Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

Convert to Troubleshooting
Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

Rename Key
Available when invoked on a key, and can be used to quickly rename a key. It also updates all references to it. Note that it does not work on DITA 1.3 key scopes.

Attributes Refactoring Actions
Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

Add/Change attribute
Allows you to change the value of an attribute or insert a new one.

Convert attribute to element
Allows you to change an attribute into an element.

Delete attribute
Allows you to remove one or more attributes.

Rename attribute
Allows you to rename an attribute.

Replace in attribute value
Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

Comments Refactoring Actions
Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

Delete comments
Allows you to delete comments found inside one or more elements.
Elements Refactoring Actions

Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

Delete element

Allows you to delete elements.

Delete element content

Allows you to delete the content of elements.

Insert element

Allows you to insert new elements.

Rename element

Allows you to rename elements.

Unwrap element

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

Wrap element

Allows you to surround elements with element tags.

Wrap element content

Allows you to surround the content of elements with element tags.

Fragments Refactoring Actions

Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

Insert XML fragment

Allows you to insert an XML fragment.

Replace element content with XML fragment

Allows you to replace the content of elements with an XML fragment.

Replace element with XML fragment

Allows you to replace elements with an XML fragment.

Editing Attributes in Author Mode

You can easily edit attributes in Author mode by using the Attributes View (page 319) and Oxygen XML Editor plugin also allows you to edit attribute and element values in-place, directly in the Author mode, using an in-place attribute editor.

**In-place Attributes Editor**

Oxygen XML Editor plugin includes an in-place attributes editor in Author mode. To edit the attributes of an XML element in-place, do one of the following:

- Select an element or place the cursor inside it and then press the Alt + Enter keyboard shortcut.
- Double-click any named start tag when the document is edited in one of the following display modes. (page 331): Full Tags with Attributes, Full Tags, Block Tags, or Inline Tags.

This opens an in-place attributes editor that contains the same content as the Attributes view. By default, this editor presents the Name and Value fields, with the list of all the possible attributes collapsed.

*Figure 92: In-place Attributes Editor*

![In-place Attributes Editor](image)

**Name Combo Box**
Use this combo box to select an attribute. The drop-down list displays the list of possible attributes allowed by the schema of the document, as in the Attributes view.

**Value Combo Box**

Use this combo box to add, edit, or select the value of an attribute. If the selected attribute has predefined values in the schema, the drop-down list displays those possible values. You can use the Browse button to select a URL for the value of an attribute. You can also press Ctrl + Space to open a content completion window that offers a list of possible choices and allows you to select multiple values.

**Note:** For built-in frameworks, if the selected attribute in the Name field is an @id attribute, the Browse button is replaced by a Generate Unique ID Value button. Clicking this button will automatically generate a unique ID for the selected element.

If you click More while in the collapsed version, it is expanded to the full version of the in-place attribute editor.

**Figure 93: In-place Attributes Editor (Full Version)**

The full version includes a table grid, similar to the Attributes view, that presents all the attributes for the selected element.

**Note:** If the cursor is located inside read-only content, the attribute names and values are faded and you cannot add, edit, or remove values.

Folding XML Elements in Author Mode

When working with a large document, the folding (page 2706) support in Oxygen XML Editor plugin can be used to collapse some element content leaving only the parts that you need to edit in focus. Expanding and collapsing works on individual elements. Expanding an element leaves the child elements unchanged.

Folding Actions in Author Mode

Foldable elements (page 2706) are marked with a small triangle (.folded\) on the left side of the editor panel. If you hover over that arrow, the entire content of the element is highlighted by a dotted border for quick identification of the foldable area. To toggle the fold, simply click the icon. Also, the following actions are available in the Folding sub-menu of the contextual menu:

- **Toggle Fold (or you can simply click on the \folded\ arrow)**
  Toggles the state of the current fold.

- **Collapse Other Folds (Ctrl + NumPad/ (Command + NumPad/ on OS X))**
  Folds all the elements except the current element.

- **Collapse Child Folds (Ctrl + NumPad- (Command + NumPad- on OS X))**
  Folds the child elements that are indented one level inside the current element.

- **Expand Child Folds (Ctrl + NumPad+ (Command + NumPad+ on OS X))**
  Unfolds all child elements of the currently selected element.

- **Expand All (Ctrl + NumPad* (Command + NumPad* on OS X))**
  Unfolds all elements in the current document.
For more information about the folding support in Oxygen XML Editor plugin, watch our video demonstration:

Drag and Drop in Author Mode

The Oxygen XML Editor plugin Author mode includes support for dragging and dropping content in XML documents.

When editing content in Author mode, entire sections or chunks of data can be moved or copied by using the drag and drop feature. The following situations can be encountered:

- When both of the drag and drop sources are from the Author mode editor, a well-formed XML fragment is transferred. The section is balanced before dropping it by adding matching tags when needed.
- When the drag source is from the Author mode editor but the drop target is a text-based editor, only the text inside the selection is transferred as it is.
- The text dropped from another text editor or another application into the Author mode editor is inserted without changes.

Related Information:

- Smart Paste Mechanism (page 696)

Smart Paste Mechanism

The Author editing mode includes a Smart Paste feature that preserves certain style and structure information when copying content and pasting it into document types that support the feature. You can copy content from various sources, including web pages, external applications (such as Office-type applications), or other document types within Oxygen XML Editor plugin, and then paste it into DITA, TEI, DocBook, JATS, and XHTML documents. Oxygen XML Editor plugin preserves the original
text styling (such as bold, italics, underline) and formatting (such as lists, tables, paragraphs) and considers various pasting solutions to keep the resulting document valid.

The styles and general layout of the pasted content are converted to the equivalent XML markup for the target document type while preserving certain style and structure information. For example, if you copy content that includes multiple paragraphs and then paste it in **Author** mode, the multiple paragraph structure is preserved. If you paste the content in a location where the resulting XML would not be valid, Oxygen XML Editor plugin will attempt to place it in a valid location, and may prompt you with one or more choices for where to place it.

**Tip:** When pasting text fragments formatted with the *Courier New* font, the **Smart Paste** mechanism will wrap it in an inline code element (for example, in DITA it would be wrapped in a `codeph` element).

### Smart Paste Options

By default, the **Smart Paste** feature is enabled in Oxygen XML Editor plugin. There are several options in the **Schema Aware** preferences page (page 128) that control the **Smart Paste** mechanism:

- **Smart paste and drag and drop** (page 129) - This option determines whether or not Oxygen XML Editor plugin will try to find an appropriate insert position when the current location is not valid for the pasted content. This option is selected by default.
- **Reject action when its result is invalid** (page 129) - If you select this option, Oxygen XML Editor plugin will not let you paste content into a position where it would be invalid. This option is deselected by default.
- **Convert external content on paste** (page 131) - This option determines whether or not Oxygen XML Editor plugin will convert the styling and formatting of copied content from external sources when pasting it into a document type that supports the feature. This option is selected by default.
- **Convert even when pasting inside space-preserve elements** (page 131) - If you select this option, the **Smart Paste** feature will also work when pasting external content into a space-preserve element (such as a `codeblock`). This option is deselected by default.

### Smart Paste Supported Document Types

The **Smart Paste** feature is supported for the following document types (**frameworks** (page 2706)):

- DITA
- DocBook 4
- DocBook 5
- TEI
- XHTML
• JATS

**Selecting Content in Author Mode**

Oxygen XML Editor plugin includes a variety of keyboard shortcuts that allow you to easily select content in *Author* mode.

**Selection Shortcuts in Author Mode**

**Ctrl + A (Meta + A on Mac OS X)**

Selects all content in the document.

**Shift + Left/Right Arrow Keys**

Beginning a continuous selection at the cursor position and extends it one character at a time in the direction that you press the arrow keys.

**Shift + Up/Down Arrow Keys**

Beginning a continuous selection at the cursor position and extends it one line at a time in the direction that you press the arrow keys.

**Ctrl + Shift + Left/Right Arrow Keys (Meta + Shift + Left/Right Arrow Keys on Mac OS X)**

Beginning a continuous selection at the cursor position and extends it one word at a time in the direction that you press the arrow keys.

**Shift + Home**

Beginning a continuous selection at the cursor position and extends it to the beginning of the current line (on Mac OS X, it extends to the beginning of the document).

**Shift + End**
Begins a continuous selection at the cursor position and extends it to the end of the current line (on Mac OS X, it extends to the end of the document).

**Ctrl + Shift + Home**

Begins a continuous selection at the cursor position and extends it to the beginning of the document.

**Ctrl + Shift + End**

Begins a continuous selection at the cursor position and extends it to the end of the document.

**Shift + PageUp**

Begins a continuous selection at the cursor position and extends it up one screen page.

**Shift + PageDown**

Begins a continuous selection at the cursor position and extends it down one screen page.

**Double-Click**

Selects the word at the cursor position.

**Triple-Click**

Selects the node at the cursor position.

**Right-Click > Select > Element**

Selects the entire element at the current cursor position.

**Right-Click > Select > Content**

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

**Right-Click > Select > Parent**

Selects the entire parent element at the current cursor position.

**Content Completion Assistant in Author Mode**

One of the most useful features in **Author** mode is the **Content Completion Assistant** (page 2704). It offers a list of elements, attributes, attribute values, and other options that are valid in the current editing context.

*Figure 95: Content Completion Assistant in Author Mode*
The Content Completion Assistant is enabled by default. To disable it, open the Preferences dialog box (page 55), go to Editor > Content Completion, and deselect the Enable content completion option (page 101).

Using the Content Completion Assistant in Author Mode

To activate the feature in Author mode, use any of the following shortcut keys:

- Enter
- Ctrl + Space (Command + Space on OS X)
- Alt + ForwardSlash (Command + Alt + ForwardSlash on OS X)

You can navigate through the list of proposals by using the Up and Down keys on your keyboard. In some cases, the Content Completion Assistant displays a documentation window with information about the particular proposal and some of them have links to additional information (for example, DITA elements might have a link to the DITA Style Guide). You can use Tab and Shift + Tab to navigate to those links and Space to trigger them. You can also change the size of the documentation window by dragging its top, right, and bottom borders.

To insert the selected proposal in Author mode, simply press Enter.

Types of Proposals Listed in the Content Completion Assistant

The Content Completion Assistant offers the following types of proposed actions depending on the current context:

- Insert allowed elements for the current context schema and the list of proposals contains elements depending on the elements inserted both before and after the cursor position.
- Insert element values if such values are specified in the schema for the current context.
- Insert new undeclared elements by entering their name in the text field.
- Insert CDATA sections, comments, processing instructions.
- Insert code templates (page 639).
If invoked on a selection that only contains an element start or end tag (remember that you can see all element tags while working in Full Tags mode (page 331)), it will allow you to rename the element.

If invoked on a selection of multiple elements or other content, it will allow you to surround the content with certain tags.

If invoked on an empty list item that is the last element of the list, it will allow you to convert the list item to a paragraph.

If the Show all possible elements in the content completion list option from the Schema-Aware preferences page (page 130) is selected, the content completion pop-up window will present all the elements defined by the schema. When choosing an element from this section, the insertion will be performed using the schema-aware smart editing features.

**Note:** By default, you are not allowed to insert element names that are not defined by the schema. This can be changed by deselecting the Allow only insertion of valid elements and attributes check box from the Schema-Aware preferences page (page 130).

### Examples of How the Content Completion Assistant Works

To illustrate how the feature works, consider the following examples of invoking the Content Completion Assistant in certain contexts:

- If the cursor is positioned at the beginning or at the end of the element, the first item offered in the Content Completion Assistant is a **New <Element>** item. Selecting this item will insert an empty element.

  *Figure 96: Example (New [Element Name]*)

- If the cursor is positioned somewhere inside the element, the first entry in the Content Completion Assistant is a **Split <Element>** item. In most cases, you can only split the closest block element (page 2703) to the cursor position, but if it is inside a list item, the list item will also be proposed for split. Selecting **Split <Element>** splits the content of the specified element around the cursor position.

  *Figure 97: Example (Split [Element Name]*)
• If the cursor is positioned inside a **space-preserved element (page 2711)** (for example, a **codeblock**), the first choice in the **Content Completion Assistant** is **Enter**, which will insert a new line in the content of the element, followed by **New <Element>**.

*Figure 98: Example (‘ENTER’ New Line)*

• If invoked on a selection that only contains an element start or end tag (remember that you can see all element tags while working in **Full Tags mode (page 331)**), it will allow you to rename the element.

*Figure 99: Example (Rename)*

• If invoked on a selection of multiple elements or other content, it will allow you to surround the content with certain tags.

*Figure 100: Example (Surround)*

**Related Information:**
Set the Schema to be Used for Content Completion

The proposals that are presented in the Content Completion Assistant (page 2704) depend on the associated schemas. The DTD, XML Schema, Relax NG, or NVDL schema used to populate the Content Completion Assistant is specified in the following methods, in the order of their precedence:

- The schema specified explicitly in the document (page 894). In this case, Oxygen XML Editor plugin reads the beginning of the document and resolves the location of the DTD, XML Schema, Relax NG schema, or NVDL schema.
- The default schema declared (page 896) in the Schema tab of the Document Type configuration dialog box (page 75) for the particular document type.

Schema Annotations in Author Mode

A schema annotation is a documentation snippet associated with the definition of an element or attribute in a schema. If such a schema is associated with an XML document, the annotations are displayed in the Content Completion Assistant (page 2704).

Figure 101: Schema Annotation in the Content Completion Assistant

The schema annotations support is available if the schema type is one of the following:

- XML Schema
- Relax NG
- NVDL schema
- DTD

This feature is enabled by default, but you can disable it by deselecting the Show annotations in Content Completion Assistant (page 103) option in the Annotations preferences page.
Styling Annotations with HTML

You can use HTML format in the annotations you add in an XML Schema or Relax NG schema. This improves the visual appearance and readability of the documentation window displayed when editing XML documents validated against such a schema. An annotation is recognized and displayed as HTML if it contains at least one HTML element (such as `div`, `body`, `p`, `br`, `table`, `ul`, or `ol`).

The HTML rendering is controlled by the Show annotations using HTML format, if possible (page 103) option in the Annotations preferences page. When this option is deselected, the annotations are converted and displayed as plain text and if the annotation contains one or more HTML tags (`p`, `br`, `ul`, `li`), they are rendered as an HTML document loaded in a web browser. For example, `p` begins a new paragraph, `br` breaks the current line, `ul` encloses a list of items, and `li` encloses an item of the list.

Collecting Annotations from XML Schemas

In an XML Schema, the annotations are specified in an `<xs:annotation>` element like this:

```xml
<xs:annotation>
   <xs:documentation>
      Description of the element.
   </xs:documentation>
</xs:annotation>
```

If an element or attribute does not have a specific annotation, then Oxygen XML Editor plugin looks for an annotation in the type definition of that element or attribute.

Collecting Annotations from Relax NG Schemas

For Relax NG schema, element and attribute annotations are made using the `<documentation>` element from the `http://relaxng.org/ns/compatibility/annotations/1.0` namespace like this:

```xml
<define name="person">
   <element name="person">
      <a:documentation xmlns:a="http://relaxng.org/ns/compatibility/annotations/1.0">
         Information about a person.
      </a:documentation>
      <ref name="name"/>
      <zeroOrMore>
         <ref name="email"/>
      </zeroOrMore>
   </element>
</define>
```
However, any element outside the Relax NG namespace (http://relaxng.org/ns/structure/1.0) is handled as annotation and the text content is displayed in the annotation window. To activate this behavior, select the Use all Relax NG annotations as documentation (page 104) option in the Annotations preferences page.

### Collecting Annotations from Relax NG Compact Syntax Schemas

For Relax NG Compact Syntax schema, annotations are made using comments like this:

```xml
## Information about a person.
element person { name, email*}
```

### Collecting Annotation from DTDs

For DTD, Oxygen XML Editor plugin defines a custom mechanism for annotations using comments enabled by the Prefer DTD comments that start with "doc:" as annotations (page 103) option in the Annotations preferences page. The following is an example of a DTD annotation:

```xml
<!--doc:Description of the element. -->
```

### Content Completion Helper Views

Information about the current element being edited is also available in various dockable (page 2705) views, such as the Model view (page 263), Attributes view (page 261), Elements view (page 265), and Entities view (page 266). By default, they are located on the right-hand side of the main editor window. These views, along with the powerful Outline view (page 257), provide spatial and insight information about the edited document and the current element. If any particular view is not displayed, it can be opened by selecting it from the Window > Show View menu.

**Model View**
The **Model** view presents the structure of the currently selected tag, and its documentation, defined as annotation in the schema of the current document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

**Figure 102: Model View**

![Model View](image)

The **Model** view is comprised of two sections, an element structure panel and an annotations panel.

**Element Structure Panel**

The element structure panel displays the structure of the currently edited or selected tag in a tree-like format. The information includes the name, model, and attributes of the current tag. The allowed attributes are shown along with imposed restrictions, if any.

**Figure 103: Element Structure Panel**

![Element Structure Panel](image)
The **Annotation** panel displays the annotation information for the currently selected element. This information is collected from the XML schema.

**Attributes View in Author Mode**

The **Attributes** view presents all the attributes of the current element determined by the schema of the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

You can use this view to edit or add attribute values. The attributes of an element are editable if any one of the following is true:

- The CSS stylesheet associated with the document does not specify a **false** value for the **-oxy-editable** *(page 2229)* property associated with the element.
- The element is entirely included in a deleted **Track Changes** *(page 719)* marker.
- The element is part of a content fragment that is referenced in **Author** mode from another document.

The attributes are rendered differently depending on their state:
• The names of the attributes are rendered with a bold font, and their values with a plain font.
• Default values are rendered with a plain font, painted gray.
• Empty values display the text "[empty]", painted gray.
• Invalid attributes and values are painted red.

To edit the value of the corresponding attribute, double-click a cell in the Value column. If the possible values of the attribute are specified as list in the schema of the edited document, the Value column acts as a combo box that allows you to either select the value from a list or manually enter it.

**Note:** If the cursor is located inside read-only content, the attribute names and values are faded and you cannot add, edit, or remove values.

You can sort the attributes table by clicking the Attribute column header. The table contents can be sorted as follows:

• By attribute name in ascending order.
• By attribute name in descending order.
• Custom order, where the used attributes are displayed at the beginning of the table sorted in ascending order, followed by the rest of the allowed elements sorted in ascending order.

![Figure 105: Attributes View](image)

A drop-down list located in the upper part of the view allows you to select the current element or its ancestors.

**Contextual Menu Actions in the Attributes View**

The following actions are available in the contextual menu of the Attributes view when editing in Author mode:
Set empty value

Specifies the current attribute value as empty.

Remove

Removes the attribute (action available only if the attribute is specified). You can invoke this action by pressing the (Delete) or (Backspace) keys.

Copy

Copies the attrName="attrValue" pair to the clipboard. The attrValue can be:

• The value of the attribute.
• The value of the default attribute, if the attribute does not appear in the edited document.
• Empty, if the attribute does not appear in the edited document and has no default value set.

Paste

Depending on the content of the clipboard, the following cases are possible:

• If the clipboard contains an attribute and its value, both of them are introduced in the Attributes view. The attribute is selected and its value is changed if they exist in the Attributes view.
• If the clipboard contains an attribute name with an empty value, the attribute is introduced in the Attributes view and you can start editing it. The attribute is selected and you can start editing it if it exists in the Attributes view.
• If the clipboard only contains text, the value of the selected attribute is modified.

In-place Attributes Editor

Oxygen XML Editor plugin includes an in-place attributes editor in Author mode. To edit the attributes of an XML element in-place, do one of the following:

• Select an element or place the cursor inside it and then press the Alt + Enter keyboard shortcut.
• Double-click any named start tag when the document is edited in one of the following display modes. (page 331): Full Tags with Attributes, Full Tags, Block Tags, or Inline Tags.

This opens an in-place attributes editor that contains the same content as the Attributes view. By default, this editor presents the Name and Value fields, with the list of all the possible attributes collapsed.

Figure 106: In-place Attributes Editor
Name Combo Box

Use this combo box to select an attribute. The drop-down list displays the list of possible attributes allowed by the schema of the document, as in the Attributes view.

Value Combo Box

Use this combo box to add, edit, or select the value of an attribute. If the selected attribute has predefined values in the schema, the drop-down list displays those possible values. You can use the Browse button to select a URL for the value of an attribute. You can also press Ctrl + Space to open a content completion window that offers a list of possible choices and allows you to select multiple values.

Note: For built-in frameworks, if the selected attribute in the Name field is an @id attribute, the Browse button is replaced by a Generate Unique ID Value button. Clicking this button will automatically generate a unique ID for the selected element.

If you click More while in the collapsed version, it is expanded to the full version of the in-place attribute editor.

Figure 107: In-place Attributes Editor (Full Version)
The full version includes a table grid, similar to the Attributes view, that presents all the attributes for the selected element.

**Elements View in Author Mode**

The **Elements** view presents a list of all defined elements that are valid at the current cursor position according to the schema associated to the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

The upper part of the view features a combo box that contains the ordered ancestors of the current element. Selecting a new element in this combo box updates the list of the allowed elements. By default, only the elements that are allowed at the current cursor position are listed. However, if the **Show only items allowed at cursor position** option ([page 161](#)) is not selected in the **View preferences** page ([page 160](#)), two additional tabs (Before and After) will be displayed at the bottom of the view and they list elements that are allowed before or after the element at the current cursor position.

Double-clicking any of the listed elements inserts that element into the edited document and its position depends on the tab.

- **Cursor** tab - Double-clicking an element inserts it at the current cursor position.
- **Before** tab - Double-clicking an element inserts it before the element at the cursor position.
- **After** tab - Double-clicking an element inserts it after the element at the cursor position.

Pressing **F2** with an element selected will display information about that particular element.

*Figure 108: Elements View in Author Mode*

```

Entities View
```
Entities provide abbreviated entries that can be used in XML files when there is a need of repeatedly inserting certain characters or large blocks of information. An entity is defined using the `ENTITY` statement either in the DOCTYPE declaration or in a DTD file associated with the current XML file.

There are three types of entities:

- **Predefined** - Entities that are part of the predefined XML markup (`&lt;`, `&gt;`, `&amp;`, `&apos;`, `&quot;`).
- **Internal** - Defined in the DOCTYPE declaration header of the current XML.
- **External** - Defined in an external DTD module included in the DTD referenced in the XML DOCTYPE declaration.

**Note:** If you want to add internal entities, you would need to switch to the Text editing mode and manually modify the DOCTYPE declaration. If you want to add external entities, you need to open the DTD module file and modify it directly.

The Entities view displays a list with all entities declared in the current document, as well as built-in ones. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

Double-clicking one of the entities will insert it at the current cursor position in the XML document. You can also sort entities by name and value by clicking the column headers.

**Figure 109: Entities View**

![Entities View](image)

The view features a filtering capability that allows you to search an entity by name, value, or both. Also, you can choose to display the internal or external entities.
Note: When entering filters, you can use the ? and * wildcards. Also, you can enter multiple filters by separating them with a comma.

Code Templates

Code templates are code fragments that can be inserted quickly at the current editing position. Oxygen XML Editor plugin includes a set of built-in code templates for CSS, Schematron, XSL, XQuery, JSON, and XML Schema document types. You can also define your own code templates for any type of file and share them with others.

Code templates are displayed with a .tt symbol in the content completion list (Enter in Author mode or Ctrl + Space (Command + Space on OS X) in Text mode). Also, in Text mode you can press Ctrl + Shift + Space to see a complete list of the available code templates. To enter the code template at the cursor position, select it from the content completion list or type its code and press Enter. If a shortcut key has been assigned to the code template, you can also use the shortcut key to enter it.

How to Create Code Templates

To create a code template, follow these steps:

1. Open the Preferences dialog box (page 55) and go to Editor > Templates > Code Templates.
2. Click New to open a code template configuration dialog box.

   Tip: You can use one of the existing code templates as a starting point by selecting that template and clicking Duplicate.

Figure 110: Code Template Configuration Dialog Box

3. Configure your template using the fields in the code template configuration dialog box:
   - Name - The name of the code template.
• **Description** - [Optional] The description of the code template that will appear in the **Code Templates** preferences page and in the tooltip message when selecting it from the **Content Completion Assistant** (page 2704). HTML markup can be used for better rendering.

• **Associate with** - You can choose to set the code template to be associated with a specific type of editor or for all editor types.

• **Shortcut key** - [Optional] If you want to assign a shortcut key that can be used to insert the code template, place the cursor in the **Shortcut key** field and press the desired key combination on your keyboard. Use the **Clear** button if you make a mistake. If the **Enable platform-independent shortcut keys** checkbox is selected, the shortcut is platform-independent and the following modifiers are used:
  - $M_1$ represents the **Command** key on MacOS X, and the **Ctrl** key on other platforms.
  - $M_2$ represents the **Shift** key.
  - $M_3$ represents the **Option** key on MacOS X, and the **Alt** key on other platforms.
  - $M_4$ represents the **Ctrl** key on MacOS X, and is undefined on other platforms.

• **Content** - Text box where you define the content that is used when the code template is inserted. An [editor variable](page 201) can be inserted in the text box using the **Insert Editor Variables** button.

4. Click **OK** to save your new code template.

**Result:** Your code template can now be selected using the **Content Completion Assistant** (page 2704) (**Enter** in **Author** mode or **Ctrl + Space** (**Command + Space on OS X**) in **Text** mode). The code templates are displayed with a ⭐ symbol.

### How to Share Code Templates

There are two ways to easily share all of your code templates with other members of your team:

#### Method 1: Export/Import

1. Open the **Preferences** dialog box (page 55) and go to **Editor > Templates > Code Templates**.
2. Click the **Export** button to export all of your code templates into an XML file.
3. Save the XML file.
4. Share the XML file with other members of your team.
5. Instruct them to open the **Preferences** dialog box (page 55), go to **Editor > Templates > Code Templates**, click the **Import** button, and select the file you sent them.

**Result:** The code templates will be now available in their content completion list.

#### Method 2: Share Project

1. Open the **Preferences** dialog box (page 55) and go to **Editor > Templates > Code Templates**.
2. Select **Project Options** at the bottom of the dialog box. This stores the preferences in the project file (.xpr).

3. Share the project file with the other members of your team. For example, you can commit it to your version control system and have them update their working copy.

   **Result:** When they open the updated project file in their **Navigator view** (page 250), the code templates will be available in their content completion list.

   **Tip:** It is also possible to configure certain actions that function similar to code templates and add them to the content completion list (page 2067) for a particular framework. You could then share the whole framework (page 2086) with other members of your team.

**Reviewing Documents**

Oxygen XML Editor plugin includes a variety of helpful review tools that improve your ability to collaborate with other members of your team, track changes, mark content for various reasons, add comments in your content, and to manage the review features.

**Tracking Document Changes**

The **Track Changes feature** (page 2711) is a way to keep track of the changes you make in a document. The **Track Changes** feature highlights changes that you make to the content in a document, as well as changes to attributes. Changes can be tracked for insertions and deletions. When the **Track Changes feature is activated** (page 721), insertions are rendered in **Author mode** with an underline while deletions are rendered with a strike through.

The tracked changes are also displayed in the **Review view** (page 742) and you can also choose to present the changes in **callouts** (page 735) by selecting the **Track Changes Deletions** (page 127) and **Track Changes Insertions** (page 127) options in the **Callouts preferences page** (page 127).

**Adding Comments in Documents**

You can associate a comment to a selected area of content. Comments can highlight virtually any content from your document, with the exception of *read-only* text. The difference between using comments and change tracking is that a comment can be associated to an area of text without modifying or deleting the text.

Comments are presented in **callouts** (page 735) with persistent highlights and a colored background. The background color is assigned automatically by the application, but it can also be customized from the **Review preferences page** (page 124).
Highlighting Content

Oxygen XML Editor plugin includes a highlighting feature that allows you to create digital markers to emphasize important fragments of your documents. This is especially useful when you want to mark content that needs additional work or the attention of others.

Using the Review View

Oxygen XML Editor plugin includes a Review view (page 742) that provides a simplified way of monitoring all the insertions, deletions, comments, and highlights in an XML document. This handy tool is especially useful for large teams that need to gather and manage all the edits from team members who are working on the same project.

The Review view is also useful for managing tracked changes and comments in a single panel. In this view, the changes and comments are presented in a compact form, in the order they appear in the document, and they are synchronized with the changes and comments in the main editing area.

You can use this view to quickly navigate through changes, accept or reject them, or to view and manage comments or highlights. You can also search for specific changes or comments and it includes some filtering options (for example, you can filter it to only show certain types of edits or to only show edits for a particular author).

Printing Review Information

When you print a document from Author mode, whatever review information is shown in the main editing area will be included in the printed output. For example, tracked changes will be included and as long as the Comments option (page 127) is selected in the Callouts preferences page (page 127), comment callouts will also be included (same with tracked change callouts if their corresponding options are selected in the Callouts preferences page (page 127).

Managing Tracked Changes

Oxygen XML Editor plugin includes a Track Changes feature (page 2711) that allows you to review changes that you or other authors have made and then accept or reject them. You can also manage the visualization mode of the tracked changes, add comments to changes, and mark them as being done. These actions are easily accessible from contextual menus, the toolbar, or the Review view (page 742).

The Track Changes feature is also able to keep track of changes you make to attributes in a document and the changes are presented in the Review view (page 742) and Attributes view (page 319).
Types of Tracked Changes

The types of tracked changes include:

- Inserting, deleting content (text or elements)
- Drag and drop content (text or elements)
- Cutting or pasting content (text or elements)
- Inserting, deleting, and changing the structure of tables
- Inserting and editing lists and their content
- Inserting and deleting entities
- Inserting and deleting element tags
- Editing attributes
- Performing a Split operation
- Performing a Surround with operation
- Changes in referenced content (for example, XInclude fragments or DITA conrefs)

**Important:** If you copy content in Author mode that contains tracked changes, the changes will automatically be accepted prior to the content being copied to the clipboard. This filtering is performed only if the selection is not entirely inside a tracked change.

Activating the Change Tracking Feature

To activate the Track Changes feature for the current document, use any of the following methods:

- Click the Track Changes button on the toolbar.
- Select Track Changes from the Review submenu of the contextual menu in the main editing area in Author mode.
- Select Track Changes from the Edit > Review menu.

To activate the Track Changes feature globally for all documents that you open in Oxygen XML Editor plugin, change the Initial State option to Always On (page 124) in the Review preferences page (page 124).

Rendering Tracked Changes in Author Mode

When Track Changes (page 2711) is enabled, your modifications are highlighted using a distinctive color. The colors can be customized from the Review preferences page (page 124), along with the name of the author and the initial state of the feature when you open a document. Insertions are rendered with an underline while deletions are rendered with a strike through.

*Figure 111: Change Tracking in Author Mode*
When hovering over a change a tooltip displays information about the author and modification time.

**Change Tracking Contextual Menu Actions**

You can right-click any change in **Author** mode to access the following contextual menu actions:

- **Accept Change(s)**
  
  Accepts the *Tracked Change (page 2711)* located at the cursor position or all of the changes in a selection. If you select a part of a *deletion or insertion* change, only the selected content is accepted. If you select multiple changes, all of them are accepted. For an *insertion* change, it keeps the inserted text and for a *deletion* change, it removes the content from the document.

- **Reject Change(s)**
  
  Rejects the *Tracked Change (page 2711)* located at the cursor position or all of the changes in a selection. If you select a part of a *deletion or insertion* change, only the selected content is rejected. If you select multiple changes, all of them are rejected. For an *insertion* change, it removes the inserted text and for a *deletion* change, it preserves the original content.

- **Comment Change**
  
  Opens a dialog box that allows you to add a comment to an existing *Tracked Change (page 2711)*. The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.
Change Tracking Toolbar Actions

By default, the toolbar includes the following actions and options for reviewing or tracking changes (page 2711) (similar actions are also available in the **Edit > Review** menu and the **Review** submenu of the contextual menu):

- **Track Changes**
  Enables or disables the **Track Changes** (page 2711) support for the current document.

- **Accept Change(s) combo box**
  This combo box is both a button and a drop-down menu that includes the following actions (when you select an action from the drop-down menu, that action becomes the default action for the combo box button):

  - **✓ Accept Change(s) and Move to Next** - Accepts the **Tracked Change** (page 2711) located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is accepted.
  
  - **✓ Accept Change(s)** - Accepts the **Tracked Change** (page 2711) located at the cursor position or all of the changes in a selection.
  
  - **✓ Accept All Changes** - Accepts all **Tracked Changes** (page 2711) in the current document.

- **Reject Change(s) combo box**
  This combo box is both a button and a drop-down menu that includes the following actions (when you select an action from the drop-down menu, that action becomes the default action for the combo box button):

  - **✗ Reject Change(s) and Move to Next** - Rejects the **Tracked Change** (page 2711) located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is rejected.
  
  - **✗ Reject Change(s)** - Rejects the **Tracked Change** (page 2711) located at the cursor position or all of the changes in a selection.
  
  - **✗ Reject All Changes** - Rejects all **Tracked Changes** (page 2711) in the current document.

- **Comment Change**
Opens a dialog box that allows you to add a comment to an existing Tracked Change (page 2711). The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

Track Changes Visualization Modes Drop-Down Menu

This drop-down menu includes specialized actions that allow you to switch between the following visualization modes:

- **View All Changes/Comments** - This mode is active by default. When you use this mode, all tracked changes are represented in the Author mode.
- **View only Changes/Comments by** - Only the tracked changes made by the author you select are presented.
- **View Final** - This mode offers a preview of the document as if all tracked changes (both inserted and deleted) were accepted.
- **View Original** - This mode offers a preview of the document as if all tracked changes (both inserted and deleted) were rejected. If you attempt to edit the document in this mode, the view mode will switch to View All Changes/Comments.

**Note:** If you use **View Final** mode and **View Original** mode, callouts (page 2704) are not displayed for comments or changes. To display callouts, use the **View All Changes/Comments** mode.

**Highlight**

Enables or disables the Highlight tool (page 734). Use the Highlight drop-down menu to select a new color.

**Add Comment**

Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).

**Show/Edit Comment**

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

**Remove Comment**

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.
Manage Reviews
Opens the Review view (page 742).

Tracked Change Callouts
You can also choose to display insertion and deletion changes in callouts (page 2704) in Author mode. By default, tracked changes are not displayed in callouts, but you can change this behavior by selecting the Track Changes Deletions (page 127) and Track Changes Insertions (page 127) options in the Callouts preferences page (page 127). You can also choose to display the actual content of the deletion or insertion.

By displaying the changes in callouts, you then have access to even more actions, such as the ability to reply or mark them as being done. For more information, see Author Callouts (page 735).

Tracked Changes in the Review View
The Review view (page 742) is also useful for managing tracked changes and comments. In this view, the edits are presented in a compact form, in the order they appear in the document and each edit is marked with a type-specific icon. You can use this view to quickly navigate through changes, accept or reject them, or to add and manage comments for the changes. You can also search for specific changes and it includes some filtering options (for example, you can filter it to only show certain types of changes or to only show changes for a particular author).

For more information, see Review View (page 742).

Tracked Changes XML Source Code
The changes are stored in the document source code as processing instructions and they do not interfere with validation or transformations. For each change, the author name and the modification time are preserved.

Example - Insertion Change: The following processing instruction is an example of how an insertion change is stored in a document:

```xml
<?oxy_insert_start author="John Doe" timestamp="20090408T164459+0300"?>all<?oxy_insert_end?>
```

Example - Deletion Change: The following processing instruction is an example of how a deletion change is stored in a document:

```xml
<?oxy_delete author="John Doe" timestamp="20090508T164459+0300" content="belong"?>
```

Tracked Changes Behavior

The behavior of the Track Changes feature (page 2711) depends on the context, the type of change, and whether or not it is activated.

Inserting Content

If the Track Changes feature is disabled and you insert content, the following behavior is possible:

- Making an insertion in a **Delete** change results in the change being split in two and the content is inserted without being marked as change.
- Making an insertion in an **Insert** change results in the change being split in two and the content is inserted without being marked as change.
- Making an insertion in regular content results in a regular insertion.

If the Track Changes feature is enabled and you insert content, the following behavior is possible:

- Making an insertion in a **Delete** change results in the change being split in two and the current inserted content appears marked as an INSERT.
- Making an insertion in an **Insert** change results in the following:
  - If the original insertion was made by another user, the change is split in two and the current inserted content appears marked as an INSERT by the current author.
  - If the original Insert change was made by the same user, the change is just expanded to contain the inserted content. The creation time-stamp of the previous insert is preserved.
- If inserted in regular content, the current inserted content appears marked as an **Insert** change.
Surrounding Content

If the Track Changes feature is enabled and you surround content in a new XML element, the following behavior is possible:

• Making a surround in a Delete change results in nothing happening.
• Making a surround in an Insert change results in the following:
  ◦ If the original insertion was made by another user, the change is split in two and the surround operation appears marked as being performed by the current author.
  ◦ If the original Insert change was made by the same user, the existing change is just expanded to contain the surrounded content.
• Making a surround in regular content results in the operation being marked as a surround change.

Deleting Characters

If the Track Changes feature is disabled and you delete content character by character, the following behavior is possible:

• Deleting content in an existing Delete change results in nothing happening.
• Deleting content in an existing Insert change results in the content being deleted without being marked as a deletion and the INSERT change shrinks accordingly.
• Deleting in regular content results in a regular deletion.

If the Track Changes feature is enabled and you delete content character by character, the following behavior is possible:

• Deleting content in an existing Delete change results in the following:
  ◦ If the same author created the Delete change, the previous change is marked as deleted by the current author.
  ◦ If another author created the Delete change, nothing happens.
• Deleting content in an existing Insert change results in the following:
  ◦ If the same author created the Insert change, the content is deleted and the Insert change shrinks accordingly.
  ◦ If another author created the Insert change, the Insert change is split in two and the deleted content appears marked as a Delete change by the current author.
• Deleting in regular content results in the content being marked as a Delete change by the current author.
Deleting Selections of Content

If the Track Changes feature is disabled and you delete a selection of content, the following behavior is possible:

- If the selection contains an entire **Delete** change, the change disappears and the content is deleted.
- If the selection intersects with a **Delete** change (starts or ends in one), it results in nothing happening.
- If the selection contains an entire **Insert** change, the change disappears and the content is deleted.
- If the selection intersects with an **Insert** change (starts or ends in one), the **Insert** change is shrunk and the content is deleted.

If the Track Changes feature is enabled and you delete a selection of content, the following behavior is possible:

- If the selection contains an entire **Delete** change, the change is considered as rejected and then marked as deleted by the current author, along with the other selected content.
- If the selection intersects a **Delete** change (starts or ends in one), the change is considered as rejected and marked as deleted by the current author, along with the other selected content.
- If the selection contains an entire **Insert** change, the following is possible:
  - If the **Insert** is made by the same author, the change disappears and the content is deleted.
  - If the **Insert** is made by another author, the change is considered as accepted and then marked as deleted by the current author, along with the other selected content.
- If the selection intersects an **Insert** change (starts or ends in one), the **Insert** change shrinks and the part of the **Insert** change that intersects with the selection is deleted.

Deleting Tags

Assuming you are using any of the Tag Display Modes (page 331) other than **No Tags** and the Track Changes feature is disabled, if you delete a start or end tag, both the start and end tag will be removed, while any content that was inside the element is preserved.

Assuming you are using any of the Tag Display Modes (page 331) other than **No Tags** and the Track Changes feature is enabled, if you delete a start tag of an inline element (page 2707), both the start and end tag are marked as a **Delete** change by the current author, while any content that was inside the element is preserved.
Copying Content

If the *Track Changes* feature is disabled and you copy content, if the copied area contains *Insert* or *Delete* changes (or attribute edits), these are also copied to the clipboard.

If the *Track Changes* feature is enabled and you copy content, if the copied area contains *Insert* or *Delete* changes (or attribute edits), these are all accepted in the content of the clipboard (the changes will no longer be in the clipboard).

Pasting Content

If the *Track Changes* feature is disabled and you paste content, if the clipboard content contains *Insert* or *Delete* changes (or attribute edits), they will be preserved on paste.

If the *Track Changes* feature is enabled and you paste content, if the clipboard content contains *Insert* or *Delete* changes (or attribute edits), all the changes are accepted and then the paste operation proceeds according to the insertion rules.

Tracked Changes Limitations

There are some inherent limitations to the *Change Tracking* feature. These limitations include the following:

- **Limitations to rejected changes** - Recording changes has limitations and there is no guarantee that rejecting all changes will return the document exactly to its original state.

- **Limitations to hierarchical changes** - Recorded changes are not hierarchical, a change cannot contain other changes inside. For example, if you delete an insertion made by another user, then reject the deletion, the information about the author who made the previous insertion is not preserved.

- **Limitations to using certain actions** - Some actions cannot be implemented with the *Track Changes* feature enabled. For example, some of the table-related actions (*Delete Row(s)*, *Delete Column(s)*, *Join Cells*, *Split Cell*) ignore the *Track Changes* feature when executing the action.

Tracked Changes XML Markup

Depending on the type of edits, the following markup appears in the document source code when you activate the *Track Changes* feature:

<table>
<thead>
<tr>
<th>Edit Type</th>
<th>Processing Instruction Start Marker</th>
<th>Processing Instruction End Marker</th>
<th>Attributes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Edit Type</td>
<td>Processing Instruction Start Marker</td>
<td>Processing Instruction End Marker</td>
<td>Attributes</td>
</tr>
<tr>
<td>-------------------</td>
<td>--------------------------------------</td>
<td>-----------------------------------</td>
<td>--------------------------</td>
</tr>
<tr>
<td>Split</td>
<td>&lt;?oxy_insert_start?&gt;</td>
<td>&lt;?oxy_insert_end?&gt;</td>
<td>author, timestamp, type=&quot;split&quot;</td>
</tr>
<tr>
<td>Surround</td>
<td>&lt;?oxy_insert_start?&gt;</td>
<td>&lt;?oxy_insert_end?&gt;</td>
<td>author, timestamp, type=&quot;surround&quot;</td>
</tr>
<tr>
<td>Deletion</td>
<td>&lt;?oxy_delete?&gt;</td>
<td>_</td>
<td>author, timestamp, content</td>
</tr>
<tr>
<td>Comment</td>
<td>&lt;?oxy_comment_start?&gt;</td>
<td>&lt;?oxy_comment_end?&gt;</td>
<td>author, timestamp, comment, mid</td>
</tr>
<tr>
<td>Attribute Change</td>
<td>&lt;?oxy_attributes?&gt;</td>
<td>_</td>
<td>id, type, oldValue, author, timestamp</td>
</tr>
</tbody>
</table>

If a comment intersects another, the `mid` attribute is used to correctly identify start and end processing instruction markers.

Managing Comments

You can add comments to any selected area of content within XML documents, with the exception of read-only content. The difference between using comments and tracked changes (page 271) is that a comment is associated to a selection without modifying or deleting the content.

By default, when you annotate your XML documents, the comments are displayed in the Author mode as callouts (page 2704) (balloons) and they are rendered with a unique name and background for each user. If comments are not currently displayed in callouts, select the Comments option (page 127) in the Callouts preferences page (page 127). Comments are also displayed in the Review view (page 742).

![Figure 112: Comments in Author Mode](image)

Managing Comments in the Main Editor

You can insert and manage comments directly in the main editing area in Author mode.

Add Comment
To insert a comment at the cursor position or on a specific selection of content, select the Add Comment action from the toolbar (or in the Review submenu of the contextual menu).

Tip: When adding or editing a comment, you can use Enter to insert line breaks and Oxygen XML Editor plugin will take the line breaks into account when presenting the callout. You can also use Ctrl + Enter to accept your changes and close the dialog box.

Show/Edit Comments

To edit an existing comment that you have added in the main editing area in Author mode, select the Show/Edit Comments action from the toolbar (or in the Review submenu of the contextual menu). The action opens a dialog box that allows you to see and edit your comment at the cursor position. Note that you cannot edit a comment that was added by another user, so in that case, the dialog box just displays the comment without the possibility of editing it.

Remove Comments

To remove a comment at the cursor position or multiple comments in a selection, select Remove Comment(s) from the toolbar (or in the Review submenu of the contextual menu).

Copy/Paste

If you copy content that includes comments, they will be preserved when you paste it.

Managing Comments in Callouts

As long as the Comments option (page 127) is selected in the Callouts preferences page (page 127), comments are also displayed in callouts (page 735). By displaying the comments in callouts, you then have access to even more actions, such as the ability to reply or mark them as being done. When you right-click a specific comment in its callout, the contextual menu includes the following actions.

Reply

Opens a dialog box that allows you to add a reply to a comment or Tracked Changes (page 2711). When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and Review view (page 742).

Mark as Done

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for Tracked Changes (page 2711) that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited.
unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendents. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

**Show/Edit Comment**

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

**Remove Comment**

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

**Callouts Options**

Select this option to open the Callouts preference page (page 127) where you can configure various callout options.

**Tip:** When adding, editing, or replying to a comment, you can use Enter to insert line breaks and Oxygen XML Editor plugin will take the line breaks into account when presenting the callout. You can also use Ctrl + Enter to accept your changes and close the dialog box.

**Managing Comments in the Review View**

The Review view (page 742) is also useful for managing comments. In this view, comments are presented in a compact form, in the order they appear in the document, along with tracked changes. You can also use this view to search for specific comments and it includes some filtering options (for example, you can filter it to only show comments for a particular author). When you right-click a specific comment in the Review view, the contextual menu includes the following actions.

**Reply**

Opens a dialog box that allows you to add a reply to a comment or Tracked Changes (page 2711). When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and Review view (page 742).

**Mark as Done**

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for Tracked Changes (page 2711) that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular
comment and all of its descendents. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

Show/Edit Comment

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

Remove Comment

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

Show only reviews by ‘<author name>’

Filters the comments to only show comments for the particular author.

Remove all Comments

Removes all comments from the document.

Comments XML Source Code

The comments are stored in the document source code as processing instructions that contain information about the author name and the comment time:

```xml
<?oxy_comment_start author="John Doe" timestamp="20090508T164459+0300" comment="Do not change this content"?>
   Important content
<?oxy_comment_end?>
```

Replies to comments are stored in the document source code as a comment (with information about the author name and time), but with a parentID attribute and its value is the same as the id value of the parent comment.

```xml
<?oxy_comment_start author="Tom" timestamp="20160217T102630+0200" comment="We should not forget about recycling the oil and oil filter!" parentID="vws_x4l_1v" mid="4"?>
```

Managing Highlights

Use the 📝 Highlight tool to mark fragments in your document using various colors. This is especially useful when you want to mark sections that need additional editing or to draw the attention of others to particular content.

Using the Highlight Tool

You can find the 📝 Highlight action on the main toolbar, in the Edit > Review menu, or in the Review submenu of the contextual menu of a document. You can also choose the color to use for the highlight or choose to Stop highlighting from the same menus.

To highlight content, follow these steps:

1. Click the 📝 Highlight icon on the toolbar.
   
   **Step Result:** The highlighting mode is on and the cursor changes to a dedicated symbol.

2. Click the small arrow next to the 📝 Highlight icon and select the color that you want to use for the highlighting.

3. Select the content you want to highlight. To mark multiple parts of a document, press and hold Ctrl (Meta on Mac OS) and select the parts you want to highlight.

4. To exit the highlighting mode, press Esc, click the 📝 Highlight icon, or start editing the document.

To remove highlighting from a document, follow these steps:

1. Either select the text you want to remove highlighting from using your cursor, or press Ctrl + A (Command + A on OS X) if you want to select all of the text.

2. Click the small arrow next to the 📝 Highlight icon and select No color (erase), or right-click the highlighted content and select Remove highlight(s).

3. To exit the highlighting mode, press Esc, click the 📝 Highlight icon, or start editing the document.

**Note:** Oxygen XML Editor plugin preserves the highlighting of a document between working sessions. Also, if you copy content that includes highlights, the highlighting will be preserved when you paste it.
**Review View**

The **Review view** *(page 742)* is also useful for managing highlights. In this view, the highlights are presented in a compact form, in the order they appear in the document, along with **tracked changes** *(page 2711)* and comments. The following actions are available in the contextual menu of each highlight in the **Review** view:

- **Change Color**
  
  Allows you to change the color of an existing highlight by selecting the new color from this menu.

- **Remove Highlight**
  
  Removes the selected highlight.

- **Remove Highlights with the Same Color**
  
  Removes the selected highlight and all others that have the same color.

- **Remove All Highlights**
  
  Removes all highlights from the document.

**Highlights XML Source Code**

The highlights are stored in the document source code as processing instructions that contain information about the color:

```xml
<?oxy_custom_start type="oxy_content_highlight" color="0,128,255"/>

The highlights are stored<?oxy_custom_end?>
```

For more information about using the **Highlight** tool, watch our video demonstration:

**Related Information:**

- **Review View** *(page 742)*

**Author Callouts**

Oxygen XML Editor plugin uses **callouts** *(page 2704)* to present comments and **tracked change** *(page 2711)* modifications that you or other members of your team have added to the document.
Displaying Callouts in Author Mode

The callouts are displayed in the right side of the editing area in Author mode. They are decorated with a colored border and also have a colored background. The background color is assigned automatically by the application depending on the user who is editing the document and the type of change, but it can also be customized from the Review preferences page (page 124). This preferences page allows you to configure the colors for tracked change insertions or deletions, and for comments.

You can also choose to use the same color for all changes of that particular type of change, regardless of who makes the change. To do this, select the Fixed option for the particular type of change and choose a color from the color box. If the Automatic option is selected, Oxygen XML Editor plugin automatically assigns a color based upon the Colors for automatic assignment list (page 126).

The horizontal line that connects the callouts to their corresponding text fragments has the same color as the border. If this horizontal line is not visible, select the Show all connecting lines option (page 127) in the Callouts preferences page. If you hover over a callout, it is highlighted and a tooltip is displayed that contains additional information.

Figure 113: Multiple Author Callouts

Note: Oxygen XML Editor plugin displays callouts only if View All Changes/Comments or View Only Changes/Comments by is selected in the Track Changes Visualization Modes drop-down menu. Oxygen XML Editor plugin does not display callouts in View Final and View Original modes.
In some cases, the text you are editing can span into the callouts area. For example, this situation can appear for callouts associated with wide images or *space-preserved elements (page 2711)* that contain long fragments (such as a DITA *codeblock* element or *programlisting* in DocBook). To help you view the text under the covered area, Oxygen XML Editor plugin applies transparency to these callouts. When the cursor is located under a callout, the transparency is enhanced, allowing you to both edit the covered content and access the contextual menu of the editing area.

*Figure 114: Transparent Callout*

**Adjusting Callout Width**

To display more of the content in all the callouts in the current document, you can adjust the width by dragging the left side of any of the callouts. This will adjust the width for all comments in the current document. When you end the current editing session, the width of all callouts will revert back to the default value, which is the value of the *Initial Width option (page 127)* in the *Callouts* preferences page.

You can also adjust the maximum number of lines to be shown in the callouts using the *Text Lines Count Limit option (page 128)*. Note that this does not limit the number of lines in the actual comment. It only limits the number of lines shown without opening or editing it.

**Type of Callouts in Oxygen XML Editor plugin**

Oxygen XML Editor plugin uses callouts to display comments and *Tracked Changes (page 2711)* that you associate with fragments of the document you are editing. You can choose which types of edits will be shown in callouts by configuring the options in the *Callouts preferences page (page 127)*. You can choose to enable the following types of review callouts:

- **Comment Callouts** - As long as the *Comments option (page 127)* is selected in the *Callouts preferences page (page 127)*, comments are displayed in callouts. A comment callout contains the name of the author who inserts the callout and the comment itself. You can also select the *Show review time option (page 127)* to include timestamp information in the comment callouts.

*Figure 115: Comment Callouts*
There are several types of comments that can be added in Author mode:

- **Author Review Comments** - Comments that you associate with specific content. To insert this type of comment, select the content and use the Add Comment action that is available on the toolbar (or in the Review submenu of the contextual menu).
- **Comments Added to Tracked Changes** - Comments that you add to an already existing tracked change insertion or deletion. To insert this type of comment, right-click the change in the main editor or its callout and select Comment Change.
- **Replies to Comments** - You can use this type of comment to create discussion threads. To insert this type of comment, right-click the change in its callout and select Reply. A single callout is presented for a root comment or change and its replies. The replies are displayed with an indentation in the callouts and those that are on the same level are sorted depending on the timestamp.

*Figure 116: Callout for a Comment with Replies*

> Tip: When adding, editing, or replying to a comment, you can use Enter to insert line breaks and Oxygen XML Editor plugin will take the line breaks into account when presenting the callout. You can also use Ctrl + Enter to accept your changes and close the dialog box.

- **Tracked Change Deletion Callouts** - As long as the Track Changes Deletions option (page 127) is selected in the Callouts preferences page (page 127), deletions that are made while the Track Changes feature is enabled are displayed in callouts. A deletion callout contains the type of callout (Deleted) and the name of the author that made the deletion. You can also select the Show deleted content in callout option (page 127) to display the actual deleted content in the callout. Additionally, you can select the Show review time option (page 127) to include timestamp information in the deletion callouts.

*Figure 117: Deletion Callouts*
• **Tracked Change Insertion Callouts** - As long as the **Track Changes Insertions** option (page 127) is selected in the Callouts preferences page (page 127), insertions that are done while the Track Changes feature is enabled are displayed in callouts. An insertion callout contains the type of callout (Inserted) and the name of the author that inserted the content. You can also select the **Show inserted content in callout** option (page 127) to display the actual deleted content in the callout. Additionally, you can select the **Show review time** option (page 127) to include timestamp information in the deletion callouts.

![Figure 118: Insertion Callouts](image)

**Callout Contextual Menu Actions**

Some useful actions are available when the contextual menu is invoked on a callout. The actions depend on the type of callout.

**Insertion or Deletion Callout Actions**

The following actions are available in the contextual menu of an insertion or deletion callout:

**Reply**

Opens a dialog box that allows you to add a reply to a comment or **Tracked Changes** (page 2711). When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and **Review view** (page 742).

**Mark as Done**

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for **Tracked Changes** (page 2711) that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendents. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.
Accept Change

Accepts the tracked change, removes the callout, and moves to the next change. For an *insertion* change, it keeps the inserted text and for a *deletion* change, it removes the content from the document.

Reject Change

Rejects the tracked change, removes the callout, and moves to the next change. For an *insertion* change, it removes the inserted text and for a *deletion* change, it preserves the original content.

Comment Change

Opens a dialog box that allows you to add a comment to an existing Tracked Change (page 2711). The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

Edit Reference

If the fragment that contains a callout is a reference, use this option to go to the reference and edit the callout.

Callouts Options

Select this option to open the Callouts preference page (page 127) where you can configure various callout options.

Comment Callout Actions

The following options are available in the contextual menu of a comment callout:

Reply

Opens a dialog box that allows you to add a reply to a comment or Tracked Changes (page 2711). When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and Review view (page 742).

Mark as Done

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for Tracked Changes (page 2711) that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all
of its descendents. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

**Show/Edit Comment**

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

**Remove Comment**

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

**Edit Reference**

If the fragment that contains a callout is a reference, use this option to go to the reference and edit the callout.

**Callouts Options**

Select this option to open the Callouts preference page (page 127) where you can configure various callout options.

### Printing Callouts

When you print a document from Author mode, all callouts that you or other authors have added to the document are printed. For a preview of the document and its callouts, go to File > Print Preview.

### Review View

The Review view (page 742) is also useful for managing the information in callouts. In this view, changes and comments are presented in a compact form, in the order they appear in the document, and they are synchronized with the changes in the callouts. You can also search for specific changes or comments and it includes some filtering options (for example, you can filter it to only show certain types of edits or to only show edits for a particular author).

For more information, see Review View (page 742).

Related Information:
Review View

The Review view is an independent panel, available both for built-in and custom XML document frameworks (page 2706). It is designed to offer an enhanced way of monitoring all the changes that you make to a document. This means you can view and manage highlights, comments, and tracked changes (page 2711) using a single view.

The Review view is useful when you are working with documents that contain large number of edits. The edits are presented in a compact form, in the order they appear in the document. Each type of edit is marked with a specific icon. This view and the editing area are synchronized. When you select an edit listed in the Review view, its corresponding fragment of text is highlighted in the editing area and the reverse is also true. For example, when you place the cursor inside an area of text marked as inserted, its corresponding edit is selected in the list.

You can use this view to quickly navigate through changes and it includes some useful hover actions and contextual menu actions to help you manage changes, comments, and highlights. You can also search for specific changes or comments and it includes some filtering options (for example, you can filter it to only show certain types of edits or to only show edits for a particular author).

Figure 119: Review View
Activating the Review View

To activate the Review view, do one of the following:

- Click the Manage reviews button on the toolbar.
- Right-click anywhere in a document and select Review > Manage reviews.
- Open it from the Window > Show View menu.

Review View Toolbar Actions and Settings

The upper part of the view contains a filtering area that allows you to search for specific edits. The filter field also includes a search history drop-down list. The toolbar also includes a Settings menu button.

Settings

The Settings menu includes the following options:

Show highlights

- Controls whether or not the Review view displays the highlighting in your document.

Show comments

- Controls whether or not the Review view displays the comments in the document you are editing.

Show track changes

- Controls whether or not the Review view displays the inserted and deleted content in your document.

Show reviews in read-only content

- Controls whether or not the Review view displays review items from content referenced with a @conref or @conkeyref attribute.

Show review time

- Displays the time when the edits from the Review view were made.

Sort by date

- Expands to offer the following sorting options: Oldest to newest, Newest to oldest, and No sorting.

Configure review options
Opens the Review preferences page (page 124) where you can configure various options for review information.

**Hover Actions in the Review View**

You can use this view to easily manage changes, highlights, and comments that have been added by you or other users. The following actions are available when you hover over the changes in the Review view:

- **Remove**
  Available for highlights and comments presented in the Review view and it removes the particular highlight or comment from your document and moves to the next change.

- **Accept**
  Available for inserted and deleted content presented in the Review view and it accepts the particular change in your document and moves to the next change.

- **Reject**
  Available for inserted and deleted content presented in the Review view and it rejects the particular change in your document and moves to the next change.

**Contextual Menu Actions in the Review View**

Depending on the type of an edit, the following additional actions are available in the contextual menu of the Review view:

- **Reply**
  Opens the Reply dialog box where you can add a reply to comment or change. The replies are displayed with an indentation in this view.

- **Mark as Done**
  Toggles the comment or change as being done and grays it out. You can mark a whole discussion thread as being done by selecting the action on the first (parent) comment in the thread.

- **Show Comment**
  Available for comments added by other users and you can use this option to view it in a Show comment dialog box.

- **Edit Comment**
  Available for comments you have added and you can use this action to edit a comment.

- **Remove Comment**
Use this action to remove the selected comment.

**Show only Reviews by `<author name>`**

Use this action to filter the edits to only show them for a certain author.

**Remove All Comments**

Use this action to remove all the comments that appear in the edited document.

**Change Color**

Available for highlights and it opens a palette that allows you to choose a new color for the highlighted content.

**Remove Highlight**

Use this action to remove the selected highlight.

**Remove Highlights with the Same Color**

Use this action to remove all the highlights with the same color from the entire document.

**Remove All Highlights**

Use this action to remove all the highlights in your document.

✔️ **Accept Change**

Accepts the selected change and moves to the next change.

❌ **Reject change**

Rejects the selected change and moves to the next change.

💬 **Comment change**

Available for insertions or deletions and you can use this option to add a comment for the particular change.

✔️ ✔️ **Accept all changes**

Accepts all the changes in the current document.

❌ ❌ **Reject all changes**

Rejects all the changes in the current document.

Profiling and Conditional Text

Profiling text is a way to mark blocks of text meant to appear in some renditions of the document but not in others. Conditional text differs from one variant of the document to another, while unconditional text appears in all document versions. For example, you can mark a section of a document that is to be included in a manual to be designated for expert users and another section for novice users, while unmarked sections are included in all renditions.

Profiling Attributes and Condition Sets

Oxygen XML Editor plugin allows you to define values for the profiling attributes and they can be easily managed to filter content in the published output. You can switch between profile sets to see how the edited content looks like before publishing. You can also conditionally profile parts of a document so that certain parts are displayed when certain profiling conditions are set. You can even customize the colors and styling of how the profiling is displayed in Author mode.

You can use profiling and conditional text to help you create documentation for multiple output scenarios, including:

- Multiple outputs for a series of similar products.
- Multiple outputs for various releases of a product.
- Multiple outputs for various audiences.

This feature helps to reduce the effort for updating and translating your content and provides an easy way to customize the output for various audiences.

Figure 120: Example: Profiling Content
Oxygen XML Editor plugin includes a preconfigured set of profiling attribute values for some of the most popular document types. These attributes can be redefined to match your specific needs in the Profiling/Conditional Text preferences page (page 119). You can also define your own profiling attributes and condition sets for each document type (framework (page 2706)).

For information about creating and editing profiling attributes, see Creating and Editing Profiling Attributes (page 747).

For information about creating and editing condition sets, see Creating and Editing Profiling Condition Sets (page 752).

Creating and Editing Profiling Attributes

Oxygen XML Editor plugin includes support for defining your own profiling attributes, or modifying existing ones, for each particular document type (framework (page 2706)). You can then apply the profiling attributes to content in Author mode to see how the profiling will affect the output.

**Create or Editing Profiling Attributes**

To create or edit profiling attributes for a specific document type, follow these steps:

1. Make sure the attribute is already defined in the document DTD or schema before continuing with the procedure.
2. Open the Preferences dialog box (page 55) and go to Editor > Edit modes > Author > Profiling/Conditional Text.

**Information:** The Profiling Attributes section (page 120) is used to define the attributes and their values for each document type.
3. To add new attributes and values, click the **New** button at the bottom of the **Profiling Attributes** table. To customize existing attributes and their values, select an attribute and click the **Edit** button.

**Step Result:** In either case, this opens a **Profiling Attribute** configuration dialog box where you can define attributes that exist in your schema.

**Figure 121: Profiling Attribute Dialog Box**

![Profiling Attribute Dialog Box](image)

The following options are available in this dialog box:

**Document type**

Select the document type (*framework (page 2706)*).

**Tip:** You can use the * or ? wildcards in this combo box. For example, DITA* would match any document type that starts with "DITA". You can also specify multiple document types by using commas to separate them.

**Attribute name**

The name of the profiling attribute.

**Display name**

This optional field is used for descriptive rendering in profiling dialog boxes.

**Attribute Values Table**
This table displays information about the values for the profiling attribute. You can configure them by using the buttons at the bottom of the table (New, Edit, Delete).

The columns are as follows:

- **Value** - The attribute value.
- **Label** - You can specify a label for the attribute value that will be rendered as its name in various components in Author mode (Edit Profiling Attributes dialog box (page 750), Condition Set dialog box (page 752), and other UI components where the profiling is shown (page 756)). If the Label is not specified, the Value will be used as its rendered name.
- **Description** - A description for the attribute value that will be displayed in this table.

**Single value**

Select this option if you want the attribute to only accept a single value.

**Multiple values separated by**

Select this option if you want the attribute to accept multiple values, and you can choose the type of delimiter to use. You can choose between space, comma, and semicolon, or you can enter a custom delimiter in the text field. A custom delimiter must be supported by the specified document type. For example, the DITA document type only accepts spaces as delimiters for attribute values.

4. After defining or configuring the attributes and their values according to your needs, click OK to confirm your selections and close the Profiling Attributes configuration dialog box.

5. Click Apply to save the changes.

**Adding Profiling Attribute Values Directly in a Document**

You can add values directly to the existing profiling attributes in a document using the In-Place Attributes Editor (page 692) in Author mode, the Attributes view (page 319), or in the source code in Text mode. However, this just adds them to the document and does not change the conditional text configuration. If you invoke the Edit Profiling Attributes action (from the contextual menu in Author mode) on the new value, the Profiling Values Conflict dialog box will appear and it includes an Add these values to the configuration action that will automatically add the new value to the particular profiling attribute. It also includes an Edit the configuration action that opens the Profiling / Conditional Text preferences page (page 119) where you can edit the profiling configuration.

**Note:** If the Allow contributing extra profiling attribute values (page 121) option is not selected in the Profiling / Conditional Text preferences page, the Profiling Values Conflict dialog box will never appear, so this automatically adding value not be possible.
Applying Profiling Attributes

Profiling attributes are applied on element nodes. You can apply profiling attributes on a text fragment (it will automatically be wrapped into a phrase-type element), on a single element, or on multiple elements at the same time. If there is no selection in your document, the profiling attributes are applied on the element at the cursor position.

To apply a profiling attribute to content in **Author** mode, follow these steps:

1. To apply a profiling attribute to content in **Author** mode, highlight the content and select **Edit Profiling Attributes** from the contextual menu. To profile an entire element, position the cursor inside the element, right-click, and select **Edit Profiling Attributes** (you can also right-click the element in the **breadcrumb (page 684)** or **Outline (page 316)** view).

   **Step Result:** The **Edit Profiling Attributes** dialog box is displayed and shows all the profiling attributes and their values, as defined for the particular document type (**framework**). If you have
a large list of profiling attributes, you can use the text filter field to search for attributes or values, and you can expand or collapse attributes by using the Expand All / Collapse All buttons to the right of the text filter or the arrow button to the left of the profiling attribute name.

The attributes and values that appear in the dialog box are determined as follows:

- If you have defined profiling attribute values (page 747) for the DITA document type in the Profiling/Conditional Text preferences page (page 119), those values are displayed in the dialog box.
- Otherwise, a generic default set of profiling attributes and values are available.

2. In the Edit Profiling Attributes dialog box, select the checkboxes that correspond to the attribute values you want to apply on the document fragment (page 2705).
3. Click OK to finish the profiling configuration.

**Result:** The attribute names and values selected in the Edit Profiling Attributes dialog box are set on the elements contained in the profiled fragment. If you only select a fragment of content (rather than the entire element), this fragment is wrapped in phrase-type elements in which the profiling attributes are set.

If the Show Profiling Attributes option (page 756) (available in the Profiling / Conditional Text toolbar menu) is selected, a green border is painted around profiled text in the Author mode and all profiling attributes set on the current element are listed at the end of the highlighted block. To edit the attributes of a profiled fragment, click one of the listed attribute values. A form control pops up and allows you to add or remove attribute values.
Creating and Editing Profiling Condition Sets

Multiple profiling attributes can be aggregated into a profiling condition set that allows you to apply more complex filters on the document content. A Profile Condition Set is a very powerful and convenient tool that can be used to preview the content that goes into the published output. For example, an installation manual available in both Windows and Linux variants can be profiled to highlight only the Linux procedures for more advanced users.

Create Profiling Condition Sets

To create a new profiling condition set, follow these steps:

1. Open the Preferences dialog box  (page 55) and go to Editor > Edit modes > Author > Profiling/Conditional Text.
Information: The Profiling Condition Sets section (page 121) is used to define condition sets.

2. To add new condition set, click the New button at the bottom of the Profiling Condition Sets table. To customize existing condition sets, select an existing condition set and click the Edit button.

Step Result: In either case, this opens a Condition Set configuration dialog box where you can define attributes that exist in your schema.

Figure 125: Condition Set Configuration Dialog Box

The following options are available in this dialog box:

Name

The name of the new condition set.

Document type

Select the document type (framework (page 2706)) for which you have defined profiling attributes.

Use DITAVAL file
For DITA projects, select this option if you want the Profiling Condition Set to reference a DITAVAL file (page 2656). You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (page 201) button, or the browsing actions in the Browse drop-down list.

**Include the content matching the following conditions**

You can select this option to define the combination of attribute values for your condition set by selecting the appropriate checkboxes for the values you want to be included in this particular condition set. If you have defined a lot of profiling attributes, you can use the filter text field to search for specific conditions.

3. After defining or configuring the condition sets according to your needs, click OK to confirm your selections and close the Condition Set configuration dialog box.
4. Click Apply to save the condition set.

**Result:** All saved profiling condition sets are available in the Profiling / Conditional Text toolbar drop-down menu (page 756).

**Applying Profiling Condition Sets**

All defined Profiling Condition Sets (page 752) are available as shortcuts in the Profiling / Conditional Text toolbar menu (page 756). Select a menu entry to apply the condition set. The filtered content is then grayed-out in the Author mode and Outline view (page 316). An element is filtered-out when one of its attributes is part of the condition set and its value does not match any of the value covered by the condition set.

**EXAMPLE:**
Suppose that you have the following document:

```
```

If you apply the following condition set, it means that you want to filter out the content to only include content profiled with the `expert` value for the `@audience` attribute and content that has the `prop1` value for the `@other` attribute.

This is how the document looks in Author mode after you apply the condition set:
You can visualize the effects of profiled content in **Author** mode by using the options in the Profiling/Conditional Text drop-down menu that is located on toolbar. This drop-down menu includes the following filtering options:

**Show Profiling Colors and Styles**

Select this option to show colors and styles for profiled content in **Author** mode. You can configure the colors and styles or specify whether or not this option is selected by default in the Profiling/Conditional Text > Colors and Styles preferences page *(page 122).*
Show Profiling Attributes

Select this option to display the values of the profiling attributes at the end of profiled content in Author mode. You can specify whether or not this option is selected by default in the Profiling/Conditional Text > Attributes Rendering preferences page (page 122).

Show Excluded Content

Controls whether the content filtered out by a particular condition set is hidden or grayed-out in Author mode and the Outline (page 316) view. When this option is selected and a condition set is selected in this drop-down menu (page 757), the filtered content is grayed-out. If this option is not selected and a condition set is selected in this drop-down menu (page 757), the filtered content is hidden. You can specify whether or not this option is selected by default in the Profiling/Conditional Text preferences page (page 121).

Choose Condition Set (Available if more than 15 condition sets are defined)

This option is available if you have more than 15 conditions sets defined. It opens a dialog box that makes it easier to find and select condition sets that are not displayed in this drop-down menu.

List of Defined Condition Sets

Up to 15 defined condition sets are listed and you can toggle each one of them on to filter the content in Author mode to only show content that will appear in the output for that particular condition set. If there are more than 15 defined condition sets, the rest of them can be accessed in the More submenu or by using the Choose Condition Set option (page 757) to access a dialog box that presents all of them.

Profiling Settings

Opens the Profiling/Conditional Text preferences page (page 119) where you can add and edit profiling attributes and condition sets.

Figure 126: Example: Profiling Controls in Author Mode
If the Show Profiling Attributes option is selected, a green border is painted around profiled text in the Author mode. Also, all profiling attributes set on the current element are listed at the end of the highlighted block and in its tooltip message. To edit the attributes of a profiled fragment, click one of the listed attribute values. A form control pops up and allows you to add or remove attribute values.

Customizing Colors and Styles for Rendering Profiling in Author Mode

By applying profiling colors and styles, you can mark profiled content in Author mode so that you can instantly spot differences between multiple variants of the output. This allows you to preview the content that will go into the published output. The excluded text is grayed-out or hidden in Author mode, allowing you to easily recognize the differences.

Figure 128: Example: Profiling Colors and Styles in Author Mode

Choosing the right style for a specific profiling attribute is a matter of personal taste, but be aware of the following:

- If the same block of text is profiled with two or more profiling attributes, their associated styles combine. Depending on the styling, this might result in an excessively styled content that may prove difficult to read or work with.
- It is recommended that you only profile the differences. There is no need to profile common content, since excessive profiling can visually pollute the document.
- A mnemonic associated with a style will help you instantly spot differences in the types of content.

Styling Profiling Attribute Values

To set colors and styles for profiling attribute values, follow these steps:
1. Select the Show Profiling Colors and Styles option (page 756) from the Profiling / Conditional Text toolbar drop-down menu.

2. Select Profiling Settings (page 757) from the Profiling / Conditional Text toolbar drop-down menu. This is a shortcut to the Profiling/Conditional Text preferences page (page 119).

3. Go to the Colors and Styles preferences page (page 122) to configure the colors and styling for the profiling attributes.

4. Go to the Attributes Rendering preferences page (page 121) to configure how you want the profiling attributes to appear in Oxygen XML Editor plugin.

**Result:** The styling is now applied in the Author editing mode and the Outline view (page 316). Also, to help you more easily identify the profiling you want to apply in the current context, the styling is applied in the Edit Profiling Attributes dialog box (page 747) and in the inline form control pop up that allows you to quickly set the profiling attributes.

Adding Tables in Author Mode

You can use the Insert Table action on the toolbar or from the contextual menu to add a table in various frameworks (page 2706) (DITA, DocBook, TEI, and XHTML). This opens the Insert Table dialog box. Each framework has a different set of options that are available in this dialog box for configuring the properties of the tables. In all cases, Oxygen XML Editor plugin includes some general editing actions for configuring tables in Author mode.

This section explains those general actions and the various configuration options and layouts for tables that are inserted in the most commonly used document types.

Editing Tables in Author Mode

Oxygen XML Editor plugin provides support for editing data in a tabular form. A variety of features and operations are available for editing tables in Author mode and they include the following:

Adjusting Column Width

To adjust the width of a column or table, drag the border of the column or table. The changes you make to a table are committed into the source document. You can also manage table width and column width specifications from the source document, and some types of tables include a colspecs section that appears above the table in Author mode that allows you to easily configure some column specifications (such as column width). These column width specifications are supported in fixed, dynamic, and proportional dimensions. The built-in DITA, DocBook, and XHTML frameworks (page 2706) support this feature. The layout of the tables for these document types takes into account the table width and the column width specifications particular to them.

Figure 130: Resizing a Table Column in Author Mode

Selecting Columns and Rows

To select a row or a column of a table, place the mouse cursor above the column or in front of the row you want to select, then click. When hovering the mouse cursor in front of rows or above column
headers, the cursor changes to $\mathbf{\text{select}}$ for row selection and to $\mathbf{\text{select}}$ for column selection and that specific row or column is highlighted.

You can use the Ctrl and Shift keys to select multiple rows.

Selecting Cells

To select a cell in a table, press and hold the Ctrl key and click anywhere inside the cell. You can also use the Ctrl and Shift keys to select multiple cells or to deselect cells from a selection. Alternatively, you can click the left corner of a cell (right corner if you are editing a RTL document (page 503)) to select it. The cursor changes to $\mathbf{\text{select}}$ when you hover over the corner of the cell.

You can also select multiple rectangular blocks of cells by using your mouse to select a cell and drag it to expand the selection.

Drag and Drop

You can use the drag and drop action to edit the content of a table. You can select a column and drag it to another location in the table you are editing. When you drag a column and hover the cursor over a valid drop position, Oxygen XML Editor plugin decorates the target location with bold rectangles. The same drag and drop action is also available for entire rows or columns by hovering the mouse cursor in front of rows or above column headers, then selecting the row or column and dragging them to the desired location.

Copy/Cut and Paste

In Oxygen XML Editor plugin, you can copy/cut entire rows or columns of the table you are editing and paste the copied columns or rows inside the same table or inside other tables. You can also use the copy or cut actions for tables located in other documents. If you paste a row or column into non-table content, Oxygen XML Editor plugin introduces a new table that contains the fragments of the copied row or column content.

For copied columns, the fragments are introduced starting with the header of the column. Also, if the copied column is from a CALS table, Oxygen XML Editor plugin preserves column width information. This information is then used when you paste the column into another CALS table.

For copied cells, when pasting them into another cell without a selection (the cursor is just placed in the new cell), the copied cells are pasted while preserving their initial order and spacing. If pasting them into a selection of cells, first the content of the selected cells is deleted, then the copied cells are pasted with their initial order and spacing preserved and if there are more cells in the selection than in the copied content, the pasting will repeat the copied cells until the end of the selection.
Deleting Content

To delete the content of a cell, select the cell and press the Delete or Backspace key on your keyboard. If you press Delete or Backspace again, the selected table structure will also be removed.

To delete an entire row or column, place the cursor inside the row or column (or select it) and use the Delete Row(s) or Delete Column(s) actions from the toolbar or contextual menu. This will delete both the content and the table structure for the current row or column.

To delete a selection of multiple rows or columns, select them and use the Delete Row(s) or Delete Column(s) actions from the toolbar or contextual menu. This will delete both the content and the table structure for all rows or columns that exist in the current selection.

Navigating Cells

Along with the normal mouse navigation, you can also navigate between cells by using the arrow keys on your keyboard. By default, when using the arrow keys to navigate between table cells, the cursor jumps from one cell to another. However, if the Quick navigation in tables option (page 118) is not selected in the Cursor Navigation preferences page, using the arrow keys to navigate between table cells will cause the cursor to navigate between XML nodes, rather than jumping from cell to cell.

Adding Tables in DocBook

You can use the Insert Table action on the toolbar or from the contextual menu to add a table in a DocBook document.

DocBook supports two types of tables:

- CALS table model - This is used for more advanced functionality.
- HTML table model - This is used for inserting a formal (captioned) HTML table.
Inserting a CALS Table Model in DocBook

To insert a CALS table model in DocBook documents, select the Insert Table action on the toolbar or from the contextual menu. The Insert Table dialog box appears. Select CALS for the table Model. This model allows you to configure a few more properties than the HTML model.

![Insert Table Dialog Box - CALS Model](image)

The dialog box allows you to configure the following options when you select the CALS table model:

**Title**

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

**Table Size**

Allows you to choose the number of Rows and Columns for the table.

**Generate table header**

If selected, an extra row will be inserted at the top of the table to be used as the table header.

**Generate table footer**

If selected, an extra row will be inserted at the bottom of the table to be used as the table footer.

**Column widths**

Allows you to specify the type of properties for column widths (colwidth attribute). You can choose one of the following properties for the column width:
• **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a `colwidth` attribute with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, `colwidth="1* 2* 3*"` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the `colwidth` attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the `colwidth` attribute is `1*`.

• **dynamic** - If you choose this option, the columns are created without a specified width (`colwidth` attribute). Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

• **fixed** - The width is specified in fixed units. By default, the `pt` unit is inserted, but you can change the units in the `colspecs` (column specifications) section above the table or in **Text** mode. The following units are allowed: `pt` (points), `cm` (centimeters), `mm` (millimeters), `pi` (picas), `in` (inches).

**Frame**

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. There are a variety of allowed values, as specified in the DocBook CALS table specifications.

**Row separator**

Specifies whether or not to include row separators (`rowsep` attribute). The allowed values are: `0` (no separator) and `1` (include separators).

**Column separator**

Specifies whether or not to include column separators (`colsep` attribute). The allowed values are: `0` (no separator) and `1` (include separators).

**Alignment**

Specifies the alignment of the text within the table (`align` attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.
Note: The `justify` value cannot be rendered in Author mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the `char` attribute for alignment.

Note: The options in the **Insert Table** dialog box for DocBook documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, a CALS table is inserted into your document at the current cursor position.

When you insert a CALS table, you see a link for setting the `colspecs` (column specifications) of your table. Click the link to open the controls that allow you to adjust various column properties. Although they appear as part of the **Author mode** (page 303), the `colspecs` link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

**Figure 132: CALS Table in DocBook**

![Sample DocBook CALS Table](image)

Inserting an HTML Table Model

To insert an HTML table model in DocBook documents, select the **Insert Table** action on the toolbar or from the contextual menu. The **Insert Table** dialog box appears. Select **HTML** for the table Model.

**Figure 133: Insert Table Dialog Box - Simple Model**
The dialog box allows you to configure the following options when you select the HTML table model:

**Title**

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

**Table Size**

Allows you to choose the number of Rows and Columns for the table.

**Generate table header**

If selected, an extra row will be inserted at the top of the table to be used as the table header.

**Generate table footer**

If selected, an extra row will be inserted at the bottom of the table to be used as the table footer.

**Column widths**

Allows you to specify the type of properties for column widths (width attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a width attribute (in a col element) with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, `width="1* 2* 3*"` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in Author mode, the values of the width attribute
are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the width attribute is 1*.

- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

- **fixed** - The width is specified in fixed units. By default, the pt unit is inserted, but you can change the units in the section above the table or in **Text** mode. In addition to the standard pixel, percentage, and relative values, this attribute also allows the special form "0*" (zero asterisk), which means that the width of each column in the group should be the minimum width necessary to hold the contents.

**Frame**

Allows you to specify a value for the frame attribute. It is used to specify where a border should appear in the table. There are a variety of allowed values, as specified in the DocBook HTML table specifications.

**Alignment**

Specifies the alignment of the text within the table (align attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

**Note:** The justify value cannot be rendered in **Author** mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the char attribute for alignment.

**Note:** The options in the Insert Table dialog box for DocBook documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, an HTML style of table is inserted into your document at the current cursor position.

When you insert an HTML table, you see a section above the table that allows you to easily configure some properties without opening the Table Properties dialog box. Although this section appears as part of the **Author mode** (**page 303**), it will not appear in your output. It is just there to make it easier to adjust how the columns of your table are formatted.
Editing an Existing Table

You can edit the structure of an existing table using the table buttons on the toolbar (or in the contextual menu) to add or remove cells, rows, or columns, and to set basic table properties. Additional attributes can be used to fine-tune the formatting of your tables by using the Attributes view (page 319) (Window > Show View > Attributes).

You can also use the Table Properties (Ctrl + T (Command + T on OS X)) (page 786) action from the toolbar or contextual menu to modify many of the properties of the table (page 771).

Also, remember that underneath the visual representation, both table models are really just XML. If necessary, you can edit the XML directly by switching to Text mode (page 223).

DocBook Table Layouts

The DocBook framework (page 2706) supports the following two table model layouts:

- CALS table model (page 769)
- HTML table model (page 770)

CALS Table Model Layout

The CALS table model allows for more flexibility and table customization than other models. When choosing a CALS table model from the Insert Table dialog box, you have access to more configurable properties. The layout of a CALS table includes a colspecs section that allows you to easily configure some properties without opening the Table Properties dialog box. For example, you can change the value of column widths (colwidth attribute) or the text alignment (align attribute). Although they appear as part of the Author mode (page 303), the colspecs link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

Figure 134: CALS Table in DocBook
**HTML Table Model Layout**

Choosing an **HTML** table model from the **Insert Table** dialog box in a DocBook document inserts a formal (captioned) HTML table. The layout of an **HTML** table includes a section above the table that allows you to easily configure some properties without opening the **Table Properties** dialog box. For example, you can change the value of column widths (width attribute) or the text alignment (align attribute). Although these properties appear as part of the **Author mode** (page 303), they will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

*Figure 135: HTML Table in DocBook*

**Pasting Tables in DocBook**

Tables that are pasted into a DocBook file are automatically converted to the **CALS** model. If you want to overwrite this behavior and instruct Oxygen XML Editor plugin to convert them to **HTML** tables, set the **docbook.html.table** parameter to 1. You can find this parameter in the following stylesheet:

- [OXYGEN_INSTALL_DIR]/frameworks/docbook/resources/xhtml2db5Driver.xsl for DocBook 5
Table Validation in DocBook

Oxygen XML Editor plugin reports table layout problems that are detected in manual or automatic validations. The types of errors that may be reported for DocBook table layout problems include:

**CALS Tables**

- A row has fewer cells than the number of columns detected from the table `<cols>` attribute.
- A row has more cells than the number of columns detected from the table `<cols>` attribute.
- A cell has a vertical span greater than the available rows count.
- The number of `<colspecs>` is different than the number of columns detected from the table `<cols>` attribute.
- The number of columns detected from the table `<cols>` attribute is different than the number of columns detected in the table structure.
- The value of the `<cols>`, `<rowsep>`, or `<colsep>` attributes are not numeric.
- The `<namest>`, `<nameend>`, or `<colname>` attributes point to an incorrect column name.

**HTML Tables**

- A row has fewer cells than the number of table columns.
- The value of the `<colspan>`, `<rowspan>`, or `<span>` attributes are not numeric.
- A cell has a vertical span greater than the available rows count.

Editing Table Properties in DocBook

You can edit the structure of an existing table using the table buttons on the toolbar (or from the contextual menu) to add or remove cells, rows, or columns, and to set basic table properties. Additional attributes can be used to fine-tune the formatting of your tables by using the **Attributes view** (page 319) (Window > Show View > Attributes).

You can use the **Table Properties (Ctrl + T (Command + T on OS X))** action to modify many of the properties of the table. You can also adjust some of the properties in the specification section above the table.

The **Table properties** dialog box allows you to set specific properties to the table elements. The options that are available depend on the context and location within the table in which the action was invoked.
**Note:** Some properties allow the following special values, depending on the context and the current properties or values:

- **<not set>** - Use this value if you want to remove a property.
- **<preserve>** - If you select multiple elements that have the same property set to different values, you can choose this value to keep the values that are already set. In some cases it can also be used to keep the current non-standard value for a particular property.

### Edit Table Properties for a CALS Table Model

For a CALS table model, the **Table properties** dialog box includes four tabs of options:

- **Table** tab - The options in this tab apply to the entire table.
- **Row** tab - The options in this tab apply to the current row or selection of multiple rows. A message at the bottom of the tab tells you how many rows will be affected.
- **Column** tab - The options in this tab apply to the current column or selection of multiple columns. A message at the bottom of the tab tells you how many columns will be affected.
- **Cell** tab - The options in this tab apply to the current cell or selection of multiple cells. A message at the bottom of the tab tells you how many cells will be affected.

The options in four tabs include a **Preview** pane that shows a representation of the modification.

*Figure 136: Table Properties Dialog Box with Cell Tab Selected (DocBook CALS Table Model)*

The options in the four tabs include the following:

**Horizontal alignment (Available in the Table, Column, and Cell tabs)**
Specifies the horizontal alignment of text within the current table/column/cell or selection of multiple columns/cells (align attribute). The allowed values are as follows:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

![Note:](image) The justify value cannot be rendered in Author mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the char attribute for alignment.

**Vertical alignment (Available in the Row and Cell tabs)**

Specifies the vertical alignment of text within the current row/cell or selection of multiple rows/cells (valign attribute). The allowed values are as follows:

- **top** - Aligns the text at the top of the cell.
- **middle** - Aligns the text in a vertically centered position.
- **bottom** - Aligns the text at the bottom of the cell.

**Column separator (Available in the Table, Column, and Cell tabs)**

Specifies whether or not to include column separators (borders/grid lines) in the form of the colsep attribute. The allowed values are: 0 (no separator) and 1 (include separators).

**Row separator (Available in all four tabs)**

Specifies whether or not to include row separators (borders/grid lines) in the form of the rowsep attribute. The allowed values are: 0 (no separator) and 1 (include separators).

**Frame**

Allows you to specify a value for the frame attribute. It is used to specify where a border should appear in the table. There are a variety of allowed values, as specified in the DocBook CALS table specifications.

**Row type (Available in the Row tab only)**

Allows you change the row to a header, body, or footer type of row (within a thead, tbody, or tbody attribute).
Edit Table Properties for an HTML Table Model

For an HTML table model, the Table properties dialog box includes four tabs of options (Table, Row, Column, and Cell) and the options include a Preview pane that shows a representation of the modification.

The options in the four tabs include the following:

**Frame (Available only in the Table tab)**

Allows you to specify a value for the frame attribute. It is used to specify where a border should appear in the table. There are a variety of allowed values, as specified in the DocBook HTML table specifications.

**Row type (Available in the Row tab only)**

Allows you to change the row to a header, body, or footer type of row (within a thead, tbody, or tfoot attribute).

**Horizontal alignment (Available in the Row, Column, and Cell tabs)**

Specifies the horizontal alignment for the text in the current row/column/cell or selection of multiple rows/columns/cells (align attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

⚠️ Note: The justify value cannot be rendered in Author mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the char attribute for alignment.

**Vertical alignment (Available in the Row, Column, and Cell tabs)**

Specifies the vertical alignment for the text in the current row/column/cell or selection of multiple rows/columns/cells (valign attribute). The allowed values are:

- **top** - Aligns the text at the top of the cell.
- **middle** - Aligns the text in a vertically centered position.
- **bottom** - Aligns the text at the bottom of the cell.
- **baseline** - Sets the row so that all the table data share the same baseline. This often has the same effect as the bottom value. However, if the fonts are different sizes, the baseline value often makes the table look better.
Adding Tables in DITA Topics

You can use the Insert Table action on the toolbar or from the contextual menu to add a table in a DITA topic. By default, DITA supports four types of tables:

- **DITA Simple table model (page 775)** - This is the most commonly used model for basic tables.
- **CALS table model (OASIS Exchange Table Model) (page 777)** - This is used for more advanced functionality.
- **DITA Choice table model (page 780)** - This is used within a `step` element in a DITA Task document to describe a series of optional choices that a user must make before proceeding.
- **DITA Properties table model (page 782)** - This is used in DITA Reference documents to describe a property (for example, its type, value, and description).

If you are using a specialized DITA vocabulary, it may contain specialized versions of these table models.

Since DITA is a structured format, you can only insert a table in places in the structure of a topic where tables are allowed. The Oxygen XML Editor plugin toolbar provides support for entering and editing tables. It also helps to indicate where you are allowed to insert a table or its components by disabling the appropriate buttons.

**Inserting a Simple Table Model**

To insert a Simple DITA table, select the Insert Table action on the toolbar or from the contextual menu (or the Table submenu from the DITA menu). The Insert Table dialog box appears. Select Simple for the table Model.

*Figure 137: Insert Table Dialog Box - Simple Model*
The dialog box allows you to configure the following options when you select the **Simple** table model:

**Title**

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

**Generate table header**

If selected, an extra row will be inserted at the top of the table to be used as the table header.

**Column widths**

Allows you to specify the type of properties for column widths (**colwidth** attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a **relcolwidth** attribute with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, **relcolwidth=1* 2* 3*** causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the **relcolwidth** attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the **relcolwidth** attribute is **1***.

- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.
Frame

Allows you to specify a value for the frame attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the conref target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

**Note:** The options in the Insert Table dialog box for DITA documents are persistent, so changes made in one session will carry over to another.

When you click Insert, a simple table is inserted into your document at the current cursor position.

**Inserting a CALS Table Model (OASIS Exchange Table)**

To insert an OASIS Exchange Table (CALS), select the Insert Table action on the toolbar or from the contextual menu (or the Table submenu from the DITA menu). The Insert Table dialog box appears. Select CALS for the table Model. This model allows you to configure more properties than the Simple model.

*Figure 138: Insert Table Dialog Box - CALS Model*
The dialog box allows you to configure the following options when you select the CALS table model:

**Title**

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

**Table Size**

Allows you to choose the number of Rows and Columns for the table.

**Generate table header**

If selected, an extra row will be inserted at the top of the table to be used as the table header.

**Column widths**

Allows you to specify the type of properties for column widths (colwidth attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a colwidth attribute with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, colwidth="1* 2* 3*" causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in Author mode, the values of the colwidth attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the colwidth attribute is 1*.

- **dynamic** - If you choose this option, the columns are created without a specified width (colwidth attribute). Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in Author mode, a dialog
box will be displayed that asks you if you want to switch to proportional or fixed column widths.

- **fixed** - The width is specified in fixed units. By default, the \text{pt} unit is inserted, but you can change the units in the \text{colspecs} (column specifications) section above the table or in Text mode. The following units are allowed: \text{pt} (points), \text{cm} (centimeters), \text{mm} (millimeters), \text{pi} (picas), \text{in} (inches).

**Frame**

Allows you to specify a value for the \text{frame} attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a \text{conref}, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the \text{conref} target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

**Row separator**

Specifies whether or not to include row separators (\text{rowsep} attribute). The allowed values are: \text{0} (no separator) and \text{1} (include separators).

**Column separator**

Specifies whether or not to include column separators (\text{colsep} attribute). The allowed values are: \text{0} (no separator) and \text{1} (include separators).

**Alignment**

Specifies the alignment of the text within the table (\text{align} attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.
Note: The justify value cannot be rendered in Author mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the char attribute for alignment.
- **-dita-use-conref-target** - Normally, when using a conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the conref target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

Note: The options in the Insert Table dialog box for DITA documents are persistent, so changes made in one session will carry over to another.

When you click Insert, a CALS table is inserted into your document at the current cursor position.

When you insert a CALS table, you see a link for setting the colspecs (column specifications) of your table. Click the link to open the controls that allow you to adjust various column properties. Although they appear as part of the Author mode (page 303), the colspecs link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

Inserting a Choice Table Model

To insert a Choice table within a step element in a DITA Task document, select the Insert Table action on the toolbar or in the Insert submenu from the contextual menu (or the Table submenu from the DITA menu), or select choicetable from the Content Completion Assistant (page 2704). The Insert Table dialog box appears. Select Simple for the table Model.

Figure 140: Insert Table Dialog Box - Choice Model
The dialog box allows you to configure the following options when you insert a Choice table model within a DITA Task:

**Table Size**

Allows you to choose the number of **Rows** and **Columns** for the table.

**Generate table header**

If selected, an extra row will be inserted at the top of the table to be used as the table header.

**Column widths**

Allows you to specify the type of properties for column widths (colwidth attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a relcolwidth attribute with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, relcolwidth="1* 2* 3*" causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in Author mode, the values of the relcolwidth attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the relcolwidth attribute is 1*.

- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in Author mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

**Frame**

Allows you to specify a value for the frame attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
• **all** - A border will be added to all frames.
• **top** - A border will be added to the top frame.
• **topbot** - A border will be added to the top and bottom frames.
• **bottom** - A border will be added to the bottom frame.
• **sides** - A border will be added to the side frames.
• **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

When you click **Insert**, a *Choice* table is inserted into your DITA Task document at the current cursor position (within a `step` element).

### Inserting a Properties Table Model

To insert a *Properties* table within a `refbody` element in a DITA Reference document, select the **Insert Table** action on the toolbar or in the **Insert** submenu from the contextual menu (or the **Table** submenu from the **DITA** menu), or select **properties(wizard)** from the **Content Completion Assistant** (page 2704). The **Insert Table** dialog box appears. Select **Properties** for the table **Model**.

**Figure 141: Insert Table Dialog Box - Properties Model**

![Insert Table Dialog Box - Properties Model](image)

The dialog box allows you to configure the following options when you insert a *Properties* table model within a DITA Reference:

**Table Size**

Allows you to choose the number of **Rows** and **Columns** for the table.
Generate table header

If selected, an extra row will be inserted at the top of the table to be used as the table header.

Frame

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

When you click **Insert**, a Properties table is inserted into your DITA Reference document at the current cursor position (within a `refbody` element).

Editing an Existing Table

You can edit the structure of an existing table using the table buttons on the toolbar (or in the contextual menu) to add or remove cells, rows, or columns, and to set basic table properties.

Additional attributes can be used to fine-tune the formatting of your tables by using the Attributes view (page 319) (Window > Show View > Attributes). See the DITA documentation for a full explanation of these attributes.

You can also use the Table Properties (Ctrl + T (Command + T on OS X)) (page 786) action from the toolbar or contextual menu (or DITA menu) to modify many of the properties of the table (page 786).

Also, remember that underneath the visual representation, both table models are really just XML. If necessary, you can edit the XML directly by switching to Text mode (page 223).

DITA Table Layouts

Depending on the context, DITA accepts the following table layouts:

- **CALS table model** *(page 784)*
- **Simple table model** *(page 784)*
- **Choice table model** *(page 785)*
- **Properties table model** *(page 785)*

**CALS Table Model Layout**

The **CALS** table model allows for more flexibility and table customization than other models. When choosing a **CALS** table model from the **Insert Table** dialog box, you have access to more configurable properties. The layout of a **CALS** table includes a **colspecs** section that allows you to easily configure some properties without opening the **Table Properties** dialog box. For example, you can change the value of column widths (**colwidth** attribute) or the text alignment (**align** attribute). Although they appear as part of the **Author mode** *(page 303)*, the **colspecs** link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

*Figure 142: CALS Table in DITA*
Simple Table Model Layout

When choosing a Simple table model from the Insert Table dialog box, you only have access to configure a few properties. For example, you can choose the number of rows and columns, specify values for frames, and choose from a few types of properties for the column width. The layout of this type of table is very simple, as the name suggests.

![Figure 143: DITA Simple Table](image)

Choice Table Model Layout

A Choice table model is used within a step element in a DITA Task document to describe a series of optional choices that a user must make before proceeding. The choicetable element is a useful device for documenting options within a single step of a task. You can insert Choice tables in DITA Task documents either by selecting choicetable from the Content Completion Assistant (page 2704) (within a step element) or by using the Insert Table action on the toolbar or from the contextual menu). The options and layout of a Choice table is similar to the Simple table model.

![Figure 144: DITA Choice Table](image)

Properties Table Model Layout

A Properties table model is used within a refbody element in a DITA Reference document to describe a property (for example, its type, value, and description). You can insert Properties tables in DITA Reference documents either by selecting properties(wizard) from the Content Completion Assistant (page 2704) (within a refbody element) or by using the Insert Table action on the toolbar (or from the contextual menu) and selecting Properties for the Model. The layout of a Properties table is very simple. It allows for a maximum of 3 columns (typically for property type, value, and description) and the only options available are for whether or not you want a header row and for specifying frames (borders).

![Figure 145: DITA Properties Table](image)
Table Validation in DITA

Oxygen XML Editor plugin reports table layout problems that are detected in manual or automatic validations. When you validate a DITA map (page 2705) with the Validate and Check for Completeness action, if the Report table layout problems option is selected in the DITA Map Completeness Check dialog box (page 2450), table layout problems will be reported in the validation results. The types of errors that may be reported for DITA table layout problems include:

**CALS Tables**

- A row has fewer cells than the number of columns detected from the table `cols` attribute.
- A row has more cells than the number of columns detected from the table `cols` attribute.
- A cell has a vertical span greater than the available rows count.
- The number of `colspecs` is different than the number of columns detected from the table `cols` attribute.
- The number of columns detected from the table `cols` attribute is different than the number of columns detected in the table structure.
- The value of the `cols`, `rowsep`, or `colsep` attributes are not numeric.
- The `namest`, `nameend`, or `colname` attributes point to an incorrect column name.

**Simple or Choice Tables**

A row has fewer cells than the number of table columns.

Editing Table Properties in DITA

To customize the look of a table in DITA, place the cursor anywhere in a table and invoke the Table Properties (`Ctrl + T (Command + T on OS X)`) action from the toolbar or the Table submenu of the contextual menu (or DITA menu). This opens the Table properties dialog box.

The Table properties dialog box allows you to set specific properties to the table elements. The options that are available depend on the context and location within the table in which the action was invoked.

---

Note: Some properties allow the following special values, depending on the context and the current properties or values:
• `<not set>` - Use this value if you want to remove a property.
• `<preserve>` - If you select multiple elements that have the same property set to different values, you can choose this value to keep the values that are already set. In some cases it can also be used to keep the current non-standard value for a particular property.

**Edit Table Properties for a CALS Table Model**

For a **CALS** table model, the **Table properties** dialog box includes four tabs of options:

- **Table** tab - The options in this tab apply to the entire table.
- **Row** tab - The options in this tab apply to the current row or selection of multiple rows. A message at the bottom of the tab tells you how many rows will be affected.
- **Column** tab - The options in this tab apply to the current column or selection of multiple columns. A message at the bottom of the tab tells you how many columns will be affected.
- **Cell** tab - The options in this tab apply to the current cell or selection of multiple cells. A message at the bottom of the tab tells you how many cells will be affected.

The options in four tabs include a **Preview** pane that shows a representation of the modification.

*Figure 146: Table Properties Dialog Box with Cell Tab Selected (DITA CALS Table Model)*

The options in the four tabs include the following:

**Horizontal alignment (Available in the Table, Column, and Cell tabs)**
Specifies the horizontal alignment of text within the current table/column/cell or selection of multiple columns/cells (align attribute). The allowed values are as follows:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

**Note:** The justify value cannot be rendered in Author mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the char attribute for alignment.
- **-dita-use-conref-target** - Normally, when using a conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the conref target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

**Vertical alignment (Available in the Row and Cell tabs)**

Specifies the vertical alignment of text within the current row/cell or selection of multiple rows/cells (valign attribute). The allowed values are as follows:

- **top** - Aligns the text at the top of the cell.
- **middle** - Aligns the text in a vertically centered position.
- **bottom** - Aligns the text at the bottom of the cell.
- **-dita-use-conref-target** - Normally, when using a conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the conref target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

**Column separator (Available in the Table, Column, and Cell tabs)**

Specifies whether or not to include column separators (borders/grid lines) in the form of the colsep attribute. The allowed values are: 0 (no separator) and 1 (include separators).

**Row separator (Available in all four tabs)**

Specifies whether or not to include row separators (borders/grid lines) in the form of the rowsep attribute. The allowed values are: 0 (no separator) and 1 (include separators).
Frame (Available only in the Table tab)

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. Edit Table Properties for a Simple, Choice, or Properties Table Model

For a *Simple, Choice, Properties* table model, the **Table properties** dialog box only allows you to edit a few options.

**Table tab**

**Frame**

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. Adding Tables in XHTML Documents

You can use the **Insert Table** action on the toolbar or from the contextual menu to add a table in an XHTML document. This action opens the **Insert Table** dialog box.

*Figure 147: Insert Table Dialog Box in XHTML*

The dialog box allows you to configure the following options:

**Caption**

If this checkbox is selected, you can specify a title (caption) for your table in the adjacent text box.

**Table Size**

Allows you to choose the number of **Rows** and **Columns** for the table.

**Generate table header**

If selected, an extra row will be inserted at the top of the table to be used as the table header.
Generate table footer

If selected, an extra row will be inserted at the bottom of the table to be used as the table footer.

Column widths

Allows you to specify the type of properties for column widths (width attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a width attribute (in a col element) with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, width="1* 2* 3*" causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in Author mode, the values of the width attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the width attribute is 1*.

- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in Author mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

- **fixed** - The width is specified in fixed units. By default, the pt unit is inserted, but you can change the units in the section above the table or in Text mode. In addition to the standard pixel, percentage, and relative values, this attribute also allows the special form "0*" (zero asterisk), which means that the width of each column in the group should be the minimum width necessary to hold the contents.

Frame

Allows you to specify a value for the frame attribute. It is used to specify where a border should appear in the table. There are a variety of allowed values, as specified in HTML specifications.

Alignment

Specifies the alignment of the text within the table (align attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.
Note: The justify value cannot be rendered in Author mode, so you will only see it in the output.

- char - Aligns text to the leftmost occurrence of the value specified on the char attribute for alignment.

Note: The options in the Insert Table dialog box for XHTML documents are persistent, so changes made in one session will carry over to another.

When you click Insert, an HTML style of table is inserted into your XHTML document at the current cursor position.

When you insert an HTML table, you see a link for setting the colspecs (column specifications) of your table. Click the link to open the controls that allow you to adjust various column properties. Although they appear as part of the Author mode (page 303), the colspecs link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

Editing an Existing Table

You can edit the structure of an existing table using the table buttons on the toolbar (or in the contextual menu) to add or remove cells, rows, or columns, and to set basic table properties. Additional attributes can be used to fine-tune the formatting of your tables by using the Attributes view (page 319) (Window > Show View > Attributes). Also, remember that underneath the visual representation, the table is really just XML. If necessary, you can edit the XML directly by switching to Text mode (page 223).

XHTML Table Layout

When you insert a table in an XHTML document, an HTML type of table is added. The layout of an XHTML table includes a colspecs section that allows you to easily configure some properties. For example, you can change the value of column widths (width attribute) or the text alignment (align attribute). Although they appear as part of the Author mode (page 303), the colspecs link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

Figure 148: Table Layout in XHTML Documents
Table Validation in XHTML

Oxygen XML Editor plugin reports table layout problems that are detected in manual or automatic validations. The types of errors that may be reported for XHTML table layout problems include:

**HTML Tables**

- A row has fewer cells than the number of table columns.
- The value of the `<colspan>`, `<rowspan>`, or `<span>` attributes are not numeric.
- A cell has a vertical span greater than the available rows count.

Adding Tables in TEI Documents

You can use the `Insert Table` action on the toolbar or from the contextual menu to add a table in a TEI document. This action opens the **Insert Table** dialog box.

**Figure 149: Insert Table Dialog Box in TEI**

The dialog box allows you to configure the following options:

**Head**

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

**Table Size**

Allows you to choose the number of **Rows** and **Columns** for the table.

**Generate table header**
If selected, an extra row will be inserted at the top of the table to be used as the table header.

**Note:** The options in the **Insert Table** dialog box for TEI documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, a simple table is inserted into your TEI document at the current cursor position.

**Editing an Existing Table**

You can edit the structure of an existing table using the table buttons on the toolbar (or in the contextual menu) to add or remove cells, rows, or columns. Additional attributes can be used to fine-tune the formatting of your tables by using the **Attributes view** (page 319) *(Window > Show View > Attributes)*. Also, remember that underneath the visual representation, the table is really just XML. If necessary, you can edit the XML directly by switching to **Text mode** (page 223).

**Inserting Images**

To insert an image in a document while editing in **Author** mode, use one of the following methods:

- Click the **Insert Image** action from the toolbar. This opens a dialog box that allows you to choose the image file you want to insert and configure some properties. Oxygen XML Editor plugin tries to reference the image with a path that is relative to that of the document you are currently editing. For example, if you want to add the `file:/C:/project/xml/dir/img1.jpg` image into the `file:/C:/project/xml/doc1.xml` document, Oxygen XML Editor plugin inserts a reference to `dir/img1.jpg`. This is useful when multiple users work on a common project and they have it stored in multiple locations.

  **Note:** The **Insert Image** action is available for the following document types: DITA, DocBook, TEI, XHTML, JATS.

- Drag an image from other application and drop it in the **Author** editing mode. If it is an image file, it is inserted as a reference to the image file. For example, in a DITA topic the path of the image file is inserted as the value of the `href` attribute in an `image` element:

  ```
  <image href="../images/image_file.png"/>
  ```

  **Tip:** To replace an image, just drag and drop a new image over the existing one. Oxygen XML Editor plugin will automatically update the reference to the new image.
• Copy an image file from another document or another application (such as a system file browser or web browser) and paste it into your document. Oxygen XML Editor plugin will insert it as a reference to the image file the same as the drag/drop method.
• Select an image (or part of an image) from another application (such as an image editor), copy it, and paste it into your document. Oxygen XML Editor plugin will prompt you to save it. After saving the image, a reference to that file path is inserted at the paste position.

When an image cannot be rendered, Oxygen XML Editor plugin Author mode displays a warning message that contains the reason why this is happening. Possible causes include the following:
• The image is too large. Select the **Show very large images** option *(page 111)*.
• The image format is not supported by default. It is recommended to install the **Java Advanced Imaging (JAI) Image I/O Tools** plug-in *(page 802)*.

**Tip:** If you are using a custom XML format and you want images to be displayed in **Author** mode, you could use a custom CSS to define the rendering.

For example, if your XML has something like this:

```xml
<image href="blue.png"/>
```

You can add a selector in your custom CSS like this:

```css
image[href]{
    content: attr(href, url);
}
```

### Scaling Images

Image dimension and scaling attributes are taken into account when an image is rendered. The following rules apply:

• If you specify only the width attribute of an image, the height of the image is proportionally applied.
• If you specify only the height attribute of an image, the width of the image is proportionally applied.
• If you specify width and height attributes of an image, both of them control the rendered image.
• If you want to scale both the width and height of an image proportionally, use the **scale** attribute.

**Note:** As a Java application, Oxygen XML Editor plugin uses the **Java Advanced Imaging API** that provides a pluggable support for new image types. If you have an **ImageIO** library that supports additional image formats, just copy this library to the **[OXYGEN_INSTALL_DIR]/lib** directory.

### Rendering CGM Images (Experimental Support)

Oxygen XML Editor plugin offers a few add-ons that provide experimental support for CGM 1.0 images. To allow the rendering of CGM images in **Author** mode, go to https://github.com/oxygenxml/oxygenxml.cgm.support.eclipse and follow the instructions.

### Rendering PDF Images
Starting with version 20.0, Oxygen XML Editor plugin provides built-in support for rendering PDF images in **Author** mode and PDF output. For previous versions, they are not rendered by default and you need to add the *Apache PDFBox* library:

**Manually Adding the ApachePDFBox Libraries**

To manually add the *Apache PDFBox* library so that PDF images are rendered in **Author** mode, follow this procedure:

1. Go to [http://pdfbox.apache.org/downloads.html](http://pdfbox.apache.org/downloads.html) and download the pre-built PDFBox standalone binary **JAR (page 2707)** files: `pdfbox-2.0.3.jar`, `fontbox-2.0.3.jar`, and `xmpbox-2.0.3.jar`. Alternatively, you can use the 1.8.12 version of these files, as they have been tested and work properly.

   **Note:** It is not recommended to use `pdfbox-app-2.0.3.jar` file instead of the three specified files because it contains additional classes that may cause conflicts elsewhere in Oxygen XML Editor plugin.

2. Create a subfolder called `pdfImageJars` in the `\[OXYGEN_INSTALL_DIR\]\lib` directory.
3. Copy the downloaded **JAR** libraries to that newly created subfolder.
4. Open `OXYGEN_PLUGIN_DIR/META-INF/MANIFEST.MF` and add a reference to the **JAR** libraries in the `Bundle-ClassPath` entry.
5. Restart Eclipse in clean mode (edit the shortcut you use to start Eclipse and add `-clean` as the first argument.)

**Rendering PSD Images**

Oxygen XML Editor plugin provides support for rendering PSD (Adobe Photoshop) images.

To allow the rendering of PSD images in **Author** mode, follow this procedure:

1. Download the following **JAR (page 2707)** files:
   - [http://search.maven.org/remotecontent?filepath=com/twelvemonkeys/common/common-image/3.1.0/common-image-3.1.0.jar](http://search.maven.org/remotecontent?filepath=com/twelvemonkeys/common/common-image/3.1.0/common-image-3.1.0.jar)
2. Copy the downloaded JAR libraries to the \{OXYGEN_INSTALL_DIR\}\lib directory.
3. Open OXYGEN_PLUGIN_DIR/META-INF/MANIFEST.MF and add a reference to the JAR libraries in the Bundle-ClassPath entry.
4. Restart Eclipse in clean mode (edit the shortcut you use to start Eclipse and add -clean as the first argument.)

Rendering EPS and AI Images

Most EPS and AI image files include a preview picture of the content. Oxygen XML Editor plugin tries to render this preview picture. The following scenarios are possible:

- The EPS or AI image does not include the preview picture. Oxygen XML Editor plugin cannot render the image.
- The EPS image includes a TIFF preview picture.
  
  Note: Some newer versions of the TIFF picture preview are rendered in gray-scale.
- The AI image contains a JPEG preview picture. Oxygen XML Editor plugin renders the image correctly.

Rendering Special Images with Java Advanced Imaging (JAI) Plugin

Certain special image types can be rendered in Oxygen XML Editor plugin by using a Java Advanced Imaging (JAI) Image I/O Tools plugin.

How to Install JAI Image I/O Tools Plugin

To install this plug, follow this procedure:

1. Start Oxygen XML Editor plugin and open the Help > About dialog box. Click the Installation Details button, go to the Configuration tab, and look for the java.runtime.name and java.home properties. Keep their values for later use.
2. Download the JAI Image I/O kit corresponding to your operating system and Java distribution (found in the java.runtime.name property). A list of archived JAI distributions can be found at: http://www.oracle.com/technetwork/java/javasebusiness/downloads/java-archive-downloads-java-client-419417.html.
Note: The JAI API is not the same thing as JAI Image I/O. Make sure you have installed the latter.

3. Run the installer. When the installation wizard displays the Choose Destination Location page, fill-in the Destination Folder field with the value of the java.home property. Continue with the installation procedure and follow the on-screen instructions.

OS X Workaround

There is no native implementation of the JAI Image I/O Tools plugin for OS X 10.5 and later. However, it has a Java implementation fallback that also works on OS X. Some of the image formats are not fully supported in this fallback mode, but at least the TIFF image format is known to be supported.

Use the following procedure for this OS X workaround:

2. In the [OXYGEN_INSTALL_DIR]/lib directory, create a directory named endorsed ([OXYGEN_INSTALL_DIR]/lib/endorsed).
3. Unpack the tar.gz. Copy the clibwrapper_jiio.jar and jai_imageio.jar files from its lib directory and paste them in the [OXYGEN_INSTALL_DIR]/lib/endorsed directory.
4. Restart the application and the JAI Image I/O support will be up and running.

Retina/HiDPI Images in Author Mode

Oxygen XML Editor plugin provides support for Retina and HiDPI images through simple naming conventions. The higher resolution images are stored in the same images folder as the normal resolution images and they are identified by a scaling factor that is included in the name of the image files. For instance, images with a Retina scaling factor of 2 will include @2x in the name (for example, myImage@2x.png). Oxygen XML Editor plugin displays the larger set of icons starting with 150% (1.5x) scaling.

You can reference an image to style an element in a CSS by using the url function in the content property, as in the following example:

```css
listItem:before{
    content: url('../img/myImage.png');
}
```
This would place the image that is loaded from the `myImage.png` file just before the `listItem` element. However, if you are using a Retina display (on a Mac), the icon looks a bit blurry as it automatically gets scaled, or if you are using an HiDPI display (on a Windows-based PC), the icon remains at the original size, thus it will look very small. To solve this rendering problem, you need to be able to reference both a `normal` DPI image and a `high` DPI image. However, referencing both of them from the CSS is not practical, as there is no standard way of doing this.

Starting with version 17, Oxygen XML Editor plugin interprets the argument of the `url` function as key rather than a fixed URL. Therefore, when running on a system with a Retina or HiDPI display, Oxygen XML Editor plugin will first try to find the image file that corresponds to the retina scaling factor. For instance, using the previous example, Oxygen XML Editor plugin would first try to find `myImage@2x.png`. If this file is not found, it defaults back to the `normal` resolution image file (`myImage.png`).

Oxygen XML Editor plugin also supports dark color themes. This means that the background of the editor area can be of a dark color and the foreground a lighter color. On a dark background, you may find it useful to invert the colors of images. Again, this can be done with simple naming conventions. If an image designed for a dark background is not found, the `normal` image is used.

**Retina/HiDPI Naming Convention**

Refer to the following table for examples of the Retina/HiDPI image naming convention that is used in Oxygen XML Editor plugin:

<table>
<thead>
<tr>
<th>Color Theme</th>
<th>Referred Image File</th>
<th>Double Density Image File</th>
<th>Triple Density Image File</th>
</tr>
</thead>
<tbody>
<tr>
<td>normal</td>
<td>../img/myImage.png</td>
<td>../img/myImage@2x.png</td>
<td>../img/myImage@3x.png</td>
</tr>
<tr>
<td>dark</td>
<td>../img/myImage_dark.png</td>
<td>../img/myImage_dark@2x.png</td>
<td>../img/myImage_dark@3x.png</td>
</tr>
</tbody>
</table>

**Image Map Editor**

Oxygen XML Editor plugin includes an **Image Map Editor** that allows you to create hyperlinks in specific areas of an image that will link to various destinations. For example, an image that is a map of the seven continents may have a specific hyperlink for each continent that links to a resource that has information about the particular continent. The main purpose of an **image map** is to provide an
easy way of linking various parts of an image without having to divide the image into separate image files.

The support for image maps in Oxygen XML Editor plugin is available for images in DITA, DocBook, TEI, and XHTML document types (frameworks (page 2706)). To create an image map on an existing image and open the Image Map Editor, right-click the image and select Image Map Editor.

*Figure 150: Image Map Rendered in Author Mode*

Image Maps in DITA

Oxygen XML Editor plugin includes support for image maps in DITA documents through the use of the `imagemap` element. This feature provides an easy way to create hyperlinks in various areas within an image without having to divide the image into separate image files. The visual Author editing mode includes an Image Map Editor that helps you to easily create and configure image maps.

*Figure 151: Image Map Editor in DITA*
Image Map Editor Interface in DITA

The interface of the Image Map Editor consists of the following sections and actions:

**Toolbar**

- **New Rectangle**
  
  Use this button to draw a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

- **New Circle**
  
  Use this button to draw a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

- **New Polygon**
  
  Use this button to draw a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

- **New Free Form Shape**
Use this button to draw a free form shape over an area in the image. After selecting this button, left-click anywhere in the image to place the first point of your shape. Then move the cursor to the location of the next desired point and left-click to place the next point, and so on. To complete the shape (area), click the first point again and a line will automatically be added from the last point that was added, or simply double-click the last point to automatically add the line from the last point back to the first.

- **Duplicate**
  
  Use this button to create a duplicate of the currently selected shape.

- **Delete**
  
  Use this button to delete the currently selected shape.

- **Undo**
  
  Use this button to undo the last action.

- **Redo**
  
  Use this button to redo the last action that was undone.

- **Show/Hide Numbers**
  
  Use this button to toggle between showing or hiding the numbers for the shapes.

- **Bring Shape to Front**
  
  Use this button to bring the currently selected shape forward to the top layer.

- **Bring Shape Forward**
  
  Use this button to bring the currently selected shape forward one layer.

- **Send Shape Backward**
  
  Use this button to send the currently selected shape back one layer.

- **Send Shape to Back**
  
  Use this button to send the currently selected shape back to the bottom layer.

- **Color Chooser**
  
  Use this drop-down menu to select a color scheme for the lines and numbers of the shapes.

Zoom Slider

Use this slider to zoom the image in or out in the main image pane.

Image Pane

This main Image Pane is where you work with shapes to add hyperlinks to multiple areas within an image. The editing mechanisms that are supported in the Image Pane include the following:

Mouse Controls and Keyboard Shortcuts

- Use the mouse to select and move shapes around in the image pane. It is easy to see which shape is selected in this image pane because the border of the selected shape changes from a solid line to a dotted one.
- You can also drag any of the points of a selected shape to adjust its size and shape.
- You can hold down the Ctrl key to select multiple shapes and then move them simultaneously.
- You can also move shapes by using the arrow keys on your keyboard. In addition, you can hold down Shift while using the arrow keys to move the shape farther or Alt to move it 1 pixel at a time.
- To zoom in or out, you can use the NumPad + or NumPad - keys respectively. Use Ctrl + NumPad 0 to reset the zoom level to its default value.
- You can use Ctrl + Z to undo an action or Ctrl + Y to redo the last action that was undone.

Contextual Menu Actions Available in the Image Pane

You can right-click the shapes, points, or anywhere in the Image Pane to invoke the contextual menu where the following actions are available:

Add Point

Adds a point to Polygon or Free Form shapes.

Remove Point

Removes the current point from Polygon or Free Form shapes.

Duplicate

Create a duplicate of the currently selected shape.
Delete
Delete the currently selected shape.

New Rectangle
Creates a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

New Circle
Creates a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

New Polygon
Creates a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

Undo
Use this action to undo the last action.

Redo
Use this action to redo the last action that was undone.

Shape Table
The table at the right of the Image Pane is a sequential list of all the areas (shapes) that have been added in the image. It shows their number, type, and description (if one has been added). If you select one of the entries in the table, the corresponding shape will be selected in the Image Pane.

Properties

Type
Displays information about the selected coordinate.

Target
Allows you to choose the target resource that you want the selected area (shape) to be linked to. Select a target by using the Link drop-down menu to the right of the text field. You can choose between the following types of links: Cross Reference, File Reference, or Web Link. All three types will open a dialog box that allows you to define the target resource. This linking process is similar to the normal process of inserting links in...
DITA (page 2572) by using the identical Link drop-down menu from the main toolbar.

When you click OK to finalize your changes in the Image Map Editor, an xref element will be inserted with either an href attribute or a keyref attribute. Additional attributes may also be inserted and their values depend on the target and the type of link. For details about the three types of links and their dialog boxes, see Inserting a Link in Oxygen XML Editor plugin (page 2572).

Description
You can enter an optional description for the selected area (shape) that will be displayed in the Image Map Details section (page 811) in Author mode and as a tooltip message when the end user hovers over the hyperlink in the output.

How to Create an Image Map in DITA
To create an image map on an existing image in a DITA document, follow these steps:

1. Right-click the image and select Image Map Editor.

   Result: This action will apply an image map to the current image and open the Image Map Editor dialog box.

2. Add hyperlinks to the image by selecting one of the shape buttons (New Rectangle, New Circle, or New Polygon).

3. Move the shape to the desired area in the image and drag any of the points on the shape to adjust its size or form. You can use the other buttons on the toolbar (page 806) to adjust its layer and color, or to perform other editing actions.

   Tip: You can right-click any of the points, shapes, or anywhere in the Image Pane to access various helpful contextual menu actions (page 808). For example, the easiest way to remove a point is to right-click the point and select Remove Point.

4. With the shape selected, use one of the linking options (page 809) in the Link drop-down menu to select a target resource (or enter its path in the Target (page 809) text field).

5. (Optional) Enter a Description (page 810) for the selected area (shape).

6. If you want to add more hyperlinks to the image, select a shape button again and repeat the appropriate steps.

7. When you are finished creating hyperlinks, click OK to process your changes.
Result: The image map is applied on the image and the appropriate elements and attributes are automatically added. In Author mode, the image map is now rendered over the image. If the image includes an alt element, its value will be displayed under the image. The following two buttons will also now be available under the image in Author mode:

- **Image Map Editor** - Click this button to open the Image Map Editor.
- **Image Map Details** - Click this button to expand a section that displays the details of the image map and allows you to change the shape and coordinates of the hyperlinked areas. Keep in mind that if you change the shape in this section, you also need to add or remove coordinates to match the requirements of the new shape.

**How to Edit an Existing Image Map in DITA**

To edit an existing image map, use any of the following methods:

- Simply double-click the image.
- Right-click the image and select Image Map Editor.
- Click the Image Map Editor button below the image.

All three methods open the Image Map Editor where you can make changes to the image map using the various features described above. You can also make changes to the XML structure of the image map in the Text editing mode.

You can also click the Image Map Details button below the image to expand a section that displays the details of the image map and allows you to change the shape and coordinates of the hyperlinked areas. Keep in mind that if you change the shape in this section, you also need to add or remove coordinates to match the requirements of the new shape.

**Overlapping Areas**

If shapes overlap one another in the Image Map Editor, the one on the top layer takes precedence. The number shown inside each shape represent its layer (if the numbers are not displayed, click the
Show/Hide Numbers button on the Image Map Editor toolbar (page 806). To change the layer order for a shape, use the layer buttons on the Image Map Editor toolbar (page 806) (§, §, §, §).

If you insert a shape and all of its coordinates are completely inside another shape, the Image Map Editor will display a warning to let you know that the shape is entirely covered by a bigger shape. Keep in mind that if a shape is completely inside another shape, its hyperlink will only be accessible if its layer is on top of the bigger shape.

Image Maps in DocBook

Oxygen XML Editor plugin includes support for image maps in DocBook documents through the use of the areaspec element. This feature provides an easy way to create hyperlinks in various parts of an image without having to divide the image into separate image files. The visual Author editing mode includes an Image Map Editor that helps you to easily create and configure image maps.

Figure 153: Image Map Editor in DocBook
Image Map Editor Interface in DocBook

The interface of the Image Map Editor consists of the following sections and actions:

**Toolbar**

- **New Rectangle**
  Use this button to draw a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

- **Duplicate**
  Use this button to create a duplicate of the currently selected shape.

- **Delete**
  Use this button to delete the currently selected shape.

- **Undo**
  Use this button to undo the last action.

- **Redo**
  Use this button to redo the last action that was undone.
Show/Hide Numbers

Use this button to toggle between showing or hiding the numbers for the shapes.

Bring Shape to Front

Use this button to bring the currently selected shape forward to the top layer.

Bring Shape Forward

Use this button to bring the currently selected shape forward one layer.

Send Shape Backward

Use this button to send the currently selected shape back one layer.

Send Shape to Back

Use this button to send the currently selected shape back to the bottom layer.

Color Chooser

Use this drop-down menu to select a color scheme for the lines and numbers of the shapes.

Zoom Slider

Use this slider to zoom the image in or out in the main image pane.

Image Pane

This main Image Pane is where you work with shapes to add hyperlinks to multiple areas within an image. The editing mechanisms that are supported in the Image Pane include the following:

Mouse Controls and Keyboard Shortcuts

- Use the mouse to select and move shapes around in the image pane. It is easy to see which shape is selected in this image pane because the border of the selected shape changes from a solid line to a dotted one.
- You can also drag any of the points of a selected shape to adjust its size and shape.
- You can hold down the Ctrl key to select multiple shapes and then move them simultaneously.
• You can also move shapes by using the arrow keys on your keyboard. In addition, you can hold down Shift while using the arrow keys to move the shape farther or Alt to move it 1 pixel at a time.
• To zoom in or out, you can use the NumPad + or NumPad - keys respectively. Use Ctrl + NumPad 0 to reset the zoom level to its default value.
• You can use Ctrl + Z to undo an action or Ctrl + Y to redo the last action that was undone.

**Contextual Menu Actions Available in the Image Pane**

You can right-click the shapes, or anywhere in the Image Pane to invoke the contextual menu where the following actions are available:

- **Duplicate**
  Create a duplicate of the currently selected shape.

- **Delete**
  Delete the currently selected shape.

- **New Rectangle**
  Creates a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

- **Undo**
  Use this action to undo the last action.

- **Redo**
  Use this action to redo the last action that was undone.

**Shape Table**

The table at the right of the Image Pane is a sequential list of all the areas (shapes) that have been added in the image. It shows their number, type, and ID. If you select one of the entries in the table, the corresponding shape will be selected in the Image Pane.

**Properties**

- **Type**
  Displays information about the selected coordinate.

- **ID**
The identifier for the selected area. This will become the value of the `xml:id` attribute for the particular `area` element.

**Target**

Allows you to choose the target resource that you want the selected area to be linked to. You can enter the path to the target in the text field but the easiest way to select a target is to use the Link drop-down menu to the right of the text field. You can choose between the following types of links: Cross Reference or Web Link. Both types open a dialog box that allows you to select the target resource and it is inserted as the value of an `xlink:href` attribute.

**Description**

You can enter an optional description for the selected area that will be displayed in the Image Map Details section (page 817) in Author mode and as a tooltip message when the end user hovers over the hyperlink in the output.

### How to Create an Image Map in DocBook

To create an image map on an existing image in a DocBook document, follow these steps:

1. Right-click the image and select **Image Map Editor**.

   **Result:** This action will apply an image map to the current image and open the Image Map Editor dialog box.

2. Add hyperlinks to the image by selecting the [New Rectangle] button.

3. Move the shape to the desired area in the image and drag any of the points on the shape to adjust its size or form. You can use the other buttons on the toolbar (page 813) to adjust its layer and color, or to perform other editing actions.

   **Tip:** You can right-click any of the shapes or anywhere in the Image Pane to access various helpful contextual menu actions (page 815).

4. With the shape selected, enter an **ID** (page 815) and use one of the linking options (page 816) in the Link drop-down menu to select a target resource (or enter its path in the **Target** (page 816) text field).

5. (Optional) Enter a **Description** (page 816) for the selected area (shape).

6. If you want to add more hyperlinks to the image, select [New Rectangle] button again and repeat the appropriate steps.

7. When you are finished creating hyperlinks, click **OK** to process your changes.
Result: The image map is applied on the image and the appropriate elements and attributes are automatically added. In Author mode, the image map is now rendered over the image. If the image includes an alt element, its value will be displayed above the image. The following two buttons will also now be available at the top of the image in Author mode:

- **Image Map Editor** - Click this button to open the Image Map Editor.
- **Image Map Details** - Click this button to expand a section that displays the details of the image map.

### How to Edit an Existing Image Map in DocBook

To edit an existing image map, use any of the following methods:

- Simply double-click the image.
- Right-click the image and select **Image Map Editor**.
- Click the **Image Map Editor** button below the image.

All three methods open the Image Map Editor where you can make changes to the image map using the various features described above. You can also make changes to the XML structure of the image map in the Text editing mode.

You can also click the **Image Map Details** button above the image to expand a section that displays the details of the image map and allows you to change the coordinates and IDs of the hyperlinked areas.

**Note:** If you want to link a set of related area elements, you can use areaset elements. To add areaset elements, and area elements to the areaset, switch to Text mode and insert them manually.

### Overlapping Areas

If shapes overlap one another in the Image Map Editor, the one on the top layer takes precedence. The number shown inside each shape represents its layer (if the numbers are not displayed, click the **Show/Hide Numbers** button on the Image Map Editor toolbar (page 813)). To change the layer order for a shape, use the layer buttons on the Image Map Editor toolbar (page 813) (, , , ).

If you insert a shape and all of its coordinates are completely inside another shape, the Image Map Editor will display a warning to let you know that the shape is entirely covered by a bigger shape. Keep in mind that if a shape is completely inside another shape, its hyperlink will only be accessible if its layer is on top of the bigger shape.
Image Maps in TEI

Oxygen XML Editor plugin includes support for **image maps** in TEI documents through the use of the `facsimile` element. In TEI documents, this feature provides an easy way to create areas (using `zone` elements) in an image where the end user can hover or click to retrieve more information about that particular area of the image. The visual **Author** editing mode includes an **Image Map Editor** that helps you to easily create the areas in the image.

*Figure 154: Image Map Editor in TEI*

The interface of the **Image Map Editor** consists of the following sections and actions:

**Toolbar**
☐ New Rectangle

Use this button to draw a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

☐ New Polygon

Use this button to draw a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

☐ New Free Form Shape

Use this button to draw a free form shape over an area in the image. After selecting this button, left-click anywhere in the image to place the first point of your shape. Then move the cursor to the location of the next desired point and left-click to place the next point, and so on. To complete the shape (area), click the first point again and a line will automatically be added from the last point that was added, or simply double-click the last point to automatically add the line from the last point back to the first.

☐ Duplicate

Use this button to create a duplicate of the currently selected shape.

☒ Delete

Use this button to delete the currently selected shape.

☐ Undo

Use this button to undo the last action.

☐ Redo

Use this button to redo the last action that was undone.

☐ Show/Hide Numbers

Use this button to toggle between showing or hiding the numbers for the shapes.

☐ Bring Shape to Front

Use this button to bring the currently selected shape forward to the top layer.
Bring Shape Forward

Use this button to bring the currently selected shape forward one layer.

Send Shape Backward

Use this button to send the currently selected shape back one layer.

Send Shape to Back

Use this button to send the currently selected shape back to the bottom layer.

Color Chooser

Use this drop-down menu to select a color scheme for the lines and numbers of the shapes.

Zoom Slider

Use this slider to zoom the image in or out in the main image pane.

Image Pane

This main Image Pane is where you work with shapes to add hyperlinks to multiple areas within an image. The editing mechanisms that are supported in the Image Pane include the following:

Mouse Controls and Keyboard Shortcuts

- Use the mouse to select and move shapes around in the image pane. It is easy to see which shape is selected in this image pane because the border of the selected shape changes from a solid line to a dotted one.
- You can also drag any of the points of a selected shape to adjust its size and shape.
- You can hold down the Ctrl key to select multiple shapes and then move them simultaneously.
- You can also move shapes by using the arrow keys on your keyboard. In addition, you can hold down Shift while using the arrow keys to move the shape farther or Alt to move it 1 pixel at a time.
- To zoom in or out, you can use the NumPad + or NumPad - keys respectively. Use Ctrl + NumPad 0 to reset the zoom level to its default value.
• You can use **Ctrl + Z** to undo an action or **Ctrl + Y** to redo the last action that was undone.

**Contextual Menu Actions**

You can right-click the shapes, points, or anywhere in the Image Pane to invoke the contextual menu where the following actions are available:

- **Add Point**
  Adds a point to *Polygon* or *Free Form* shapes.

- **Remove Point**
  Removes the current point from *Polygon* or *Free Form* shapes.

- **Duplicate**
  Create a duplicate of the currently selected shape.

- **Delete**
  Delete the currently selected shape.

- **New Rectangle**
  Creates a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

- **New Polygon**
  Creates a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

- **Undo**
  Use this action to undo the last action.

- **Redo**
  Use this action to redo the last action that was undone.

**Shape Table**

The table at the right of the *Image Pane* is a sequential list of all the areas (shapes) that have been added in the image. It shows their number, type, and ID. If you select one of the entries in the table, the corresponding shape will be selected in the *Image Pane*.
Properties

Type
Displays information about the selected coordinate.

ID
The identifier for the selected area. This will become the value of the xml:id attribute for the particular zone element. When you insert a new zone, a unique ID is automatically generated and displayed in this field. However, you can change this value if you want to.

How to Create an Image Map in TEI

To create an image map on an existing image in a TEI document, follow these steps:

1. The image (graphic) must be inside a facsimile element to support the Image Map Editor feature.
2. Right-click the image and select Image Map Editor.

   **Result:** This action will apply an image map to the current image and open the Image Map Editor dialog box.

3. Add areas (zones) in the image by selecting one of the shape buttons (□ New Rectangle or ○ New Polygon).
4. Move the shape to the desired area in the image and drag any of the points on the shape to adjust its size or form. You can use the other buttons on the toolbar (page 818) to adjust its layer and color, or to perform other editing actions.

   **Tip:** You can right-click any of the points, shapes, or anywhere in the Image Pane to access various helpful contextual menu actions (page 821). For example, the easiest way to remove a point is to right-click the point and select \( \times \) Remove Point.

5. With the shape selected, enter an ID (page 822).
6. If you want to add more areas (zones) to the image, select a shape button again and repeat the appropriate steps.
7. When you are finished, click OK to process your changes.

**Result:** The image map is applied on the image and the appropriate elements and attributes are automatically added. In Author mode, the image map is now rendered over the image and the following two buttons will now be available at the bottom of the image:

- **Image Map Editor** - Click this button to open the Image Map Editor.
• **Image Map Details** - Click this button to expand a section that displays the details of the image map.

**How to Edit an Existing Image Map in TEI**

To edit an existing image map, use any of the following methods:

- Simply double-click the image.
- Right-click the image and select **Image Map Editor**.
- Click the **Image Map Editor** button below the image.

All three methods open the **Image Map Editor** where you can make changes to the image map using the various features described above. You can also make changes to the XML structure of the image map in the **Text** editing mode.

You can also click the **Image Map Details** button below the image to expand a section that displays the details of the image map and allows you to change the coordinates and IDs of the hyperlinked areas.

⚠️ **Restriction**: Currently, if **zone** elements contain additional content (such as text or comments) and you edit the image map, the **Image Map Editor** does not preserve the additional content. Therefore, if you do need to insert additional content inside the **zone** elements, you should do so after the image map has been created and finalized. Subsequent changes to the image map should then be done in **Text** mode.

**Overlapping Areas**

If shapes overlap one another in the **Image Map Editor**, the one on the top layer takes precedence. The number shown inside each shape represent its layer (if the numbers are not displayed, click the **Show/Hide Numbers** button on the **Image Map Editor** toolbar (page 818)). To change the layer order for a shape, use the layer buttons on the **Image Map Editor** toolbar (page 818) (•, •, •)

If you insert a shape and all of its coordinates are completely inside another shape, the **Image Map Editor** will display a warning to let you know that the shape is entirely covered by a bigger shape. Keep in mind that if a shape is completely inside another shape, its hyperlink will only be accessible if its layer is on top of the bigger shape.

⚠️ **Warning**: PDF output is limited to rectangular shaped image map objects. Therefore, if your image contains circles or polygons, those objects will be redrawn as rectangles in the PDF output. Keep in mind that this might affect overlaps in the output.

It shows their number, type, and description (value of the Alternative property). If you select one of the entries in the table, the corresponding shape will be selected in the Image Pane.

Properties

Type

Displays information about the selected coordinate.

Href

Specifies the hyperlink target for the selected area. This will become the value of the href attribute for the particular area element. The possible values are:

- **An Absolute URL** - A URL of another website (for example, http://www.example.com/index.htm).
- **A Relative URL** - A link to a file within your website (for example, index.htm).
- **An Element** - A link to the ID of an element within the page (for example, #top).
- **Other Protocols** - A specified path using other protocols (such as https://, ftp://, mailto:, file:).
- **A Script** - A link to a script (for example, javascript:alert('Hello');)

Alternate

The description for the selected area. The value is inserted in an alt attribute in the particular area element. This is a required attribute to present a text alternative for browsers that do not display images.

Target

Specifies where to open the linked resource. The allowed values are:

- **_blank** - Opens the linked resource in a new window or tab.
- **_self** - Opens the linked resource in the same frame as it was clicked.
- **_parent** - Opens the linked resource in the full body of the window.
- **framename** - Opens the linked resource in the named frame.

How to Create an Image Map in XHTML

To create an image map on an existing image in an XHTML document, follow these steps:
1. Right-click the image and select **Image Map Editor**.

   **Result:** This action will apply an *image map* to the current image and open the **Image Map Editor** dialog box.

2. Add hyperlinks to the image by selecting one of the shape buttons (☐ **New Rectangle**, ☐ **New Circle**, or ☐ **New Polygon**).

3. Move the shape to the desired area in the image and drag any of the points on the shape to adjust its size or form. You can use the other buttons on the toolbar *(page 824)* to adjust its layer and color, or to perform other editing actions.

   **Tip:** You can right-click any of the points, shapes, or anywhere in the Image Pane to access various helpful contextual menu actions *(page 827)*. For example, the easiest way to remove a point is to right-click the point and select **X Remove Point**.

4. With the shape selected, specify the hyperlink target in the **Href field** *(page 828)* and enter a description for the selected area in the **Alternate field** *(page 828)*.

5. (Optional) Specify where the hyperlink resource will be opened in the **Target field** *(page 828)*.

6. If you want to add more hyperlinks to the image, select a shape button again and repeat the appropriate steps.

7. When you are finished creating hyperlinks, click **OK** to process your changes.

   **Result:** The *image map* is applied on the image and the appropriate elements and attributes are automatically added. In **Author** mode, the image map is now rendered over the image and its properties are displayed in a section below the image.

### How to Edit an Existing Image Map in XHTML

To edit an existing image map, use any of the following methods:

- Simply double-click the image.
- Right-click the image and select **Image Map Editor**.
- Click the **Image Map Editor** button below the image.

All three methods open the **Image Map Editor** where you can make changes to the image map using the various features described above. You can also make changes to the XML structure of the image map in the **Text** editing mode.

In **Author** mode, the details of the image map are also displayed below the image and you can edit the description, href, shape, and coordinates of the hyperlinked areas. Keep in mind that if you change the
shape in this section, you also need to add or remove coordinates to match the requirements of the new shape.

**Overlapping Areas**

If shapes overlap one another in the **Image Map Editor**, the one on the top layer takes precedence. The number shown inside each shape represents its layer (if the numbers are not displayed, click the `Show/Hide Numbers` button on the **Image Map Editor toolbar** [page 824]). To change the layer order for a shape, use the layer buttons on the **Image Map Editor toolbar** [page 824] (., ., ,).

If you insert a shape and all of its coordinates are completely inside another shape, the **Image Map Editor** will display a warning to let you know that the shape is entirely covered by a bigger shape. Keep in mind that if a shape is completely inside another shape, its hyperlink will only be accessible if its layer is on top of the bigger shape.

**Warning:** PDF output is limited to rectangular shaped image map objects. Therefore, if your image contains circles or polygons, those objects will be redrawn as rectangles in the PDF output. Keep in mind that this might affect overlaps in the output.

**Adding Video, Audio, and Embedded HTML Resources**

You can insert references to media resources (such as videos, audio clips, or embedded HTML frames) in your DITA, DocBook, or XHTML topics. The media resources can be played directly in **Author** mode and in all HTML5-based outputs. There is a toolbar button ( ) that allows you to insert and configure a reference to the media resource. You can also drag media files from your system explorer or the **Navigator view** [page 250] and drop them into your documents (or copy and paste them).

**Table 4. Supported Media Types**

<table>
<thead>
<tr>
<th>Media</th>
<th>Description</th>
<th>Type</th>
<th>Supported Size Properties</th>
</tr>
</thead>
<tbody>
<tr>
<td>mp3</td>
<td>Moving Picture Experts Group Layer-3 Audio</td>
<td>audio</td>
<td>Width</td>
</tr>
<tr>
<td>wav</td>
<td>Windows Wave</td>
<td>audio</td>
<td>Width</td>
</tr>
<tr>
<td>pcm</td>
<td>Pulse Code Modulation</td>
<td>audio</td>
<td>Width</td>
</tr>
</tbody>
</table>
Adding a Media Resource

To insert a media resource in a document, use the following procedure:

1. Place the cursor at the location where you want the media resource.
2. Select the Insert Media Resource action from the toolbar. A Choose Media dialog box appears.

   ![Note](Note.png) You can also drag media files from your system explorer or the Navigator view (page 250) and drop them into your documents (or copy and paste them).

3. Select the URL for the media resource and click Ok.

**Result in Author Mode:** A reference to the specified media object is inserted and rendered in Author mode so that it can be played directly from there.

**Attention:**

- On Mac OS X, if you receive a Blocked Plug-in error message, you need to updated your Flash Player to the latest version.
- On Ubuntu 17.10, if you receive an error when trying to play videos in Author mode, you need to install the libavformat57 library.

**Result in Output:** In the publishing stage, the media object is converted to an HTML5 element so that it can be rendered properly and played in all HTML5-based outputs.

Embedding HTML Content in DITA Topics
The DITA Open Toolkit that comes bundled with Oxygen XML Editor plugin includes a pre-installed plugin (page 2709) that allows you to embed well-formed HTML content directly in a DITA topic.

For example, suppose you wanted to embed a YouTube video directly in a DITA topic.

The DITA topic would look like this:

```xml
....
<foreign outputclass="html-embed"><![CDATA[
  <iframe width="420" height="315"
       src="https://www.youtube.com/embed/qepRkQxhTX"
       frameborder="0" allowfullscreen="true">
    </iframe>
  </iframe>
]]></foreign>
....
```

The converted HTML output would look like this:

```html
...........
<iframe width="420" height="315" src="https://www.youtube.com/embed/qepRkQxhTX"
       frameborder="0" allowfullscreen="true">
    </iframe>
............
```

The plugin is also available on the oxygenxml GitHub projects page.

Figure 156: Default MathML Editor
Configure the MathFlow Editor

The MathFlow Components product can replace the default MathML editor with a specialized MathML editor. You have to purchase a MathFlow Component from Design Science and configure it in Oxygen XML Editor plugin with the following procedure:

1. Install MathFlow by using the Universal installer (for versions prior to 2.1, use the MathFlow SDK).

2. Set the path to the MathFlow install folder in the MathML preferences page (page 118).

3. Set the path to the MathFlow license file in the MathML preferences page (page 118).

Figure 157: Default MathFlow Editor
MathML Equations in HTML Output

Currently, only Firefox can render MathML equations embedded in the HTML code. MathJax is a solution to properly view MathML equations embedded in HTML content in a variety of browsers.

If you have DocBook or DITA content that has embedded MathML equations and you want to properly view the equations in published HTML output types (WebHelp, CHM, EPUB, etc.), you need to add a reference to the MathJax script in the head element of all HTML files that have the equation embedded.

For example:

```
<script type="text/javascript"
    src="https://cdnjs.cloudflare.com/ajax/libs/mathjax/2.7.1/MathJax.js?config=TeX-AMS-MML_HTMLorMML">
</script>
```

For DITA documents, you can also use the following procedure:

1. Edit the DITA Map WebHelp transformation scenario (page 1498) and open the Parameters tab.
2. Set the following parameter to point to an XML resource file that contains your script, depending on your type of WebHelp system.
   - **WebHelp Responsive Systems** - Set the webhelp.fragment.head parameter to point to your resource file.
   - **WebHelp Classic Systems** - Set the webhelp.head.script parameter to point to your resource file.
3. Run the transformation scenario.

**Result:** The equation should now be properly rendered in other browsers, such as Edge, IE, or Chrome.

**Refreshing the Content**

On occasion you may need to reload the content of the document from the disk or reapply the CSS. This can be performed by using the **Reload** action.

To refresh the content of the referenced resources you can use the **Refresh references** action that is available in the current framework menu (for example, the DITA or DocBook5 menu). However, this action will not refresh the expanded external entities, for which you will need to use the **Reload** action.

**Generating IDs for Elements in Author Mode**

Oxygen XML Editor plugin allows you to manually assign or edit values of the `id` attributes in Author mode by using the **Attributes View** (page 319) or an in-place attribute editor (page 692). Oxygen XML Editor plugin also includes mechanisms to generate ID values for elements, either on-request or automatically, in DITA, DocBook, or TEI documents.

**Generate IDs On-Request**

You can generate ID values for specific elements on-request. To do so, select the element for which you want to generate an ID (or place the cursor inside the element) and select the **Generate IDs** action from the contextual menu. This action generates a unique ID for the current element. If you invoke the action on a block of selected content, the action will generate IDs for all top-level elements and elements that are listed in the **ID Options** dialog box (page 836). To open this dialog box, select **ID Options** from the DITA, DocBook, or TEI menu (depending on your document type).

**Note:** The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

**Automatically Generate IDs**

Oxygen XML Editor plugin includes an option to automatically add unique ID values to certain elements when they are created in Author mode. The **Auto generate IDs for elements** option can be found in the **ID Options** dialog box (page 836) that is displayed when you select the **ID Options** action from the framework (page 2706)-specific menu (DITA, DocBook, or TEI). If this **Auto generate IDs for elements** option is selected, Oxygen XML Editor plugin automatically generates unique ID values for elements that are listed in this dialog box. You can use this dialog box to customize the
format of the ID values and choose which elements will have their ID values automatically generated (for example, you can customize the list of elements to include those that you most often need to identify).

**ID Options Dialog Box**

To configure options for generating IDs, select **ID Options** from the DITA, DocBook, or TEI menu (depending on your document type).

*Figure 158: ID Options Dialog Box*

The **ID Options** dialog box allows you to configure the following options with regards to generating ID values:

**ID Pattern**

The pattern for the ID values that will be generated. This text field can be customized using constant strings or any of the Oxygen XML Editor plugin Editor Variables (*page 201*).

**Element name or class value to generate ID for**

The elements for which ID values will be generated, specified using class attribute values. To customize the list, use the Add, Edit, or Remove buttons.

**Auto generate IDs for elements**

If selected, Oxygen XML Editor plugin will automatically generate unique IDs for the elements listed in this dialog box when they are created in Author mode.

**Remove IDs when copying content in the same document (DITA or TEI)**
When copying and pasting content in the same DITA or TEI document, this option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs. To retain the element IDs, deselect this option.

**Note:** This option does not have an effect on content that is cut and pasted.

**Remove IDs when copying content (DocBook)**

This option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs in DocBook documents. If this option is not selected, IDs are always retained when you copy or cut content and paste it in the same document or other documents. If this option is selected, IDs are never retained for copied content, but if you cut the content, they are preserved for the first paste action (and not retained for any subsequent paste actions).

**Duplicating Elements with Existing IDs**

If you duplicate elements with existing IDs (for example, through copy/paste or drag/drop actions), all IDs are removed at the resolution of the operation. However, you can use the options in the ID Options dialog box to change this behavior. The options in this dialog box affect duplicated elements with existing IDs in the following ways:

- Only the elements listed in this dialog box are affected by these options. Therefore, if you want to use these options to preserve IDs or generate new ones, you must first add the elements to be duplicated to the list in this dialog box.
- If the Auto generate IDs for elements option (page 836) is selected and you duplicate elements with existing IDs, Oxygen XML Editor plugin assigns new, unique ID values to the duplicates.
- If the Auto generate IDs for elements option (page 836) is not selected and you duplicate elements with existing IDs, the ID values are removed from the duplicates.
- For DITA and TEI, if the Remove IDs when copying content in the same document option (page 836) is selected, the ID values are removed from elements that are duplicated in the same document. If it is not selected, the ID values are preserved when elements are duplicated in the same document. Selecting this option has no effect if the Auto generate IDs for elements option is selected and this option has no affect on elements that are duplicated in other documents.
- For DocBook, if the Remove IDs when copying content option (page 837) is selected, the ID values are removed from any element that is duplicated. If it is not selected, the ID values are preserved when elements are duplicated. Selecting this option has no effect if the Auto generate IDs for elements option is selected.
Controlling the Default ID Generation Options

It is possible to configure the default ID generation options for DITA, DocBook, and TEI document types. In the frameworks folder for each of those document types, there is an XML configuration file called idGenerationDefaultOptions.xml that contains the default settings for generating IDs in each particular type of document. To configure the default settings, you can edit this file and save it back to the same directory.

The configuration file can be found in the resources folder within the particular framework (page 2706). For example, the configuration file for the DITA framework is located in: [OXYGEN_INSTALL_DIR]/frameworks/dita/resources/idGenerationDefaultOptions.xml.

Sharing Default ID Generation Options

If you want to share your configured default ID generation settings with other members of your team, follow these steps:

1. Configure the idGenerationDefaultOptions.xml file for your framework according to your needs.
2. Bundle a modified version of the entire framework folder (for example, [OXYGEN_INSTALL_DIR]/frameworks/dita/). To do this:
   a. Open the Preferences dialog box (page 55) and go to Document Type Association.
   b. Select your document type and click the Extend button.
   c. In the Document type configuration dialog box (page 72) that is now displayed, select External for the Storage option. By default, this will save the extension in a new folder in the frameworks folder (for example, [OXYGEN_INSTALL_DIR]/frameworks/dita-extension (1)), but you can also use the Browse button to specify a specific name and folder.
   d. In this new extension folder, create a new folder called resources and add your modified idGenerationDefaultOptions.xml file to this new resources folder.
   e. Go back to the Document Type Association preferences page, select the extended framework, and click Edit.
   f. Go to the Classpath tab (page 76), add a reference to your new resources folder, and move this reference up (using the Move Up button) so that it is the first one that appears in the list.
   g. Click OK and exit out of the preferences page.
3. Distribute your newly extended folder to other team members by using one of the methods described in Sharing a Custom Framework (page 2086).
Using Form Controls in Author Mode

Form controls make it easier to capture, organize, and edit content. They are especially helpful for less technical users because form controls provide a way to interact with the content of a document in a graphical manner without intimidating the user with the XML structure.

Oxygen XML Editor plugin includes a variety of built-in form controls (page 2255) that can be defined in CSS stylesheets that are used to render Author mode (page 2255). You can also implement custom form controls (page 2288) for more specific needs. The types of built-in form controls that are available include:

- **Audio (page 2256)** - A media object that plays audio clips.
- **Browser (page 2257)** - A media object that renders HTML frames or interact with SVG documents.
- **Button (page 2261)** - A graphical user interface object that performs a specific action.
- **Button Group (page 2264)** - A graphical user interface group of buttons (such as radio buttons) that perform specific actions.
- **Checkbox (page 2268)** - A graphical user interface box that you can click to select or deselect a value.
- **Combo Box (page 2270)** - A graphical user interface object that can be a drop-down menu or a combination of a drop-down menu and a single-line text field.
- **Date Picker (page 2273)** - A form control object that allows you to select a date in a specified format.
- **HTML Content (page 2274)** - A graphical user interface box that is used for rendering HTML content.
- **Pop-up (page 2276)** - A contextual menu that provides quick access to various actions.
- **Text Area (page 2279)** - A box that allows you to enter multiple lines of text.
- **Text Field (page 2283)** - A graphical user interface box that allows you to enter a single line of text.
- **URL Chooser (page 2285)** - A dialog box that allows you to select the location of local or remote resources.
- **Video (page 2287)** - A media object that plays videos.

The following image is an example of several form controls rendered in Author mode. The first (Direct manager) is a combo box with both a drop-down menu and an editable text field. This is followed by a simple text field (Homepage), and the [+] and [-] icons also represent button form controls that are assigned specific actions to add or delete records from the document.

*Figure 159: Example of Form Controls in Author Mode*
You can use your imagination to envision the multitude of ways that you can use form controls to make the editing experience for content authors easier and more efficient. As a working example, a bundled samples project (located in the samples folder inside the Oxygen XML Editor plugin installation directory) contains a file called personal.xml that contains form controls. You can use this file, along with its corresponding personal.css file to experiment with an example of how form controls can be implemented in Author mode.

Contextual Menu Actions in Author Mode

Oxygen XML Editor plugin includes powerful support for editing XML documents through actions included in the contextual menu. When editing XML documents in Author mode, the contextual menu includes general actions that are available for all of the recognized document types and framework (page 2706)-specific actions that are configured for each document type.

General Contextual Menu Actions in Author Mode

The general actions that are available in the contextual menu (some of them are also available in the submenus of the Document menu) for all built-in document types include the following:

Quick Fix (Alt + 1 (Command + Alt + 1 on OS X))

Available when the contextual menu is invoked on an error where Oxygen XML Editor plugin can provide a Quick Fix (page 884).

Open Image
Available when the contextual menu is invoked on an image. This action allows you to open an image in a default system application associated with the current image type.

**Track Changes Actions**

Available when the *Track Changes feature* (page 2711) is enabled and the contextual menu is invoked on a change. The following options are available:

- **✓ Accept Change(s)**
  
  Accepts the *Tracked Change* (page 2711) located at the cursor position or all of the changes in a selection. If you select a part of a *deletion* or *insertion* change, only the selected content is accepted. If you select multiple changes, all of them are accepted. For an *insertion* change, it keeps the inserted text and for a *deletion* change, it removes the content from the document.

- **× Reject Change(s)**
  
  Rejects the *Tracked Change* (page 2711) located at the cursor position or all of the changes in a selection. If you select a part of a *deletion* or *insertion* change, only the selected content is rejected. If you select multiple changes, all of them are rejected. For an *insertion* change, it removes the inserted text and for a *deletion* change, it preserves the original content.

- **✍ Comment Change**
  
  Opens a dialog box that allows you to add a comment to an existing *Tracked Change* (page 2711). The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

**Author Callout Actions**

Available when the contextual menu is invoked on a *callout* (page 2704). If the corresponding options in the *Show review callouts* section (page 127) are selected in the *Callouts preferences page* (page 127), the callouts are displayed in Author mode for comments, tracked insertion changes, or tracked deletion changes.

**Insertion or Deletion Callout Actions**

The following actions are available in the contextual menu when invoked on an *insertion* or *deletion* callout box:

- **Reply**
Opens a dialog box that allows you to add a reply to a comment or Tracked Changes (page 2711). When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and Review view (page 742).

**Mark as Done**

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for Tracked Changes (page 2711) that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendents. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

✓ **Accept Change(s)**

Accepts the Tracked Change (page 2711) located at the cursor position or all of the changes in a selection. If you select a part of a deletion or insertion change, only the selected content is accepted. If you select multiple changes, all of them are accepted. For an insertion change, it keeps the inserted text and for a deletion change, it removes the content from the document.

✗ **Reject Change(s)**

Rejects the Tracked Change (page 2711) located at the cursor position or all of the changes in a selection. If you select a part of a deletion or insertion change, only the selected content is rejected. If you select multiple changes, all of them are rejected. For an insertion change, it removes the inserted text and for a deletion change, it preserves the original content.

✓ **Comment Change**

Opens a dialog box that allows you to add a comment to an existing Tracked Change (page 2711). The comment
will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

**Edit Reference**

If the fragment that contains a callout is a reference, use this option to go to the reference and edit the callout.

**Callouts Options**

Select this option to open the Callouts preference page (page 127) where you can configure various callout options.

**Comment Callout Actions**

The following actions are available in the contextual menu when invoked on a comment callout box:

**Reply**

Opens a dialog box that allows you to add a reply to a comment or Tracked Changes (page 2711). When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and Review view (page 742).

**Mark as Done**

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for Tracked Changes (page 2711) that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendents. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

**Show/Edit Comment**

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original
comment, the dialog box just displays the comment without the possibility of editing it.

Remove Comment

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

Callouts Options

Select this option to open the Callouts preference page (page 127) where you can configure various callout options.

Edit Attributes

Displays an in-place attributes editor (page 322) that allows you to manage the attributes of an element.

Edit Profiling Attributes

Allows you to change the profiling attributes (page 746) defined on all selected elements.

Insert submenu

This submenu includes insert actions that are specific to each framework (page 2706), along with the following general action:

Insert Entity

Allows you to insert a predefined entity or character entity. Surrogate character entities (range #x10000 to #x10FFFF) are also accepted. Character entities can be entered in one of the following forms:

- \<decimal value> - e. g. \#65
- &\<decimal value> - e. g. &\#65
- \#x<hexadecimal value> - e. g. \#x41
- &#x<hexadecimal value> - e. g. &#x41

Cut (Ctrl + X (Command + X on OS X))

Removes the current selected content from the document and places it in the clipboard.

Copy (Ctrl + C (Command + C on OS X))

Places a copy of the current selected content in the clipboard.

Paste (Ctrl + V (Command + V on OS X))

Inserts the current clipboard content into the document at the cursor position.
This submenu includes special paste actions that are specific to each framework (page 2706), as well as the following general paste actions:

**Paste As XML**

Paste clipboard content that is considered to be XML, preserving its XML structure.

**Paste As Text**

Paste clipboard content, ignoring any structure or styling markup.

**Select submenu**

This submenu allows you to select the following:

**Element**

Selects the entire element at the current cursor position.

**Content**

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

**Parent**

Selects the entire parent element at the current cursor position.

**Text submenu**

This submenu contains the following actions:

**To Lower Case**

Converts the selected content to lower case characters.

**To Upper Case**

Converts the selected content to upper case characters.

**Capitalize Sentences**

Converts to upper case the first character of every selected sentence.

**Capitalize Words**

Converts to upper case the first character of every selected word.

**Count Words**

Counts the number of words and characters (no spaces) in the entire document or in the selection for regular content and read-only content.
Note: The content marked as deleted with change tracking (page 271) is ignored when counting words.

Convert Hexadecimal Sequence to Character (Ctrl + Shift + H (Command + Shift + H on OS X))

Converts a sequence of hexadecimal characters to the corresponding Unicode character (page 602). The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the 0x or 0X prefix. Examples of valid sequences and the characters they will be converted to:

- 0x0045 will be converted to E
- 0X0125 to #
- 265 to #
- 2190 to #

Note: For more information about finding the hexadecimal value of a character, see Finding the Decimal, Hexadecimal, or Character Entity Equivalent (page 609).

Refactoring submenu

Contains a series of actions designed to alter the XML structure of the document:

- ➕! Toggle Comment
  Encloses the currently selected text in an XML comment, or removes the comment if it is commented.

- Move Up (Alt + UpArrow)
  Moves the current node or selected nodes in front of the previous node.

- Move Down (Alt + DownArrow)
  Moves the current node or selected nodes after the subsequent node.

- ✎ Split Element
  Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

- ✎ Join Elements
Joins two adjacent block elements (page 2703) that have the same name. The action is available only when the cursor position is between the two adjacent block elements. Also, joining two block elements can be done by pressing the Delete or Backspace keys and the cursor is positioned between the boundaries of these two elements.

**Surround with Tags (Alt + Shift + E)**

Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

- If the Position cursor between tags option (page 101) is selected in the Content Completion preferences page, the cursor is placed between the start and end tag.
- If the Position cursor between tags option (page 101) is not selected in the Content Completion preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

**Surround with '[tag]' (Alt + Shift + ForwardSlash)**

Surround the selected content with the last tag used.

**Rename Element**

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the Rename dialog box.

**Delete Element Tags**

Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the Delete or Backspace keys.

**Remove All Markup**

Removes all the XML markup inside the selected block of content and keeps only the text content.

**Remove Text**

Removes the text content of the selected block of content and keeps the markup intact with empty elements.

**DITA Refactoring Actions**
A variety of built-in XML refactoring operations that pertain to DITA documents with some of the information preconfigured based upon the current context.

**Change Topic ID to File Name**

Use this operation to change the ID of a topic to be the same as its file name.

**Convert CALS Tables to Simple Tables**

Use this operation to convert DITA CALS tables to simple tables. If you invoke this operation from a nested table (a table inside a table), only the nested table will be affected. If it is invoked on a parent table that contains nested tables, all of the contained tables will be converted.

**Convert conrefs to conkeyrefs**

Use this operation to convert `conref` attributes to `conkeyref` attributes.

**Convert Simple Tables to CALS Tables**

Use this operation to convert DITA simple tables to CALS tables. If you invoke this operation from a nested table (a table inside a table), only the nested table will be affected. If it is invoked on a parent table that contains nested tables, all of the contained tables will be converted.

**Convert to Concept**

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

**Convert to General Task**

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA General Task is a less restrictive alternative to the Strict Task information type.

**Convert to Reference**

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

**Convert to Task**

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).
Convert to Topic

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

Convert to Troubleshooting

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

Rename Key

Available when invoked on a key, and can be used to quickly rename a key. It also updates all references to it. Note that it does not work on DITA 1.3 key scopes.

Attributes Refactoring Actions

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

Add/Change attribute

Allows you to change the value of an attribute or insert a new one.

Convert attribute to element

Allows you to change an attribute into an element.

Delete attribute

Allows you to remove one or more attributes.

Rename attribute

Allows you to rename an attribute.

Replace in attribute value

Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

Comments Refactoring Actions

Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

Delete comments

Allows you to delete comments found inside one or more elements.
Elements Refactoring Actions

Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

Delete element
Allows you to delete elements.

Delete element content
Allows you to delete the content of elements.

Insert element
Allows you to insert new elements.

Rename element
Allows you to rename elements.

Unwrap element
Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

Wrap element
Allows you to surround elements with element tags.

Wrap element content
Allows you to surround the content of elements with element tags.

Fragments Refactoring Actions

Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

Insert XML fragment
Allows you to insert an XML fragment.

Replace element content with XML fragment
Allows you to replace the content of elements with an XML fragment.

Replace element with XML fragment
Allows you to replace elements with an XML fragment.

JATSKit Refactoring Actions
Available for JATS documents. Contains built-in XML refactoring operations that pertain to JATS documents with some of the information preconfigured based upon the current context.

**Add BITS DOCTYPE - NLM/NCBI Book Interchange 2.0**

Adds an NLM 'BITS' 2.0 DOCTYPE declaration.

**Add Blue DOCTYPE - NISO JATS Publishing 1.1**

Adds a JATS 'Blue' 1.1 DOCTYPE declaration.

**Normalize IDs**

Assigned IDs are normalized and IDs are assigned to some elements that are missing them.

**Review submenu**

This submenu includes the following actions:

- **Track Changes**
  Enables or disables the *Track Changes (page 2711)* support for the current document.

- **Accept Change(s) and Move to Next**
  Accepts the *Tracked Change (page 2711)* located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is accepted.

- **Accept All Changes**
  Accepts all *Tracked Changes (page 2711)* in the current document.

- **Reject Change(s) and Move to Next**
  Rejects the *Tracked Change (page 2711)* located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is rejected.

- **Reject All Changes**
  Rejects all *Tracked Changes (page 2711)* in the current document.

- **Comment Change**
  Opens a dialog box that allows you to add a comment to an existing *Tracked Change (page 2711)*. The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on
an existing commented change, the dialog box will allow you to edit the comment.

**Highlight**

Enables the highlighting tool that allows you to mark text in your document.

**Colors**

Allows you to select the color for highlighting text.

**Stop highlighting**

Use this action to deactivate the highlighting tool.

**Remove highlight(s)**

Use this action to remove highlighting from the document.

**Add Comment**

Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).

**Show/Edit Comment**

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

**Remove Comment**

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

**Manage Reviews**

Opens the Review view (page 742).

**Manage IDs submenu**

This submenu is available for XML documents that have an associated DTD, XML Schema, or Relax NG schema (not available for DITA documents). It includes the following actions:

**Rename in**

 Renames the ID and all its occurrences. Selecting this action opens the Rename XML ID dialog box. This dialog box lets you insert the new ID value and choose the scope of the rename operation.

**Search References**
Searches for the references of the ID. By default, the scope of this action is the current project. If you configure a scope using the Select the scope for the Search and Refactor operations (page 904) dialog box, this scope will be used instead.

Search References in

Searches for the references of the ID. Selecting this action opens the Select the scope for the Search and Refactor operations (page 904).

Search Occurrences in file

Searches for the occurrences of the ID in the current document.

Folding submenu

This submenu includes the following actions:

- **Toggle Fold**
  Toggles the state of the current fold.

- **Collapse Other Folds (Ctrl + NumPad/ (Command + NumPad/ on OS X))**
  Folds all the elements except the current element.

- **Collapse Child Folds (Ctrl + NumPad- (Command + NumPad- on OS X))**
  Folds the elements indented with one level inside the current element.

- **Expand Child Folds (Ctrl + NumPad+ (Command + NumPad+ on OS X))**
  Unfolds all child elements of the currently selected element.

- **Expand All (Ctrl + NumPad* (Command + NumPad* on OS X))**
  Unfolds all elements in the current document.

Inspect Styles

Document Type-Specific Contextual Menu Actions in Author Mode

Other document type-specific actions are available in the contextual menu of Author mode for the following document types (click the links to see the default actions that are available for each specific document types):
Special Character Support in Author Mode

Oxygen XML Editor plugin offers support for bidirectional text, such as Arabic or Hebrew languages that require right-to-left scripts, certain Asian languages (such as Devanagari, Bengali, Gurmukhi, Gujarati, Oriya, Tamil, Telugu, Kannada, Malayalam, Sinhala, Thai, Khmer), or other special characters (such as combining characters). To achieve this, Oxygen XML Editor plugin implements the Unicode Bidirectional Algorithm, as specified by the Unicode Consortium. The text arrangement is similar to what you get in a modern HTML browser. The final text layout is rendered according to the directional CSS properties matching the XML elements and the Unicode directional formatting codes.

By default, when navigating bidirectional text with the arrow keys in Author mode, pressing the right arrow key moves the cursor in the writing direction and the left arrow moves it in the opposite direction. However, if the Arrow keys move the cursor in the writing direction option (page 118) in the Cursor Navigation preferences page is not selected, pressing the right arrow will simply move the cursor to the right (and the left arrow moves it to the left), regardless of the text direction.

Tip: If you experience performance issues when editing documents that contain bidirectional text, you could try the following solution:

- You could try changing the font. For example, you could try using the David font in Hebrew content. If it is not already installed in your operating system, this font is available at: https://www.microsoft.com/typography/fonts/family.aspx?FID=234. To change the font in Oxygen XML Editor plugin, open the Preferences dialog box (page 55), go to Fonts, and change the font using the Author option in the Fonts preferences page (page 158).

Controlling the Text Direction Using XML Markup

Oxygen XML Editor plugin supports the following CSS properties that control the direction of text:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>direction</strong></td>
<td>Specifies the writing direction of the text. Possible values are <strong>ltr</strong> (text direction is left to right), <strong>rtl</strong> (text direction is right to left), and <strong>inherit</strong> (direction property is inherited from the parent element).</td>
</tr>
<tr>
<td><strong>unicodeBidi</strong></td>
<td>Used along with the <strong>direction</strong> property to create levels of embedded text with different text directions in the same document. Possible values are <strong>bidi-override</strong> (creates an additional level of embedding and forces all strong characters to the direction specified in the <strong>direction</strong>), <strong>embed</strong> (creates an additional level of embedding), <strong>normal</strong> (does not use an additional level of embedding), and <strong>inherit</strong> (value of the <strong>unicodeBidi</strong> property is inherited from parent element).</td>
</tr>
</tbody>
</table>

For instance, to declare an element as being Right to Left, you could use a stylesheet like this:

**XML File:**

```xml
<article>
  <myRTLpara>RIGHT TO LEFT TEXT</myRTLpara>
</article>
```

**Associated CSS File:**

```css
myRTLpara{
  direction:rtl;
  unicode-bidi:embed;
}
```

Oxygen XML Editor plugin recognizes the **dir** attribute on any XML document. Supported values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ltr</td>
<td>The text from the current element is Left to Right, embedded.</td>
</tr>
<tr>
<td>rtl</td>
<td>The text from the current element is Right to Left, embedded.</td>
</tr>
<tr>
<td>lro</td>
<td>The text from the current element is Left to Right, embedded.</td>
</tr>
</tbody>
</table>
The text from the current element is Right to Left, embedded.

The following XML document types make use of the `dir` attribute with the above values:

- DITA
- DocBook
- TEI
- XHTML

**Note:** When the inline element (page 2707) tags are visible, the text in the line is arranged according to the BIDI algorithm after replacing the tags symbols with Object Replacement Characters. This makes it possible to get a different text arrangement when viewing a document in the No Tags mode versus viewing it in the Full Tags mode.

Controlling the Text Direction Using the Unicode Direction Formatting Codes

These Unicode Direction Formatting Codes codes can be embedded in the edited text, specifying a text direction and embedding. However, it is not recommended to use them in XML as they are zero width characters, making it hard to debug the text arrangement.

**Table 6. Directional Formatting Codes**

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>U+202A (LRE)</td>
<td>LEFT-TO-RIGHT EMBEDDING Treats the following text as embedded left-to-right.</td>
</tr>
<tr>
<td>U+202B (RLE)</td>
<td>RIGHT-TO-LEFT EMBEDDING Treats the following text as embedded right to left.</td>
</tr>
<tr>
<td>U+202D (LRO)</td>
<td>LEFT-TO-RIGHT OVERRIDE Forces the following characters to be treated as strong left-to-right characters.</td>
</tr>
<tr>
<td>U+202E (RLO)</td>
<td>RIGHT-TO-LEFT OVERRIDE Forces the following characters to be treated as strong right-to-left characters.</td>
</tr>
<tr>
<td>U+202C (PDF)</td>
<td>POP DIRECTIONAL FORMATTING CODE Restores the bidirectional state to what it was before the last LRE, RLE, RLO, or LRO.</td>
</tr>
<tr>
<td>U+200E (LRM)</td>
<td>LEFT-TO-RIGHT MARK Left-to-right strong zero-width character.</td>
</tr>
<tr>
<td>U+200F (RLM)</td>
<td>RIGHT-TO-LEFT MARK Right-to-left strong zero-width character.</td>
</tr>
</tbody>
</table>

To insert Unicode Direction Formatting Codes, use the **Symbols** toolbar action. To easily find such a code, you can either enter directly the hexadecimal value, or use the **Details** tab to enter the codes name.

Oxygen XML Editor plugin offers the support for bi-directional text in all the side views (Outline view (page 316), Attributes view (page 319) and so on) and text fields.
Design Editing Mode (XML Schema Diagram Editor)

XML Schemas allow document designers to specify the allowed structure and content of an XML document and to check if an XML document is valid.

Oxygen XML Editor plugin provides a simple and expressive XML Schema diagram editor (Design mode) for editing XML Schemas. The schema diagram helps both the content authors who want to understand a schema and schema designers who develop complex schemas.

To switch to this mode, select Design at the bottom of the editing area.

Figure 160: XML Schema Diagram
For more information about designing XML Schemas, watch our video demonstration:

Navigation in the XML Schema Design Mode

The following editing and navigation features work for all types of schema components in the XML Schema Design mode:

- Select consecutive components on the diagram (components from the same level) using the Shift key. You can also make discontinuous selections in the schema diagram using the Ctrl (Meta on Mac OS) key. To deselect one of the components, use Ctrl + Single-Click (Command + Single-Click on OS X).
- Use the arrow keys to navigate the diagram vertically and horizontally.
- Use Home/End keys to jump to the first/last component from the same level. Use Ctrl + Home (Command + Home on OS X) key combination to go to the diagram root and Ctrl + End (Command + End on OS X) to go to the last child of the selected component.
- You can easily go back to a previously visited component while moving from left to right. The path will be preserved only if you use the left arrow key or right arrow key. For example, if the current selection is on the second attribute from an attribute group and you press the left arrow key to jump to the attribute group, when you press the right arrow key, then the selection will be moved to the second attribute.
- Go back and forward between components viewed or edited in the diagram by selecting them in the Outline view (page 507):
  - Back (go to previous schema component).
  - Forward (go to next schema component).
  - Go to Last Modification (go to last modified schema component).
- Copy, reference, or move global components, attributes, and identity constraints to another position and from one schema to another using the Cut/Copy and Paste/Paste as Reference actions.
- Go to the definition of an element or attribute with the Go to Definition action.
- You can expand and see the contents of the imports/includes/redefines in the diagram. To edit components from other schemas, the schema for each component will be opened as a separate file in Oxygen XML Editor plugin.

**Tip:** If an XML Schema referenced by the current opened schema was modified on disk, the change will be detected and you will be asked to refresh the current schema contents.
• Recursive references are marked with a *recurse symbol* (🔗). Click this symbol to navigate between the element declaration and its reference.

*Figure 161: Recursive Reference*

<Diagram showing recursive reference>

**XML Schema Outline View**

The **Outline** view for XML Schemas presents all the global components grouped by their location, namespace, or type. By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

*Figure 162: Outline View for XML Schema*

<Diagram showing XML Schema Outline View>

The **Outline** view provides the following options in the **View Menu** on the **Outline** view action bar:

- **Filter returns exact matches**
  
  The text filter of the **Outline** view returns only exact matches;

- **Selection update on cursor move**
Allows a synchronization between Outline view and schema diagram. The selected view from the diagram is also selected in the Outline view.

**Sort**

Allows you to sort alphabetically the schema components.

**Show all components**

Displays all components that were collected starting from the master files (page 2708). Components that are not referable from the current file are marked with an orange underline. To reference them, add an import directive with the componentNS namespace.

**Show referable components**

Displays all components (collected starting from the master files (page 2708)) that can be referenced from the current file. This option is set by default.

**Show only local components**

Displays the components defined in the current file only.

**Group by location/namespace/type**

These three operations allow you to group the components by location, namespace, or type. When grouping by namespace, the main schema target namespace is the first presented in the Outline view.

The following contextual menu actions are available in the Outline view:

**Remove (Delete)**

Removes the selected item from the diagram.

**Search References**

Searches all references of the item found at current cursor position in the defined scope, if any.

**Search References in**

Searches all references of the item found at current cursor position in the specified scope.

**Component Dependencies**

Opens the Component Dependencies view (page 1064) that allows you to see the dependencies for the current selected component.

**Resource Hierarchy**

Opens the Resource Hierarchy / Dependencies view (page 904) that allows you to see the hierarchy for the current selected resource.
**Resource Dependencies**

Opens the Resource Hierarchy / Dependencies view (page 904) that allows you to see the dependencies for the current selected resource.

**Rename Component in**

Renames the selected component.

**Generate Sample XML Files**

Generate XML files using the current opened schema. The selected component is the XML document root.

The upper part of the Outline view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (such as *, ?) and separate multiple patterns with commas.

**Tip:** The search filter is case insensitive. The following wildcards are accepted:

- * - any string
- ? - any character
- , - patterns separator

If no wildcards are specified, the string to search will be searched as a partial match.

The content of the Outline view and the editing area are synchronized. When you select a component in the Outline view, its definition is highlighted in the editing area.

XML Schema Attributes View

The Attributes view for XML Schemas presents the properties for the selected component in the schema diagram. By default, it is displayed on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

*Figure 163: Attributes View*

The default value of a property is presented in the Attributes view with blue foreground. The properties that can not be edited are rendered with gray foreground. A non-editable category that contains at least one child is rendered with bold. Bold properties are properties with values set explicitly to them.

Properties for components that do not belong to the current edited schema are read-only but if you double-click them you can choose to open the corresponding schema and edit them.

You can edit a property by double-clicking by pressing Enter. For most properties you can choose valid values from a list or you can specify another value. If a property has an invalid value or a warning, it will be highlighted in the table with the corresponding foreground color. By default, properties with errors are highlighted with red and the properties with warnings are highlighted with yellow. You can customize these colors from the Document checking user preferences (page 108).

For imports, includes and redefines, the properties are not edited directly in the Attributes view. A dialog box will open that allows you to specify properties for them.
The schema namespace mappings are not presented in Attributes view. You can view/edit these by choosing Edit Schema Namespaces from the contextual menu on the schema root. See more in the Edit Schema Namespaces (page 1049) section.

The Attributes view has five actions available on the toolbar and also on the contextual menu:

- **Add**
  
  Allows you to add a new member type to an union's member types category.

- **Remove**
  
  Allows you to remove the value of a property.

- **Move Up**
  
  Allows you to move up the current member to an union's member types category.

- **Move Down**
  
  Allows you to move down the current member to an union's member types category.

- **Copy**
  
  Copy the attribute value.

- **Go to Definition**
  
  Shows the definition for the selected type.

- **Show Facets**
  
  Allows you to edit the facets for a simple type.

XML Schema Facets View

The Facets view for XML Schemas presents the facets for the selected component, if available. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

*Figure 164: Facets View*
The default value of a facet is rendered in the **Facets** view with a blue color. The facets that cannot be edited are rendered with a gray color. The grouping categories (for example: **Enumerations** and **Patterns**) are not editable. If these categories contain at least one child they are rendered with bold. Bold facets are facets with values set explicitly to them.

⚠️ **Important:** Usually inherited facets are presented as default in the **Facets** view but if patterns are inherited from a base type and also specified in the current simple type only the current specified patterns will be presented. You can see the effective pattern value obtained by combining the inherited and the specified patterns as a tooltip on the **Patterns** category.

Facets for components that do not belong to the current edited schema are read-only but if you double-click them you can choose to open the corresponding schema and edit them.

You can edit a facet by double-clicking it or by pressing Enter, when that facet is selected. For some facets you can choose valid values from a list or you can specify another value. If a facet has an invalid value or a warning, it will be highlighted in the table with the corresponding foreground color. By default, facets with errors are presented with red and the facets with warnings with yellow. You can customize the error colors from the **Document Checking user preferences** (page 108).

The **Facets** view provides the following actions in its toolbar and contextual menu:

- **Add**
  
  Allows you to add a new enumeration or a new pattern.

- **Remove**
  
  Allows you to remove the value of a facet.

- **Edit Annotations**
  
  Allows you to edit an annotation for the selected facet.

- **Move Up**
  
  Allows you to move up the current enumeration/pattern in **Enumerations/Patterns** category.
Move Down

Allows you to move down the current enumeration/pattern in Enumerations/Patters category.

Copy

Copy the attribute value.

Open in Regular Expressions Builder

Rather than editing regular expressions manually, this action allows you to open the pattern in the XML Schema Regular Expressions Builder (page 1094) that guides you through the process of testing and constructing the pattern.

Facets can be fixed to prevent a derivation from modifying its value. To fix a facet value just press the Pin button.

XML Schema Palette View

The Palette view is designed to offer quick access to XML Schema components and to improve the usability of the XML Schema diagram builder. You can use the Palette to drag and drop components in the Design mode. The components offered in the Palette depend on the XML schema version set in the XML Schema preferences page (page 176). If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

Figure 165: Palette View

Figure 166: Palette View

Components are organized functionally into 4 collapsible categories:
• Basic components: *elements, group, attribute, attribute group, complex type, simple type, type alternative.*
• Compositors and Wildcards: *sequence, choice, all, any, any attribute, open content.*
• Directives: *import, include, redefine, override.*
• Identity constraints: *key, keyref, unique, selector, field, assert.*

**Note:** The *type alternative, open content, override, and assert* components are available for XML Schema 1.1.

To add a component to the edited schema:

• Click and hold a graphic symbol from the **Palette** view, then drag the component into the **Design** view.
• A line dynamically connects the component with the XML schema structure.
• Release the component into a valid position.

**Note:** You cannot drop a component into an invalid position. When you hover the component into an invalid position, the mouse cursor changes its shape into . Also, the connector line changes its color from the usual dark gray to the color defined in the **Validation error highlight color option** (page 108) (default color is red).

**Schema Editing Actions**

You can edit an XML schema using drag and drop operations or contextual menu actions.

Drag and drop is the easiest way to move the existing components to other locations in an XML schema. For example, you can quickly insert an element reference in the diagram with a drag and drop from the **Outline view** (page 507) to a compositor in the diagram. Also, the components order in an *xs:sequence* can be easily changed using drag and drop.

If this property has not been set, you can easily set the attribute/element type by dragging over it a simple type or complex type from the diagram. If the type property for a simple type or complex type is not already set, you can set it by dragging over it a simple or complex type.

Depending on the drop area, various actions are available:

• **move** - Context dependent, the selected component is moved to the destination.
- **reference** - Context dependent, the selected component is referenced from the parent.
- **copy** - If (Ctrl (Meta on Mac OS)) key is pressed, a copy of the selected component is inserted to the destination.

Visual clues about the operation type are indicated by the mouse pointer shape:

- ◀ - When moving a component.
- ◀ - When referencing a component.
- ◀ - When copying a component.

You can edit some schema components directly in the diagram. For these components, you can edit the name and the additional properties presented in the diagram by double clicking the value you want to edit. If you want to edit the name of a selected component, you can also press (Enter). The list of properties that can be displayed for each component can be customized in the Preferences (page 134).

When editing references, you can choose from a list of available components. Components from an imported schema for which the target namespace does not have an associated prefix is displayed in the list as componentName#targetNamespace. If the reference is from a target namespace that was not yet mapped, you are prompted to add prefix mappings for the inserted component namespace in the current edited schema.

You can also change the compositor by double-clicking it and choose the compositor you want from the proposals list.

There are some components that cannot be edited directly in the diagram: imports, includes, redefines. The editing action can be performed if you double-click or press (Enter) on an import/include/redefine component. An edit dialog box is displayed, allowing you to customize the directives.

Contextual Menu Actions in the Design Mode

The contextual menu of the Design mode includes the following actions:

- **Go to Definition (Ctrl + Shift + Enter)**
  Shows the definition for the current selected component. For references, this action is available by clicking the arrow displayed in its bottom right corner.

- **Open Schema (Ctrl + Shift + Enter)**
  Opens the selected schema. This action is available for `xsd:import`, `xsd:include` and `xsd:redefine` elements. If the file you try to open does not exist, a warning message is displayed and you have the possibility to create the file.

- **Edit Attributes (Alt + Shift + Enter)**
  Allows you to edit the attributes of the selected component in a small in-place editor that presents the same attributes as in the Attributes view (page 510) and the Facets view (page 511). The actions that can be performed on attributes in this dialog box are the same actions presented in the two views.

- **Append child**
  Offers a list of valid components, depending on the context, and appends your selection as a child of the currently selected component. You can set a name for a named component after it has been added in the diagram.

- **Insert before**
  Offers a list of valid components, depending on the context, and inserts your selection before the selected component, as a sibling. You can set a name for a named component after it has been added in the diagram.

- **Insert after**
  Offers a list of valid components, depending on the context, and inserts your selection after the selected component, as a sibling. You can set a name for a named component after it has been added in the diagram.

- **New global**
  Inserts a global component in the schema diagram. This action does not depend on the current context. If you choose to insert an import you have to specify the URL of the imported file, the target namespace and the import ID. The same information, excluding the target namespace, is requested for an `xsd:include` or `xsd:redefine` element.
**Note:** If the imported file has declared a target namespace, the field **Namespace** is completed automatically.

**Edit Schema Namespaces**

When performed on the schema root, it allows you to edit the schema target namespace and namespace mappings. You can also invoke the action by double-clicking the target namespace property from **Attributes view (page 510)** for the schema or by double-clicking the schema component.

**Edit Annotations**

Allows you to edit the annotation for the selected schema component in the **Edit Annotations** dialog box. You can perform the following operations in the dialog box:

- **Edit all appinfo/documentation items for a specific annotation** - All appinfo/documentation items for a specific annotation are presented in a table and can be easily edited. Information about an annotation item includes: type (documentation/appinfo), content, source (optional, specify the source of the documentation/appinfo element) and xml:lang. The content of a documentation/appinfo item can be edited in the **Content** area below the table.

- **Insert/Insert before/Remove documentation/appinfo**. The **Add** button allows you to insert a new annotation item (documentation/appinfo). You can add a new item before the item selected in table by pressing the **Insert Before** button. Also, you can delete the selected item using the **Remove** button.

- **Move items up/down** - to do this use the **Move up** and **Move down** buttons.

- **Insert/Insert before/Remove annotation** - Available for components that allow multiple annotations such as schemas or redefines.

- **Specify an ID for the component annotation**. An optional identifier for the annotation.

Annotations are rendered by default under the graphical representation of the component. When you have a reference to a component with annotations, these annotations are presented in the diagram also below the reference component. The **Edit Annotations** action invoked from the contextual menu edit the annotations for the reference. If the reference component does not have annotations, you can edit the annotations of the referenced component by double-clicking the annotations area. Otherwise, you can edit the referenced component annotations only if you go to the definition of the component.
Note: For imported/included components that do not belong to the currently edited schema, the Edit Annotations dialog box presents the annotation as read-only. To edit its annotation, open the schema where the component is defined.

Extract Global Element

Action that is available for local elements. A local element is made global and is replaced with a reference to the global element. The local element properties that are also valid for the global element declaration are kept.

Figure 167: Extracting a Global Element

If you use the Extract Global Element action on a name element, the result is:

Figure 168: Extracting a Global Element on a name Element

Extract Global Attribute

Action available for local attributes. A local attribute is made global and replaced with a reference to the global attribute. The properties of local attribute that are also valid in the global attribute declaration are kept.

Figure 169: Extracting a Global Attribute
If you use the **Extract Global Attribute** action on a `note` attribute, the result is:

*Figure 170: Extracting a Global Attribute on a note Attribute*

---

**Extract Global Group**

Action available for compositors (sequence, choice, all). This action extracts a global group and makes a reference to it. The action is available only if the parent of the compositor is not a group.

*Figure 171: Extracting a Global Group*
If you use the **Extract Global Group** action on the `sequence` element, the **Extract Global Component** dialog box is displayed and you can choose a name for the group. If you type `personGroup`, the result is:

*Figure 172: Extracting a Global Group on a sequence Element*

---

**Extract Global Type**

Action used to extract an anonymous simple type or an anonymous complex type as global. For anonymous complex types, the action is available on the parent element.

*Figure 173: Extracting a Global Simple Type*

If you use the action on the `union` component and choose `numericST` for the new global simple type name, the result is:

*Figure 174: Extracting a Global Simple Type on a union Component*
Figure 175: Extracting a Global Complex Type

If you use the action on a `person` element and choose `person_type` for the new complex type name, the result is:

Figure 176: Extracting a Global Complex Type on a `person` Element

**Rename Component in**

Rename the selected component.

**Cut Ctrl + X (Command + X on OS X)**

Cut the selected component(s).

**Copy Ctrl + C (Command + C on OS X)**

Copy the selected component(s).

**Copy XPath**

This action copies an XPath expression that identifies the selected element or attribute in an instance XML document of the edited schema and places it in the clipboard.

**Paste Ctrl + V (Command + V on OS X)**

Paste the component(s) from the clipboard as children of the selected component.
Paste as Reference

Create references to the copied component(s). If not possible a warning message is displayed.

Remove (Delete)

Remove the selected component(s).

Override component

Copies the overridden component in the current XML Schema. This option is available for xs:override components.

Redefine component

The referenced component is added in the current XML Schema. This option is available for xs:redefine components.

Optional

Can be performed on element/attribute/group references, local attributes, elements, compositors, and element wildcards. The minOccurs property is set to 0 and the use property for attributes is set to optional.

Unbounded

Can be performed on element/attribute/group references, local attributes, elements, compositors, and element wildcards. The maxOccurs property is set to unbounded and the use property for attributes is set to required.

Search

Can be performed on local elements or attributes. This action makes a reference to a global element or attribute.

Search References

Searches all references of the item found at current cursor position in the defined scope if any.

Search References in

Searches all references of the item found at current cursor position in the specified scope.

Search Occurrences in File

Searches all occurrences of the item found at current cursor position in the current file.

Component Dependencies

Opens the Component Dependencies view (page 1064) that allows you to see the dependencies for the current selected component.
Resource Hierarchy

Opens the Resource Hierarchy / Dependencies view (page 1061) that allows you to see the hierarchy for the current selected resource.

Flatten Schema

Recursively adds the components of included Schema files to the main one. It also flattens every imported XML Schema from the hierarchy.

Resource Dependencies

Allows you to see the dependencies for the current selected resource.

- Expand All
  Recursively expands all sub-components of the selected component.

- Collapse All
  Recursively collapses all sub-components of the selected component.

Save as Image

Save the diagram as image, in JPEG, BMP, SVG or PNG format.

- Generate Sample XML Files
  Generate XML files using the current opened schema. The selected component is the XML document root. See more in the Generate Sample XML Files (page 1070) section.

- Options
  Show the Schema preferences panel (page 133).

XML Schema Components

A schema diagram contains a series of interconnected components. To quickly identify the relation between two connected components, the connection is represented as:

- A thick line to identify a connection with a required component (in the following image, family is a required element).

  Figure 177: Example: Required Component

- A thin line to identify a connection with an optional component (in the following image, email is an optional element).
The following topics explain in detail all available components and their symbols as they appear in an XML schema diagram.

**xs:schema**

*Figure 179: The xs:schema Component*

Defines the root element of a schema. A schema document contains representations for a collection of schema components, such as type definitions and element declarations, that have a common target namespace. See more info at [http://www.w3.org/TR/xmlschema11-1/#element-schema](http://www.w3.org/TR/xmlschema11-1/#element-schema).

By default, it displays the **targetNamespace** property when rendered.

**xs:element**

*Figure 180: The xs:element Component*

![xs:element Component](image)

Defines an element. An element declaration is an association of a name with a type definition, either simple or complex, an (optional) default value and a (possibly empty) set of identity-constraint definitions. See more info at [http://www.w3.org/TR/xmlschema11-1/#element-element](http://www.w3.org/TR/xmlschema11-1/#element-element).

An element by default displays the following properties when rendered in the diagram: *default*, *fixed*, *abstract* and *type*. When referenced or declared locally, the element graphical representation also contains the value for the *minOccurs* and *maxOccurs* properties (for 0..1 and 1..1 occurs the values are implied by the connector style) and the connectors to the element are drawn using dotted lines if the element is optional.

- Constraining element information items by providing Attribute Declarations governing the appearance and content of attributes.
- Constraining element information item children to be empty, or to conform to a specified element-only or mixed content model, or else constraining the character information item children to conform to a specified simple type definition.
- Using the mechanisms of Type Definition Hierarchy to derive a complex type from another simple or complex type.
- Specifying post-schema-validation infoset contributions for elements.
- Limiting the ability to derive additional types from a given complex type.
- Controlling the permission to substitute, in an instance, elements of a derived type for elements declared in a content model to be of a given complex type.

Tip: A complex type that is a base type to another type will be rendered with yellow background.

**xs:simpleType**

*Figure 184: The xs:simpleType Component*

Defines a simple type. A simple type definition is a set of constraints on strings and information about the values they encode, applicable to the normalized value of an attribute information item or of an element information item with no element children. Informally, it applies to the values of attributes and the text-only content of elements. See more info at [http://www.w3.org/TR/xmlschema11-1/#element-simpleType](http://www.w3.org/TR/xmlschema11-1/#element-simpleType).

The graphical representation also contains the value for the minOccurs and maxOccurs properties (for 0..1 and 1..1 occurs the values are implied by the connector style) and the connectors to the wildcard are drawn using dotted lines if the wildcard is optional.

**Constructs Used to Group Schema Components**

This section explains the components that can be used for grouping other schema components:

- Attributes (page 1046)
- Constraints (page 1047)
- Substitutions (page 1047)

**Attributes**

**Schema Validation**

Validation for the **Design** mode is seamlessly integrated in the Oxygen XML Editor plugin [XML documents validation](page 854) capability.

**Figure 207: XML Schema Validation**

A schema validation error is presented by highlighting the invalid component:

- In the **Attributes View** (page 510).
- In the diagram by surrounding the component that has the error with a red border.

Invalid facets for a component are highlighted in the **Facets View** (page 511).

Components with invalid properties are rendered with a red border. This is a default color, but you can customize it in the **Document checking user preferences** (page 108). When hovering an invalid component, the tooltip will present the validation errors associated with that component.

When editing a value that is supposed to be a qualified or unqualified XML name, the application provides automatic validation of the entered value. This proves to be very useful in avoiding setting invalid XML names for the given property.
If you validate the entire schema using the validation action from the XML menu or from the Validation toolbar drop-down menu, all validation errors will be presented in the Errors tab. To resolve an error, just click it (or double-click for errors located in other schemas) and the corresponding schema component will be displayed as the diagram root so that you can easily correct the error.

⚠️ **Important:** If the schema imports only the namespace of other schema without specifying the schema location and a catalog is set-up (page 897) that maps the namespace to a certain location both the validation and the diagram will correctly identify the imported schema.

ℹ️ **Tip:** If the validation action finds that the schema contains unresolved references, the application will suggest the use of validation scenarios, but only if the current edited schema is an XML Schema module.

### Edit Schema Namespaces

You can use the XML Schema Namespaces dialog box to easily set a target namespace and define namespace mappings for a newly created XML Schema. In the Design mode these namespaces can be modified anytime by choosing Edit Schema Namespaces from the contextual menu. You can also do this by double-clicking the schema root in the diagram.

The XML Schema Namespaces dialog box allows you to edit the following information:

- **Target namespace** - The target namespace of the schema.
- **Prefixes** - The dialog box displays a table with namespaces and the mapped prefixes. You can add a new prefix mapping or remove an already existing one.
7. Working with Documents

Oxygen XML Editor plugin includes a variety of general features that can be used when working with any type of document. More specialized features are available when working with specific type of documents, such as the various types of XML documents, CSS, JavaScript, Markdown, and more. For details about those specialized features for specific types of documents, see Editing Specific Document Types (page 614).

This chapter includes information about how to create and work with documents, working with projects, and various editing features that are provided in Oxygen XML Editor plugin for all document types. This chapter also includes information about some of the special tools that are included in Oxygen XML Editor plugin, such as the file and directory comparison tools.

Creating and Working with Documents

Oxygen XML Editor plugin includes various features, actions, and wizards to assist you with creating new files and working with existing files. This section explains many of these features, including information on creating new documents, opening, saving, and closing existing files, searching documents, viewing file properties, and more.

Creating New Documents and Templates

Oxygen XML Editor plugin includes a helpful New Document wizard that allows you to customize and create new files from a large list of document types and built-in templates. You can also create your own templates (page 555) and share them with others (page 560).

To quickly create a new document:

1. Click the New button on the toolbar or select File > New > Other > Oxygen XML Editor plugin.
2. Select the type of document that you want to create.
   
   Tip: You can use the text filter field at the top of the dialog box to search for a specific template.

3. Click the Next button, then Finish.
New Document Wizard

Oxygen XML Editor plugin supports a wide range of document types. The New Document wizard presents the default associations between a file extension and the type of editor that opens the file. The New Document wizard creates a skeleton document that may contain a root element, the document prolog, and possibly other child elements depending on options that are specific for each schema type. The wizard also provides access to the New from Templates option (page 554) that opens a wizard where you can create a document based upon built-in templates or custom templates.

New Document Wizard

To create a new document in Oxygen XML Editor plugin, follow these steps:

1. Click the New button on the toolbar or select File > New > Other > Oxygen XML Editor plugin.
   
   Result: The New Document wizard is displayed with all the supported document types.

2. Select the type of document that you want to create. Oxygen XML Editor plugin includes a series of Eclipse wizards that help you create the new document based upon the type you choose.

   Tip: You can use the text filter field at the top of the dialog box to search for a specific template.

3. Click Next.

   Result: The next wizard page allows you to select a path where you want to store the new file and for some document types it includes some customization options. If you selected XML File or XML Schema (XSD) File for the type of document, you need to select the storage path and click Next again to reach customization options.

   Note: For DITA documents, the dialog box includes some additional options for generating a title, file name, and root ID attribute. For more information, see Creating a New DITA Topic (page 2459).

4. After configuring the options for the particular type of document, click Finish to create the file. If the Open file for editing when done option is selected, the new file will be opened in the appropriate editor.

New XML Document Wizard

Figure 208: New XML File Configuration Options
If you selected XML File for the type of document you want to create, the wizard will include the following options:

**URL**

Specifies the path to the schema file. When you select a file, Oxygen XML Editor plugin analyzes its content and tries to fill in the rest of the dialog box.

**Schema Type**

Allows you to select the schema type. The following options are available: XML Schema, DTD, RelaxNG XML syntax, RelaxNG compact syntax, and NVDL.

**Public ID**

Specifies the PUBLIC identifier declared in the document prolog.

**Namespace**

Specifies the document namespace.

**Prefix**

Specifies the prefix for the namespace of the document root.

**Root Element**

Populated with elements defined in the specified schema, enables selection of the element used as document root.
Description pane

A small description of the selected document root.

Add Optional Content

If you select this option, the elements and attributes defined in the XML Schema as optional are generated in the skeleton XML document.

Add First Choice Particle

If you select this option, Oxygen XML Editor plugin generates the first element of an \textit{xs:choice} schema element in the skeleton XML document. Oxygen XML Editor plugin creates this document in a new editor panel when you click Finish.

XSL Document Wizard

\textit{Figure 209: New XSL Document Configuration Options}

If you selected \textit{Stylesheet (XSL) File} for the type of file you want to create, the wizard will include the following options:

\textbf{Stylesheet version}

Allows you to select the Stylesheet version number. You can select from: 1.0, 2.0, and 3.0.

\textbf{Add documentation annotations}
Select this option to generate the stylesheet annotation documentation.

**XML Schema (XSD) Document Wizard**

*Figure 210: New XML Schema Configuration Options*

If you selected XML Schema (XSD) File for the type of file you want to create, the wizard will include the following options:

**Default XML Schema version**

Select this option to use the XML Schema version defined in the XML Schema preferences page (page 176).

**XML Schema 1.0**

Sets the minVersion attribute to 1.0 and the maxVersion attribute to 1.1.

**XML Schema 1.1**

Sets the minVersion attribute to 1.1.

**Target namespace**

Allows you to specify the schema target namespace.

**Namespace prefix declaration table**
This table contains namespace prefix declarations. Table information can be managed using the New and Delete buttons.

Tip: For further details on how you can set the version of an XML Schema, go to Setting the XML Schema Version (page 1098).

## Schematron Document Wizard

Figure 211: New Schematron Configuration Options

If you selected Schematron File for the type of file you want to create and selected the Customize option, the configuration dialog box will include the following option:

**Schematron version**

Specifies the Schematron version. Possible options: 1.5 (deprecated) and ISO.

Note: Starting with version 16.0 of Oxygen XML Editor plugin, the support for Schematron 1.5 is deprecated. It is recommended to use ISO Schematron instead.

### Creating New Documents Based on Templates

The New from Templates wizard (page 550) allows you to select built-in templates or custom templates that you or other users created in previous sessions. You can access this wizard by selecting the New from Templates option in the New Document wizard (page 550).
The categories of templates presented in the wizard include:

- **User-defined template directory** - You can add your own custom templates by creating template files (page 555) in a directory and then add that directory to the list of template directories that Oxygen XML Editor plugin uses in the Document Templates preferences page (page 156). This user-defined directory will appear in the **New from templates** wizard.

- **Global templates** - Contains a list of built-in templates as well as any user-defined custom templates (page 555) that are saved in the templates directory of the Oxygen XML Editor plugin installation folder ([OXYGEN_INSTALL_DIR]/templates).

- **Framework templates** - Contains the list of templates defined in the Document Type configuration dialog box (Templates tab) (page 94) for each framework (page 2706).

**New from Templates Wizard**

To create a new document using this wizard, follow these steps:

1. Click the ✉️ **New** button on the toolbar and select **New from Templates** (or select **File > New > Other > Oxygen XML Editor plugin > New From Templates**).

   **Result:** The **New from Templates** wizard is displayed where you to select various types of document templates.

2. Select the type of document that you want to create and click **Next**.

3. Choose the storage path and a file name for the new document.

4. Click the **Finish** button.

   **Result:** The new file is created and if the **Open file for editing when done** option is selected, the new file will be opened in the appropriate type of editor.

**Creating New Document Templates**

Oxygen XML Editor plugin allows you to create your own custom document templates and they will appear in the **New from templates** wizard (page 554).

**Creating a New Document Template**

To create your own custom document template and have it appear in the new document wizard, follow these steps:

1. Create a new file (whatever type of document you need) and customize it to become a starting point for creating new files of this type.
Tip: You can use editor variables (page 201) in the template file content and they will be expanded when the files are opened. Also, see Customizing Document Templates (page 557) for other template customization tips (for example, you could add placeholders or hints (page 559) to assist authors).

2. Save the new document template and reference that location in Oxygen XML Editor plugin. There are several options for doing this:

- **Saving the new template in a specific framework's directory** - Save the new template in a directory (for example, called `templates`) within that specific framework directory (usually a custom framework (page 2037)). Then open the Document Type configuration dialog box (page 72) for that specific framework, go to the Templates tab (page 94), and click the + button in the bottom-right corner to add your new directory to the list. It is recommended that the reference be made relative to the framework directory (for example, `${frameworkDir}/templates`). You can also remove any existing entries in the list that aren't applicable or won't be used in your custom framework. Click OK to close the configuration dialog box and then OK or Apply to save your changes.

- **Saving the new template in the Oxygen installation directory** - Save the new template in the `templates` directory of the Oxygen XML Editor plugin installation directory (`{OXYGEN_INSTALL_DIR}/templates`). Document templates saved in this directory will appear in the Global templates category in the New from templates wizard (page 554).

- **Saving the new template in a custom directory** - Save the new template in any directory of your choice and then add that directory to the list of templates in the Document Templates preferences page (page 156). This user-defined directory will appear in the New from templates wizard (page 554) along with all the new document templates that you save inside it. Click OK or Apply to save your changes.

Attention: The name that you use to save the template will be the name that appears in the new document wizard, including capitalization, space, and characters (for example, `My Custom Template1.xml` will appear in the new file wizard as `My Custom Template1`). You can also configure the displayed name in a properties file by following the procedure found in the Configure the Displayed Names for Document Templates (page 559) section.

3. Open the new document wizard (New toolbar button or File > New > New from Templates) and you should see your custom template in the appropriate folder.

Note: For DITA templates, they will also appear in the dialog box for creating new DITA topics from the DITA Maps Manager, but if you customize the template (page 557), you need to set the type property to dita in the corresponding properties file.

Related Information:
Customizing Document Templates

Oxygen XML Editor plugin allows you to customize certain aspects of built-in or custom document templates. For example, you can customize the icons or specify a prefix/suffix that will be used for the proposed file name in the New from templates wizard (page 554).

Customizing the Icons for a Document Template

If you want to customize the icons to be used for document templates, use a properties file to specify the icons using the following procedure:

1. Create a new properties file or edit an existing one following these guidelines:
   a. If you want to create a new properties file, you can use the Properties template found in the New Document folder in the New from templates wizard (page 554). If you want to edit an existing template, you can find them within the subfolders in the templates folder for each framework (for example, the DITA topic properties file is located in: OXYGEN_INSTALL_DIR/frameworks/dita/templates/topic/topic.properties).
   b. Use the same name as your custom template file except with a .properties extension (for example, MyTemplate.properties).
   c. In this properties file, specify the paths to the icons that will be used in the new file wizard. The properties file should look like this:

   ```properties
   type=general
   smallIcon=../icons/Article_16.png
   bigIcon=../icons/Article_48.png
   ```

   **Tip:** For DITA files, the type property needs to be set to dita. Otherwise, the template will not appear in the dialog box for creating new DITA topics from the DITA Maps Manager (page 2400). For all other types of files, set it to general. The icons specified in this properties file will only be used for the new file wizards and not in any other part of the interface.

   **Important:** If you created a new template and chose to use a custom directory for the new template (in step 2 of the new template procedure (page 556)), make sure the path to the icons is relative to that directory.
2. Save the properties file in the same directory as your custom template.

3. Open the new file wizard (File > New > New from Templates) and you should see your custom icons next to the document template in the appropriate folder.

Add a Prefix or Suffix to File Names for a Document Template

You can use a properties file for each document template to add a prefix or suffix to the file name that is proposed in certain dialog boxes when you create a new file from that template. This applies to the following new document dialog boxes:

- The new document dialog box that appears when you click the New button on the toolbar (or File > New > Other > Oxygen XML Editor plugin). The prefix or suffix is added to the name of the file in the File field.
- The new document dialog box that appears when you select New > New from Templates > [Template Name] > Next from the contextual menu in the Navigator view (page 250). The prefix or suffix is added to the name of the file in the File field.
- For DITA files, it also applies to the new document dialog box that appears when you select Append Child > New, Insert Before > New, or Insert After > New from the DITA Maps Manager (page 2400). The prefix or suffix is added to the name of the file in the Save as field.
- For DITA files, it also applies to the Fast Create Topics dialog box (page 2462) that you can use to create multiple skeleton topics at once.

To add a prefix or suffix to the file names for a document template, follow these steps:

1. Create a new properties file or edit an existing one.
   - If you create a new properties file, use the same name as the template file except with a .properties extension (for example, MyTemplate.properties). This properties file will specify the prefix/suffix that will be used to propose the file name in the new file wizards.
   
   When defining the prefix/suffix, the properties file should look something like this:

   ```
   type=general
   filenamePrefix=prod_
   filenameSuffix=_test
   ```

   **Important:** For DITA files, the type property needs to be set to dita. For all other types of files, set it to general.

   - If you edit an existing template, simply define the prefix/suffix as specified above (page 558).

2. Save the properties file in the same directory as the document template.
3. Open the new document wizard (using the methods described above (page 558)) and when you select the appropriate template, you should see your prefix or suffix in the file name that is proposed in that dialog box.

Configure the Displayed Names for Document Templates

To change the name that is displayed for a document template, use the following procedure:

1. Create a new properties file or edit an existing one. If you create a new properties file, use the same name as the template file except with a .properties extension (for example, MyTemplate.properties).
2. Add a displayName property in the properties file:

```xml
<xml>
displayName=My Template Name
</xml>
```

**Tip:** The names for framework (page 2706)-specific document templates (such as DITA Topic or DocBook Article, as you would see in the Framework templates folder in the New file wizard) can be translated via the internationalization support. In this case, the properties file should contain something like:

```xml
<xml>
displayName=${i18n(tag)}
</xml>
```

where tag refers to an entry in the translation.xml file for that specific framework (for example, OXYGEN_INSTALL_DIR/frameworks/dita/i18n/translation.xml for DITA).

3. Save the properties file in the same directory as the document template.
4. Open the new file wizard (File > New > New from Templates) and you should see the new name for the template.

Adding Placeholders or Hints in a Document Template

Document templates sometimes contain empty elements and it may not be clear to the Author what should be inserted. You can define placeholders in document templates that provide hints for Authors to help them understand what type of content should be added in any particular empty element within the document. The placeholder text is specified using a processing instruction and the placeholders are removed when the Author inserts content in the corresponding element.

To define placeholders in a document template to provide authors with hints, follow this procedure:

1. Edit the document template.
2. Add placeholders in the form of processing instructions within the elements where you want hints to be displayed when an Author creates a document from the template. For example:
3. Save the template file.

4. Use the New from templates wizard (page 554) to create a new document using your customized template and you should see the hints in the opened document.

**Related Information:**

- Creating New Document Templates (page 555)
- Sharing Custom Document Templates (page 560)

**Sharing Custom Document Templates**

Your custom document templates (page 555) can be shared with the other members of your team so that they all have access to the templates in the New from templates wizard (page 554). The best way to share them is by integrating them in an extended framework (page 2706) (document type) configuration and then sharing the whole framework with the other users.

**Sharing Custom Document Templates**

To share custom document templates with other members of your team:

1. Create a custom framework by extending an existing one (page 2037), if you haven't already done so.
2. Create the new document template (page 555), if you haven't already done so.
3. Save the new template in a directory (for example, called templates) within your custom framework directory. Then open the Document Type configuration dialog box (page 72) for that
specific framework, go to the Templates tab (page 94), and click the button in the bottom-right corner to add your new directory to the list. It is recommended that the reference be made relative to the framework directory (for example, ${frameworkDir}/templates). You can also remove any existing entries in the list that aren't applicable or won't be used in your custom framework.

4. Click OK to close the configuration dialog box and then OK or Apply to save your changes.

5. All that remains is to share the entire framework with anyone who needs to have access to the custom templates. There are several methods for sharing frameworks and you can find details here: Sharing a Custom Framework (page 2086).

**Opening Documents**

To open a document in Oxygen XML Editor plugin, do one of the following:

- Go to File > Open File to display the Open File dialog box.
- Go to File > Open URL to display a dialog box where you can specify a URL (defined by a protocol, host, resource path, and an optional port) or use the browsing actions in the Browse for remote file drop-down menu.
- Select the Open or Open with action from the contextual menu of the Navigator view (page 250).

**Opening the Current Document in a System Application**

To open the currently edited document in the associated system application, use the View in Browser/System Application action that is available in the XML menu. If you want to open XML files in a specific internet browser, instead of the associated system application, you can specify the internet browser to be used. To do so, go to Window > Preferences > General > Web Browser and specify it there. This will take precedence over the default system application settings.

**Saving Documents**

You can save the document you are editing with one of the following actions:

- File > Save.
- File > Save As - Displays the Save As dialog box, used either to name and save an open document to a file or to save an existing file with a new name.
• **File > Save All** - Saves all open documents.

## Working with Remote Documents

Oxygen XML Editor plugin supports editing remote files, using the FTP, SFTP, and WebDAV protocols. You can edit remote files in the same way you edit local files.

You can open one or more remote files in the **Open using FTP/SFTP** dialog box (page 562)

A WebDAV resource can be locked when it is opened in Oxygen XML Editor plugin by selecting the **Lock WebDAV files on open** option (page 159) to prevent other users to modify it concurrently on the server. If a user tries to edit a locked file, Oxygen XML Editor plugin displays an error message that contains the lock owner’s name. The lock is released automatically when the editor for that resource is closed in Oxygen XML Editor plugin.

To avoid conflicts with other users when you edit a resource stored on a SharePoint server, you can **Check Out** the resource.

To improve the transfer speed, the content exchanged between Oxygen XML Editor plugin and the HTTP / WebDAV server is compressed using the GZIP algorithm.

The current **WebDAV Connection** (page 1974) details can be saved by switching to the **Database perspective** (page 2709) and then you can browse and manage the connection in the **Data Source Explorer** view (page 1917).

### Open URL

To access the **Open using FTP/SFTP/WebDAV** dialog box, go to **File > Open URL** menu, then choose the **Browse for remote file** option from the drop-down action list.

*Figure 212: Open URL Dialog Box*
The displayed dialog box is composed of several parts:

- The editable **URL** combo box, in which you specify the URL to be opened or saved.

  **Tip:** If the file is accessible through an anonymous FTP, you can type a URL like: `ftp://anonymous@some.site/home/test.xml`.

  This combo box also displays the current selection when you change selection by browsing the tree of folders and files on the server.

- The **Identification** section contains the access credentials. If you want to browse for a file on a server, you have to specify the user and password. This information is bound to the selected URL and is also used in opening or saving the file. If the **Save** checkbox is selected, the user and password are saved between editing sessions. The password is encrypted and kept in the options file.

  **Note:** Your password is well protected. If the options file is used on another machine by a user with a different user name the password, it will become unreadable since the encryption is
user-name dependent. This is also true if you add URLs to your project that include a user and
password.

• The **Browse for remote file** section contains the **Server URL** combo box and **Autoconnect**
  checkbox. In the **Server URL** combo box, you can specify the protocol, the server host name, or
  server IP.

  **Tip:** When accessing a FTP server, you only need to specify the protocol and the host (such

  By pressing the **Browse** button, the directory listing will be shown in the component. When
  **Autoconnect** is selected, every time the dialog box is displayed, the browse action will be
  performed.

  • The bottom part of the dialog box displays the tree view of the documents stored on the server.
  You can browse the directories and make multiple selections. Additionally, you can use the
  **Rename**, **Delete**, and **New Folder** actions to manage the file repository.

  The file names are sorted in a case-insensitive manner.

### Changing File Permissions on a Remote FTP Server

Some FTP servers allow the modification of permissions of the files served over the FTP protocol.
This protocol feature is accessible directly in the FTP file browser dialog box by right-clicking a tree
node and selecting the **Change permissions** menu item.

In this dialog box, the usual Unix file permissions **Read**, **Write**, and **Execute** are granted or denied
for the file owner, owner group, and the rest of the users. The aggregate number of permissions is
updated in the **Permissions** text field when it is modified with one of the checkboxes.

### WebDAV over HTTPS

If you want to access a WebDAV repository across a non-secure network, Oxygen XML Editor plugin
allows you to load and save the documents over the HTTPS protocol (if the server understands this
protocol) so that any data exchange with the WebDAV server is encrypted.

When a WebDAV repository is first accessed over HTTPS, the server hosting the repository will
present a security certificate as part of the HTTPS protocol, without any user intervention. Oxygen
XML Editor plugin will use this certificate to decrypt any data stream received from the server. For
the authentication to succeed you should make sure the security certificate of the server hosting the
repository can be read by Oxygen XML Editor plugin. This means that Oxygen XML Editor plugin can
find the certificate in the key store of the Java Runtime Environment in which it runs. You know the
server certificate is not in the JRE key store if you get the error *No trusted certificate found* when trying to access the WebDAV repository.

**Troubleshooting HTTPS**

When Oxygen XML Editor plugin cannot connect to an HTTPS-capable server, most likely there is no certificate set in the *Java Runtime Environment (JRE)* that Oxygen XML Editor plugin runs into. The following procedure describes how to:

- Export a certificate to a local file using any HTTPS-capable Web browser (for example, Internet Explorer).
- Import the certificate file into the JRE using the *keytool* that comes bundled with Oxygen XML Editor plugin.

**Tip:** To make Oxygen XML Editor plugin accept a certificate even if it is invalid, open the *Preferences* dialog box (page 55), go to *Network Connection settings > HTTP(S)/WebDAV*, and select the *Automatically accept a security certificate, even if invalid* option.

**Note:** This *Automatically accept a security certificate, even if invalid* option does not influence the entire Eclipse workspace. It is limited to URLs that are opened directly by Oxygen XML Editor plugin.

1. Export the certificate into a local file
   - a. Point your HTTPS-aware Web browser to the repository URL.
      
      If this is your first visit to the repository it will be displayed a security alert stating that the security certificate presented by the server is not trusted.

      *Figure 213: Security alert - untrusted certificate*
b. Go to menu **Tools > Internet Options.**
   
   **Internet Options** dialog box is opened.

c. Select **Security** tab.

d. Select **Trusted sites** icon.

e. Press **Sites** button.
   
   This will open **Trusted sites** dialog box.

f. Add repository URL to **Websites** list.

g. Close the **Trusted sites** and **Internet Options** dialog boxes.

h. Try again to connect to the same repository URL in Internet Explorer.
   
   The same error page as above will be displayed.

i. Select **Continue to this website** option.
   
   A clickable area with a red icon and text **Certificate Error** is added to Internet Explorer address bar.

j. Click the **CertificateError** area.
   
   A dialog box containing a **View certificates** link is displayed.

k. Click the **View certificates** link.
   
   **Certificate** dialog box is displayed.

l. Select **Details** tab of **Certificate** dialog box.

m. Press **Copy to File** button.
Certificate Export Wizard is started.

n. Follow indications of wizard for DER encoded binary X.509 certificate. Save certificate to local file server.cer.

2. Import the local file into the JRE running Oxygen XML Editor plugin.

   a. Open a text-mode console with administrative rights.
      If Oxygen XML Editor plugin has been installed in a user's home directory and includes a bundled JRE, administrative rights are not required. In all other cases administrative rights will be required.

   b. Go to the lib/security directory of the JRE running Oxygen XML Editor plugin. You find the home directory of the JRE in the java.home property that is displayed in the About dialog box (Installation Details > Configuration).
      On OS X, for the distribution of Oxygen XML Editor plugin that bundles the JRE from Oracle, the JRE uses the .install4j/jre.bundle/Contents/Home/jre/lib/security/cacerts path within its installation directory.

   c. Run the following command:

      ```
      ..\..\bin\keytool -import -trustcacerts -file server.cer -keystore cacerts
      ```

      The server.cer file contains the server certificate, created during the previous step. The keytool requires a password before adding the certificate to the JRE keystore (page 2707). The default password is changeit. If someone changed the default password, then that person is the only one who can perform the import.

      Tip: If you need to import multiple certificates, you need to specify a different alias for each additional imported certificate with the -alias command-line argument, as in the following example:

      ```
      ..\..\bin\keytool -import -alias myalias1 -trustcacerts -file server1.cer -keystore cacerts
      ..\..\bin\keytool -import -alias myalias2 -trustcacerts -file server2.cer -keystore cacerts
      ```

3. Restart Oxygen XML Editor plugin.

Related Information:
HTTP Authentication Schemes

Oxygen XML Editor plugin supports the following HTTP authentication schemes:

- **Basic** - The basic authentication scheme defined in the RFC2617 specifications.
- **Digest** - The digest authentication scheme defined in the RFC2617 specifications.
- **NTLM** - The NTLM scheme is a proprietary Microsoft Windows Authentication protocol (considered to be the most secure among currently supported authentication schemes).

**Note:** For NTLM authentication, the user name must be preceded by the name of the domain it belongs to, as in the following example:

```
domain\username
```

- **Kerberos (page 568)** - An authentication protocol that works on the basis of *tickets* to allow nodes communicating over a non-secure network to prove their identity to one another in a secure manner.

**Single Sign-on**

Oxygen XML Editor plugin implements the *Single sign-on* property (meaning that you can log on once and gain access to multiple services without being prompted to log on for each of them), based on the Kerberos protocol and relies on a *ticket-granting ticket (TGT)* that Oxygen XML Editor plugin obtains from the operating system.

**Restriction:** This *Single sign-on* support is not available for SharePoint integrations.

To turn on the Kerberos-based authentication, you need to add the following system property in the `eclipse.ini` configuration file (on a separate line after the `-vmargs` parameter):

```
-Djavax.security.auth.useSubjectCredsOnly=false
```

**Closing Documents**

To close open documents, use one of the following actions that are available in the contextual menu of the current editor tab (or from the File menu):

- **Close (Ctrl + F4 (Command + F4 on OS X))**
Closes the currently selected editor.

**Close Others**

If multiple files are opened, this action is available to close all opened editors in the current group/stack of tabs except for the one you are currently viewing.

**Close All (Ctrl + Shift + F4 (Command + Shift + F4 on OS X))**

If multiple files are opened, this action is available to close all opened editors in the current group/stack of tabs. If this action is selected from the File menu, it closes all opened editors in all groups/stacks of tabs.

**Contextual Menu of the Current Editor Tab**

A contextual menu is available when you right-click the current editor tab label.

The actions that are available depend on the context and the number of files that are opened. The menu includes the following actions:

**Close (Ctrl + F4 (Command + F4 on OS X))**

Closes the currently selected editor.

**Close Others**

If multiple files are opened, this action is available to close all opened editors in the current group/stack of tabs except for the one you are currently viewing.

**Close All (Ctrl + Shift + F4 (Command + Shift + F4 on OS X))**

If multiple files are opened, this action is available to close all opened editors.

**Viewing File Properties**

The Editor Properties view displays information about the currently edited document. The information includes:

- Character encoding.
- Full path on the file system.
- Schema used for content completion and document validation.
- Document type name and path.
- Associated transformation scenario.
- Read-only state of a file.
- Bidirectional text (left to right and right to left) state.
• Total number of characters in the document.
• Line width.
• Indent with tabs state.
• Indent size.

The view can be accessed from Window > Show View > Other > Editor Properties.

To copy a value from the Editor Properties view in the clipboard (for example, the full file path), use the Copy action available on the contextual menu of the view.

Simple Text Editor

While Oxygen XML Editor plugin specializes in XML-related technologies, you can also use it to create and edit various types of non-XML files. Non-XML files are opened in a simple text editor and many of the helpful features that are commonly used when editing XML files in the Oxygen XML Editor plugin Text editing mode (page 614) are available in this simple editor.

Types of Non-XML Files That are Supported in the Simple Text Editor

The types of non-XML files that can be created and edited in the simple text editor include:

• Java
• C++
• C
• PHP
• Perl
• Properties
• SQL
• Shell executables
• Batch
• Python
• Text

Features Available in the Simple Text Editor

When editing files in the simple text editor, the features that are available include the following:

• Project Support - The unique features that are designed to help you work with projects (page 571) are available for all types of files.
• Shortcut Actions - Many of the shortcut actions that are available in Text mode (page 618) are also available in the simple text editor.
• **Drag and Drop** - The normal drag and drop support is available in the simple text editor.

• **Content Selection Features** - The content selection shortcuts ([page 626](#)) that are available in Text mode are also available in the simple text editor.

• **Convert Hexadecimal Characters** - You can convert a sequence of hexadecimal characters to the corresponding Unicode character ([page 656](#)).

• **Encoding/Decoding Actions** - Contextual menu actions are available to encode or decode Base 64, Base 32, and Hex schemes ([page 657](#)).

• **Code Templates** - You can define your own code templates ([page 639](#)) for any type of file and use the Content Completion Assistant ([page 2704](#)) to invoke them.

• **Syntax Highlighting** - Non-XML files also support syntax highlighting with dedicated coloring schemes. To customize them, open the Preferences dialog box ([page 55](#)) and go to Editor > Syntax Highlight ([page 149](#)). Select and expand the appropriate section in the top pane for the type of file you are editing and you can see the effects of your changes in the Preview pane.

**Using Projects to Group Documents**

Oxygen XML Editor plugin includes a Navigator view ([page 250](#)) that helps you organize your projects. Oxygen XML Editor plugin offers a variety of helpful features for working with projects and makes it easy to share your projects with other members of your team. This section presents various unique features that will help you to create and work with projects.

**Creating a New Project**

Oxygen XML Editor plugin allows you to organize your XML-related files into projects. This helps you manage and organize your files and also allows you to perform batch operations (such as validation and transformation) over multiple files. Use the Navigator view ([page 250](#)) to manage projects, and the files and folders contained within.

**Creating a New Project**

To create a new project, select New > XML Project or New > Sample XML Project from the contextual menu or File menu. This opens a dialog box that allows you to create and customize a new project and adds it to the structure of the project in the Navigator view ([page 250](#)).

**Adding Items to the Project**

To add items to the project, select the desired document type or folder from the New menu of the contextual menu, when invoked from the Navigator view (or from the File menu). You can also create a document from a template by selecting New > New from Templates from the contextual menu.
Using Linked Folders (Shortcuts)

Another easy way to organize your XML working files is to place them in a directory and then to create a corresponding linked folder in your project. If you add new files to that folder, you can simply use the Refresh (F5) action from the toolbar or contextual menu and the Navigator view (page 250) will display the existing files and subdirectories. If your files are scattered amongst several folders, but represent the same class of files, you might find it useful to combine them in a logical folder.

You can create linked folders (shortcuts) by dragging and dropping folders from the Windows Explorer (Mac OS X Finder) to the project tree, or by using the contextual menu from the location in the project tree where you want it added and selecting New > Folder > Advanced. The linked folders presented in the Navigator view (page 250) are marked with a special icon. To create a file inside a linked folder, use the contextual menu and select New > File (you can use the Advanced button to link to a file in the local file system).

Note: Files may have multiple instances within the folder system, but cannot appear twice within the same folder.

For more information on managing projects and their content, see Navigator View (page 250).

Related Information:

- Using Projects to Group Documents (page 571)

Navigator View

The Navigator view is designed to assist you with organizing and managing related files grouped in the same XML project. The actions available in the contextual menu and on the toolbar associated to this panel allows you to create XML projects and provide shortcuts to various operations for the project documents.

Tip: You can also use the Project Explorer view for many of the same purposes as the Navigator view.

Figure 214: Navigator View
By default, the view is positioned on the left side of the Oxygen XML Editor plugin window, above the Outline view (page 257). If the view has been closed, it can be reopened at any time from the Window > Show View menu (the Project Explorer view is in the Other submenu).

Project View Toolbar

The following actions are grouped in the upper right corner:

- **Collapse All**
  
  Collapses all project tree folders. You can also collapse/expand a project tree folder if you select it and press the Enter key or Left Arrow to collapse and Right Arrow to expand.

- **Link with Editor**
  
  When selected, the project tree highlights the currently edited file, if it is found in the project files.

  **Note:** This button is disabled automatically when you move to the Debugger perspective (page 2709).

View Menu

Drop-down menu that contains various settings contributed by the Eclipse plugin.

File Explorer Area

The rest of the view is basically a file explorer similar to most other commonly used file explorers. The XML project (.xpr file) is a logical container with a collection of resources (folders and files). The types of resources displayed include:
• **Logical folders with Linked folders/files** - This folder type is used as containers for linked resources (shortcuts). The icons for file shortcuts include a shortcut symbol (🔗). The linked folders/files are added using **New > Folder > Advanced** or **New > File > Advanced**, or by dragging and dropping files/folders from the view or the system file explorer. **Delete** can be used to remove them from the project.

• **Physical folders and files** - Marked with the operating system-specific icon for folders (usually a yellow icon on Windows and a blue icon on Mac OS X). These folders and files are mirrors of real folders or files that exist in the local file system. They are created or added to the project by using contextual menu actions (such as **New > File**, **New > Folder**, **Copy**, and **Paste**) or by dragging and dropping files/folders from the view or the system file explorer. Also, the contextual menu action **Delete** can be used to remove them from the project and local file system.

Figure 215: Navigator View with Both Types of Resources

Creating New Projects

The following actions are available from the **New** menu when right-clicking any item, or the **File > New** menu:

**XML Project**

Opens the **New XML Project** dialog box that allows you to create a new project and adds it to the project structure in the **Navigator** view.

**Sample XML Project**

Opens the **New sample XML project** dialog box that allows you to customize sample resources in a new project and adds it to the project structure in the **Navigator** view.
Managing Project Contents

There are various contextual menu actions, shortcuts, and ways to organize the folders and files inside the project:

Creating New Folders and Files

- **Right-click any item > New > 📌 File**
  - Opens a [New Document Wizard (page 550)](page 550) that helps you create a new file and adds it to the project structure.

- **Right-click any item > New > 📌 New from Templates**
  - Opens a wizard where you can create a new document based on a template (page 554) and adds it to the project structure.

- **Right-click any item > New > 📌 Folder**
  - Opens a [New Folder](page 551) dialog box that allows you to specify a name for a new folder and adds it to the structure of the project.

Adding Resources

You can add resources by using drag and drop (or **Copy** and **Paste**) actions from within the Navigator view or dragging them from the system file explorer. Files may have multiple instances within the folder system, but cannot appear twice within the same folder.

Removing Folders and Files

To remove logical folders or the linked resources inside them from the project, use ✖️ Delete from the contextual menu (or press **Delete** on your keyboard) and confirm by clicking **OK** in the resulting dialog box.

To remove folders or files from both the project and the local file system, use ✖️ Delete from the contextual menu (or press **Delete** on your keyboard) and confirm by clicking **OK** in the resulting dialog box.

Moving Folders and Files

You can move the resources by using drag and drop actions from within the Navigator view.

You can also use the usual ✏️ Copy and ✏️ Paste actions (or the Move action) from the contextual menu to move resources in the project.
You can also move certain types of files (such as XML, XML Schema, Relax NG, WSDL, and XSLT) by using the Refactoring > Move resource action from the contextual menu. This action opens the Move resource dialog box that includes the following options:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - Select this option to update the references to the resource you are moving, based upon the selected scope. You can select or configure the scope (page 904) by using the button.

#### Renaming Folders and Files

There are several ways to rename a folder or file in the project (this works for both physical and linked resources):

- Select **Rename** from the contextual menu.
- Press F2 on your keyboard.

You also can rename certain types of files (such as XML, XML Schema, Relax NG, WSDL, and XSLT) by using the Refactoring > Rename resource action from the contextual menu. This action opens the Rename resource dialog box that includes the following options:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references of the renamed resource** - Select this option to update the references to the resource you are renaming. You can select or configure the scope (page 904) by using the button.

#### Opening Files

There are several ways to open a file:

- Double-click the file.
- Select it and press Enter on your keyboard.
- Right-click the file and select Open.
- Drag the file from the project tree and drop it in the editor area.
- If you want to choose the application or location where to open it, you can right-click the file and select Open with.
Saving the Project

The project file is automatically saved every time the content of the Navigator view is saved or modified by actions such as adding or removing files and drag and drop.

Other Contextual Menu Actions

Numerous other actions are available in the contextual menu, depending on the type of file or folder where it is invoked from (some actions are available for multiple selected files):

Refactoring submenu

Oxygen XML Editor plugin includes some refactoring operations that help you manage the structure of your documents. The following actions are available from the contextual menu in the Refactoring submenu:

Rename resource (Available for certain types of XML documents)

Opens the Rename resource dialog box (page 579) where you can change the name of a resource. It also includes an option to update the references to the renamed resource and you can choose between various scopes for the operation.

Move resource (Available for certain types of XML documents)

Opens the Move resource dialog box (page 579) where you can choose a destination and change the name of a resource. It also includes an option to update the references to the moved resource and you can choose between various scopes for the operation.

XML Refactoring

Opens the XML Refactoring tool wizard (page 913) that presents refactoring operations to assist you with managing the structure of your XML documents.

Show Resource Hierarchy

Opens the Resource Hierarchy/Dependencies view (page 904) that allows you to see the resource hierarchy for an XML document.

Show Resource Dependencies

Opens the Resource Hierarchy/Dependencies view (page 904) that allows you to see the resource dependencies for an XML document.

Refresh

Refreshes the content and the dependencies between the resources in the Master Files directory (page 581).
**XPath in Files**

Opens the **XPath/XQuery Builder view** (page 1902) that allows you to compose XPath and XQuery expressions and execute them over the currently edited XML document.

**Check Spelling in Files**

Allows you to check the spelling of multiple files. (page 598)

**Format and Indent Files**

Opens the **Format and Indent Files dialog box** (page 652) that allows you to configure the format and indent (pretty-print (page 2709)) action that will be applied on the selected documents.

**Transform submenu**

The currently selected files associated with the Oxygen XML Editor plugin in the **Package Explorer** view or in the **Navigator** view can be transformed in one step with one of the following actions available from contextual menu in the Transform submenu:

- **Apply Transformation Scenario(s)**
  Obtains the output with one of the built-in scenarios (page 1382).

- **Configure Transformation Scenario(s)**
  Opens a dialog box (page 1502) that allows you to configure pre-defined transformation scenarios.

- **Transform with**
  Allows you to select a transformation scenario to be applied to the currently selected files.

**Validate submenu**

The currently selected files associated with the Oxygen XML Editor plugin in the **Package Explorer** view or in the **Navigator** view can be checked to be XML well-formed or validated against a schema (DTD, XML Schema, Relax NG, Schematron or NVDL) with one of the following contextual menu actions found in the Validate submenu:

- **Check Well-Formedness**
  Checks if the selected file or files are well-formed.

- **Validate**
  Validates the selected file or files against their associated schema.
  For EPUB files, this action triggers an **EPUB Validate and Check for Completeness** (page 1912) operation.

**Validate with Schema**
Validates the selected file of files against a specified schema.

✔️ **Configure Validation Scenario(s)**

Allows you to configure and run a validation scenario *(page 868).*

❌ **Clear Validation Markers**

Clears all the error markers from the main editor and **Problems** view.

**Generate XML Schema Documentation**

Opens the XML Schema Documentation Dialog Box *(page 1076).*

**Generate Stylesheet Documentation**

Opens the XSLT Stylesheet Documentation Dialog Box *(page 1000).*

**Generate XQuery Documentation**

Opens the XQuery Documentation Dialog Box *(page 1113).*

**Generate WSDL Documentation**

Opens the WSDL Documentation Dialog Box *(page 1135).*

🔍 **Properties**

Displays the properties of the current file in a **Properties** dialog box.

**Enable Master Files Support (Available from the project container)**

Allows you to enable the **Master Files Support** *(page 582)* for each project you are working on.

🔍 **Detect Master Files (Available from the project container when Master Files Support is enabled)**

Opens the **Detect Master Files** wizard *(page 582)* that enables the automatic detection of master files.

🔍 **Add to Master Files (Available when Master Files Support is enabled)**

Adds the selected files to the Master Files folder *(page 584).*

**Moving/Renaming Resources in the Navigator View**

The **Refactoring** submenu in the contextual menu of the **Navigator view** *(page 250)* provides actions for moving or renaming resources in the current project while offering the option to update the references to the resources.
Moving Resources

You can move certain types of files (such as XML, XML Schema, Relax NG, WSDL, and XSLT) by using the **Refactoring > Move resource** action from the contextual menu. This action opens the **Move resource** dialog box that includes the following options:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - Select this option to update the references to the resource you are moving, based upon the selected scope. You can select or configure the scope (page 904) by using the button.

Renaming Resources

You can rename certain types of files (such as XML, XML Schema, Relax NG, WSDL, and XSLT) by using the **Refactoring > Rename resource** action from the contextual menu. This action opens the **Rename resource** dialog box that includes the following options:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references of the renamed resource** - Select this option to update the references to the resource you are renaming. You can select or configure the scope (page 904) by using the button.

Problems Updating References of Moved/Renamed Resources

In some cases, the references of a moved or a renamed resource cannot be updated. For example, when a resource is resolved through an **XML Catalog (page 2712)** or when the path to the moved or renamed resource contains entities. For these cases, Oxygen XML Editor plugin displays a warning dialog box.

*Figure 216: Problems Dialog Box*
Master Files Support

Oxygen XML Editor plugin allows you to define Master Files (page 2708) at project level. These master files are automatically used by Oxygen XML Editor plugin to determine the context for operations such as validation, transformation, content completion, refactoring, or searches for XML, XSD, XSL, WSDL, and RNG modules. Oxygen XML Editor plugin maintains the hierarchy of the master files, helping you to determine the editing context.

Oxygen XML Editor plugin also provides unique support for using the Master Files support in DITA projects. In DITA, when you rename or move non-DITA resources, it allows you to update all the references to these resources in the scope of the Master Files (in this case the main DITA map (root map) (page 2711)). For more information, see Master Files Support in DITA (page 2675).

Master Files Benefits

Using the Master Files support in Oxygen XML Editor plugin includes the following benefits:

- When the master file is validated, Oxygen XML Editor plugin automatically identifies the modules included in the master file and validates all of them.
- When the master file is transformed, Oxygen XML Editor plugin automatically identifies the modules included in the master file and transforms them accordingly.
- The Content Completion Assistant (page 2704) presents all the components that are collected from the master files for the modules they include.
- The Outline view (page 257) displays all the components that are defined in the master files hierarchy.
- The master files that are defined for the current module determines the scope of the search and refactoring actions (page 904). Oxygen XML Editor plugin performs the search and refactoring actions in the context that the master files determine, thus improving the speed of execution.

Enabling the Master Files Support

Oxygen XML Editor plugin stores the master files in a folder located in the Navigator view (page 250), as the first child of the project root. The Master Files Support is disabled by default and Oxygen XML Editor plugin allows you to enable or disable the Master Files Support for each project you are working on.

To enable Master Files support, select Enable Master Files Support from the contextual menu of the project root folder in the Navigator view (page 250).

Related Information:

- Detecting Master Files (page 582)
- Adding Files to the Master File Directory (page 584)
Oxygen XML Editor plugin allows you to detect the *master files* using the **Detect Master Files** option. This action applies to the folders you select in the project.

To detect *master files* over the entire project, do one of the following:

- Right-click the root of the project and select **Detect Master Files from Project**.
- Use the **Detect Master Files from Project** option, available in the contextual menu of the Master Files folder.

Both of these options display the **Detect Master Files** wizard. In the first panel you can select the type of *master files* you want Oxygen XML Editor plugin to detect. In the subsequent panel the detected *master files* are presented in a tree-like fashion. The resources are grouped into three categories:

- **Possible master files** - The files presented on the first level in this category are not imported or included from other files. These files are most likely to be set as *master files*.

  **Note:** For DITA projects, only *DITA Maps* (page 2705) are reported as possible *master files*.

- **Cycles** - The files that are presented on the first level have circular dependencies between them. Any file presented on the first level of a cycle is a possible *master file*.

- **Standalone** - Files that do not include or import other files and are also not included or imported themselves. It is not necessary to set them as *master files*.

To set them as *master files*, simply select their checkboxes. Oxygen XML Editor plugin marks all the children of a *master file* as modules. Modules are rendered in gray and their tool-tip presents a list of their *master files*. A module can be accessed from multiple *master files*.

The *master files* that are already defined in the project are automatically marked in the tree and cannot be removed. The only way to disable a *master file* is to delete it from the Master Files folder.

The next panel displays a list with the selected *master files*. Click the **Finish** button to add the *master files* in the Master Files folder.

You can use the **Select Master Files** option to automatically mark all *master files*. This action sets all the resources from the **Possible Master Files** category and the first resource of each **Cycle** as *master files*. The **Deselect All** button simply removes all of your selections.

**Tip:** It is recommended that you only add top-level files (files that are at the root of the include/import graph) in the Master Files directory.

Adding Files to the Master File Directory

The Master Files directory only contains logical folders and linked files. To add files in the Master Files directory, use one of the following methods:

- Right-click a file from your project and select Add to Master Files from the contextual menu.
- Drag and drop files into the Master Files directory.
- From the contextual menu of the Resource Hierarchy Dependencies view (page 904), use the Add to Master Files action.

You can view the master files for the currently edited resource in the Editor Properties view (page 569).

Finding and Replacing Text

This section includes topics in regards to the find and replace features available in Oxygen XML Editor plugin.

Find All Elements Dialog Box

To open the Find All Elements dialog box, go to Edit > Find All Elements. It assists you in defining XML element / attribute search operations in the current document.

Figure 217: Find All Elements Dialog Box
The dialog box can perform the following actions:

- Find all the elements with a specified name.
- Find all the elements that contain, or does not contain, a specified string in their text content.
- Find all the elements that have a specified attribute.
- Find all the elements that have an attribute with, or without, a specified value.

You can combine all of these search criteria to filter your results.

The following fields are available in the dialog box:

- **Element name** - The qualified name of the target element to search for. You can use the drop-down menu to find an element or enter it manually. It is populated with valid element names collected from the associated schema. To specify any element name, leave the field empty.
  
  **Note:** Use the qualified name of the element (<namespace prefix>:<element name>) when the document uses this element notation.

- **Element text** - The target element text to search for. The drop-down menu beside this field allows you to specify whether you are looking for an exact or partial match of the element text. For any element text, select contains from the drop-down menu and leave the field empty. If you leave the field empty but select equals from the drop-down menu, only elements with no text will be found. Select not contains to find all elements that do not include the specified text.
  
  **Note:** Use the qualified name of the element (<namespace prefix>:<element name>) when the document uses this element notation.

- **Attribute name** - The name of the attribute that must be present in the element. You can use the drop-down menu to select an attribute or enter it manually. It is populated with valid attribute names collected from the associated schema. For any or no attribute name, leave the field empty.
  
  **Note:** Use the qualified name of the attribute (<namespace prefix>:<attribute name>) when the document uses this attribute notation.

- **Attribute value** - The drop-down menu beside this field allows you to specify that you are looking for an exact or partial match of the attribute value. For any or no attribute value, select contains from the drop-down menu and leave the field empty. If you leave the field empty but select equals
from the drop-down menu, only elements that have at least an attribute with an empty value will be found. Select **not contains** to find all elements that have attributes without a specified value.

- **Case sensitive** - When this option is selected, operations are case-sensitive.

When you press **Find All**, Oxygen XML Editor plugin tries to find the items that match all the search parameters. The results of the operation are presented as a list in the message panel.

**Regular Expressions Syntax**

Oxygen XML Editor plugin uses the **Java regular expression syntax**. It is **similar** to that used in Perl 5, with several exceptions. Thus, Oxygen XML Editor plugin does not support the following constructs:

- The conditional constructs `{?X}` and `{?(condition)X|Y}`.
- The embedded code constructs `{?{code}}` and `{??{code}}`.
- The embedded comment syntax `{??comment}`.
- The preprocessing operations `\l`, `\u`, `\L`, and `\U`.

When using regular expressions, note that some sets of characters from XPath/XML Schema/Schematron are slightly different than the ones used by Oxygen XML Editor plugin/Java in the text searches. The most common example is with the `/w` and `/W` set of characters. To ensure consistent results between the two, it is recommended that you use the following constructs:

- `/w` - `/\w\p{P}\p{Z}\p{C}` instead of `/w`
- `/W` - `/\W\p{P}\p{Z}\p{C}` instead of `/W`

There are some other notable differences that may cause unexpected results, including the following:

- In Perl, `\1` through `\9` are always interpreted as back references. A backslash-escaped number greater than 9 is treated as a back reference if at least that many sub-expressions exist. Otherwise, it is interpreted, if possible, as an octal escape. In this class octal escapes must always begin with a zero. In Java, `\1` through `\9` are always interpreted as back references, and a larger number is accepted as a back reference if at least that many sub-expressions exist at that point in the regular expression. Otherwise, the parser will drop digits until the number is smaller or equal to the existing number of groups or it is one digit.
- Perl uses the `g` flag to request a match that resumes where the last match left off.
- In Perl, embedded flags at the top level of an expression affect the whole expression. In Java, embedded flags always take effect at the point where they appear, whether they are at the top level or within a group. In the latter case, flags are restored at the end of the group just as in Perl.
• Perl is forgiving about malformed matching constructs, as in the expression `\*a`, as well as dangling brackets, as in the expression `abc\]`, and treats them as literals. This class also accepts dangling brackets but is strict about dangling meta-characters such as `+`, `?` and `*`.

Spell Checking

Oxygen XML Editor plugin includes an automatic (as-you-type) spell checking feature (page 596), as well as a manual spell checking action to open a Spelling dialog box that offers a variety of options.

To manually check spelling in the current document, use the `Check Spelling` action on the toolbar.

Figure 218: Check Spelling Dialog Box

The Spelling dialog box contains the following:

Unrecognized word

Displays the word that cannot be found in the selected dictionary. The word is also highlighted in the XML document.
Replace with

The character string that will replace the misspelled word.

Guess

Displays a list of suggested words to replace the unknown word. Double-click a word to automatically insert it in the document and resume the spell checking process.

Default language

Allows you to select the default language dictionary used by the spelling engine.

Paragraph language

In an XML document, you can mix content written in multiple languages. You can set the language code in the `lang` or `xml:lang` attribute for any particular section and Oxygen XML Editor plugin will automatically instruct the spell checker engine to apply the appropriate language dictionary for that section.

Begin at cursor position

Instructs the spell checker to begin checking the document starting from the current cursor position.

Action Buttons

Replace

Use this button to replace the unrecognized word with the selected word from the Replace with field.

Replace All

Use this button to replace all occurrences of the unrecognized word with the selected word from the Replace with field.

Ignore

Ignores the first occurrence of the unrecognized word and allows you to continue checking the document. Oxygen XML Editor plugin skips the content of the XML elements marked to be ignored (page 596).

Ignore All

Ignores all instances of the unrecognized word in the current document.

Learn

Adds the unrecognized word to the list of valid words.

Options

Opens the Spell Check preferences page (page 145) where you can configure various options regarding the feature.
Spell Check Dictionaries and Term Lists

Oxygen XML Editor plugin uses the Hunspell engine for the spell checking feature. The Hunspell spell checking engine is open source and has an LGPL license. It is designed for languages with rich morphology and complex compounding or character encoding. Each language-country variant combination have their own specific dictionaries. Oxygen XML Editor plugin includes the following built-in dictionaries for the spell checker:

- English (US) [ en_US ]
- English (UK) [ en_GB ]
- French [ fr ]
- German [ de_DE ]
- Spanish [ es_ES ]

Other Hunspell Dictionaries

You can also download Hunspell dictionaries for other languages and add them to the Oxygen XML Editor plugin spell checker. An example of a website that includes numerous dictionary files is: http://extensions.services.openoffice.org/dictionary.

If you cannot find a Hunspell dictionary that is already built for your language, you can build the dictionary you need. To build a full Hunspell dictionary, follow these instructions and then add the dictionary to the Oxygen XML Editor plugin spell checker by following this procedure (page 590).

Personalized Term Lists

Authoring in certain areas of expertise (for example, the pharmaceutical or automobile industries) might require the use of specific terms that are not part of the standard spell checker dictionary. To avoid marking these terms as errors, Oxygen XML Editor plugin provides a way of adding personalized term lists (page 593) to the spell check engine. This involves creating a term list file that the spell checker will recognize and it is similar to the file Oxygen XML Editor plugin uses for storing learned words (page 595).

The term list files are specific for each language and can be specific to each domain or area of expertise (for example, legal, medical, automotive). They can also be used to control forbidden words.
Adding Custom Dictionaries and Term Lists

The Oxygen XML Editor plugin spell checker allows you to add customized Hunspell dictionaries and personalized term lists. The Hunspell dictionary mechanism requires a dictionary file (with a .dic file extension) and an affix file (with the .aff file extension). The personalized term lists are custom files (with the .tdi file extension) that you can create to include specialized terms or specify forbidden words in the Oxygen XML Editor plugin spell checker.

You can add dictionaries (page 590) and personalized term lists (page 593) to the default folder where they are stored or specify your own custom locations. You can view the default storage location in the Spell Check Dictionaries preferences page (page 148) and the Include dictionaries and term list from option (page 148) allows you to choose a custom storage location. All the dictionaries and term lists for a particular language that are found in either location are merged and used by the spell checker in Oxygen XML Editor plugin.

Adding Custom Spell Check Dictionaries

There are three possible scenarios for adding Hunspell dictionaries to the Oxygen XML Editor plugin spell checker:

- You can download a pre-built Hunspell dictionary and add it to the spell checking mechanism.
- You can create a custom Hunspell dictionary file that defines your own list of words and add it to the spell checking mechanism.
- You can build your own full Hunspell dictionary and add it to the spell checking mechanism.
Download and Add a Pre-Built Hunspell Dictionary

To add a downloaded pre-built dictionary, follow these steps:

1. Download the files needed for your dictionary. You will need a dictionary file (with a .dic file extension) and an affix file (with the .aff file extension). If the dictionary does not include an affix file (.aff), you can create one and leave it empty, but it is needed for the mechanism to work properly. An example of a website that includes numerous dictionary files is: http://extensions.services.openoffice.org/dictionary.

   **Important:** The name of the files should begin with a two letter prefix for the language code, followed by an underscore or hyphen, then two letters that indicate the country code, followed by another underscore or hyphen, and then a descriptive name (for example, en_US_medical.dic for a medical dictionary in the US version of the English language, or for a less specific English medical dictionary, you could omit the country code like this: en_medical.dic). For a list of language codes, see https://en.wikipedia.org/wiki/List_of_ISO_639-1_codes.

2. Open the Preferences dialog box (page 55) and go to Editor > Spell Check > Dictionaries (page 148).

3. Choose one of the following two options for adding the downloaded files.
   a. Copy both files (.dic and .aff) to the default directory displayed in the Dictionaries and term lists default folder option (page 148).
   b. Copy both files (.dic and .aff) to any other directory, select the Include dictionaries and term list from option (page 148), and select that directory. If you choose this option, make sure you read this important note (page 148).

4. Restart the application for the spell checker to start using the new dictionary.

Create a Custom Hunspell Dictionary that Defines a List of Words

To create a custom Hunspell dictionary that defines your own list of words, follow these steps:

1. Create a dictionary file (with a .dic file extension) and an affix file (with the .aff file extension). The affix file (.aff) can be left empty, but it is needed for the mechanism to work properly.

   **Important:** The name of the files should begin with a two letter prefix for the language code, followed by an underscore or hyphen, then two letters that indicate the country code, followed by another underscore or hyphen, and then a descriptive name (for example, en_US_medical.dic for a medical dictionary in the US version of the English language, or for a less specific English medical dictionary, you could omit the country code like this: en_medical.dic). For a list of language codes, see https://en.wikipedia.org/wiki/List_of_ISO_639-1_codes.
2. In the dictionary file (.dic extension), add the words you want to be included in your custom dictionary. Add one word per row and the first line needs to contain the number of words, as in the following example:

```
2
parabola
asimptotic
```

**Note:** Words stored in dictionaries are not handled as case-sensitive. Therefore, you do not need to include both uppercase and lowercase versions of the words.

3. Open the Preferences dialog box (page 55) and go to Editor > Spell Check > Dictionaries (page 148).

4. Choose one of the following two options for saving the files.
   a. Save both files (.dic and .aff) to the default directory displayed in the Dictionaries and term lists default folder option (page 148).
   b. Save both files (.dic and .aff) to any other directory, select the Include dictionaries and term list from option (page 148), and select that directory. If you choose this option, make sure you read this important note (page 148).

5. Restart the application for the spell checker to start using the new dictionary.

### Build and Add a Full Hunspell Dictionary

To build and add a full Hunspell dictionary, follow these steps:

1. Follow these instructions: Building and Testing Hunspell Dictionaries.

   **Result:** You should end up with a dictionary file (with a .dic file extension) and an affix file (with an .aff file extension). The affix file (.aff) can be empty, but it is needed for the mechanism to work properly.

   **Important:** The name of the files should begin with a two letter prefix for the language code, followed by an underscore or hyphen, then two letters that indicate the country code, followed by another underscore or hyphen, and then a descriptive name (for example, en_US_medical.dic for a medical dictionary in the US version of the English language, or for a less specific English medical dictionary, you could omit the country code like this: en_medical.dic). For a list of language codes, see https://en.wikipedia.org/wiki/List_of_ISO_639-1_codes.

2. Open the Preferences dialog box (page 55) and go to Editor > Spell Check > Dictionaries (page 148).

3. Choose one of the following two options for saving the files.
   a. Save both files (.dic and .aff) to the default directory displayed in the Dictionaries and term lists default folder option (page 148).
b. Save both files (.dic and .aff) to any other directory, select the Include dictionaries and term list from option (page 148), and select that directory. If you choose this option, make sure you read this important note (page 148).

4. Restart the application for the spell checker to start using the new dictionary.

Related Information:

- Adding Custom Spell Check Term Lists (page 593)

Adding Custom Spell Check Term Lists

You can create personalized term lists that are used to store specialized terms or control forbidden words. They can then be added to one of the directories that store the spell check dictionaries, and the spell checker will merge them with all the dictionaries and other term lists for a particular language.

Create and Add Personalized Term Lists

To create and add a personalized term list, follow these steps:

1. Create a term list file (with the .tdi file extension). The name of the file must begin with a two letter prefix that indicates the language it should be attached to, followed by an underscore or hyphen, and then a descriptive name (for example, en_US_myterms.tdi for term list in the US version of the English language or en_myterms.tdi for a less specific English term list). For a list of language codes, see https://en.wikipedia.org/wiki/List_of_ISO_639-1_codes.

2. In the term list file (.tdi extension), add the terms you want to be included in your custom dictionary. If you need to specify forbidden terms, those words simply need to be preceded by an asterisk. Add one word per row, as in the following example:

   | parabola                  |
   | asimptotic               |
   | *hyperbola               |

   Note: Words stored in term lists are not handled as case-sensitive. Therefore, you do not need to include both uppercase and lowercase versions of the words.

3. Open the Preferences dialog box (page 55) and go to Editor > Spell Check > Dictionaries (page 148).

4. Choose one of the following two options for saving the file.
   a. Save the file (.tdi) to the default directory displayed in the Dictionaries and term lists default folder option (page 148).
b. Save the file (.tdi) to any other directory, select the **Include dictionaries and term list from** option *(page 148)*, and select that directory. If you choose this option, make sure you read this important note *(page 148)*.

5. Restart the application for the spell checker to start using the new term list.

**Replacing a Spell Check Dictionary**

There are several possible scenarios for replacing an existing Hunspell dictionary for the Oxygen XML Editor plugin spell checker:

- You can download a pre-built Hunspell dictionary and replace an existing dictionary with it.
- You can build your own full Hunspell dictionary and replace an existing dictionary with it.

**Download a Pre-Built Hunspell Dictionary and Replace an Existing One**

To replace an existing dictionary with a downloaded pre-built dictionary, follow these steps:

1. Download the files needed for your dictionary. You will need a `dictionary` file (with a `.dic` file extension) and an `affix` file (with the `.aff` file extension). If the dictionary does not include an affix file (`.aff`), you can create one and leave it empty, but it is needed for the mechanism to work properly. An example of a website that includes numerous dictionary files is: [http://extensions.services.openoffice.org/dictionary](http://extensions.services.openoffice.org/dictionary).

2. Open the **Preferences** dialog box *(page 55)* and go to **Editor > Spell Check > Dictionaries** *(page 148)*.

3. Choose one of the following two options to replace existing files.

   a. Replace the existing files (.dic and .aff) for the particular language in the default directory displayed in the **Dictionaries and term lists default folder** option *(page 148)*. Leave the **Include dictionaries and term list from** option deselected.

   b. Replace existing files (.dic and .aff) for the particular language in a directory specified in the **Include dictionaries and term list from** option *(page 148)*. If you choose this option, make sure you read this important note *(page 148)*.

**Important:** Do not alter the naming convention. The name of the files must begin with a two letter prefix that indicates the language it should be attached to (for example, en_US.dic for

4. Restart the application for the spell checker to start using the new dictionary.

**Build a Full Hunspell Dictionary and Replace an Existing One**

To replace an existing dictionary with a full Hunspell dictionary that you build, follow these steps:

1. Follow these instructions: Building and Testing Hunspell Dictionaries.

   **Result:** You should end up with a dictionary file (with a .dic file extension) and an affix file (with the .aff file extension). The affix file (.aff) can be empty, but it is needed for the mechanism to work properly.

2. Open the Preferences dialog box (page 55) and go to Editor > Spell Check > Dictionaries (page 148).

3. Choose one of the following two options to replace existing files.

   a. Replace the existing files (.dic and .aff) for the particular language in the default directory displayed in the Dictionaries and term lists default folder option (page 148). Leave the Include dictionaries and term list from option deselected.

   b. Replace existing files (.dic and .aff) for the particular language in a directory specified in the Include dictionaries and term list from option (page 148). If you choose this option, make sure you read this important note (page 148).

4. Restart the application for the spell checker to start using the new dictionary.

**Learned Words**

Spell checker engines rely on dictionaries to decide if a word is spelled correctly. To instruct the spell checker engine that an unknown word is actually correctly spelled, you need to add that word to a list of learned words. There are two ways to do this:

- Invoke the contextual menu on an unknown word, then select Learn word.
- Press the Learn button from the Spelling dialog box (page 587) that is invoked by using the Check Spelling action on the toolbar.
**Note:** To delete items from the list of learned words, use the **Delete learned words** option in the **Editor > Spell Check > Dictionaries** preferences page (page 148).

**Related Information:**

Ignored Words (Elements)

There are certain XML elements (such as `programlisting`, `codeblock`, `codeph`, `filepath`, or `screen`) in which you may want the content to always be skipped during the spell check process. This can be done in one of several ways:

- You can skip through them manually, word by word, using the **Ignore** button in the **Spelling** dialog box (page 587) that is invoked by using the **Check Spelling** action on the toolbar.
- You can automatically skip the content of certain elements by maintaining a set of known element names that should never be checked. You can manage this set of element names by using the **Ignore elements** section (page 147) in the **Spell Check** preferences page.

Automatic Spell Check

Oxygen XML Editor plugin includes an option to automatically check the spelling as you type. Not only does it check spelling when you are typing in the main editor, but also when you are typing in a comment (page 730). This feature is disabled by default, but it can be enabled and configured in the **Spell Check** preferences page (page 145). When the **Automatic Spell Check** option (page 145) is selected, unknown words are underlined and some actions are available in the contextual menu to help you correct the word or prevent the word from being reported in the future.

**Tip:** You can configure the color and how spelling errors are shown from the Eclipse **Annotations** preferences page (Window (Eclipse on Mac OS X) > Preferences > General > Editors > Text Editors > Annotations).

The contextual menu includes the following actions:

**Delete Repeated Word**

Allows you to delete words that were repeated in consecutive order.

**List of Suggestions**

Spell Check Multiple Files

The **Check Spelling in Files** action allows you to check the spelling on multiple local or remote documents. This action is available in the following locations:

- The contextual menu of the Navigator view (page 250).
- The contextual menu of the DITA Maps Manager view (page 2400), when editing DITA documents.

This action opens the Check Spelling in Files dialog box that allows you to define the scope and several other options. After you configure the settings for the operation, click the Check All button to check the spelling in all specified files. The spelling corrections are displayed in the Results view (page 267) at the bottom of the editor and you can group the reported errors as a tree with two levels. **Tip:** If you want to instruct the spell checking engine to not report a particular word as being a spelling error in the future, use the Learn Word(s) action from the contextual menu in the Results view.

The following scopes are possible, depending on where the action was invoked:

- **All opened files** - The spell check is performed in all opened files.
- **Current file directory** - All the files in the folder of the current edited file.
- **Current DITA map hierarchy** - Option available when the dialog is invoked from the DITA Maps Manager view. Checks the spelling in all references contained in the DITA map.
- **Project** - All files from the current project.
- **Selected project resources** - The selected files from the current project.
- **Specified path** - Checks the spelling in the files located at a path that you specify.

The Options section includes the following options:

- **File filter** - Allows you to filter the files from the selected scope.
- **Recurse subdirectories** - When selected, the spell check is performed recursively for the specified scope. The one exception is that this option is ignored if the scope is set to All opened files.
- **Include hidden files** - When selected, the spell check is also performed in the hidden files.
- **Spell Check Options** - The spell check processor uses the options available in the Spell Check preferences page (page 145).
When working with DITA documents, if you invoke the **Check Spelling in Files** action in the **DITA Maps Manager view (page 2400)**, a slightly different version of the dialog box is displayed:

The following scopes are available when you check the spelling in files from the **DITA Maps Manager (page 2400)**:

- **Current DITA Map hierarchy** - All the files referenced in the currently selected **DITA map (page 2705)**, opened in the **DITA Maps Manager view**.
- **Selected references** - Checks the spelling in the selected references.
- **Specified path** - Checks the spelling in the files located at a path that you specify.

### AutoCorrect Misspelled Words

Oxygen XML Editor plugin includes an *AutoCorrect* feature to automatically correct misspelled words, as well as to insert certain symbols or other text, as you type in **Author** mode. Oxygen XML Editor plugin includes a default list of commonly misspelled words and symbols, but you can modify the list to suit your needs. You can also choose to have the **AutoCorrect** feature use suggestions from the main spell checker. The suggestions will only be used if the misspelled words are not found in the **Replacements Table (page 115)**.

When enabled, the **AutoCorrect** feature can be used to do the following:

- Automatically correct misspelled words while you edit in **Author** mode. The actual operation of replacing a word is triggered by a space, dash, or certain punctuation characters (, . ; : ? ! ' " ) ] .)
- Easily insert symbols. For example, if you want to insert a ® character, you would type (R)
- Quickly insert text fragments.

**AutoCorrect** is enabled by default. To configure this feature, open the **Preferences** dialog box (page 55) and go to **Editor > Edit Modes > Author > AutoCorrect**.

After the automatic operation of replacing a misspelled word (triggered by a space, dash, or certain punctuation characters), the affected string is highlighted. The highlight is removed upon the next editing action (text insertion or deletion). If you hover over the highlight, a small widget appears below the word. If you hover over the widget, it expands and you can click it to present a drop-down list that includes the following options:

- **Change back to "[original word]"** - Reverts the correction back to its original form.
• **Stop Automatically Correcting *(original word)*** - This option is presented if the correction is performed based on the *AutoCorrect Replacements Table (page 115)* and selecting it will delete the corresponding entry from the Replacements Table.

• **Learn Word *(original word)*** - This option is presented if the *Use additional suggestions from the spell checker option (page 115)* is selected in the *AutoCorrect preferences page (page 115)* and the correction is performed based on the *Spell Checker*. Selecting this option will add the item to the list of *learned words (page 595)*.

• **AutoCorrect options** - Opens the *AutoCorrect preferences page (page 115)* that allows you to configure the feature.

**Figure 221: AutoCorrect Widget**

The *AutoCorrect* feature results in the following types of substitutions regarding case-sensitivity:

- Words with all lower-case characters will be replaced with lower-case substitutions (for example, "aboutu" is replaced with "about").
- Words with irregular-case characters will be replaced with lower-case substitutions ("ABotU" is replaced with "about").
- Words with all upper-case characters will be replaced with upper-case substitutions ("ABOTU" is replaced with "ABOUT").
- Words starting with an upper-case character will be replaced with substitutions having the same pattern ("Abotu" is replaced with "About").

The *AutoCorrect* feature also uses the list of *ignored elements from the Spell Check preferences page (page 147)*. All elements (along with their descendant elements) included in this list will be ignored by the *AutoCorrect* engine.

**Related Information:**

- Spell Checking *(page 587)*

**Add Dictionaries for the AutoCorrect Feature**
To add new dictionaries for the *AutoCorrect mechanism* (**page 599**), or to replace an existing one, follow these steps:

1. Download an *AutoCorrect* dictionary file for the desired language. The file needs to have a `.dat` file extension. An example of a website that includes some *AutoCorrect* dictionary files is: OpenOffice Extensions Search Page.

2. Open the *Preferences* dialog box (**page 55**) and go to **Editor > Edit Modes > Author > AutoCorrect > Dictionaries** (**page 116**).

3. Choose one of the following two options for adding the downloaded files.
   a. Copy the downloaded `.dat` file to the default directory displayed in the *Dictionaries default folder option* (**page 116**). Note that if you are replacing an existing dictionary file, this is the best option.
   b. Copy the downloaded `.dat` file to any other directory, select the *Include dictionaries from option* (**page 116**), and select that directory. If you choose this option, make sure you read this important note (**page 116**).

4. Restart the application for the *AutoCorrect* mechanism to start using the new dictionary.

**Working with Special Characters and Encoding**

While regular characters make up the English and European alphabets and the corresponding basic set of figures and symbols, there are many other *special characters* that belong to various other language representations, such as Arabic, Indian, Japanese, Chinese, or Korean. Oxygen XML Editor plugin provides support for special characters in various ways:

**Opening and Saving Documents**

The *Unicode standard* provides support for all the character symbols in all known languages and Oxygen XML Editor plugin provides *support for all Unicode characters* (**page 602**). There are various encoding options and features to help determine how to handle documents with unsupported characters (**page 603**).

**Fonts**

Oxygen XML Editor plugin provides the ability to *choose the fonts to be used in the various editing modes* (**page 157**). In some cases, changing the font may be a solution when special characters are not rendered as expected.

For special characters that are not included in any of the default fonts, Oxygen XML Editor plugin tries to find that symbol in a *fallback font* (**page 603**). For the *Author* editing mode, you can specify a set of fallback fonts in the *font-family CSS property*
(in the particular CSS file used for rendering your documents). For more information, see the Customizing Author Mode Through CSS (page 2192) section.

**Tip:** For documents written in languages that use special characters (such as Japanese or Chinese), change the font to one that supports the specific characters (a Unicode font). For the Windows platform, Arial Unicode MS or MS Gothic is recommended. To change the font in Oxygen XML Editor plugin, open the Preferences dialog box (page 55), go to Fonts. You can select a font for each editing mode in this preferences page.

**Navigation and Layout**

Oxygen XML Editor plugin supports bidirectional text, such as Arabic, Hebrew, and certain Asian languages, or other special characters that are combined into a single glyph.

**Editing**

Oxygen XML Editor plugin includes a contextual menu action that converts a sequence of hexadecimal characters to the corresponding Unicode character (page 656).

If you do not have a special way of inserting special characters using your keyboard, you can insert special characters using the Character Map feature (page 608).

**Unicode Support**

Unicode is a standard for providing consistent encoding, representation, and handling of text. There is a unique Unicode number for every character, independent of the platform and language. Unicode is internationally recognized and is required by modern standards (such as XML, Java, JavaScript, LDAP, CORBA 3.0, WML, etc.).

Oxygen XML Editor plugin provides support for the Unicode standard, enabling your XML application to be targeted across multiple platforms, languages, and countries without re-engineering. Internally, the Oxygen XML Editor plugin uses 16-bit characters covering the Unicode Character set.

**Note:** Oxygen XML Editor plugin may not be able to display characters that are not supported by the operating system (either not installed or unavailable).

**Tip:** On windows, you can enable the support for CJK (Chinese, Japanese, Korean) languages from Control Panel / Regional and Language Options / Languages / Install files for East Asian languages.

**Related Information:**
Opening and Saving Documents with Unsupported Characters

When loading documents, Oxygen XML Editor plugin receives the encoding of the document from the Eclipse platform. This encoding is then used to instruct the Java Encoder to load support for and to save the document using the specified code chart.

**Saving Documents with Unsupported Characters**

When saving a document with UTF-16 encoding, the saved document has a Byte Order Mark (BOM) that specifies the byte order of the document content. The default byte order is platform-dependent. That means that a UTF-16 document created on a Windows platform (where the default byte order mark is *UnicodeLittle*) has a different BOM than one created on a Mac OS platform (where the byte order mark is *UnicodeBig*). The byte order and the BOM of an existing document are preserved when the document is edited and saved.

**Unicode Fallback Font Support**

Oxygen XML Editor plugin provides fonts for most common Unicode ranges. However, if you use special symbols or characters (page 608) that are not included in the default fonts, they will be rendered as small rectangles. A **fallback** font is a reserve typeface that contains symbols for as many Unicode characters (page 602) as possible. When a display system encounters a character that is not part of the range of any of the available fonts, Oxygen XML Editor plugin will try to find that symbol in a **fallback** font.

**Example of a Scenario Where a Fallback Font is Needed**

Suppose that you need to insert the wheelchair symbol (แดด - U+267F) into your content in a Windows operating system. By default, Oxygen XML Editor plugin does not render this symbol correctly since it is not included in any of the default fonts. It is included in *Segoe UI Symbol*, but this font is not part of the default fonts that come with Oxygen XML Editor plugin. To allow Oxygen XML Editor plugin to recognize and render the symbol correctly, you can add *Segoe UI Symbol* as a **fallback** font.
Adding a Fallback Font in Windows (7 or Later)

To add a fallback font to the Oxygen XML Editor plugin installation, use the following procedure:

1. Start Windows Explorer and browse to the \[OXYGEN_INSTALL_DIR\]/jre/lib/fonts directory.
2. Create a directory called fallback (if it is not already there).
3. Copy a font file (True Type Font - TTF) that includes the special characters into this directory.

   Tip: You could, for example, copy the Segoe UI Symbol Regular font from C:\Windows \Fonts.

4. Restart Oxygen XML Editor plugin for the changes to take full effect.

Result: Whenever Oxygen XML Editor plugin finds a character that cannot be rendered using its standard fonts, it will look for the glyph in the fonts stored in the fallback folder.

Adding a Fallback Font in Other Platforms

For Mac OS X or other platforms, you could use the following approach:

1. Use a font editor (such as FontForge) to combine multiple true type fonts into a single custom font.
2. Install the font file into the dedicated font folder of your operating system.
3. In Oxygen XML Editor plugin, open the Preferences dialog box (page 55), go to Fonts.
4. Click the Change button for the particular editing mode and select your custom font from the drop-down list in the subsequent dialog box.
5. Restart Oxygen XML Editor plugin for the font changes to take full effect.

Special Character Support in Author Mode

Oxygen XML Editor plugin offers support for bidirectional text, such as Arabic or Hebrew languages that require right-to-left scripts, certain Asian languages (such as Devanagari, Bengali, Gurmukhi, Gujarati, Oriya, Tamil, Telugu, Kannada, Malayalam, Sinhala, Thai, Khmer), or other special characters
(such as combining characters). To achieve this, Oxygen XML Editor plugin implements the Unicode Bidirectional Algorithm, as specified by the Unicode Consortium. The text arrangement is similar to what you get in a modern HTML browser. The final text layout is rendered according to the directional CSS properties matching the XML elements and the Unicode directional formatting codes.

By default, when navigating bidirectional text with the arrow keys in Author mode, pressing the right arrow key moves the cursor in the writing direction and the left arrow moves it in the opposite direction. However, if the Arrow keys move the cursor in the writing direction option (page 118) in the Cursor Navigation preferences page is not selected, pressing the right arrow will simply move the cursor to the right (and the left arrow moves it to the left), regardless of the text direction.

Tip: If you experience performance issues when editing documents that contain bidirectional text, you could try the following solution:

- You could try changing the font. For example, you could try using the David font in Hebrew content. If it is not already installed in your operating system, this font is available at: https://www.microsoft.com/typography/fonts/family.aspx?FID=234. To change the font in Oxygen XML Editor plugin, open the Preferences dialog box (page 55), go to Fonts, and change the font using the Author option in the Fonts preferences page (page 158).

For more information about the bidirectional text support in the Author mode, watch our video demonstration:

Controlling the Text Direction Using XML Markup

Oxygen XML Editor plugin supports the following CSS properties that control the direction of text:

**Table 33. CSS Properties Controlling Text Direction**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>direction</td>
<td>Specifies the writing direction of the text. The possible values are ltr (the text direction is left to right), rtl (the text direction is right to left), and inherit (the direction property is inherited from the parent element).</td>
</tr>
</tbody>
</table>
| unicodeBidi     | Used along with the direction property to create levels of embedded text with different text directions in the same document. The possible values of this property are bidi-override (creates an additional level of embedding and forces all strong characters
to the direction specified in the direction, embed (creates an additional level of embedding), normal (does not use an additional level of embedding), and inherit (the value of the unicodeBidi property is inherited from parent element).

For instance, to declare an element as being Right to Left, you could use a stylesheet like this:

**XML File:**

```xml
<article>
  <myRTLpara>RIGHT TO LEFT TEXT</myRTLpara>
</article>
```

**Associated CSS File:**

```css
myRTLpara{
  direction:rtl;
  unicode-bidi:embed;
}
```

Oxygen XML Editor plugin recognizes the dir attribute on any XML document. The supported values are:

<table>
<thead>
<tr>
<th>Values</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ltr</td>
<td>The text from the current element is Left to Right, embedded.</td>
</tr>
<tr>
<td>rtl</td>
<td>The text from the current element is Right to Left, embedded.</td>
</tr>
<tr>
<td>lro</td>
<td>The text from the current element is Left to Right, embedded.</td>
</tr>
<tr>
<td>rlo</td>
<td>The text from the current element is Right to Left, embedded.</td>
</tr>
</tbody>
</table>

The following XML document types make use of the dir attribute with the above values:

- DITA
- DocBook
- TEI
- XHTML

**Note:** When the inline element (page 2707) tags are visible, the text in the line is arranged according to the BIDI algorithm after replacing the tags symbols with Object Replacement Characters. This makes it possible to get a different text arrangement when viewing a document in the No Tags mode versus viewing it in the Full Tags mode.
Controlling the Text Direction Using the Unicode Direction Formatting Codes

These Unicode Direction Formatting Codes codes can be embedded in the edited text, specifying a text direction and embedding. However, it is not recommended to use them in XML as they are zero width characters, making it hard to debug the text arrangement.

Table 34. Directional Formatting Codes

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>U+202A</td>
<td>LEFT-TO-RIGHT EMBEDDING Treats the following text as embedded left-to-right.</td>
</tr>
<tr>
<td>U+202B</td>
<td>RIGHT-TO-LEFT EMBEDDING Treats the following text as embedded right to left.</td>
</tr>
<tr>
<td>U+202D</td>
<td>LEFT-TO-RIGHT OVERRIDE Forces the following characters to be treated as strong left-to-right characters.</td>
</tr>
<tr>
<td>U+202E</td>
<td>RIGHT-TO-LEFT OVERRIDE Forces the following characters to be treated as strong right-to-left characters.</td>
</tr>
<tr>
<td>U+202C</td>
<td>POP DIRECTIONAL FORMATTING CODE Restores the bidirectional state to what it was before the last LRE, RLE, RLO, or LRO.</td>
</tr>
<tr>
<td>U+200E</td>
<td>LEFT-TO-RIGHT MARK Left-to-right strong zero-width character.</td>
</tr>
<tr>
<td>U+200F</td>
<td>RIGHT-TO-LEFT MARK Right-to-left strong zero-width character.</td>
</tr>
</tbody>
</table>

To insert Unicode Direction Formatting Codes, use the Symbols toolbar action. To easily find such a code, you can either enter directly the hexadecimal value, or use the Details tab to enter the codes name.

Oxygen XML Editor plugin offers the support for bi-directional text in all the side views (Outline view (page 316), Attributes view (page 319) and so on) and text fields.

Special Character Support in Grid Mode

If you are editing documents with a bidirectional text orientation or other special characters (such as combining characters), you can change the way the text is rendered and edited in the grid cells by using the Change Text Orientation(Ctrl + Shift + O (Command + Shift + O on OS X)) action that is available from the Edit menu in the Grid editing mode. Use this action to switch from the default left to right text orientation to the right to left orientation, and vice versa.

Note: This change applies only to the text from the cells, and not to the layout of the grid editor.

Figure 222: Default left to right text orientation
Inserting Special Characters with the Character Map

Oxygen XML Editor plugin includes a Character Map for inserting special characters. It can also be used to find the decimal, hexadecimal, or character entity equivalent for a particular character or symbol.

**Inserting Special Characters**

To insert a special character at the current location within a document, follow these steps:

1. Open the **Character Map dialog box** *(page 609)* by Edit > Ω Insert from Character Map.
2. Find the symbol you want to insert and double-click it (or select it and click Insert).
Tip: The most recently used characters and some of the most common characters are listed when you click the Symbols drop-down button so you can easily insert any of those characters by simply selecting it from the drop-down.

Finding the Decimal, Hexadecimal, or Character Entity Equivalent

You can see the hexadecimal value for any character that is already inserted in your document by placing the cursor right after the character and you can see its value in the status bar at the bottom of the application.

For other characters, or to find the decimal equivalent, or even the character entity equivalent, following these steps:

1. Open the Character Map dialog box (page 609) by Edit > Insert from Character Map.
2. Find the symbol and select it. You can use the filters and the Search field at the top of the dialog box to narrow the search.
3. Click the Details tab on top of the preview window to see the decimal, hexadecimal, and description of the character. The character entity equivalent (both its decimal and hexadecimal values) are displayed at the bottom of the dialog box.

Character Map Dialog Box

Figure 224: Character Map Dialog Box
The **Character Map** dialog box allows you to visualize all characters that are available in a particular font, pick the character you need, and insert it in the document you are editing. It includes the following fields and sections:

**Font**

Use this drop-down list to choose the font for which you want to display characters.

**Unicode Block**

Use this drop-down list to only see a certain range of characters. This will filter the number of characters displayed, showing only a contiguous range of characters corresponding to the selected block. Unassigned characters are displayed as empty squares.

**Search**

Use this filter to search for a character by one of the following attributes:

- hexadecimal
- decimal
- description
Note: Selecting description opens the Details tab (page 611). If you enter a character description in the Search field, description is selected automatically.

Character Table Section
The characters that are available to be inserted are listed in two tabs:

- **Compact** - Matrix-like table that displays a visual representation of the characters.
- **Details** - Displays the available characters in a tabular format, presenting their decimal and hexadecimal value along with their description.

Recently Used Characters Section
Displays the symbols that you have used recently and you can also select one from there to insert it in the current document.

Character Mode Section
The next section of the dialog box allows you to select how you want the character to appear in the Text editing mode. You can choose between the following:

- **Character**
- **Character entity - decimal**
- **Character entity - hexadecimal**

You can see the character or code that will be inserted in Text mode next to the selections in this section and a box on the right side of the dialog box allows you to see the character that will be inserted in Author mode. You can also see the name and range name of a character either at the bottom of the dialog box, or in a tooltip when hovering the cursor over the character.

Press the **Insert** button to insert the selected character in the current editor at cursor position. You will see the character in the editor if the editor font (page 157) is able to render it. The **Copy** button copies it to the clipboard without inserting it in the editor.

Note: The Character Map dialog box is not available in the Grid editor (page 292).

Handling Read-Only Files

The default workbench behavior applies when editing read-only files in the Text mode. For all other modes no modification is allowed provided that the file remains read-only.

You can check out the read-only state of the file by looking in the Properties view (page 569). If you modify the file properties from the operating system and the file becomes writable, you can modify it on the spot without having to reopen it.

Viewing Status Information

Status information generated by operations such as schema detection, manual validation, automatic validation, and transformations are fed into the Console view, allowing you to monitor how the operation is being executed (the Enable Oxygen consoles option (page 161) must be selected in the View preferences page (page 160)).

Figure 225: Console View Messages

Messages contain a timestamp, the name of the thread that generated it and the actual status information. The number of displayed messages can be controlled with the Limit console output option in the View (page 161) preference page.

To make the view visible, select Window > Show View > Console.

Editor Highlights

An editor highlight is a text fragment emphasized by a colored background.

Highlights are generated in both Text and Author mode when the following actions generate results:

- Find All Elements (page 584)
• **XPath in Files** (page 256)
• **Search References** (page 664)
• **Search Declarations** (page 664)

By default, Oxygen XML Editor plugin uses a different color for each type of highlight (*XPath in Files, Find/Replace, Search References, Search Declarations*, etc.) You can customize these colors and the maximum number of highlights displayed in a document on the *Editor preferences page* (page 99). The default maximum number of highlights is 10000.

You can navigate the highlights in the current document by using the following methods:

• Clicking the markers from the range ruler, located at the right side of the editor pane.
• Clicking the **Next** and **Previous** buttons ((formatter) from the bottom of the range ruler, located at the right side of the editor pane.

**Note:** When there are multiple types of highlights in the document, the **Next** and **Previous** buttons ((formatter) navigate through highlights of the same type.

• Clicking the messages displayed in the *Results view* (page 267) at the bottom of the editor.

To remove the highlights, you can do the following:

• Click the **Remove all** button from bottom of the range ruler, located at the right side of the editor pane.
• Close the results tab at the bottom of the editor that contains the output of the action that generated the highlights.
• Click the **Remove all** button on the right side of the *Results panel* (page 267) at the bottom of the editor.

Editing Specific Document Types

This chapter includes a large amount of information about editing numerous types of documents and various editing features that are provided in Oxygen XML Editor plugin. Each type of document has unique features and options and this chapter includes an extensive collection of topics about editing XML documents in Text mode (page 614) and the visual Author mode (page 672).

Editing XML Documents

This section explains the various features in Oxygen XML Editor plugin for editing XML documents. It includes information about the user interface components and actions that are available in the various editing modes and numerous features to help you edit XML documents in any mode.

The structure of an XML document and the required restrictions on its elements and their attributes are defined with an XML schema. This makes it easier to edit XML documents in the visual Author editing mode. For more information about schema association, see Associating a Schema to XML Documents (page 887).

Editing XML Documents in Text Mode

The Oxygen XML Editor plugin Text editing mode is designed to be a simple, yet powerful, XML source editor. You can use this mode to edit XML code, markup, and text and it provides support to help you transform, and debug XML-based documents. It is similar to other common text editors, but Oxygen XML Editor plugin also includes specialized editing actions, a powerful Content Completion Assistant (page 627), a helpful Outline view (page 257), and many other unique features.
To switch to this mode, select **Text** at the bottom of the editing area.

**Navigating the Document Content in Text Mode**

Oxygen XML Editor plugin includes some useful features to help you navigate XML documents in **Text** mode.

**Navigation Keyboard Shortcuts**

- **Ctrl + CloseBracket (Command + CloseBracket on OS X)**
  Navigate to the next XML node.

- **Ctrl + OpenBracket (Command + OpenBracket on OS X)**
  Navigate to the previous XML node.

- **Ctrl + RightArrow (Command + RightArrow on OS X)**
  Navigate one word forward.

- **Ctrl + LeftArrow (Command + LeftArrow on OS X)**
  Navigate one word backward.

- **Ctrl + Home (Command + Home on OS X)**
  Position the cursor at the beginning of the document.

- **Ctrl + End (Command + End on OS X)**
  Position the cursor at the end of the document.

**Navigating to a Modification**

Oxygen XML Editor plugin includes some actions to help you quickly navigate to a particular modification. They can be invoked using keyboards shortcuts or from the **Navigation** menu:

- **Last Edit Location (Ctrl+Q)**
  Moves the cursor to the last modification in any opened document.

- **Back (Alt+LeftArrow (Command+OpenBracket on OS X))**
  Moves the cursor to the previous modification.

- **Forward (Alt+RightArrow (Command+CloseBracket on OS X))**
  Moves the cursor to the next modification.
Navigating with the Outline View

Oxygen XML Editor plugin includes an Outline view (page 257) that displays a hierarchical tag overview of the currently edited XML Document.

You can use this view to quickly navigate through the current document by selecting nodes in the outline tree. It is synchronized with the editor area, so when you make a selection in the Outline view, the corresponding nodes are highlighted in the editor area.

Figure 226: Outline View Navigation in Text Mode

Using the Breadcrumb to Navigate

A breadcrumb on the top stripe indicates the path from the document root element to the current element. It can also be used as a helpful tool to navigate to specific elements throughout the structure of the document.

Figure 227: Breadcrumb in Text Mode

The last element listed in the breadcrumb is the element at the current cursor position. Clicking an element from the breadcrumb selects the entire element and navigates to it in the editor area.

Navigating with the Go To Dialog Box

In Text mode, you can navigate precisely to a location in the document you are editing by pressing Ctrl+L (Command+L on OS X) or selecting Go To Line from the Navigation menu.

Navigating with Bookmarks

By using bookmarks, you can mark positions in an edited document so that you can return to it later. This is especially helpful for navigating through large documents or while editing multiple documents.

To insert a bookmark in Text mode, right-click the desired location in the vertical stripe on the left side of the editor and select Add Bookmark (you can remove it by selecting Remove Bookmark from the same contextual menu).
To navigate to any of the bookmarks, click their corresponding markers in the vertical stripe on the right side of the editor.

Tip: You can configure the color and how the bookmarks are shown from the Eclipse Annotations preferences page (Window (‘Eclipse’ on Mac OSX) > Preferences > General > Editors > Text Editors > Annotations).

Smart Editing in Text Mode

Oxygen XML Editor plugin includes smart editing features to help you edit XML documents in Text mode. The following smart editing features are included:

- **Closing tag auto-expansion** - This feature helps save some keystrokes by automatically inserting a closing tag when you insert a complete start tag and the cursor is automatically placed in between the start and end tags. For instance, after entering a start `<tag>`, the corresponding closing `</tag>` is automatically inserted and the cursor is placed between the two (`<tag> | </tag>`).
- **Auto-rename matching tag** - When you edit the name of a start tag, Oxygen XML Editor plugin will mirror-edit the name of the matching end tag. This feature can be controlled from the Content Completion option page (page 100).
- **Auto-breaking the edited line** - The Hard line wrap option (page 137) automatically breaks the edited line when its length exceeds the maximum line length defined for the format and indent operation (page 137).
- **Indent on Enter** - The Indent on Enter option (page 137) indents the new line inserted when you press Enter.
- **Smart Enter** - The Smart Enter option (page 137) inserts an empty line between the start and end tags. If you press Enter between a start and end tag, the action places the cursor in an indented position on the empty line between the lines that contain the start and end tag.
- **Double-click** - A double-click selects certain text, depending on the position of the click in the document:
  - If the click position is on a start tag or end tag, then the element name is selected.
  - If the click position is after a start tag or before an end tag, then the entire content of the element without the start and end tags is selected.
  - If the click position is before a start tag or after an end tag, then the entire tag is selected, including the start and end tags, and the content in between.
  - If the click position is immediately before an attribute, then the entire attribute and its value is selected.
  - If the click position is immediately after the opening quote or immediately before the closing quote of an attribute value, then the entire attribute value is selected.
  - Otherwise, a double-click selects contiguous text.
• **Triple-click** - A triple-click selects the entire current line of text.

Shortcut Actions in Text Mode

Oxygen XML Editor plugin includes numerous shortcut actions to help you edit content in the **Text** editing mode.

**Undo/Redo Actions**

The typical undo and redo actions are available with shortcuts or in the **Edit** menu:

**Undo** *(Ctrl + Z (Command + Z on OS X))*

Reverses a maximum of 200 editing actions to return to the preceding state.

**Note:** Complex operations such as Replace All or Indent selection count as single undo events.

**Redo** *(Ctrl + Y (Command + Shift + Z on OS X, Ctrl + Shift + Z on Linux/Unix))*

Recreates a maximum of 100 editing actions that were undone by the **Undo** function.

**Copy and Paste Actions**

The typical copying and pasting actions are available with shortcuts or in the contextual menu (or the **Edit** menu):

**Cut** *(Ctrl + X (Command + X on OS X))*

Removes the current selected content from the document and places it in the clipboard.

**Copy** *(Ctrl + C (Command + C on OS X))*

Places a copy of the current selected content in the clipboard.

**Paste** *(Ctrl + V (Command + V on OS X))*

Inserts the current clipboard content into the document at the cursor position.

**Select All** *(Ctrl + A (Command + A on OS X))*

Selects the entire content of the current document.

**Moving XML Nodes**

You can use the following shortcuts to move XML elements or XSLT variables up or down in **Text** mode:
**Ctrl + Alt + UpArrow (Command + Alt + UpArrow on OS X)**

Moves the node up one line.

**Ctrl + Alt + DownArrow (Command + Alt + DownArrow on OS X)**

Moves the node down one line.

**Note:** The requirements for these node moving actions to work are as follows:

- The mechanism is designed to work without a selection. If you use these actions on a selection of content, it moves the entire selection. To make this mechanism work as intended, simply position the cursor somewhere on the line that you want to move.
- A start tag must be the first text occurrence on the line where the cursor is positioned.
- On the line where the element ends, only whitespaces are allowed after the end tag.

**Miscellaneous Shortcut Actions in Text Mode**

Oxygen XML Editor plugin also includes the following other miscellaneous shortcut actions in **Text** mode:

**Ctrl + Delete (Command + Delete on OS X)**

Deletes the next word.

**Ctrl + Backspace (Command + Backspace on OS X)**

Deletes the previous word.

**Ctrl + W (Command + W on OS X)**

Cuts the previous word.

**Ctrl + K (Command + K on OS X)**

Cuts to end of line.

**Ctrl + Single-Click (Command + Single-Click on OS X)**

Use this shortcut to open any of the following:

- Any absolute URL (URLs that have a protocol), regardless of their location in the document.
- URI attributes such as: `schemaLocation`, `noNamespaceSchemaLocation`, `href` and others.
- Processing instructions used for associating resources, xml-models, xml-stylesheets.

**Ctrl + Shift + Y (Command + Shift + Y on OS X) (Document > Edit > Toggle Line Wrap)**
Enables or disables line wrapping. When enabled, if text exceeds the width of the displayed editor, content is wrapped so that you do not have to scroll horizontally.

Editing XML Markup in Text Mode

Oxygen XML Editor plugin includes some useful actions that allow you to easily edit XML markup in Text mode. These actions are available in the Refactoring submenu of the contextual menu, and many of the actions can also be done with simple keyboard shortcuts.

Using the Breadcrumb

A breadcrumb on the top stripe indicates the path from the document root element to the current element. It can also be used as a helpful tool to insert and edit specific elements in the document structure.

Figure 228: Breadcrumb in Text Mode

The last element listed in the breadcrumb is the element at the current cursor position. Clicking an element in the breadcrumb selects the entire element in the editor area. Also, each element provides a contextual menu with access to the following actions:

Append Child

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it as a child of the current element.

Insert Before

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it immediately before the current element, as a sibling.

Insert After

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it immediately after the current element, as a sibling.

Edit Attributes

Opens an editing window that allows you to edit the attributes of the currently selected element.

Toggle Comment

Encloses the currently selected element in an XML comment, if the element is not already commented. If it is already commented, this action will remove the comment.
Cut

Removes the selected element and copies it to the clipboard.

Copy

Copies the selected element to the clipboard.

Delete

Deletes the currently selected element.

**Move Nodes**

You can easily move XML nodes in the current document by using the following shortcut keys:

Alt + UpArrow

Moves the current node or selected nodes in front of the previous node.

Alt + DownArrow

Moves the current node or selected nodes after the subsequent node.

**Rename Elements**

You can rename elements by using the following actions in the Refactoring submenu of the contextual menu:

Rename Element

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the Rename dialog box.

Rename Prefix (Alt + Shift + P (Command + Shift + P on OS X))

The prefix of the element from the cursor position, and any elements with the same prefix, can be renamed according with the options from the Rename dialog box.

- If you select the Rename current element prefix option, the application will recursively traverse the current element and all its children. For example, to change the xmlns:p1="ns1" association in the current element to xmlns:p5="ns1", if the xmlns:p1="ns1" association is applied on the parent element, then Oxygen XML Editor plugin will introduce xmlns:p5="ns1" as a new declaration in the current element and will change the prefix from p1 to p5. If p5 is already associated with another namespace in the current element, then the conflict will be displayed in a dialog box. By pressing OK, the prefix is modified from p1 to p5 without inserting a new declaration.
• If you select the Rename current prefix in all document option, the application will apply the change on the entire document.
• To also apply the action inside attribute values, select the Rename also attribute values that start with the same prefix checkbox.

Surround Content with Tags (Wrap)

You can surround a selection of content with tags (wrap the content) by using the following action in the Refactoring submenu of the contextual menu:

🔍 Surround with Tags (Alt + Shift + E)

Allows you to choose a tag that encloses a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

• If the Position cursor between tags option (page 101) is selected in the Content Completion preferences page, the cursor is placed between the start and end tag.
• If the Position cursor between tags option (page 101) is not selected in the Content Completion preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

🔍 Surround with '[tag]' (Alt + Shift + ForwardSlash)

Surround the selected content with the last tag used.

🔍 Surround with <![CDATA]> (Alt + Shift + C (Command + Alt + C on OS X))

Surround the selected content with a CDATA tag so that the parser will interpret it as textual data rather than markup.

Unwrap the Content of Elements

You can unwrap the content of an element by using the following action in the Refactoring submenu of the contextual menu:

🔍 Delete element tags (Alt + Shift + Comma)

Deletes the start and end tag of the current element.

Join or Split Elements

You can join or split elements in the current document by using the following actions in the Refactoring submenu of the contextual menu:

🔍 Join elements (Alt + Shift + F (Command + Alt + F on OS X))
Joins the left and right elements relative to the current cursor position. The elements must have the same name, attributes, and attributes values.

Split element

Split the element from the cursor position into two identical elements. The cursor must be inside the element.

Other Refactoring Actions

You can also manage the structure of the markup by using the other specific XML refactoring actions that are available in the Refactoring submenu of the contextual menu:

Attributes Refactoring Actions

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

Add/Change attribute

Allows you to change the value of an attribute or insert a new one.

Convert attribute to element

Allows you to change an attribute into an element.

Delete attribute

Allows you to remove one or more attributes.

Rename attribute

Allows you to rename an attribute.

Replace in attribute value

Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

Comments Refactoring Actions

Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

Delete comments

Allows you to delete comments found inside one or more elements.

Elements Refactoring Actions

Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.
Delete element
   Allows you to delete elements.

Delete element content
   Allows you to delete the content of elements.

Insert element
   Allows you to insert new elements.

Rename element
   Allows you to rename elements.

Unwrap element
   Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

Wrap element
   Allows you to surround elements with element tags.

Wrap element content
   Allows you to surround the content of elements with element tags.

Fragments Refactoring Actions
Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

Insert XML fragment
   Allows you to insert an XML fragment.

Replace element content with XML fragment
   Allows you to replace the content of elements with an XML fragment.

Replace element with XML fragment
   Allows you to replace elements with an XML fragment.

Folding XML Elements in Text Mode

When working with a large document, the folding (page 2706) support in Oxygen XML Editor plugin can be used to collapse some element content leaving only those that you need to edit in focus. Expanding and collapsing works on individual elements. Expanding an element leaves the child elements unchanged.

![Figure 229: Folding of XML Elements in Text Mode](image)

Folding Actions in Text Mode

Element folds are marked with a small icon (≡) in the left stripe. To toggle the fold, simply click the icon. Also, if you right-click the icon, the following actions are available in the Folding sub-menu:

- **Toggle Fold**
  Toggles the state of the current fold.

- **Collapse Other Folds (Ctrl + NumPad/ (Command + NumPad/ on OS X))**
  Folds all the elements except the current element.

- **Collapse Child Folds (Ctrl + NumPad- (Command + NumPad- on OS X))**
  Folds the child elements that are indented one level inside the current element.

- **Expand Child Folds (Ctrl + NumPad+ (Command + NumPad+ on OS X))**
  Unfolds all child elements of the currently selected element.

- **Expand All (Ctrl + NumPad* (Command + NumPad* on OS X))**
  Unfolds all elements in the current document.
For more information about the *folding* support in Oxygen XML Editor plugin, watch our video demonstration:

Drag and Drop in Text Mode

To move a whole region of text to other location in the same edited document, just select the text, drag the selection by holding down the left mouse button and drop it to the target location.

You can also copy content from other applications and paste it into the document.

Selecting Content in Text Mode

Oxygen XML Editor plugin includes a variety of keyboard shortcuts that allow you to select content in **Text** mode. These include numerous standard continuous selection possibilities that are common to many text editors.

**Standard Continuous Selection Shortcuts**

**Ctrl + A (Meta + A on Mac OS X)**

Selects all content in the document.

**Shift + Left/Right Arrow Keys**

Begins a continuous selection at the cursor position and extends it one character at a time in the direction that you press the arrow keys.

**Shift + Up/Down Arrow Keys**

Begins a continuous selection at the cursor position and extends it one line at a time in the direction that you press the arrow keys.

**Ctrl + Shift + Left/Right Arrow Keys (Meta + Shift + Left/Right Arrow Keys on Mac OS X)**

Begins a continuous selection at the cursor position and extends it one word at a time in the direction that you press the arrow keys.

**Shift + Home**

Begins a continuous selection at the cursor position and extends it to the beginning of the current line (on Mac OS X, it extends to the beginning of the document).

**Shift + End**

Begins a continuous selection at the cursor position and extends it to the end of the current line (on Mac OS X, it extends to the end of the document).
**Ctrl + Shift + Home**

Begins a continuous selection at the cursor position and extends it to the beginning of the document.

**Ctrl + Shift + End**

Begins a continuous selection at the cursor position and extends it to the end of the document.

**Shift + PageUp**

Begins a continuous selection at the cursor position and extends it up one screen page.

**Shift + PageDown**

Begins a continuous selection at the cursor position and extends it down one screen page.

**Double-Click**

Selects certain text, depending on the position of the click in the document. See Smart Editing: Double-Click (page 617) for the specifics.

**Triple-Click**

Selects entire regions of text, depending on the position of the click in the document. See the Smart Editing: Triple-Click (page 618) for the specifics.

**Right-Click > Select > Element**

Selects the entire element at the current cursor position.

**Right-Click > Select > Content**

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

**Right-Click > Select > Attributes**

Selects all the attributes of the element at the current cursor position.

**Right-Click > Select > Parent**

Selects the entire parent element at the current cursor position.

### Content Completion Assistant in Text Mode

Oxygen XML Editor plugin includes an intelligent Content Completion Assistant (page 2704) that offers rapid, inline identification and insertion of structured language elements, attributes, and attribute values. Oxygen XML Editor plugin shows the available entries that are valid in the current editing context.
The Content Completion Assistant is enabled by default. To disable it, open the Preferences dialog box (page 55), go to Editor > Content Completion, and deselect the Enable content completion option (page 101).

**Figure 230: Content Completion Assistant**

```xml
<xs:element ref="name"/>
<xs:element ref="email" minOccurs="0" maxOccurs="unbounded"/>
<xs:element ref="url" minOccurs="0" maxOccurs="unbounded"/>
</xs:sequence>
<xs:element ref="id"/>
<xs:element ref="title"/>
<xs:element ref="abstract"/>
<xs:element ref="link" minOccurs="0" maxOccurs="1"/>
<xs:element ref="block">
  <xs:attribute ref="id"/>
  <xs:attribute ref="title"/>
  <xs:attribute ref="abstract"/>
  <xs:attribute ref="link"/>
</xs:element>
</xs:element>
```

The Content Completion Assistant is schema-driven and the list of proposals in the Content Completion Assistant (page 2704) depend on the associated schemas (DTD, XML Schema, Relax NG, or NVDL schema). For information about the various ways to associate a schema and the order of their precedence, see the Associating a Schema to XML Documents (page 887) section.

**Content Completion and the Associated Schema**

**Using the Content Completion Assistant in Text Mode**

The feature is activated in Text mode in the following situations:

- After you press the `<` character when inserting an element, it is automatically activated after a short delay. You can adjust the activation delay with the Activation delay of the proposals window (ms) option (page 102) from the Content Completion preferences page.
- After typing a partial element or attribute name, you can manually activate it by pressing Ctrl + Space (Command + Space on OS X) or Alt + ForwardSlash (Command + Alt + ForwardSlash on OS X). If there is only one valid proposal at the current location, it is inserted without displaying the list of proposals.

You can navigate through the list of proposals by using the Up and Down keys on your keyboard. In some cases, the Content Completion Assistant displays a documentation window with information about the particular proposal and some of them have links to additional information (for example, DITA elements might have a link to the DITA Style Guide). You can also change the size of the documentation window by dragging its top, right, and bottom borders.
To insert the selected proposal in Text mode, do one of the following:

- Press **Enter** or **Tab** to insert both the start and end tags and position the cursor inside the start tag in a position suitable for inserting attributes.
- Press **Ctrl + Enter (Command + Enter on OS X)** to insert both the start and end tags and position the cursor between the tags in a position where you can start typing content.

**Note:** When the DTD, XML Schema or RELAX NG schema specifies required child elements for the newly added element, they are inserted automatically only if the **Add Element Content option** (page 101) (in the **Content Completion preferences** page) is selected. The **Content Completion Assistant** can also add optional content and first choice particle, as specified in the DTD, XML Schema, or RELAX NG schema. To activate these features, select the **Add optional content** (page 101) and **Add first Choice particle** (page 101) options in the **Content Completion** preferences page.

After inserting an element, the cursor is positioned:

- Before the > character of the start tag, if the element allows attributes, to allow rapid insertion of any of the attributes supported by the element. Pressing the space bar displays the Content Completion list once again. This time it contains the list of allowed attribute names. If the attribute supports a fixed set of parameters, the assistant list displays the list of valid parameters. If the parameter setting is user-defined and therefore variable, the assistant is closed to allow manual insertion. The values of the attributes can be learned from the same elements in the current document.
- After the > character of the start tag, if the element has no attributes.

**Where the Content Completion Assistant is Displayed**

The **Content Completion Assistant** is displayed:

- Anywhere within a tag name or at the beginning of a tag name in an XML document, XML Schema, DTD, or Relax NG (full or compact syntax) schema.
- Anywhere within an attribute name or at the beginning of an attribute name in any XML document with an associated schema.
- Within attribute values or at the beginning of attribute values in XML documents where lists of possible values have been defined for that element in the schema associated with the document.

**Types of Proposals Listed in the Content Completion Assistant**

The following things are considered for determining the proposals that are listed in the content completion window:
Element Structure Specified in DTD or Schema

The proposals that populate the Content Completion Assistant depend on the element structure specified in the DTD, XML Schema, Relax NG (full or compact syntax) schema, or NVDL schema associated with the edited document.

Note: The Content Completion Assistant is able to offer elements defined both by XML Schemas version 1.0 and 1.1.

Current Cursor Position

The number and type of elements displayed by the Content Completion Assistant is dependent on the cursor's current position in the structured document. The child elements displayed within a given element are defined by the structure of the specified DTD, XML Schema, Relax NG (full or compact syntax) schema, or NVDL schema.

Unique ID Attribute Values

A schema may declare certain attributes as ID or IDREF/IDREFS. When the document is validated, Oxygen XML Editor plugin checks the uniqueness and correctness of the ID attributes. It also collects the attribute values declared in the document to prepare the list of proposals. This is available for documents that use DTD, XML Schema, and Relax NG schema.

Values for xml:id Attributes

Values of all the xml:id attributes are handled as ID attributes. They are collected and displayed by the Content Completion Assistant as possible values for anyURI attributes defined in the schema of the edited document. This works only for XML Schema and Relax NG schemas.

Links/References in DITA

When entering values for the various types of links and references in DITA (for example, values for href or conref elements), the Content Completion Assistant will propose potential targets when you use the forward slash key (/).

ID Values for DITA Key References

In DITA, when inserting key references (keyref) or content key references (conkeyref), the ID values that are defined in the key reference are presented as possible targets. The Content Completion Assistant will only propose targets that are valid in the current context.

Element and Attribute Values

For documents that use an XML Schema or Relax NG schema, the Content Completion Assistant offers proposals for attribute and element values as long as the allowed values
are defined in the schema. Also, if a default value or fixed value is defined in the schema, then that value is offered in the Content Completion Assistant.

### Schema Annotations in Text Mode

A schema annotation is a documentation snippet associated with the definition of an element or attribute in a schema. If such a schema is associated with an XML document, the annotations are displayed in:

- The Content Completion Assistant (page 2704).
- A small tooltip window shown when the mouse hovers over an element or attribute.

The schema annotations support is available if the schema type is one of the following:

- XML Schema
- Relax NG
- NVDL schema
- DTD

This feature is enabled by default, but you can disable it by deselecting the Show annotations in Content Completion Assistant (page 103) option in the Annotations preferences page.

### Styling Annotations with HTML

You can use HTML format in the annotations you add in an XML Schema or Relax NG schema. This improves the visual appearance and readability of the documentation window displayed when editing XML documents validated against such a schema. An annotation is recognized and displayed as HTML if it contains at least one HTML element (such as `div`, `body`, `p`, `br`, `table`, `ul`, or `ol`).

The HTML rendering is controlled by the Show annotations using HTML format, if possible (page 103) option in the Annotations preferences page. When this option is deselected, the annotations are converted and displayed as plain text and if the annotation contains one or more HTML tags (`p`, `br`, `ul`, `li`), they are rendered as an HTML document loaded in a web browser. For example, `p` begins a new paragraph, `br` breaks the current line, `ul` encloses a list of items, and `li` encloses an item of the list.
Collecting Annotations from XML Schemas

In an XML Schema, the annotations are specified in an `<xs:annotation>` element like this:

```xml
<xs:annotation>
  <xs:documentation>
    Description of the element.
  </xs:documentation>
</xs:annotation>
```

If an element or attribute does not have a specific annotation, then Oxygen XML Editor plugin looks for an annotation in the type definition of that element or attribute.

Collecting Annotations from Relax NG Schemas

For Relax NG schema, element and attribute annotations are made using the `<documentation>` element from the `http://relaxng.org/ns/compatibility/annotations/1.0` namespace like this:

```xml
<define name="person">
  <element name="person">
    <a:documentation xmlns:a="http://relaxng.org/ns/compatibility/annotations/1.0">
      Information about a person.
    </a:documentation>
    <ref name="name"/>
    <zeroOrMore>
      <ref name="email"/>
    </zeroOrMore>
  </element>
</define>
```

However, any element outside the Relax NG namespace (`http://relaxng.org/ns/structure/1.0`) is handled as annotation and the text content is displayed in the annotation window. To activate this behavior, select the **Use all Relax NG annotations as documentation** (page 104) option in the Annotations preferences page.

Collecting Annotations from Relax NG Compact Syntax Schemas

For Relax NG Compact Syntax schema, annotations are made using comments like this:

```xml
## Information about a person.
element person { name, email*}
```
Collecting Annotation from DTDs

For DTD, Oxygen XML Editor plugin defines a custom mechanism for annotations using comments enabled by the **Prefer DTD comments that start with "doc:" as annotations** (page 103) option in the **Annotations** preferences page. The following is an example of a DTD annotation:

```xml
<!--doc:Description of the element. -->
```

Content Completion Helper Views

Information about the current element being edited is also available in various **dockable** (page 2705) views, such as the **Model view** (page 263), **Attributes view** (page 261), **Elements view** (page 265), and **Entities view** (page 266). By default, they are located on the right-hand side of the main editor window. These views, along with the powerful **Outline view** (page 257), provide spatial and insight information about the edited document and the current element. If any particular view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Model View

The **Model** view presents the structure of the currently selected tag, and its documentation, defined as annotation in the schema of the current document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

*Figure 231: Model View*
The Model view is comprised of two sections, an element structure panel and an annotations panel.

**Element Structure Panel**

The element structure panel displays the structure of the currently edited or selected tag in a tree-like format. The information includes the name, model, and attributes of the current tag. The allowed attributes are shown along with imposed restrictions, if any.

*Figure 232: Element Structure Panel*
Annotation Panel

The Annotation panel displays the annotation information for the currently selected element. This information is collected from the XML schema.

Figure 233: Annotation panel

Attributes View in Text Mode

The Attributes view presents all the attributes of the current element determined by the schema of the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the Window > Show View menu.

You can use the Attributes view to insert attributes, edit their values, or add values to existing attributes.

The attributes are rendered differently depending on their state:

- The names of the attributes are rendered with a bold font, and their values with a plain font.
- Default values are rendered with a plain font, painted gray.
- Empty values display the text "[empty]", painted gray.
- Invalid attributes and values are painted red.
To edit the value of the corresponding attribute, double-click a cell in the **Value** column. If the possible values of the attribute are specified as `list` in the schema of the edited document, the **Value** column acts as a combo box that allows you to either select the value from a list or manually enter it.

You can sort the attributes table by clicking the **Attribute** column header. The table contents can be sorted as follows:

- By attribute name in ascending order.
- By attribute name in descending order.
- Custom order, where the used attributes are displayed at the beginning of the table sorted in ascending order, followed by the rest of the allowed elements sorted in ascending order.

**Figure 234: Attributes View**

![Attributes View](image)

**Contextual Menu Actions in the Attributes View**

The following actions are available in the contextual menu of the **Attributes** view when editing in **Text** mode:

**Add**

Allows you to insert a new attribute. Adding an attribute that is not in the list of all defined attributes is not possible when the **Allow only insertion of valid elements and attributes** (page 128) schema-aware option is selected.

**Set empty value**

Specifies the current attribute value as empty.

**Remove**

Removes the attribute (action available only if the attribute is specified). You can invoke this action by pressing the **Delete** or **Backspace** keys.
Copy

Copies the `attrName="attrValue"` pair to the clipboard. The `attrValue` can be:

- The value of the attribute.
- The value of the default attribute, if the attribute does not appear in the edited document.
- Empty, if the attribute does not appear in the edited document and has no default value set.

Paste

Depending on the content of the clipboard, the following cases are possible:

- If the clipboard contains an attribute and its value, both of them are introduced in the Attributes view. The attribute is selected and its value is changed if they exist in the Attributes view.
- If the clipboard contains an attribute name with an empty value, the attribute is introduced in the Attributes view and you can start editing it. The attribute is selected and you can start editing it if it exists in the Attributes view.
- If the clipboard only contains text, the value of the selected attribute is modified.

Elements View in Text Mode

The Elements view presents a list of all defined elements that are valid at the current cursor position according to the schema associated to the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

Double-clicking any of the listed elements inserts that element into the edited document, at the current cursor position. Pressing F2 with an element selected will display information about that particular element.

Figure 235: Elements View in Text Mode
Entities View

Entities provide abbreviated entries that can be used in XML files when there is a need of repeatedly inserting certain characters or large blocks of information. An entity is defined using the ENTITY statement either in the DOCTYPE declaration or in a DTD file associated with the current XML file.

There are three types of entities:

- **Predefined** - Entities that are part of the predefined XML markup (`, ` , `&`, `&apos; , `&quot; ).
- **Internal** - Defined in the DOCTYPE declaration header of the current XML.
- **External** - Defined in an external DTD module included in the DTD referenced in the XML DOCTYPE declaration.

**Note:** If you want to add internal entities, you would need to switch to the Text editing mode and manually modify the DOCTYPE declaration. If you want to add external entities, you need to open the DTD module file and modify it directly.

The Entities view displays a list with all entities declared in the current document, as well as built-in ones. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

Double-clicking one of the entities will insert it at the current cursor position in the XML document. You can also sort entities by name and value by clicking the column headers.

*Figure 236: Entities View*
The view features a filtering capability that allows you to search an entity by name, value, or both. Also, you can choose to display the internal or external entities.

Note: When entering filters, you can use the ? and * wildcards. Also, you can enter multiple filters by separating them with a comma.

Code Templates

Code templates are code fragments that can be inserted quickly at the current editing position. Oxygen XML Editor plugin includes a set of built-in code templates for CSS, Schematron, XSL, XQuery, JSON, and XML Schema document types. You can also define your own code templates for any type of file and share them with others.

Code templates are displayed with a : template symbol in the content completion list (Enter in Author mode or Ctrl + Space (Command + Space on OS X) in Text mode). Also, in Text mode you can press Ctrl + Shift + Space to see a complete list of the available code templates. To enter the code template at the cursor position, select it from the content completion list or type its code and press Enter. If a shortcut key has been assigned to the code template, you can also use the shortcut key to enter it.

How to Create Code Templates

To create a code template, follow these steps:

1. Open the Preferences dialog box (page 55) and go to Editor > Templates > Code Templates.
2. Click New to open a code template configuration dialog box.
Tip: You can use one of the existing code templates as a starting point by selecting that template and clicking Duplicate.

Figure 237: Code Template Configuration Dialog Box

3. Configure your template using the fields in the code template configuration dialog box:
   - **Name** - The name of the code template.
   - **Description** - [Optional] The description of the code template that will appear in the Code Templates preferences page and in the tooltip message when selecting it from the Content Completion Assistant (page 2704). HTML markup can be used for better rendering.
   - **Associate with** - You can choose to set the code template to be associated with a specific type of editor or for all editor types.
   - **Shortcut key** - [Optional] If you want to assign a shortcut key that can be used to insert the code template, place the cursor in the Shortcut key field and press the desired key combination on your keyboard. Use the Clear button if you make a mistake. If the Enable platform-independent shortcut keys checkbox is selected, the shortcut is platform-independent and the following modifiers are used:
     - M1 represents the Command key on MacOS X, and the Ctrl key on other platforms.
     - M2 represents the Shift key.
     - M3 represents the Option key on MacOS X, and the Alt key on other platforms.
     - M4 represents the Ctrl key on MacOS X, and is undefined on other platforms.
   - **Content** - Text box where you define the content that is used when the code template is inserted. An editor variable (page 201) can be inserted in the text box using the Insert Editor Variables button.

4. Click OK to save your new code template.

Result: Your code template can now be selected using the Content Completion Assistant (page 2704) (Enter in Author mode or Ctrl + Space (Command + Space on OS X) in Text mode). The code templates are displayed with a .ai symbol.
How to Share Code Templates

There are two ways to easily share all of your code templates with other members of your team:

Method 1: Export/Import

1. Open the Preferences dialog box (page 55) and go to Editor > Templates > Code Templates.
2. Click the Export button to export all of your code templates into an XML file.
3. Save the XML file.
4. Share the XML file with other members of your team.
5. Instruct them to open the Preferences dialog box (page 55), go to Editor > Templates > Code Templates, click the Import button, and select the file you sent them.

Result: The code templates will be now available in their content completion list.

Method 2: Share Project

1. Open the Preferences dialog box (page 55) and go to Editor > Templates > Code Templates.
2. Select Project Options at the bottom of the dialog box. This stores the preferences in the project file (.xpr).
3. Share the project file with the other members of your team. For example, you can commit it to your version control system and have them update their working copy.

Result: When they open the updated project file in their Navigator view (page 250), the code templates will be available in their content completion list.

Tip: It is also possible to configure certain actions that function similar to code templates and add them to the content completion list (page 2067) for a particular framework. You could then share the whole framework (page 2086) with other members of your team.

Syntax Highlighting in XML Documents

Oxygen XML Editor plugin supports syntax highlighting in Text mode to make it easier to read the semantics of the structured content by displaying each type of code in different colors and fonts.

To customize the colors or styles used for the syntax highlighting colors for XML files, follow these steps:

1. Open the Preferences dialog box (page 55).
2. Go to Editor > Syntax Highlight (page 149).
3. Select and expand the XML section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.
5. Select the XML tab in the Preview pane to see the effects of your changes.

**Tip:** Oxygen XML Editor plugin also allows you to specify syntax highlighting colors for specific XML elements and attributes with specific namespace prefixes. This can be done in the Editor > Syntax Highlight > Elements/Attributes by Prefix preferences page (page 150).

Related Information:
- Customize Syntax Highlight colors (page 149)

Outline View in Text Mode

The Outline view in Text mode displays a general tag overview of the currently edited XML Document. When you edit a document, the Outline view dynamically follows the changes that you make, displaying the node that you modify. This functionality gives you great insight on the location of your modifications in the current document. It also shows the correct hierarchical dependencies between elements. This makes it easy for you to be aware of the document structure and the way element tags are nested.

**Outline View Features**

The Outline view allows you to:

- Quickly navigate through the document by selecting nodes in the Outline tree.
- Insert or delete nodes using contextual menu actions.
- Move elements by dragging them to a new position in the tree structure.
- Highlight elements in the editor area. It is synchronized with the editor area, so when you make a selection in the editor area, the corresponding nodes are highlighted in the Outline view, and vice versa.
- View document errors, as they are highlighted in the Outline view. A tooltip also provides more information about the nature of the error when you hover over the faulted element.

**Outline View Interface**

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.
The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (such as * , ? ) and separate multiple patterns with commas.

It also includes a **View menu** in the top-right corner that presents a variety of options to help you filter the view even further.

**Drop and Drop Actions in the Outline View**

Entire XML elements can be moved or copied in the edited document using only the mouse in the **Outline** view with drag-and-drop operations. Several drag and drop actions are possible:

- If you drag an XML element in the **Outline** view and drop it on another node, then the dragged element will be moved after the drop target element.
- If you hold the mouse pointer over the drop target for a short time before the drop then the drop target element will be expanded first and the dragged element will be moved inside the drop target element after its opening tag.
- You can also drop an element before or after another element if you hold the mouse pointer towards the upper or lower part of the targeted element. A marker will indicate whether the drop will be performed before or after the target element.
- If you hold down the **(Ctrl (Command on OS X))** key after dragging, a copy operation will be performed instead of a move.

**Figure 238: Outline View in Text Mode**
Outline View Filters in Text Mode

The upper part of the Outline view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (such as *, ?, ) and separate multiple patterns with commas.

The following actions are available in the View menu of the Outline view when editing in Text mode:

**Filter returns exact matches**

The text filter of the Outline view returns only exact matches.

**Selection update on cursor move**

Controls the synchronization between Outline view and source document. The selection in the Outline view can be synchronized with the cursor moves or the changes in the editor. Selecting one of the components from the Outline view also selects the corresponding item in the source document.

**Flat presentation mode of the filtered results**

When active, the application flattens the filtered result elements to a single level.

**Show comments and processing instructions**

Show/hide comments and processing instructions in the Outline view.

**Show element name**

Show/hide element name.

**Show text**

Show/hide additional text content for the displayed elements.

**Show attributes**

Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from the Outline preferences panel (page 197).

**Configure displayed attributes**

Displays the XML Structured Outline preferences page (page 197).
Outline View Contextual Menu Actions in Text Mode

The following actions are available from the contextual menu in the Outline view in Text mode:

**Append Child**

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it as a child of the current element.

**Insert Before**

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it immediately before the current element, as a sibling.

**Insert After**

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it immediately after the current element, as a sibling.

**Edit Attributes**

Opens a dialog box that allows you to edit the attributes of the currently selected component.

**Toggle Comment**

Encloses the currently selected element in an XML comment, if the element is not already commented. If it is already commented, this action will remove the comment.

**Cut**

Cuts the currently selected component.

**Copy**

Copies the currently selected component.

**Paste**

Pastes the copied component.

**Delete**

Deletes the currently selected component.

**Expand All**

Expands the structure of a component in the Outline view.

**Collapse All**

Collapses the structure of all the component in the Outline view.

Formatting and Indenting XML Documents
Oxygen XML Editor creates XML documents using several edit modes (page 223). In Text mode (page 223), you as the author decide how the XML file is formatted and indented. In the other modes, and when you switch between modes, Oxygen XML Editor must decide how to format and indent the XML. Oxygen XML Editor will also format and indent your XML for you in Text mode if you use one of the Format and Indent options:

- **Document > Source > Format and Indent** - Formats and indents the whole document.
- **Document > Source > Indent Selection** - Indents the current selection (but does not add line breaks). This action is also available in the Source submenu of the contextual menu.
- **Document > Source > Format and Indent Element** - Formats and indents the current element (the inmost nested element that currently contains the cursor) and its child-elements. This action is also available in the Source submenu of the contextual menu.

A number of settings affect how Oxygen XML Editor formats and indents XML. Many of these settings have to do with how whitespace is handled.

**Significant and insignificant whitespace in XML**

XML documents are text files that describe complex documents. Some of the white space (spaces, tabs, line feeds, etc.) in the XML document belongs to the document it describes (such as the space between words in a paragraph) and some of it belongs to the XML document (such as a line break between two XML elements). Whitespace belonging to the XML file is called insignificant whitespace. The meaning of the XML would be the same if the insignificant whitespace were removed. Whitespace belonging to the document being described is called significant whitespace.

Knowing when whitespace is significant or insignificant is not always easy. For instance, a paragraph in an XML document might be laid out like this:

```xml
<p>NO Free man shall be taken or imprisoned, or be stripped of his Freedom, or Liberties, or free Customs, or be outlawed, or exiled, or any otherwise destroyed; nor will we not pass upon him, nor condemn him, but by lawful judgment of his Peers, or by the <xref href="http://en.wikipedia.org/wiki/Law_of_the_land" format="html" scope="external">Law of the land</xref>. We will sell to no man, we will not deny to any man either Justice or Right.</p>
```

By default, XML considers a single whitespace between words to be significant, and all other whitespace to be insignificant. The paragraph above could have been written on one line because the XML parser would see it as exactly the same paragraph since all multiple consecutive whitespaces
will be replaced with a single whitespace. Removing the insignificant space in markup like this is called *normalizing space*.

In some cases, all the spaces inside an element should be treated as significant. For example, in a code sample:

```xml
<codeblock>
class HelloWorld
{
    public static void main(String args[])
    {
        System.out.println("Hello World");
    }
}
</codeblock>
```

Here every whitespace character between the `codeblock` tags should be treated as significant.

**How Oxygen XML Editor plugin determines when whitespace is significant**

When Oxygen XML Editor plugin formats and indents an XML document, it introduces or removes insignificant whitespace to produce a layout with reasonable line lengths and elements indented to show their place in the hierarchy of the document. To correctly format and indent the XML source, Oxygen XML Editor plugin needs to know when to treat whitespace as significant and when to treat it as insignificant. However it is not always possible to tell this from the XML source file alone. To determine what whitespace is significant, Oxygen XML Editor plugin assigns each element in the document to one of four categories:

**Ignore space**

In the ignore space category, all whitespace is considered insignificant. This generally applies to content that consists only of elements nested inside other elements, with no text content.

**Normalize space**

In the normalize space category, a single whitespace character between character strings is considered significant and all other spaces are considered insignificant. Therefore, all consecutive whitespaces will be replaced with a single space. This generally applies to elements that contain text content only.

**Mixed content**
In the mixed content category, a single whitespace between text characters is considered significant and all other spaces are considered insignificant. However,

- Whitespace between two child elements embedded in the text is normalized to a single space (rather than to zero spaces as would normally be the case for a text node with only whitespace characters, or the space between elements generally).
- The lack of whitespace between a child element embedded in the text and either adjacent text or another child element is considered significant. That is, no whitespace can be introduced here when formatting and indenting the file.

For example:

```xml
<p>
The file is located in <i>HOME</i>/USER/hello. This is a <strong>big</strong> deal.</emphasis>
</p>
```

In this example, whitespace should not be introduced around the i tags as it would introduce extra significant whitespace into the document. The space between the end <strong>tag and the beginning <emphasis>tag should be normalized to a single space, not zero spaces.

Preserve space

In the preserve space category, all whitespace in the element is regarded as significant. No changes are made to the spaces in elements in this category. However, child elements may be in another category, and may be treated differently.

Attribute values are always in the preserve space category. The spaces between attributes in an element tag are always in the default space category.

Oxygen XML Editor plugin consults several pieces of information to assign an element to one of these categories. An element is always assigned to the most restrictive category (from Ignore to Preserve) that it is assigned to by any of the sources Oxygen XML Editor plugin consults. For instance, if the element is named on the Default elements list (as described below) but it has an xml:space="preserve" attribute in the source file, it will be assigned to the preserve space category. If an element has the xml:space="default" attribute in the source, but is listed on the Mixed content elements list, it will be assigned to the mixed content category.

To assign elements to these categories, Oxygen XML Editor plugin consults information from the following sources:
xml:space

If the XML element contains the `xml:space` attribute, the element is promoted to the appropriate category based on the value of the attribute.

CSS whitespace property

If the CSS stylesheet controlling the Author mode editor applies the `whitespace: pre` setting to an element, it is promoted to the preserve space category.

CSS display property

If a text node contains only white-spaces:

- If the node has a parent element with the CSS `display` property set to `inline` then the node is promoted to the mixed content category.
- If the left or right sibling is an element with the CSS `display` property set to `inline` then the node is promoted to the mixed content category.
- If one of its ancestors is an element with the CSS `display` property set to `table` then the node is assigned to the ignore space category.

Schema aware formatting

If a schema is available for the XML document, Oxygen XML Editor plugin can use information from the schema to promote the element to the appropriate category. For example:

- If the schema declares an element to be of type `xs:string`, the element will be promoted to the preserve space category because the string built-in type has the whitespace facet with the value `preserve`.
- If the schema declares an element to be mixed content, it will be promoted to the mixed content category.

Schema aware formatting can be turned on and off.

- To turn it on or off for Author mode, open the Preferences dialog box (page 55), go to Editor > Edit modes > Author > Schema aware, and select/deselect the Schema aware normalization, format and indent option (page 128).
- To turn it on or off for the Text editing mode, open the Preferences dialog box (page 55), go to Editor > Format > XML, and select/deselect the Schema aware format and indent option (page 142).

Preserve space elements list
If an element is listed in the **Preserve space** tab of the **Element Spacing** list (page 141) in the XML formatting preferences (page 139), it is promoted to the preserve space category.

**Default space elements list**

If an element is listed in the **Default space** tab of the **Element Spacing** list (page 141) in the XML formatting preferences (page 139), it is promoted to the default space category.

**Mixed content elements list**

If an element is listed in the **Mixed content** tab of the **Element Spacing** list (page 141) in the XML formatting preferences (page 139), it is promoted to the mixed content category.

**Element content**

If an element contains mixed content, that is, a mix of text and other elements, it is promoted to the mixed content category. (Note that, in accordance with these rules, this happens even if the schema declares the element to have element only content.)

If an element contains text content, it is promoted to the default space category.

**Text node content**

If a text node contains any non-whitespace characters then the text node is promoted to the normalize space category.

**Exception to the Rule**

In general, an element can only be promoted to a more restrictive category (one that treats more whitespace as significant). However, there is one exception. In **Author** mode, if an element is marked as mixed content in the schema, but the actual element contains no text content, it can be demoted to the space ignore category if all of its child elements are displayed as *blocks* by the associated CSS (that is, they have a CSS property of `display: block`). For example, in some schemas, a section or a table entry can be defined as having mixed content but in many cases they contain only *block elements* (page 2703). In these cases, any whitespace they contain cannot be significant and they can be treated as space ignore elements. This exception can be turned on or off using the **Schema Aware Editing** option (page 128) in the Schema-Aware preferences page.

**How Oxygen XML Editor plugin formats and indents XML**

You can control how Oxygen XML Editor plugin formats and indents XML documents. This can be particularly important if you store your XML document in a version control system, as it allows you to
Oxygen XML Editor plugin formats and indents XML

Oxygen XML Editor plugin formats and indents a document, or part of it, on the following occasions:

- In Text mode when you select one of the format and indent actions (Document > Source > Format and Indent, Document > Source > Indent Selection, or Document > Source > Format and Indent Element).
- When saving documents in Author mode.
- When switching from Author mode to another mode.
- When saving documents in Design mode.
- When switching from Design mode to another mode.
- When saving or switching to Text mode from Grid mode, if the Format and indent when passing from grid to text or on save option (page 132) is selected in the Grid preferences page.

Setting an Indent Size to Zero

Oxygen XML Editor plugin will automatically format and indent (page 645) documents at certain times. This includes indenting the content from the margin to reflect its structure. In some cases, you may not want your content indented. To avoid your content being indented, you can set an indent size of zero.

⚠️ Note: Changing the indent size does not override the rules that Oxygen XML Editor plugin uses for handling whitespace when formatting and indenting XML documents. Therefore, changing the indent size will have no effect on elements that require whitespaces to be maintained.

There are two cases to consider.

Maintaining zero indent in documents with zero indent

If you have existing documents with zero indent and you want Oxygen XML Editor plugin to maintain a zero indent when editing or formatting those documents:

1. Open the Preferences dialog box (page 55) and go to Editor > Format (page 135).
2. Select Detect indent on open.
3. Select **Use zero-indent if detected**.

Oxygen XML Editor plugin will examine the indent of each document as it is opened and if the indent is zero for all lines, or for nearly all lines, a zero indent will be used when formatting and indenting the document. Otherwise, Oxygen XML Editor plugin will use the indent closest to what it detects in the document.

**Enforcing zero indent for all documents**

If you want all documents to be formatted with zero indent, regardless of their current indenting:

1. Open the **Preferences** dialog box (page 55) and go to Editor > **Format** (page 135).
2. Deselect **Detect indent on open**.
3. Set **Indent size** to 0.

All documents will be formatted and indented with an indent of zero.

**Warning:** Setting the indent size to zero can change the meaning of some file types, such as Python source files.

**Format and Indent (Pretty-Print) Multiple Files**

Oxygen XML Editor plugin provides support for formatting and indenting (**pretty-print** (page 2709)) multiple files at once. This action is available for any document in XML format, as well as for XQuery, CSS, JavaScript, and JSON documents.

To format and indent multiple files, use the **Format and Indent Files** action that is available in the contextual menu of the **Navigator view** (page 250). This opens the **Format and Indent Files** dialog box that allows you to configure options for the action.

*Figure 239: Format and Indent Files Dialog Box*
The **Scope** section allows you choose from the following scopes:

- **All opened files** - The pretty-print ([page 2709](#)) is performed in all opened files.
- **Directory of the current file** - All the files in the folder of the current edited file.
- **Project files** - All files from the current project.
- **Selected project files** - The selected files from the current project.
- **Specified path** - the pretty-print ([page 2709](#)) is performed in the files located at a specified path.

The **Options** section includes the following options:

- **File filter** - Allow you to filter the files from the selected scope.
- **Recurse subdirectories** - When selected, the pretty-print ([page 2709](#)) is performed recursively for the specified scope. The one exception is that this option is ignored if the scope is set to **All opened files**.
- **Include hidden files** - When selected, the pretty-print ([page 2709](#)) is also performed in the hidden files.
- **Make backup files with extension** - When selected, Oxygen XML Editor plugin makes backup files of the modified files. The default extension is `.bak`, but you can change the extension as you prefer.

**Quick Assist Support for IDs and IDREFS**

The **Quick Assist support** ([page 2710](#)) is activated automatically when you place the cursor inside an ID or IDREF in **Text** mode. To access it, click the yellow bulb help marker placed on the current line, in the line number stripe of the editor. You can also invoke the **Quick Assist** menu from the contextual menu or by pressing **Ctrl+1** (**Command+1** on Mac OS X) on your keyboard.
The following actions are available:

**Rename in**

Renames the ID and all its occurrences. Selecting this action opens the **Rename XML ID** dialog box. This dialog box lets you insert the new ID value and choose the scope of the rename operation (page 904). For a preview of the changes you are about to make, click **Preview**. This opens the **Preview** dialog box, which presents a list with the files that contain changes and a preview zone of these changes.

**Search Declarations**

Searches for the declaration of the ID reference. By default, the scope of this action is the current project. If you configure a scope using the **Select the scope for the Search and Refactor operations** (page 904) dialog box, this scope will be used instead.

**Search References**

Searches for the references of the ID. By default, the scope of this action is the current project. If you configure a scope using the **Select the scope for the Search and Refactor operations** (page 904) dialog box, this scope will be used instead.

**Change scope**

Opens the **Select the scope for the Search and Refactor operations** (page 904) dialog box.

**Rename in File**

Renames the ID you are editing and all its occurrences from the current file.

**Search Occurrences**

Searches for the declaration an references of the ID located at the cursor position in the current document.

### Related Information:

**Highlight ID Occurrences in Text Mode**

To see the occurrences of an ID in an XML document in the **Text** mode, place the cursor inside the ID declaration or reference. The occurrences are marked in the vertical side bar at the right of the editor. Click a marker on the side bar to jump to the occurrence that it corresponds to. The occurrences are also highlighted in the editing area.
Note: Highlighted ID declarations are rendered with a different color than highlighted ID references. To customize these colors or disable this feature, open the Preferences dialog box (page 55) and go to Editor > Mark Occurrences (page 144).

Contextual Menu Actions in Text Mode

When editing XML documents in Text mode, Oxygen XML Editor plugin provides the following actions in the contextual menu (many of them also appear in the submenus of the Document menu):

- **Cut, Copy, Paste**
  
  Executes the typical editing actions on the currently selected content.

- **Copy XPath**
  
  Copies the XPath expression of the current element or attribute (or property for JSON documents) from the current editor to the clipboard.

- **Toggle Comment (Ctrl + Shift + Comma (Command + Shift + Comma on OS X))**
  
  Comments the current selection of the current editor. If the selection already contains a comment the action removes the comment from around the selection. If there is no selection in the current editor and the cursor is not positioned inside a comment the current line is commented. If the cursor is positioned inside a comment then the commented text is uncommented.

- **Go to submenu**
  
  This submenu includes the following actions:

  - **Go to Matching Tag (Ctrl + Shift + G)**
    
    Moves the cursor to the end tag that matches the start tag, or vice versa.

  - **Go after Next Tag (Ctrl + CloseBracket (Command + CloseBracket on OS X))**
    
    Moves the cursor to the end of the next tag.

  - **Go after Previous Tag (Ctrl + OpenBracket (Command + OpenBracket on OS X))**
    
    Moves the cursor to the end of the previous tag.

- **Select submenu**

  This submenu allows you to select the following:

  - **Element**
Selects the entire element at the current cursor position.

**Content**

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

**Attributes**

Selects all the attributes of the element at the current cursor position.

**Parent**

Selects the parent element at the current cursor position.

**Source submenu**

This submenu includes the following actions:

- **Shift Right**
  Shifts the currently selected block to the right.

- **Shift Left**
  Shifts the currently selected block to the left.

- **Indent selection (Ctrl + I (Command + I on OS X))**
  Corrects the indentation of the selected block of lines if it does not follow the current indenting preferences (page 135).

- **Escape Selection**
  Escapes a range of characters by replacing them with the corresponding character entities.

- **Unescape Selection**
  Replaces the character entities with the corresponding characters.

- **Format and Indent Element (Ctrl + Shift + I (Command + Shift + I on OS X))**
  Pretty-prints (page 2709) the element that surrounds the current cursor position.

- **Convert Hexadecimal Sequence to Character (Ctrl + Shift + H (Command + Shift + H on OS X))**
  Converts a sequence of hexadecimal characters to the corresponding Unicode character (page 602). The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor
is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the 0x or 0X prefix. Examples of valid sequences and the characters they will be converted to:

- 0x0045 will be converted to E
- 0X0125 to 
- 265 to 
- 2190 to 

Note: For more information about finding the hexadecimal value of a character, see Finding the Decimal, Hexadecimal, or Character Entity Equivalent (page 609).

Base64 Encode/Decode submenu

This submenu include the following actions for encoding or decoding base 64 schemes:

Import File to Encode and Insert

Encodes a file and then inserts the encoded content into the current document at the cursor position.

Decode Selection and Export to File

Decodes a selection of text from the current document and then exports (saves) the result to another file.

Encode Selection

Replaces a selection of text with the result of encoding that selection.

Decode Selection

Replaces a selection of text with the result of decoding that selection.

Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is
displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

**Base32 Encode/Decode submenu**

This submenu include the following actions for encoding or decoding **base32** schemes:

- **Import File to Encode and Insert**
  
  Encodes a file and then inserts the encoded content into the current document at the cursor position.

- **Decode Selection and Export to File**
  
  Decodes a selection of text from the current document and then exports (saves) the result to another file.

- **Encode Selection**
  
  Replaces a selection of text with the result of encoding that selection.

- **Decode Selection**
  
  Replaces a selection of text with the result of decoding that selection.

- **Modify All Matches**
  
  Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

**Hex Encode/Decode submenu**

This submenu include the following actions for encoding or decoding **hex** schemes:

- **Import File to Encode and Insert**
  
  Encodes a file and then inserts the encoded content into the current document at the cursor position.

- **Decode Selection and Export to File**
Decodes a selection of text from the current document and then exports (saves) the result to another file.

**Encode Selection**

Replaces a selection of text with the result of encoding that selection.

**Decode Selection**

Replaces a selection of text with the result of decoding that selection.

**Modify All Matches**

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

**Join and Normalize Lines**

For the current selection, this action joins the lines by replacing the line separator with a single space character. It also normalizes the whitespaces by replacing a sequence of such characters with a single space.

**Insert XInclude**

Displays a dialog box that allows you to browse and select the content to be included and automatically generates the corresponding XInclude instruction.

*Note:* In the Author mode, this dialog box presents a preview of the inserted document as an author page in the Preview tab and as a text page in the Source tab. In the Text mode, the Source tab is presented.

**Import entities list**

Displays a dialog box that allows you to select a list of files as sources for external DTD entities. The internal subset of the DOCTYPE declaration of your document will be updated with the chosen entities. For instance, choosing the files `chapter1.xml` and `chapter2.xml` inserts the following section in the DOCTYPE:
Canonicalize

Opens the Canonicalize dialog box that allows you to select a canonicalization (page 2704) algorithm to standardize the format of the document.

Sign

Opens the Sign dialog box that allows you to configure a digital signature for the document.

Verify Signature

Allows you to specify the location of a file to verify its digital signature.

Manage Highlighted Content submenu

This submenu is available from the contextual menu when it is invoked from a highlight after you perform a search operation or apply an XPath expression that highlights more than one result. The following options are available in this submenu:

Modify All

Allows you to modify (in-place) all the occurrences of the selected content. A thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Surround All

Surround the highlighted content with a specific tag. This option opens the Tag dialog box. The Specify the tag drop-down menu presents all the available elements that you can choose from.

Remove All

Removes all the highlighted content.

Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Go to Definition (Ctrl + Shift + Enter)
Navigates to the definition of the current element or attribute in the schema (DTD, XML Schema, Relax NG schema) associated with the edited XML document. If the current attribute is a "type" belonging to the "http://www.w3.org/2001/XMLSchema-instance" namespace, the cursor is moved in the XML schema to the definition of the type referenced in the value of the attribute. For JSON documents, it navigates to the definition of the current JSON property in the associated JSON Schema.

Refactoring submenu

This submenu includes the following actions:

- **Rename Element**
  The element from the cursor position, and any elements with the same name, can be renamed according with the options from the Rename dialog box.

- **Rename Prefix (Alt + Shift + P (Command + Shift + P on OS X))**
  The prefix of the element from the cursor position, and any elements with the same prefix, can be renamed according with the options from the Rename dialog box.
  
  - If you select the **Rename current element prefix** option, the application will recursively traverse the current element and all its children. For example, to change the `xmlns:p1="ns1"` association in the current element to `xmlns:p5="ns1"`, if the `xmlns:p1="ns1"` association is applied on the parent element, then Oxygen XML Editor plugin will introduce `xmlns:p5="ns1"` as a new declaration in the current element and will change the prefix from `p1` to `p5`. If `p5` is already associated with another namespace in the current element, then the conflict will be displayed in a dialog box. By pressing OK, the prefix is modified from `p1` to `p5` without inserting a new declaration.
  
  - If you select the **Rename current prefix in all document** option, the application will apply the change on the entire document.
  
  - To also apply the action inside attribute values, select the **Rename also attribute values that start with the same prefix** checkbox.

- **Surround with Tags (Alt + Shift + E)**
  Allows you to choose a tag that encloses a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.
• If the **Position cursor between tags** option (page 101) is selected in the **Content Completion** preferences page, the cursor is placed between the start and end tag.

• If the **Position cursor between tags** option (page 101) is not selected in the **Content Completion** preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

**Surround with `[tag]` (Alt + Shift + ForwardSlash)**

Surround the selected content with the last tag used.

**Surround with `<![CDATA]]>` (Alt + Shift + C (Command + Alt + C on OS X))**

Surround the selected content with a **CDATA** tag so that the parser will interpret it as textual data rather than markup.

**Delete element tags (Alt + Shift + Comma)**

Deletes the start and end tag of the current element.

**Split element**

Split the element from the cursor position into two identical elements. The cursor must be inside the element.

**Join elements (Alt + Shift + F (Command + Alt + F on OS X))**

Joins the left and right elements relative to the current cursor position. The elements must have the same name, attributes, and attributes values.

**Attributes Refactoring Actions**

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

**Add/Change attribute**

Allows you to change the value of an attribute or insert a new one.

**Convert attribute to element**

Allows you to change an attribute into an element.

**Delete attribute**

Allows you to remove one or more attributes.

**Rename attribute**

Allows you to rename an attribute.

**Replace in attribute value**
Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

**Comments Refactoring Actions**

Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

**Delete comments**

Allows you to delete comments found inside one or more elements.

**Elements Refactoring Actions**

Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

**Delete element**

Allows you to delete elements.

**Delete element content**

Allows you to delete the content of elements.

**Insert element**

Allows you to insert new elements.

**Rename element**

Allows you to rename elements.

**Unwrap element**

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

**Wrap element**

Allows you to surround elements with element tags.

**Wrap element content**

Allows you to surround the content of elements with element tags.

**Fragments Refactoring Actions**

Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.
Insert XML fragment

Allows you to insert an XML fragment.

Replace element content with XML fragment

Allows you to replace the content of elements with an XML fragment.

Replace element with XML fragment

Allows you to replace elements with an XML fragment.

Manage IDs submenu

This submenu is available for XML documents that have an associated DTD, XML Schema, or Relax NG schema (not available for DITA). It includes the following actions:

- Rename in
  Renames the ID and all its occurrences. Selecting this action opens the Rename XML ID dialog box. This dialog box lets you insert the new ID value and choose the scope of the rename operation (page 904). For a preview of the changes you are about to make, click Preview. This opens the Preview dialog box, which presents a list with the files that contain changes and a preview zone of these changes.

- Rename in File
  Renames the ID you are editing and all its occurrences from the current file.

- Search References
  Searches for the references of the ID. By default, the scope of this action is the current project. If you configure a scope using the Select the scope for the Search and Refactor operations (page 904) dialog box, this scope will be used instead.

- Search References in
  Searches for the references of the ID. Selecting this action opens the Select the scope for the Search and Refactor operations (page 904).

- Search Declarations
  Searches for the declaration of the ID reference. By default, the scope of this action is the current project. If you configure a scope using the Select the scope for the Search and Refactor operations (page 904) dialog box, this scope will be used instead.
Search Declarations in

Searches for the declaration of the ID reference. Selecting this action opens the Select the scope for the Search and Refactor operations (page 904).

Search Occurrences in file

Searches for the declaration and references of the ID in the current document.

Quick Assist (Ctrl + 1 (Command + 1 on OS X))

Available when the cursor is inside an ID or IDREF, this action opens the Quick Assist (page 2710) window that allows you to select some search and refactoring actions for the selected ID or IDREF.

Open File at Cursor

Opens the file at the cursor position in a new panel. If the file path represents a directory path, it will be opened in system file browser. If the file at the specified location does not exist, an error dialog box is displayed and it includes a Create new file button that starts the New document wizard. This allows you to choose the type or the template for the file. If the action succeeds, the file is created with the referenced location and name and is opened in a new editor panel.

Resource Hierarchy

Opens the Resource Hierarchy/Dependencies view (page 904) that allows you to see the resource hierarchy for an XML document.

Resource Dependencies

Opens the Resource Hierarchy/Dependencies view (page 904) that allows you to see the resource dependencies for an XML document.

Editing XML Documents in Grid Mode

The Grid mode in Oxygen XML Editor plugin displays the XML document as a structured grid of nested tables where the text content can be modified without directly interacting with the XML markup. This is helpful for non-technical users who want to edit text content without modifying the XML markup. You can easily expand or collapse elements within the table and the document structure can be changed with simple contextual menu actions, drag/drop, or copy/paste operations. The text content can be modified simply by editing the value of cells that contain the text and a useful Content Completion Assistant (page 2704) is also available to help you edit or insert XML elements.

To switch to this mode, select Grid at the bottom of the editing area.
For more information about some of the features available in the Grid editor, watch our video demonstration:

https://www.youtube.com/embed/PoYm2VqisWk

Editing Actions in Grid Mode

Since Grid mode presents XML content in a structured grid of nested tables, editing content in this mode can be done with a combination of the Content Completion Assistant (page 671) and actions that allow you to work with the structure or content of the nested tables much like you would with any table. Oxygen XML Editor plugin provides ways to edit content in the cells of the nested tables or to edit the structure of the tables.

Tip: There are two different types of layouts available in Grid mode. Most people prefer to leave it on the default Grid mode layout, but there is also a Tree mode layout that presents the structure of the document in more of a vertical tree-like manner. You can switch between the two layouts to see which one works best for you particular situation from the Document > Grid Layout menu.

Expanding/Collapsing Nodes

An arrow sign (▼) displayed at the left of a node indicates that it has child nodes. To display the children, click this arrow sign. To collapse a node, click the reverse arrow sign (▲). The expand/collapse actions can also be invoked with the NumPad+ and NumPad- keys, or from the Expand/Collapse submenu of the contextual menu.

To expand all child nodes, right-click the cell that contains the parent node and select Expand All from the Expand/Collapse submenu. To collapse all node, right-click any cell and select Collapse All from the Expand/Collapse submenu.

Editing Elements or Attributes

To edit elements or attributes in Grid mode, simply double-click the cell that contains the element or attribute (or select the cell and press Enter) to invoke the Content Completion Assistant (page 671). This opens a pop-up window that offers a list of proposals that are valid for that particular node.

Editing Text Content in Cells

To edit the text value of a cell, simply select the grid cell and press Enter (or double-click the cell), and start editing.
To stop editing a cell value, press **Enter** again.

To cancel the editing without saving the current changes in the document, press the **Esc** key.

**Editing the Structure of the Nested Tables**

To edit the structure of the nested tables in Grid mode, Oxygen XML Editor plugin provides the following actions in the contextual menu (many of them also appear in the submenus of the Document menu, or the toolbar):

- **Cut**, **Copy**, **Paste**, **Delete** common editing actions
  - Executes the typical editing actions on the currently selected elements. The **Cut** and **Copy** operations preserve the styles of the copied content.

- **Paste as Child**
  - Pastes the copied content as the last child of the current selection.

- **Duplicate**
  - Creates a new node by duplicating the currently selected one.

- **Insert Before**
  - Offers a list of valid nodes, depending on the context, and inserts your selection before the currently selected node, as a sibling.

- **Insert After**
  - Offers a list of valid nodes, depending on the context, and inserts your selection after the currently selected node, as a sibling.

- **Append Child**
  - Offers a list of valid nodes, depending on the context, and appends your selection as a child of the currently selected node.

- **Sort Ascending**, **Sort Descending**
  - The sorting result depends on the data type of the column content. It could be a numerical sorting for numbers or an alphabetical sorting for text information. The editor automatically analyzes the content and decides what type of sorting to apply. When a mixed set of values is present in the sorted column, a dialog box is displayed that allows you to choose the desired type of sorting between **numerical** and **alphabetical**.

- **Insert Row**
  - Inserts a new row below the current selection. To insert a new row, you could also select the row header (the zone to the left of the row that holds the row number) and press **Enter**.
Insert Column
Inserts a column after the current selection.

Clear Content
Removes all content from the current cell.

Expand/Collapse > Expand All
Expands the selection and all its children.

Expand/Collapse > Collapse All
Collapses the selection and all its children.

Expand/Collapse > Expand Children
Expands all the children of the selection but not the selection.

Expand/Collapse > Collapse Children
Collapses all the children of the selection but not the selection.

Expand/Collapse > Collapse Others
Collapses all the siblings of the current selection but not the selection.

Refresh Selected
Forces the layout to be recomputed.

- Drag and Drop in the Grid Editing Mode (page 668)
- Content Completion Assistant in Grid Mode (page 671)

Drag and Drop in the Grid Editing Mode

You can easily arrange sections in your XML document in the Grid mode by using drag and drop actions.

You can do the following with drag and drop:
• Copy or move a set of nodes.
• Change the order of columns in the tables.
• Move the rows from the tables.

These operations are available for both single and multiple selections. To deselect one of the selected fragments, use Ctrl + Single-Click (Command + Single-Click on OS X).

While dragging, the editor paints guide-lines showing the locations where you can drop the nodes. You can also drag nodes outside the Grid editor and text from other applications into the Grid.

Tip: When using drag and drop to reorganize the document, the resulting layout can be different from what you expected. For instance, the layout can contain a set of sibling tables that can be joined together. To force the layout to be recomputed, you can use the Refresh Selected action that is available in the contextual menu and in the Document > Grid Edit menu.

Copy and Paste in the Grid Editing Mode

Selecting content in the Grid mode is similar to working with any table with a little more complexity. Specifically, depending on the type of node, when you select a cell, the selection may automatically include additional cells that are implied by the currently selected node. For example, if you click a node that contains any child nodes, all cells that contain the parent and child nodes will be selected. In this case, the currently selected cell is painted with a color that is different from the rest of the selection.

You can also select discontinuous regions of nodes and place them in the clipboard with the copy action. To deselect one of the selected fragments, use Ctrl + Single-Click (Command + Single-Click on OS X).

Pasting Content Within Grid Mode

You can paste copied nodes relative to the currently selected cell using one of the following actions (available in the contextual menu):

- ![Paste](Ctrl + V (Command + V on OS X)) - Pastes copied content, as a sibling, just below (after) the current selection.
- Paste as Child - Pastes copied content as the last child of the current selection.

Pasting Content from Grid Mode to Other Editors

Nodes that are copied from the Grid editor can also be pasted into Text mode or other external applications. When pasting copied content from Grid mode, the inserted string represents the nodes
serialization. The nodes from tables can be copied using HTML or RTF in table format. The resulting cells contain only the concatenated values of the text nodes.

Figure 240: Copying from Grid to Other Editors

![Diagram showing copying from Grid to other editors]

Pasting Content from Other Editors into Grid Mode

You can also paste well-formed XML content or tab-separated values from other editors into the Grid editor. If you paste XML content, the result will be the insertion of the nodes obtained by parsing this content.

Figure 241: Pasting XML Data into Grid

![Diagram showing pasting XML data into Grid]

If the pasted text contains multiple lines of tab-separated values, it can be considered as a matrix of values. By pasting this matrix of values into the Grid editor, the result will be a matrix of cells. If the
operation is performed inside existing cells, the existing values will be overwritten and new cells will be created when needed.

**Figure 242: Pasting Tab-Separated Values into Grid**

If you need to add copied content to your existing content (rather than overwriting existing cells), you need to first insert new cells by using the **Insert row** or **Insert column** actions from the contextual menu. This is useful, for example, when trying to transfer data from spreadsheet-like editors to the **Grid** editor.

### Content Completion Assistant in Grid Mode

If the edited document is associated with a schema (DTD, XML Schema, Relax NG, etc.), the **Grid** editing mode offers a **Content Completion Assistant** (page 2704) for the names and values of elements and attributes. If you choose to insert an element that has required content, the sub-tree of needed elements and attributes are also automatically included.

To display the content completion pop-up menu, simply double-click a cell that contains an element or attribute (or press **Enter** on your keyboard).

**Figure 243: Content Completion in Grid Editing Mode**

### Exporting XML Content to Excel

For use-cases where you have XML content that needs to be exported to Excel (or any other spreadsheet application) but the content is not already in some sort of table format, **Grid** mode offers you a way to display the content of an XML document as a structured grid of nested tables and you can work with the cells in those tables much like you would with any spreadsheet application. This makes it possible to export content to Excel by copying cells that contain the specific content
and then pasting the copied cells in Excel the same as you would when working with any table or spreadsheet.

To export XML content from Grid mode to Excel or other spreadsheet applications, follow this procedure:

1. Open the XML document in Oxygen XML Editor plugin and switch to Grid mode.
2. Expand the nodes (page 666) to gain access to the particular nested table that contains the content you want to export.
3. Copy the cells that contain the content you want to export (Copy from the contextual menu or Ctrl+C).
4. Switch to your spreadsheet application and paste the copied cells.
5. You may need to make some manual adjustments depending on the complexity of the structure in the original XML document.

Note that Oxygen XML Editor plugin also supports the reverse scenario (copying cells from a spreadsheet application and pasting them in Grid mode). For more information, see Import from MS Excel Files – Grid Mode Method (page 1995).

**Editing XML Documents in Author Mode**

The **Author** editing mode in Oxygen XML Editor plugin allows you to visually edit XML documents in a user-friendly interface that is similar to a WYSIWYG word processor. This makes structured authoring easier for people who are not familiar with XML and it also provides easier access to the XML structure for XML experts. Oxygen XML Editor plugin provides support for visually editing the most commonly used XML vocabularies in Author mode, including DITA, DocBook, TEI, and XHTML.

Adding text content in **Author** mode is as simple as doing so in a standard text editor but the content is rendered similar to how you will see it in the output. Tables, images, and media objects (such as videos) are also rendered comparable to the output. You can even play audio and video objects
directly in **Author** mode and it includes an intuitive **Image Map Editor** *(page 805)*. You can easily change the rendering by selecting one of the preset **main styles** *(page 2707)* from the **Styles drop-down menu** *(page 2065)* (available on the toolbar) and combine multiple **alternate styles** *(page 2703)* that behave like layers. You can also use the options in the **Tags Display Mode** drop-down menu *(page 331)* to control how much XML markup is displayed in **Author** mode and there are various features and views that provide information about the XML structure based upon your current location within the document.

**Author** mode provides numerous helpful editing actions, many of which are specific to the type of document you are editing and it includes a variety of other powerful editing features, such as keyboard shortcuts, **drag and drop support** *(page 695)*, a **Smart Paste mechanism** *(page 696)*, and an **intelligent Content Completion Assistant** *(page 699)*. **Author** mode also allows you to visualize and manage profiled content *(page 746)*, you can collaborate with others with various review features *(page 719)* (such as the ability to add comments, track changes, or highlight content), and includes many other unique features.

To switch to this mode, click the **Author** button at the bottom of the editing area.

For more information about some of the features available in the visual **Author** editing mode, watch our video demonstration:

https://www.youtube.com/embed/bnQwJZD58wY

**Author Mode User Roles**

There are two main types of users for the **Author** mode: **framework developers** and **content authors**.

**Framework Developers**

A **framework developer** is a technical person with advanced XML knowledge who defines the **framework** *(page 2706)* for authoring XML documents in the visual editor. Once the **framework** is created or edited by the developer, it is distributed as a deliverable component ready to plug into the application for the content authors.

The **framework** (document type) configuration defines a type of XML document by specifying all the details needed for editing the content of XML documents in **Author** mode.

The **framework** details that are created and customized by the developer include:

- The CSS stylesheet that drives the visual rendering of the document.
- The rules for associating an XML schema with the document, which is needed for the content completion assistance and validation of the document.
- Transformation scenarios for the document.
• Configuration of *XML Catalogs* (page 2712).
• Custom actions available as buttons on the toolbar or in menus.

Oxygen XML Editor plugin includes some ready-to-use built-in document types for XML *frameworks*, such as DocBook, DITA, TEI, JATS, and XHTML.

**Content Authors**

A *content author* does not need to have advanced knowledge about XML markup, operations such as validation of XML documents, or applying XPath expressions to an XML document. The content author just uses the *framework* set up by the developer in the application and starts editing the content of XML documents without editing the XML tags directly.

Styling XML Documents in Author Mode

The **Author** mode renders the content of the XML documents visually, based on CSS stylesheets associated with the document.

**Selecting and Combining Multiple CSS Styles**

Oxygen XML Editor plugin provides a **Styles** drop-down menu on the toolbar that allows you to select one *main (non-alternate) CSS style* (page 2707) and multiple *alternate CSS styles* (page 2703). This makes it easy to change the look of the document as it appears in **Author** mode and the output without having to continually edit the CSS stylesheets.

**Tip:** For information about configuring the **Styles** drop-down menu, see *Configuring and Managing Multiple CSS Styles for a Framework* (page 2063).

You can select a *main CSS style* that applies to the whole document and then *alternate styles* that are applied as layers to specific parts of the document. For example, in the subsequent figure, a DITA document has the *Century* style selected for the *main CSS* and the *alternate styles* Full width, Show table column specification, Hints, and Inline actions are combined for additive styling to specific parts of the document.

The selections from the **Styles** drop-down menu are persistent, meaning that Oxygen XML Editor plugin will remember the selections when subsequent documents are opened.

*Figure 244: Styles Drop-down Menu in a DITA Document*
Navigating the Document Content in Author Mode

Oxygen XML Editor plugin includes some useful features to help you navigate XML documents.

Navigation Keyboard Shortcuts

**Tab**

Navigate to the next XML node.

**Tip:** If you encounter a *space-preserved element* (page 2711) when you navigate through a document and you do not press another key, pressing the **Tab** key will
continue the navigation. However, if the cursor is positioned in a *space-preserved element* and you press another key or you position the cursor inside such an element using the mouse, the Tab key can be used to arrange the text.

**Shift + Tab**

Navigate to the previous XML node.

**Ctrl + RightArrow (Command + RightArrow on OS X)**

Navigate one word forward.

**Ctrl + LeftArrow (Command + LeftArrow on OS X)**

Navigate one word backward.

**Ctrl + Home (Command + Home on OS X)**

Position the cursor at the beginning of the document.

**Ctrl + End (Command + End on OS X)**

Position the cursor at the end of the document.

### Navigating to a Modification

Oxygen XML Editor plugin includes some actions to help you quickly navigate to a particular modification. They can be invoked using keyboards shortcuts or from the Navigation menu:

**Last Edit Location (Ctrl+Q)**

Moves the cursor to the last modification in any opened document.

**Back (Alt+LeftArrow (Command+OpenBracket on OS X))**

Moves the cursor to the previous modification.

**Forward (Alt+RightArrow (Command+CloseBracket on OS X))**

Moves the cursor to the next modification.

### Navigating with the Outline View

Oxygen XML Editor plugin includes an Outline view *(page 316)* that displays a hierarchical tag overview of the currently edited XML Document.

You can use this view to quickly navigate through the current document by selecting nodes in the outline tree. It is synchronized with the editor area, so when you make a selection in the Outline view, the corresponding nodes are highlighted in the editor area.

*Figure 245: Outline View Navigation in Author Mode*
Using the Breadcrumb to Navigate

A *breadcrumb* in the toolbar area at the top of the document indicates the path from document root to the current element. It can also be used as a helpful tool to navigate to specific elements throughout the structure of the document.

*Figure 246: Breadcrumb in Author Mode*

The last element listed in the *breadcrumb* is the element at the current cursor position. Clicking an element from the *breadcrumb* selects the entire element and navigates to it in the editor area.

Using the Linking Support

When working on multiple documents that reference each other (references, external entities, XInclude, DITA conref, etc.), the linking support is useful for navigating between the documents. In the built-in frameworks that are bundled with Oxygen XML Editor plugin, links are marked with an icon representing a chain link (🔗). When hovering over the icon, the mouse pointer changes its shape to indicate that the link can be accessed and a tooltip presents the destination location. Click the link to open the referenced resource in the editor or system browser. The same effect can be obtained by pressing the F3 key when the cursor is in a link element.

**Note:** Depending on the referenced file type, the target link will either be opened in the Oxygen XML Editor plugin or in the default system application. If the target file does not exist, Oxygen XML Editor plugin prompts you to create it.

Displaying the Markup

You can control the amount of markup that is displayed in the **Author** mode with various levels of tag modes for both *block* and *in-line* elements.

The following dedicated tag modes are available from the **Tags Display Mode** drop-down menu (available on the toolbar):

- **Full Tags with Attributes**
Displays full tag names with attributes for both block and inline elements.

Full Tags
Displays full tag names without attributes for both block and inline elements.

Block Tags
Displays full tag names for block elements and simple tags without names for inline elements.

Inline Tags
Displays full tag names for inline elements, while block elements are not displayed.

Partial Tags
Displays simple tags without names for inline elements, while block elements are not displayed.

No Tags
No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

Configure Tags Display Mode
Opens the Author preferences page (page 110) where you can configure options regarding tags, such as the default Tags Display Mode, Tags Background Color, Tags Foreground Color, Tags Font, and whether or not Oxygen XML Editor plugin will use a Compact Tag Layout for displaying the tags (this option tries to group consecutive block tags on the same line).

Note: The associated CSS information is used to determine whether a tag should be considered inline or block. If the current document does not have an associated CSS stylesheet, then the Full Tags mode will be used.

Displaying Referenced Content

The references to entities, XInclude, DITA conrefs, and constructs in other vocabularies with displayable referenced content (page 2116) are expanded by default in Author mode and the referenced content is displayed. You can control this behavior from the Author preferences page (page 110). The referenced resources are loaded and displayed inside the element or entity that references them, but the displayed content cannot be modified directly in current document.

When the referenced resource cannot be resolved, an error will be presented inside the element that refers them instead of the content.
If you want to make modifications to the referenced content, you must open the source where the referenced resource resides. The referenced resource can be opened quickly by clicking the link (marked with the 🌐 icon) that is displayed before the referenced content or by using the **Edit Reference** action from the contextual menu (in this case, the cursor is placed at the precise location where the action was invoked). The referenced resource is resolved through the **XML Catalog** set in the **XML Catalog** preferences page.

The referenced content is refreshed as follows:

- Automatically, when it is modified and saved from Oxygen XML Editor plugin.
- On demand, by using the **Refresh references** action. This is useful when the referenced content is modified outside the Oxygen XML Editor plugin scope.

**Related Information:**
- [Configuring a Reference Resolver](page:2116)

**Visual Hints for the Cursor Position**

When the cursor is positioned inside a new context, a tooltip will be shown for a couple of seconds displaying the position of the cursor relative to the context of the current element.

Here are some of the common situations that can be encountered:

- **Before first block** - The cursor is positioned before the first block child of the current node.
- **Between two block elements** - The cursor is positioned between two block elements.
- **After last block** - The cursor is positioned after the last block element child of the current node.
• **Inside a node** - The cursor is positioned inside a node.

• **Before an inline element** - The cursor is positioned inside an element, before a child *inline element* (page 2707).

• **Between two inline elements** - The cursor is positioned between two *inline elements* (page 2707).

• **After an inline element** - The cursor is positioned inside an element, after a child *inline element* (page 2707).

The nodes in these cases are displayed in the tooltip window using the element names.

To deactivate this feature, open the **Preferences** dialog box (page 55), go to **Author > Cursor Navigation**, and deselect the **Show cursor position tooltip** option (page 117). Even if this option is deselected, you can still display the position tooltip by pressing **Shift+F2**.

**Note:** The position information tooltip is not displayed if **Full Tags with Attributes** or **Full Tags** is selected in the **Tags display mode** drop-down menu (page 331).

**Location Tooltip**

When editing XML documents in a visual environment, you might find it difficult to position the cursor between certain tags that do not have a visual representation. To counterbalance this, Oxygen XML Editor plugin displays a transparent preview of the position information, called the **Location Tooltip**:

*Figure 247: Location Tooltip*
Oxygen XML Editor plugin displays a **Location Tooltip** when the following conditions are met:

- You are editing the document in one of the following tags display modes (page 331): Inline Tags, Partial Tags, No Tags.
- The mouse pointer is moved between block elements (page 2703).

To activate or deactivate this feature, use the **Show location tooltip on mouse move** option (page 117) in the Cursor Navigation preferences page (page 117).

### Whitespace Handling in Author Mode

When you edit a document in **Author** mode, Oxygen XML Editor plugin must serialize the resulting document as XML. Oxygen XML Editor plugin serializes the document when you save it or switch to another editing mode. When the document is serialized, Oxygen XML Editor plugin **formats and indents the XML document** (page 645) according to the current format and indent settings (page 135).

### Minimizing Whitespace Differences Between Versions

When serializing a document to XML, **Author** mode will only format and indent those elements of the document that have been edited. Any element that has not been edited will be serialized exactly as it was loaded from disk. This is useful when your content is managed in a version control systems, as it avoids introducing insignificant whitespace differences between version, which in turn makes diff output easier to read.

### Entering Whitespace in Author Mode

Oxygen XML Editor plugin controls the entry of whitespace characters in **Author** mode according the XML whitespace rules (page 645), which means it will not let you insert insignificant whitespace. This means that it will not let you insert extra line-breaks or spaces inside a typical paragraph element, for instance. (Any such whitespace would be normalized away when the document was serialized to XML, so Oxygen XML Editor plugin is saving you from any surprises when this happens.)

Of course, you will legitimately want to enter additional spaces and returns in some cases, such as code samples. Oxygen XML Editor plugin will allow this in elements that are configured as preserve space elements according to the XML whitespace rules. For all of its built-in document types (page
Oxygen XML Editor plugin is correctly configured to recognize preserve space elements (page 139) and to allow you to enter additional spaces in them.

If you are using a built-in document type and you are unable to enter additional whitespace, make sure that you are using an element from that document type that is intended to be a preserve-space element.

If you are using a custom document type, make sure that it is configured correctly (page 2037) so that Oxygen XML Editor plugin recognizes that the current element is a preserve-space element.

Serialization Options for Author Mode

The Author preferences page (page 110) (open the Preferences dialog box (page 55) and go to Editor > Edit modes > Author) includes a Serialization section (page 112) that contains some options that control how the formatting and indenting is applied when a document is saved in Author mode or when switching from Author to Text mode. It also includes a Compatibility with other tools option (page 113) that controls how line breaks are handled when a document is serialized to help obtain better compatibility with other applications.

Editing Content in Author Mode

The Author mode includes a large variety of user-friendly authoring features to help you work with XML content, including numerous toolbar, menu, and shortcut actions and some specialized content editing features.

Undo/Redo Actions

The typical undo and redo actions are available with shortcuts or in the Edit menu:

**Undo (Ctrl + Z (Command + Z on OS X))**

Reverses a maximum of 200 editing actions to return to the preceding state.

**Note:** Complex operations such as Replace All or Indent selection count as single undo events.

**Redo (Ctrl + Y (Command + Shift + Z on OS X, Ctrl + Shift + Z on Linux/Unix))**

Recreates a maximum of 100 editing actions that were undone by the Undo function.

Copy and Paste Actions

The typical copying and pasting actions are available with shortcuts or in the contextual menu (or the Edit menu):
Cut (Ctrl + X (Command + X on OS X))
Removes the current selected content from the document and places it in the clipboard.

Copy (Ctrl + C (Command + C on OS X))
Places a copy of the current selected content in the clipboard.

Paste (Ctrl + V (Command + V on OS X))
Inserts the current clipboard content into the document at the cursor position.

Select All (Ctrl + A (Command + A on OS X))
Selects the entire content of the current document.

Entering Text in Elements

By default, you can only enter text in elements that accept text content. If the element is declared as empty or element only in the associated schema, you are not allowed to insert text in it. Instead, a warning message is displayed.

Figure 248: Editing in empty element warning

To allow text to be inserted in these instances, go to the Schema-Aware preferences page and deselect the Reject action when its result is invalid option in the Typing actions section (page 130).

Editing Text Content Without Modifying the XML Markup

You can use the options in the Tags Display Mode drop-down menu (page 331) (available on the toolbar) to control how tags are displayed in Author mode. This can help you to clearly see where the current cursor position is within the tag structure so that you can avoid making unintended modifications to the XML markup. You can also switch to the Grid editing mode (page 665) to modify text content without affecting the XML tags.

Editing XML Markup in Author Mode

Oxygen XML Editor plugin includes some useful actions that allow you to easily edit XML markup in **Author** mode. Most of these actions are available in the contextual menu and some of them have simple keyboard shortcuts.

### Selecting XML Markup in Author Mode

Selecting XML tags in Oxygen XML Editor plugin is very simple with several methods for selecting entire elements:

- **Breadcrumb** - Click the element (XML tag) on the breadcrumb *(page 684)* displayed at the top of the editing window.
- **Outline View** - Click the element name in the Outline view *(page 316)*.
- **Full Tags Mode** - While editing in Full Tags mode *(page 331)*, click the start or end tag of the element in the editor.
- **Mouse Selection** - While editing in Full Tags mode *(page 331)*, click before the start tag of the element, drag the selection, and release the mouse button after the end tag.
- **Shift + Arrow Keys** - While editing in Full Tags mode *(page 331)*, place the cursor before the start tag of the element, press and hold Shift, and use the arrow keys to make the selection (including the end tag).

**Note:** If the selection does not include the entire element (for example you do not include the end tag of the element), Oxygen XML Editor plugin will automatically close the appropriate tags when pasting the copied selection. This ensures that the pasted content will always result in well-formed XML *(page 854)*.

### Using the Breadcrumb in Author Mode

A breadcrumb on the top stripe indicates the path from document root to the current element. It can also be used as a helpful tool to insert and edit specific elements in the document structure.

*Figure 249: Breadcrumb in Author Mode*
The last element listed in the breadcrumb is the element at the current cursor position. The last element is also highlighted by a thin light blue bar for easier identification. Clicking an element from the breadcrumb selects the entire element in the editor area and each element provides a contextual menu with access to the following actions:

- **Edit Attributes**
  
  Opens the in-place attributes editor (page 322) that allows you to easily edit the attributes of an element.

- **Edit Profiling Attributes**
  
  Allows you to select the profiling attributes (page 746) that apply to a certain element.

- **Append child**
  
  Opens a content completion list that allows you to select an element to be inserted as a child of the selected element.

- **Insert before**
  
  Opens a content completion list that allows you to select an element to be inserted (as a sibling) before the selected element.

- **Insert after**
  
  Opens a content completion list that allows you to select an element to be inserted (as a sibling) after the selected element.

- **Cut**
  
  Removes the selected element and copies it to the clipboard, while preserving the styles of the content.

- **Copy**
  
  Copies the selected element to the clipboard, while preserving the styles of the copied content.

- **Paste**
  
  Pastes a well-formed element from the clipboard at currently selected position in the breadcrumb.

- **Paste before**
  
  Insert a well-formed element (from the clipboard) before the currently selected element.

- **Paste after**
  
  Insert a well-formed element (from the clipboard) after the currently selected element.
Paste as XML

Inserts clipboard content that is considered to be well-formed XML content, preserving its XML structure.

× Delete

Deletes the currently selected element.

Toggle Comment

Encloses the currently selected element in an XML comment, if the element is not commented, or removes the comment if it is commented.

Rename Element

Opens the Rename dialog box that allows you to rename the currently selected element and other elements with the same name.

Tip: The tag names displayed in the breadcrumb can be customized with an Author mode extension class that implements the AuthorBreadCrumbCustomizer API. See the Oxygen SDK for more details.

Move Nodes

You can move XML nodes in the current document by using the following actions in the Refactoring submenu of the contextual menu:

Move Up (Alt + UpArrow)

Moves the current node or selected nodes in front of the previous node.

Move Down (Alt + DownArrow)

Moves the current node or selected nodes after the subsequent node.

Tip: The easiest way to move nodes is to use the Alt + UpArrow and Alt + DownArrow shortcut keys.

Promote/Demote List Item Nodes

You can easily promote or demote selected list item nodes within ordered lists or unordered lists by using the following keyboard shortcuts:

Promote (Shift + Tab)

Promotes an entirely selected list item node to be a sibling of its parent node (the list item is moved to the left). It also works for selections of multiple list item nodes as long as all the selected nodes are siblings (on the same hierarchical level).
Demote (Tab)

Demotes an entirely selected list item node (the list item is moved to the right). It also works for selections of multiple list item nodes as long as all the selected nodes are siblings (on the same hierarchical level).

Join or Split Elements

You can join or split elements in the current document by using the following actions in the Refactoring submenu of the contextual menu:

Join Elements

Joins two adjacent block elements that have the same name. The action is available only when the cursor position is between the two adjacent block elements. Also, joining two block elements can be done by pressing the Delete or Backspace keys and the cursor is positioned between the boundaries of these two elements.

Tip: Specifically, the Delete or Backspace keys can be used to join block elements in the following situations:

• The cursor is located before the end position of the first element and (Delete) key is pressed.
• The cursor is located after the end position of the first element and (Backspace) key is pressed.
• The cursor is located before the start position of the second element and (Delete) key is pressed.
• The cursor is located after the start position of the second element and (Backspace) key is pressed.

If the element has no sibling or the sibling element has a different name, an Unwrap operation will be performed.

Split Element

Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

Rename Elements

You can rename elements by using the following action in the Refactoring submenu of the contextual menu:

Rename Element
The element from the cursor position, and any elements with the same name, can be renamed according with the options from the Rename dialog box.

**Surround Content with Tags (Wrap)**

You can surround a selection of content with tags (wrap the content) by using the following action in the Refactoring submenu of the contextual menu:

- **Surround with Tags (Alt + Shift + E)**
  Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.
  
  - If the Position cursor between tags option (page 101) is selected in the Content Completion preferences page, the cursor is placed between the start and end tag.
  - If the Position cursor between tags option (page 101) is not selected in the Content Completion preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

- **Surround with [tag] (Alt + Shift + ForwardSlash)**
  Surround the selected content with the last tag used.

**Unwrap the Content of Elements**

You can unwrap the content of an element by using the following action in the Refactoring submenu of the contextual menu:

- **Delete Element Tags**
  Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the Delete or Backspace keys.

**Tip:** Specifically, the Delete or Backspace keys can be used to unwrap the content of an element in the following situations:

- The cursor is located before the start position of the element and (Delete) key is pressed.
- The cursor is located after the start position of the element and (Backspace) key is pressed.
- The cursor is located before the end position of the element and (Delete) key is pressed.
- The cursor is located after the end position of the element and (Backspace) key is pressed.
If the element has no sibling or the sibling element has a different name, an **Unwrap** operation will be performed.

**Remove Markup from Blocks of Content**

You can remove the markup from the current element by highlighting the appropriate block of content and using the following action in the **Refactoring** submenu of the contextual menu:

- **Remove All Markup**
  
  Removes all the XML markup inside the selected block of content and keeps only the text content.

**Tip:** You can use the (Delete) or (Backspace) keys to remove markup, in which case the elements in the selected block will be unwrapped or joined with their sibling, or if the current element is empty, the element tags will be deleted.

**Remove Text from Selected Markup**

You can remove the text from elements by highlighting the appropriate block of content and using the following action in the **Refactoring** submenu of the contextual menu:

- **Remove Text**
  
  Removes the text content of the selected block of content and keeps the markup intact with empty elements.

**Other Refactoring Actions**

You can also manage the structure of the markup by using the other specific XML refactoring actions that are available in the **Refactoring** submenu of the contextual menu:

**DITA Refactoring Actions**

A variety of built-in XML refactoring operations that pertain to DITA documents with some of the information preconfigured based upon the current context.

- **Change Topic ID to File Name**
  
  Use this operation to change the ID of a topic to be the same as its file name.

- **Convert CALS Tables to Simple Tables**
  
  Use this operation to convert DITA CALS tables to simple tables. If you invoke this operation from a nested table (a table inside a table), only the
nested table will be affected. If it is invoked on a parent table that contains nested tables, all of the contained tables will be converted.

**Convert conrefs to conkeyrefs**

Use this operation to convert `conref` attributes to `conkeyref` attributes.

**Convert Simple Tables to CALS Tables**

Use this operation to convert DITA simple tables to CALS tables. If you invoke this operation from a nested table (a table inside a table), only the nested table will be affected. If it is invoked on a parent table that contains nested tables, all of the contained tables will be converted.

**Convert to Concept**

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

**Convert to General Task**

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA General Task is a less restrictive alternative to the Strict Task information type.

**Convert to Reference**

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

**Convert to Task**

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

**Convert to Topic**

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

**Convert to Troubleshooting**

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

**Rename Key**

Available when invoked on a key, and can be used to quickly rename a key. It also updates all references to it. Note that it does not work on DITA 1.3 key scopes.

**Attributes Refactoring Actions**
Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

Add/Change attribute
   Allows you to change the value of an attribute or insert a new one.

Convert attribute to element
   Allows you to change an attribute into an element.

Delete attribute
   Allows you to remove one or more attributes.

Rename attribute
   Allows you to rename an attribute.

Replace in attribute value
   Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

Comments Refactoring Actions
Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

Delete comments
   Allows you to delete comments found inside one or more elements.

Elements Refactoring Actions
Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

Delete element
   Allows you to delete elements.

Delete element content
   Allows you to delete the content of elements.

Insert element
   Allows you to insert new elements.

Rename element
   Allows you to rename elements.

Unwrap element
Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

**Wrap element**

Allows you to surround elements with element tags.

**Wrap element content**

Allows you to surround the content of elements with element tags.

**Fragments Refactoring Actions**

Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

**Insert XML fragment**

Allows you to insert an XML fragment.

**Replace element content with XML fragment**

Allows you to replace the content of elements with an XML fragment.

**Replace element with XML fragment**

Allows you to replace elements with an XML fragment.

Editing Attributes in Author Mode
You can easily edit attributes in **Author mode** by using the **Attributes View (page 319)** and Oxygen XML Editor plugin also allows you to edit attribute and element values in-place, directly in the **Author mode**, using an in-place attribute editor.

**In-place Attributes Editor**

Oxygen XML Editor plugin includes an in-place attributes editor in **Author mode**. To edit the attributes of an XML element in-place, do one of the following:

- Select an element or place the cursor inside it and then press the **Alt + Enter** keyboard shortcut.
- Double-click any named start tag when the document is edited in one of the following **display modes. (page 331):** Full Tags with Attributes, Full Tags, Block Tags, or Inline Tags.

This opens an in-place attributes editor that contains the same content as the **Attributes view**. By default, this editor presents the **Name** and **Value** fields, with the list of all the possible attributes collapsed.

**Figure 250: In-place Attributes Editor**

![In-place Attributes Editor](image)

**Name Combo Box**

Use this combo box to select an attribute. The drop-down list displays the list of possible attributes allowed by the schema of the document, as in the **Attributes** view.

**Value Combo Box**

Use this combo box to add, edit, or select the value of an attribute. If the selected attribute has predefined values in the schema, the drop-down list displays those possible values. You can use the **Browse** button to select a URL for the value of an attribute. You can also press **Ctrl + Space** to open a content completion window that offers a list of possible choices and allows you to select multiple values.

**Note:** For built-in frameworks, if the selected attribute in the **Name** field is an **@id** attribute, the **Browse** button is replaced by a **Generate Unique ID Value** button. Clicking this button will automatically generate a unique ID for the selected element.
If you click **More** while in the collapsed version, it is expanded to the full version of the in-place attribute editor.

**Figure 251: In-place Attributes Editor (Full Version)**

The full version includes a table grid, similar to the **Attributes** view, that presents all the attributes for the selected element.

**Note:** If the cursor is located inside read-only content, the attribute names and values are faded and you cannot add, edit, or remove values.

**Folding XML Elements in Author Mode**

When working with a large document, the *folding* support in Oxygen XML Editor plugin can be used to collapse some element content leaving only the parts that you need to edit in focus. Expanding and collapsing works on individual elements. Expanding an element leaves the child elements unchanged.

**Figure 252: Folding of XML Elements in Author Mode**
Folding Actions in Author Mode

Foldable elements (page 2706) are marked with a small triangle (equivivalent to a arrow) on the left side of the editor panel. If you hover over that arrow, the entire content of the element is highlighted by a dotted border for quick identification of the foldable area. To toggle the fold, simply click the icon. Also, the following actions are available in the Folding sub-menu of the contextual menu:

- **Toggle Fold** (or you can simply click on the arrow)
  Toggles the state of the current fold.

- **Collapse Other Folds** (Ctrl + NumPad/ (Command + NumPad/ on OS X))
  Folds all the elements except the current element.

- **Collapse Child Folds** (Ctrl + NumPad- (Command + NumPad- on OS X))
  Folds the child elements that are indented one level inside the current element.

- **Expand Child Folds** (Ctrl + NumPad+ (Command + NumPad+ on OS X))
  Unfolds all child elements of the currently selected element.

- **Expand All** (Ctrl + NumPad* (Command + NumPad* on OS X))
  Unfolds all elements in the current document.

Drag and Drop in Author Mode

The Oxygen XML Editor plugin Author mode includes support for dragging and dropping content in XML documents.
When editing content in Author mode, entire sections or chunks of data can be moved or copied by using the drag and drop feature. The following situations can be encountered:

- When both of the drag and drop sources are from the Author mode editor, a well-formed XML fragment is transferred. The section is balanced before dropping it by adding matching tags when needed.
- When the drag source is from the Author mode editor but the drop target is a text-based editor, only the text inside the selection is transferred as it is.
- The text dropped from another text editor or another application into the Author mode editor is inserted without changes.

Related Information:

- Smart Paste Mechanism (page 696)

Smart Paste Mechanism

The Author editing mode includes a Smart Paste feature that preserves certain style and structure information when copying content and pasting it into document types that support the feature. You can copy content from various sources, including web pages, external applications (such as Office-type applications), or other document types within Oxygen XML Editor plugin, and then paste it into DITA, TEI, DocBook, JATS, and XHTML documents. Oxygen XML Editor plugin preserves the original text styling (such as bold, italics, underline) and formatting (such as lists, tables, paragraphs) and considers various pasting solutions to keep the resulting document valid.

The styles and general layout of the pasted content are converted to the equivalent XML markup for the target document type while preserving certain style and structure information. For example, if you copy content that includes multiple paragraphs and then paste it in Author mode, the multiple paragraph structure is preserved. If you paste the content in a location where the resulting XML would not be valid, Oxygen XML Editor plugin will attempt to place it in a valid location, and may prompt you with one or more choices for where to place it.

Tip: When pasting text fragments formatted with the Courier New font, the Smart Paste mechanism will wrap it in an inline code element (for example, in DITA it would be wrapped in a codeph element).
Smart Paste Options

By default, the *Smart Paste* feature is enabled in Oxygen XML Editor plugin. There are several options in the *Schema Aware* preferences page (page 128) that control the *Smart Paste* mechanism:

- **Smart paste and drag and drop** (page 129) - This option determines whether or not Oxygen XML Editor plugin will try to find an appropriate insert position when the current location is not valid for the pasted content. This option is selected by default.
- **Reject action when its result is invalid** (page 129) - If you select this option, Oxygen XML Editor plugin will not let you paste content into a position where it would be invalid. This option is deselected by default.
- **Convert external content on paste** (page 131) - This option determines whether or not Oxygen XML Editor plugin will convert the styling and formatting of copied content from external sources when pasting it into a document type that supports the feature. This option is selected by default.
- **Convert even when pasting inside space-preserve elements** (page 131) - If you select this option, the *Smart Paste* feature will also work when pasting external content into a *space-preserve* element (such as a *codeblock*). This option is deselected by default.

Smart Paste Supported Document Types

The *Smart Paste* feature is supported for the following document types (frameworks (page 2706)):

- DITA
- DocBook 4
- DocBook 5
- TEI
- XHTML
- JATS

For more information about the *Smart Paste* support, watch our video demonstration:

Selecting Content in Author Mode

Oxygen XML Editor plugin includes a variety of keyboard shortcuts that allow you to easily select content in Author mode.

**Selection Shortcuts in Author Mode**

- **Ctrl + A (Meta + A on Mac OS X)**
  Selects all content in the document.

- **Shift + Left/Right Arrow Keys**
  Begins a continuous selection at the cursor position and extends it one character at a time in the direction that you press the arrow keys.

- **Shift + Up/Down Arrow Keys**
  Begins a continuous selection at the cursor position and extends it one line at a time in the direction that you press the arrow keys.

- **Ctrl + Shift + Left/Right Arrow Keys (Meta + Shift + Left/Right Arrow Keys on Mac OS X)**
  Begins a continuous selection at the cursor position and extends it one word at a time in the direction that you press the arrow keys.

- **Shift + Home**
  Begins a continuous selection at the cursor position and extends it to the beginning of the current line (on Mac OS X, it extends to the beginning of the document).

- **Shift + End**
  Begins a continuous selection at the cursor position and extends it to the end of the current line (on Mac OS X, it extends to the end of the document).

- **Ctrl + Shift + Home**
  Begins a continuous selection at the cursor position and extends it to the beginning of the document.

- **Ctrl + Shift + End**
  Begins a continuous selection at the cursor position and extends it to the end of the document.

- **Shift + PageUp**
  Begins a continuous selection at the cursor position and extends it up one screen page.
Shift + PageDown

Begins a continuous selection at the cursor position and extends it down one screen page.

Double-Click

Selects the word at the cursor position.

Triple-Click

Selects the node at the cursor position.

Right-Click > Select > Element

Selects the entire element at the current cursor position.

Right-Click > Select > Content

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

Right-Click > Select > Parent

Selects the entire parent element at the current cursor position.

Content Completion Assistant in Author Mode

One of the most useful features in Author mode is the Content Completion Assistant (page 2704). It offers a list of elements, attributes, attribute values, and other options that are valid in the current editing context.

Figure 253: Content Completion Assistant in Author Mode

The Content Completion Assistant is enabled by default. To disable it, open the Preferences dialog box (page 55), go to Editor > Content Completion, and deselect the Enable content completion option (page 101).
Using the Content Completion Assistant in Author Mode

To activate the feature in Author mode, use any of the following shortcut keys:

- Enter
- Ctrl + Space (Command + Space on OS X)
- Alt + ForwardSlash (Command + Alt + ForwardSlash on OS X)

You can navigate through the list of proposals by using the Up and Down keys on your keyboard. In same cases, the Content Completion Assistant displays a documentation window with information about the particular proposal and some of them have links to additional information (for example, DITA elements might have a link to the DITA Style Guide). You can use Tab and Shift + Tab to navigate to those links and Space to trigger them. You can also change the size of the documentation window by dragging its top, right, and bottom borders.

To insert the selected proposal in Author mode, simply press Enter.

Types of Proposals Listed in the Content Completion Assistant

The Content Completion Assistant offers the following types of proposed actions depending on the current context:

- Insert allowed elements for the current context schema and the list of proposals contains elements depending on the elements inserted both before and after the cursor position.
- Insert element values if such values are specified in the schema for the current context.
- Insert new undeclared elements by entering their name in the text field.
- Insert CDATA sections, comments, processing instructions.
- Insert code templates (page 639).
- If invoked on a selection that only contains an element start or end tag (remember that you can see all element tags while working in Full Tags mode (page 331)), it will allow you to rename the element.
- If invoked on a selection of multiple elements or other content, it will allow you to surround the content with certain tags.
- If invoked on an empty list item that is the last element of the list, it will allow you to convert the list item to a paragraph.
- If the Show all possible elements in the content completion list option from the Schema-Aware preferences page (page 130) is selected, the content completion pop-up window will present all the elements defined by the schema. When choosing an element from this section, the insertion will be performed using the schema-aware smart editing features.
Note: By default, you are not allowed to insert element names that are not defined by the schema. This can be changed by deselecting the Allow only insertion of valid elements and attributes check box from the Schema-Aware preferences page (page 130).

Examples of How the Content Completion Assistant Works

To illustrate how the feature works, consider the following examples of invoking the Content Completion Assistant in certain contexts:

- If the cursor is positioned at the beginning or at the end of the element, the first item offered in the Content Completion Assistant is a New <Element> item. Selecting this item will insert an empty element.

  Figure 254: Example (New [Element Name])

- If the cursor is positioned somewhere inside the element, the first entry in the Content Completion Assistant is a Split <Element> item. In most cases, you can only split the closest block element (page 2703) to the cursor position, but if it is inside a list item, the list item will also be proposed for split. Selecting Split <Element> splits the content of the specified element around the cursor position.

  Figure 255: Example (Split [Element Name])

- If the cursor is positioned inside a space-preserved element (page 2711) (for example, a codeblock), the first choice in the Content Completion Assistant is Enter, which will insert a new line in the content of the element, followed by New <Element>.

  Figure 256: Example ('ENTER' New Line)
• If invoked on a selection that only contains an element start or end tag (remember that you can see all element tags while working in "Full Tags mode (page 331)"), it will allow you to rename the element.

Figure 257: Example (Rename)

• If invoked on a selection of multiple elements or other content, it will allow you to surround the content with certain tags.

Figure 258: Example (Surround)

Related Information:

• Customizing the Content Completion Assistant (page 2067)

Set the Schema to be Used for Content Completion

The proposals that are presented in the Content Completion Assistant (page 2704) depend on the associated schemas. The DTD, XML Schema, Relax NG, or NVDL schema used to populate the Content Completion Assistant is specified in the following methods, in the order of their precedence:
• The schema specified explicitly in the document (page 894). In this case, Oxygen XML Editor plugin reads the beginning of the document and resolves the location of the DTD, XML Schema, Relax NG schema, or NVDL schema.

• The default schema declared (page 896) in the Schema tab of the Document Type configuration dialog box (page 75) for the particular document type.

Schema Annotations in Author Mode

A schema annotation is a documentation snippet associated with the definition of an element or attribute in a schema. If such a schema is associated with an XML document, the annotations are displayed in the Content Completion Assistant (page 2704).

Figure 259: Schema Annotation in the Content Completion Assistant

The schema annotations support is available if the schema type is one of the following:

• XML Schema
• Relax NG
• NVDL schema
• DTD

This feature is enabled by default, but you can disable it by deselecting the Show annotations in Content Completion Assistant (page 103) option in the Annotations preferences page.

Styling Annotations with HTML

You can use HTML format in the annotations you add in an XML Schema or Relax NG schema. This improves the visual appearance and readability of the documentation window displayed when editing XML documents validated against such a schema. An annotation is recognized and displayed as HTML if it contains at least one HTML element (such as div, body, p, br, table, ul, or ol).

The HTML rendering is controlled by the Show annotations using HTML format, if possible (page 103) option in the Annotations preferences page. When this option is deselected, the annotations are converted and displayed as plain text and if the annotation contains one or more HTML tags (p, br, ul, li), they are rendered as an HTML document loaded in a web browser. For example, p begins
a new paragraph, br breaks the current line, ul encloses a list of items, and li encloses an item of the list.

Collecting Annotations from XML Schemas

In an XML Schema, the annotations are specified in an <xs:annotation> element like this:

```
<xs:annotation>
  <xs:documentation>
    Description of the element.
  </xs:documentation>
</xs:annotation>
```

If an element or attribute does not have a specific annotation, then Oxygen XML Editor plugin looks for an annotation in the type definition of that element or attribute.

Collecting Annotations from Relax NG Schemas

For Relax NG schema, element and attribute annotations are made using the <documentation> element from the http://relaxng.org/ns/compatibility/annotations/1.0 namespace like this:

```
<define name="person">
  <element name="person">
    <a:documentation xmlns:a="http://relaxng.org/ns/compatibility/annotations/1.0">
      Information about a person.
    </a:documentation>
    <ref name="name"/>
    <zeroOrMore>
      <ref name="email"/>
    </zeroOrMore>
  </element>
</define>
```

However, any element outside the Relax NG namespace (http://relaxng.org/ns/structure/1.0) is handled as annotation and the text content is displayed in the annotation window. To activate this behavior, select the Use all Relax NG annotations as documentation (page 104) option in the Annotations preferences page.

Collecting Annotations from Relax NG Compact Syntax Schemas

For Relax NG Compact Syntax schema, annotations are made using comments like this:

```xml
## Information about a person.
```
Collecting Annotation from DTDs

For DTD, Oxygen XML Editor plugin defines a custom mechanism for annotations using comments enabled by the Prefer DTD comments that start with "doc:" as annotations (page 103) option in the Annotations preferences page. The following is an example of a DTD annotation:

```
<!--doc:Description of the element. -->
```

Content Completion Helper Views

Information about the current element being edited is also available in various dockable (page 2705) views, such as the Model view (page 263), Attributes view (page 261), Elements view (page 265), and Entities view (page 266). By default, they are located on the right-hand side of the main editor window. These views, along with the powerful Outline view (page 257), provide spatial and insight information about the edited document and the current element. If any particular view is not displayed, it can be opened by selecting it from the Window > Show View menu.

Model View

The Model view presents the structure of the currently selected tag, and its documentation, defined as annotation in the schema of the current document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

Figure 260: Model View
The Model view is comprised of two sections, an element structure panel and an annotations panel.

**Element Structure Panel**

The element structure panel displays the structure of the currently edited or selected tag in a tree-like format. The information includes the name, model, and attributes of the current tag. The allowed attributes are shown along with imposed restrictions, if any.

*Figure 261: Element Structure Panel*
Annotation Panel

The **Annotation** panel displays the annotation information for the currently selected element. This information is collected from the XML schema.

*Figure 262: Annotation panel*

Attributes View in Author Mode

The **Attributes** view presents all the attributes of the current element determined by the schema of the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

You can use this view to edit or add attribute values. The attributes of an element are editable if any one of the following is true:

- The CSS stylesheet associated with the document does not specify a `false` value for the `-oxy-editable` (page 2229) property associated with the element.
- The element is entirely included in a deleted `Track Changes (page 719)` marker.
- The element is part of a content fragment that is referenced in **Author** mode from another document.

The attributes are rendered differently depending on their state:
• The names of the attributes are rendered with a bold font, and their values with a plain font.
• Default values are rendered with a plain font, painted gray.
• Empty values display the text "[empty]", painted gray.
• Invalid attributes and values are painted red.

To edit the value of the corresponding attribute, double-click a cell in the **Value** column. If the possible values of the attribute are specified as `list` in the schema of the edited document, the **Value** column acts as a combo box that allows you to either select the value from a list or manually enter it.

**Note:** If the cursor is located inside read-only content, the attribute names and values are faded and you cannot add, edit, or remove values.

You can sort the attributes table by clicking the **Attribute** column header. The table contents can be sorted as follows:

• By attribute name in ascending order.
• By attribute name in descending order.
• Custom order, where the used attributes are displayed at the beginning of the table sorted in ascending order, followed by the rest of the allowed elements sorted in ascending order.

**Figure 263: Attributes View**

A drop-down list located in the upper part of the view allows you to select the current element or its ancestors.

**Contextual Menu Actions in the Attributes View**

The following actions are available in the contextual menu of the **Attributes** view when editing in **Author** mode:
Set empty value

Specifies the current attribute value as empty.

Remove

Removes the attribute (action available only if the attribute is specified). You can invoke this action by pressing the (Delete) or (Backspace) keys.

Copy

Copies the attrName="attrValue" pair to the clipboard. The attrValue can be:

- The value of the attribute.
- The value of the default attribute, if the attribute does not appear in the edited document.
- Empty, if the attribute does not appear in the edited document and has no default value set.

Paste

Depending on the content of the clipboard, the following cases are possible:

- If the clipboard contains an attribute and its value, both of them are introduced in the Attributes view. The attribute is selected and its value is changed if they exist in the Attributes view.
- If the clipboard contains an attribute name with an empty value, the attribute is introduced in the Attributes view and you can start editing it. The attribute is selected and you can start editing it if it exists in the Attributes view.
- If the clipboard only contains text, the value of the selected attribute is modified.

In-place Attributes Editor

Oxygen XML Editor plugin includes an in-place attributes editor in Author mode. To edit the attributes of an XML element in-place, do one of the following:

- Select an element or place the cursor inside it and then press the Alt + Enter keyboard shortcut.
- Double-click any named start tag when the document is edited in one of the following display modes. (page 331): Full Tags with Attributes, Full Tags, Block Tags, or Inline Tags.

This opens an in-place attributes editor that contains the same content as the Attributes view. By default, this editor presents the Name and Value fields, with the list of all the possible attributes collapsed.

Figure 264: In-place Attributes Editor
Name Combo Box

Use this combo box to select an attribute. The drop-down list displays the list of possible attributes allowed by the schema of the document, as in the Attributes view.

Value Combo Box

Use this combo box to add, edit, or select the value of an attribute. If the selected attribute has predefined values in the schema, the drop-down list displays those possible values. You can use the Browse button to select a URL for the value of an attribute. You can also press Ctrl + Space to open a content completion window that offers a list of possible choices and allows you to select multiple values.

Note: For built-in frameworks, if the selected attribute in the Name field is an @id attribute, the Browse button is replaced by a Generate Unique ID Value button. Clicking this button will automatically generate a unique ID for the selected element.

If you click More while in the collapsed version, it is expanded to the full version of the in-place attribute editor.

Figure 265: In-place Attributes Editor (Full Version)
The full version includes a table grid, similar to the Attributes view, that presents all the attributes for the selected element.

**Elements View in Author Mode**

The Elements view presents a list of all defined elements that are valid at the current cursor position according to the schema associated to the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

The upper part of the view features a combo box that contains the ordered ancestors of the current element. Selecting a new element in this combo box updates the list of the allowed elements. By default, only the elements that are allowed at the current cursor position are listed. However, if the **Show only items allowed at cursor position** option (page 161) is not selected in the View preferences page (page 160), two additional tabs (Before and After) will be displayed at the bottom of the view and they list elements that are allowed before or after the element at the current cursor position.

Double-clicking any of the listed elements inserts that element into the edited document and its position depends on the tab.

- **Cursor** tab - Double-clicking an element inserts it at the current cursor position.
- **Before** tab - Double-clicking an element inserts it before the element at the cursor position.
- **After** tab - Double-clicking an element inserts it after the element at the cursor position.

Pressing **F2** with an element selected will display information about that particular element.

*Figure 266: Elements View in Author Mode*

**Entities View**
Entities provide abbreviated entries that can be used in XML files when there is a need of repeatedly inserting certain characters or large blocks of information. An entity is defined using the `ENTITY` statement either in the DOCTYPE declaration or in a DTD file associated with the current XML file.

There are three types of entities:

- **Predefined** - Entities that are part of the predefined XML markup (`&lt;`, `&gt;`, `&amp;`, `&apos;`, `&quot;`).
- **Internal** - Defined in the DOCTYPE declaration header of the current XML.
- **External** - Defined in an external DTD module included in the DTD referenced in the XML DOCTYPE declaration.

**Note:** If you want to add internal entities, you would need to switch to the Text editing mode and manually modify the DOCTYPE declaration. If you want to add external entities, you need to open the DTD module file and modify it directly.

The Entities view displays a list with all entities declared in the current document, as well as built-in ones. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Double-clicking one of the entities will insert it at the current cursor position in the XML document. You can also sort entities by name and value by clicking the column headers.

![Entities View](image)

The view features a filtering capability that allows you to search an entity by name, value, or both. Also, you can choose to display the internal or external entities.
Note: When entering filters, you can use the ? and * wildcards. Also, you can enter multiple filters by separating them with a comma.

Code Templates

Code templates are code fragments that can be inserted quickly at the current editing position. Oxygen XML Editor plugin includes a set of built-in code templates for CSS, Schematron, XSL, XQuery, JSON, and XML Schema document types. You can also define your own code templates for any type of file and share them with others.

Code templates are displayed with a .! symbol in the content completion list (Enter in Author mode or Ctrl + Space (Command + Space on OS X) in Text mode). Also, in Text mode you can press Ctrl + Shift + Space to see a complete list of the available code templates. To enter the code template at the cursor position, select it from the content completion list or type its code and press Enter. If a shortcut key has been assigned to the code template, you can also use the shortcut key to enter it.

How to Create Code Templates

To create a code template, follow these steps:

1. Open the Preferences dialog box (page 55) and go to Editor > Templates > Code Templates.
2. Click New to open a code template configuration dialog box.

   Tip: You can use one of the existing code templates as a starting point by selecting that template and clicking Duplicate.

   Figure 268: Code Template Configuration Dialog Box

3. Configure your template using the fields in the code template configuration dialog box:
   - Name - The name of the code template.
• **Description** - [Optional] The description of the code template that will appear in the Code Templates preferences page and in the tooltip message when selecting it from the Content Completion Assistant (page 2704). HTML markup can be used for better rendering.

• **Associate with** - You can choose to set the code template to be associated with a specific type of editor or for all editor types.

• **Shortcut key** - [Optional] If you want to assign a shortcut key that can be used to insert the code template, place the cursor in the Shortcut key field and press the desired key combination on your keyboard. Use the Clear button if you make a mistake. If the Enable platform-independent shortcut keys checkbox is selected, the shortcut is platform-independent and the following modifiers are used:
  - $M_1$ represents the Command key on MacOS X, and the Ctrl key on other platforms.
  - $M_2$ represents the Shift key.
  - $M_3$ represents the Option key on MacOS X, and the Alt key on other platforms.
  - $M_4$ represents the Ctrl key on MacOS X, and is undefined on other platforms.

• **Content** - Text box where you define the content that is used when the code template is inserted. An editor variable (page 201) can be inserted in the text box using the Insert Editor Variables button.

4. Click OK to save your new code template.

**Result:** Your code template can now be selected using the Content Completion Assistant (page 2704) (Enter in Author mode or Ctrl + Space (Command + Space on OS X) in Text mode). The code templates are displayed with a «!» symbol.

### How to Share Code Templates

There are two ways to easily share all of your code templates with other members of your team:

**Method 1: Export/Import**

1. Open the Preferences dialog box (page 55) and go to Editor > Templates > Code Templates.
2. Click the Export button to export all of your code templates into an XML file.
3. Save the XML file.
4. Share the XML file with other members of your team.
5. Instruct them to open the Preferences dialog box (page 55), go to Editor > Templates > Code Templates, click the Import button, and select the file you sent them.

**Result:** The code templates will be now available in their content completion list.

**Method 2: Share Project**

1. Open the Preferences dialog box (page 55) and go to Editor > Templates > Code Templates.
2. Select **Project Options** at the bottom of the dialog box. This stores the preferences in the project file (.xpr).

3. Share the project file with the other members of your team. For example, you can commit it to your version control system and have them update their working copy.

**Result:** When they open the updated project file in their **Navigator view** (page 250), the code templates will be available in their content completion list.

**Tip:** It is also possible to configure certain actions that function similar to code templates and add them to the content completion list (page 2067) for a particular framework. You could then share the whole framework (page 2086) with other members of your team.

Outline View in Author Mode

The **Outline** view in **Author** mode displays a general tag overview of the currently edited XML Document. When you edit a document, the **Outline** view dynamically follows the changes that you make, displaying the node that you modify. This functionality gives you great insight on the location of your modifications in the current document. It also shows the correct hierarchical dependencies between elements. This makes it easy for you to be aware of the document structure and the way element tags are nested.

Outline View Features

The **Outline** view allows you to:

- Quickly navigate through the document by selecting nodes in the **Outline** tree.
- Insert or delete nodes using contextual menu actions.
- Move elements by dragging them to a new position in the tree structure.
- Highlight elements in the editor area. It is synchronized with the editor area, so when you make a selection in the editor area, the corresponding nodes are highlighted in the **Outline** view, and vice versa.
- View document errors, as they are highlighted in the **Outline** view. A tooltip also provides more information about the nature of the error when you hover over the faulted element.

Outline View Interface

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are
presented. For advanced usage you can use wildcard characters (such as `*`, `?`) and separate multiple patterns with commas.

It also includes a View menu in the top-right corner that presents a variety of options to help you filter the view even further.

**Drop and Drop Actions in the Outline View**

Entire XML elements can be moved or copied in the edited document using only the mouse in the Outline view with drag-and-drop operations. Several drag and drop actions are possible:

- If you drag an XML element in the Outline view and drop it on another node, then the dragged element will be moved after the drop target element.
- If you hold the mouse pointer over the drop target for a short time before the drop then the drop target element will be expanded first and the dragged element will be moved inside the drop target element after its opening tag.
- You can also drop an element before or after another element if you hold the mouse pointer towards the upper or lower part of the targeted element. A marker will indicate whether the drop will be performed before or after the target element.
- If you hold down the **(Ctrl (Command on OS X))** key after dragging, a copy operation will be performed instead of a move.

**Tip:** You can select and drag multiple nodes in the Outline view when editing in Author mode.

*Figure 269: Outline View*
Outline View Filters in Author Mode

The upper part of the Outline view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (such as *, ?) and separate multiple patterns with commas.

The following actions are available in the View menu of the Outline view when editing in Author mode:

- **Filter returns exact matches**
  The text filter of the Outline view returns only exact matches.

- **Flat presentation mode of the filtered results**
  When active, the application flattens the filtered result elements to a single level.

- **Show comments and processing instructions**
  Show/hide comments and processing instructions in the Outline view.

- **Show element name**
  Show/hide element name.

- **Show text**
  Show/hide additional text content for the displayed elements.

- **Show attributes**
  Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from the Outline preferences panel (page 197).

- **Configure displayed attributes**
  Displays the XML Structured Outline preferences page (page 197).

Outline View Contextual Menu Actions in Author Mode

The contextual menu of the Outline view in Author mode contains the following actions:

- **Edit Attributes**
  Displays an in-place attributes editor (page 322) that allows you to edit the attributes of a selected node.

**Edit Profiling Attributes**

  Allows you to change the profiling attributes (page 746) defined on all selected elements.

**Append Child**
Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection as a child of the current element.

**Insert Before**
Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection immediately before the current element, as a sibling.

**Insert After**
Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection immediately after the current element, as a sibling.

.cut, .copy, .paste, .delete common editing actions
Executes the typical editing actions on the currently selected elements. The **Cut** and **Copy** operations preserve the styles of the copied content.

**Paste before**
Inserts a well-formed copied element before the currently selected element.

**Paste after**
Inserts a well-formed copied element after the currently selected element.

**Paste as XML**
Pastes copied content that is considered to be valid XML, preserving its XML structure.

.togglle comment
Encloses the currently selected element in an XML comment, if the element is not already commented. If it is already commented, this action will remove the comment.

.rename element
Invokes a **Rename** dialog box that allows you to rename the currently selected element, siblings with the same name, or all elements with the same name.

.expand all
Expands the structure tree of the currently selected element.

.collapse all
Collapses all of the structure tree of the currently selected node.

Tip: You can copy, cut or delete multiple nodes in the **Outline** by using the contextual menu after selecting multiple nodes in the tree.

Related Information:
Reviewing Documents

Oxygen XML Editor plugin includes a variety of helpful review tools that improve your ability to collaborate with other members of your team, track changes, mark content for various reasons, add comments in your content, and to manage the review features.

**Tracking Document Changes**

The *Track Changes feature* is a way to keep track of the changes you make in a document. The Track Changes feature highlights changes that you make to the content in a document, as well as changes to attributes. Changes can be tracked for insertions and deletions. When the Track Changes feature is activated, insertions are rendered in Author mode with an underline while deletions are rendered with a strike through.

The tracked changes are also displayed in the Review view and you can also choose to present the changes in callouts by selecting the Track Changes Deletions and Track Changes Insertions options in the Callouts preferences page.

**Adding Comments in Documents**

You can associate a comment to a selected area of content. Comments can highlight virtually any content from your document, with the exception of read-only text. The difference between using comments and change tracking is that a comment can be associated to an area of text without modifying or deleting the text.

Comments are presented in callouts with persistent highlights and a colored background. The background color is assigned automatically by the application, but it can also be customized from the Review preferences page.

**Highlighting Content**

Oxygen XML Editor plugin includes a highlighting feature that allows you to create digital markers to emphasize important fragments of your documents. This is especially useful when you want to mark content that needs additional work or the attention of others.
Using the Review View

Oxygen XML Editor plugin includes a Review view (page 742) that provides a simplified way of monitoring all the insertions, deletions, comments, and highlights in an XML document. This handy tool is especially useful for large teams that need to gather and manage all the edits from all team members who are working on the same project.

The Review view is also useful for managing tracked changes and comments in a single panel. In this view, the changes and comments are presented in a compact form, in the order they appear in the document, and they are synchronized with the changes and comments in the main editing area.

You can use this view to quickly navigate through changes, accept or reject them, or to view and manage comments or highlights. You can also search for specific changes or comments and it includes some filtering options (for example, you can filter it to only show certain types of edits or to only show edits for a particular author).

Printing Review Information

When you print a document from Author mode, whatever review information is shown in the main editing area will be included in the printed output. For example, tracked changes will be included and as long as the Comments option (page 127) is selected in the Callouts preferences page (page 127), comment callouts will also be included (same with tracked change callouts if their corresponding options are selected in the Callouts preferences page (page 127).

Managing Tracked Changes

Oxygen XML Editor plugin includes a Track Changes feature (page 2711) that allows you to review changes that you or other authors have made and then accept or reject them. You can also manage the visualization mode of the tracked changes, add comments to changes, and mark them as being done. These actions are easily accessible from contextual menus, the toolbar, or the Review view (page 742).

The Track Changes feature is also able to keep track of changes you make to attributes in a document and the changes are presented in the Review view (page 742) and Attributes view (page 319).

Types of Tracked Changes

The types of tracked changes include:

- Inserting, deleting content (text or elements)
- Drag and drop content (text or elements)
• Cutting or pasting content (text or elements)
• Inserting, deleting, and changing the structure of tables
• Inserting and editing lists and their content
• Inserting and deleting entities
• Inserting and deleting element tags
• Editing attributes
• Performing a Split operation
• Performing a Surround with operation
• Changes in referenced content (for example, XInclude fragments or DITA conrefs)

⚠️ Important: If you copy content in Author mode that contains tracked changes, the changes will automatically be accepted prior to the content being copied to the clipboard. This filtering is performed only if the selection is not entirely inside a tracked change.

Activating the Change Tracking Feature

To activate the Track Changes feature for the current document, use any of the following methods:

• Click the Track Changes button on the toolbar.
• Select Track Changes from the Review submenu of the contextual menu in the main editing area in Author mode.
• Select Track Changes from the Edit > Review menu.

To activate the Track Changes feature globally for all documents that you open in Oxygen XML Editor plugin, change the Initial State option to Always On (page 124) in the Review preferences page (page 124).

Rendering Tracked Changes in Author Mode

When Track Changes (page 2711) is enabled, your modifications are highlighted using a distinctive color. The colors can be customized from the Review preferences page (page 124), along with the name of the author and the initial state of the feature when you open a document. Insertions are rendered with an underline while deletions are rendered with a strike through.

Figure 270: Change Tracking in Author Mode
When hovering over a change a tooltip displays information about the author and modification time.

**Change Tracking Contextual Menu Actions**

You can right-click any change in **Author** mode to access the following contextual menu actions:

- **Accept Change(s)**
  
  Accepts the *Tracked Change* located at the cursor position or all of the changes in a selection. If you select a part of a *deletion* or *insertion* change, only the selected content is accepted. If you select multiple changes, all of them are accepted. For an *insertion* change, it keeps the inserted text and for a *deletion* change, it removes the content from the document.

- **Reject Change(s)**
  
  Rejects the *Tracked Change* located at the cursor position or all of the changes in a selection. If you select a part of a *deletion* or *insertion* change, only the selected content is rejected. If you select multiple changes, all of them are rejected. For an *insertion* change, it removes the inserted text and for a *deletion* change, it preserves the original content.

- **Comment Change**
  
  Opens a dialog box that allows you to add a comment to an existing *Tracked Change*. The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.
Change Tracking Toolbar Actions

By default, the toolbar includes the following actions and options for reviewing or tracking changes (page 2711) (similar actions are also available in the Edit > Review menu and the Review submenu of the contextual menu):

Track Changes

Enables or disables the Track Changes (page 2711) support for the current document.

Accept Change(s) combo box

This combo box is both a button and a drop-down menu that includes the following actions (when you select an action from the drop-down menu, that action becomes the default action for the combo box button):

- ✓ Accept Change(s) and Move to Next - Accepts the Tracked Change (page 2711) located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is accepted.
- ✓ Accept Change(s) - Accepts the Tracked Change (page 2711) located at the cursor position or all of the changes in a selection.
- ✓ Accept All Changes - Accepts all Tracked Changes (page 2711) in the current document.

Reject Change(s) combo box

This combo box is both a button and a drop-down menu that includes the following actions (when you select an action from the drop-down menu, that action becomes the default action for the combo box button):

- ✗ Reject Change(s) and Move to Next - Rejects the Tracked Change (page 2711) located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is rejected.
- ✗ Reject Change(s) - Rejects the Tracked Change (page 2711) located at the cursor position or all of the changes in a selection.
- ✗ Reject All Changes - Rejects all Tracked Changes (page 2711) in the current document.

Comment Change
Opens a dialog box that allows you to add a comment to an existing Tracked Change (page 2711). The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

- **Track Changes Visualization Modes Drop-Down Menu**

  This drop-down menu includes specialized actions that allow you to switch between the following visualization modes:

  - ![View All Changes/Comments](image) - This mode is active by default. When you use this mode, all tracked changes are represented in the Author mode.
  - ![View only Changes/Comments by](image) - Only the tracked changes made by the author you select are presented.
  - ![View Final](image) - This mode offers a preview of the document as if all tracked changes (both inserted and deleted) were accepted.
  - ![View Original](image) - This mode offers a preview of the document as if all tracked changes (both inserted and deleted) were rejected. If you attempt to edit the document in this mode, the view mode will switch to View All Changes/Comments.

  **Note:** If you use ![View Final](image) mode and ![View Original](image) mode, callouts (page 2704) are not displayed for comments or changes. To display callouts, use the ![View All Changes/Comments](image) mode.

- **Highlight**

  Enables or disables the Highlight tool (page 734). Use the ![Highlight](image) drop-down menu to select a new color.

- **Add Comment**

  Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).

- **Show/Edit Comment**

  Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

- **Remove Comment**

  Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.
Manage Reviews

Opens the Review view (page 742).

Tracked Change Callouts

You can also choose to display insertion and deletion changes in callouts (page 2704) in Author mode. By default, tracked changes are not displayed in callouts, but you can change this behavior by selecting the Track Changes Deletions (page 127) and Track Changes Insertions (page 127) options in the Callouts preferences page (page 127). You can also choose to display the actual content of the deletion or insertion.

By displaying the changes in callouts, you then have access to even more actions, such as the ability to reply or mark them as being done. For more information, see Author Callouts (page 735).

Tracked Changes in the Review View

The Review view (page 742) is also useful for managing tracked changes and comments. In this view, the edits are presented in a compact form, in the order they appear in the document and each edit is marked with a type-specific icon. You can use this view to quickly navigate through changes, accept or reject them, or to add and manage comments for the changes. You can also search for specific changes and it includes some filtering options (for example, you can filter it to only show certain types of changes or to only show changes for a particular author).

For more information, see Review View (page 742).

Tracked Changes XML Source Code

The changes are stored in the document source code as processing instructions and they do not interfere with validation or transformations. For each change, the author name and the modification time are preserved.

Example - Insertion Change: The following processing instruction is an example of how an insertion change is stored in a document:

```xml
<?oxy_insert_start author="John Doe" timestamp="20090408T164459+0300"?>all<?oxy_insert_end?>
```

Example - Deletion Change: The following processing instruction is an example of how a deletion change is stored in a document:

```xml
<?oxy_delete author="John Doe" timestamp="20090508T164459+0300" content="belong"?>
```

**Tracked Changes Behavior**

The behavior of the *Track Changes feature* *(page 2711)* depends on the context, the type of change, and whether or not it is activated.

**Inserting Content**

If the *Track Changes* feature is disabled and you insert content, the following behavior is possible:

- Making an insertion in a **Delete** change results in the change being split in two and the content is inserted without being marked as change.
- Making an insertion in an **Insert** change results in the change being split in two and the content is inserted without being marked as change.
- Making an insertion in regular content results in a regular insertion.

If the *Track Changes* feature is enabled and you insert content, the following behavior is possible:

- Making an insertion in a **Delete** change results in the change being split in two and the current inserted content appears marked as an INSERT.
- Making an insertion in an **Insert** change results in the following:
  - If the original insertion was made by another user, the change is split in two and the current inserted content appears marked as an INSERT by the current author.
  - If the original **Insert** change was made by the same user, the change is just expanded to contain the inserted content. The creation time-stamp of the previous insert is preserved.
- If inserted in regular content, the current inserted content appears marked as an **Insert** change.
Surrounding Content

If the Track Changes feature is enabled and you surround content in a new XML element, the following behavior is possible:

- Making a surround in a Delete change results in nothing happening.
- Making a surround in an Insert change results in the following:
  - If the original insertion was made by another user, the change is split in two and the surround operation appears marked as being performed by the current author.
  - If the original Insert change was made by the same user, the existing change is just expanded to contain the surrounded content.
- Making a surround in regular content results in the operation being marked as a surround change.

Deleting Characters

If the Track Changes feature is disabled and you delete content character by character, the following behavior is possible:

- Deleting content in an existing Delete change results in nothing happening.
- Deleting content in an existing Insert change results in the content being deleted without being marked as a deletion and the INSERT change shrinks accordingly.
- Deleting in regular content results in a regular deletion.

If the Track Changes feature is enabled and you delete content character by character, the following behavior is possible:

- Deleting content in an existing Delete change results in the following:
  - If the same author created the Delete change, the previous change is marked as deleted by the current author.
  - If another author created the Delete change, nothing happens.
- Deleting content in an existing Insert change results in the following:
  - If the same author created the Insert change, the content is deleted and the Insert change shrinks accordingly.
  - If another author created the Insert change, the Insert change is split in two and the deleted content appears marked as a Delete change by the current author.
- Deleting in regular content results in the content being marked as a Delete change by the current author.
Deleting Selections of Content

If the Track Changes feature is disabled and you delete a selection of content, the following behavior is possible:

- If the selection contains an entire Delete change, the change disappears and the content is deleted.
- If the selection intersects with a Delete change (starts or ends in one), it results in nothing happening.
- If the selection contains an entire Insert change, the change disappears and the content is deleted.
- If the selection intersects with an Insert change (starts or ends in one), the Insert change is shrunk and the content is deleted.

If the Track Changes feature is enabled and you delete a selection of content, the following behavior is possible:

- If the selection contains an entire Delete change, the change is considered as rejected and then marked as deleted by the current author, along with the other selected content.
- If the selection intersects a Delete change (starts or ends in one), the change is considered as rejected and marked as deleted by the current author, along with the other selected content.
- If the selection contains an entire Insert change, the following is possible:
  - If the Insert is made by the same author, the change disappears and the content is deleted.
  - If the Insert is made by another author, the change is considered as accepted and then marked as deleted by the current author, along with the other selected content.
- If the selection intersects an Insert change (starts or ends in one), the Insert change shrinks and the part of the Insert change that intersects with the selection is deleted.

Deleting Tags

Assuming you are using any of the Tag Display Modes (page 331) other than No Tags and the Track Changes feature is disabled, if you delete a start or end tag, both the start and end tag will be removed, while any content that was inside the element is preserved.

Assuming you are using any of the Tag Display Modes (page 331) other than No Tags and the Track Changes feature is enabled, if you delete a start tag of an inline element (page 2707), both the start and end tag are marked as a Delete change by the current author, while any content that was inside the element is preserved.
Copying Content

If the Track Changes feature is disabled and you copy content, if the copied area contains Insert or Delete changes (or attribute edits), these are also copied to the clipboard.

If the Track Changes feature is enabled and you copy content, if the copied area contains Insert or Delete changes (or attribute edits), these are all accepted in the content of the clipboard (the changes will no longer be in the clipboard).

Pasting Content

If the Track Changes feature is disabled and you paste content, if the clipboard content contains Insert or Delete changes (or attribute edits), they will be preserved on paste.

If the Track Changes feature is enabled and you paste content, if the clipboard content contains Insert or Delete changes (or attribute edits), all the changes are accepted and then the paste operation proceeds according to the insertion rules.

Tracked Changes Limitations

There are some inherent limitations to the Change Tracking (page 2711) feature. These limitations include the following:

• **Limitations to rejected changes** - Recording changes has limitations and there is no guarantee that rejecting all changes will return the document exactly to its original state.

• **Limitations to hierarchical changes** - Recorded changes are not hierarchical, a change cannot contain other changes inside. For example, if you delete an insertion made by another user, then reject the deletion, the information about the author who made the previous insertion is not preserved.

• **Limitations to using certain actions** - Some actions cannot be implemented with the Track Changes feature (page 2711) enabled. For example, some of the table-related actions (Delete Row(s), Delete Column(s), Join Cells, Split Cell) ignore the Track Changes feature when executing the action.

Tracked Changes XML Markup

Depending on the type of edits, the following markup appears in the document source code when you activate the Track Changes feature (page 2711):

<table>
<thead>
<tr>
<th>Edit Type</th>
<th>Processing Instruction Start Marker</th>
<th>Processing Instruction End Marker</th>
<th>Attributes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Edit Type</td>
<td>Processing Instruction Start Marker</td>
<td>Processing Instruction End Marker</td>
<td>Attributes</td>
</tr>
<tr>
<td>------------------</td>
<td>-------------------------------------</td>
<td>----------------------------------</td>
<td>---------------------------------</td>
</tr>
<tr>
<td>Split</td>
<td>&lt;?oxy_insert_start?&gt;</td>
<td>&lt;?oxy_insert_end?&gt;</td>
<td>author, timestamp, type=&quot;split&quot;</td>
</tr>
<tr>
<td>Surround</td>
<td>&lt;?oxy_insert_start?&gt;</td>
<td>&lt;?oxy_insert_end?&gt;</td>
<td>author, timestamp, type=&quot;surround&quot;</td>
</tr>
<tr>
<td>Deletion</td>
<td>&lt;?oxy_delete?&gt;</td>
<td>_</td>
<td>author, timestamp, content</td>
</tr>
<tr>
<td>Comment</td>
<td>&lt;?oxy_comment_start?&gt;</td>
<td>&lt;?oxy_comment_end?&gt;</td>
<td>author, timestamp, comment, mid</td>
</tr>
<tr>
<td>Attribute Change</td>
<td>&lt;?oxy_attributes?&gt;</td>
<td>_</td>
<td>id, type, oldValue, author, timestamp</td>
</tr>
</tbody>
</table>

If a comment intersects another, the `mid` attribute is used to correctly identify start and end processing instruction markers.

**Managing Comments**

You can add comments to any selected area of content within XML documents, with the exception of read-only content. The difference between using comments and tracked changes (page 271) is that a comment is associated to a selection without modifying or deleting the content.

By default, when you annotate your XML documents, the comments are displayed in the Author mode as callouts (page 2704) (balloons) and they are rendered with a unique name and background for each user. If comments are not currently displayed in callouts, select the Comments option (page 127) in the Callouts preferences page (page 127). Comments are also displayed in the Review view (page 742).

**Figure 271: Comments in Author Mode**

![Comments in Author Mode](image)

**Managing Comments in the Main Editor**

You can insert and manage comments directly in the main editing area in Author mode.

**Add Comment**
To insert a comment at the cursor position or on a specific selection of content, select the Add Comment action from the toolbar (or in the Review submenu of the contextual menu).

Tip: When adding or editing a comment, you can use Enter to insert line breaks and Oxygen XML Editor plugin will take the line breaks into account when presenting the callout. You can also use Ctrl + Enter to accept your changes and close the dialog box.

Show/Edit Comments

To edit an existing comment that you have added in the main editing area in Author mode, select the Show/Edit Comments action from the toolbar (or in the Review submenu of the contextual menu). The action opens a dialog box that allows you to see and edit your comment at the cursor position. Note that you cannot edit a comment that was added by another user, so in that case, the dialog box just displays the comment without the possibility of editing it.

Remove Comments

To remove a comment at the cursor position or multiple comments in a selection, select Remove Comment(s) from the toolbar (or in the Review submenu of the contextual menu).

Copy/Paste

If you copy content that includes comments, they will be preserved when you paste it.

Managing Comments in Callouts

As long as the Comments option (page 127) is selected in the Callouts preferences page (page 127), comments are also displayed in callouts (page 735). By displaying the comments in callouts, you then have access to even more actions, such as the ability to reply or mark them as being done. When you right-click a specific comment in its callout, the contextual menu includes the following actions.

Reply

Opens a dialog box that allows you to add a reply to a comment or Tracked Changes (page 2711). When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and Review view (page 742).

Mark as Done

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for Tracked Changes (page 2711) that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited.
unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendents. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

- **Show/Edit Comment**
  Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

- **Remove Comment**
  Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

- **Callouts Options**
  Select this option to open the Callouts preference page (page 127) where you can configure various callout options.

Tip: When adding, editing, or replying to a comment, you can use Enter to insert line breaks and Oxygen XML Editor plugin will take the line breaks into account when presenting the callout. You can also use Ctrl + Enter to accept your changes and close the dialog box.

**Managing Comments in the Review View**

The Review view (page 742) is also useful for managing comments. In this view, comments are presented in a compact form, in the order they appear in the document, along with tracked changes. You can also use this view to search for specific comments and it includes some filtering options (for example, you can filter it to only show comments for a particular author). When you right-click a specific comment in the Review view, the contextual menu includes the following actions.

- **Reply**
  Opens a dialog box that allows you to add a reply to a comment or Tracked Changes (page 2711). When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and Review view (page 742).

- **Mark as Done**
  A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for Tracked Changes (page 2711) that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular
comment and all of its descendents. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

**Show/Edit Comment**

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

**Remove Comment**

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

**Show only reviews by ‘<author name>’**

Filters the comments to only show comments for the particular author.

**Remove all Comments**

Removes all comments from the document.

**Comments XML Source Code**

The comments are stored in the document source code as processing instructions that contain information about the author name and the comment time:

```xml
<?oxy_comment_start author="John Doe" timestamp="20090508T164459+0300" comment="Do not change this content"?>
  Important content
<?oxy_comment_end?>
```

Replies to comments are stored in the document source code as a comment (with information about the author name and time), but with a `parentID` attribute and its value is the same as the `id` value of the parent comment.

```xml
<?oxy_comment_start author="Tom" timestamp="20160217T102630+0200" comment="We should not forget about recycling the oil and oil filter!"
  parentID="vws_x4l_1v" mid="4"?>
```

Managing Highlights

Use the Highlight tool to mark fragments in your document using various colors. This is especially useful when you want to mark sections that needs additional editing or to draw the attention of others to particular content.

Using the Highlight Tool

You can find the Highlight action on the main toolbar, in the Edit > Review menu, or in the Review submenu of the contextual menu of a document. You can also choose the color to use for the highlight or choose to Stop highlighting from the same menus.

To highlight content, follow these steps:

1. Click the Highlight icon on the toolbar.
   
   Step Result: The highlighting mode is on and the cursor changes to a dedicated symbol.

2. Click the small arrow next to the Highlight icon and select the color that you want to use for the highlighting.

3. Select the content you want to highlight. To mark multiple parts of a document, press and hold Ctrl (Meta on Mac OS) and select the parts you want to highlight.

4. To exit the highlighting mode, press Esc, click the Highlight icon, or start editing the document.

To remove highlighting from a document, follow these steps:

1. Either select the text you want to remove highlighting from using your cursor, or press Ctrl + A (Command + A on OS X) if you want to select all of the text.

2. Click the small arrow next to the Highlight icon and select No color (erase), or right-click the highlighted content and select Remove highlight(s).

3. To exit the highlighting mode, press Esc, click the Highlight icon, or start editing the document.

Note: Oxygen XML Editor plugin preserves the highlighting of a document between working sessions. Also, if you copy content that includes highlights, the highlighting will be preserved when you paste it.
Review View

The Review view (page 742) is also useful for managing highlights. In this view, the highlights are presented in a compact form, in the order they appear in the document, along with tracked changes (page 2711) and comments. The following actions are available in the contextual menu of each highlight in the Review view:

**Change Color**
- Allows you to change the color of an existing highlight by selecting the new color from this menu.

**Remove Highlight**
- Removes the selected highlight.

**Remove Highlights with the Same Color**
- Removes the selected highlight and all others that have the same color.

**Remove All Highlights**
- Removes all highlights from the document.

Highlights XML Source Code

The highlights are stored in the document source code as processing instructions that contain information about the color:

```xml
<?oxy_custom_start type="oxy_content_highlight" color="0,128,255"?>
The highlights are stored<?oxy_custom_end?>
```

Author Callouts

Oxygen XML Editor plugin uses callouts (page 2704) to present comments and tracked change (page 2711) modifications that you or other members of your team have added to the document.
Displaying Callouts in Author Mode

The callouts are displayed in the right side of the editing area in Author mode. They are decorated with a colored border and also have a colored background. The background color is assigned automatically by the application depending on the user who is editing the document and the type of change, but it can also be customized from the Review preferences page (page 124). This preferences page allows you to configure the colors for tracked change insertions or deletions, and for comments.

You can also choose to use the same color for all changes of that particular type of change, regardless of who makes the change. To do this, select the Fixed option for the particular type of change and choose a color from the color box. If the Automatic option is selected, Oxygen XML Editor plugin automatically assigns a color based upon the Colors for automatic assignment list (page 126).

The horizontal line that connects the callouts to their corresponding text fragments has the same color as the border. If this horizontal line is not visible, select the Show all connecting lines option (page 127) in the Callouts preferences page. If you hover over a callout, it is highlighted and a tooltip is displayed that contains additional information.

Figure 272: Multiple Author Callouts

Note: Oxygen XML Editor plugin displays callouts only if View All Changes/Comments or View Only Changes/Comments by is selected in the Track Changes Visualization Modes drop-down menu. Oxygen XML Editor plugin does not display callouts in View Final and View Original modes.
In some cases, the text you are editing can span into the callouts area. For example, this situation can appear for callouts associated with wide images or space-preserved elements (page 2711) that contain long fragments (such as a DITA codeblock element or programlisting in DocBook). To help you view the text under the covered area, Oxygen XML Editor plugin applies transparency to these callouts. When the cursor is located under a callout, the transparency is enhanced, allowing you to both edit the covered content and access the contextual menu of the editing area.

![Transparent Callout](image)

**Adjusting Callout Width**

To display more of the content in all the callouts in the current document, you can adjust the width by dragging the left side of any of the callouts. This will adjust the width for all comments in the current document. When you end the current editing session, the width of all callouts will revert back to the default value, which is the value of the Initial Width option (page 127) in the Callouts preferences page.

You can also adjust the maximum number of lines to be shown in the callouts using the Text Lines Count Limit option (page 128). Note that this does not limit the number of lines in the actual comment. It only limits the number of lines shown without opening or editing it.

**Type of Callouts in Oxygen XML Editor plugin**

Oxygen XML Editor plugin uses callouts to display comments and Tracked Changes (page 2711) that you associate with fragments of the document you are editing. You can choose which types of edits will be shown in callouts by configuring the options in the Callouts preferences page (page 127). You can choose to enable the following types of review callouts:

- **Comment Callouts** - As long as the Comments option (page 127) is selected in the Callouts preferences page (page 127), comments are displayed in callouts. A comment callout contains the name of the author who inserts the callout and the comment itself. You can also select the Show review time option (page 127) to include timestamp information in the comment callouts.
There are several types of comments that can be added in Author mode:

- **Author Review Comments** - Comments that you associate with specific content. To insert this type of comment, select the content and use the Add Comment action that is available on the toolbar (or in the Review submenu of the contextual menu).
- **Comments Added to Tracked Changes** - Comments that you add to an already existing tracked change insertion or deletion. To insert this type of comment, right-click the change in the main editor or its callout and select Comment Change.
- **Replies to Comments** - You can use this type of comment to create discussion threads. To insert this type of comment, right-click the change in the its callout and select Reply. A single callout is presented for a root comment or change and its replies. The replies are displayed with an indentation in the callouts and those that are on the same level are sorted depending on the timestamp.

*Figure 275: Callout for a Comment with Replies*

**Tip:** When adding, editing, or replying to a comment, you can use Enter to insert line breaks and Oxygen XML Editor plugin will take the line breaks into account when presenting the callout. You can also use Ctrl + Enter to accept your changes and close the dialog box.

- **Tracked Change Deletion Callouts** - As long as the Track Changes Deletions option (page 127) is selected in the Callouts preferences page (page 127), deletions that are made while the Track Changes feature is enabled are displayed in callouts. A deletion callout contains the type of callout (Deleted) and the name of the author that made the deletion. You can also select the Show deleted content in callout option (page 127) to display the actual deleted content in the callout. Additionally, you can select the Show review time option (page 127) to include timestamp information in the deletion callouts.

*Figure 276: Deletion Callouts*
• **Tracked Change Insertion Callouts** - As long as the **Track Changes Insertions** option (page 127) is selected in the **Callouts preferences page** (page 127), insertions that are done while the **Track Changes** feature is enabled are displayed in callouts. An insertion callout contains the type of callout (Inserted) and the name of the author that inserted the content. You can also select the **Show inserted content in callout** option (page 127) to display the actual deleted content in the callout. Additionally, you can select the **Show review time** option (page 127) to include timestamp information in the deletion callouts.

Figure 277: Insertion Callouts

**Callout Contextual Menu Actions**

Some useful actions are available when the contextual menu is invoked on a callout. The actions depend on the type of callout.

**Insertion or Deletion Callout Actions**

The following actions are available in the contextual menu of an insertion or deletion callout:

**Reply**

Opens a dialog box that allows you to add a reply to a comment or **Tracked Changes** (page 2711). When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and **Review view** (page 742).

**Mark as Done**

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for **Tracked Changes** (page 2711) that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendents. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.
Accept Change

Accepts the tracked change, removes the callout, and moves to the next change. For an insertion change, it keeps the inserted text and for a deletion change, it removes the content from the document.

Reject Change

Rejects the tracked change, removes the callout, and moves to the next change. For an insertion change, it removes the inserted text and for a deletion change, it preserves the original content.

Comment Change

Opens a dialog box that allows you to add a comment to an existing Tracked Change (page 2711). The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

Edit Reference

If the fragment that contains a callout is a reference, use this option to go to the reference and edit the callout.

Callouts Options

Select this option to open the Callouts preference page (page 127) where you can configure various callout options.

Comment Callout Actions

The following options are available in the contextual menu of a comment callout:

Reply

Opens a dialog box that allows you to add a reply to a comment or Tracked Changes (page 2711). When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and Review view (page 742).

Mark as Done

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for Tracked Changes (page 2711) that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all
of its descendents. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

- **Show/Edit Comment**
  
  Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

- **Remove Comment**
  
  Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

- **Edit Reference**
  
  If the fragment that contains a callout is a reference, use this option to go to the reference and edit the callout.

- **Callouts Options**
  
  Select this option to open the Callouts preference page (page 127) where you can configure various callout options.

---

### Printing Callouts

When you print a document from Author mode, all callouts that you or other authors have added to the document are printed. For a preview of the document and its callouts, go to **File > Print Preview**.

### Review View

The Review view (page 742) is also useful for managing the information in callouts. In this view, changes and comments are presented in a compact form, in the order they appear in the document, and they are synchronized with the changes in the callouts. You can also search for specific changes or comments and it includes some filtering options (for example, you can filter it to only show certain types of edits or to only show edits for a particular author).

For more information, see Review View (page 742).

Related Information:
Review View

The Review view is an independent panel, available both for built-in and custom XML document frameworks (page 2706). It is designed to offer an enhanced way of monitoring all the changes that you make to a document. This means you can view and manage highlights, comments, and tracked changes (page 2711) using a single view.

The Review view is useful when you are working with documents that contain large number of edits. The edits are presented in a compact form, in the order they appear in the document. Each type of edit is marked with a specific icon. This view and the editing area are synchronized. When you select an edit listed in the Review view, its corresponding fragment of text is highlighted in the editing area and the reverse is also true. For example, when you place the cursor inside an area of text marked as inserted, its corresponding edit is selected in the list.

You can use this view to quickly navigate through changes and it includes some useful hover actions and contextual menu actions to help you manage changes, comments, and highlights. You can also search for specific changes or comments and it includes some filtering options (for example, you can filter it to only show certain types of edits or to only show edits for a particular author).

Figure 278: Review View
Activating the Review View

To activate the Review view, do one of the following:

- Click the Manage reviews button on the toolbar.
- Right-click anywhere in a document and select Review > Manage reviews.
- Open it from the Window > Show View menu.

Review View Toolbar Actions and Settings

The upper part of the view contains a filtering area that allows you to search for specific edits. The filter field also includes a search history drop-down list. The toolbar also includes a Settings menu button.

Settings

The Settings menu includes the following options:

Show highlights

Controls whether or not the Review view displays the highlighting in your document.

Show comments

Controls whether or not the Review view displays the comments in the document you are editing.

Show track changes

Controls whether or not the Review view displays the inserted and deleted content in your document.

Show reviews in read-only content

Controls whether or not the Review view displays review items from content referenced with a @conref or @conkeyref attribute.

Show review time

Displays the time when the edits from the Review view were made.

Sort by date

Expands to offer the following sorting options: Oldest to newest, Newest to oldest, and No sorting.

Configure review options
Opens the Review preferences page (page 124) where you can configure various options for review information.

**Hover Actions in the Review View**

You can use this view to easily manage changes, highlights, and comments that have been added by you or other users. The following actions are available when you hover over the changes in the Review view:

- **Remove**
  
  Available for highlights and comments presented in the Review view and it removes the particular highlight or comment from your document and moves to the next change.

- **Accept**
  
  Available for inserted and deleted content presented in the Review view and it accepts the particular change in your document and moves to the next change.

- **Reject**
  
  Available for inserted and deleted content presented in the Review view and it rejects the particular change in your document and moves to the next change.

**Contextual Menu Actions in the Review View**

Depending on the type of an edit, the following additional actions are available in the contextual menu of the Review view:

- **Reply**
  
  Opens the Reply dialog box where you can add a reply to comment or change. The replies are displayed with an indentation in this view.

- **Mark as Done**
  
  Toggles the comment or change as being done and grays it out. You can mark a whole discussion thread as being done by selecting the action on the first (parent) comment in the thread.

- **Show Comment**
  
  Available for comments added by other users and you can use this option to view it in a Show comment dialog box.

- **Edit Comment**
  
  Available for comments you have added and you can use this action to edit a comment.

- **Remove Comment**
Use this action to remove the selected comment.

**Show only Reviews by `<author name>`**

Use this action to filter the edits to only show them for a certain author.

**Remove All Comments**

Use this action to remove all the comments that appear in the edited document.

**Change Color**

Available for highlights and it opens a palette that allows you to choose a new color for the highlighted content.

**Remove Highlight**

Use this action to remove the selected highlight.

**Remove Highlights with the Same Color**

Use this action to remove all the highlights with the same color from the entire document.

**Remove All Highlights**

Use this action to remove all the highlights in your document.

✓ **Accept Change**

Accepts the selected change and moves to the next change.

✖ **Reject change**

Rejects the selected change and moves to the next change.

✉ **Comment change**

Available for insertions or deletions and you can use this option to add a comment for the particular change.

✓✓ **Accept all changes**

Accepts all the changes in the current document.

✓✗ **Reject all changes**

Rejects all the changes in the current document.

Profiling and Conditional Text

Profiling text is a way to mark blocks of text meant to appear in some renditions of the document but not in others. Conditional text differs from one variant of the document to another, while unconditional text appears in all document versions. For example, you can mark a section of a document that is to be included in a manual to be designated for expert users and another section for novice users, while unmarked sections are included in all renditions.

**Profiling Attributes and Condition Sets**

Oxygen XML Editor plugin allows you to define values for the profiling attributes and they can be easily managed to filter content in the published output. You can switch between profile sets to see how the edited content looks like before publishing. You can also conditionally profile parts of a document so that certain parts are displayed when certain profiling conditions are set. You can even customize the colors and styling of how the profiling is displayed in Author mode.

You can use profiling and conditional text to help you create documentation for multiple output scenarios, including:

* Multiple outputs for a series of similar products.
* Multiple outputs for various releases of a product.
* Multiple outputs for various audiences.

This feature helps to reduce the effort for updating and translating your content and provides an easy way to customize the output for various audiences.

*Figure 279: Example: Profiling Content*
Oxygen XML Editor plugin includes a preconfigured set of profiling attribute values for some of the most popular document types. These attributes can be redefined to match your specific needs in the Profiling/Conditional Text preferences page (page 119). You can also define your own profiling attributes and condition sets for each document type (framework (page 2706)).

For information about creating and editing profiling attributes, see Creating and Editing Profiling Attributes (page 747).

For information about creating and editing condition sets, see Creating and Editing Profiling Condition Sets (page 752).

Creating and Editing Profiling Attributes

Oxygen XML Editor plugin includes support for defining your own profiling attributes, or modifying existing ones, for each particular document type (framework (page 2706)). You can then apply the profiling attributes to content in Author mode to see how the profiling will affect the output.

Create or Editing Profiling Attributes

To create or edit profiling attributes for a specific document type, follow these steps:

1. Make sure the attribute is already defined in the document DTD or schema before continuing with the procedure.
2. Open the Preferences dialog box (page 55) and go to Editor > Edit modes > Author > Profiling/Conditional Text.

Information: The Profiling Attributes section (page 120) is used to define the attributes and their values for each document type.
3. To add new attributes and values, click the **New** button at the bottom of the **Profiling Attributes** table. To customize existing attributes and their values, select an attribute and click the **Edit** button.

**Step Result:** In either case, this opens a **Profiling Attribute** configuration dialog box where you can define attributes that exist in your schema.

![Profiling Attribute Dialog Box](image)

The following options are available in this dialog box:

**Document type**

Select the document type (*framework (page 2706)*).

**Tip:** You can use the * or ? wildcards in this combo box. For example, DITA* would match any document type that starts with "DITA". You can also specify multiple document types by using commas to separate them.

**Attribute name**

The name of the profiling attribute.

**Display name**

This optional field is used for descriptive rendering in profiling dialog boxes.

**Attribute Values Table**
This table displays information about the values for the profiling attribute. You can configure them by using the buttons at the bottom of the table (➕ New, ✏️ Edit, ✗ Delete).

The columns are as follows:
- **Value** - The attribute value.
- **Label** - You can specify a label for the attribute value that will be rendered as its name in various components in Author mode (Edit Profiling Attributes dialog box (page 750), Condition Set dialog box (page 752), and other UI components where the profiling is shown (page 756)). If the Label is not specified, the Value will be used as its rendered name.
- **Description** - A description for the attribute value that will be displayed in this table.

**Single value**
Select this option if you want the attribute to only accept a single value.

**Multiple values separated by**
Select this option if you want the attribute to accept multiple values, and you can choose the type of delimiter to use. You can choose between space, comma, and semicolon, or you can enter a custom delimiter in the text field. A custom delimiter must be supported by the specified document type. For example, the DITA document type only accepts spaces as delimiters for attribute values.

4. After defining or configuring the attributes and their values according to your needs, click OK to confirm your selections and close the Profiling Attributes configuration dialog box.
5. Click Apply to save the changes.

**Adding Profiling Attribute Values Directly in a Document**

You can add values directly to the existing profiling attributes in a document using the In-Place Attributes Editor (page 692) in Author mode, the Attributes view (page 319), or in the source code in Text mode. However, this just adds them to the document and does not change the conditional text configuration. If you invoke the Edit Profiling Attributes action (from the contextual menu in Author mode) on the new value, the Profiling Values Conflict dialog box will appear and it includes an Add these values to the configuration action that will automatically add the new value to the particular profiling attribute. It also includes an Edit the configuration action that opens the Profiling / Conditional Text preferences page (page 119) where you can edit the profiling configuration.

**Note:** If the Allow contributing extra profiling attribute values (page 121) option is not selected in the Profiling / Conditional Text preferences page, the Profiling Values Conflict dialog box will never appear, so this automatically adding value not be possible.
Applying Profiling Attributes

Profiling attributes are applied on element nodes. You can apply profiling attributes on a text fragment (it will automatically be wrapped into a phrase-type element), on a single element, or on multiple elements at the same time. If there is no selection in your document, the profiling attributes are applied on the element at the cursor position.

To apply a profiling attribute to content in **Author** mode, follow these steps:

1. To apply a profiling attribute to content in **Author** mode, highlight the content and select **Edit Profiling Attributes** from the contextual menu. To profile an entire element, position the cursor inside the element, right-click, and select **Edit Profiling Attributes** (you can also right-click the element in the breadcrumbs (page 684) or **Outline** (page 316) view).

   **Step Result:** The **Edit Profiling Attributes** dialog box is displayed and shows all the profiling attributes and their values, as defined for the particular document type (framework). If you have
a large list of profiling attributes, you can use the text filter field to search for attributes or values, and you can expand or collapse attributes by using the Expand All / Collapse All buttons to the right of the text filter or the arrow button to the left of the profiling attribute name.

The attributes and values that appear in the dialog box are determined as follows:

- If you have defined profiling attribute values (page 747) for the DITA document type in the Profiling/Conditional Text preferences page (page 119), those values are displayed in the dialog box.
- Otherwise, a generic default set of profiling attributes and values are available.

Figure 282: Edit Profiling Attributes Dialog Box

2. In the Edit Profiling Attributes dialog box, select the checkboxes that correspond to the attribute values you want to apply on the document fragment (page 2705).

3. Click OK to finish the profiling configuration.

Result: The attribute names and values selected in the Edit Profiling Attributes dialog box are set on the elements contained in the profiled fragment. If you only select a fragment of content (rather than the entire element), this fragment is wrapped in phrase-type elements in which the profiling attributes are set.

If the Show Profiling Attributes option (page 756) (available in the Profiling / Conditional Text toolbar menu) is selected, a green border is painted around profiled text in the Author mode and all profiling attributes set on the current element are listed at the end of the highlighted block.

To edit the attributes of a profiled fragment, click one of the listed attribute values. A form control pops up and allows you to add or remove attribute values.

Figure 283: Profiling Attribute Value Form Control Pop Up
Creating and Editing Profiling Condition Sets

Multiple profiling attributes can be aggregated into a profiling condition set that allows you to apply more complex filters on the document content. A Profiling Condition Set is a very powerful and convenient tool that can be used to preview the content that goes into the published output. For example, an installation manual available in both Windows and Linux variants can be profiled to highlight only the Linux procedures for more advanced users.

Create Profiling Condition Sets

To create a new profiling condition set, follow these steps:

1. Open the Preferences dialog box (page 55) and go to Editor > Edit modes > Author > Profiling/Conditional Text.
**Information:** The **Profiling Condition Sets** section (page 121) is used to define condition sets.

2. To add new condition set, click the **New** button at the bottom of the **Profiling Condition Sets** table. To customize existing condition sets, select an existing condition set and click the **Edit** button.

**Step Result:** In either case, this opens a **Condition Set** configuration dialog box where you can define attributes that exist in your schema.

*Figure 284: Condition Set Configuration Dialog Box*

The following options are available in this dialog box:

**Name**

The name of the new condition set.

**Document type**

Select the document type (**framework (page 2706)**) for which you have defined profiling attributes.

**Use DITAVAL file**
For DITA projects, select this option if you want the *Profiling Condition Set* to reference a [DITAVAL file](page 2656). You can specify the path by using the text field, its history drop-down, the *Insert Editor Variables* (page 201) button, or the browsing actions in the *Browse* drop-down list.

**Include the content matching the following conditions**

You can select this option to define the combination of attribute values for your condition set by selecting the appropriate checkboxes for the values you want to be included in this particular condition set. If you have defined a lot of profiling attributes, you can use the *filter* text field to search for specific conditions.

3. After defining or configuring the condition sets according to your needs, click **OK** to confirm your selections and close the **Condition Set** configuration dialog box.

4. Click **Apply** to save the condition set.

**Result:** All saved profiling condition sets are available in the *Profiling / Conditional Text* toolbar drop-down menu (page 756).

**Applying Profiling Condition Sets**

All defined *Profiling Condition Sets* (page 752) are available as shortcuts in the *Profiling / Conditional Text* toolbar menu (page 756). Select a menu entry to apply the condition set. The filtered content is then grayed-out in the **Author** mode and **Outline view** (page 316). An element is filtered-out when one of its attributes is part of the condition set and its value does not match any of the value covered by the condition set.

**EXAMPLE:**
Suppose that you have the following document:

```
Spray painting
Short Description: When paint is applied using a spray nozzle, it is referred to as spray painting.
Context:
   The garage is a good place to spray paint.

Step 1  Move the car out of the garage to avoid getting paint on it. Audience [novice]
Step 2  Place newspaper, cardboard, or a drop-cloth on the garage floor. Audience [expert]
Step 3  Place the object to be painted on the covered area. Audience [expert] Other [prop2]
Step 4  Follow the directions on the paint can to paint the object. Audience [expert] Other [prop1]
Step 5  Let the paint dry thoroughly before you move the object. Audience [novice] Other [prop1]
```

If you apply the following condition set, it means that you want to filter out the content to only include content profiled with the `expert` value for the `@audience` attribute and content that has the `prop1` value for the `@other` attribute.

This is how the document looks in **Author** mode after you apply the condition set:
You can visualize the effects of profiled content in **Author** mode by using the options in the `Profiling/Conditional Text` drop-down menu that is located on toolbar. This drop-down menu includes the following filtering options:

**Show Profiling Colors and Styles**

Select this option to show colors and styles for profiled content in **Author** mode. You can configure the colors and styles or specify whether or not this option is selected by default in the `Profiling/Conditional Text > Colors and Styles` preferences page *(page 122).*

Show Profiling Attributes

Select this option to display the values of the profiling attributes at the end of profiled content in Author mode. You can specify whether or not this option is selected by default in the Profiling/Conditional Text > Attributes Rendering preferences page (page 122).

Show Excluded Content

Controls whether the content filtered out by a particular condition set is hidden or grayed-out in Author mode and the Outline (page 316) view. When this option is selected and a condition set is selected in this drop-down menu (page 757), the filtered content is grayed-out. If this option is not selected and a condition set is selected in this drop-down menu (page 757), the filtered content is hidden. You can specify whether or not this option is selected by default in the Profiling/Conditional Text preferences page (page 121).

Choose Condition Set (Available if more than 15 condition sets are defined)

This option is available if you have more than 15 conditions sets defined. It opens a dialog box that makes it easier to find and select condition sets that are not displayed in this drop-down menu.

List of Defined Condition Sets

Up to 15 defined condition sets are listed and you can toggle each one of them on to filter the content in Author mode to only show content that will appear in the output for that particular condition set. If there are more than 15 defined condition sets, the rest of them can be accessed in the More submenu or by using the Choose Condition Set option (page 757) to access a dialog box that presents all of them.

Profiling Settings

Opens the Profiling/Conditional Text preferences page (page 119) where you can add and edit profiling attributes and condition sets.

Customizing Colors and Styles for Rendering Profiling in Author Mode

By applying profiling colors and styles, you can mark profiled content in **Author** mode so that you can instantly spot differences between multiple variants of the output. This allows you to preview the content that will go into the published output. The excluded text is grayed-out or hidden in **Author** mode, allowing you to easily recognize the differences.

**Figure 287: Example: Profiling Colors and Styles in Author Mode**

Choosing the right style for a specific profiling attribute is a matter of personal taste, but be aware of the following:

- If the same block of text is profiled with two or more profiling attributes, their associated styles combine. Depending on the styling, this might result in an excessively styled content that may prove difficult to read or work with.
- It is recommended that you only profile the differences. There is no need to profile common content, since excessive profiling can visually pollute the document.
- A mnemonic associated with a style will help you instantly spot differences in the types of content.

**Styling Profiling Attribute Values**

To set colors and styles for profiling attribute values, follow these steps:
1. Select the **Show Profiling Colors and Styles** option (page 756) from the **Profiling / Conditional Text** toolbar drop-down menu.

2. Select **Profiling Settings** (page 757) from the **Profiling / Conditional Text** toolbar drop-down menu. This is a shortcut to the **Profiling/Conditional Text** preferences page (page 119).

3. Go to the **Colors and Styles** preferences page (page 122) to configure the colors and styling for the profiling attributes.

4. Go to the **Attributes Rendering** preferences page (page 121) to configure how you want the profiling attributes to appear in Oxygen XML Editor plugin.

**Result:** The styling is now applied in the **Author** editing mode and the **Outline view** (page 316). Also, to help you more easily identify the profiling you want to apply in the current context, the styling is applied in the **Edit Profiling Attributes** dialog box (page 747) and in the inline form control pop up that allows you to quickly set the profiling attributes.

Adding Tables in Author Mode

You can use the Insert Table action on the toolbar or from the contextual menu to add a table in various frameworks (page 2706) (DITA, DocBook, TEI, and XHTML). This opens the Insert Table dialog box. Each framework has a different set of options that are available in this dialog box for configuring the properties of the tables. In all cases, Oxygen XML Editor plugin includes some general editing actions for configuring tables in Author mode.

This section explains those general actions and the various configuration options and layouts for tables that are inserted in the most commonly used document types.

Editing Tables in Author Mode

Oxygen XML Editor plugin provides support for editing data in a tabular form. A variety of features and operations are available for editing tables in Author mode and they include the following:

Adjusting Column Width

To adjust the width of a column or table, drag the border of the column or table. The changes you make to a table are committed into the source document. You can also manage table width and column width specifications from the source document, and some types of tables include a colspecs section that appears above the table in Author mode that allows you to easily configure some column specifications (such as column width). These column width specifications are supported in fixed, dynamic, and proportional dimensions. The built-in DITA, DocBook, and XHTML frameworks (page 2706) support this feature. The layout of the tables for these document types takes into account the table width and the column width specifications particular to them.

Figure 289: Resizing a Table Column in Author Mode

Selecting Columns and Rows

To select a row or a column of a table, place the mouse cursor above the column or in front of the row you want to select, then click. When hovering the mouse cursor in front of rows or above column
headers, the cursor changes to for row selection and to for column selection and that specific row or column is highlighted.

You can use the Ctrl and Shift keys to select multiple rows.

**Selecting Cells**

To select a cell in a table, press and hold the Ctrl key and click anywhere inside the cell. You can also use the Ctrl and Shift keys to select multiple cells or to deselect cells from a selection. Alternatively, you can click the left corner of a cell (right corner if you are editing a RTL document) to select it. The cursor changes to when you hover over the corner of the cell.

You can also select multiple rectangular blocks of cells by using your mouse to select a cell and drag it to expand the selection.

**Drag and Drop**

You can use the drag and drop action to edit the content of a table. You can select a column and drag it to another location in the table you are editing. When you drag a column and hover the cursor over a valid drop position, Oxygen XML Editor plugin decorates the target location with bold rectangles. The same drag and drop action is also available for entire rows or columns by hovering the mouse cursor in front of rows or above column headers, then selecting the row or column and dragging them to the desired location.

**Copy/Cut and Paste**

In Oxygen XML Editor plugin, you can copy/cut entire rows or columns of the table you are editing and paste the copied columns or rows inside the same table or inside other tables. You can also use the copy or cut actions for tables located in other documents. If you paste a row or column into non-table content, Oxygen XML Editor plugin introduces a new table that contains the fragments of the copied row or column content.

For copied columns, the fragments are introduced starting with the header of the column. Also, if the copied column is from a CALS table, Oxygen XML Editor plugin preserves column width information. This information is then used when you paste the column into another CALS table.

For copied cells, when pasting them into another cell without a selection (the cursor is just placed in the new cell), the copied cells are pasted while preserving their initial order and spacing. If pasting them into a selection of cells, first the content of the selected cells is deleted, then the copied cells are pasted with their initial order and spacing preserved and if there are more cells in the selection than in the copied content, the pasting will repeat the copied cells until the end of the selection.
Deleting Content

To delete the content of a cell, select the cell and press the **Delete** or **Backspace** key on your keyboard. If you press **Delete** or **Backspace** again, the selected table structure will also be removed.

To delete an entire row or column, place the cursor inside the row or column (or select it) and use the **Delete Row(s)** or **Delete Column(s)** actions from the toolbar or contextual menu. This will delete both the content and the table structure for the current row or column.

To delete a selection of multiple rows or columns, select them and use the **Delete Row(s)** or **Delete Column(s)** actions from the toolbar or contextual menu. This will delete both the content and the table structure for all rows or columns that exist in the current selection.

Navigating Cells

Along with the normal mouse navigation, you can also navigate between cells by using the arrow keys on your keyboard. By default, when using the arrow keys to navigate between table cells, the cursor jumps from one cell to another. However, if the **Quick navigation in tables** option (page 118) is not selected in the **Cursor Navigation** preferences page, using the arrow keys to navigate between table cells will cause the cursor to navigate between XML nodes, rather than jumping from cell to cell.

Adding Tables in DocBook

You can use the **Insert Table** action on the toolbar or from the contextual menu to add a table in a DocBook document.

DocBook supports two types of tables:

- **CALS** table model - This is used for more advanced functionality.
- **HTML** table model - This is used for inserting a formal (captioned) HTML table.
Inserting a CALS Table Model in DocBook

To insert a CALS table model in DocBook documents, select the **Insert Table** action on the toolbar or from the contextual menu. The **Insert Table** dialog box appears. Select **CALS** for the table **Model**. This model allows you to configure a few more properties than the **HTML** model.

**Figure 290: Insert Table Dialog Box - CALS Model**

The dialog box allows you to configure the following options when you select the **CALS** table model:

**Title**

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

**Table Size**

Allows you to choose the number of **Rows** and **Columns** for the table.

**Generate table header**

If selected, an extra row will be inserted at the top of the table to be used as the table header.

**Generate table footer**

If selected, an extra row will be inserted at the bottom of the table to be used as the table footer.

**Column widths**

Allows you to specify the type of properties for column widths (**colwidth** attribute). You can choose one of the following properties for the column width:
- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a `colwidth` attribute with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, `colwidth="1* 2* 3*"` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the `colwidth` attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the `colwidth` attribute is 1*.

- **dynamic** - If you choose this option, the columns are created without a specified width (`colwidth` attribute). Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

- **fixed** - The width is specified in fixed units. By default, the `pt` unit is inserted, but you can change the units in the `colspecs` (column specifications) section above the table or in **Text** mode. The following units are allowed: `pt` (points), `cm` (centimeters), `mm` (millimeters), `pi` (picas), `in` (inches).

### Frame

allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. There are a variety of allowed values, as specified in the DocBook CALS table specifications.

### Row separator

Specifies whether or not to include row separators (`rowsep` attribute). The allowed values are: 0 (no separator) and 1 (include separators).

### Column separator

Specifies whether or not to include column separators (`colsep` attribute). The allowed values are: 0 (no separator) and 1 (include separators).

### Alignment

Specifies the alignment of the text within the table (`align` attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.
Note: The justify value cannot be rendered in Author mode, so you will only see it in the output.

- char - Aligns text to the leftmost occurrence of the value specified on the char attribute for alignment.

Note: The options in the Insert Table dialog box for DocBook documents are persistent, so changes made in one session will carry over to another.

When you click Insert, a CALS table is inserted into your document at the current cursor position.

When you insert a CALS table, you see a link for setting the colspecs (column specifications) of your table. Click the link to open the controls that allow you to adjust various column properties. Although they appear as part of the Author mode (page 303), the colspecs link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

Figure 291: CALS Table in DocBook

Inserting an HTML Table Model

To insert an HTML table model in DocBook documents, select the Insert Table action on the toolbar or from the contextual menu. The Insert Table dialog box appears. Select HTML for the table Model.

Figure 292: Insert Table Dialog Box - Simple Model
The dialog box allows you to configure the following options when you select the HTML table model:

**Title**

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

**Table Size**

Allows you to choose the number of **Rows** and **Columns** for the table.

**Generate table header**

If selected, an extra row will be inserted at the top of the table to be used as the table header.

**Generate table footer**

If selected, an extra row will be inserted at the bottom of the table to be used as the table footer.

**Column widths**

Allows you to specify the type of properties for column widths (**width** attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a **width** attribute (in a **col** element) with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, `width="1* 2* 3*"` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the **width** attribute
are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the `width` attribute is `1*`.

- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

- **fixed** - The width is specified in fixed units. By default, the `pt` unit is inserted, but you can change the units in the section above the table or in **Text** mode. In addition to the standard pixel, percentage, and relative values, this attribute also allows the special form "0*" (zero asterisk), which means that the width of each column in the group should be the minimum width necessary to hold the contents.

**Frame**

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. There are a variety of allowed values, as specified in the DocBook HTML table specifications.

**Alignment**

Specifies the alignment of the text within the table (`align` attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

**Note:** The `justify` value cannot be rendered in **Author** mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the `char` attribute for alignment.

**Note:** The options in the **Insert Table** dialog box for DocBook documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, an HTML style of table is inserted into your document at the current cursor position.

When you insert an HTML table, you see a section above the table that allows you to easily configure some properties without opening the **Table Properties** dialog box. Although this section appears as part of the **Author mode** *(page 303)*, it will not appear in your output. It is just there to make it easier to adjust how the columns of your table are formatted.
Editing an Existing Table

You can edit the structure of an existing table using the table buttons on the toolbar (or in the contextual menu) to add or remove cells, rows, or columns, and to set basic table properties. Additional attributes can be used to fine-tune the formatting of your tables by using the Attributes view (page 319) (Window > Show View > Attributes).

You can also use the Table Properties (Ctrl + T (Command + T on OS X)) (page 786) action from the toolbar or contextual menu to modify many of the properties of the table (page 771).

Also, remember that underneath the visual representation, both table models are really just XML. If necessary, you can edit the XML directly by switching to Text mode (page 223).

DocBook Table Layouts

The DocBook framework (page 2706) supports the following two table model layouts:

- CALS table model (page 769)
- HTML table model (page 770)

CALS Table Model Layout

The CALS table model allows for more flexibility and table customization than other models. When choosing a CALS table model from the Insert Table dialog box, you have access to more configurable properties. The layout of a CALS table includes a colspecs section that allows you to easily configure some properties without opening the Table Properties dialog box. For example, you can change the value of column widths (colwidth attribute) or the text alignment (align attribute). Although they appear as part of the Author mode (page 303), the colspecs link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

Figure 293: CALS Table in DocBook
**HTML Table Model Layout**

Choosing an *HTML* table model from the **Insert Table** dialog box in a DocBook document inserts a formal (captioned) HTML table. The layout of an *HTML* table includes a section above the table that allows you to easily configure some properties without opening the **Table Properties** dialog box. For example, you can change the value of column widths (**width** attribute) or the text alignment (**align** attribute). Although these properties appear as part of the **Author mode** (page 303), they will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

*Figure 294: HTML Table in DocBook*

**Pasting Tables in DocBook**

Tables that are pasted into a DocBook file are automatically converted to the **CALS** model. If you want to overwrite this behavior and instruct Oxygen XML Editor plugin to convert them to **HTML** tables, set the **docbook.html.table** parameter to 1. You can find this parameter in the following stylesheet:

```
• [OXYGEN_INSTALL_DIR]/frameworks/docbook/resources/xhtml2db5Driver.xsl for DocBook 5
```
Table Validation in DocBook

Oxygen XML Editor plugin reports table layout problems that are detected in manual or automatic validations. The types of errors that may be reported for DocBook table layout problems include:

CALS Tables

- A row has fewer cells than the number of columns detected from the table `cols` attribute.
- A row has more cells than the number of columns detected from the table `cols` attribute.
- A cell has a vertical span greater than the available rows count.
- The number of `colspecs` is different than the number of columns detected from the table `cols` attribute.
- The number of columns detected from the table `cols` attribute is different than the number of columns detected in the table structure.
- The value of the `cols`, `rowsep`, or `colsep` attributes are not numeric.
- The `namest`, `nameend`, or `colname` attributes point to an incorrect column name.

HTML Tables

- A row has fewer cells than the number of table columns.
- The value of the `colspan`, `rowspan`, or `span` attributes are not numeric.
- A cell has a vertical span greater than the available rows count.

Editing Table Properties in DocBook

You can edit the structure of an existing table using the table buttons on the toolbar (or from the contextual menu) to add or remove cells, rows, or columns, and to set basic table properties. Additional attributes can be used to fine-tune the formatting of your tables by using the Attributes view (page 319) (Window > Show View > Attributes).

You can use the Table Properties (Ctrl + T (Command + T on OS X)) action to modify many of the properties of the table. You can also adjust some of the properties in the specification section above the table.

The Table properties dialog box allows you to set specific properties to the table elements. The options that are available depend on the context and location within the table in which the action was invoked.
**Note:** Some properties allow the following special values, depending on the context and the current properties or values:

- `<not set>` - Use this value if you want to remove a property.
- `<preserve>` - If you select multiple elements that have the same property set to different values, you can choose this value to keep the values that are already set. In some cases it can also be used to keep the current non-standard value for a particular property.

### Edit Table Properties for a CALS Table Model

For a **CALS** table model, the **Table properties** dialog box includes four tabs of options:

- **Table** tab - The options in this tab apply to the entire table.
- **Row** tab - The options in this tab apply to the current row or selection of multiple rows. A message at the bottom of the tab tells you how many rows will be affected.
- **Column** tab - The options in this tab apply to the current column or selection of multiple columns. A message at the bottom of the tab tells you how many columns will be affected.
- **Cell** tab - The options in this tab apply to the current cell or selection of multiple cells. A message at the bottom of the tab tells you how many cells will be affected.

The options in four tabs include a **Preview** pane that shows a representation of the modification.

*Figure 295: Table Properties Dialog Box with Cell Tab Selected (DocBook CALS Table Model)*

The options in the four tabs include the following:

- **Horizontal alignment** *(Available in the Table, Column, and Cell tabs)*
Specifies the horizontal alignment of text within the current table/column/cell or selection of multiple columns/cells (align attribute). The allowed values are as follows:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

Note: The justify value cannot be rendered in Author mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the char attribute for alignment.

**Vertical alignment (Available in the Row and Cell tabs)**

Specifies the vertical alignment of text within the current row/cell or selection of multiple rows/cells (valign attribute). The allowed values are as follows:

- **top** - Aligns the text at the top of the cell.
- **middle** - Aligns the text in a vertically centered position.
- **bottom** - Aligns the text at the bottom of the cell.

**Column separator (Available in the Table, Column, and Cell tabs)**

Specifies whether or not to include column separators (borders/grid lines) in the form of the colsep attribute. The allowed values are: 0 (no separator) and 1 (include separators).

**Row separator (Available in all four tabs)**

Specifies whether or not to include row separators (borders/grid lines) in the form of the rowsep attribute. The allowed values are: 0 (no separator) and 1 (include separators).

**Frame**

Allows you to specify a value for the frame attribute. It is used to specify where a border should appear in the table. There are a variety of allowed values, as specified in the DocBook CALS table specifications.

**Row type (Available in the Row tab only)**

Allows you change the row to a header, body, or footer type of row (within a thead, tbody, or tfoot attribute).
Edit Table Properties for an HTML Table Model

For an HTML table model, the Table properties dialog box includes four tabs of options (Table, Row, Column, and Cell) and the options include a Preview pane that shows a representation of the modification.

The options in the four tabs include the following:

**Frame (Available only in the Table tab)**

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. There are a variety of allowed values, as specified in the DocBook HTML table specifications.

**Row type (Available in the Row tab only)**

Allows you change the row to a header, body, or footer type of row (within a `thead`, `tbody`, or `tfoot` attribute).

**Horizontal alignment (Available in the Row, Column, and Cell tabs)**

Specifies the horizontal alignment for the text in the current row/column/cell or selection of multiple rows/columns/cells (`align` attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

⚠️ Note: The `justify` value cannot be rendered in Author mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the `char` attribute for alignment.

**Vertical alignment (Available in the Row, Column, and Cell tabs)**

Specifies the vertical alignment for the text in the current row/column/cell or selection of multiple rows/columns/cells (`valign` attribute). The allowed values are:

- **top** - Aligns the text at the top of the cell.
- **middle** - Aligns the text in a vertically centered position.
- **bottom** - Aligns the text at the bottom of the cell.
- **baseline** - Sets the row so that all the table data share the same baseline. This often has the same effect as the `bottom` value. However, if the fonts are different sizes, the `baseline` value often makes the table look better.

Adding Tables in DITA Topics

You can use the Insert Table action on the toolbar or from the contextual menu to add a table in a DITA topic. By default, DITA supports four types of tables:

- **DITA Simple table model (page 775)** - This is the most commonly used model for basic tables.
- **CALS table model (OASIS Exchange Table Model) (page 777)** - This is used for more advanced functionality.
- **DITA Choice table model (page 780)** - This is used within a step element in a DITA Task document to describe a series of optional choices that a user must make before proceeding.
- **DITA Properties table model (page 782)** - This is used in DITA Reference documents to describe a property (for example, its type, value, and description).

If you are using a specialized DITA vocabulary, it may contain specialized versions of these table models.

Since DITA is a structured format, you can only insert a table in places in the structure of a topic where tables are allowed. The Oxygen XML Editor plugin toolbar provides support for entering and editing tables. It also helps to indicate where you are allowed to insert a table or its components by disabling the appropriate buttons.

**Inserting a Simple Table Model**

To insert a Simple DITA table, select the Insert Table action on the toolbar or from the contextual menu (or the Table submenu from the DITA menu). The Insert Table dialog box appears. Select Simple for the table Model.

*Figure 296: Insert Table Dialog Box - Simple Model*
The dialog box allows you to configure the following options when you select the *Simple* table model:

**Title**

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

**Generate table header**

If selected, an extra row will be inserted at the top of the table to be used as the table header.

**Column widths**

Allows you to specify the type of properties for column widths (*colwidth* attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a *recolwidth* attribute with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, *recolwidth="1* 2* 3*"* causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in Author mode, the values of the *recolwidth* attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the *recolwidth* attribute is 1*.

- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in Author mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.
Frame

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

**Note:** The options in the Insert Table dialog box for DITA documents are persistent, so changes made in one session will carry over to another.

When you click Insert, a simple table is inserted into your document at the current cursor position.

Inserting a CALS Table Model (OASIS Exchange Table)

To insert an OASIS Exchange Table (CALS), select the **Insert Table** action on the toolbar or from the contextual menu (or the Table submenu from the DITA menu). The Insert Table dialog box appears. Select CALS for the table Model. This model allows you to configure more properties than the Simple model.

*Figure 297: Insert Table Dialog Box - CALS Model*
The dialog box allows you to configure the following options when you select the CALS table model:

**Title**

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

**Table Size**

Allows you to choose the number of Rows and Columns for the table.

**Generate table header**

If selected, an extra row will be inserted at the top of the table to be used as the table header.

**Column widths**

Allows you to specify the type of properties for column widths (colwidth attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a colwidth attribute with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, colwidth="1* 2* 3***" causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in Author mode, the values of the colwidth attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the colwidth attribute is 1*.

- **dynamic** - If you choose this option, the columns are created without a specified width (colwidth attribute). Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in Author mode, a dialog
box will be displayed that asks you if you want to switch to proportional or fixed column widths.

- **fixed** - The width is specified in fixed units. By default, the \texttt{pt} unit is inserted, but you can change the units in the \texttt{colspecs} (column specifications) section above the table or in Text mode. The following units are allowed: \texttt{pt} (points), \texttt{cm} (centimeters), \texttt{mm} (millimeters), \texttt{pi} (picas), \texttt{in} (inches).

**Frame**

Allows you to specify a value for the \texttt{frame} attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a \texttt{conref}, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the \texttt{conref} target. For more information, see \url{https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html}.

**Row separator**

Specifies whether or not to include row separators (\texttt{rowsep} attribute). The allowed values are: \texttt{0} (no separator) and \texttt{1} (include separators).

**Column separator**

Specifies whether or not to include column separators (\texttt{colsep} attribute). The allowed values are: \texttt{0} (no separator) and \texttt{1} (include separators).

**Alignment**

Specifies the alignment of the text within the table (\texttt{align} attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.
Note: The justify value cannot be rendered in Author mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the `char` attribute for alignment.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

Note: The options in the Insert Table dialog box for DITA documents are persistent, so changes made in one session will carry over to another.

When you click Insert, a CALS table is inserted into your document at the current cursor position.

When you insert a CALS table, you see a link for setting the `colspecs` (column specifications) of your table. Click the link to open the controls that allow you to adjust various column properties. Although they appear as part of the Author mode (page 303), the `colspecs` link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

**Inserting a Choice Table Model**

To insert a Choice table within a `step` element in a DITA Task document, select the Insert Table action on the toolbar or in the Insert submenu from the contextual menu (or the Table submenu from the DITA menu), or select choicetable from the Content Completion Assistant (page 2704). The Insert Table dialog box appears. Select Simple for the table Model.

**Figure 299: Insert Table Dialog Box - Choice Model**
The dialog box allows you to configure the following options when you insert a *Choice* table model within a DITA Task:

**Table Size**

- Allows you to choose the number of **Rows** and **Columns** for the table.

**Generate table header**

- If selected, an extra row will be inserted at the top of the table to be used as the table header.

**Column widths**

- Allows you to specify the type of properties for column widths (*colwidth* attribute). You can choose one of the following properties for the column width:
  - **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a *relcolwidth* attribute with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, *relcolwidth="1* 2* 3*"* causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the *relcolwidth* attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the *relcolwidth* attribute is *1*.  
  - **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

**Frame**

- Allows you to specify a value for the *frame* attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:
  - **none** - No border will be added.
• **all** - A border will be added to all frames.
• **top** - A border will be added to the top frame.
• **topbot** - A border will be added to the top and bottom frames.
• **bottom** - A border will be added to the bottom frame.
• **sides** - A border will be added to the side frames.
• **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

When you click **Insert**, a *Choice* table is inserted into your DITA Task document at the current cursor position (within a *step* element).

**Inserting a Properties Table Model**

To insert a *Properties* table within a `refbody` element in a DITA Reference document, select the ✉️ **Insert Table** action on the toolbar or in the **Insert** submenu from the contextual menu (or the **Table** submenu from the **DITA** menu), or select `properties(wizard)` from the **Content Completion Assistant** (page 2704). The **Insert Table** dialog box appears. Select **Properties** for the table **Model**.

![Insert Table Dialog Box - Properties Model](image)

The dialog box allows you to configure the following options when you insert a *Properties* table model within a DITA Reference:

**Table Size**

Allows you to choose the number of **Rows** and **Columns** for the table.
Generate table header

If selected, an extra row will be inserted at the top of the table to be used as the table header.

Frame

Allows you to specify a value for the frame attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- none - No border will be added.
- all - A border will be added to all frames.
- top - A border will be added to the top frame.
- topbot - A border will be added to the top and bottom frames.
- bottom - A border will be added to the bottom frame.
- sides - A border will be added to the side frames.
- -dita-use-conref-target - Normally, when using a conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the conref target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

When you click Insert, a Properties table is inserted into your DITA Reference document at the current cursor position (within a refbody element).

Editing an Existing Table

You can edit the structure of an existing table using the table buttons on the toolbar (or in the contextual menu) to add or remove cells, rows, or columns, and to set basic table properties.

Additional attributes can be used to fine-tune the formatting of your tables by using the Attributes view (page 319) (Window > Show View > Attributes). See the DITA documentation for a full explanation of these attributes.

You can also use the Table Properties (Ctrl + T (Command + T on OS X)) (page 786) action from the toolbar or contextual menu (or DITA menu) to modify many of the properties of the table (page 786).

Also, remember that underneath the visual representation, both table models are really just XML. If necessary, you can edit the XML directly by switching to Text mode (page 223).
DITA Table Layouts

Depending on the context, DITA accepts the following table layouts:

- CALS table model (page 784)
- Simple table model (page 784)
- Choice table model (page 785)
- Properties table model (page 785)

**CALS Table Model Layout**

The **CALS** table model allows for more flexibility and table customization than other models. When choosing a **CALS** table model from the **Insert Table** dialog box, you have access to more configurable properties. The layout of a **CALS** table includes a **colspecs** section that allows you to easily configure some properties without opening the **Table Properties** dialog box. For example, you can change the value of column widths ( **colwidth** attribute) or the text alignment ( **align** attribute). Although they appear as part of the **Author mode** (page 303), the **colspecs** link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

*Figure 301: CALS Table in DITA*
Simple Table Model Layout

When choosing a Simple table model from the Insert Table dialog box, you only have access to configure a few properties. For example, you can choose the number of rows and columns, specify values for frames, and choose from a few types of properties for the column width. The layout of this type of table is very simple, as the name suggests.

![Simple Table](image)

Choice Table Model Layout

A Choice table model is used within a step element in a DITA Task document to describe a series of optional choices that a user must make before proceeding. The choicetable element is a useful device for documenting options within a single step of a task. You can insert Choice tables in DITA Task documents either by selecting choicetable from the Content Completion Assistant (page 2704) (within a step element) or by using the Insert Table action on the toolbar or from the contextual menu. The options and layout of a Choice table is similar to the Simple table model.

![Choice Table](image)

Properties Table Model Layout

A Properties table model is used within a refbody element in a DITA Reference document to describe a property (for example, its type, value, and description). You can insert Properties tables in DITA Reference documents either by selecting properties(wizard) from the Content Completion Assistant (page 2704) (within a refbody element) or by using the Insert Table action on the toolbar (or from the contextual menu) and selecting Properties for the Model. The layout of a Properties table is very simple. It allows for a maximum of 3 columns (typically for property type, value, and description) and the only options available are for whether or not you want a header row and for specifying frames (borders).

![Properties Table](image)
Table Validation in DITA

Oxygen XML Editor plugin reports table layout problems that are detected in manual or automatic validations. When you validate a DITA map with the Validate and Check for Completeness action, if the Report table layout problems option is selected in the DITA Map Completeness Check dialog box, table layout problems will be reported in the validation results. The types of errors that may be reported for DITA table layout problems include:

**CALS Tables**

- A row has fewer cells than the number of columns detected from the table `cols` attribute.
- A row has more cells than the number of columns detected from the table `cols` attribute.
- A cell has a vertical span greater than the available rows count.
- The number of `colspecs` is different than the number of columns detected from the table `cols` attribute.
- The number of columns detected from the table `cols` attribute is different than the number of columns detected in the table structure.
- The value of the `cols`, `rowsep`, or `colsep` attributes are not numeric.
- The `namest`, `nameend`, or `colname` attributes point to an incorrect column name.

**Simple or Choice Tables**

A row has fewer cells than the number of table columns.

Editing Table Properties in DITA

To customize the look of a table in DITA, place the cursor anywhere in a table and invoke the Table Properties (Ctrl + T (Command + T on OS X)) action from the toolbar or the Table submenu of the contextual menu (or DITA menu). This opens the Table properties dialog box.

The Table properties dialog box allows you to set specific properties to the table elements. The options that are available depend on the context and location within the table in which the action was invoked.

**Note:** Some properties allow the following special values, depending on the context and the current properties or values:
• **<not set>** - Use this value if you want to remove a property.

• **<preserve>** - If you select multiple elements that have the same property set to different values, you can choose this value to keep the values that are already set. In some cases it can also be used to keep the current non-standard value for a particular property.

### Edit Table Properties for a CALS Table Model

For a **CALS** table model, the **Table properties** dialog box includes four tabs of options:

- **Table** tab - The options in this tab apply to the entire table.
- **Row** tab - The options in this tab apply to the current row or selection of multiple rows. A message at the bottom of the tab tells you how many rows will be affected.
- **Column** tab - The options in this tab apply to the current column or selection of multiple columns. A message at the bottom of the tab tells you how many columns will be affected.
- **Cell** tab - The options in this tab apply to the current cell or selection of multiple cells. A message at the bottom of the tab tells you how many cells will be affected.

The options in four tabs include a **Preview** pane that shows a representation of the modification.

*Figure 305: Table Properties Dialog Box with Cell Tab Selected (DITA CALS Table Model)*

The options in the four tabs include the following:

- **Horizontal alignment (Available in the Table, Column, and Cell tabs)**
Specifies the horizontal alignment of text within the current table/column/cell or selection of multiple columns/cells (align attribute). The allowed values are as follows:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

**Note:** The justify value cannot be rendered in Author mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the char attribute for alignment.
- **-dita-use-conref-target** - Normally, when using a conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the conref target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

**Vertical alignment (Available in the Row and Cell tabs)**

Specifies the vertical alignment of text within the current row/cell or selection of multiple rows/cells (valign attribute). The allowed values are as follows:

- **top** - Aligns the text at the top of the cell.
- **middle** - Aligns the text in a vertically centered position.
- **bottom** - Aligns the text at the bottom of the cell.
- **-dita-use-conref-target** - Normally, when using a conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the conref target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

**Column separator (Available in the Table, Column, and Cell tabs)**

Specifies whether or not to include column separators (borders/grid lines) in the form of the colsep attribute. The allowed values are: 0 (no separator) and 1 (include separators).

**Row separator (Available in all four tabs)**

Specifies whether or not to include row separators (borders/grid lines) in the form of the rowsep attribute. The allowed values are: 0 (no separator) and 1 (include separators).
Frame (Available only in the Table tab)

Allows you to specify a value for the \texttt{frame} attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a \texttt{conref}, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the \texttt{conref} target. For more information, see \url{https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html}.

Edit Table Properties for a Simple, Choice, or Properties Table Model

For a \textit{Simple}, \textit{Choice}, \textit{Properties} table model, the \textbf{Table properties} dialog box only allows you to edit a few options.

**Table tab**

**Frame**

Allows you to specify a value for the \texttt{frame} attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a \texttt{conref}, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the \texttt{conref} target. For more information, see \url{https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html}. 
Row tab (not available for Properties tables)

Row type

Allows you change the row to a body or header type of row.

Adding Tables in XHTML Documents

You can use the Insert Table action on the toolbar or from the contextual menu to add a table in an XHTML document. This action opens the Insert Table dialog box.

Figure 306: Insert Table Dialog Box in XHTML

The dialog box allows you to configure the following options:

Caption

If this checkbox is selected, you can specify a title (caption) for your table in the adjacent text box.

Table Size

Allows you to choose the number of Rows and Columns for the table.

Generate table header

If selected, an extra row will be inserted at the top of the table to be used as the table header.
Generate table footer

If selected, an extra row will be inserted at the bottom of the table to be used as the table footer.

Column widths

Allows you to specify the type of properties for column widths (width attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a width attribute (in a col element) with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, width="1* 2* 3*" causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in Author mode, the values of the width attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the width attribute is 1*.

- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in Author mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

- **fixed** - The width is specified in fixed units. By default, the pt unit is inserted, but you can change the units in the section above the table or in Text mode. In addition to the standard pixel, percentage, and relative values, this attribute also allows the special form "0*" (zero asterisk), which means that the width of each column in the group should be the minimum width necessary to hold the contents.

Frame

Allows you to specify a value for the frame attribute. It is used to specify where a border should appear in the table. There are a variety of allowed values, as specified in HTML specifications.

Alignment

Specifies the alignment of the text within the table (align attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.
Note: The `justify` value cannot be rendered in **Author** mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the `char` attribute for alignment.

Note: The options in the **Insert Table** dialog box for XHTML documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, an HTML style of table is inserted into your XHTML document at the current cursor position.

When you insert an HTML table, you see a link for setting the `colspecs` (column specifications) of your table. Click the link to open the controls that allow you to adjust various column properties. Although they appear as part of the **Author mode** (page 303), the `colspecs` link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

**Editing an Existing Table**

You can edit the structure of an existing table using the table buttons on the toolbar (or in the contextual menu) to add or remove cells, rows, or columns, and to set basic table properties. Additional attributes can be used to fine-tune the formatting of your tables by using the **Attributes view** (page 319) (**Window > Show View > Attributes**). Also, remember that underneath the visual representation, the table is really just XML. If necessary, you can edit the XML directly by switching to **Text mode** (page 223).

**XHTML Table Layout**

When you insert a table in an XHTML document, an HTML type of table is added. The layout of an **XHTML** table includes a `colspecs` section that allows you to easily configure some properties. For example, you can change the value of column widths (`width` attribute) or the text alignment (`align` attribute). Although they appear as part of the **Author mode** (page 303), the `colspecs` link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

*Figure 307: Table Layout in XHTML Documents*
Table Validation in XHTML

Oxygen XML Editor plugin reports table layout problems that are detected in manual or automatic validations. The types of errors that may be reported for XHTML table layout problems include:

**HTML Tables**

- A row has fewer cells than the number of table columns.
- The value of the `colspan`, `rowspan`, or `span` attributes are not numeric.
- A cell has a vertical span greater than the available rows count.

Adding Tables in TEI Documents

You can use the **Insert Table** action on the toolbar or from the contextual menu to add a table in a TEI document. This action opens the **Insert Table** dialog box.

*Figure 308: Insert Table Dialog Box in TEI*

The dialog box allows you to configure the following options:

**Head**

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

**Table Size**

Allows you to choose the number of **Rows** and **Columns** for the table.

**Generate table header**
If selected, an extra row will be inserted at the top of the table to be used as the table header.

**Note:** The options in the *Insert Table* dialog box for TEI documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, a simple table is inserted into your TEI document at the current cursor position.

### Editing an Existing Table

You can edit the structure of an existing table using the table buttons on the toolbar (or in the contextual menu) to add or remove cells, rows, or columns. Additional attributes can be used to fine-tune the formatting of your tables by using the *Attributes view* (page 319) *(Window > Show View > Attributes)*. Also, remember that underneath the visual representation, the table is really just XML. If necessary, you can edit the XML directly by switching to **Text mode** (page 223).

#### Sorting Content in Tables and List Items

Oxygen XML Editor plugin offers support for sorting the content of tables and list items of ordered and unordered lists.

**Sorting a Table**

To sort rows in a table, select the entire table (or specific rows) and use the **Sort** action from the main toolbar or the contextual menu. This opens the **Sort** dialog box.

*Figure 309: Sort Dialog Box*

![Sort Dialog Box](image)

This dialog box sets the range that is sorted and the sorting criteria. The range is automatically selected depending on whether you sort an entire table or only a selection of its rows.
When you invoke the sorting operation over an entire table, the **Selected rows** option is disabled.

The **Criteria** section specifies the sorting criteria (a maximum of three sorting criteria are available), defined by the following:

- A name, which is collected from the column heading.
- The type of the information that is sorted. You can choose between the following:
  - **Text** - Alphanumeric characters.
  - **Numeric** - Regular integer or floating point numbers are accepted.
  - **Date** - Default date and time formats from the local OS are accepted (such as *short*, *medium*, *long*, *full*, *xs:date*, and *xs:dateTime*).
- The sorting direction (either **ascending** or **descending**).

The sort criteria is automatically set to the column where the cursor is located at the time when the sorting operation is invoked.

After you finish configuring the options in the **Sort** dialog box, click **OK** to complete the sorting operation. If you want to revert to the initial order of your content, press **Ctrl + Z (Command + Z on OS X)** on your keyboard.

The sorting support takes the value of the `xml:lang` attribute into account and sorts the content in a natural order.

**Sorting a Selection of Rows**

To sort a selection of rows in a table, select the rows that you want to sort and either right-click the selection and choose **Sort**, or click **Sort** on the main toolbar. This opens the **Sort** dialog box.

**Figure 310: Sort Selected Rows**
This dialog box sets the range that is sorted and the sorting criteria. The range is automatically selected depending on whether you sort an entire table or only a selection of its rows.

The **Sort** dialog box also allows you to apply the sorting operation to the entire table, using the **All rows** option.

The **Criteria** section specifies the sorting criteria (a maximum of three sorting criteria are available), defined by the following:

- A name, which is collected from the column heading.
- The type of the information that is sorted. You can choose between the following:
  - **Text** - Alphanumeric characters.
  - **Numeric** - Regular integer or floating point numbers are accepted.
  - **Date** - Default date and time formats from the local OS are accepted (such as *short*, *medium*, *long*, *full*, *xs:date*, and *xs:dateTime*).
- The sorting direction (either *ascending* or *descending*).

The sort criteria is automatically set to the column where the cursor is located at the time when the sorting operation is invoked.

After you finish configuring the options in the **Sort** dialog box, click **OK** to complete the sorting operation. If you want to revert to the initial order of your content, press **Ctrl + Z (Command + Z on OS X)** on your keyboard.

**Note:** The sorting support takes the value of the *xml:lang* attribute into account and sorts the content in a natural order.

### Sort Using Multiple Criteria

You can also sort an entire table or a selection of its rows based on multiple sorting criteria. To do so, select the rest of boxes in the **Criteria** section of the **Sort** dialog box, configure the applicable items, and click **OK** to complete the sorting operation.

*Figure 311: Sorting Based on Multiple Criteria*
Sorting a Table that Contains Merged Cells

If a table contains cells that span over multiple rows, you can not perform the sorting operation over the entire table. Still, the sorting mechanism works over a selection of rows that do not contain rowspans.

**Note:** For this type of table, the Sort dialog box keeps the All rows option disabled even if you perform the sorting operation over a selection of rows.

Sorting List Items

A sorting operation can be performed on various types of lists and list items. The types of lists that can be sorted in Oxygen XML Editor plugin depend on the framework (document type), but examples of the types that can be sorted include:

- Ordered list (DITA, DocBook, XHTML, TEI)
- Unordered list (DITA, DocBook, XHTML, TEI)
- Definition list (DITA)
- Variable list (DocBook)
- Parameter list (DITA)
- Simple list (DITA)
- Required conditions (DITA Machinery Task)
- Supplies list (DITA Machinery Task)
- Spare parts list (DITA Machinery Task)
- Safety conditions (DITA Machinery Task)

The sorting mechanism works on an entire list or on a selection of list items. To sort items in a list, select the items or list and use the Sort action from the main toolbar or the contextual menu. This opens the Sort dialog box.
This dialog box sets the range that is sorted and the sorting criteria. The range is automatically selected depending on whether you sort an entire list or only a selection of its items.

**Note:** When you invoke the sorting operation over an entire list, the **Selected rows** option is disabled.

The **Criteria** section specifies the sorting criteria, defined by the following:

- The name of the type of item being sorted.
- The type of the information that is sorted. You can choose between the following:
  - **Text** - Alphanumeric characters.
  - **Numeric** - Regular integer or floating point numbers are accepted.
  - **Date** - Default date and time formats from the local OS are accepted (such as *short*, *medium*, *long*, *full*, *xs:date*, and *xs:dateTime*).
- The sorting direction (either **ascending** or **descending**).

After you finish configuring the options in the **Sort** dialog box, click **OK** to complete the sorting operation. If you want to revert to the initial order of your content, press `Ctrl + Z` (**Command + Z** on OS X) on your keyboard.

**Note:** The sorting support takes the value of the `xml:lang` attribute into account and sorts the content in a natural order.

### Inserting Images

To insert an image in a document while editing in **Author** mode, use one of the following methods:

- Click the **Insert Image** action from the toolbar. This opens a dialog box that allows you to choose the image file you want to insert and configure some properties. Oxygen XML Editor plugin tries to reference the image with a path that is relative to that of the document you are currently editing. For example, if you want to add the file:`C:/project/xml/dir/img1.jpg` image into the file:`C:/project/xml/doc1.xml` document, Oxygen XML Editor plugin inserts a
reference to `dir/img1.jpg`. This is useful when multiple users work on a common project and they have it stored in multiple locations.

Note: The **Insert Image** action is available for the following document types: DITA, DocBook, TEI, XHTML, JATS.

- Drag an image from other application and drop it in the **Author** editing mode. If it is an image file, it is inserted as a reference to the image file. For example, in a DITA topic the path of the image file is inserted as the value of the `href` attribute in an `image` element:

  ```xml
  <image href="../images/image_file.png"/>
  ```

  **Tip:** To replace an image, just drag and drop a new image over the existing one. **Oxygen XML Editor** plugin will automatically update the reference to the new image.

- Copy an image file from another document or another application (such as a system file browser or web browser) and paste it into your document. **Oxygen XML Editor** plugin will insert it as a reference to the image file the same as the drag/drop method.

- Select an image (or part of an image) from another application (such as an image editor), copy it, and paste it into your document. **Oxygen XML Editor** plugin will prompt you to save it. After saving the image, a reference to that file path is inserted at the paste position.

When an image cannot be rendered, Oxygen XML Editor plugin Author mode displays a warning message that contains the reason why this is happening. Possible causes include the following:

- The image is too large. Select the Show very large images option (page 111).
- The image format is not supported by default. It is recommended to install the Java Advanced Imaging (JAI) Image I/O Tools plug-in (page 802).

Tip: If you are using a custom XML format and you want images to be displayed in Author mode, you could use a custom CSS to define the rendering.

For example, if your XML has something like this:

```
<image href="blue.png"/>
```

You can add a selector in your custom CSS like this:

```
image[href]{
  content: attr(href, url);
}
```

**Scaling Images**

Image dimension and scaling attributes are taken into account when an image is rendered. The following rules apply:

- If you specify only the width attribute of an image, the height of the image is proportionally applied.
- If you specify only the height attribute of an image, the width of the image is proportionally applied.
- If you specify width and height attributes of an image, both of them control the rendered image.
• If you want to scale both the width and height of an image proportionally, use the `scale` attribute.

**Note:** As a Java application, Oxygen XML Editor plugin uses the *Java Advanced Imaging API* that provides a pluggable support for new image types. If you have an *ImageIO* library that supports additional image formats, just copy this library to the `{OXYGEN_INSTALL_DIR}/lib` directory.

Rendering CGM Images (Experimental Support)

Oxygen XML Editor plugin offers a few add-ons that provide experimental support for CGM 1.0 images. To allow the rendering of CGM images in **Author** mode, go to [https://github.com/oxygenxml/oxygenxml.cgm.support.eclipse](https://github.com/oxygenxml/oxygenxml.cgm.support.eclipse) and follow the instructions.

Rendering PDF Images

Starting with version 20.0, Oxygen XML Editor plugin provides built-in support for rendering PDF images in **Author** mode and PDF output. For previous versions, they are not rendered by default and you need to add the *Apache PDFBox* library:

### Manually Adding the ApachePDFBox Libraries

To manually add the *Apache PDFBox* library so that PDF images are rendered in **Author** mode, follow this procedure:

1. Go to [http://pdfbox.apache.org/downloads.html](http://pdfbox.apache.org/downloads.html) and download the pre-built PDFBox standalone binary *JAR (page 2707)* files: `pdfbox-2.0.3.jar`, `fontbox-2.0.3.jar`, and `xmpbox-2.0.3.jar`. Alternatively, you can use the 1.8.12 version of these files, as they have been tested and work properly.

   **Note:** It is not recommended to use `pdfbox-app-2.0.3.jar` file instead of the three specified files because it contains additional classes that may cause conflicts elsewhere in Oxygen XML Editor plugin.

2. Create a subfolder called `pdfImageJars` in the `{OXYGEN_INSTALL_DIR}/lib` directory.
3. Copy the downloaded `JAR` libraries to that newly created subfolder.
4. Open `OXYGEN_PLUGIN_DIR/META-INF/MANIFEST.MF` and add a reference to the `JAR` libraries in the `Bundle-ClassPath` entry.
5. Restart Eclipse in clean mode (edit the shortcut you use to start Eclipse and add `-clean` as the first argument.)

Rendering PSD Images
Oxygen XML Editor plugin provides support for rendering PSD (Adobe Photoshop) images.

To allow the rendering of PSD images in Author mode, follow this procedure:

1. Download the following *JAR* files:
   - http://search.maven.org/remotecontent?filepath=com/twelvemonkeys/common/common-image/3.1.0/common-image-3.1.0.jar
   - http://search.maven.org/remotecontent?filepath=com/twelvemonkeys/imageio/imageio-metadata/3.1.0/imageio-metadata-3.1.0.jar

2. Copy the downloaded JAR libraries to the \{OXYGEN_INSTALL_DIR\}\lib directory.

3. Open OXYGEN_PLUGIN_DIR/META-INF/MANIFEST.MF and add a reference to the JAR libraries in the Bundle-ClassPath entry.

4. Restart Eclipse in clean mode (edit the shortcut you use to start Eclipse and add -clean as the first argument.)

**Rendering EPS and AI Images**

Most EPS and AI image files include a preview picture of the content. Oxygen XML Editor plugin tries to render this preview picture. The following scenarios are possible:

- The EPS or AI image does not include the preview picture. Oxygen XML Editor plugin cannot render the image.
- The EPS image includes a TIFF preview picture.

**Note:** Some newer versions of the TIFF picture preview are rendered in gray-scale.

- The AI image contains a JPEG preview picture. Oxygen XML Editor plugin renders the image correctly.

**Rendering Special Images with Java Advanced Imaging (JAI) Plugin**
Certain special image types can be rendered in Oxygen XML Editor plugin by using a Java Advanced Imaging (JAI) Image I/O Tools plugin.

**How to Install JAI Image I/O Tools Plugin**

To install this plug, follow this procedure:

1. Start Oxygen XML Editor plugin and open the Help > About dialog box. Click the Installation Details button, go to the Configuration tab, and look for the `java.runtime.name` and `java.home` properties. Keep their values for later use.

2. Download the JAI Image I/O kit corresponding to your operating system and Java distribution (found in the `java.runtime.name` property). A list of archived JAI distributions can be found at: http://www.oracle.com/technetwork/java/javasebusiness/downloads/java-archive-downloads-java-client-419417.html.

   **Note:** The JAI API is not the same thing as JAI Image I/O. Make sure you have installed the latter.

3. Run the installer. When the installation wizard displays the Choose Destination Location page, fill-in the Destination Folder field with the value of the `java.home` property. Continue with the installation procedure and follow the on-screen instructions.

**OS X Workaround**

There is no native implementation of the JAI Image I/O Tools plugin for OS X 10.5 and later. However, it has a Java implementation fallback that also works on OS X. Some of the image formats are not fully supported in this fallback mode, but at least the TIFF image format is known to be supported.

Use the following procedure for this OS X workaround:

2. In the `{OXYGEN_INSTALL_DIR}/lib` directory, create a directory named `endorsed` (`{OXYGEN_INSTALL_DIR}/lib/endorsed`).

3. Unpack the `.tar.gz`. Copy the `clibwrapper_jiio.jar` and `jai_imageio.jar` files from its `lib` directory and paste them in the `{OXYGEN_INSTALL_DIR}/lib/endorsed` directory.

4. Restart the application and the JAI Image I/O support will be up and running.

**Retina/HiDPI Images in Author Mode**
Oxygen XML Editor plugin provides support for Retina and HiDPI images through simple naming conventions. The higher resolution images are stored in the same images folder as the normal resolution images and they are identified by a scaling factor that is included in the name of the image files. For instance, images with a Retina scaling factor of 2 will include \texttt{@2x} in the name (for example, \texttt{myImage@2x.png}). Oxygen XML Editor plugin displays the larger set of icons starting with 150% (1.5x) scaling.

You can reference an image to style an element in a CSS by using the \texttt{url} function in the \texttt{content} property, as in the following example:

```css
listItem:before{
    content: url('../img/myImage.png');
}
```

This would place the image that is loaded from the \texttt{myImage.png} file just before the \texttt{listItem} element. However, if you are using a Retina display (on a Mac), the icon looks a bit blurry as it automatically gets scaled, or if you are using an HiDPI display (on a Windows-based PC), the icon remains at the original size, thus it will look very small. To solve this rendering problem, you need to be able to reference both a normal DPI image and a high DPI image. However, referencing both of them from the CSS is not practical, as there is no standard way of doing this.

Starting with version 17, Oxygen XML Editor plugin interprets the argument of the \texttt{url} function as key rather than a fixed URL. Therefore, when running on a system with a Retina or HiDPI display, Oxygen XML Editor plugin will first try to find the image file that corresponds to the retina scaling factor. For instance, using the previous example, Oxygen XML Editor plugin would first try to find \texttt{myImage@2x.png}. If this file is not found, it defaults back to the normal resolution image file (\texttt{myImage.png}).

Oxygen XML Editor plugin also supports dark color themes. This means that the background of the editor area can be of a dark color and the foreground a lighter color. On a dark background, you may find it useful to invert the colors of images. Again, this can be done with simple naming conventions. If an image designed for a dark background is not found, the normal image is used.

**Retina/HiDPI Naming Convention**

Refer to the following table for examples of the Retina/HiDPI image naming convention that is used in Oxygen XML Editor plugin:

<table>
<thead>
<tr>
<th>Color Theme</th>
<th>Referred Image File</th>
<th>Double Density Image File</th>
<th>Triple Density Image File</th>
</tr>
</thead>
<tbody>
<tr>
<td>normal</td>
<td>../img/myImage.png</td>
<td>../img/myImage@2x.png</td>
<td>../img/myImage@3x.png</td>
</tr>
</tbody>
</table>
Image Map Editor

Oxygen XML Editor plugin includes an Image Map Editor that allows you to create hyperlinks in specific areas of an image that will link to various destinations. For example, an image that is a map of the seven continents may have a specific hyperlink for each continent that links to a resource that has information about the particular continent. The main purpose of an image map is to provide an easy way of linking various parts of an image without having to divide the image into separate image files.

The support for image maps in Oxygen XML Editor plugin is available for images in DITA, DocBook, TEI, and XHTML document types (frameworks (page 2706)). To create an image map on an existing image and open the Image Map Editor, right-click the image and select Image Map Editor.

Oxygen XML Editor plugin includes support for image maps in DITA documents through the use of the `imagemap` element. This feature provides an easy way to create hyperlinks in various areas within an image without having to divide the image into separate image files. The visual Author editing mode includes an Image Map Editor that helps you to easily create and configure image maps.

Figure 314: Image Map Editor in DITA

The interface of the Image Map Editor consists of the following sections and actions:

**Toolbar**

- **New Rectangle**
  
  Use this button to draw a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

- **New Circle**
  
  Use this button to draw a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.
**New Polygon**

Use this button to draw a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

**New Free Form Shape**

Use this button to draw a free form shape over an area in the image. After selecting this button, left-click anywhere in the image to place the first point of your shape. Then move the cursor to the location of the next desired point and left-click to place the next point, and so on. To complete the shape (area), click the first point again and a line will automatically be added from the last point that was added, or simply double-click the last point to automatically add the line from the last point back to the first.

**Duplicate**

Use this button to create a duplicate of the currently selected shape.

**Delete**

Use this button to delete the currently selected shape.

**Undo**

Use this button to undo the last action.

**Redo**

Use this button to redo the last action that was undone.

**Show/Hide Numbers**

Use this button to toggle between showing or hiding the numbers for the shapes.

**Bring Shape to Front**

Use this button to bring the currently selected shape forward to the top layer.

**Bring Shape Forward**

Use this button to bring the currently selected shape forward one layer.

**Send Shape Backward**

Use this button to send the currently selected shape back one layer.
Send Shape to Back

Use this button to send the currently selected shape back to the bottom layer.

Color Chooser

Use this drop-down menu to select a color scheme for the lines and numbers of the shapes.

Zoom Slider

Use this slider to zoom the image in or out in the main image pane.

Image Pane

This main Image Pane is where you work with shapes to add hyperlinks to multiple areas within an image. The editing mechanisms that are supported in the Image Pane include the following:

Mouse Controls and Keyboard Shortcuts

- Use the mouse to select and move shapes around in the image pane. It is easy to see which shape is selected in this image pane because the border of the selected shape changes from a solid line to a dotted one.
- You can also drag any of the points of a selected shape to adjust its size and shape.
- You can hold down the Ctrl key to select multiple shapes and then move them simultaneously.
- You can also move shapes by using the arrow keys on your keyboard. In addition, you can hold down Shift while using the arrow keys to move the shape farther or Alt to move it 1 pixel at a time.
- To zoom in or out, you can use the NumPad + or NumPad - keys respectively. Use Ctrl + NumPad 0 to reset the zoom level to its default value.
- You can use Ctrl + Z to undo an action or Ctrl + Y to redo the last action that was undone.

Contextual Menu Actions Available in the Image Pane

You can right-click the shapes, points, or anywhere in the Image Pane to invoke the contextual menu where the following actions are available:

Add Point
Adds a point to *Polygon* or *Free Form* shapes.

**Remove Point**

Removes the current point from *Polygon* or *Free Form* shapes.

**Duplicate**

Create a duplicate of the currently selected shape.

**Delete**

Delete the currently selected shape.

**New Rectangle**

Creates a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

**New Circle**

Creates a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

**New Polygon**

Creates a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

**Undo**

Use this action to undo the last action.

**Redo**

Use this action to redo the last action that was undone.

**Shape Table**

The table at the right of the *Image Pane* is a sequential list of all the areas (shapes) that have been added in the image. It shows their number, type, and description (if one has been added). If you select one of the entries in the table, the corresponding shape will be selected in the *Image Pane*.

**Properties**

**Type**

Displays information about the selected coordinate.
**Target**

Allows you to choose the target resource that you want the selected area (shape) to be linked to. Select a target by using the Link drop-down menu to the right of the text field. You can choose between the following types of links: Cross Reference, File Reference, or Web Link. All three types will open a dialog box that allows you to define the target resource. This linking process is similar to the normal process of inserting links in DITA (page 2572) by using the identical Link drop-down menu from the main toolbar.

When you click OK to finalize your changes in the Image Map Editor, an xref element will be inserted with either an href attribute or a keyref attribute. Additional attributes may also be inserted and their values depend on the target and the type of link. For details about the three types of links and their dialog boxes, see Inserting a Link in Oxygen XML Editor plugin (page 2572).

**Description**

You can enter an optional description for the selected area (shape) that will be displayed in the Image Map Details section (page 811) in Author mode and as a tooltip message when the end user hovers over the hyperlink in the output.

### How to Create an Image Map in DITA

To create an image map on an existing image in a DITA document, follow these steps:

1. Right-click the image and select Image Map Editor.

   **Result:** This action will apply an image map to the current image and open the Image Map Editor dialog box.

2. Add hyperlinks to the image by selecting one of the shape buttons (☐ New Rectangle, ☐ New Circle, or ☐ New Polygon).

3. Move the shape to the desired area in the image and drag any of the points on the shape to adjust its size or form. You can use the other buttons on the toolbar (page 806) to adjust its layer and color, or to perform other editing actions.

   **Tip:** You can right-click any of the points, shapes, or anywhere in the Image Pane to access various helpful contextual menu actions (page 808). For example, the easiest way to remove a point is to right-click the point and select X Remove Point.
4. With the shape selected, use one of the linking options (page 809) in the Link drop-down menu to select a target resource (or enter its path in the Target (page 809) text field).
5. (Optional) Enter a Description (page 810) for the selected area (shape).
6. If you want to add more hyperlinks to the image, select a shape button again and repeat the appropriate steps.
7. When you are finished creating hyperlinks, click OK to process your changes.

**Result:** The image map is applied on the image and the appropriate elements and attributes are automatically added. In Author mode, the image map is now rendered over the image. If the image includes an alt element, its value will be displayed under the image. The following two buttons will also now be available under the image in Author mode:

- **Image Map Editor** - Click this button to open the Image Map Editor.
- **Image Map Details** - Click this button to expand a section that displays the details of the image map and allows you to change the shape and coordinates of the hyperlinked areas. Keep in mind that if you change the shape in this section, you also need to add or remove coordinates to match the requirements of the new shape.

*Figure 315: Image Map Details*

**How to Edit an Existing Image Map in DITA**

To edit an existing image map, use any of the following methods:

- Simply double-click the image.
- Right-click the image and select Image Map Editor.
- Click the Image Map Editor button below the image.

All three methods open the Image Map Editor where you can make changes to the image map using the various features described above. You can also make changes to the XML structure of the image map in the Text editing mode.

You can also click the Image Map Details button below the image to expand a section that displays the details of the image map and allows you to change the shape and coordinates of the hyperlinked
areas. Keep in mind that if you change the shape in this section, you also need to add or remove coordinates to match the requirements of the new shape.

**Overlapping Areas**

If shapes overlap one another in the **Image Map Editor**, the one on the top layer takes precedence. The number shown inside each shape represent its layer (if the numbers are not displayed, click the [Show/Hide Numbers](#) button on the **Image Map Editor** toolbar ([page 806](#)). To change the layer order for a shape, use the layer buttons on the **Image Map Editor** toolbar ([page 806](#)) (•, •, •).

If you insert a shape and all of its coordinates are completely inside another shape, the **Image Map Editor** will display a warning to let you know that the shape is entirely covered by a bigger shape. Keep in mind that if a shape is completely inside another shape, its hyperlink will only be accessible if its layer is on top of the bigger shape.

**Image Maps in DocBook**

Oxygen XML Editor plugin includes support for **image maps** in DocBook documents through the use of the **areaspec** element. This feature provides an easy way to create hyperlinks in various parts of an image without having to divide the image into separate image files. The visual **Author** editing mode includes an **Image Map Editor** that helps you to easily create and configure image maps.

*Figure 316: Image Map Editor in DocBook*
Image Map Editor Interface in DocBook

The interface of the Image Map Editor consists of the following sections and actions:

**Toolbar**

- **New Rectangle**
  
  Use this button to draw a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

- **Duplicate**
  
  Use this button to create a duplicate of the currently selected shape.

- **Delete**
  
  Use this button to delete the currently selected shape.

- **Undo**
  
  Use this button to undo the last action.

- **Redo**
  
  Use this button to redo the last action that was undone.
Show/Hide Numbers

Use this button to toggle between showing or hiding the numbers for the shapes.

Bring Shape to Front

Use this button to bring the currently selected shape forward to the top layer.

Bring Shape Forward

Use this button to bring the currently selected shape forward one layer.

Send Shape Backward

Use this button to send the currently selected shape back one layer.

Send Shape to Back

Use this button to send the currently selected shape back to the bottom layer.

Color Chooser

Use this drop-down menu to select a color scheme for the lines and numbers of the shapes.

Zoom Slider

Use this slider to zoom the image in or out in the main image pane.

Image Pane

This main Image Pane is where you work with shapes to add hyperlinks to multiple areas within an image. The editing mechanisms that are supported in the Image Pane include the following:

Mouse Controls and Keyboard Shortcuts

• Use the mouse to select and move shapes around in the image pane. It is easy to see which shape is selected in this image pane because the border of the selected shape changes from a solid line to a dotted one.
• You can also drag any of the points of a selected shape to adjust its size and shape.
• You can hold down the Ctrl key to select multiple shapes and then move them simultaneously.
• You can also move shapes by using the arrow keys on your keyboard. In addition, you can hold down \textit{Shift} while using the arrow keys to move the shape farther or \textit{Alt} to move it 1 pixel at a time.
• To zoom in or out, you can use the \textit{NumPad} + or \textit{NumPad} - keys respectively. Use \textit{Ctrl + NumPad} 0 to reset the zoom level to its default value.
• You can use \textit{Ctrl + Z} to undo an action or \textit{Ctrl + Y} to redo the last action that was undone.

\textbf{Contextual Menu Actions Available in the Image Pane}

You can right-click the shapes, or anywhere in the Image Pane to invoke the contextual menu where the following actions are available:

- \textbf{Duplicate}
  Create a duplicate of the currently selected shape.

- \textbf{Delete}
  Delete the currently selected shape.

- \textbf{New Rectangle}
  Creates a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

- \textbf{Undo}
  Use this action to undo the last action.

- \textbf{Redo}
  Use this action to redo the last action that was undone.

\textbf{Shape Table}

The table at the right of the \textit{Image Pane} is a sequential list of all the areas (shapes) that have been added in the image. It shows their number, type, and ID. If you select one of the entries in the table, the corresponding shape will be selected in the \textit{Image Pane}.

\textbf{Properties}

- \textbf{Type}
  Displays information about the selected coordinate.

- \textbf{ID}
The identifier for the selected area. This will become the value of the `xml:id` attribute for the particular `area` element.

**Target**

Allows you to choose the target resource that you want the selected area to be linked to. You can enter the path to the target in the text field but the easiest way to select a target is to use the Share Link drop-down menu to the right of the text field. You can choose between the following types of links: Cross Reference or Web Link. Both types open a dialog box that allows you to select the target resource and it is inserted as the value of an `xlink:href` attribute.

**Description**

You can enter an optional description for the selected area that will be displayed in the Image Map Details section (page 817) in Author mode and as a tooltip message when the end user hovers over the hyperlink in the output.

**How to Create an Image Map in DocBook**

To create an image map on an existing image in a DocBook document, follow these steps:

1. Right-click the image and select Image Map Editor.
   
   **Result:** This action will apply an image map to the current image and open the Image Map Editor dialog box.

2. Add hyperlinks to the image by selecting the New Rectangle button.
3. Move the shape to the desired area in the image and drag any of the points on the shape to adjust its size or form. You can use the other buttons on the toolbar (page 813) to adjust its layer and color, or to perform other editing actions.

   **Tip:** You can right-click any of the shapes or anywhere in the Image Pane to access various helpful contextual menu actions (page 815).

4. With the shape selected, enter an ID (page 815) and use one of the linking options (page 816) in the Share Link drop-down menu to select a target resource (or enter its path in the Target (page 816) text field).
5. (Optional) Enter a Description (page 816) for the selected area (shape).
6. If you want to add more hyperlinks to the image, select New Rectangle button again and repeat the appropriate steps.
7. When you are finished creating hyperlinks, click OK to process your changes.
**Result:** The *image map* is applied on the image and the appropriate elements and attributes are automatically added. In *Author* mode, the image map is now rendered over the image. If the image includes an *alt* element, its value will be displayed above the image. The following two buttons will also now be available at the top of the image in *Author* mode:

- **Image Map Editor** - Click this button to open the *Image Map Editor*.
- **Image Map Details** - Click this button to expand a section that displays the details of the image map.

**How to Edit an Existing Image Map in DocBook**

To edit an existing image map, use any of the following methods:

- Simply double-click the image.
- Right-click the image and select *Image Map Editor*.
- Click the *Image Map Editor* button below the image.

All three methods open the *Image Map Editor* where you can make changes to the image map using the various features described above. You can also make changes to the XML structure of the image map in the *Text* editing mode.

You can also click the *Image Map Details* button above the image to expand a section that displays the details of the image map and allows you to change the coordinates and IDs of the hyperlinked areas.

**Note:** If you want to link a set of related *area* elements, you can use *areaset* elements. To add *areaset* elements, and *area* elements to the *areaset*, switch to *Text* mode and insert them manually.

**Overlapping Areas**

If shapes overlap one another in the *Image Map Editor*, the one on the top layer takes precedence. The number shown inside each shape represent its layer (if the numbers are not displayed, click the **Show/Hide Numbers** button on the *Image Map Editor* toolbar (*page 813*)). To change the layer order for a shape, use the layer buttons on the *Image Map Editor* toolbar (*page 813*) (`,` , `,`, `,`).

If you insert a shape and all of its coordinates are completely inside another shape, the *Image Map Editor* will display a warning to let you know that the shape is entirely covered by a bigger shape. Keep in mind that if a shape is completely inside another shape, its hyperlink will only be accessible if its layer is on top of the bigger shape.
Oxygen XML Editor plugin includes support for **image maps** in TEI documents through the use of the `facsimile` element. In TEI documents, this feature provides an easy way to create areas (using `zone` elements) in an image where the end user can hover or click to retrieve more information about that particular area of the image. The visual **Author** editing mode includes an **Image Map Editor** that helps you to easily create the areas in the image.

*Figure 317: Image Map Editor in TEI*

The interface of the **Image Map Editor** consists of the following sections and actions:

**Toolbar**
- **New Rectangle**
  
  Use this button to draw a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

- **New Polygon**
  
  Use this button to draw a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

- **New Free Form Shape**
  
  Use this button to draw a free form shape over an area in the image. After selecting this button, left-click anywhere in the image to place the first point of your shape. Then move the cursor to the location of the next desired point and left-click to place the next point, and so on. To complete the shape (area), click the first point again and a line will automatically be added from the last point that was added, or simply double-click the last point to automatically add the line from the last point back to the first.

- **Duplicate**
  
  Use this button to create a duplicate of the currently selected shape.

- **Delete**
  
  Use this button to delete the currently selected shape.

- **Undo**
  
  Use this button to undo the last action.

- **Redo**
  
  Use this button to redo the last action that was undone.

- **Show/Hide Numbers**
  
  Use this button to toggle between showing or hiding the numbers for the shapes.

- **Bring Shape to Front**
  
  Use this button to bring the currently selected shape forward to the top layer.
**Bring Shape Forward**

Use this button to bring the currently selected shape forward one layer.

**Send Shape Backward**

Use this button to send the currently selected shape back one layer.

**Send Shape to Back**

Use this button to send the currently selected shape back to the bottom layer.

**Color Chooser**

Use this drop-down menu to select a color scheme for the lines and numbers of the shapes.

**Zoom Slider**

Use this slider to zoom the image in or out in the main image pane.

**Image Pane**

This main Image Pane is where you work with shapes to add hyperlinks to multiple areas within an image. The editing mechanisms that are supported in the Image Pane include the following:

**Mouse Controls and Keyboard Shortcuts**

- Use the mouse to select and move shapes around in the image pane. It is easy to see which shape is selected in this image pane because the border of the selected shape changes from a solid line to a dotted one.
- You can also drag any of the points of a selected shape to adjust its size and shape.
- You can hold down the Ctrl key to select multiple shapes and then move them simultaneously.
- You can also move shapes by using the arrow keys on your keyboard. In addition, you can hold down Shift while using the arrow keys to move the shape farther or Alt to move it 1 pixel at a time.
- To zoom in or out, you can use the NumPad + or NumPad - keys respectively. Use Ctrl + NumPad 0 to reset the zoom level to its default value.
You can use \texttt{Ctrl + Z} to undo an action or \texttt{Ctrl + Y} to redo the last action that was undone.

**Contextual Menu Actions**

You can right-click the shapes, points, or anywhere in the Image Pane to invoke the contextual menu where the following actions are available:

- **Add Point**
  
  Adds a point to \textit{Polygon} or \textit{Free Form} shapes.

- **Remove Point**
  
  Removes the current point from \textit{Polygon} or \textit{Free Form} shapes.

- **Duplicate**
  
  Create a duplicate of the currently selected shape.

- **Delete**
  
  Delete the currently selected shape.

- **New Rectangle**
  
  Creates a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

- **New Polygon**
  
  Creates a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

- **Undo**
  
  Use this action to undo the last action.

- **Redo**
  
  Use this action to redo the last action that was undone.

**Shape Table**

The table at the right of the \textit{Image Pane} is a sequential list of all the areas (shapes) that have been added in the image. It shows their number, type, and ID. If you select one of the entries in the table, the corresponding shape will be selected in the \textit{Image Pane}. 
Properties

Type

Displays information about the selected coordinate.

ID

The identifier for the selected area. This will become the value of the xml:id attribute for the particular zone element. When you insert a new zone, a unique ID is automatically generated and displayed in this field. However, you can change this value if you want to.

How to Create an Image Map in TEI

To create an image map on an existing image in a TEI document, follow these steps:

1. The image (graphic) must be inside a facsimile element to support the Image Map Editor feature.
2. Right-click the image and select Image Map Editor.

   Result: This action will apply an image map to the current image and open the Image Map Editor dialog box.

3. Add areas (zones) in the image by selecting one of the shape buttons (New Rectangle or New Polygon).
4. Move the shape to the desired area in the image and drag any of the points on the shape to adjust its size or form. You can use the other buttons on the toolbar (page 818) to adjust its layer and color, or to perform other editing actions.

   Tip: You can right-click any of the points, shapes, or anywhere in the Image Pane to access various helpful contextual menu actions (page 821). For example, the easiest way to remove a point is to right-click the point and select \( \times \) Remove Point.

5. With the shape selected, enter an ID (page 822).
6. If you want to add more areas (zones) to the image, select a shape button again and repeat the appropriate steps.
7. When you are finished, click OK to process your changes.

Result: The image map is applied on the image and the appropriate elements and attributes are automatically added. In Author mode, the image map is now rendered over the image and the following two buttons will now be available at the bottom of the image:

- Image Map Editor - Click this button to open the Image Map Editor.
• **Image Map Details** - Click this button to expand a section that displays the details of the image map.

### How to Edit an Existing Image Map in TEI

To edit an existing image map, use any of the following methods:

- Simply double-click the image.
- Right-click the image and select **Image Map Editor**.
- Click the **Image Map Editor** button below the image.

All three methods open the **Image Map Editor** where you can make changes to the image map using the various features described above. You can also make changes to the XML structure of the image map in the **Text** editing mode.

You can also click the **Image Map Details** button below the image to expand a section that displays the details of the image map and allows you to change the coordinates and IDs of the hyperlinked areas.

**Restriction**: Currently, if *zone* elements contain additional content (such as text or comments) and you edit the image map, the **Image Map Editor** does not preserve the additional content. Therefore, if you do need to insert additional content inside the *zone* elements, you should do so after the image map has been created and finalized. Subsequent changes to the image map should then be done in **Text** mode.

### Overlapping Areas

If shapes overlap one another in the **Image Map Editor**, the one on the top layer takes precedence. The number shown inside each shape represent its layer (if the numbers are not displayed, click the **Show/Hide Numbers** button on the **Image Map Editor** toolbar (*page 818*)). To change the layer order for a shape, use the layer buttons on the **Image Map Editor** toolbar (*page 818*) (•, •, •, •).

If you insert a shape and all of its coordinates are completely inside another shape, the **Image Map Editor** will display a warning to let you know that the shape is entirely covered by a bigger shape. Keep in mind that if a shape is completely inside another shape, its hyperlink will only be accessible if its layer is on top of the bigger shape.

**Warning**: PDF output is limited to rectangular shaped image map objects. Therefore, if your image contains circles or polygons, those objects will be redrawn as rectangles in the PDF output. Keep in mind that this might affect overlaps in the output.

- **New Rectangle**
  Creates a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

- **New Circle**
  Creates a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

- **New Polygon**
  Creates a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

- **Undo**
  Use this action to undo the last action.

- **Redo**
  Use this action to redo the last action that was undone.

**Shape Table**
The table at the right of the *Image Pane* is a sequential list of all the areas (shapes) that have been added in the image. It shows their number, type, and description (value of the *Alternative* property). If you select one of the entries in the table, the corresponding shape will be selected in the *Image Pane*.

**Properties**

**Type**

Displays information about the selected coordinate.

**Href**

Specifies the hyperlink target for the selected area. This will become the value of the *href* attribute for the particular *area* element. The possible values are:

- **An Absolute URL** - A URL of another website (for example, `http://www.example.com/index.htm`).
- **A Relative URL** - A link to a file within your website (for example, `index.htm`).
- **An Element** - A link to the ID of an element within the page (for example, `#top`).
- **A Script** - A link to a script (for example, `javascript:alert('Hello');`)

**Alternate**

The description for the selected area. The value is inserted in an *alt* attribute in the particular *area* element. This is a required attribute to present a text alternative for browsers that do not display images.

**Target**

Specifies where to open the linked resource. The allowed values are:

- **_blank** - Opens the linked resource in a new window or tab.
- **_self** - Opens the linked resource in the same frame as it was clicked.
- **_parent** - Opens the linked resource in the full body of the window.
- **framename** - Opens the linked resource in the named frame.

**How to Create an Image Map in XHTML**

To create an image map on an existing image in an XHTML document, follow these steps:
1. Right-click the image and select **Image Map Editor**.

   **Result:** This action will apply an *image map* to the current image and open the **Image Map Editor** dialog box.

2. Add hyperlinks to the image by selecting one of the shape buttons (☐ **New Rectangle**, ☪ **New Circle**, or ☑ **New Polygon**).

3. Move the shape to the desired area in the image and drag any of the points on the shape to adjust its size or form. You can use the other buttons on the toolbar (page 824) to adjust its layer and color, or to perform other editing actions.

   **Tip:** You can right-click any of the points, shapes, or anywhere in the Image Pane to access various helpful contextual menu actions (page 827). For example, the easiest way to remove a point is to right-click the point and select **X Remove Point**.

4. With the shape selected, specify the hyperlink target in the **Href** field (page 828) and enter a description for the selected area in the **Alternate** field (page 828).

5. (Optional) Specify where the hyperlink resource will be opened in the **Target** field (page 828).

6. If you want to add more hyperlinks to the image, select a shape button again and repeat the appropriate steps.

7. When you are finished creating hyperlinks, click **OK** to process your changes.

   **Result:** The *image map* is applied on the image and the appropriate elements and attributes are automatically added. In **Author** mode, the image map is now rendered over the image and its properties are displayed in a section below the image.

**How to Edit an Existing Image Map in XHTML**

To edit an existing image map, use any of the following methods:

- Simply double-click the image.
- Right-click the image and select **Image Map Editor**.
- Click the **Image Map Editor** button below the image.

All three methods open the **Image Map Editor** where you can make changes to the image map using the various features described above. You can also make changes to the XML structure of the image map in the **Text** editing mode.

In **Author** mode, the details of the image map are also displayed below the image and you can edit the description, href, shape, and coordinates of the hyperlinked areas. Keep in mind that if you change the
shape in this section, you also need to add or remove coordinates to match the requirements of the new shape.

**Overlapping Areas**

If shapes overlap one another in the Image Map Editor, the one on the top layer takes precedence. The number shown inside each shape represent its layer (if the numbers are not displayed, click the Show/Hide Numbers button on the Image Map Editor toolbar (page 824)). To change the layer order for a shape, use the layer buttons on the Image Map Editor toolbar (page 824) (previous, back, next, forward).

If you insert a shape and all of its coordinates are completely inside another shape, the Image Map Editor will display a warning to let you know that the shape is entirely covered by a bigger shape. Keep in mind that if a shape is completely inside another shape, its hyperlink will only be accessible if its layer is on top of the bigger shape.

**Warning:** PDF output is limited to rectangular shaped image map objects. Therefore, if your image contains circles or polygons, those objects will be redrawn as rectangles in the PDF output. Keep in mind that this might affect overlaps in the output.

**Adding Video, Audio, and Embedded HTML Resources**

You can insert references to media resources (such as videos, audio clips, or embedded HTML frames) in your DITA, DocBook, or XHTML topics. The media resources can be played directly in Author mode and in all HTML5-based outputs. There is a toolbar button that allows you to insert and configure a reference to the media resource. You can also drag media files from your system explorer or the Navigator view (page 250) and drop them into your documents (or copy and paste them).

**Table 36. Supported Media Types**

<table>
<thead>
<tr>

</tbody>
</table>
### Adding a Media Resource

To insert a media resource in a document, use the following procedure:

1. Place the cursor at the location where you want the media resource.
2. Select the **Insert Media Resource** action from the toolbar. A **Chose Media** dialog box appears.
   
   **Note:** You can also drag media files from your system explorer or the **Navigator view** (page 250) and drop them into your documents (or copy and paste them).

3. Select the URL for the media resource and click **Ok**.

**Result in Author Mode:** A reference to the specified media object is inserted and rendered in **Author** mode so that it can be played directly from there.

**Attention:**

- On Mac OS X, if you receive a **Blocked Plug-in** error message, you need to updated your **Flash Player** to the latest version.
- On Ubuntu 17.10, if you receive an error when trying to play videos in **Author** mode, you need to install the **libavformat57** library.

**Result in Output:** In the publishing stage, the media object is converted to an HTML5 element so that it can be rendered properly and played in all HTML5-based outputs.

### Embedding HTML Content in DITA Topics

The DITA Open Toolkit that comes bundled with Oxygen XML Editor plugin includes a pre-installed **plugin** (page 2709) that allows you to embed well-formed HTML content directly in a DITA topic.

For example, suppose you wanted to embed a YouTube video directly in a DITA topic.
The DITA topic would look like this:

```xml
<foreign outputclass="html-embed"><![CDATA[
    <iframe width="420" height="315"
    src="https://www.youtube.com/embed/qepRkQxhTX"
    frameborder="0" allowfullscreen="true">
</iframe>
]]></foreign>
```

The converted HTML output would look like this:

```html
<iframe width="420" height="315" src="https://www.youtube.com/embed/qepRkQxhTX"
    frameborder="0" allowfullscreen="true">
</iframe>
```

The plugin is also available on the oxygenxml GitHub projects page.

Editing MathML Notations

The Author editor includes a built-in editor for MathML notations. To start the MathML editor, double-click a MathML notation (for embedded notations, you can also select the Edit Equation action from its contextual menu).

*Figure 319: Default MathML Editor*
Configure the MathFlow Editor

The MathFlow Components product can replace the default MathML editor with a specialized MathML editor. You have to purchase a MathFlow Component from Design Science and configure it in Oxygen XML Editor plugin with the following procedure:

1. Install MathFlow by using the Universal installer (for versions prior to 2.1, use the MathFlow SDK).

2. Set the path to the MathFlow install folder in the MathML preferences page (page 118).

3. Set the path to the MathFlow license file in the MathML preferences page (page 118).

Figure 320: Default MathFlow Editor
MathML Equations in HTML Output

Currently, only Firefox can render MathML equations embedded in the HTML code. MathJax is a solution to properly view MathML equations embedded in HTML content in a variety of browsers.

If you have DocBook or DITA content that has embedded MathML equations and you want to properly view the equations in published HTML output types (WebHelp, CHM, EPUB, etc.), you need to add a reference to the MathJax script in the head element of all HTML files that have the equation embedded.

For example:

```html
<script type="text/javascript"
src="https://cdnjs.cloudflare.com/ajax/libs/mathjax/2.7.1/MathJax.js?config=TeX-AMS-MML_HTMLorMML"></script>
```

For DITA documents, you can also use the following procedure:

1. Edit the DITA Map WebHelp transformation scenario (page 1498) and open the Parameters tab.
2. Set the following parameter to point to an XML resource file that contains your script, depending on your type of WebHelp system.
   - **WebHelp Responsive Systems** - Set the `webhelp.fragment.head` parameter to point to your resource file.
   - **WebHelp Classic Systems** - Set the `webhelp.head.script` parameter to point to your resource file.
3. Run the transformation scenario.

**Result:** The equation should now be properly rendered in other browsers, such as Edge, IE, or Chrome.

Refreshing the Content

On occasion you may need to reload the content of the document from the disk or reapply the CSS. This can be performed by using the **Reload** action.

To refresh the content of the referenced resources you can use the **Refresh references** action that is available in the current framework menu (for example, the DITA or DocBook5 menu). However, this action will not refresh the expanded external entities, for which you will need to use the **Reload** action.

Generating IDs for Elements in Author Mode

Oxygen XML Editor plugin allows you to manually assign or edit values of `id` attributes in **Author** mode by using the **Attributes View** (page 319) or an in-place attribute editor (page 692). Oxygen XML Editor plugin also includes mechanisms to generate ID values for elements, either on-request or automatically, in DITA, DocBook, or TEI documents.

**Generate IDs On-Request**

You can generate ID values for specific elements on-request. To do so, select the element for which you want to generate an ID (or place the cursor inside the element) and select the **Generate IDs** action from the contextual menu. This action generates a unique ID for the current element. If you invoke the action on a block of selected content, the action will generate IDs for all top-level elements and elements that are listed in the **ID Options** dialog box (page 836). To open this dialog box, select **ID Options** from the DITA, DocBook, or TEI menu (depending on your document type).

**Note:** The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

**Automatically Generate IDs**

Oxygen XML Editor plugin includes an option to automatically add unique ID values to certain elements when they are created in **Author** mode. The **Auto generate IDs for elements** option can be found in the **ID Options** dialog box (page 836) that is displayed when you select the **ID Options** action from the framework (page 2706)-specific menu (DITA, DocBook, or TEI). If this **Auto generate IDs for elements** option is selected, Oxygen XML Editor plugin automatically generates unique ID values for elements that are listed in this dialog box. You can use this dialog box to customize the
format of the ID values and choose which elements will have their ID values automatically generated (for example, you can customize the list of elements to include those that you most often need to identify).

**ID Options Dialog Box**

To configure options for generating IDs, select **ID Options** from the **DITA**, **DocBook**, or **TEI** menu (depending on your document type).

*Figure 321: ID Options Dialog Box*

The **ID Options** dialog box allows you to configure the following options with regards to generating ID values:

**ID Pattern**

The pattern for the ID values that will be generated. This text field can be customized using constant strings or any of the Oxygen XML Editor plugin **Editor Variables** (page 201).

**Element name or class value to generate ID for**

The elements for which ID values will be generated, specified using class attribute values. To customize the list, use the **Add**, **Edit**, or **Remove** buttons.

**Auto generate IDs for elements**

If selected, Oxygen XML Editor plugin will automatically generate unique IDs for the elements listed in this dialog box when they are created in **Author** mode.

**Remove IDs when copying content in the same document (DITA or TEI)**
When copying and pasting content in the same DITA or TEI document, this option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs. To retain the element IDs, deselect this option.

**Note:** This option does not have an effect on content that is *cut* and *pasted*.

### Remove IDs when copying content (DocBook)

This option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs in DocBook documents. If this option is not selected, IDs are always retained when you copy or cut content and paste it in the same document or other documents. If this option is selected, IDs are never retained for copied content, but if you cut the content, they are preserved for the first paste action (and not retained for any subsequent paste actions).

### Duplicating Elements with Existing IDs

If you duplicate elements with existing IDs (for example, through copy/paste or drag/drop actions), all IDs are removed at the resolution of the operation. However, you can use the options in the **ID Options** dialog box to change this behavior. The options in this dialog box affect duplicated elements with existing IDs in the following ways:

- Only the elements listed in this dialog box are affected by these options. Therefore, if you want to use these options to preserve IDs or generate new ones, you must first add the elements to be duplicated to the list in this dialog box.
- If the **Auto generate IDs for elements** option (page 836) is selected and you duplicate elements with existing IDs, Oxygen XML Editor plugin assigns new, unique ID values to the duplicates.
- If the **Auto generate IDs for elements** option (page 836) is not selected and you duplicate elements with existing IDs, the ID values are removed from the duplicates.
- For DITA and TEI, if the **Remove IDs when copying content in the same document** option (page 836) is selected, the ID values are removed from elements that are duplicated in the same document. If it is not selected, the ID values are preserved when elements are duplicated in the same document. Selecting this option has no effect if the **Auto generate IDs for elements** option is selected and this option has no affect on elements that are duplicated in other documents.
- For DocBook, if the **Remove IDs when copying content** option (page 837) is selected, the ID values are removed from any element that is duplicated. If it is not selected, the ID values are preserved when elements are duplicated. Selecting this option has no effect if the **Auto generate IDs for elements** option is selected.
Controlling the Default ID Generation Options

It is possible to configure the default ID generation options for DITA, DocBook, and TEI document types. In the `frameworks` folder for each of those document types, there is an XML configuration file called `idGenerationDefaultOptions.xml` that contains the default settings for generating IDs in each particular type of document. To configure the default settings, you can edit this file and save it back to the same directory.

The configuration file can be found in the `resources` folder within the particular framework (page 2706). For example, the configuration file for the DITA framework is located in: `[OXYGEN_INSTALL_DIR]/frameworks/dita/resources/idGenerationDefaultOptions.xml`.

Sharing Default ID Generation Options

If you want to share your configured default ID generation settings with other members of your team, follow these steps:

1. Configure the `idGenerationDefaultOptions.xml` file for your framework according to your needs.
2. Bundle a modified version of the entire framework folder (for example, `[OXYGEN_INSTALL_DIR]/frameworks/dita/`). To do this:
   a. Open the Preferences dialog box (page 55) and go to Document Type Association.
   b. Select your document type and click the Extend button.
   c. In the Document type configuration dialog box (page 72) that is now displayed, select External for the Storage option. By default, this will save the extension in a new folder in the frameworks folder (for example, `[OXYGEN_INSTALL_DIR]/frameworks/dita-extension (1)`), but you can also use the Browse button to specify a specific name and folder.
   d. In this new extension folder, create a new folder called resources and add your modified `idGenerationDefaultOptions.xml` file to this new resources folder.
   e. Go back to the Document Type Association preferences page, select the extended framework, and click Edit.
   f. Go to the Classpath tab (page 76), add a reference to your new resources folder, and move this reference up (using the Move Up button) so that it is the first one that appears in the list.
   g. Click OK and exit out of the preferences page.
3. Distribute your newly extended folder to other team members by using one of the methods described in Sharing a Custom Framework (page 2086).

Using Form Controls in Author Mode
Form controls make it easier to capture, organize, and edit content. They are especially helpful for less technical users because form controls provide a way to interact with the content of a document in a graphical manner without intimidating the user with the XML structure.

Oxygen XML Editor plugin includes a variety of built-in form controls (page 2255) that can be defined in CSS stylesheets that are used to render Author mode (page 2255). You can also implement custom form controls (page 2288) for more specific needs. The types of built-in form controls that are available include:

- **Audio (page 2256)** - A media object that plays audio clips.
- **Browser (page 2257)** - A media object that renders HTML frames or interact with SVG documents.
- **Button (page 2261)** - A graphical user interface object that performs a specific action.
- **Button Group (page 2264)** - A graphical user interface group of buttons (such as radio buttons) that perform specific actions.
- **Checkbox (page 2268)** - A graphical user interface box that you can click to select or deselect a value.
- **Combo Box (page 2270)** - A graphical user interface object that can be a drop-down menu or a combination of a drop-down menu and a single-line text field.
- **Date Picker (page 2273)** - A form control object that allows you to select a date in a specified format.
- **HTML Content (page 2274)** - A graphical user interface box that is used for rendering HTML content.
- **Pop-up (page 2276)** - A contextual menu that provides quick access to various actions.
- **Text Area (page 2279)** - A box that allows you to enter multiple lines of text.
- **Text Field (page 2283)** - A graphical user interface box that allows you to enter a single line of text.
- **URL Chooser (page 2285)** - A dialog box that allows you to select the location of local or remote resources.
- **Video (page 2287)** - A media object that plays videos.

The following image is an example of several form controls rendered in Author mode. The first (Direct manager) is a combo box with both a drop-down menu and an editable text field. This is followed by a simple text field (Homepage), and the [+] and [-] icons also represent button form controls that are assigned specific actions to add or delete records from the document.

*Figure 322: Example of Form Controls in Author Mode*
You can use your imagination to envision the multitude of ways that you can use form controls to make the editing experience for content authors easier and more efficient. As a working example, a bundled samples project (located in the samples folder inside the Oxygen XML Editor plugin installation directory) contains a file called personal.xml that contains form controls. You can use this file, along with its corresponding personal.css file to experiment with an example of how form controls can be implemented in Author mode.

Contextual Menu Actions in Author Mode

Oxygen XML Editor plugin includes powerful support for editing XML documents through actions included in the contextual menu. When editing XML documents in Author mode, the contextual menu includes general actions that are available for all of the recognized document types and framework-specific actions that are configured for each document type.

General Contextual Menu Actions in Author Mode

The general actions that are available in the contextual menu (some of them are also available in the submenus of the Document menu) for all built-in document types include the following:

**Quick Fix (Alt + 1 (Command + Alt + 1 on OS X))**

Available when the contextual menu is invoked on an error where Oxygen XML Editor plugin can provide a Quick Fix (page 884).

Open Image
Available when the contextual menu is invoked on an image. This action allows you to open an image in a default system application associated with the current image type.

**Track Changes Actions**

Available when the *Track Changes feature (page 2711)* is enabled and the contextual menu is invoked on a change. The following options are available:

- **✓ Accept Change(s)**
  
  Accepts the *Tracked Change (page 2711)* located at the cursor position or all of the changes in a selection. If you select a part of a *deletion* or *insertion* change, only the selected content is accepted. If you select multiple changes, all of them are accepted. For an *insertion* change, it keeps the inserted text and for a *deletion* change, it removes the content from the document.

- **✗ Reject Change(s)**
  
  Rejects the *Tracked Change (page 2711)* located at the cursor position or all of the changes in a selection. If you select a part of a *deletion* or *insertion* change, only the selected content is rejected. If you select multiple changes, all of them are rejected. For an *insertion* change, it removes the inserted text and for a *deletion* change, it preserves the original content.

- **🔗 Comment Change**
  
  Opens a dialog box that allows you to add a comment to an existing *Tracked Change (page 2711)*. The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

**Author Callout Actions**

Available when the contextual menu is invoked on a *callout (page 2704)*. If the corresponding options in the *Show review callouts section (page 127)* are selected in the *Callouts preferences page (page 127)*, the callouts are displayed in Author mode for comments, tracked insertion changes, or tracked deletion changes.

**Insertion or Deletion Callout Actions**

The following actions are available in the contextual menu when invoked on an *insertion* or *deletion* callout box:

- **Reply**
Opens a dialog box that allows you to add a reply to a comment or Tracked Changes (page 2711). When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and Review view (page 742).

**Mark as Done**

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for Tracked Changes (page 2711) that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendents. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

✔️ **Accept Change(s)**

Accepts the Tracked Change (page 2711) located at the cursor position or all of the changes in a selection. If you select a part of a deletion or insertion change, only the selected content is accepted. If you select multiple changes, all of them are accepted. For an insertion change, it keeps the inserted text and for a deletion change, it removes the content from the document.

❌ **Reject Change(s)**

Rejects the Tracked Change (page 2711) located at the cursor position or all of the changes in a selection. If you select a part of a deletion or insertion change, only the selected content is rejected. If you select multiple changes, all of them are rejected. For an insertion change, it removes the inserted text and for a deletion change, it preserves the original content.

✍️ **Comment Change**

Opens a dialog box that allows you to add a comment to an existing Tracked Change (page 2711). The comment
will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

**Edit Reference**

If the fragment that contains a callout is a reference, use this option to go to the reference and edit the callout.

**Callouts Options**

Select this option to open the Callouts preference page (page 127) where you can configure various callout options.

**Comment Callout Actions**

The following actions are available in the contextual menu when invoked on a comment callout box:

**Reply**

Opens a dialog box that allows you to add a reply to a comment or Tracked Changes (page 2711). When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and Review view (page 742).

**Mark as Done**

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for Tracked Changes (page 2711) that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendents. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

**Show/Edit Comment**

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original
comment, the dialog box just displays the comment without
the possibility of editing it.

Remove Comment

Removes a selected comment. If you remove a comment
that contains replies, all of the replies will also be removed.

Callouts Options

Select this option to open the Callouts preference page (page
127) where you can configure various callout options.

Edit Attributes

Displays an in-place attributes editor (page 322) that allows you to manage the
attributes of an element.

Edit Profiling Attributes

Allows you to change the profiling attributes (page 746) defined on all selected
elements.

Insert submenu

This submenu includes insert actions that are specific to each framework (page 2706),
along with the following general action:

Insert Entity

Allows you to insert a predefined entity or character entity. Surrogate
caracter entities (range #x10000 to #x10FFFF) are also accepted.
Character entities can be entered in one of the following forms:

• \#<decimal value>- e.g. \#65
• &\#<decimal value>; - e.g. &\#65
• #x<hexadecimal value>- e.g. #x41
• &x<hexadecimal value>; - e.g. &x41

Cut (Ctrl + X (Command + X on OS X))

Removes the current selected content from the document and places it in the clipboard.

Copy (Ctrl + C (Command + C on OS X))

Places a copy of the current selected content in the clipboard.

Paste (Ctrl + V (Command + V on OS X))

Inserts the current clipboard content into the document at the cursor position.

Paste special submenu
This submenu includes special paste actions that are specific to each framework (page 2706), as well as the following general paste actions:

**Paste As XML**

Paste clipboard content that is considered to be XML, preserving its XML structure.

**Paste As Text**

Paste clipboard content, ignoring any structure or styling markup.

**Select submenu**

This submenu allows you to select the following:

**Element**

Selects the entire element at the current cursor position.

**Content**

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

**Parent**

Selects the entire parent element at the current cursor position.

**Text submenu**

This submenu contains the following actions:

**To Lower Case**

Converts the selected content to lower case characters.

**To Upper Case**

Converts the selected content to upper case characters.

**Capitalize Sentences**

Converts to upper case the first character of every selected sentence.

**Capitalize Words**

Converts to upper case the first character of every selected word. 0034

**Count Words**

Counts the number of words and characters (no spaces) in the entire document or in the selection for regular content and read-only content.
Note: The content marked as deleted with change tracking (page 2711) is ignored when counting words.

Convert Hexadecimal Sequence to Character (Ctrl + Shift + H (Command + Shift + H on OS X))

Converts a sequence of hexadecimal characters to the corresponding Unicode character (page 602). The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the 0x or 0X prefix. Examples of valid sequences and the characters they will be converted to:

- 0x0045 will be converted to E
- 0X0125 to #
- 265 to #
- 2190 to #

Note: For more information about finding the hexadecimal value of a character, see Finding the Decimal, Hexadecimal, or Character Entity Equivalent (page 609).

Refactoring submenu

Contains a series of actions designed to alter the XML structure of the document:

![Toggle Comment]

Encloses the currently selected text in an XML comment, or removes the comment if it is commented.

Move Up (Alt + UpArrow)

Moves the current node or selected nodes in front of the previous node.

Move Down (Alt + DownArrow)

Moves the current node or selected nodes after the subsequent node.

Split Element

Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

Join Elements
Joins two adjacent block elements (page 2703) that have the same name. The action is available only when the cursor position is between the two adjacent block elements. Also, joining two block elements can be done by pressing the Delete or Backspace keys and the cursor is positioned between the boundaries of these two elements.

**Surround with Tags (Alt + Shift + E)**

Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

- If the Position cursor between tags option (page 101) is selected in the Content Completion preferences page, the cursor is placed between the start and end tag.
- If the Position cursor between tags option (page 101) is not selected in the Content Completion preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

**Surround with \[tag\] (Alt + Shift + ForwardSlash)**

Surround the selected content with the last tag used.

**Rename Element**

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the Rename dialog box.

**Delete Element Tags**

Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the Delete or Backspace keys.

**Remove All Markup**

Removes all the XML markup inside the selected block of content and keeps only the text content.

**Remove Text**

Removes the text content of the selected block of content and keeps the markup intact with empty elements.

**DITA Refactoring Actions**
A variety of built-in XML refactoring operations that pertain to DITA documents with some of the information preconfigured based upon the current context.

**Change Topic ID to File Name**

Use this operation to change the ID of a topic to be the same as its file name.

**Convert CALS Tables to Simple Tables**

Use this operation to convert DITA CALS tables to simple tables. If you invoke this operation from a nested table (a table inside a table), only the nested table will be affected. If it is invoked on a parent table that contains nested tables, all of the contained tables will be converted.

**Convert conrefs to conkeyrefs**

Use this operation to convert `conref` attributes to `conkeyref` attributes.

**Convert Simple Tables to CALS Tables**

Use this operation to convert DITA simple tables to CALS tables. If you invoke this operation from a nested table (a table inside a table), only the nested table will be affected. If it is invoked on a parent table that contains nested tables, all of the contained tables will be converted.

**Convert to Concept**

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

**Convert to General Task**

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA General Task is a less restrictive alternative to the Strict Task information type.

**Convert to Reference**

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

**Convert to Task**

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).
Convert to Topic

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

Convert to Troubleshooting

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

Rename Key

Available when invoked on a key, and can be used to quickly rename a key. It also updates all references to it. Note that it does not work on DITA 1.3 key scopes.

Attributes Refactoring Actions

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

Add/Change attribute

Allows you to change the value of an attribute or insert a new one.

Convert attribute to element

Allows you to change an attribute into an element.

Delete attribute

Allows you to remove one or more attributes.

Rename attribute

Allows you to rename an attribute.

Replace in attribute value

Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

Comments Refactoring Actions

Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

Delete comments

Allows you to delete comments found inside one or more elements.
Elements Refactoring Actions

Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

Delete element
- Allows you to delete elements.

Delete element content
- Allows you to delete the content of elements.

Insert element
- Allows you to insert new elements.

Rename element
- Allows you to rename elements.

Unwrap element
- Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

Wrap element
- Allows you to surround elements with element tags.

Wrap element content
- Allows you to surround the content of elements with element tags.

Fragments Refactoring Actions

Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

Insert XML fragment
- Allows you to insert an XML fragment.

Replace element content with XML fragment
- Allows you to replace the content of elements with an XML fragment.

Replace element with XML fragment
- Allows you to replace elements with an XML fragment.

JATSKit Refactoring Actions
Available for JATS documents. Contains built-in XML refactoring operations that pertain to JATS documents with some of the information preconfigured based upon the current context.

Add BITS DOCTYPE - NLM/NCBI Book Interchange 2.0
Add an NLM 'BITS' 2.0 DOCTYPE declaration.

Add Blue DOCTYPE - NISO JATS Publishing 1.1
Adds a JATS 'Blue' 1.1 DOCTYPE declaration.

Normalize IDs
Assigned IDs are normalized and IDs are assigned to some elements that are missing them.

Review submenu
This submenu includes the following actions:

✔ Track Changes
Enables or disables the Track Changes (page 2711) support for the current document.

✔ Accept Change(s) and Move to Next
Accepts the Tracked Change (page 2711) located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is accepted.

✔ Accept All Changes
Accepts all Tracked Changes (page 2711) in the current document.

✘ Reject Change(s) and Move to Next
Rejects the Tracked Change (page 2711) located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is rejected.

✘ Reject All Changes
Rejects all Tracked Changes (page 2711) in the current document.

💬 Comment Change
Opens a dialog box that allows you to add a comment to an existing Tracked Change (page 2711). The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on
an existing commented change, the dialog box will allow you to edit the comment.

**Highlight**

Enables the highlighting tool that allows you to mark text in your document.

**Colors**

Allows you to select the color for highlighting text.

**Stop highlighting**

Use this action to deactivate the highlighting tool.

**Remove highlight(s)**

Use this action to remove highlighting from the document.

**Add Comment**

Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).

**Show/Edit Comment**

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

**Remove Comment**

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

**Manage Reviews**

Opens the Review view (page 742).

**Manage IDs submenu**

This submenu is available for XML documents that have an associated DTD, XML Schema, or Relax NG schema (not available for DITA documents). It includes the following actions:

**Rename in**

 Renames the ID and all its occurrences. Selecting this action opens the **Rename XML ID** dialog box. This dialog box lets you insert the new ID value and choose the scope of the rename operation.

**Search References**
Searches for the references of the ID. By default, the scope of this action is
the current project. If you configure a scope using the Select the scope for
the Search and Refactor operations (page 904) dialog box, this scope
will be used instead.

Search References in

Searches for the references of the ID. Selecting this action opens the
Select the scope for the Search and Refactor operations (page 904).

Search Occurrences in file

Searches for the occurrences of the ID in the current document.

Folding submenu

This submenu includes the following actions:

- **Toggle Fold**
  Toggles the state of the current fold.

- **Collapse Other Folds (Ctrl + NumPad/ (Command + NumPad/ on OS X))**
  Folds all the elements except the current element.

- **Collapse Child Folds (Ctrl + NumPad- (Command + NumPad- on OS X))**
  Folds the elements indented with one level inside the current element.

- **Expand Child Folds (Ctrl + NumPad+ (Command + NumPad+ on OS X))**
  Unfolds all child elements of the currently selected element.

- **Expand All (Ctrl + NumPad* (Command + NumPad* on OS X))**
  Unfolds all elements in the current document.

Inspect Styles

Opens the CSS Inspector view (page 329) that allows you to examine the CSS rules that
match the currently selected element.

Options

Opens the Author mode options page (page 110).

Document Type-Specific Contextual Menu Actions in Author Mode

Other document type-specific actions are available in the contextual menu of Author mode for the
following document types (click the links to see the default actions that are available for each specific
document types):
Validating XML Documents

The W3C XML specification states that a program should not continue to process an XML document if it finds a validation error. The reason is that XML software should be easy to write and all XML documents should be compatible. With HTML, for example, it is possible to create documents with lots of errors (for instance, when you forget an end tag). One of the main reasons that various HTML browsers have performance and compatibility problems is that they have different methods of figuring out how to render a document when an HTML error is encountered. Using XML helps to eliminate such problems.

Even when creating XML documents, errors are easily introduced. When working with large projects or a large number of files, the probability that errors will occur is even greater. Preventing and solving errors in your projects can be time consuming and frustrating. Fortunately, Oxygen XML Editor plugin provides validation functions that allow you to easily identify errors and their location.

Checking XML Well-Formedness

A Well-formed XML document is a document that conforms to the XML syntax rules. A Namespace Well-Formed XML document is a document that is Well-formed XML and is also Namespace-wellformed and Namespace-valid.

Well-Formedness Rules

The XML Syntax rules for Well-formed XML include:

- All XML elements must have a closing tag.
- XML tags are case-sensitive.
- All XML elements must be properly nested.
• All XML documents must have a root element.
• Attribute values must always be quoted.
• With XML, whitespace is preserved.

The **Namespace-wellformed** rules include:

• All element and attribute names contain either zero or one colon.
• No entity names, processing instruction targets, or notation names contain any colons.

The **Namespace-valid** rules include:

• The `xml` prefix is by definition bound to the namespace name: `http://www.w3.org/XML/1998/namespace`. It MAY be declared, but MUST NOT be undeclared or bound to any other namespace name. Other prefixes MUST NOT be bound to this namespace name.
• The `xmlns` prefix is used only to declare namespace bindings and is by definition bound to the namespace name: `http://www.w3.org/2000/xmlns/`. It MUST NOT be declared or undeclared. Other prefixes MUST NOT be bound to this namespace name.
• All other prefixes beginning with the three-letter sequence `x`, `m`, `l`, in any case combination, are reserved. This means that users SHOULD NOT use them except as defined by later specifications and processors MUST NOT treat them as fatal errors.
• The namespace prefix (unless it is `xml` or `xmlns`) MUST have been declared in a namespace declaration attribute in either the start tag of the element where the prefix is used or in an ancestor element (for example, an element in whose content the prefixed markup occurs). Furthermore, the attribute value in the innermost such declaration MUST NOT be an empty string.

**Check for Well-Formedness**

To check if a document is **Namespace Well-Formed XML** and **Namespace-valid**:

• Select the [Check Well-Formedness](https://example.com) (Alt + Shift + V, W (Command + Alt + V, W on OS X)) action from the [Validation](https://example.com) drop-down menu on the toolbar (or the [XML](https://example.com) menu).
• A selection of files can be checked for well-formedness by selecting the [Check Well-Formedness](https://example.com) action from the [Validate](https://example.com) submenu when invoking the contextual menu in the [Navigator](https://example.com) view (page 250).

**Result:** If any errors are found, the result is displayed in the message panel at the bottom of the editor. Each error is displayed as one record in the result list and is accompanied by an error message. Clicking the record will open the document containing the error and highlight its approximate location.

**Example: A non Well-formed XML Document**

```xml
<root><tag></root>
```
When Check Well-Formedness is performed the following error is raised:

```
The element type "tag" must be terminated by the matching end-tag "</tag>"
```

To resolve the error, click the record in the result list and it will locate and highlight the approximate position of the error. In this case, identify the tag that is missing an end tag and insert </tag>.

**Example: A non Namespace-wellformed Document**

```
<prefix:elem></prefix:elem>
```

When Check document form is performed the following error is raised:

```
The prefix "prefix" for element "prefix:elem" is not bound.
```

**Example: A non Namespace-valid Document**

```
<x:y></x:y>
```

When Check document form is performed the following error is raised:

```
The prefix "x" for element "x:y" is not bound.
```

Validating XML Documents Against a Schema

A Valid XML document is a Well-Formed XML document that also conforms to the rules of a schema that defines the legal elements of an XML document. The schema type can be: XML Schema, Relax NG (full or compact syntax), Schematron, Document Type Definition (DTD), or Namespace-based Validation Dispatching Language (NVDL).

The purpose of the schema is to define the legal building blocks of an XML document. It defines the document structure with a list of legal elements.

This section contains topics that explain the automatic and manual validation possibilities in Oxygen XML Editor plugin, how validation errors are presented, and information about built-in and custom validation scenarios.

For information about how to associate a schema for the purposes of validation (and content completion), see the Associating a Schema to XML Documents (page 887) section.

**Automatic Validation**

By default, Oxygen XML Editor plugin automatically checks for validation errors in the document as you are editing. The Enable automatic validation option (page 109) in the Document Checking
preferences page (page 108) controls whether or not all validation errors and warnings will automatically be highlighted in the editor panel.

The automatic validation starts parsing the document and marking the errors after a configurable delay (page 109) from the last key typed. Errors are highlighted with underline markers in the main editor panel and small rectangles on the right side ruler of the editor panel. Hovering over a validation error presents a tooltip message with more details about the error.

Manual Validation Actions

You can choose to validate documents at any time by using the manual validation actions that are available in Oxygen XML Editor plugin.

### Manual Validation Actions

To manually validate the currently edited document, use one of the following actions:

- **Validate (Alt + Shift + V, V)**
  
  Available from the Validation drop-down menu on the toolbar, the XML menu, or from the Validate submenu when invoking the contextual menu in the Navigator view (page 250).

  An error list is presented in the message panel at the bottom of the editor. Markup of the current document is checked to conform with the specified DTD, XML Schema, or Relax NG schema rules. This action also re-parses the XML Catalogs (page 2712) and resets the schema used for content completion.

- **Validate (cached)**
  
  Available from the Validation drop-down menu on the toolbar or the XML menu.
This action caches the schema, allowing it to be reused for the next validation. Markup of the current document is checked to conform with the specified DTD, XML Schema, or Relax NG schema rules.

Note: Automatic validation also caches the associated schema.

Validate with

Available from the Validation drop-down menu on the toolbar, (or XML menu).

This action opens a dialog box that allows you to specify a schema for validating the current document (page 890).

You can use this action to validate the current document using a schema of your choice (XML Schema, DTD, Relax NG, NVDL, Schematron schema), other than the associated one. An error list is presented in the message panel at the bottom of the editor. Markup of current document is checked to conform with the specified schema rules.

Validate with Schema

Available from the Validate submenu when invoking contextual menu in the Navigator view (page 250).

This action opens a dialog box that allows you to specify a schema for validating all selected files (page 891).

Other Validation Options

To quickly open the schema used for validating the current document, select the Open Associated Schema action from the toolbar (or XML menu).

To clear the error markers added to the Problems view in the last validation, select Clear Validation Markers from the Validate submenu when invoking the contextual menu in the Navigator view.

Tip: If a large number of validation errors are detected and the validation process takes too long, you can limit the maximum number of reported errors in the Document Checking preferences page (page 108).

Presenting Validation Errors in Text Mode

By default, Oxygen XML Editor plugin automatically validates documents (page 856) while editing in the Text mode, and actions are also available to manually validate documents (page 857) on-request.

Validation Marker Locations

In Text mode, validation issues are marked in the following locations:

- In the main editing pane, with the issue underlined in a color according to the type of issue.
- In the right-side vertical stripe, with a marker that is colored according to the type of issue.
- For attributes with detected issues, in the Attributes view (page 261), with the attribute and its value colored according to the type of issue.

Validation Marker Colors

The colors for each type of issue are as follows:
• **Validation Errors** [Red] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the Attributes view are colored in red.

• **Validation Warnings** [Yellow] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the Attributes view are colored in yellow.

• **Validation Info** [Blue] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the Attributes view are colored in blue.

You can configure the colors and how the various types of validation problems are rendered from the Eclipse Annotations preferences page (Window ('Eclipse' on Mac OSX) > Preferences > General > Editors > Text Editors > Annotations).

**Validation Markers in the Right-Side Stripe**

Also, the stripe on the right side of the editor panel is designed to display the issues found during the validation process and to help you locate them in the document. The stripe contains the following:

**Upper Part of the Stripe**

A success indicator square will turn green if the validation is successful or only info messages are found, red if validation errors are found, or yellow if only validation warnings are found. More details about the issues are displayed in a tool tip when you hover over indicator square. If there are numerous problems, only the first three are presented in the tool tip.

**Middle Part of the Stripe**

Errors are presented with red markers, warnings with yellow markers, and info message with blue markers. If you want to limit the number of markers that are displayed, open the Preferences dialog box (page 55), go to Editor > Document checking, and specify the desired limit in the Maximum number of validation highlights option (page 108).

Clicking a marker will highlight the corresponding text area in the editor. The validation message is also displayed both in a tool tip (when hovering over the marker) and in the message area on the bottom of the application.

**Bottom Part of the Stripe**

Two navigation arrows ((shift) allow you to jump to the next or previous issue. The same actions can be triggered from Document > Automatic validation > Next error (Ctrl + Period (Command + Period on OS X)) and Document > Automatic validation > Previous error (Ctrl + Comma (Command + Comma on OS X)).
Hovering Over Validation Issues

Hovering over a validation issue presents a tooltip message with more details about the problem and possible quick fixes (page 884) (if available for that issue). Also, when hovering over an issue, pressing F2 will change the focus to the tooltip where you can use Tab and Shift + Tab to navigate between quick fixes and Space to trigger them.

Details About Validation Issues

- Information about the issue is also displayed in the message area on the bottom of the editor panel (clicking the Document checking options button opens the Document Checking preferences page (page 108) where you can configure some validation options.
- Status messages from every validation action are logged in the Console view (page 612) (the Enable Oxygen consoles option (page 161) must be selected in the View preferences page).
- If you want to see all the validation messages grouped in the Results view (page 267), you should use the Validate action from the toolbar or XML menu. This action also collects the validation messages and displays them in the Problems view if the validated file is in the current workspace or in a custom Errors view if the validated file is outside the workspace.

This action also collects the validation messages and displays them in the Problems view if the validated file is in the current workspace or in a custom Errors view if the validated file is outside the workspace.
Customizing Assert Error Messages

To customize the error messages that the Xerces or Saxon validation engines display for the `assert` and `assertion` elements, set the `message` attribute on these elements.

- For Xerces, the `message` attribute has to belong to the `http://xerces.apache.org` namespace.
- For Saxon, the `message` attribute has to belong to the `http://saxon.sourceforge.net/` namespace.

The value of the `message` attribute is the error message displayed if the assertion fails.

Custom Validators

If you need to validate the edited document with a validation engine that is different from the built-in engine, you can configure external validators in the Custom Validation Engines preferences page (page 106). After a custom validation engine is properly configured (page 106), it can be applied on the current document by selecting it from the list of custom validation engines in the Validation toolbar drop-down menu. The document is validated against the schema declared in the document.

Some validators are configured by default but there are third-party processors that do not support the output message format (page 866) of Oxygen XML Editor plugin for linked messages:

- **Saxon-EE** - Included in Oxygen XML Editor plugin. It is associated to XML Editor and XSD Editor. It is able to validate XML Schema schemas and XML documents against XML Schema schemas. The validation is done according to the W3C XML Schema 1.0 or 1.1. This can be configured in Preferences (page 176).
- **MSXML 4.0** - Included in Oxygen XML Editor plugin (Windows edition only). It is associated to XML Editor, XSD Editor and XSL Editor. It is able to validate the edited document against XML Schema, internal DTD (included in the XML document), external DTD or a custom schema type.
- **MSXML.NET** - Included in Oxygen XML Editor plugin (Windows edition only). It is associated to XML Editor, XSD Editor and XSL Editor. It is able to validate the edited document against XML Schema, internal DTD (included in the XML document), external DTD or a custom schema type.
- **LIBXML** - Not included in Oxygen XML Editor plugin and, depending on your operating system, the libraries need to be downloaded and installed separately from [http://xmlsoft.org/downloads.html](http://xmlsoft.org/downloads.html). Afterwards, the `PATH` environment variable needs to be updated to contain the parent folder of the `xmllint` executable. Alternatively, you can go to Options > Preferences > Editor > Custom
Validation Engines, edit the LIBXML validation engine and set a custom path to the `xmllint` executable.

The LIBXML validator is associated with the XML Editor. It is able to validate the edited document against XML Schema, Relax NG schema full syntax, internal DTD (included in the XML document) or a custom schema type. Support for XML Catalogs (page 2712) (the `--catalogs` parameter) and XInclude processing (`--xinclude`) are enabled by default in the preconfigured LIBXML validator. The `--postvalid` parameter is also set by default and it allows LIBXML to validate correctly the main document even if the XInclude fragments contain IDREFS to ID's located in other fragments.

For validation against an external DTD specified by URI in the XML document, add the `--dtdvalid` parameter manually to the DTD validation command line. `${ds}` represents the detected DTD declaration in the XML document.

⚠️ **CAUTION:** File paths containing spaces are not handled correctly in the LIBXML processor. For example, the built-in XML Catalog (page 2712) files of the built-in document types (DocBook, TEI, DITA, etc.) are not handled by LIBXML if Oxygen XML Editor plugin is installed in the default location on Windows (`C:\Program Files`) because the built-in XML catalog files are stored in the `frameworks` subfolder of the installation folder and in this case, the file path contains at least one space character.

⚠️ **Attention:** On OS X, if the full path to the LIBXML executable file is not specified in the Executable path text field, some errors may occur during validation against a W3C XML Schema, such as:

```
Unimplemented block at ... xmlschema.c
```

To avoid these errors, specify the full path to the LIBXML executable file.

• **XSV** - Not included in Oxygen XML Editor plugin. Windows and Linux distributions of XSV can be downloaded from [http://www.cogsci.ed.ac.uk/~ht/xsv-status.html](http://www.cogsci.ed.ac.uk/~ht/xsv-status.html). The executable path is already configured in Oxygen XML Editor plugin (page 106) for the `{OXYGEN_INSTALL_DIR}/xsv` installation folder. If it is installed in a different folder, the predefined executable path must be corrected in Preferences. (page 106) It is associated to XML Editor and XSD Editor. It is able to validate the edited document against XML Schema or a custom schema type.

• **SQC (Schema Quality Checker from IBM)** - Not included in Oxygen XML Editor plugin. It can be downloaded from here (it comes as a .zip file, at the time of this writing SQC2.2.1.zip is about 3 megabytes). The executable path and working directory are already configured for the SQC installation directory `{OXYGEN_INSTALL_DIR}/sqc`. If it is installed in a different folder, the predefined executable path and working directory must be corrected in the Preferences page. (page 106) It is associated to XSD Editor.
Linked Output Messages of an External Engine

Validation engines display messages in an output view at the bottom of the Oxygen XML Editor plugin window. If such an output message (warning, error, fatal error, etc) spans between three to six lines of text and has the format specified below, then the message is linked to a location in the validated document. Clicking the message in the output view highlights the location of the message in an editor panel containing the file referenced in the message. This behavior is similar to the linked messages generated by the default built-in validator.

Linked messages have the following format:

- **Type**: [F|E|W] (the string Type: followed by a letter for the type of the message: fatal error, error, warning). This property is optional in a linked message.
- **SystemID**: A system ID of a file (the string SystemID: followed by the system ID of the file that will be opened for highlighting when the message is clicked in the output message - usually the validated file, the schema file or an included file).
- **Line**: A line number (the string Line: followed by the number of the line that will be highlighted).
- **Column**: A column number (the string Column: followed by the number of the column where the highlight will start on the highlighted line). This property is optional in a linked message.
- **EndLine**: A line number (the string EndLine: followed by the number of the line where the highlight ends). This property is optional in a linked message.
- **EndColumn**: A column number (the string EndColumn: followed by the number of the column where the highlight ends on the end line). This property is optional in a linked message.
- **AdditionalInfoURL**: The URL string pointing to a remote location where additional information about the error can be found - this line is optional in a linked message.
- **Description**: Message content (the string Description: followed by the content of the message that will be displayed in the output view).

**Example:**

Example of how a custom validation engine can report an error using the format specified above:

```
Type: E
SystemID: file:///c:/path/to/validatedFile.xml
Line: 10
Column: 20
```
Using Saxon Integrated Extension Functions

Saxon, the transformation and validation engine used by Oxygen XML Editor plugin, can be customized by adding custom functions (called Integrated Extension Functions) that can be called from XPath.

To define such a function, follow these steps:

1. Create a file with a Java class that extends net.sf.saxon.lib.ExtensionFunctionDefinition. Here is an example:

```java
private static class ShiftLeft extends ExtensionFunctionDefinition {

    @Override
    public StructuredQName getFunctionQName() {
        return new StructuredQName("eg", "http://example.com/saxon-extension", "shift-left");
    }

    @Override
    public SequenceType[] getArgumentTypes() {
        return new SequenceType[] {SequenceType.SINGLE_INTEGER, SequenceType.SINGLE_INTEGER};
    }

    @Override
    public SequenceType getResultType(SequenceType[] suppliedArgumentTypes) {
        return SequenceType.SINGLE_INTEGER;
    }

    @Override
    public ExtensionFunctionCall makeCallExpression() {
        return new ExtensionFunctionCall() {
            @Override
            public SequenceIterator call(SequenceIterator[] arguments, XPathContext context) throws XPathException {
                throw new XPathException();
            }
        };
    }
}
```
2. Compile the class and add it to a JAR file.

3. Add a file called `net.sf.saxon.lib.ExtensionFunctionDefinition` that contains the fully qualified name of the Java class in the `META-INF/services/` folder of the JAR file.

  **Note:** To add more function definitions in the same JAR file, you need to add their fully qualified names on different lines.

To enable Oxygen XML Editor plugin to pick up your custom function definition, the JAR file should be added to the classpath of the transformer. Here are some possibilities:

- If you develop a framework, you just need to link the JAR file in the **Classpath** tab (page 76).
- In a validation scenario (page 869), you can use the **Extensions** button to open a dialog box where you can add libraries.
- In a transformation scenario, you can use the **Extensions** button in the **XSLT** tab (page 1417) to open a dialog box where you can add libraries.

**Validation Scenarios**

A complex XML document is split in smaller interrelated modules. These modules do not make much sense individually and cannot be validated in isolation due to interdependencies with other modules. Oxygen XML Editor plugin validates the main module of the document when an imported module is checked for errors.

A typical example is the chunking of a DocBook XSL stylesheet that has `chunk.xsl` as the main module and `param.xsl`, `chunk-common.xsl`, and `chunk-code.xsl` as imported modules. `param.xsl` only defines XSLT parameters. The module `chunk-common.xsl` defines an XSLT template with the name `chunk`. `Chunk-code.xsl` calls this template. The parameters defined in `param.xsl` are used in the other modules without being redefined.

Validating `chunk-code.xsl` as an individual XSLT stylesheet generates misleading errors regarding parameters and templates that are used but undefined. These errors are only caused by ignoring the context in which this module is used in real XSLT transformations and in which it is validated. To validate such a module, define a validation scenario to set the main module of the stylesheet and the
validation engine used to find the errors. Usually this engine applies the transformation during the validation process to detect the errors that the transformation generates.

You can validate a stylesheet with several engines to make sure that you can use it in various environments and have the same results. For example, an XSLT stylesheet may be applied with Saxon 6.5, Xalan, and MSXML 4.0 engines in different production systems.

Other examples of documents that can benefit from a validation scenario include:

- A complex XQuery file with a main module that imports modules developed independently but validated in the context of the main module of the query. In an XQuery validation scenario, the default validator of Oxygen XML Editor plugin (Saxon 9) or any connection to a database that supports validation (Berkeley DB XML Database, eXist XML Database, MarkLogic version 5 or newer) can be set as a validation engine.
- An XML document in which the master file (page 2708) includes smaller fragment files using XML entity references.

**Note:** If a master file is associated with the current file, the validation scenarios defined in the master file, along with any Schematron schema defined in the default scenarios for that particular framework, are used for the validation. These take precedence over other types of validation units defined in the default scenarios for the particular framework. For more information on master files, see Master Files Support (page 581) or Working with Modular XML Files in the Master Files Context (page 901).

Creating a New Validation Scenario

To create a validation scenario, follow these steps:
1. Select the `Configure Validation Scenario(s)` from the toolbar, or from the XML menu (or the Validate submenu when invoking the contextual menu on a file in the Navigator view (page 250)). The `Configure Validation Scenario(s)` dialog box is displayed. It contains built-in and user-defined scenarios. The built-in scenarios are organized in categories depending on the type of file they apply to and you can identify them by a yellow key icon that marks them as `read-only`. The user-defined scenarios are organized under a single category. The default scenarios for the particular framework (page 2706) are rendered in bold.

**Note:** If a *master file* is associated with the current file, the validation scenarios defined in the *master file*, along with any Schematron schema defined in the default scenarios for that particular framework, are used for the validation. These take precedence over other types of validation units defined in the default scenarios for the particular framework. For more information on master files, see Master Files Support (page 581) or Working with Modular XML Files in the Master Files Context (page 901).

*Figure 325: Configure Validation Scenario Dialog Box*

The top section of the dialog box contains a filter that allows you to search through the scenarios list and the `Settings` button allows you to configure the following options:

- **Show all scenarios**
  
  Select this option to display all the available scenarios, regardless of the document they are associated with.

- **Show only the scenarios available for the editor**
Select this option to only display the scenarios that Oxygen XML Editor plugin can apply for the current document type.

**Show associated scenarios**

Select this option to only display the scenarios associated with the document you are editing.

**Import scenarios**

This option opens the **Import scenarios** dialog box that allows you to select the scenarios file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Editor plugin ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

- Keep or replace the existing scenario.
- Keep both scenarios.

**Note:** When you keep both scenarios, Oxygen XML Editor plugin adds **imported** to the name of the imported scenario.

**Export selected scenarios**

Use this option to export selected scenarios individually. Oxygen XML Editor plugin creates a scenarios file that contains the scenarios that you export. This is useful if you want to share scenarios with others or export them to another computer.

2. To add a scenario, click the **New** button.

A validation scenario configuration dialog box is displayed and it lists all the validation units for the scenario.

*Figure 326: Validation Scenario Configuration Dialog Box*
This scenario configuration dialog box allows you to configure the following information and options:

**Name**

The name of the validation scenario.

**URL of the file to validate**

The URL of the main module that includes the current module. It is also the entry module of the validation process when the current one is validated. To edit the URL, click its cell and specify the URL of the main module by doing one of the following:

- Enter the URL in the text field or select it from the drop-down list.
- Use the **Browse** drop-down button to browse for a local, remote, or archived file.
- Use the **Insert Editor Variable** button to insert an editor variable (page 201) or a custom editor variable (page 208).

Figure 327: Insert an Editor Variable

$(start-dir) - Start directory of custom validator
$(standard-param) - List of standard parameters
$(conf) - The current file name without extension
$(current(URL) - The path of the currently edited file (URL)
$(file) - The path of current file directory (URL)
$(frameworks) - Oxygen frameworks directory (URL)
$(pdx) - Project directory (URL)
$(oxygenHome) - Oxygen installation directory (URL)
$(home) - The path to user home directory (URL)
$(p) - Project name
$(env[VAR_NAME]) - Value of environment variable VAR_NAME
$(system[var.name]) - Value of system variable var.name

**File type**

The type of the document that is validated in the current validation unit. Oxygen XML Editor plugin automatically selects the file type depending on the value of the **URL of the file to validate** field.

**Validation engine**

You can select one of the engines available in Oxygen XML Editor plugin for validation of the particular document type.

**Default engine** means that the default engine is used to run the validation for the current document type, as specified in the preferences page for that type of document (for example, XSLT preferences page (page 188), XQuery preferences page (page 185), XML Schema preferences page (page 176)).

The **DITA Validation** engine performs DITA-specific checks in the context of the specifications (it is similar to the checks done with the **DITA Maps Manager**
Validate and Check for Completeness action (page 2446), but for a local file rather than an entire DITA map (page 2705).

The Table Layout Validation engine looks for table layout problems (for more information, see Report table layout problems (page 2450)).

Automatic validation

If this option is selected, the validation operation defined by this row is also applied by the automatic validation feature (page 856). If the Automatic validation feature is disabled in the Document Checking preferences page (page 108), then this option is ignored, as the preference setting has a higher priority.

Schema

This option becomes active when you set the File type to XML Document and allows you to specify the schema used for the validation unit.

Specify Schema

Opens the Specify Schema dialog box that allows you to set a schema to be used for validating XML documents.

Figure 328: Specify Schema Dialog Box

The Specify Schema dialog box contains the following options:

Use detected schema

Uses the schema detected for the particular document (page 887).

Use custom schema

Allows you to specify the schema using the following options:

- **URL**: Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from
a remote server through HTTP(S), FTP(S). You can specify the URL by using the text field, the history drop-down, the \( \text{Insert Editor Variables (page 201)} \) button, or the browsing actions in the \( \text{Browse} \) drop-down list.

- **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the URL field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.

- **Embedded Schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, select this option.

- **Extensions** - Opens a dialog box that allows you to specify Java extension JARs (page 2707) to be used during the validation.

- **Public ID** - Allows you to specify a public ID if you have selected a DTD.

- **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.

  - **Move Up**
    
    Moves the selected scenario up one spot in the list.

  - **Move Down**
    
    Moves the selected scenario down one spot in the list.

  - **Add**
    
    Adds a new validation unit to the list.

  - **Remove**
    
    Removes an existing validation unit from the list.

3. Configure any of the existing validation units according to the information above, and you can use the buttons at the bottom of the table to add, remove, or move validation units. Note that if you add a Schematron validation unit, you can also select the validation phase.

4. Press **OK**.

The newly created validation scenario will now be included in the list of scenarios in the **Configure Validation Scenario(s)** dialog box. You can select the scenario in this dialog box.
to associate it with the current document and press the **Apply associated** button to run the validation scenario.

**Editing a Validation Scenario**

To edit an existing validation scenario, follow these steps:

1. Select the **Configure Validation Scenario(s)** from the toolbar, or from the XML menu (or the Validate submenu when invoking the contextual menu on a file in the *Navigator view* (page 250)). The **Configure Validation Scenario(s)** dialog box is displayed. It contains built-in and user-defined scenarios. The built-in scenarios are organized in categories depending on the type of file they apply to and you can identify them by a yellow key icon that marks them as *read-only*. The user-defined scenarios are organized under a single category. The default scenarios for the particular *framework* (page 2706) are rendered in bold.

**Note:** If a *master file* is associated with the current file, the validation scenarios defined in the *master file*, along with any Schematron schema defined in the default scenarios for that particular *framework*, are used for the validation. These take precedence over other types of validation units defined in the default scenarios for the particular *framework*. For more information on *master files*, see *Master Files Support* (page 581) or *Working with Modular XML Files in the Master Files Context* (page 901).

Select this option to display all the available scenarios, regardless of the document they are associated with.

Show only the scenarios available for the editor

Select this option to only display the scenarios that Oxygen XML Editor plugin can apply for the current document type.

Show associated scenarios

Select this option to only display the scenarios associated with the document you are editing.

Import scenarios

This option opens the Import scenarios dialog box that allows you to select the scenarios file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Editor plugin ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

- Keep or replace the existing scenario.
- Keep both scenarios.

Note: When you keep both scenarios, Oxygen XML Editor plugin adds imported to the name of the imported scenario.

Export selected scenarios

Use this option to export selected scenarios individually. Oxygen XML Editor plugin creates a scenarios file that contains the scenarios that you export. This is useful if you want to share scenarios with others or export them to another computer.

2. Select the scenario and press the Edit button. If you try to edit one of the read-only built-in scenarios, you will receive a warning message that Oxygen XML Editor plugin needs to creates customizable duplicate (you can also use the Duplicate button).

The Edit scenario dialog box is displayed and it lists all the validation units for the scenario.

If the **Automatic validation** feature is disabled in the **Document Checking preferences page** (page 108), then this option is ignored, as the preference setting has a higher priority.

**Schema**

This option becomes active when you set the **File type** to **XML Document** and allows you to specify the schema used for the validation unit.

**Specify Schema**

Opens the **Specify Schema** dialog box that allows you to set a schema to be used for validating XML documents.

*Figure 332: Specify Schema Dialog Box*
The **Specify Schema** dialog box contains the following options:

**Use detected schema**

Uses the schema detected for the particular document *(page 887)*.

**Use custom schema**

Allows you to specify the schema using the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S). You can specify the URL by using the text field, the history drop-down, the **Insert Editor Variables** *(page 201)* button, or the browsing actions in the **Browse** drop-down list.

- **Embedded Schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, select this option.

- **Extensions** - Opens a dialog box that allows you to specify **Java extension JARs** *(page 2707)* to be used during the validation.

- **Public ID** - Allows you to specify a public ID if you have selected a DTD.

- **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you
want to use for validation. The listed phases are defined in the Schematron document.

- **Move Up**
  Moves the selected scenario up one spot in the list.

- **Move Down**
  Moves the selected scenario down one spot in the list.

- **Add**
  Adds a new validation unit to the list.

- **Remove**
  Removes an existing validation unit from the list.

3. Configure any of the existing validation units according to the information above, and you can use the buttons at the bottom of the table to add, remove, or move validation units. Note that if you add a Schematron validation unit, you can also select the validation phase.

4. When you are done configuring the scenario, press **OK**.
   The modified validation scenario will now be included in the list of scenarios in the Configure Validation Scenario(s) dialog box. If you chose to duplicate an existing one, the modified scenario will be listed with the word `copy` at the end of its name.

**Sharing Validation Scenarios**

The validation scenarios and their settings can be shared with other users by exporting them to a specialized scenarios file (page 200) that can then be imported.

**Resolving References to Remote Schemas with an XML Catalog**

When a reference to a remote schema must be used in the validated XML document for interoperability purposes, but a local copy of the schema should actually be used for performance reasons, the reference can be resolved to the local copy of the schema with an XML Catalog (page 2712).

For example, if the XML document contains a reference to a remote schema `docbook.rng` like this:

```xml
<?xml-model href="http://www.oasis-open.org/docbook/xml/5.0/rng/docbook.rng" type="application/xml" schematypens="http://relaxng.org/ns/structure/1.0"?>
```

it can be resolved to a local copy with a catalog entry like this:
An XML Catalog can also be used to map an XML Schema specified with a URN in the xsi:schemaLocation attribute of an XML document to a local copy of the schema. For example, if the XML document specifies the schema with:

```xml
<topic xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
```

the URN can be resolved to a local schema file with a catalog entry like this:

```xml
<uri name="urn:oasis:names:tc:dita:xsd:topic.xsd:1.1"
     uri="topic.xsd"/>
```

- Working with XML Catalogs (page 897)

Validation Example - A DocBook Validation Error

In the following DocBook 4 document, the content of the listitem element does not match the rules of the DocBook 4 schema (docbookx.dtd).

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE article PUBLIC "-//OASIS//DTD DocBook XML V4.4//EN"
         "http://www.docbook.org/xml/4.4/docbookx.dtd">
<article>
    <title>Article Title</title>
    <sect1>
        <title>Section1 Title</title>
        <itemizedlist>
            <listitem>
                <link>a link here</link>
            </listitem>
        </itemizedlist>
    </sect1>
</article>
```

The Validate Document action will return the following error:
Unexpected element "link". The content of the parent element type must match "(calloutlist|glosslist|bibliolist|itemizedlist|orderedlist|segmentedlist|simplelist |variablelist|caution|important|note|tip|warning|literallayout|programlisting |programlistingco|screen|screenco|screenshot|synopsis|cmdsynopsis|funcsynopsis |classsynopsis|fieldsynopsis|constructorsynopsis|destructorsynopsis|methodsynopsis |formalpara|para|simpara|address|blockquote|graphic|graphicco|mediaobject|mediaobjectco|informalequation|informalexample|informalfigure|informaltable|equation|example|figure |table|msgset|procedure|sidebar|qandaset|task|anchor|bridgehead|remark|highlights |abstract|authorblurb|epigraph|indexterm|beginpage)+".

This error message is a little more difficult to understand, so understanding of the syntax or processing rules for the DocBook XML DTD listitem element is recommended. However, the error message does offer a clue as to the source of the problem, indicating that ‘The content of element type must match’.

Fortunately, most standards-based DTDs, XML Schemas, and Relax NG schemas are supplied with reference documentation. This enables you to lookup the element and read about it. In this case, you should learn about the child elements of listitem and their nesting rules. Once you have correctly inserted the required child element and nested it in accordance with the XML rules, the document will become valid.

Embedding Schematron Rules in XML Schema or RELAX NG

Schematron rules can be embedded into an XML Schema through annotations (using the appinfo element), or in any element on any level of a RELAX NG Schema (taking into account that the RELAX NG validator ignores all elements that are not in the RELAX NG namespace).

Oxygen XML Editor plugin accepts such documents as Schematron validation schemas and it is able to extract and use the embedded rules.

Validating XML Documents with XML Schema and Embedded Schematron

To validate an XML document with XML Schema and its embedded Schematron, you can associate the document like this:

```xml
<?xml-model href="percent.xsd" type="application/xml" schematypens="http://purl.oclc.org/dsdl/schematron"?>
```
Validating XML Documents with Relax NG and Embedded Schematron

To validate an XML document with RELAX NG schema and its embedded Schematron rules, you need to associate the document with both schemas like this:

```xml
<?xml-model href="percent.rng" type="application/xml"
schematypens="http://relaxng.org/ns/structure/1.0"/>
<?xml-model href="percent.rng" type="application/xml"
schematypens="http://purl.oclc.org/dsdl/schematron"/>
```

The second association validates your document with Schematron rules extracted from the RELAX NG Schema.

**Note:** When you work with XML Schema or Relax NG documents that have embedded Schematron rules Oxygen XML Editor plugin provides two built-in validation scenarios: **Validate XML Schema with embedded Schematron** for XML schema, and **Validate Relax NG with embedded Schematron** for Relax NG. You can use one of these scenarios to validate the embedded Schematron rules.

**Example: Embedded Schematron in XML Schema**

```xml
<xsd:appinfo>
  <sch:pattern>
    <sch:rule context="...">
      <sch:assert test="...">Message.</sch:assert>
    </sch:rule>
  </sch:pattern>
</xsd:appinfo>
```

**Example: Embedded Schematron in Relax NG Schema**

```xml
<grammar
  xmlns="http://relaxng.org/ns/structure/1.0"
  xmlns:sch="http://purl.oclc.org/dsdl/schematron" >
  <sch:pattern>
    <sch:rule context="...">
      <sch:assert test="...">Message.</sch:assert>
    </sch:rule>
  </sch:pattern>
  <start>
    ............
  </start>
</grammar>
```

- Embedding Schematron Quick Fixes in Relax NG or XML Schema (page 1249)

XML Quick Fixes

The Oxygen XML Editor plugin Quick Fix support (page 2710) helps you resolve errors that appear in an XML document by offering Quick Fixes to problems such as missing required attributes or invalid elements. Quick Fixes are available in Text mode and Author mode.

To activate this feature, hover over or place the cursor in the highlighted area of text where a validation error or warning occurs. If a Quick Fix is available for that particular error or warning, you can access the Quick Fix proposals with any of the following methods:

- When hovering over the error or warning, the proposals may be presented in a tooltip pop-up window and the available quick Quick Fixes include a link that can be used to perform the fix.

  Figure 333: Quick Fix Presented in a Tooltip in Text Mode

- When hovering over the error or warning in Author mode, a small Quick Fix drop-down menu is presented. You can use the drop-down menu to display a list of available Quick Fixes to select from for the particular error or warning.

  Figure 334: Quick Fix Drop-Down Menu in Author Mode
• If you place the cursor in the highlighted area where a validation error or warning occurs, a *Quick Fix* icon (改革发展) is displayed in the stripe on the left side of the editor. If you click this icon, Oxygen XML Editor plugin displays the list of available fixes.

*Figure 336: Quick Fix Menu Invoked by Clicking on the \(|\) Icon*

• With the cursor placed in the highlighted area of the error or warning, you can also invoke the *Quick Fix* menu by pressing **Ctrl + 1 (Command + 1 on OS X)** on your keyboard.

Whenever you make a modification in the XML document or you apply a fix, the list of *Quick Fixes* is recomputed to ensure that you always have valid proposals.

**Note:** A *Quick Fix* that adds an element inserts it along with required and optional elements, and required and fixed attributes, depending on how the *Content Completion* preferences (page 100) are configured.

**Quick Fixes for DTD, XSD, and Relax NG Errors**

Oxygen XML Editor plugin offers *Quick Fixes* (page 2710) for common errors that appear in XML documents that are validated against DTD, XSD, or Relax NG schemas.

**Note:** For XML documents validated against XSD schemas, the *Quick Fixes* are only available if you use the default Xerces validation engine.

*Quick Fixes* are available in Text mode and Author mode.

Oxygen XML Editor plugin provides *Quick Fixes* for numerous types of problems, including the following:

<table>

Schematron Quick Fixes (SQF)

Oxygen XML Editor plugin provides support for Schematron Quick Fixes (page 2710) (SQF). They help you resolve issues that appear in XML documents that are validated against Schematron schemas by offering you solution proposals. The Schematron Quick Fixes are an extension of the Schematron language and they allow you to define fixes for Schematron validation messages. Specifically, they are associated with assert or report messages.

A typical use case is using Schematron Quick Fixes to assist content authors with common editing tasks. For example, you can use Schematron rules to automatically report certain validation warnings (or errors) when performing regular editing tasks, such as inserting specific elements or changing IDs to match specific naming conventions. For more details and examples, see the following blog post: http://blog.oxygenxml.com/2015/05/schematron-checks-to-help-technical.html.

Displaying the Schematron Quick Fix Proposals

The defined Schematron Quick Fixes are displayed on validation errors in Text mode and Author mode.

Associating a Schema to XML Documents

To provide as-you-type validation and to compute valid proposals for the Content Completion Assistant (page 2704), Oxygen XML Editor plugin requires a schema to be associated with the XML document. The schema specifies how the internal structure of the XML is defined.

Supported Types of Schema

The following schema types are supported:

- **W3C XML Schema 1.0 and 1.1** (with and without embedded Schematron rules) - The association with an XML Schema is added as an attribute of the root element with one of the following:
  - `xsi:schemaLocation` attribute, if the root element of the document is in the namespace.
  - `xsi:noNamespaceSchemaLocation` attribute, if the root element is not in the namespace.
- **DTD** - The association with a DTD is added as a `DOCTYPE` declaration.
- **Relax NG - XML Syntax** (with and without embedded Schematron rules) - The association is added as an `xml-model` processing instruction.
- **Relax NG - Compact Syntax** - The association is added as an `xml-model` processing instruction.
- **NVDL** - The association is added as an `xml-model` processing instruction.
- **Schematron** (both ISO Schematron and Schematron 1.5) - The association is added as an `xml-model` processing instruction.

Detecting the Schema(s) for Validation

For validation, Oxygen XML Editor plugin tries to detect one or more schemas by searching multiple locations, in the following order:

1. The schema or multiple schemas referenced in validation stages from the validation scenario(s) (page 888) associated with the current XML document.
2. If no validation scenario is selected to be used with the current XML document, then it falls back to the schema or multiple schemas defined in validation stages from the validation scenarios specified as default in the particular document type configuration (page 892).
3. If a schema is still not detected, then it falls back to the schema or multiple schemas associated directly in the XML document (page 894).

**Tip:** To quickly open the schema used for validating the current document, select the Open Associated Schema action from the toolbar (or XML menu).

4. If a schema is still not detected, then it falls back to the schema defined in the Schema tab of a framework (document type) configuration (page 896).

### Detecting a Schema for Content Completion

For content completion, Oxygen XML Editor plugin uses just one schema and tries to detect that schema by searching multiple locations, in the following order:

1. If no schema is detected in the document, then it falls back to the highest ranking schema defined in validation stages from the validation scenario(s) associated with the current document (page 888).
2. If a schema is still not detecting, then it falls back to the highest ranking schema defined in validation stages from validation scenarios specified as default in the particular document type configuration (page 892).
3. Oxygen XML Editor plugin determines the most appropriate or highest ranking schema that is associated directly in the XML document (page 894) and uses it for content completion.
4. If a schema is still not detecting, then it falls back to the schema defined in the Schema tab of a framework (document type) configuration (page 896).

### Associating a Schema Through a Validation Scenario

Oxygen XML Editor plugin uses the rules defined in the detected schema to report errors and warnings during automatic and manual validations that help maintain the structural integrity of your XML documents. You can specify the schema to be used for validation directly in validation scenarios (page 868) and there are several methods that can be used to do so.

**Configure a Validation Scenario and Specify the Schema**

To associate a schema to a validation scenario to be used whenever the scenario is invoked, follow these steps:
1. Select the Configure Validation Scenario(s) from the toolbar, or from the XML menu (or the Validate submenu when invoking the contextual menu on a file in the Navigator view (page 250)).
2. Press the New button to create a new validation scenario or the Edit button to modify an existing one.
3. Add or configure validation units (page 876) according to your needs and click the Specify Schema button.

Step Result: The Specify Schema dialog box is displayed:

Figure 338: Specify Schema Dialog Box

The Specify Schema dialog box contains the following options:

**Use detected schema**

Uses the schema detected for the particular document (page 887).

**Use custom schema**

Allows you to specify the schema using the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S). You can specify the URL by using the text field, the history drop-down, the Insert Editor Variables (page 201) button, or the browsing actions in the Browse drop-down list.

- **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the URL field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.
• **Embedded Schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, select this option.

• **Public ID** - Allows you to specify a public ID if you have selected a DTD.

• **Extensions** - Opens a dialog box that allows you to specify [Java extension JARs](page 2707) to be used during the validation.

• **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.

4. Select the schema to be associated with the validation unit and configure the rest of the options according to your preferences.

5. Click **OK** on both dialog boxes.

**Result:** The schema is now associated with that validation scenario whenever it is invoked.

### Use the Validate with Action to Specify a Schema for Validating the Current Document

To validate the current document using a specified schema, follow these steps:

1. Select the **Validation with** action from the **Validation** drop-down menu on the toolbar (or **XML** menu).

**Step Result:** The **Validate with** dialog box is displayed:

*Figure 339: Validate with Dialog Box*

This dialog box contains the following options:

• **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S). You can specify the URL by using the text field, the history drop-down, the [Insert Editor Variables](page 201) button, or the browsing actions in the **• Browse** drop-down list.
- **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the URL field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.
- **Embedded Schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, select this option.
- **Public ID** - Allows you to specify a public ID if you have selected a DTD.
- **Extensions** - Opens a dialog box that allows you to specify Java extension JARs (page 2707) to be used during the validation.
- **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.

2. Select the schema to be associated with the manual validation and configure the rest of the options according to your preferences.

3. Click **OK**.

**Result:** The current document is validated using the schema you specified.

**Tip:** To quickly open the schema used for validating the current document, select the [Open Associated Schema](#) action from the toolbar (or XML menu).

### Use the Validate with Schema Action to Specify a Schema for Validating all Selected Documents

To validate multiple documents using a specified schema, follow these steps:

1. Select all the documents you want to validate in the Navigator view.
2. Invoke the contextual menu (right-click) and select the [Validate with Schema](#) action from the Validate submenu.

**Step Result:** The [Validate with](#) dialog box is displayed:

*Figure 340: Validate with Dialog Box*

This dialog box contains the following options:
• **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S). You can specify the URL by using the text field, the history drop-down, the [Insert Editor Variables (page 201)](#) button, or the browsing actions in the [Browse drop-down list](#).

• **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the **URL** field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.

• **Embedded Schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, select this option.

• **Public ID** - Allows you to specify a public ID if you have selected a DTD.

• **Extensions** - Opens a dialog box that allows you to specify [Java extension JARs (page 2707)](#) to be used during the validation.

• **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.

3. Select the schema that you want to use to validate all selected documents and configure the rest of the options according to your preferences.

4. Click **OK**.

**Result:** The selected documents are validated using the schema you specified.

### Associating a Schema in Validation Scenarios Defined in the Document Type

To report errors and warnings during automatic and manual validations that help maintain the structural integrity of particular XML document types, Oxygen XML Editor plugin uses rules defined in the schema that is detected in the validation scenarios that are associated to each particular document type.

To associate a schema in validation scenarios defined in the [framework (page 2706)](#) (document type) configuration, follow these steps:

1. Open the **Preferences** dialog box (page 55) and go to **Document Type Association**.

2. Select your particular document type and click the **Edit** or **Duplicate** button to modify an existing framework (or use the **New** button to create a new one). **Step Result:** This opens a **Document type** configuration dialog box (page 72).

3. Go to the **Validation** tab (page 97).

4. Create or edit a validation scenario:
   a. To create a new validation scenario (page 869), click the [New button](#).
b. To edit the properties of an existing validation scenario (page 875), select it and click the **Edit** button (you can also use the **Duplicate** button to copy an existing scenario and edit its properties).

5. Add or configure validation units (page 876) according to your needs and click the **Specify Schema** button.

**Step Result:** The **Specify Schema** dialog box is displayed:

*Figure 341: Specify Schema Dialog Box*

![Specify Schema Dialog Box](image)

The **Specify Schema** dialog box contains the following options:

- **Use detected schema**
  Uses the schema detected for the particular document (page 887).

- **Use custom schema**
  Allows you to specify the schema using the following options:
  - **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S). You can specify the URL by using the text field, the history drop-down, the **Insert Editor Variables** (page 201) button, or the browsing actions in the **Browse** drop-down list.
  - **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the **URL** field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.
  - **Embedded Schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, select this option.
  - **Public ID** - Allows you to specify a public ID if you have selected a DTD.
• **Extensions** - Opens a dialog box that allows you to specify Java extension JARs (page 2707) to be used during the validation.

• **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.

6. Select the schema to be associated with the validation unit and configure the rest of the options according to your preferences.
7. Click **OK** on both dialog boxes.

**Result:** The schema is now associated with the validation scenario you just configured for that particular document type.

### Associating a Schema Directly in XML Documents

The schema used by the [Content Completion Assistant (page 2704)](page) and document validation engine can be directly associated with the current document by using the "Associate Schema" action. For most of the schema types, it uses the `xml-model` processing instruction, with the exceptions of:

- **W3C XML Schema** - The `xsi:schemaLocation` attribute or `xsi:noNamespaceSchemaLocation` attribute is used.
- **DTD** - The `DOCTYPE` declaration is used.

The association can specify a relative file path or a URL of the schema. The advantage of relative file path is that you can configure the schema at file level instead of [framework (page 2706)](page) level.

To associate a schema to the current document, follow these steps:

1. Select the "Associate Schema" action from the toolbar (or Document > Schema menu).

**Step Result:** The Associate Schema dialog box is displayed:

*Figure 342: Associate Schema Dialog Box*
This dialog box contains the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S).

- **Use path relative to file location** - Select this option if the XML instance document and the associated schema contain relative paths. The location of the schema file is inserted in the XML instance document as a relative file path. This practice allows you, for example, to share these documents with other users without running into problems caused by multiple project locations on physical disk.

- **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the **URL** field. The possible schema types are: XMLSchema, DTD, RelaxNG, RelaxNG Compact, Schematron, or NVDL.

- **Add additional association for embedded Schematron rules** - If you have selected XML Schema or RelaxNG schemas with embedded Schematron rules and you want to use those embedded rules, select this option.

- **Public ID** - Allows you to specify a public ID if you have selected a DTD.

- **Keep existing schema associations** - Select this option to use the existing schema associations of the currently edited document.

2. Select the schema that will be associated with the XML document and configure the rest of the options according to your preferences.

3. Click **OK**.

**Result:** The schema association is created based upon the specified type.

- **XML Schema** - The association with an XML Schema is added as an attribute of the root element with one of the following:
• xsi:schemaLocation attribute, if the root element of the document is in the namespace.
• xsi:noNamespaceSchemaLocation attribute, if the root element is not in the namespace.

- **DTD** - The association with a DTD is added as a **DOCTYPE** declaration.
- **Other** - The association with a Relax NG, Schematron, or NVDL schema is added as an **xml-model** processing instruction.

**Tip:** To quickly open the schema used for validating the current document, select the **Open Associated Schema** action from the toolbar (or XML menu).

### Associating a Schema in a Framework (Document Type) Configuration

The schema used to compute valid proposals in the **Content Completion Assistant (page 2704)** and by the document validation engine to report errors and warnings can be defined in each particular **framework (page 2706)** (document type). This schema will be used only if one is not detected in the current XML file *(page 894)*.

To associate a schema in a particular **framework** (document type), follow these steps:

1. **Open the Preferences dialog box** *(page 55)* and go to **Document Type Association**.
2. Select your particular document type and click the **Edit** *(page 70)*, **Extend** *(page 70)*, or **Duplicate** *(page 70)* button to modify an existing **framework** (or use the **New** button to create a new one).

   **Step Result:** This opens a **Document type** configuration dialog box *(page 72)*.
3. Go to the **Schema** tab *(page 75)*.
4. Select the schema type and its URI.
5. Click **OK**.

**Result:** The schema is now associated with the particular document type and will be used by the **Content Completion Assistant** and validation engine if a schema is not detected in the current XML document.
Learn Document Structure when Schema is not Detected

When working with documents that do not specify a schema, or for which the schema is not known or does not exist, Oxygen XML Editor plugin is able to learn and translate the document structure to a DTD. You can choose to save the learned structure to a file to provide a DTD as an initialization source for content completion (page 627) and document validation (page 854). This feature is also useful for producing DTDs for documents that contain personal or custom element types.

When you open a document that is not associated with a schema, Oxygen XML Editor plugin automatically learns the document structure and uses it for content completion (page 627). To disable this feature, deselect the Learn on open document option in the user preferences (page 100).

Related Information:
- Detecting a Schema (page 887)

Create a DTD from Learn Document Structure Option

When there is no schema associated with an XML document, Oxygen XML Editor plugin can learn the document structure by parsing the document internally. This feature is enabled by the Learn on open document option (page 100) that is available in the user preferences.

To create a DTD from the learned structure, follow these steps:

1. Open the XML document for which a DTD will be created.
2. Go to XML > Learn Structure (Ctrl + Shift + L (Command + Shift + L on OS X)).
   The Learn Structure action reads the mark-up structure of the current document. The Learn completed message is displayed in the application status bar when the action is finished.
3. Go to XML > Save Structure (Ctrl + Shift + S (Command + Shift + S on OS X)) and enter the DTD file path.
4. Press the Save button.

Working with XML Catalogs

Oxygen XML Editor plugin uses XML Catalogs (page 2712) to resolve references for validations and transformations and they are especially helpful for resolving external resources when internet access is not available or your connection is slow.
Oxygen XML Editor plugin supports any XML Catalog file that conforms to one of the following:

1. OASIS XML Catalogs Committee Specification v1.1.
2. OASIS Technical Resolution 9401:1997, including the plain-text flavor described in that resolution.

The version 1.1 of the OASIS XML Catalog specification introduces the possibility to map a system ID, public ID, or a URI to a local copy using only a suffix of the ID or URI used in the actual document. This is done using the catalog elements `systemSuffix` and `uriSuffix`.

Depending on the resource type, Oxygen XML Editor plugin uses different catalog mappings.

### Table 37. Catalog Mappings

<table>
<thead>
<tr>

The following strategy is used (if one step fails to provide a resource, the next is applied):

1. Resolve the schema using `URI` catalog mappings.
2. Resolve the schema using `system` catalog mappings.
   
   This happens only if the **Resolve schema locations also through system mappings option (page 171)** is selected (it is by default).
3. Resolve the root `namespace` using `URI` catalog mappings.
Creating an XML Catalog with a Template

An XML Catalog (page 2712) file can be created quickly in Oxygen XML Editor plugin starting from the two document templates called OASIS XML Catalog 1.0 and OASIS XML Catalog 1.1. They are available when creating new document templates (page 554).

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE catalog
 PUBLIC "-//OASIS//DTD XML Catalogs V1.1//EN"
 "http://www.oasis-open.org/committees/entity/release/1.1/catalog.dtd">
<catalog xmlns="urn:oasis:names:tc:entity:xmlns:xml:catalog">

<!-- Use "system" and "public" mappings when resolving DTDs -->
<system
  systemId="http://www.docbook.org/xml/4.4/docbookx.dtd"
  uri="frameworks/docbook/4.4/dtd/docbookx.dtd"/>

<!-- "systemSuffix" matches any system ID ending in a specified string -->
<systemSuffix
  systemIdSuffix="docbookx.dtd"
  uri="frameworks/docbook/4.4/dtd/docbookx.dtd"/>

<!-- Use "uri" for resolving XML Schema and XSLT stylesheets -->
<uri
  name="http://www.oasis-open.org/docbook/xml/5.0/rng/docbook.rng"
  uri="frameworks/docbook/5.0/rng/docbookxi.rng"/>

<!-- The "uriSuffix" matches any URI ending in a specified string -->
<uriSuffix
  uriSuffix="docbook.xsl"
  uri="frameworks/docbook/xsl/fo/docbook.xsl"/>
</catalog>
```
How Oxygen XML Editor plugin Determines which Catalog to Use

Oxygen XML Editor plugin uses XML Catalogs (page 2712) to resolve references for validations and transformations and it maps such references to the built-in local copies of the schemas associated with the various frameworks (page 2706) (DocBook, DITA, TEI, XHTML, SVG, etc.)

Oxygen XML Editor plugin includes default global catalogs as well as default catalogs for each of the built-in frameworks, and you can also create your own.

Oxygen XML Editor plugin looks for catalogs in the following order:

- Global user-defined catalogs that are set in the XML Catalog preferences page (page 171).
- User-defined catalogs that are set for each framework (page 2706) in the Catalog tab (page 95) of the Document Type configuration dialog box (page 72).
- Default built-in catalogs.

Example:

An XML Catalog can be used to map an XML Schema specified with an URN in the xsi:noNamespaceSchemaLocation attribute of an XML document to a local copy of the schema.

Considering the following XML document code snippet:

```xml
<topic xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
```

The URN can be resolved to a local schema file with a catalog entry like this:

```xml
<uri name="urn:oasis:names:tc:dita:xsd:topic.xsd:1.1" url="topic.xsd"/>
```

Resolving Schema Locations Through XML Catalogs

Schema locations can be mapped using an XML Catalog (page 2712). Oxygen XML Editor plugin resolves the location of a schema in the following order:
• First, it attempts to resolve the schema location as a URI (uri, uriSuffix, rewriteUri, delegateUri mappings from the XML Catalog). If this succeeds, the process end here.
• If the Resolve schema locations also through system mappings option (page 171) is selected, it attempts to resolve the schema location as a system ID (system, systemSuffix, rewriteSuffix, rewriteSystem from the XML Catalog). If this succeeds, the process ends here.
• If the Process "schemaLocation" namespaces through URI mappings for XML Schema option (page 172) is selected, the target namespace of the imported XML Schema is resolved through URI mappings. If the schema specified in the schemaLocation attribute is not resolved successfully, the namespace of the root element is taken into account. If this succeeds, the process ends here.
• If none of these succeeds, the actual schema location (page 887) is used.

Working with Modular XML Files in the Master Files Context

Smaller interrelated modules that define a complex XML modular structure cannot be correctly edited or validated individually, due to their interdependency with other modules. Oxygen XML Editor plugin provides the support for defining the main module (or modules), allowing you to edit any file from the hierarchy in the context of the master files (page 2708).

You can set a main XML document either using the master files support from the Navigator view (page 581), or using a validation scenario.

To set a master file using a validation scenario, add validation units that point to the main modules. Oxygen XML Editor plugin warns you if the current module is not part of the dependencies graph computed for the main XML document. In this case, it considers the current module as the main XML document.

The advantages of working with modular XML files in the context of a master file (page 2708) include:

• Correct validation of a module in the context of a larger XML structure.
• Content Completion Assistant (page 2704) displays all collected entities and IDs starting from the master files.
• Oxygen XML Editor plugin uses the schema defined in the master file when you edit a module that is included in the hierarchy through the External Entity mechanism.

• The master files defined for the current module determines the scope of the search and refactoring actions (page 904) for ID/IDREFS values and for updating references when renaming/moving a resource. Oxygen XML Editor plugin performs the search and refactoring actions in the context that the master files determine, improving the speed of execution.

Search and Refactoring Actions for IDs and IDREFS

Oxygen XML Editor plugin allows you to search for ID declarations and references (IDREFS) and to define the scope of the search and refactor operations (page 904). These operations are available for XML documents that have an associated DTD, XML Schema, or Relax NG schema. These operations are available through the search and refactor actions in the contextual menu. In Text mode, these actions are also available in the Quick Assist (page 653) menu.

The search and refactor actions from the contextual menu are grouped in the Manage IDs section:

Rename in

Renames the ID and all its occurrences. Selecting this action opens the Rename XML ID dialog box. This dialog box lets you insert the new ID value and choose the scope of the rename operation (page 904). For a preview of the changes you are about to make, click Preview. This opens the Preview dialog box, which presents a list with the files that contain changes and a preview zone of these changes.

Rename in File

Renames the ID you are editing and all its occurrences from the current file.

Note: Available in the Text mode only.

Search References
Searches for the references of the ID. By default, the scope of this action is the current project. If you configure a scope using the Select the scope for the Search and Refactor operations (page 904) dialog box, this scope will be used instead.

**Search References in**

Searches for the references of the ID. Selecting this action opens the Select the scope for the Search and Refactor operations (page 904).

**Search Declarations**

Searches for the declaration of the ID reference. By default, the scope of this action is the current project. If you configure a scope using the Select the scope for the Search and Refactor operations (page 904) dialog box, this scope will be used instead.

**Note:** Available in the Text mode only.

**Search Declarations in**

Searches for the declaration of the ID reference. Selecting this action opens the Select the scope for the Search and Refactor operations (page 904).

**Note:** Available in the Text mode only.

**Search Occurrences in file**

Searches for the declaration and references of the ID in the current document.

**Tip:** A quick way to go to the declaration of an ID in Text mode is to move the cursor over an ID reference and use the Ctrl + Single-Click (Command + Single-Click on OS X) navigation.

Selecting an ID that you use for search or refactor operations differs between the Text and Author modes. In the Text mode, you position the cursor inside the declaration or reference of an ID. In the Author mode, Oxygen XML Editor plugin collects all the IDs by analyzing each element from the path to the root. If more IDs are available, you are prompted to choose one of them.

Search and Refactor Operations Scope

The scope is a collection of documents that define the context of a search and refactor operation. To control it you can use the Change scope operation, available in the Quick Fix action set or on the Resource Hierarchy/Dependency View toolbar. You can restrict the scope to the current project or to one or multiple working sets (page 2712). The Use only Master Files, if enabled checkbox allows you to restrict the scope of the search and refactor operations to the resources from the Master Files directory. Click read more for details about the Master Files support (page 581).

Figure 344: Change Scope Dialog Box

The scope you define is applied to all future search and refactor operations until you modify it. Contextual menu actions allow you to add or delete files, folders, and other resources to the working set (page 2712) structure.

XML Resource Hierarchy/Dependencies View

The Resource Hierarchy/Dependencies view allows you to easily see the hierarchy / dependencies for an XML document. The tree structure presented in this view is built based on the Xinclude and External Entity mechanisms. To define the scope for calculating the dependencies of a resource, click Configure dependencies search scope (page 904) on the Resource Hierarchy/Dependencies toolbar.

To open this view, go to Window > Show View > Other > Oxygen XML Editor plugin > Resource Hierarchy/Dependencies. As an alternative, right-click the current document and either select Resource Hierarchy or Resource Dependencies.

Figure 345: Resource Hierarchy/Dependencies View - Hierarchy for Syncro phone v1.xml
The build process for the dependencies view is started with the **Resource Dependencies** action available on the contextual menu.

*Figure 346: Resource Hierarchy/Dependencies View - Dependencies for Insert battery.xml*

The following actions are available in the **Resource Hierarchy/Dependencies** view:

- **Refresh**
  
  Refreshes the Hierarchy/Dependencies structure.

- **Stop**
  
  Stops the hierarchy/dependencies computing.

- **Show Hierarchy**
  
  Allows you to choose a resource to compute the hierarchy structure.

- **Show Dependencies**
  
  Allows you to choose a resource to compute the dependencies structure.

- **Configure**
Allows you to configure a scope to compute the dependencies structure. There is also an option for automatically using the defined scope for future operations.

History

Provides access to the list of previously computed dependencies. Use the Clear history button to remove all items from this list.

The contextual menu contains the following actions:

Open

Opens the resource. You can also double-click a resource in the Hierarchy/Dependencies structure to open it.

Copy location

Copies the location of the resource.

Move resource

Moves the selected resource.

Rename resource

Renames the selected resource.

Show Resource Hierarchy

Shows the hierarchy for the selected resource.

Show Resource Dependencies

Shows the dependencies for the selected resource.

Add to Master Files

Adds the currently selected resource in the Master Files directory (page 581).

Expand All

Expands all the children of the selected resource from the Hierarchy/Dependencies structure.

Collapse All

Collapses all children of the selected resource from the Hierarchy/Dependencies structure.

Tip: When a recursive reference is encountered in the Hierarchy view, the reference is marked with a special icon.
Note: The Move resource or Rename resource actions give you the option to update the references to the resource (page 907). Only the references made through the XInclude and External Entity mechanisms are handled.

Moving/Renaming XML Resources

When you select the Rename action in the contextual menu of the Resource/Hierarchy Dependencies view, the Rename resource dialog box is displayed. The following fields are available:

- New name - Presents the current name of the edited resource and allows you to modify it.
- Update references - Select this option to update the references to the resource you are renaming.

When you select the Move action from the contextual menu of the Resource/Hierarchy Dependencies view, the Move resource dialog box is displayed. The following fields are available:

- Destination - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- New name - Presents the current name of the moved resource and gives you the option to change it.
- Update references of the moved resource(s) - Select this option to update the references to the resource you are moving, in accordance with the new location and name.

If the Update references of the moved resource(s) option is selected, a Preview option (which opens the Preview dialog box) is available for both actions. The Preview dialog box presents a list with the resources that are updated.

Combining XML Content Using DTD Entities and XInclude

When documenting large projects, it is likely that there are multiple people involved. In this case, it is usually more efficient to using a modular approach so that everyone involved in the project can work in parallel. Other advantages of modular documentation include: reusable content possibilities, smaller file units are easier to edit, and better version control.

Two possible solutions for this are to use DTD Entities or XInclude to combine XML content in a master file (page 2708). A master document can be created with references to various document
parts, users can edit those documents individually, and then apply an XSLT stylesheet over the master
document to obtain the output files in various formats (for example, PDF or HTML).

Combining XML Document Content Using DTD Entities

There are two conditions for including a document fragment using DTD entities:

- The master document should declare the DTD to be used, while the external entities should
declare the XML fragments to be referenced.
- The referenced documents that contain the fragments cannot also define the DTD because the
main document will not be valid. If you want to validate the parts separately you have to use
XInclude (page 909) for assembling the parts together with the master file.

The master document looks like this:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE book SYSTEM "../xml/docbookx.dtd" [
  <!ENTITY testing SYSTEM "testing.xml" > ]
> 
<book>
  <chapter> ...
</book>
```

The referenced document (testing.xml) looks like this:

```xml
<section> ... here is the section content ... </section>
```

![Note:]

The indicated DTD and the element names (section, chapter) are used here only for illustrating the
inclusion mechanism. You can use any DTD and element names you need.

The content from the referenced file (in the example above, it's a section in the test.xml file) can be
inserted somewhere in the master document:

```xml
... &testing; ...
```

To obtain output in various formats (for example, PDF or HTML), you simply need to apply an XSLT
stylesheet over the master document using a transformation scenario.

**Viewing the Expanded Content in Oxygen XML Editor plugin**

When a transformation scenario is applied on the master file, an intermediary file combines all the
referenced content and it will be expanded in the final output. If you want to see how the referenced
content will be expanded before applying the transformation, you can do one of the following:
• Simply switch to **Author** mode.
• Create a minimal XSLT stylesheet that simply copies the XML content, then create a new XSLT transformation scenario that applies the stylesheet over the XML. The XSLT stylesheet would look like this:

```xml
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    xmlns:math="http://www.w3.org/2005/xpath-functions/math"
    exclude-result-prefixes="xs math"
    version="3.0">
  <xsl:template match="node() | @*">
    <xsl:copy>
      <xsl:apply-templates select="node() | @*"/>
    </xsl:copy>
  </xsl:template>
</xsl:stylesheet>
```

Combining XML Documents and Fragments Using XInclude

**XInclude** is a standard for assembling XML instances into another XML document through inclusion. A **master file (page 2708)** can be dynamically created from smaller XML documents without having to physically duplicate the content of the smaller files. The advantage of using XInclude instead of the **DTD Entities method (page 908)** is that each of the assembled documents is permitted to contain a Document Type Declaration (DOCTYPE). This means that each file is a valid XML instance and can be independently validated. It also means that the main document, which includes smaller instances, can be validated without having to remove or comment out the DOCTYPE (as is the case with External Entities).

**Enabling XInclude Support in Oxygen XML Editor plugin**

The XInclude support in Oxygen XML Editor plugin is enabled by default. It is controlled by the **Enable XInclude processing** option (page 173) in the **XML > XML Parser** preferences page (page 173). When enabled, Oxygen XML Editor plugin will be able to validate and transform documents comprised of parts added using XInclude.

**Example: Using XInclude to Combine Files**

A chapter file (**introduction.xml**) looks like this:
The main article (master file) looks like this:

```xml
<?xml version="1.0"?>
<!DOCTYPE article PUBLIC "-//OASIS//DTD DocBook XML V4.3//EN" "http://www.docbook.org/xml/4.3/docbookx.dtd"
[ <!ENTITY % xinclude SYSTEM "../frameworks/docbook/dtd/xinclude.mod">
%xinclude;
]>
<article>
  <title>Install guide</title>
  <para>This is the install guide.</para>
  <xi:include xmlns:xi="http://www.w3.org/2001/XInclude"
               href="introduction.xml">
    <xi:fallback>
      <para><emphasis>FIXME: MISSING XINCLUDE CONTENT</emphasis></para>
    </xi:fallback>
  </xi:include>
</article>
```

In this example, note the following:

- The DOCTYPE declaration defines an entity that references a file containing the information to add the `xi` namespace to certain elements defined by the DocBook DTD.
- The `href` attribute of the `xi:include` element specifies that the `introduction.xml` file will replace the `xi:include` element when the document is parsed.
- If the `introduction.xml` file cannot be found, the parser will use the value of the `xi:fallback` element - a `FIXME` message.
Example: Using XInclude to Combine Fragments of Files

If you want to include only a fragment of a file in the master file (page 2708), the fragment must be contained in a tag having an xml:id attribute and you must use an XPointer expression pointing to the xml:id value.

Note: Oxygen XML Editor plugin supports the XPointer Framework and the XPointer element() Scheme, but it does NOT support the XPointer xpointer() Scheme.

For example, if the master file is:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<?xml-model href="test.rng" type="application/xml" schematypens="http://relaxng.org/ns/structure/1.0"?>
<test>
  <xi:include href="a.xml" xpointer="a1"
    xmlns:xi="http://www.w3.org/2001/XInclude"/>
</test>
```

and the file (a.xml) is:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<test>
  <a xml:id="a1">test</a>
</test>
```

after resolving the XPointer reference, the document is:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<?xml-model href="test.rng" type="application/xml" schematypens="http://relaxng.org/ns/structure/1.0"?>
<test>
  <a xml:id="a1" xml:base="a.xml">test</a>
</test>
```

Viewing the Expanded Content in Oxygen XML Editor plugin

When a transformation scenario is applied on the master file, an intermediary file combines all the referenced content and it will be expanded in the final output. If you want to see how the referenced content will be expanded before applying the transformation, you can do one of the following:

- Simply switch to Author mode.
• Create a minimal XSLT stylesheet that simply copies the XML content, then create a new XSLT transformation scenario that applies the stylesheet over the XML. The XSLT stylesheet would look like this:

```xml
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    xmlns:math="http://www.w3.org/2005/xpath-functions/math"
    exclude-result-prefixes="xs math"
    version="3.0">
  <xsl:template match="node() | @*">
    <xsl:copy>
      <xsl:apply-templates select="node() | @*"/>
    </xsl:copy>
  </xsl:template>
</xsl:stylesheet>
```

**XInclude 1.1 Features**

Oxygen XML Editor plugin offers partial support for XInclude 1.1 features. This includes support for fragment identifiers and attribute copying.

• **Fragment Identifiers**

You can `xi:include` a text file and specify the `@fragid` value so that you only get part of that text file in the main document. For some examples and to see how `xi:include` gets expanded when the `@fragid` specifies a line range or character range, see [Textual Inclusion Examples with RFC5147 Fragment Identifiers](#).

• **Attribute Copying**

Any `namespaced` attribute defined on the `xi:include` element will be passed to the root element of the included content.

For example, if you have this:

```xml
<xi:include href="section2.xml" xmlns:xi="http://www.w3.org/2001/XInclude"
            xml:id="sectInner1"/>
```

and `section2.xml` looks like this:

```xml
<sect2 xmlns="http://docbook.org/ns/docbook" version="5.0"
       xmlns:xlink="http://www.w3.org/1999/xlink" xml:id="section2">
  <title>FS2</title>
</sect2>
```
then the final processed result will have the original xml:id="section2" replaced with the value specified in the xi:included section.

For more information, see Attribute Copying when Processing XML. Also, to see more examples, see Attribute Copying Examples.

Refactoring XML Documents

In the life cycle of XML documents there are instances when the XML structure needs to be changed to accommodate various needs. For example, when an associated schema is updated, an attribute may have been removed, or a new element added to the structure.

These types of situations cannot be resolved with a traditional Find/Replace tool, even if the tool accepts regular expressions. The problem becomes even more complicated if an XML document is computed or referenced from multiple modules, since multiple resources need to be changed.

To assist you with these types of refactoring tasks, Oxygen XML Editor plugin includes a specialized XML Refactoring tool that helps you manage the structure of your XML documents.

XML Refactoring Tool

The XML Refactoring tool is presented in the form of an easy to use wizard that is designed to reduce the time and effort required to perform various structure management tasks. For example, you can insert, delete, or rename an attribute in all instances of a particular element that is found in all documents within your project.

To access the tool, select the XML Refactoring action from one of the following locations:

- The XML Tools menu.
- The Refactoring submenu from the contextual menu in the Navigator view (page 250).
- The Refactoring submenu from the contextual menu in the DITA Maps Manager view (page 2400).
Note: The built-in refactoring operations are also available from the Refactoring submenu in the contextual menu of Author or Text mode. This is useful because by selecting the operations from the contextual menu, Oxygen XML Editor plugin considers the editing context to skip directly to the wizard page of the appropriate operation and to help you by preconfiguring some of the parameter values. For your convenience, the last 5 operations that were finished (page 916) or previewed (page 916) also appear in the Refactoring submenu of the contextual menu in the DITA Maps Manager.

XML Refactoring Wizard

The XML Refactoring tool includes the following wizard pages:

Refactoring operations

The first wizard page presents the available operations, grouped by category. To search for an operation, you can use the filter text box at the top of the page.

Figure 347: XML Refactoring Wizard

Configure Operation Parameters
The next wizard page allows you to specify the parameters for the refactoring operation. The parameters are specific to the type of refactoring operation that is being performed. For example, to delete an attribute you need to specify the parent element and the qualified name of the attribute to be removed.

**Figure 348: XML Refactoring 2nd Wizard Page (Delete Attribute Operation)**

![XML Refactoring 2nd Wizard Page](image)

**Scope and Filters**

The last wizard page allows you to select the set of files that represent the input of the operation.

**Figure 349: XML Refactoring - Scope and Filters Wizard Page**

![XML Refactoring - Scope and Filters Wizard Page](image)

**Scope section**
In the **Scope** section, you can select from predefined resource sets (such as the current file, your whole project, the current DITA map (page 2705) hierarchy for DITA projects, etc.) or you can define your own set of resources by creating a working set (page 2712).

**Filters**

The **Filters** section includes the following options:

- **Include files** - Allows you to filter the selected resources by using a file pattern. For example, to restrict the operation to only analyze build files you could use `build*.xml` for the file pattern.
- **Restrict only to known XML file types** - When selected, only resources with a known XML file type will be affected by the operation.

**Preview**

You can use the **Preview** button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.

**Finish**

After clicking the **Finish** button, the operation will be processed and Oxygen XML Editor plugin provides no automatic means for reverting the operations. Any **Undo** action will only revert changes on the current document.

⚠️ **Troubleshooting:** If an operation fails, a notification will be displayed in the **Results** panel with some information about the error. For example, if the operation was invoked on a read-only resource, the error will indicate that a read-only file cannot be converted.

💡 **Tip:** If an operation takes longer than expected you can use the ▼ Stop button in the progress bar to cancel the operation.

⚠️ **Restriction:** XML refactoring operations cannot preserve CDATA sections. If your document contains XML CDATA sections, the refactoring operations will convert them to plain text nodes.

**Built-in Refactoring Operations**

The XML Refactoring tool includes a variety of built-in operations that can be used for common refactoring tasks. They are grouped by category in the **Refactoring operations** wizard page. You can also access the operations from the **Refactoring** submenu in the contextual menu of **Author** or **Text** mode. The operations are also grouped by category in this submenu. When selecting the operations from the contextual menu, Oxygen XML Editor plugin considers the editing context to get the names
and namespaces of the current element or attribute, and uses this information to preconfigure some of the parameter values for the selected refactoring operation.

Tip: Each operation includes a link in the lower part of the wizard that opens the XML / XSLT-FO- XQuery / XPath preferences page where you can configure XPath options and declare namespace prefixes.

The following built-in operations are available:

**Refactoring Operations for Attributes**

**Add/Change attribute**

Use this operation to change the value of an attribute or insert a new one. This operation allows you to specify the following parameters:

**Parent element section**

Element

The parent element of the attribute to be changed, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

**Attribute section**

Local name

The local name of the affected attribute.

Namespace

The namespace of the affected attribute.

Value

The value for the affected attribute.

**Options section**

You can choose between one of the following options for the Operation mode:

Add the attribute in the parent elements where it is missing

Adds the attribute to all instances of the specified parent element.

Change the value in the parent elements where the attribute already exists
Replaces the value of the already existing attribute in all instance of the specified parent element.

Both

Adds the attributes to the instances where it is missing and replaces the value in instances where the attribute already exists.

**Convert attribute to element**

Use this operation to convert a specified attribute to an element. This operation allows you to specify the following parameters:

**Parent element section**

**Element**

The parent element of the attribute to be converted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

**Attribute section**

**Local name**

The local name of the affected attribute.

**Namespace**

The namespace of the affected attribute.

**New element section**

**Local name**

The local name of the new element.

**Namespace**

The namespace of the new element.

**Delete attribute**

Use this operation to remove one or more attributes. This operation requires you to specify the following parameters:

**Element**

The parent element of the attribute to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.
Attribute
   The name of the attribute to be deleted.

Rename attribute
   Use this operation to rename an attribute. This operation requires you to specify the following parameters:

   Element
   The parent element of the attribute to be renamed, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

   Attribute
   The name of the attribute to be renamed.

   New local name
   The new local name of the attribute.

Replace in attribute value
   Use this operation to search for a text fragment inside an attribute value and change the fragment to a new value. This operation allows you to specify the following parameters:

   Target attribute section

   Element
   The parent element of the attribute to be modified, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

   Attribute
   The name of the attribute to be modified.

   Find / Replace section

   Find
   The text fragments to find. You can use Perl-like regular expressions.

   Replace with
   The text fragment to replace the target with. This parameter can bind regular expression capturing groups ($1, $2, etc.) from the find pattern.
Refactoring Operations for Comments

Delete comments

Use this operation to delete comments from one or more elements. This operation requires you specify the following parameter:

Element

The target element (or elements) for which comments will be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Note: Comments that are outside the root element will not be deleted because the serializer preserves the content before and after the root.

Refactoring Operations for DITA

Change topic ID to file name

Use this operation to change the ID of a topic to be the same as its file name.

Convert CALS tables to simple tables

Use this operation to convert DITA CALS tables to simple tables.

Convert conrefs to conkeyrefs

Use this operation to convert conref attributes to conkeyref attributes. For more information and instructions for using this operation, see Converting Conrefs to Conkeyrefs (page 2540).

Convert simple tables to CALS tables

Use this operation to convert DITA simple tables to CALS tables.

Convert Nested Topics to New Topics (Available from the contextual menu of editable maps/nodes in the DITA Maps Manager (page 2400))

Use this operation on topics that contain nested <topic> elements to convert each nested topic to a new topic. Also, the new topics are added in the DITA Maps Manager as the first child topics of the original topic.

Convert Sections to New Topics (Available from the contextual menu of editable maps/nodes in the DITA Maps Manager (page 2400))

Use this operation on topics that contain multiple sections to convert each section to a new topic. Also, the new topics are added in the DITA Maps Manager as the first child topics of the original topic.

Convert to Concept
Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept). For more information, see Converting DITA Topics to Another Type (page 2468).

Convert to General Task

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). For more information, see Converting DITA Topics to Another Type (page 2468).

Convert to Reference

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference). For more information, see Converting DITA Topics to Another Type (page 2468).

Convert to Task

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task). For more information, see Converting DITA Topics to Another Type (page 2468).

Convert to Topic

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic). For more information, see Converting DITA Topics to Another Type (page 2468).

Convert to Troubleshooting

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting). For more information, see Converting DITA Topics to Another Type (page 2468).

Rename Key

Use this operation to rename a key. It also updates all references to it. Note that it does not work on DITA 1.3 key scopes.

All of these DITA refactoring actions allow you to choose a scope for the operation and some filters:

Scope

Select from a variety of options to define the scope for which resources will be affected by the operation. For example, you can choose to affect all resources in the Project, All opened files, Current DITA map hierarchy, or just the Current file.

Filters section

Include files
Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as * or ?).

**Restrict to known XML file types only**
Excludes non-XML file types from the operation.

**Refactoring Operations for Elements**

**Delete element**
Use this operation to delete elements. This operation requires you to specify the following parameter:

**Element**
The target element to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

**Delete element content**
Use this operation to delete the content of elements. This operation requires you to specify the following parameter:

**Element**
The target element whose content is to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

**Insert element**
Use this operation to insert new elements. This operation allows you to specify the following parameters:

**Element section**

**Local name**
The local name of the element to be inserted.

**Namespace**
The namespace of the element to be inserted.

**Location section**

**XPath**
An XPath expression that identifies an existing element to which the new element is relative, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

**Position**

The position where the new element will be inserted, in relation to the specified existing element. The possible selections in the drop-down menu are: **After**, **Before**, **First child**, or **Last child**.

**Rename element**

Use this operation to rename elements. This operation requires you to specify the following parameters:

**Target elements (XPath)**

The target elements to be renamed, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

**New local name**

The new local name of the element.

**Unwrap element**

Use this operation to remove the surrounding tags of elements, while keeping the content unchanged. This operation requires you to specify the following parameter:

**Target elements (XPath)**

The target elements whose surrounding tags will be removed, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

**Wrap element**

Use this operation to surround elements with element tags. This operation allows you to specify the following parameters:

**Target elements (XPath)**

The target elements to be surrounded with tags, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

**Wrapper element section**
Local name

The local name of the Wrapper element.

Namespace

The namespace of the Wrapper element.

Wrap element content

Use this operation to surround the content of elements with element tags. This operation allows you to specify the following parameters:

Target elements (XPath)

The target elements whose content will be surrounded with tags, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

Wrapper element section

Local name

The local name of the Wrapper element that will surround the content of the target.

Namespace

The namespace of the Wrapper element that will surround the content of the target.

Refactoring Operations for Fragments

Insert XML fragment

Use this operation to insert an XML fragment. This operation allows you to specify the following:

XML Fragment

The XML fragment to be inserted.

Location section

XPath

An XPath expression that identifies an existing element to which the inserted fragment is relative, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.
Position

The position where the fragment will be inserted, in relation to the specified existing element. The possible selections in the drop-down menu are: After, Before, First child, or Last child.

Replace element content with XML fragment

Use this operation to replace the content of elements with an XML fragment. This operation allows you to specify the following parameters:

Target elements (XPath)

The target elements whose content will be replaced, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

XML Fragment

The XML fragment with which to replace the content of the target element.

Replace element with XML fragment

Use this operation to replace elements with an XML fragment. This operation allows you to specify the following parameters:

Target elements (XPath)

The target elements to be replaced, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

XML Fragment

The XML fragment with which to replace the target element.

Refactoring Operations for JATSKit

Add BITS DOCTYPE - NLM/NCBI Book Interchange 2.0

Use this operation to add an NLM 'BITS' 2.0 DOCTYPE declaration.

Add Blue DOCTYPE - NISO JATS Publishing 1.1

Use this operation to add a JATS 'Blue' 1.1 DOCTYPE declaration.

Normalize IDs

Use this operation to normalize assigned IDs and assigned IDs to elements that are missing them.
All of these JATSKit refactoring actions allow you to choose a scope for the operation and some filters:

**Scope**

Select from a variety of options to define the scope for which resources will be affected by the operation. For example, you can choose to affect all resources in the **Project, All opened files**, or just the **Current file**.

**Filters section**

- **Include files**
  - Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as * or ?).
- **Restrict to known XML file types only**
  - Excludes non-XML file types from the operation.

**Refactoring Operations for Publishing Template**

These operations are for those who use **Oxygen Publishing Templates for WebHelp Responsive output customization.**

- **Migrate HTML Page Layout Files to v21**
  - Use this operation to convert custom HTML page layout files ([page 1649](#)) that are included in a custom Publishing Template that was created in Oxygen XML Editor plugin version 20.0 or 20.1 so that they will be compatible with Oxygen XML Editor plugin version 21.0.

- **Update HTML Pages**
  - **Attention:** This operation is only used by Oxygen XML Editor plugin and should not be used manually.

**Additional Notes**

- **Note:** There are some operations that allow `<ANY>` for the **local name** and **namespace** parameters. This value can be used to select an element or attribute regardless of its local name or namespace. Also, the `<NO_NAMESPACE>` value can be used to select nodes that do not belong to a namespace.

- **Note:** Some operations have parameters that accept XPath expressions to match elements or attributes. In these XPath expressions you can only use the prefixes declared in the **Options >**
Preferences > XML > XSLT-FO-XQUERY > XPath (page 184) page. This preferences page can be easily opened by clicking the link in the note *(Each prefix used in an XPath expression must be declared in the Default prefix-namespace mappings section)* at the bottom of the Configure Operation Parameters wizard page.

Custom Refactoring Operations

While Oxygen XML Editor plugin includes a variety of built-in XML refactoring operations to help you accomplish particular tasks, you can also create custom operations according to your specific needs. For example, you could create a custom refactoring operation to convert an attribute to an element and insert the element as the first child of the parent element.

An XML Refactoring operation is defined as a pair of resources:

- An XQuery Update script or XSLT stylesheet that Oxygen XML Editor plugin will run to refactor the XML files.
- An XML Operation Descriptor file that contains information about the operation (such as the name, description, and parameters).

*Figure 350: Diagram of an XML Refactoring Operation*

All the defined custom operations are loaded by the XML Refactoring Tool and presented in the Refactoring Operations wizard page (page 914), along with the built-in operations.
After the user chooses an operation and specifies its parameters, Oxygen XML Editor plugin processes an XQuery Update or XSLT transformation over the input file. This transformation is executed in a **safe mode**, which implies the following:

- **When loading the document:**
  - The **XInclude** mechanism is disabled. This means that the resources included by using XInclude will not be visible in the transformation.
  - The DTD entities will be processed without being expanded.
  - The associated DTD will be not loaded, so the default attributes declared in the DTD will not be visible in the transformation.

- **When saving the updated XML document:**
  - The **DOCTYPE** will be preserved.
  - The DTD entities will be preserved as they are in the original document when the document is saved.
  - The attribute values will be kept in their original form without being normalized.
  - The spaces between attributes are preserved. Basically, the spaces are lost by a regular XML serialization since they are not considered important.

The result of this transformation overrides the initial input file.

**Note:** This can be changed using Saxon extension functions in XSLT *(page 944).*

- The DTD entities will be preserved as they are in the original document when the document is saved.
- The attribute values will be kept in their original form without being normalized.
- The spaces between attributes are preserved. Basically, the spaces are lost by a regular XML serialization since they are not considered important.

**Note:** To achieve some of the previous goals, the XML Refactoring mechanism adds several attributes that are interpreted internally. The attributes belong to the `http://www.oxygenxml.com/ns/xmlRefactoring/additional_attributes` namespace. These attributes should not be taken into account when processing the input XML document since they are discarded when the transformed document is serialized.

**Restriction:** *Comments or processing instructions* that are in any node before or after the root element cannot be modified by an XML Refactoring operation. In other words, XML Refactoring operations can only be applied on the root element and the nodes inside it. However, as a work around to this limitation, you can use Saxon extension functions and the XSLT stylesheet method *(page 944)* to implement the new custom XML refactoring operation.

### Creating a Custom Refactoring Operation

To create a custom refactoring operation, follow these steps:

1. Create an **XQuery Update script** *(page 934)* or **XSLT stylesheet file** *(page 939)*.
2. Create an **XML Refactoring Operation Descriptor** file contains the path to the **XQuery Update script** *(page 937)* or **XSLT stylesheet** *(page 941).*
3. Store both files in one of the locations that Oxygen XML Editor plugin (page 946) scans when loading the custom operations.

**Result:** Once you run the XML Refactoring tool again, the custom operation appears in the Refactoring Operations wizard page (page 914).

**Custom Refactoring Script**

The first step in creating a custom refactoring operation is to create an XQuery Update script (page 934) or XSLT stylesheet (page 939) that is needed to process the refactoring operations. The easiest way to create this script file is to use the New document wizard to create a new XQuery or XSLT file and you can use the XQuery method example (page 934) or XSLT method example (page 939) to help you with the content.

There are cases when it is necessary to add parameters in the XQuery script (page 934) or XSLT stylesheet (page 939). For instance, if you want to rename an element, you may want to declare an external parameter associated with the name of the element to be renamed. To allow you to specify the value for these parameters, they need to be declared in the refactoring operation descriptor file that is associated with this operation.

**Note:** The XQuery Update processing is disabled by default in Oxygen XML Editor plugin. Thus, if you want to create or edit an XQuery Update script you have to enable this mechanism by creating an XQuery transformation scenario (page 1489) and choose Saxon EE as the transformation engine. Also, you need to make sure the Enable XQuery update option is selected in the Saxon processor advanced options (page 1439).

**Note:** If you are using an XSLT file, XPath expressions that are passed as parameters will automatically be rewritten to conform with the mapping of the namespace prefixes declared in the XML /XSLT-FO-XQuery / XPath preferences page (page 184).

The next step in creating a custom refactoring operation is to create an XML Refactoring Operation Descriptor file contains the path to the XQuery Update script (page 937) or XSLT stylesheet (page 941).
Custom Refactoring Operation Descriptor File

The second step in creating a custom refactoring operation is to create an operation descriptor file. The easiest way to do this is to use the New document wizard and choose the XML Refactoring Operation Descriptor template.

Introduction to the Descriptor File

This file contains information (such as name, description, and id) that is necessarily when loading an XML Refactoring operation. It also contains the path to the XQuery Update script (page 934) or XSLT stylesheet (page 939) that is associated with the particular operation through the script element.

You can specify a category for your custom operations to logically group certain operations. The category element is optional and if it is not included in the descriptor file, the default name of the category for the custom operations is Other operations.

The descriptor file is edited and validated against the following schema: frameworks/xml_refactoring/operation_descriptor.xsd.

Declaring Parameters in the Descriptor File

If the XQuery Update script or XSLT stylesheet includes parameters, they should be declared in the parameters section of the descriptor file. All the parameters specified in this section of the descriptor file will be displayed in the XML Refactoring tool within the Configure Operation Parameters wizard page (page 914) for that particular operation.

The value of the first description element in the parameters section will be displayed at the top of the Configure Operation Parameters wizard page (page 914).

To declare a parameter, specify the following information:

- **label** - This value is displayed in the user interface for the parameter.
- **name** - The parameter name used in the XQuery Update script or XSLT stylesheet and it should be the same as the one declared in the script.
• **type** - Defines the type of the parameter and how it will be rendered. There are several types available:
  - **TEXT** - Generic type used to specify a simple text fragment.
  - **XPATH** - Type of parameter whose value is an XPATH expression. For this type of parameter, Oxygen XML Editor plugin will use a text input with corresponding content completion and syntax highlighting.

  ❗️ **Note:** The value of this parameter is transferred as plain text to the XQuery Update or XSLT transformation without being evaluated. You should evaluate the XPath expression inside the XQuery Update script or XSLT stylesheet. For example, you could use the `saxon:evaluate` Saxon extension function.

  ❗️ **Note:** A relative XPath expression is converted to an absolute XPath expression by adding `//` before it (`//XPathExp`). This conversion is done before transferring the XPath expression to the XML refactoring engine.

  ❗️ **Note:** When writing XPath expressions, you can only use prefixes declared in the **Options > Preferences > XML > XSLT-FO-XQUERY > XPath (page 184)** options page.

  - **NAMESPACE** - Used for editing namespace values.
  - **REG_EXP_FIND** - Used when you want to match a certain text by using Perl-like regular expressions.
  - **REG_EXP_REPLACE** - Used along with **REG_EXP_FIND** to specify the replacement string.
  - **XML_FRAGMENT** - This type is used when you want to specify an XML fragment. For this type, Oxygen XML Editor plugin will display a text area specialized for inserting XML documents.
  - **NC_NAME** - The parameter for **NC_NAME** values. It is useful when you want to specify the local part of a **QName (page 2710)** for an element or attribute.
  - **BOOLEAN** - Used to edit boolean parameters.
  - **TEXT_CHOICE** - It is useful for parameters whose value should be from a list of possible values. Oxygen XML Editor plugin renders each possible value as a radio button option.

• **description** - The description of the parameter. It is used by the application to display a tooltip when you hover over the parameter.

• **possibleValues** - Contains the list with possible values for the parameter and you can specify the default value, as in the following example:

```xml
<possibleValues onlyPossibleValuesAllowed="true">
  <value name="before">Before</value>
  <value name="after" default="true">After</value>
  <value name="firstChild">First child</value>
  <value name="lastChild">Last child</value>
</possibleValues>
```
Specialized Parameters to Match Elements or Attributes

If you want to match elements or attributes, you can use some specialized parameters, in which case Oxygen XML Editor plugin will propose all declared elements or attributes based on the schema associated with the currently edited file. The following specialized parameters are supported:

**elementLocation**

This parameter is used to match elements. For this type of parameter, the application displays a text field where you can enter the element name or an XPath expression. The text from the `label` attribute is displayed in the application as the label of the text field. The `name` attribute is used to specify the name of the parameter from the XQuery Update script or XSLT stylesheet. If the value of the `useCurrentContext` attribute is set to `true`, the element name from the cursor position is used as proposed values for this parameter.

Example of an `elementLocation`:

```xml
<elementLocation name="elem_loc" useCurrentContext="false">
  <element label="Element location">
    <description>Element location description.</description>
  </element>
</ElementLocation>
```

**attributeLocation**

This parameter is used to match attributes. For this type of parameter, the application displays two text fields where you can enter the parent element name and the attribute name (both text fields accept XPath expressions for a finer match). The text from the `label` attributes is displayed in the application as the label of the associated text fields. The `name` attribute is used to specify the name of the parameter from the XQuery Update script or XSLT stylesheet. The value of this parameter is an XPath expression that is computed by using the values of the expression from the `element` and `attribute` text fields. For example, if `section` is entered for the element and a `title` is entered for the attribute, the XPath expression would be computed as `//section/@title`. If the value of the `useCurrentContext` attribute is set to `true`, the element and attribute name from the cursor position is used as proposed values for the operation parameters.

Example of an `attributeLocation`:

```xml
<attributeLocation name="attr_xpath" useCurrentContext="true">
  <element label="Element path">
```

elementParameter

This parameter is used to specify elements by local name and namespace. For this type of parameter, the application displays two combo boxes with elements and namespaces collected from the associated schema of the currently edited file. The text from the label attribute is displayed in the application as label of the associated combo. The name attribute is used to specify the name of the parameter from the XQuery Update script or XSLT stylesheet. If you specify the allowsAny attribute, the application will propose <ANY> as a possible value for the Name and Namespace combo boxes. You can also use the useCurrentContext attribute and if its value is set to true, the element name and namespace from the cursor position is used as proposed values for the operation parameters.

Example of an elementParameter:

```xml
<elementParameter id="elemID" useCurrentContext="true">
  <localName label="Name" name="element_localName" allowsAny="true">
    <description>Local name of the parent element.</description>
  </localName>

  <namespace label="Namespace" name="element_namespace" allowsAny="true">
    <description>Local name of the parent element</description>
  </namespace>
</elementParameter>
```

attributeParameter

This parameter is used to specify attributes by local name and namespace. For this type of parameter, the application displays two combo boxes with attributes and their namespaces collected from the associated schema of the currently edited file. The text from the label attribute is displayed in the application as the label of the associated combo box. You can also use the useCurrentContext attribute and if its value is set to true, the attribute name and namespace from the cursor position is used as proposed values for the operation parameters.
**Note:** An attributeParameter is dependant upon an elementParameter.

The list of attributes and namespaces are computed based on the selection in the elementParameter combo boxes.

Example of an attributeParameter:

```xml
<attributeParameter dependsOn="elemID" useCurrentContext="true">
  <localName label="Name" name="attribute_localName">
    <description>The name of the attribute to be converted.</description>
  </localName>

  <namespace label="Namespace" name="attribute_namespace" allowsAny="true">
    <description>Namespace of the attribute to be converted.</description>
  </namespace>
</attributeParameter>
```

**Note:** All built-in operations are loaded from the \[OXYGEN_INSTALL_DIR\]/refactoring folder.

**XQuery Update Script for Creating a Custom Operation**

To demonstrate creating a custom operation, suppose that you have a task where you need to convert an attribute into an element and insert it inside another element. A specific example would be if you have a project with a variety of image elements where a deprecated alt attribute was used for the description and you want to convert all instances of that attribute into an element with the same name and insert it as the first child of the image element.

Thus, the task is to convert this attribute into an element with the same name and insert it as the first child of the image element.

*Figure 351: Example: Custom XML Refactoring Operation*
An XQuery Update script can be used to implement the new custom XML refactoring operation. The second requirement is an XML Refactoring operation descriptor file (page 937) that contains the path to the XQuery Update script.

⚠️ **Restriction**: There is a limitation to using an XQuery script in that comments or processing instructions that are in any node before or after the root element cannot be modified by an XML Refactoring operation. In other words, XML Refactoring operations can only be performed on comments or processing instructions that are inside the root element. However, as a work around to this limitation, you can use Saxon extension functions and the XSLT stylesheet method (page 944) to implement the new custom XML refactoring operation.

**Example of an XQuery Update Script for Creating a Custom Operation to Convert an Attribute to an Element**

The XQuery Update script does the following:

- Iterates over all elements from the document that have the specified local name and namespace.
- Finds the attribute that will be converted to an element.
- Computes the QName (page 2710) of the new element to be inserted and inserts it as the first child of the parent element.

```xml
<image
  href="../image/insertBattery.jpg"
  alt="Insert the battery into the battery compartment."
  placement="break"/>

After you have developed the XQuery script, you have to create an XML Refactoring operation descriptor. This descriptor is used by the application to load the operation details such as name, description, or parameters.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<refactoringOperationDescriptor
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"

<!-- For the XSLT stylesheet option uncomment the following line and comment the line referring the XQuery Update script -->
<!-- <script type="XSLT" href="convert-attribute-to-element.xsl"/> -->
<script type="XQUERY_UPDATE" href="convert-attribute-to-element.xq"/>
<parameters>
<description>Specify the attribute to be converted to element.</description>
<section label="Parent element">
<elementParameter id="elemID">
/localName label="Name" name="element_localName" allowsAny="true">
<description>Local name of the parent element.</description>
</localName>
<namespace label="Namespace" name="element_namespace" allowsAny="true">
<description>Local name of the parent element</description>
```
Results

After you have created these files, copy them into a folder scanned by Oxygen XML Editor plugin when it loads the custom operation (page 946). When the XML Refactoring tool is started again, you will see the created operation.

Since various parameters can be specified, this custom operation can also be used for other similar tasks. The following image shows the parameters that can be specified in the example of the custom operation to convert an attribute to an element:

**Note:** If you are using an XSLT file, the line with the `script` element would look like this:

```
<script type="XSLT" href="convert-attribute-to-element.xsl"/>
```

**Results**

After you have created these files, copy them into a folder scanned by Oxygen XML Editor plugin when it loads the custom operation (page 946). When the XML Refactoring tool is started again, you will see the created operation.

Since various parameters can be specified, this custom operation can also be used for other similar tasks. The following image shows the parameters that can be specified in the example of the custom operation to convert an attribute to an element:

*Figure 354: Example: XML Refactoring Wizard for a Custom Operation*
Using Saxon Extension Functions to Allow Custom Refactoring Operations to Read and Modify Content Outside the Root Node

One advantage to using an XSLT stylesheet is that there is limitation when using an XQuery Update script (page 934) in that refactoring operations can only be performed on comments or processing instructions that are inside the root element. Thus, using the XQuery method, comments or processing instructions that are in any node before or after the root element cannot be modified by an XML Refactoring operation.

The XSLT stylesheet method offers a work around to this limitation through the use of some Saxon extension functions.

To illustrate the use of these functions, consider the following sample XML file:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!-- comment before root -->
<?pi before root ?>
<root>
  <child></child>
</root>
<!-- comment after root -->
<?pi after root ?>
```

The following Saxon extension functions can be used to read and modify content outside the root node:

Note: They belong to the [http://www.oxygenxml.com/ns/xmlRefactoring/functions](http://www.oxygenxml.com/ns/xmlRefactoring/functions) namespace.
• **get-content-after-root()** - Returns the content after root as `xs:string`.

For the XML above, the call of this function will return the following string value:

```
<!-- comment after root -->
<?pi after root ?>
```

• **set-content-after-root(xs:string)** - Updates the content that will be serialized in the refactored document after the root node.

The function call `set-content-after-root('<!-- Inserted comment -->')` will result in replacing the nodes after the root element with the comment passed as string argument. The XML document will be modified as follows:

```
<?xml version="1.0" encoding="UTF-8"?>
<!-- comment before root -->
<?pi before root ?>
<root>
  <child/>
</root>
<!-- Inserted comment -->
```

• **get-content-before-root()** - Returns the content before root as `xs:string`.

For the XML above, the call of this function will return the following string value:

```
<?xml version="1.0" encoding="UTF-8"?>
<!-- comment before root -->
<?pi before root ?>
```

• **set-content-before-root(xs:string)** - Updates the content that will be serialized in the refactored document after the root node.

The function call `set-content-before-root('<!-- Inserted comment -->')` will result in replacing the nodes before the root element with the comment passed as string argument. The XML document will be modified as follows:

```
<!-- Inserted comment -->
<root>
  <child/>
</root>
<!-- comment after root -->
<?pi after root ?>
```

**XSLT Example:**

To process content after the root node, the XSLT would look like this:
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema" exclude-result-prefixes="xs"
    xmlns:xrf="http://www.oxygenxml.com/ns/xmlRefactoring/functions" version="3.0">
    <xsl:template match="/">
        <!-- The comment content that will be inserted after the root element -->
        <xsl:variable name="commentAsText">"COMMENT ADDED FROM XR OPERATION"</xsl:variable>
        <!-- Retrieve the content after the root element as is -->
        <xsl:variable name="after-root-content" as="xs:string">
            xrf:get-content-after-root()
        </xsl:variable>
        <!-- Update the content after the root element -->
        <xsl:value-of select="xrf:set-content-after-root(concat($after-root-content, $commentAsText))"/>
        <xsl:apply-templates/>
    </xsl:template>

    <xsl:template match="node() | @*">
        <xsl:copy>
            <xsl:apply-templates select="node() | @*"/>
        </xsl:copy>
    </xsl:template>
</xsl:stylesheet>

**Note:** The above XSLT retrieves the nodes after the root element as string, appends a new comment, and then sets back the updated content into the XML document.

Storing and Sharing Refactoring Operations

Oxygen XML Editor plugin scans the following locations when looking for XML Refactoring operations to provide flexibility:

- A **refactoring** folder, created inside a directory that is associated to a **framework** you are customizing. To associate the parent directory to the **framework**, you need to add it in the **Classpath tab** of the **Document type** configuration dialog box ([page 76](#)).
• A folder that you specify in the **Load additional refactoring operations from** text box (page 178) in the **XML Refactoring** preferences page (page 178).
• The **refactoring** folder from the Oxygen XML Editor plugin installation directory (`{OXYGEN_INSTALL_DIR}/refactoring/`).

### Sharing Custom Refactoring Operations

The purpose of Oxygen XML Editor plugin scanning multiple locations for the XML Refactoring operations is to provide more flexibility for developers who want to share the refactoring operations with the other team members. Depending on your particular use case, you can attach the custom refactoring operations to other resources, such as *framework* (page 2706) or projects.

After storing custom operations, you can share them with other users by sharing the resources.

### Localizing XML Refactoring Operations

Oxygen XML Editor plugin includes localization support for the XML refactoring operations.

The translation keys for the built-in refactoring operations are located in `{OXYGEN_INSTALL_DIR}/refactoring/i18n/translation.xml`.

The localization support is also available for custom refactoring operations. The following information can be translated:

- The operation name, description, and category.
- The description of the parameters element.
- The label, description, and possibleValues for each parameter.

Translated refactoring information uses the following form:

`${i18n(translation_key)}`

Oxygen XML Editor plugin scans the following locations to find the *translation.xml* files that are used to load the translation keys:

- A *refactoring/i18n* folder, created inside a directory that is associated to a customized framework.
- A *i18n* folder, created inside a directory that is associated to a customized framework.
- An *i18n* folder inside any specified folder. In this case, you need to open the *Preferences* dialog box (page 55), go to XML > XML Refactoring, and specify the folder in the **Load additional refactoring operations from** text box.
The refactoring/i18n folder from the Oxygen XML Editor plugin installation directory
({OXYGEN_INSTALL_DIR}/refactoring/i18n).

Example: Refactoring Operation Descriptor File with i18n Support

```
<?xml version="1.0" encoding="UTF-8"?>
<refactoringOperationDescriptor
   xmlns="http://www.oxygenxml.com/ns/xmlRefactoring" id="remove_text_content"
   name="${i18n(Remove_text_content)}">
   <description>${i18n(Remove_text_content_description)}</description>
   <script type="XQUERY_UPDATE" href="remove_text_content.xq"/>
   <parameters>
     <description>${i18n(parameters_description)}</description>
     <parameter label="${i18n(Element_name)}" name="element_localName"
                 type="NC_NAME">
       <description>${i18n(Element_name_descriptor)}</description>
       <possibleValues>
         <value default="true" name="value1">${i18n(value_1)}</value>
         <value name="value2">${i18n(value_2)}</value>
       </possibleValues>
     </parameter>
   </parameters>
</refactoringOperationDescriptor>
```

XML Digital Signatures

This chapter explains how to apply and verify digital signatures on XML documents.

Digital Signatures Overview

_Digital signatures_ are widely used as security tokens, not just in XML. A_ digital signature_ provides a mechanism for assuring integrity of data, the authentication of its signer, and the non-repudiation of the entire signature to an external party:

- A _digital signature_ must provide a way to verify that the data has not been modified or replaced to ensure integrity.
- The _signature_ must provide a way to establish the identity of the data's signer for authentication.
- The _signature_ must provide the ability for the data's integrity and authentication to be provable to a third party for non-repudiation.
A **public key system** is used to create the digital signature and it’s also used for verification. The signature binds the signer to the document because digitally signing a document requires the originator to create a hash of the message and then encrypt that hash value with their own private key. Only the originator has that private key and that person is the only one who can encrypt the hash so that it can be unencrypted using their public key. The recipient, upon receiving both the message and the encrypted hash value, can decrypt the hash value, knowing the originator’s public key. The recipient must also try to generate the hash value of the message and compare the newly generated hash value with the unencrypted hash value received from the originator. If the hash values are identical, it proves that the originator created the message, because only the actual originator could encrypt the hash value correctly.

**XML Signatures** can be applied to any digital content (data object), including XML (see W3C Recommendation, *XML-Signature Syntax and Processing*). An XML Signature may be applied to the content of one or more resources:

- Enveloped or enveloping signatures are applied over data within the same XML document as the signature
- Detached signatures are applied over data external to the signature element; the signature is “detached” from the content it signs. This definition typically applies to separate data objects, but it also includes the instance where the signature and data object reside within the same XML document but are sibling elements.

The **XML Signature** is a method of associating a key with referenced data. It does not normatively specify how keys are associated with persons or institutions, nor the meaning of the data being referenced and signed.

The original data is not actually signed. Instead, the signature is applied to the output of a chain of **canonicalization** (page 2704) and transformation algorithms, which are applied to the data in a designated sequence. This system provides the flexibility to accommodate whatever “normalization” or desired preprocessing of the data that might be required or desired before subjecting it to being signed.

Since the signature is dependent on the content it is signing, a signature produced from a **non-canonicalized** document could possibly be different from one produced from a **canonicalized** (page 2704) document. The **canonical** (page 2704) form of an XML document is physical representation of the document produced by the method described in this specification. The **XML canonicalization** (page 2704) method is the algorithm defined by this specification that generates the canonical form of a given XML document or document subset. **XML canonicalization** is designed to be useful for applications that require the ability to test whether or not the information content of a document or document subset has been changed. This is done by comparing the **canonical** form of the original
document before application processing with the canonical form of the document result of the application processing.

A digital signature over the canonical (page 2704) form of an XML document or document subset would allow the signature digest calculations to be oblivious to changes in the original document’s physical representation. During signature generation, the digest is computed over the canonical form of the document. The document is then transferred to the relying party, which validates the signature by reading the document and computing a digest of the canonical form of the received document. The equivalence of the digests computed by the signing and relying parties (hence, the equivalence of the canonical forms for which they were computed) ensures that the information content of the document has not been altered since it was signed.

The following canonicalization algorithms are used in Oxygen XML Editor plugin:

- **Canonical XML (or Inclusive XML Canonicalization)** (XMLC14N) - Used for XML where the context doesn't change.

  Inclusive Canonicalization copies all the declarations, even if they are defined outside of the scope of the signature, and all the declarations you might use will be unambiguously specified. Inclusive Canonicalization is useful when it is less likely that the signed data will be inserted in other XML document and it is the safer method from the security standpoint because it requires no knowledge of the data that are to be secured to safely sign them. A problem may occur if the signed document is moved into another XML document that has other declarations because the Inclusive Canonicalization will copy them and the signature will be invalid.

- **Exclusive XML Canonicalization** (EXCC14N) - Designed for canonicalization where the context might change.

  Exclusive Canonicalization just copies the namespaces you are actually using (the ones that are a part of the XML syntax). It does not look into attribute values or element content, so the namespace declarations required to process these are not copied. This is useful if you have a signed XML document that you want to insert into other XML documents (or you need self-signed structures that support placement within various XML contexts), as it will ensure the signature is verified correctly each time.

The canonicalization (page 2704) method can specify whether or not comments should be included in the canonical form output by the XML canonicalization method. If a canonical form contains comments corresponding to the comment nodes in the input node-set, the result is called canonical XML with comments. In an uncommented canonical form comments are removed, including delimiter for comments outside document element.
The three operations. **Canonicalize** (page 952), **Sign** (page 953), and **Verify Signature** (page 956), are available from the **Source** submenu when invoking the contextual menu in **Text** mode or from the **XML Tools** menu.

### Certificates

A certificate is a digitally signed statement from the issuer (an individual, an organization, a website or a firm), saying that the public key (and some other information) of some other entity has a particular value. When data is digitally signed, the signature can be verified to check the data integrity and authenticity. Integrity means that the data has not been modified. Authenticity means the data comes indeed from the entity that claims to have created and signed it. Certificates are kept in special repositories called **keystores** (page 2707).

All **keystore** entries (key and trusted certificate entries) are accessed via unique aliases. An alias must be assigned for every new entry of either a key or certificate as a reference for that entity. No **keystore** can store an entity if its alias already exists in that **keystore** and cannot store trusted certificates generated with keys in its **keystore**.

Oxygen XML Editor plugin provides two types of **keystores**: Java Key Store (JKS) and Public-Key Cryptography Standards version 12 (PKCS-12). A **keystore** file is protected by a password. In a PKCS 12 **keystore** you should not store a certificate without alias together with other certificates, with or without alias, as in such a case the certificate without alias cannot be extracted from the **keystore**.

To configure the options for a certificate or to validate it, open the **Preferences** dialog box (page 55) and go to **XML > XML Signing Certificates**. This opens the certificates preferences page (page 178).
Canonicalizing Files

You can select the canonicalization (page 2704) algorithm to be used for a document from the dialog box that is displayed by using the Canonicalize action that is available from the Source submenu when invoking the contextual menu in Text mode or from the XML Tools menu.

Figure 355: Canonicalization Settings Dialog Box

The Canonicalize dialog box allows you to set the following options:

- **Input URL** - Available if the Canonicalize action was selected from the XML Tools menu. It allows you to specify the location of the input file.
- **Exclusive** - If selected, the exclusive (uncommented) canonicalization (page 2704) method is used.

**Note**: Exclusive Canonicalization just copies the namespaces you are actually using (the ones that are a part of the XML syntax). It does not look into attribute values or element content, so the namespace declarations required to process these are not copied. This is useful if you have a signed XML document that you want to insert into other XML documents (or you need self-signed structures that support placement within various XML contexts), as it will ensure the signature is verified correctly each time.
• **Exclusive with comments** - If selected, the exclusive with comments [canonicalization](page 2704) method is used.

• **Inclusive** - If selected, the inclusive (uncommented) [canonicalization](page 2704) method is used.

**Note:** Inclusive Canonicalization copies all the declarations, even if they are defined outside of the scope of the signature, and all the declarations you might use will be unambiguously specified. Inclusive Canonicalization is useful when it is less likely that the signed data will be inserted in other XML document and it is the safer method from the security standpoint because it requires no knowledge of the data that are to be secured to safely sign them. A problem may occur if the signed document is moved into another XML document that has other declarations because the Inclusive Canonicalization will copy them and the signature will be invalid.

• **Inclusive with comments** - If selected, the inclusive with comments [canonicalization](page 2704) method is used.

• **XPath** - The XPath expression provides the fragments of the XML document to be signed.

• **Output** - Available if the Canonicalize action was selected from the XML Tools menu. It allows you to specify the output file path where the signed XML document will be saved.

• **Open in editor** - If selected, the output file will be opened in the editor.

**Related Information:**

**Signing Files**

You can select the type of signature to be used for documents from a signature settings dialog box. To open this dialog box, select the **Sign** action from the Source submenu when invoking the contextual menu in **Text** mode or from the XML Tools menu.

*Figure 356: Signature Settings Dialog Box*
The following options are available:

**Note:** If Oxygen XML Editor plugin could not find a valid certificate, a link is provided at the top of the dialog box that opens the XML Signing Certificates preferences page (page 178) where you can configure a valid certificate.

- **Input** - Available if the **Sign** action was selected from the **XML Tools** menu. Specifies the location of the input URL.
- **Transformation Options** - See the Digital Signature Overview (page 948) section for more information about these options.
  - **None** - If selected, no canonicalization (page 2704) algorithm is used.
  - **Exclusive** - If selected, the exclusive (uncommented) canonicalization (page 2704) method is used.

**Note:** Exclusive Canonicalization just copies the namespaces you are actually using (the ones that are a part of the XML syntax). It does not look into attribute values or element content, so the namespace declarations required to process these are not copied. This is useful if you have a signed XML document that you want to insert into other XML documents.
(or you need self-signed structures that support placement within various XML contexts), as it will ensure the signature is verified correctly each time.

- **Exclusive with comments** - If selected, the exclusive with comments canonicalization (page 2704) method is used.
- **Inclusive** - If selected, the inclusive (uncommented) canonicalization (page 2704) method is used.

**Note:** Inclusive Canonicalization copies all the declarations, even if they are defined outside of the scope of the signature, and all the declarations you might use will be unambiguously specified. Inclusive Canonicalization is useful when it is less likely that the signed data will be inserted in other XML document and it is the safer method from the security standpoint because it requires no knowledge of the data that are to be secured to safely sign them. A problem may occur if the signed document is moved into another XML document that has other declarations because the Inclusive Canonicalization will copy them and the signature will be invalid.

- **Inclusive with comments** - If selected, the inclusive with comments canonicalization (page 2704) method is used.

- **XPath** - The XPath expression provides the fragments of the XML document to be signed.
- **ID** - Provides ID of the XML element to be signed.
- **Envelope** - If selected, the enveloped signature is used. See the Digital Signature Overview (page 948) for more information.
- **Detached** - If selected, the detached signature is used. See the Digital Signature Overview (page 948) for more information.
- **Append KeyInfo** - If this option is selected, the ds:KeyInfo element will be added in the signed document.
- **Signature algorithm** - The algorithm used for signing the document. The following options are available: RSA with SHA1, RSA with SHA256, RSA with SHA384, and RSA with SHA512.
- **Output** - Available if the Sign action was selected from the XML Tools menu. Specifies the path of the output file where the signed XML document will be saved.
- **Open in editor** - If selected, the output file will be opened in Oxygen XML Editor plugin.

Verifying Signature

You can verify the signature of a file by selecting the **Verify Signature** action from the **Source** submenu when invoking the contextual menu in **Text** mode or from the **XML Tools** menu. The **Verify Signature** dialog box then allows you to specify the location of the file whose signature is verified.

If the signature is valid, a dialog box displays the name of the signer. Otherwise, an error shows details about the problem.

Example of How to Digitally Sign XML Files or Content

Suppose you want to digitally sign an XML document, but more specifically, suppose you have multiple instances of the same element in the document and you just want to sign a specific ID. Oxygen XML Editor plugin includes a signature tool that allows you to digitally sign XML documents or specific content.

The Oxygen XML Editor plugin installation directory includes a **samples** folder that contains a file called **personal.xml**. For the purposes of this example, this file will be used to demonstrate how to digitally sign specific content. Notice that this file has multiple **person** elements inside the **personnel** element. Suppose you want to digitally sign the specific **person** element that contains the **id=robert.taylor**. To do this, follow this procedure:

1. Open the **personal.xml** file in Oxygen XML Editor plugin in **Text** editing mode.

2. Right-click anywhere in the editor and select the **Sign** action from the **Source** submenu. The **Sign** dialog box is displayed.
**Tip:** If you want to sign a file but create a new output file so that the original file remains unchanged, use the **Sign** action from the **XML Tools** menu. Selecting the action from this menu will allow you to choose an input file and output file in the **Sign** dialog box.

3. If Oxygen XML Editor plugin cannot find a valid certificate, click the link at the top of the dialog box to **configure a valid certificate**. This opens the **XML Signing Certificates** preferences page (page 178) that allows you to configure and validate a certificate.

4. Once a valid certificate is recognized, continue to configure the **Sign** dialog box.
   a. Select one of the **Transformation Options** (page 954). For the purposes of this example, select the **Inclusive with comments** option.
   b. Specify the appropriate **XPath** expression for the specific element that needs to be signed. For this example, type `/personnel/person` in the **XPath** text box.
   c. Enter the specific **ID** that needs to be signed. For this example, type `robert.taylor` in the **ID** field.
   d. Select the **Envelope option** (page 955) and leave the other options as their default values.

The digital signature is added at the end of the XML document, just before the end tag. It is always added at the end of the document, even if you only sign specific content within the document.

5. You can verify the signature by choosing the **Verify Signature** action from the **Source** submenu of the contextual menu.

### Editing XSLT Stylesheets

Oxygen XML Editor plugin includes a built-in editor for XSLT stylesheets. This section presents the features of the XSLT editor and how these features can be used. The features of the XSLT editor include:
• **Create new XSLT files and templates** - You can use the built-in new file wizards to create new XSLT documents or templates *(page 549).*

• **Open and Edit XSLT files** - XSLT files can be opened and edited in the source editor *(Text mode*(page 614)).

• **Visual Editing** - XSLT stylesheets are rendered, and can be edited, in the visual **Author editing mode** *(page 672).*

• **Validation** - Presents validation errors in XSLT files.

• **Content completion** - Offers proposals for properties and the values that are available for each property.

• **Syntax highlighting** - The syntax highlighting in Oxygen XML Editor plugin makes XSLT files more readable.

### Editing XSLT Stylesheets in the Master Files Context

Smaller interrelated modules that define a complex stylesheet cannot be correctly edited or validated individually, due to their interdependency with other modules. For example, a function defined in a main stylesheet is not visible when you edit an included or imported module. Oxygen XML Editor plugin provides the support for defining the main module (or modules), allowing you to edit any of the imported/included files in the context of the larger stylesheet structure.

You can set a main XSLT stylesheet either using the *master files support from the Navigator view*(page 581), or using a validation scenario.

To set a *master file* using a validation scenario, add validation units that point to the main modules. Oxygen XML Editor plugin warns you if the current module is not part of the dependencies graph computed for the main stylesheet. In this case, it considers the current module as the main stylesheet.

The advantages of editing in the context of *master file*(page 2708) include:

- Correct validation of a module in the context of a larger stylesheet structure.
- **Content Completion Assistant** *(page 2704)* displays all components valid in the current context.
- The **Outline view** *(page 972)* displays the components collected from the entire stylesheet structure.

For more information about editing XSLT stylesheets in the *master files* context, watch our video demonstration:

**Related Information:**
Validating XSLT Stylesheets

Numerous XSLT code quality assurance checks are done during automatic validation to help you keep your stylesheets valid and well formed. Oxygen XML Editor plugin performs the validation of XSLT documents with the help of an XSLT processor that you can configure in the preferences pages (page 188) according to the XSLT version.

For XSLT 1.0, the options are: Xalan, Saxon 6.5.5, Saxon 9.8.0.12 and a JAXP transformer specified by the main Java class. (page 188) For XSLT 2.0, the options are: Saxon 9.8.0.12 and a JAXP transformer specified by the main Java class. (page 188) For XSLT 3.0, the options are Saxon 9.8.0.12 and a JAXP transformer specified by the main Java class. (page 188)

Creating a Validation Scenario for XSLT Stylesheets

You can validate an XSLT document using the engine defined in the transformation scenario, or a custom validation scenario. If you choose to validate using the engine from transformation scenario, and a transformation scenario is not associated with the current document or the engine has no validation support, the default engine is used. To set the default engine, open the Preferences dialog box (page 55) and go to XML > XSLT/FO/XQuery > XSLT.

You can also create new validation scenarios or edit existing ones, and you can add JARS (page 2707) and classes that contain extension functions. To create or edit a validation scenario for an XSLT stylesheet, follow these steps:

1. With the XSLT file opened in Oxygen XML Editor plugin, select the ➕ Configure Validation Scenario(s) from the XML menu, or the toolbar, or from the Validate submenu when invoking the contextual menu on the XSLT file in the Navigator view (page 250).
   The Configure Validation Scenario(s) dialog box is displayed. It contains the existing scenarios, organized in categories depending on the type of file they apply to. You can use the options in the Settings drop-down menu to filter which scenarios are shown.

2. To edit an existing scenario, select the scenario and press the Edit button. If you try to edit one of the read-only built-in scenarios, Oxygen XML Editor plugin creates a customizable duplicate (you can also use the Duplicate button).
3. To add a new scenario, press the + New button.
   The New scenarios dialog box is displayed. It lists all validation units of the scenario.

   **Figure 357: Add / Edit a Validation Unit**

4. Configure the following information in this dialog box:
   a. **Name** - The name of the validation scenario.
   b. **URL of the file to validate** - In most cases, leave this field as the default selection (the URL of the current file). If you want to specify a different URL, click its cell and enter the URL in the text field, select it from the drop-down list, or use the ➔ • Browse drop-down menu or ➔. Insert Editor Variable (page 201) button.
   c. **File type** - The file type should be XSLT Document.
   d. **Validation engine** - Click the cell to select a validation engine. You must select an engine to be able to add or edit extensions.
   e. **Automatic validation** - If this option is selected, the validation operation defined by this row is also used by the automatic validation feature (page 856).

5. To add or edit extensions, click the ‹ Edit extensions button. This button is only available if the File type is set as XSLT Document and a Validation engine is chosen.
   The Libraries dialog box is opened. It is used to specify the JARS and classes that contain extension functions called from the XSLT file of the current validation scenario. They will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item and press the ↑ Move up or ↓ Move down buttons.

6. Press OK to close the New scenario dialog box.
   The newly created validation scenario is now included in the list of scenarios in the Configure Validation Scenario(s) dialog box. You can select the scenario in this dialog box to associate
it with the current XSLT document and press the **Apply associated** button to run the validation scenario.

Validating XSLT Stylesheets with Custom Engines

If you need to validate an XSLT stylesheet with a validation engine that is different from the built-in engine, you can configure external engines as custom XSLT validation engines in the Oxygen XML Editor plugin preferences. After a custom validation engine is properly configured, it can be applied on the current document by selecting it from the list of custom validation engines in the Validation toolbar drop-down menu. The document is validated against the schema declared in the document.

By default, there are two validators that are configured for XSLT stylesheets:

- **MSXML 4.0** - included in Oxygen XML Editor plugin (Windows edition). It is associated to the XSL Editor type in Preferences page. *(page 106)*
- **MSXML.NET** - included in Oxygen XML Editor plugin (Windows edition). It is associated to the XSL Editor type in Preferences page. *(page 106)*

Validating XSLT Stylesheets that Call Java Extensions

It is possible to validate XSLT that call Java extensions. This is achieved through a transformation scenario in which the Java extensions are specified, and the default validation will be processed using the parameters defined in the transformation scenario.

To validate XSLT with Java extensions, follow this procedure:

1. Create an XSLT transformation scenario *(page 1463)* for your XSLT document (select **Configure Transformation Scenario(s)** action from the toolbar, then click **New**, and select XSLT transformation).
2. In the **New scenario** dialog box, click the **Extensions** button (in the XSLT tab), specify the Java extensions (JAR libraries) that are needed, and click **OK**.
3. Once you are finished configuring the transformation scenario, click **OK**, then select **Save and close**.
4. Use the **Validate** button on the toolbar (or **Alt + Shift + V, V**) and the default validation will detect and use the transformation scenario profile you just configured and saved.

XSLT Quick Fix Support

The Oxygen XML Editor plugin Quick Fix support (page 2710) helps you resolve various errors that appear in a stylesheet by proposing Quick Fixes to problems such as missing templates, misspelled template names, missing functions, or references to an undeclared variable or parameter.

To activate this feature, hover over or place the cursor in the highlighted area of text where a validation error or warning occurs. If a Quick Fix is available for that particular error or warning, you can access the Quick Fix proposals with any of the following methods:

• When hovering over the error or warning, the proposals are presented in a tooltip pop-up window.
• If you place the cursor in the highlighted area where a validation error or warning occurs, a Quick Fix icon (🔍) is displayed in the stripe on the left side of the editor. If you click this icon, Oxygen XML Editor plugin displays the list of available fixes.
• With the cursor placed in the highlighted area of the error or warning, you can also invoke the Quick Fix menu by pressing Ctrl + 1 (Command + 1 on OS X) on your keyboard.

Note: The Quick Fixes are available only when validating an XSLT file with Saxon HE/PE/EE.

Figure 358: Example of an Undefined XSLT Functions Quick Fix

Figure 359: Example of an Undeclared XSLT Variables/Parameters Quick Fix

Oxygen XML Editor plugin provides XSLT Quick Fixes for the following types of instances:
• **Template does not exist**, when the template name referenced in a `call-template` element does not exist. The following fixes are available:
  - **Create template “TemplateName”** - creates a template and generates its corresponding parameters. The template name and parameter names and types are collected from the `call-template` element.
  - **Change reference to “newTemplateName”** - changes the name of the missing template referenced in the `call-template` element. The proposed new names are the existing templates with names similar with the missing one.

• **Variable/Parameter not declared**, when a parameter or variable reference cannot be found. The following fixes are available:
  - **Create global variable “varName”** - creates a global variable with the specified name in the current stylesheet. The new variable is added at the beginning of the stylesheet after the last global variable or parameter declaration.
  - **Create global parameter “paramName”** - creates a global parameter with the specified name in the current stylesheet. The new parameter is added at the beginning of the stylesheet after the last global parameter or variable declaration.
  - **Create local variable “varName”** - creates a local variable with the specified name before the current element.
  - **Create template parameter “paramName”** - creates a new parameter with the specified name in the current template. This fix is available if the error is located inside a template.
  - **Create function parameter “paramName”** - creates a new parameter with the specified name in the current function. This fix is available if the error is located inside a function.
  - **Change reference to “varName”** - changes the name of the referenced variable/parameter to an existing local or global variable/parameter, that has a similar name with the current one.

• **Parameter from a called template is not declared**, when a parameter referenced from a `call-template` element is not declared. The following fixes are available:
  - **Create parameter “paramName” in the template “templateName”** - creates a new parameter with the specified name in the referenced template.
  - **Change ”paramName” parameter reference to ”newParamName”** - changes the parameter reference from the `call-template` element to a parameter that is declared in the called template.
  - **Remove parameter ”paramName” from call-template** - removes the parameter with the specified name from the `call-template` element.

• **No value supplied for required parameter**, when a required parameter from a template is not referenced in a `call-template` element. The **Add parameter ”paramName” in call-template** quick-fix is available. It creates a new parameter with the specified name in call-template element.

• **Function “prefix:functionName()” has not been defined**, when a function declaration is not found. The following **Quick Fixes** are available:
• Create function "prefix:functionName(param1, param2)" - creates a new function with the specified signature, after the current top level element from stylesheet.

• Change function to "newFunctionName(..)" - changes the referenced function name to an already defined function. The proposed names are collected from functions with similar names and the same number of parameters.

• Attribute-set "attrSetName" does not exist, when the referenced attribute set does not exist. The following Quick Fixes are available:
  ◦ Create attribute-set "attrSetName" - creates a new attribute set with the specified name, after the current top level element from stylesheet.
  ◦ Change reference to "attrSetName" - changes the referenced attribute set to an already defined one.

• Character-map "chacterMap" has not been defined, when the referenced character map declaration is not found. The following Quick Fixes are available:
  ◦ Create character-map "characterMapName" - creates a new character map with the specified name, after the current top level element from stylesheet.
  ◦ Change reference to "characterMapName" - changes the referenced character map to an already defined one.

Content Completion in XSLT Stylesheets

The list of proposals offered by the Content Completion Assistant (page 2704) in XSLT are context-sensitive and includes proposals that are valid at the current cursor position. It can be manually activated with the Ctrl + Space (Command + Space on OS X) shortcut.

You can enhance the list of proposals by specifying an additional schema. This schema is defined in the Content Completion / XSLT preferences (page 105) page and can be any of the following: XML Schema, DTD, RELAX NG schema, or NVDL schema.

Figure 360: XSLT Content Completion Assistant
The feature is activated in **Text** mode in the following situations:

- After you press the `<` character when inserting an element, it is automatically activated after a short delay. You can adjust the activation delay with the **Activation delay of the proposals window (ms)** option (page 102) from the **Content Completion** preferences page.
- After typing a partial element or attribute name, you can manually activate it by pressing **Ctrl + Space** (**Command + Space** on **OS X**) or **Alt + ForwardSlash** (**Command + Alt + ForwardSlash** on **OS X**). If there is only one valid proposal at the current location, it is inserted without displaying the list of proposals.

The **Content Completion Assistant** proposes numerous item types (such as templates, variables, parameters, keys, etc.) that are defined in the current stylesheet, and in the imported and included XSLT stylesheets. The **Content Completion Assistant** also includes **code templates** that can be used to quickly insert code fragments (page 639) into stylesheets.

**Note:** For XSL and XSD resources, the **Content Completion Assistant** collects its components starting from the **master files** (page 2708). The **master files** can be defined in the project or in the associated validation scenario. For further details about the **Master Files** support go to **Defining Master Files at Project Level** (page 581).

The extension functions included in the Saxon 6.5.5 and 9.8.0.12 transformation engines are presented in the content completion list only if the Saxon namespace (**http://saxon.sf.net** for XSLT version 2.0 / 3.0 or **http://icl.com/saxon** for XSLT version 1.0) is declared and one of the following conditions is true:

- The edited file has a transformation scenario that uses as transformation engine Saxon 6.5.5 (for XSLT version 1.0), Saxon 9.8.0.12 PE or Saxon 9.8.0.12 EE (for XSLT version 2.0 / 3.0).
- The edited file has a validation scenario that uses as validation engine Saxon 6.5.5 (for version 1.0), Saxon 9.8.0.12 PE or Saxon 9.8.0.12 EE (for version 2.0 / 3.0).
- The validation engine specified in **Options** (page 188) page is Saxon 6.5.5 (for version 1.0), Saxon 9.8.0.12 PE or Saxon 9.8.0.12 EE (for version 2.0 / 3.0).

Additionally, the Saxon-CE-specific extension functions and instructions are presented in the list of content completion assistance proposals only if the **http://saxonica.com/ns/interactiveXSLT** namespace is declared.

Namespace prefixes in the scope of the current context are presented at the top of the content completion assistance window to speed up the insertion into the document of prefixed elements.

*Figure 361: Namespace Prefixes in the Content Completion Assistant*
For the common namespaces such as XSL namespace (http://www.w3.org/1999/XSL/Transform), XML Schema namespace (http://www.w3.org/2001/XMLSchema), or Saxon namespace (http://icl.com/saxon for version 1.0, http://saxon.sf.net/ for version 2.0 / 3.0), Oxygen XML Editor plugin provides an easy mode to declare them by proposing a prefix for these namespaces.

Content Completion in XPath Expressions

In XSLT stylesheets, the **Content Completion Assistant (page 2704)** provides all the features available in the XML editor (page 627) and also adds some enhancements. In XPath expressions used in attributes of XSLT stylesheets (elements such as `match`, `select`, and `test`), the **Content Completion Assistant** offers the names of XPath and XSLT functions, XSLT axes, and user-defined functions (the name of the function and its parameters). If a transformation scenario was defined and associated to the edited stylesheet, the **Content Completion Assistant** computes and presents elements and attributes based on:

- The input XML document selected in the scenario.
- The current context in the stylesheet.

The associated document is displayed in the **XSLT/XQuery Input view (page 976)**.

Content completion for XPath expressions is started:

- On XPath operators detected in one of the `match`, `select` and `test` attributes of XSLT elements: `*`, `*`, `/`, `//`, `{`, `|`, `::`, `$`
- For attribute value templates of non-XSLT elements, that is the `{` character when detected as the first character of the attribute value.
- On request, if the combination **Ctrl + Space (Command + Space on OS X)** is pressed inside an edited XPath expression.

The proposals presented in the **Content Completion Assistant** are dependent on:
• The context of the current XSLT element.
• The XML document associated with the edited stylesheet in the stylesheet transformation scenario.
• The XSLT version of the stylesheet (1.0, 2.0, or 3.0).

Note: The XSLT 3.0 content completion list of proposals includes specific elements and attributes for the 3.0 version.

For example, if the document associated with the edited stylesheet is:

```xml
<personnel>
  <person id="Big.Boss">
    <name>
      <family>Boss</family>
      <given>Big</given>
    </name>
    <email>chief@oxygenxml.com</email>
    <link subordinates="one.worker"/>
  </person>
  <person id="one.worker">
    <name>
      <family>Worker</family>
      <given>One</given>
    </name>
    <email>one@oxygenxml.com</email>
    <link manager="Big.Boss"/>
  </person>
</personnel>
```

If you enter an `xsl:template` element using the Content Completion Assistant, the following actions are triggered:

• The `match` attribute is inserted automatically.
• The cursor is placed between the quotes.
• The XPath Content Completion Assistant automatically displays a pop-up window with all the XSLT axes, XPath functions and elements and attributes from the XML input document that can be inserted in the current context.

The set of XPath functions depends on the XSLT version declared in the root element `xsl:stylesheet`: 1.0, 2.0, or 3.0.
If the cursor is inside the `select` attribute of an `xsl:for-each`, `xsl:apply-templates`, `xsl:value-of` or `xsl:copy-of` element the content completion proposals depend on the path obtained by concatenating the XPath expressions of the parent XSLT elements `xsl:template` and `xsl:for-each` as shown in the following figure:

![Content Completion in the `select` Attribute](image)

Also XPath expressions typed in the `test` attribute of an `xsl:if` or `xsl:when` element benefit of the assistance of the content completion.

![Content Completion in the `test` Attribute](image)
XSLT variable references are easier to insert in XPath expressions with the help of the content completion pop-up triggered by the $ character, which signals the start of such a reference in an XPath expression.

Figure 365: Content Completion in the test Attribute

If the { character is the first one in the value of the attribute, the same Content Completion Assistant is available also in attribute value templates of non-XSLT elements.

Figure 366: Content Completion in Attribute Value Templates
The time delay (configured in the Content Completion preferences page (page 102)) for all content completion assistance windows is also applied for the content completion in XPath expressions.

**Tooltip Helper for the XPath Functions Arguments**

When editing the arguments of an XPath/XSLT function, Oxygen XML Editor plugin tracks the current entered argument by displaying a tooltip containing the function signature. The currently edited argument is highlighted with a bolder font.

When moving the cursor through the expression, the tooltip is updated to reflect the argument found at the cursor position.

**Examples:**

If you want to concatenate the absolute values of two variables, named \( v1 \) and \( v2 \):

```
<xsl:template match="/">
  <xsl:value-of select="concat(abs($v1), abs($v2))"></xsl:value-of>
</xsl:template>
```

When moving the cursor before the first \( abs \) function, Oxygen XML Editor plugin identifies it as the first argument of the \( concat \) function. The tooltip shows in bold font the following information about the first argument:

- Its name is \$arg1\.
- Its type is \texttt{xdt:anyAtomicType}\.
- It is optional (note the \?\ sign after the argument type).

The function also takes other arguments that have the same type and returns a \texttt{xs:string}\.

**Figure 367: XPath Tooltip Helper - Identify the \texttt{concat} Function’s First Argument**

Moving the cursor on the first variable \( v1 \), the editor identifies the \( abs \) as context function and shows its signature:
Further, clicking the second \texttt{abs} function name, the editor detects that it represents the second argument of the \texttt{concat} function. The tooltip is repainted to display the second argument in bold font.

\textbf{Note:} The tooltip helper is also available in the \textit{XPath Builder} view (page 1902).

\section*{Syntax Highlighting in XSLT}

Oxygen XML Editor plugin supports syntax highlighting in \textit{Text} mode to make it easier to read the semantics of the structured content by displaying each type of code in different colors and fonts.

To customize the colors or styles used for the syntax highlighting colors for XSLT files, follow these steps:

1. Open the \textit{Preferences} dialog box (page 55).
2. Go to Editor > Syntax Highlight (page 149).
3. Select and expand the XML section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.
5. Select the \textit{XSL} tab in the \textit{Preview} pane to see the effects of your changes.

\textbf{Tip:} Oxygen XML Editor plugin also allows you to specify syntax highlighting colors for specific XML elements and attributes with specific namespace prefixes. This can be done in the Editor > Syntax Highlight > Elements/Attributes by Prefix preferences page (page 150).
XSLT Outline View

The **Outline** view for XSLT stylesheets displays the list of all the components (templates, attribute-sets, character-maps, variables, functions, keys, outputs) from both the edited stylesheet and its imports or includes. For XSL and XSD resources, the **Outline** view collects its components starting from the master files (page 2708). The master files can be defined in the project or in the associated validation scenario. For further details about the Master Files support go to Defining Master Files at Project Level (page 581).

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

**Figure 370: XSLT Outline View**

The following actions are available in the **View Menu** on the **Outline** view action bar:

- **Filter returns exact matches**
  
  The text filter of the **Outline** view returns only exact matches;

- **Selection update on cursor move**
  
  Controls the synchronization between **Outline** view and source document. The selection in the **Outline** view can be synchronized with the cursor moves or the changes in the
XSLT editor. Selecting one of the components from the Outline view also selects the corresponding item in the source document.

When the Show components option is selected, the following actions are available:

- **Show XML structure**
  Displays the XML document structure in a tree-like structure.

- **Show all components**
  Displays all components that were collected starting from the master file (page 2708). This option is set by default.

- **Show only local components**
  Displays the components defined in the current file only.

- **Group by location/type**
  The stylesheet components can be grouped by location and type.

When the Show XML structure option is selected, the following actions are available:

- **Show components**
  Switches the Outline view to the components display mode.

- **Flat presentation mode of the filtered results**
  When active, the application flattens the filtered result elements to a single level.

- **Show comments and processing instructions**
  Show/hide comments and processing instructions in the Outline view.

- **Show element name**
  Show/hide element name.

- **Show text**
  Show/hide additional text content for the displayed elements.

- **Show attributes**
  Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from the Outline preferences panel (page 197).

- **Configure displayed attributes**
  Displays the XML Structured Outline preferences page (page 197).

The following contextual menu actions are also available when the Show components option is selected in the View menu:
Edit Attributes

Opens a small in-place editor that allow you to edit the attributes of the selected node.

Cut

Cuts the currently selected node.

Copy

Copies the currently selected node.

Delete

Deletes the currently selected node.

Search References Ctrl + Shift + R (Command + Shift + R on OS X)

Searches all references of the item found at current cursor position in the defined scope, if any. See Finding XSLT References and Declarations (page 985) for more details.

Search References in

Searches all references of the item found at current cursor position in the specified scope. See Finding XSLT References and Declarations (page 985) for more details.

Component Dependencies

Opens the Component Dependencies view (page 983) that allows you to see the dependencies for the current selected component.

Resource Hierarchy

Opens the Resource Hierarchy/Dependencies view (page 980) that displays the hierarchy for the currently selected resource.

Resource Dependencies

Opens the Resource Hierarchy/Dependencies view (page 980) that displays the dependencies of the currently selected resource.

Rename Component in

Renames the selected component. See XSLT Refactoring Actions (page 989) for more details.

The following contextual menu actions are available in the Outline view when the Show XML structure option is selected in the View menu:

Append Child

Displays a list of elements that you can insert as children of the current element.

Insert Before
Displays a list of elements that you can insert as siblings of the current element, before the current element.

**Insert After**
Displays a list of elements that you can insert as siblings of the current element, after the current element.

*Edit Attributes*
Open a small in-place editor that allows you to edit the attributes of the selected node.

**Toggle Comment**
Comments/uncomments the currently selected element.

**Search references**
Searches for the references of the currently selected component.

**Search references in**
Searches for the references of the currently selected component in the context of a scope that you define.

**Component dependencies**
Open the Component Dependencies view (page 983) that displays the dependencies of the currently selected component.

**Rename Component in**
Renames the currently selected component in the context of a scope that you define.

**Cut**
Cuts the currently selected component.

**Copy**
Copies the currently selected component.

**Delete**
Deletes the currently selected component.

**Expand All**
Expands the structure of a component in the Outline view.

**Collapse All**
Collapses the structure of all the component in the Outline view.

The stylesheet components information is presented on two columns: the first column presents the name and match attributes, the second column the mode attribute. If you know the component
name, match or mode, you can search it in the Outline view by typing one of these pieces of information in the filter text field from the top of the view or directly on the tree structure. When you type the component name, match or mode in the text field, you can switch to the tree structure using:

- Keyboard arrow keys
- Enter key
- Tab key
- Shift-Tab key combination

To switch from tree structure to the filter text field, you can use Tab and Shift-Tab.

Tip: The search filter is case insensitive. The following wildcards are accepted:

- * - any string
- ? - any character
- , - patterns separator

If no wildcards are specified, the string to search is used as a partial match.

The content of the Outline view and the editing area are synchronized. When you select a component in the Outline view, its definition is highlighted in the editing area.

Oxygen XML Editor plugin allows you to sort the components of the tree in the Outline view.

Note: Sorting groups in the Outline view is not supported.

Oxygen XML Editor plugin has a predefined order of the groups in the Outline view:

- For location, the names of the files are sorted alphabetically. The file you are editing is located at the top of the list.
- For type, the order is: parameters, variables, templates, functions, set attributes, character-map.

Note: When no grouping is available and the table is not sorted, Oxygen XML Editor plugin sorts the components depending on their order in the document. Oxygen XML Editor plugin also takes into account the name of the file that the components are part of.

XSLT/XQuery Input View

The structure of the XML document associated to the edited XSLT stylesheet, or the structure of the source documents of the edited XQuery is displayed in a tree form in a view called the XSLT/XQuery Input view. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu. The tree nodes represent the elements of the documents.
XSLT

If you click a node in the XSLT/XQuery Input view, the corresponding template from the stylesheet is highlighted. A node can be dragged from this view and dropped in the editor area for quickly inserting xsl:template, xsl:for-each, or other XSLT elements that have the match, select, or test attribute already completed. The value of the attribute is the correct XPath expression that refers to the dragged tree node. This value is based on the current editing context of the drop spot.

Figure 371: XSLT Input View

XSLT Example:

For the following XML document:

```xml
<personnel>
  <person id="Big.Boss"/>
  <name>
    <family>Boss</family>
    <given>Big</given>
  </name>
  <email>chief@oxygenxml.com</email>
  <link subordinates="one.worker"/>
  <person id="one.worker"> 
    <name>
        <family>Worker</family>
        <given>One</given>
    </name>
    <email>one@oxygenxml.com</email>
    <link manager="Big.Boss"/>
  </person>
</personnel>
```
and the following XSLT stylesheet:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    version="2.0">  
  <xsl:template match="personnel">  
    <xsl:for-each select="*"> 
    </xsl:for-each>  
  </xsl:template>  
</xsl:stylesheet>
```

if you drag the `given` element and drop it inside the `xsl:for-each` element, the following pop-up menu is displayed:

**Figure 372: XSLT Input Drag and Drop Pop-up Menu**

![XSLT Input Drag and Drop Pop-up Menu](image)

If you select **Insert xsl:copy-of** (for example), the resulting document will look like this:

**Figure 373: XSLT Input Drag and Drop Result**

```xml
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform" version="2.0">  
  <xsl:template match="personnel">  
    <xsl:for-each select="*">  
      <xsl:copy-of select="name/given"/>  
    </xsl:for-each>  
  </xsl:template>  
</xsl:stylesheet>
```

**XQuery**

You can also use the **XSLT/XQuery Input** view to drag and drop a node into the editing area to quickly insert XQuery expressions.

**Figure 374: XQuery Input View**
**XQuery Example:**

For the following XML documents:

```xml
<movies>
  <movie id="1">
    <title>The Green Mile</title>
    <year>1999</year>
  </movie>
  <movie id="2">
    <title>Taxi Driver</title>
    <year>1976</year>
  </movie>
</movies>

<reviews>
  <review id="100" movie-id="1">
    <rating>5</rating>
    <comment>It is made after a great Stephen King book.</comment>
    <author>Paul</author>
  </review>
  <review id="101" movie-id="1">
    <rating>3</rating>
    <comment>Tom Hanks does a really nice acting.</comment>
    <author>Beatrice</author>
  </review>
  <review id="104" movie-id="2">
    <rating>4</rating>
  </review>
</reviews>
```
and the following XQuery:

```
let $review := doc("reviews.xml")
for $movie in doc("movies.xml")/movies/movie
let $movie-id := $movie/@id
return
<movie id="{$movie/@id}">
{$movie/title}
{$movie/year}
<maxRating>
{
}
</maxRating>
</movie>
```

If you drag the `review` element and drop it between the braces, the following pop-up menu is displayed:

**Figure 375: XQuery Input Drag and Drop Pop-up Menu**

```
select FLWOR review, the resulting document will look like this:

**Figure 376: XQuery Input Drag and Drop Result**

```
XSLT Resource Hierarchy/Dependencies View
The Resource Hierarchy/Dependencies view allows you to see the hierarchy/dependencies for a stylesheet. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

If you want to see the hierarchy of a stylesheet, select the desired stylesheet in the Navigator view (page 250) and choose Resource Hierarchy from the contextual menu.

**Figure 377: Resource Hierarchy/Dependencies View - Hierarchy for docbook.xsl**

If you want to see the dependencies of a stylesheet, select the desired stylesheet in the Navigator view (page 250) and choose Resource Dependencies from the contextual menu.

**Figure 378: Resource Hierarchy/Dependencies View - Dependencies for common.xsl**

The following actions are available in the Resource Hierarchy/Dependencies view:

- Refresh
Refreshes the Hierarchy/Dependencies structure.

- **Stop**
  Stops the hierarchy/dependencies computing.

- **Show Hierarchy**
  Allows you to choose a resource to compute the hierarchy structure.

- **Show Dependencies**
  Allows you to choose a resource to compute the dependencies structure.

- **Configure**
  Allows you to configure a scope to compute the dependencies structure. There is also an option for automatically using the defined scope for future operations.

- **History**
  Provides access to the list of previously computed dependencies. Use the **Clear history** button to remove all items from this list.

The contextual menu contains the following actions:

- **Open**
  Opens the resource. You can also double-click a resource in the Hierarchy/Dependencies structure to open it.

- **Copy location**
  Copies the location of the resource.

- **Move resource**
  Moves the selected resource.

- **Rename resource**
  Renames the selected resource.

- **Show Resource Hierarchy**
  Shows the hierarchy for the selected resource.

- **Show Resource Dependencies**
  Shows the dependencies for the selected resource.

- **Add to Master Files**
  Adds the currently selected resource in the **Master Files** directory (page 581).

- **Expand All**
Expands all the children of the selected resource from the Hierarchy/Dependencies structure.

**Collapse All**

Collapses all children of the selected resource from the Hierarchy/Dependencies structure.

**Tip:** When a recursive reference is encountered in the Hierarchy view, the reference is marked with a special icon.

### Moving/Renaming XSLT Resources

You can move and rename a resource presented in the Resource/Hierarchy Dependencies view, using the Rename resource and Move resource refactoring actions from the contextual menu.

When you select the Rename action in the contextual menu of the Resource/Hierarchy Dependencies view, the Rename resource dialog box is displayed. The following fields are available:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references** - Select this option to update the references to the resource you are renaming.

When you select the Move action from the contextual menu of the Resource/Hierarchy Dependencies view, the Move resource dialog box is displayed. The following fields are available:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - Select this option to update the references to the resource you are moving, in accordance with the new location and name.

If the Update references of the moved resource(s) option is selected, a Preview option (which opens the Preview dialog box) is available for both actions. The Preview dialog box presents a list with the resources that are updated.

### XSLT Component Dependencies View
The **Component Dependencies** view allows you to see the dependencies for a selected component. This is helpful if you want to see where components are used in the entire hierarchy. For example, if you want to find all the references where a given component is used.

If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

To see the dependencies of an XSLT component:

1. Right-click the desired component in the editor or **Outline** view.
2. Select the **Component Dependencies** action from the contextual menu.

The action is available for all named components (templates, variables, parameters, attribute sets, keys, functions, outputs).

If a component contains multiple references, a small table is displayed at the bottom of the view that contains all the references. When a recursive reference is encountered, it is marked with a special icon.

![Component Dependencies View - Hierarchy for table.xsl](image)

*Figure 379: Component Dependencies View - Hierarchy for table.xsl*

The **Component Dependencies** view includes the following toolbar actions:

- **Refresh**
  
  Refreshes the dependencies structure.

- **Stop**
  
  Stops the dependency computation.
Configure

Allows you to choose the search scope for computing the dependencies structure. This is helpful for making sure all imported/included resources are computed.

History

Allows you to select from a list of the most recently used dependency computations.

In addition, the following actions are available in the contextual menu:

Go to First Reference

Selects the first reference of the currently selected component in the dependencies tree.

Go to Component

Shows the definition of the currently selected component in the dependencies tree.

Highlight Component Occurrences

When a component (for example variable or named template) is found at current cursor position, Oxygen XML Editor plugin performs a search over the entire document to find the component declaration and all its references. When found, they are highlighted both in the document and in the stripe bar, at the right side of the document.

Note: Oxygen XML Editor plugin also supports occurrences highlight for template modes.

Customizable colors are used: one for the component definition and another one for component references. Occurrences are displayed until another component is selected and a new search is performed. All occurrences are removed when you start to edit the document.

This feature is enabled by default. To configure it, open the Preferences dialog box (page 55) and go to Editor > Mark Occurrences. A search can also be triggered with the Search > Search Occurrences in File (Ctrl + Shift + U (Command + Shift + U on OS X)) contextual menu action. Matches are displayed in separate tabs of the Results view (page 267).

Finding XSLT References and Declarations
The following search actions related with XSLT references and declarations are available from the Search submenu of the contextual menu:

- **Search References (Also available from the XSL menu)**
  Searches all references of the item found at current cursor position in the defined scope, if any. If a scope is defined but the currently edited resource is not part of the range of determined resources, a warning dialog box is displayed that allows you to define another search scope.

- **Search References in**
  Searches all references of the item found at current cursor position in the file or files that you specify when a scope is defined.

- **Search Declarations (Also available from the XSL menu)**
  Searches all declarations of the item found at current cursor position in the defined scope, if any. If a scope is defined but the current edited resource is not part of the range of resources determined by this scope, a warning dialog box is displayed that allows you to define another search scope.

- **Search Declarations in**
  Searches all declarations of the item found at current cursor position in the file or files that you specify when a scope is defined.

- **Search Occurrences in File**
  Searches all occurrences of the item at the cursor position in the currently edited file.

The following action is available from the XSL menu:

- **Go to Definition**
  Moves the cursor to the location of the definition of the current item.

  **Note:** You can also use the **Ctrl + Single-Click (Command + Single-Click on OS X)** shortcut on a reference to display its definition.

Related Information:

- Search and Refactor Operations Scope *(page 904)*
Oxygen XML Editor plugin offers built-in support for documenting XSLT stylesheets. If the expanded QName (page 2710) of the element has a non-null namespace URI, the `xsl:stylesheet` element may contain any element not from the XSLT namespace. Such elements are referenced as user-defined data elements. Such elements can contain the documentation for the stylesheet and its elements (top-level elements whose names are in the XSLT namespace). Oxygen XML Editor plugin offers its own XML schema that defines such documentation elements. The schema is named `stylesheet_documentation.xsd` and can be found in `[OXYGEN_INSTALL_DIR]/frameworks/stylesheet_documentation`. The user can also specify a custom schema in XSL Content Completion options (page 105).

**Content Completion**

When content completion is invoked inside an XSLT editor by pressing Ctrl + Space (Command + Space on OS X), it offers elements from the XSLT documentation schema (either the built-in one or one specified by user).

**Adding Documentation Blocks**

In Text mode, to add documentation blocks, press Ctrl + Alt + D (Command + Alt + D on OS X) or select **Add component documentation** from the contextual menu.

In Author mode, the following stylesheet documentation actions are available in the contextual menu, **Component Documentation** submenu:

- **Add component documentation** - Adds documentation blocks for the component at cursor position.
- **Paragraph** - Inserts a new documentation paragraph.
- **Bold** - Makes the selected documentation text bold.
- **Italic** - Makes the selected documentation text italic.
- **List** - Inserts a new list.
- **List Item** - Inserts a list item.

If the cursor is positioned inside the `xsl:stylesheet` element context, documentation blocks are generated for all XSLT elements. If the cursor is positioned inside a specific XSLT element (such as a template or function), a documentation block is generated for that element only.

**Example: Documentation Block Using Oxygen XML Editor plugin Built-in Schema**

```
<xd:doc>
<xd:desc>
<xd:p>Search inside parameter <xd:i>string</xd:i>
```
for the last occurrence of parameter
<xd:i>searched</xd:i>. The substring starting from the 0 position
to the identified last occurrence will be returned.

<xd:ref name="f:substring-after-last" type="function"
xmns:f="http://www.oxygenxml.com/doc/xsl/functions">See also</xd:ref>
</xd:p>
</xd:doc>

XSLT Documentation Links

Oxygen XML Editor plugin includes support for links inside XSLT documentation blocks. Using
a construct like <xd:a docid="user-defined-id">TEXT</xd:a> will cause the browser to scroll
to the particular anchor (the defined ID) in the current document. Using a construct like <xd:a>
will open the referenced link in a new tab.

Example: Documentation Links

<xd:doc xmlns:xd="http://www.oxygenxml.com/ns/doc/xsl" id="thisDoc">
  <xd:desc>
    <xd:p>
      <xd:ref name="test" type="variable">My test variable</xd:ref>
      <xd:a docid="thisDoc">Link to this documentation, see
the id="thisDoc" above</xd:a>
      <xd:a docid="otherDocID" href="included.xsl">Link to
otherDocID defined in included.xsl</xd:a>
    </xd:p>
  </xd:desc>
</xd:doc>

**XSLT 3.0 Text Value Templates**

Oxygen XML Editor plugin offers built-in support for XSLT 3.0 *Text Value Templates*, including content completion to present the variables and parameters from the current context and syntax highlighting.

A text node in the stylesheet is treated as a *text value template* if the following things are true:

- It is part of a *sequence constructor* or a child of an *<xsl:text>* instruction.
- There is an ancestor element with an *[xsl:]* expand-text attribute and on the innermost ancestor element that has such an attribute, the value of the attribute is *yes*.

**Example:**

```xml
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
xmlns:xs="http://www.w3.org/2001/XMLSchema"
expand-text="yes"
version="3.0">

  <xsl:param name="seq" as="xs:string*" select="'c', 'a', 'b', 'z'"/>

  <xsl:template name="main">
    {sort($seq)}
  </xsl:template>

</xsl:stylesheet>
```

For more information, see: *W3C XSLT Specifications: Text Value Templates*.

**XSLT Refactoring Actions**

Oxygen XML Editor plugin offers a set of actions that allow you to change the structure of an XSLT stylesheet without changing the results of running it in an XSLT transformation. Depending on the selected text, the following XSLT refactoring actions are available from the *Refactoring* submenu of the contextual menu:
**Extract template (Active only when the selection contains well-formed elements)**

Extracts the selected XSLT instructions sequence into a new template. It opens a dialog box that allows you to specify the name of the new template to be created. The possible changes to perform on the document can be previewed before altering the document. After pressing OK, the template is created and the selection is replaced with an `<xsl:call-template>` instruction referencing the newly created template.

† **Note**: The newly created template is indented and its name is highlighted in the `<xsl:call-template>` element.

**Extract function**

Extracts the selected XSLT instructions sequence into a new function. It opens a dialog box that allows you to specify the name of the new function. It then moves the selected lines to a newly created XSLT function and inserts a function call in the place of the selected lines. You can also use parts of an XPath expression to create the new functions.

**Create local variable**

Creates an XSLT variable, wrapped around the selection. It opens a dialog box that allows you to specify the name of the new variable. It then wraps the selection in the variable and you can reference it at anytime in the code.

**Move to another stylesheets (Active only when entire components are selected)**

Allows you to move one or more XSLT global components (templates, functions, or parameters) to another stylesheet. It opens a dialog box that allows you to specify where the selected components will be moved to. Follow these steps when using the dialog box:

1. Choose whether you want to move the selected components to a new stylesheet or an existing one.
2. If you choose to move the components to an existing one, select the destination stylesheet. Press the Choose button to select the destination stylesheet file. Oxygen XML Editor plugin will automatically check if the destination stylesheet is already contained by the hierarchy of the current stylesheet. If it is not contained, choose whether or not the destination stylesheet will be referenced (imported or included) from the current stylesheet. The following options are available:
   - **Include** - The current stylesheet will use an `xsl:include` instruction to reference the destination stylesheet.
   - **Import** - The current stylesheet will use an `xsl:import` instruction to reference the destination stylesheet.
• **None** - There will be created no relation between the current and destination stylesheets.

3. Press the **Move** button to move the components to the destination. The moved components are highlighted in the destination stylesheet.

**Convert attributes to xsl:attributes**

Converts the attributes from the selected element and represents each of them with an `<xsl:attribute>` instruction. For example, the following element:

```
<person id="Big{test}Boss"/>
```

is converted to:

```
<person>
  <xsl:attribute name="id">
    <xsl:text>Big</xsl:text>
    <xsl:value-of select="test"/>
    <xsl:text>Boss</xsl:text>
  </xsl:attribute>
</person>
```

**Convert xsl:attributes to attributes**

Converts `<xsl:attribute>` elements to inline attributes for elements outside the XSL namespace. For example, the following element: It is the reverse of the **Convert attributes to xsl:attributes** action with the following limitations:

- The `<xsl:attribute>` element is "text only".
- The `<xsl:attribute>` element has a single `<xsl:text>` child element.
- The `<xsl:attribute>` element has a single `<xsl:value-of>` child element. In this case, the value of the attribute will be the XPath expression from the `select` attribute surrounded by curly brackets (text value template).

```
<person>
  <xsl:attribute name="id">john.doe</xsl:attribute>
  <xsl:attribute name="email">john.doe@example.com</xsl:attribute>
  <xsl:attribute name="manager"><xsl:value-of select="person[@id='boss']/name"/></xsl:attribute>
</person>
```

is converted to:
<person id="john.doe" email="john.doe@example.com" manager="{person[@id='boss']/name}" />

**Convert `<xsl:if>` into `<xsl:choose>`/`<xsl:when>`**

Converts one or more `<xsl:if>` element blocks into one or more `<xsl:when>` blocks surrounded by an `<xsl:choose>` element. If it is invoked on a selection, the selection must contain a well-formed fragment. If there is no selection, the `<xsl:if>` element that surrounds the content at the current cursor position is converted.

For example, the following block:

```xml
<xsl:if test="a">
    <!-- XSLT code -->
</xsl:if>
```

is converted to:

```xml
<xsl:choose>
    <xsl:when test="a">
        <!-- XSLT code -->
    </xsl:when>
    <xsl:otherwise>
        |
    </xsl:otherwise>
</xsl:choose>
```

(where the `|` character is the current cursor position)

**Convert `<xsl:choose>`/`<xsl:when>` into `<xsl:if>`**

Converts each `<xsl:when>` block into an `<xsl:if>` block. For the `otherwise` branch, it also adds an `and` statement to each negated form of the conditions. For example, the following block:

```xml
<xsl:choose>
    <xsl:when test="c1">
        <!-- XSLT statement 1 -->
    </xsl:when>
    <xsl:when test="c2">
        <!-- XSLT statement 2 -->
    </xsl:when>
    <xsl:when test="c3">
        <!-- XSLT statement 3 -->
    </xsl:when>
</xsl:choose>
```
Extract local variable (Active on a selection made inside an attribute that contains an XPath expression)

Allows you to create a new local variable by extracting the selected XPath expression. After creating the new local variable before the current element, Oxygen XML Editor plugin allows you to edit the name of the variable.

Extract global variable (Active on a selection made inside an attribute that contains an XPath expression)

Allows you to create a new global variable by extracting the selected XPath expression. After creating the new global variable, Oxygen XML Editor plugin allows you to edit the name of the variable.

Note: Oxygen XML Editor plugin checks if the selected expression depends on local variables or parameters that are not available in the global context where the new variable is created.

Extract template parameter (Active on a selection made inside an attribute that contains an XPath expression)

Allows you to create a new template parameter by extracting the selected XPath expression. After creating the new parameter, Oxygen XML Editor plugin allows you to edit the name of the parameter.
• **Extract global parameter (Active on a selection made inside an attribute that contains an XPath expression)**

  Allows you to create a new global parameter by extracting the selected XPath expression. After creating the new parameter, Oxygen XML Editor plugin allows you to edit the name of the parameter.

  **Note:** Oxygen XML Editor plugin checks if the selected expression depends on local variables or parameters that are not available in the global context where the new parameter is created.

**Rename Component**

Allows you to rename the current component (in-place). The component and all its references in the document are highlighted with a thin border and the changes you make to the component at the cursor position are updated in real time to all occurrences of the component. To exit the in-place editing, press the Esc or Enter key on your keyboard.

**Rename Component in**

Opens a dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the Preview button, you can view the files to be affected by the action.

*Figure 380: Rename Identity Constraint Dialog Box*

**Note:** Many of these refactoring actions are also proposed by the Quick Assist support (page 995).

For more information about XSLT refactoring, watch our video demonstration:
XSLT Quick Assist Support

The Quick Assist support (page 2710) helps you to rapidly access search and refactoring actions. If one or more actions are available in the current context, they are accessible via a yellow bulb help (✓) placed at the current line in the stripe on the left side of the editor. Also, you can invoke the Quick Assist menu by using the Ctrl + 1 (Meta 1 on Mac OS X) keyboard shortcuts.

Two categories of actions are available in the Quick Assist menu:

- Actions available on a selection made inside an attribute that contains an XPath expression:

  - **Extract template**
    
    Extracts the selected XSLT instructions sequence into a new template.

  - **Move to another stylesheet**
    
    Allows you to move one or more XSLT global components (templates, functions, or parameters) to another stylesheet.

  - **Extract local variable**
    
    Allows you to create a new local variable by extracting the selected XPath expression.

  - **Extract global variable**
    
    Allows you to create a new global variable by extracting the selected XPath expression.

  - **Extract template parameter**
    
    Allows you to create a new template parameter by extracting the selected XPath expression.

  - **Extract global parameter**
    
    Allows you to create a new global parameter by extracting the selected XPath expression.

*Figure 381: XSLT Quick Assist Support - Refactoring Actions*
• Actions available when the cursor is positioned over the name of a component:

  Rename Component in
  
  Renames the component and all its dependencies.

  Search Declarations
  
  Searches the declaration of the component in a predefined scope. It is available only when the context represents a component name reference.

  Search References
  
  Searches all references of the component in a predefined scope.

  Component Dependencies
  
  Searches the component dependencies in a predefined scope.

  Change Scope
  
  Configures the scope that will be used for future search or refactor operations.

  Rename Component
  
  Allows you to rename the current component in-place.

  Search Occurrences
  
  Searches all occurrences of the component within the current file.

**Related Information:**
XSLT Unit Test (XSpec)

XSpec is a behavior driven development (BDD) framework for XSLT, XQuery, and Schematron. XSpec consists of syntax for describing the behavior of your XSLT, XQuery, or Schematron code, and some code that enables you to test your code against those descriptions.

**Creating an XSLT Unit Test**

To create an XSLT Unit Test, go to File > New > XSLT Unit Test. You can also create an XSLT Unit Test from the contextual menu of an XSL file in the Navigator view (page 250). Oxygen XML Editor plugin allows you to customize the XSpec document when you create it. In the customization dialog box, you can enter the path to an XSL document or to a master XSL document.

When you create an XSpec document based on an XSL document, Oxygen XML Editor plugin uses information from the validation and transformation scenarios associated with the XSL file. From the transformation scenario Oxygen XML Editor plugin uses extensions and properties of Saxon 9.8.0.12, improving the Ant scenario associated with the XSpec document.

*Figure 383: New XSLT Unit Test Wizard*
Running an XSLT Unit Test

To run a Unit Test, open the XSpec file in an editor and click **Apply Transformation Scenario(s)** on the main toolbar. This will run the built-in **Run XSpec Test** transformation scenario that is defined in the XSpec framework (page 2706).

Testing a Stylesheet

An XSpec file contains one or more test scenarios. You can test a stylesheet in one of the following ways:

- Test an entire stylesheet.

  Testing is performed in a certain context. You can define a context as follows:

  - Inline context, building the test based on a string.

  ```xml
  <x:scenario label="when processing a para element">
    <x:context>
      <para>...</para>
    </x:context>
  </x:scenario>
  ```
Based on an external file, or on a part of an external file extracted with an XPath expression.

```xml
<x:scenario label="when processing a para element">
  <x:context href="source/test.xml" select="/doc/body/p[1]" />
  ...
</x:scenario>
```

- **Test a function.**

```xml
<x:scenario label="when capitalising a string">
  <x:call function="eg:capital-case">
    <x:param select="'an example string'" />
    <x:param select="true()" />
  </x:call>
  ...
</x:scenario>
```

- **Test a template with a name.**

```xml
<x:scenario label="when creating a table">
  <x:call template="createTable">
    <x:param name="nodes">
      <value>A</value>
      <value>B</value>
    </x:param>
    <x:param name="cols" select="2" />
  </x:call>
</x:scenario>
```

You can reference test files between each other, which allows you to define a suite of tests. For further details about test scenarios, go to [https://github.com/expath/xspec/wiki/Writing-Scenarios](https://github.com/expath/xspec/wiki/Writing-Scenarios).

**Adding a Catalog to an XSpec Transformation**

If your XSLT needs a catalog, you can add one to the XSpec transformation by doing one of the following:

- If you are using a project ([page 571](#)) in Oxygen XML Editor plugin, create a `catalog.xml` file in the project directory. This catalog will then be loaded automatically.
• Edit (page 1498) the Run XSpec Test transformation scenario, go to the Parameters tab (page 1461), and set the value of the catalog parameter to the location of your catalog file.

Generating Documentation for an XSLT Stylesheet

You can use Oxygen XML Editor plugin to generate detailed documentation in HTML format for the elements (top-level elements whose names are in the XSLT namespace) of an XSLT stylesheet. You can select what XSLT elements to include in the generated documentation and also the level of details to present for each of them. The elements are hyperlinked. To generate documentation in a custom output format (page 1006), you can edit the XSLT stylesheet used to generate the documentation, or create your own stylesheet.

To open the XSLT Stylesheet Documentation dialog box, select XSLT Stylesheet Documentation from the XML Tools > Generate Documentation menu or from the Generate Stylesheet Documentation action from the contextual menu of the Navigator view (page 250).

![XSLT Stylesheet Documentation Dialog Box](image)

The XSL URL field of the dialog box must contain the full path to the XSL Stylesheet file you want to generate documentation for. The stylesheet may be a local or a remote file. You can specify the path to the stylesheet by entering it in the text field, or by using the Insert Editor Variables button or the options in the Browse drop-down menu.

**Output Tab**

The following options are available in the Output tab:
• **Format** - Allows you to choose between the following formats:
  ◦ **HTML** - The documentation is generated in HTML output format *(page 1003)*.
  ◦ **Custom** - The documentation is generated in a custom output format *(page 1006)*, allowing you to control the output. Click the **Options** button to open a **Custom format options dialog box** *(page 1007)* where you can specify a custom stylesheet for creating the output. There is also an option to **Copy additional resources to the output folder** and you can select the path to the additional **Resources** that you want to copy. You can also choose to keep the intermediate XML files created during the documentation process by deselecting the **Delete intermediate XML file** option.

• **Output file** - You can specify the path of the output file by entering it in the text field, or by using the **Insert Editor Variables** button or the options in the **Browse** drop-down menu.

• **Split output into multiple files** - Instructs the application to split the output into multiple files. For large XSLT stylesheets, choosing another split criterion may generate smaller output files, providing faster documentation browsing. You can choose to split them by namespace, location, or component name.

• **Open in Browser/System Application** - Opens the result in the system application associated with the output file type.

**Note:** To set the browser or system application that will be used, go to **Window > Preferences > General > Web Browser** and specify it there. This will take precedence over the default system application settings.

### Settings Tab

When you generate documentation for an XSLT stylesheet you can choose what XSLT elements to include in the output (templates, functions, global parameters, global variables, attribute sets, character maps, keys, decimal formats, output formats, XSLT elements from referenced stylesheets) and the details to include in the documentation.

*Figure 385: Settings Tab of the XSLT Stylesheet Documentation Dialog Box*
The Settings tab allows you to choose whether or not to include the following components: Templates, Functions, Global parameters, Global variables, Attribute sets, Character maps, Keys, Decimal formats, Output formats, Referenced stylesheets.

You can choose whether or not to include the following other details:

- **Documentation** - Shows the documentation for each XSLT element. For HTML format, the user-defined data elements that are recognized and transformed in documentation blocks of the XSLT elements they precede, are the ones from the following schemas:
  - Oxygen XML Editor plugin built-in XSLT documentation schema.
  - A subset of DocBook 5 elements. The recognized elements are: section, sect1 to sect5, emphasis, title, ulink, programlisting, para, orderedlist, itemizedlist.
  - A subset of DITA elements. The recognized elements are: concept, topic, task, codeblock, p, b, i, ul, ol, pre, sl, sli, step, steps, li, title, xref.
  - Full XHTML 1.0 support.
  - XSLStyle documentation environment. XSLStyle uses DocBook or DITA languages inside its own user-defined data elements. The supported DocBook and DITA elements are the ones mentioned above.
  - DOXSL documentation framework (page 2706). Supported elements are: codefrag, description, para, docContent, documentation, parameter, function, docSchema, link, list, listitem, module, parameter, template, attribute-set;

Other XSLT documentation blocks that are not recognized will just be serialized inside an HTML pre element. You can change this behavior by using a custom format (page 1006) instead of the built-in HTML format (page 1003) and providing your own XSLT stylesheets.

- **Use comments** - Controls whether or not the comments that precede an XSLT element is treated as documentation for the element they precede. Comments that precede or succeed
the xsl:stylesheet element, are treated as documentation for the whole stylesheet. Note that comments that precede an import or include directive are not collected as documentation for the imported/included module. Also, comments from within the body of the XSLT elements are not collected at all.

- **Namespace** - Shows the namespace for named XSLT elements.
- **Location** - Shows the stylesheet location for each XSLT element.
- **Parameters** - Shows parameters of templates and functions.
- **References** - Shows the named XSLT elements that are referenced from within an element.
- **Used by** - Shows the list of all the XSLT elements that reference the current named element.
- **Supersedes** - Shows the list of all the XSLT elements that supersede the current element.
- **Overriding** - Shows the list of all the XSLT elements that override the current element.
- **Return type** - Shows the return type of the function.
- **Source** - Shows the text stylesheet source for each XSLT element.
- **Import precedence** - Shows the computed import precedence as declared in the XSL transformation specifications.
- **Generate index** - Creates an index with all the XSLT elements included in the documentation.

**Export settings** - Save the current settings in a settings file for further use (for example, with the exported settings file you can generate the same documentation from the command-line interface (page 1007).)

**Import settings** - Reloads the settings from the exported file.

**Generate** - Use this button to generate the XSLT documentation.

Generate XSLT Documentation in HTML Format

When using the XSLT Stylesheet Documentation dialog box (page 1000) to generate XSLT documentation in HTML format, it is presented in a visual diagram style with various sections, hyperlinks, and options.

*Figure 386: XSLT Stylesheet Documentation Example*
The generated documentation includes the following:

- **Table of Contents** - You can group the contents by namespace, location, or component type. The XSLT elements from each group are sorted alphabetically (named templates are presented first and the match ones second).
- **Information about main, imported, and included stylesheets.** This information consists of:
  - XSLT modules included or imported by the current stylesheet.
  - The XSLT stylesheets where the current stylesheet is imported or included.
  - The stylesheet location.

*Figure 387: Information About an XSLT Stylesheet*
If you choose to split the output into multiple files, the table of contents is displayed in the left frame. The contents are grouped using the same criteria as the split.

After the documentation is generated, you can collapse or expand details for some stylesheet XSLT elements by using the Showing options or the Collapse or Expand buttons.

*Figure 388: Showing Options*

For each element included in the documentation, the section presents the element type followed by the element name (value of the name or match attribute for match templates).

*Figure 389: Documentation for an XSLT Element*
Generate XSLT Documentation in a Custom Format

XSLT stylesheet documentation can be also generated in a custom format. You must write your custom stylesheet based on the schema `xslDocSchema.xsd` from `[OXYGEN_INSTALL_DIR]/frameworks/stylesheet_documentation`. You can create a custom format starting from one of the stylesheets used in the built-in HTML, PDF, and DocBook formats. These stylesheets are available in `[OXYGEN_INSTALL_DIR]/frameworks/stylesheet_documentation/xsl`.

To generate XSLT documentation in a custom format:

1. Select **Tools > Generate Documentation > XSLT Stylesheet Documentation** to open the XSLT Stylesheet Documentation dialog box (page 1000).
2. Select **Custom** for the Format and click the Options button.
3. In this next dialog box, specify your own stylesheet to transform the intermediary XML generated in the documentation process.
4. You can also choose to copy additional resources into the output folder or choose whether or not to keep the intermediate XML files created during the documentation process.
5. Click **OK** to close this dialog box and then click **Generate**.

*Figure 390: Custom Format Options Dialog Box*

Generating XSLT Documentation From the Command-Line Interface

You can export the settings of the **XSLT Stylesheet Documentation** dialog box to an XML file by pressing the **Export settings** button. With the exported settings file, you can generate the same documentation from the command line by running the script `stylesheetDocumentation.bat` (on Windows) / `stylesheetDocumentation.sh` (on OS X / Linux) located in the Oxygen XML Editor plugin installation folder. The script can be integrated in an external batch process launched from the command-line interface.

The command-line parameter of the script is the relative path to the exported XML settings file. The files that are specified with relative paths in the exported XML settings are resolved relative to the script directory.

**Example:**

```xml

Compiling an XSL Stylesheet for Saxon

As of Saxon 9.7, it is possible to export a compiled form of a stylesheet as an XML file (called a stylesheet export file or SEF). Oxygen XML Editor plugin includes a simple tool called Compile XSL Stylesheet for Saxon (found in the XML Tools menu) that does this for you.

Use-Cases for a Stylesheet Export File (SEF)

• Use Saxon-JS to run transformations in a browser - A stylesheet export file (SEF) is needed if you want to use the Saxon-JS product to run transformations in a browser, as in the following example:

```javascript
<script type="text/javascript" src="SaxonJS/SaxonJS.min.js"></script>
<script>
    window.onload = function() {
        SaxonJS.transform({
            stylesheetLocation: "books.sef",
            sourceLocation: "books.xml"
        });
    }
</script>
```

• Use SEF to run transformations in Oxygen XML Editor plugin - You can also use a stylesheet export file (SEF) in Oxygen XML Editor plugin to apply an XSLT transformation over an XML file. This requires Saxon-EE or Saxon-PE versions of the Saxon product and you must select one of
those two versions for the **Target** when you configure the SEF file *(page 1011)*. When configuring the XSLT transformation, you will specify the SEF file in the **XSL URL** field *(page 1417)*.

### Compiling an SEF File

The **Compile XSL Stylesheet for Saxon** tool can be found in the **XML Tools** menu and it compiles a specified stylesheet as an XML file (*stylesheet export file* with a file extension of `.sef`).

Selecting this tool opens the **Compile XSL Stylesheet for Saxon** dialog box that allows you to configure some options for conversion.

**Figure 391: Compile XSL Stylesheet for Saxon Dialog Box**

This dialog box includes the following options:

**XSL URL**

Allows you to select URL of the source XSL stylesheet. You can specify the URL by using the text field, the history drop-down, or the browsing actions in the **Browse** drop-down list.

**Target**

Allows you to select the type of Saxon product that the export file will be used with. You can choose **Saxon-JS**, **Saxon-EE**, **Saxon-PE**, or **Saxon-HE**.

**Relocatable**

Can be used to control the Saxon `-relocate` parameter. You can select this option to produce a relocatable export package (SEF) that can be deployed to a different location, with a different base URI.

**Output file**
You can specify the path where the output file will be saved by entering it in the text field, using the  
[Insert Editor Variables] button, or using the browsing actions in the  
[Browse] drop-down list.

**Open in Editor**

Select this option to open the resulting *stylesheet export file* in the main 
Oxygen XML Editor plugin editing pane.

**Use a configuration file ("-config")**

Select this option if you want to use a Saxon 9.8.0.12 configuration file that will be 
executed for the XSLT transformation and validation processes. You can specify the 
path to the configuration file by entering it in the *URL* field, or by using the  
[Insert Editor Variables] button, or using the browsing actions in the  
[Browse] drop-down list.

**Compile**

Use this button to generate the *stylesheet export file* according the options selected in 
this dialog box.

### Editing XML Schemas

An XML Schema describes the structure of an XML document and is used to validate XML document 
instances against it, to check that the XML instances conform to the specified requirements. If an 
XML instance conforms to the schema then it is said to be valid. Otherwise, it is invalid.

Oxygen XML Editor plugin offers support for both XML Schema 1.0 and 1.1 and you can edit XML 
Schema files in the following editing modes:

- **Text editing mode (page 1049)** - Allows you to edit XML Schema files in a source editing mode.
- **Grid editing mode (page 292)** - Displays XML Schema files in a structured spreadsheet-like grid.
- **Design editing mode (page 505)** - Visual schema designer that helps you understand the 
structure and develop complex schemas.
- **Author editing mode (page 672)** - The visual Author mode is also available for XML Schema, 
allowing you to visually edit the schema annotations. It presents a polished and compact view of 
the XML Schema, with support for links on imported/included schemas.

For information about applying and detecting schemas, see [Associating a Schema to XML Documents (page 887)](page 887).

For more information about editing XML Schemas, see our video demonstration:
Design Editing Mode (XML Schema Diagram Editor)

XML Schemas allow document designers to specify the allowed structure and content of an XML document and to check if an XML document is valid.

Oxygen XML Editor plugin provides a simple and expressive XML Schema diagram editor (Design mode) for editing XML Schemas. The schema diagram helps both the content authors who want to understand a schema and schema designers who develop complex schemas.

To switch to this mode, select **Design** at the bottom of the editing area.

Navigation in the XML Schema Design Mode

The following editing and navigation features work for all types of schema components in the XML Schema Design mode:

- Select consecutive components on the diagram (components from the same level) using the Shift key. You can also make discontinuous selections in the schema diagram using the Ctrl (Meta on...
Mac OS) key. To deselect one of the components, use Ctrl + Single-Click (Command + Single-Click on OS X).

- Use the arrow keys to navigate the diagram vertically and horizontally.
- Use Home/End keys to jump to the first/last component from the same level. Use Ctrl + Home (Command + Home on OS X) key combination to go to the diagram root and Ctrl + End (Command + End on OS X) to go to the last child of the selected component.
- You can easily go back to a previously visited component while moving from left to right. The path will be preserved only if you use the left arrow key or right arrow key. For example, if the current selection is on the second attribute from an attribute group and you press the left arrow key to jump to the attribute group, when you press the right arrow key, then the selection will be moved to the second attribute.
- Go back and forward between components viewed or edited in the diagram by selecting them in the Outline view (page 507):
  - Back (go to previous schema component).
  - Forward (go to next schema component).
  - Go to Last Modification (go to last modified schema component).
- Copy, reference, or move global components, attributes, and identity constraints to another position and from one schema to another using the Cut/Copy and Paste/Paste as Reference actions.
- Go to the definition of an element or attribute with the Go to Definition action.
- You can expand and see the contents of the imports/includes/redefines in the diagram. To edit components from other schemas, the schema for each component will be opened as a separate file in Oxygen XML Editor plugin.

Tip: If an XML Schema referenced by the current opened schema was modified on disk, the change will be detected and you will be asked to refresh the current schema contents.

- Recursive references are marked with a recurse symbol (recurse symbol). Click this symbol to navigate between the element declaration and its reference.

Figure 393: Recursive Reference

Schema Editing Actions

You can edit an XML schema using drag and drop operations or contextual menu actions.
Drag and drop is the easiest way to move the existing components to other locations in an XML schema. For example, you can quickly insert an element reference in the diagram with a drag and drop from the **Outline view** (page 507) to a compositor in the diagram. Also, the components order in an `xs:sequence` can be easily changed using drag and drop.

If this property has not been set, you can easily set the attribute/element type by dragging over it a simple type or complex type from the diagram. If the type property for a simple type or complex type is not already set, you can set it by dragging over it a simple or complex type.

Depending on the drop area, various actions are available:

- **move** - Context dependent, the selected component is moved to the destination.
- **reference** - Context dependent, the selected component is referenced from the parent.
- **copy** - If (Ctrl (Meta on Mac OS)) key is pressed, a copy of the selected component is inserted to the destination.

Visual clues about the operation type are indicated by the mouse pointer shape:

- ![move](image)
- When moving a component.
- ![reference](image)
- When referencing a component.
- ![copy](image)
- When copying a component.

You can edit some schema components directly in the diagram. For these components, you can edit the name and the additional properties presented in the diagram by double clicking the value you want to edit. If you want to edit the name of a selected component, you can also press (Enter). The list of properties that can be displayed for each component can be customized in the Preferences (page 134).

When editing references, you can choose from a list of available components. Components from an imported schema for which the target namespace does not have an associated prefix is displayed in the list as `componentName#targetNamespace`. If the reference is from a target namespace that was not yet mapped, you are prompted to add prefix mappings for the inserted component namespace in the current edited schema.

You can also change the compositor by double-clicking it and choose the compositor you want from the proposals list.

There are some components that cannot be edited directly in the diagram: imports, includes, redefines. The editing action can be performed if you double-click or press (Enter) on an import/include/redefine component. An edit dialog box is displayed, allowing you to customize the directives.
Contextual Menu Actions in the Design Mode

The contextual menu of the **Design** mode includes the following actions:

- **Go to Definition (Ctrl + Shift + Enter)**
  
  Shows the definition for the current selected component. For references, this action is available by clicking the arrow displayed in its bottom right corner.

- **Open Schema (Ctrl + Shift + Enter)**
  
  Opens the selected schema. This action is available for `xsd:import`, `xsd:include` and `xsd:redefine` elements. If the file you try to open does not exist, a warning message is displayed and you have the possibility to create the file.

- **Edit Attributes (Alt + Shift + Enter)**
  
  Allows you to edit the attributes of the selected component in a small in-place editor that presents the same attributes as in the **Attributes view** and the **Facets view**. The actions that can be performed on attributes in this dialog box are the same actions presented in the two views.

**Append child**

Offers a list of valid components, depending on the context, and appends your selection as a child of the currently selected component. You can set a name for a named component after it has been added in the diagram.

**Insert before**
Offers a list of valid components, depending on the context, and inserts your selection before the selected component, as a sibling. You can set a name for a named component after it has been added in the diagram.

**Insert after**

Offers a list of valid components, depending on the context, and inserts your selection after the selected component, as a sibling. You can set a name for a named component after it has been added in the diagram.

**New global**

Inserts a global component in the schema diagram. This action does not depend on the current context. If you choose to insert an import you have to specify the URL of the imported file, the target namespace and the import ID. The same information, excluding the target namespace, is requested for an `xsd:include` or `xsd:redefine` element.

**Note:** If the imported file has declared a target namespace, the field **Namespace** is completed automatically.

**Edit Schema Namespaces**

When performed on the schema root, it allows you to edit the schema target namespace and namespace mappings. You can also invoke the action by double-clicking the target namespace property from **Attributes view** (page 510) for the schema or by double-clicking the schema component.

**Edit Annotations**

Allows you to edit the annotation for the selected schema component in the **Edit Annotations** dialog box. You can perform the following operations in the dialog box:

- **Edit all appinfo/documentation items for a specific annotation** - All `appinfo/documentation` items for a specific annotation are presented in a table and can be easily edited. Information about an annotation item includes: type (`documentation/appinfo`), content, source (optional, specify the source of the `documentation/appinfo` element) and `xml:lang`. The content of a `documentation/appinfo` item can be edited in the **Content** area below the table.

- **Insert/Insert before/Remove documentation/appinfo.** The ✈ **Add** button allows you to insert a new annotation item (`documentation/appinfo`). You can add a new item before the item selected in table by pressing the ✅ **Insert Before** button. Also, you can delete the selected item using the ✗ **Remove** button.

- **Move items up/down** - to do this use the ⬆ **Move up** and ⬇ **Move down** buttons.

- **Insert/Insert before/Remove annotation** - Available for components that allow multiple annotations such as schemas or redefines.
• **Specify an ID for the component annotation.** An optional identifier for the annotation.

Annotations are rendered by default under the graphical representation of the component. When you have a reference to a component with annotations, these annotations are presented in the diagram also below the reference component. The **Edit Annotations** action invoked from the contextual menu edit the annotations for the reference. If the reference component does not have annotations, you can edit the annotations of the referenced component by double-clicking the annotations area. Otherwise, you can edit the referenced component annotations only if you go to the definition of the component.

**Note:** For imported/included components that do not belong to the currently edited schema, the **Edit Annotations** dialog box presents the annotation as read-only. To edit its annotation, open the schema where the component is defined.

### Extract Global Element

Action that is available for local elements. A local element is made global and is replaced with a reference to the global element. The local element properties that are also valid for the global element declaration are kept.

*Figure 394: Extracting a Global Element*

If you use the **Extract Global Element** action on a `name` element, the result is:

*Figure 395: Extracting a Global Element on a name Element*

### Extract Global Attribute
Action available for local attributes. A local attribute is made global and replaced with a reference to the global attribute. The properties of local attribute that are also valid in the global attribute declaration are kept.

*Figure 396: Extracting a Global Attribute*

If you use the **Extract Global Attribute** action on a `note` attribute, the result is:

*Figure 397: Extracting a Global Attribute on a `note` Attribute*

**Extract Global Group**

Action available for compositors (sequence, choice, all). This action extracts a global group and makes a reference to it. The action is available only if the parent of the compositor is not a group.
If you use the **Extract Global Group** action on the `sequence` element, the **Extract Global Component** dialog box is displayed and you can choose a name for the group. If you type `personGroup`, the result is:

**Figure 399: Extracting a Global Group on a `sequence` Element**

![Diagram](image)

**Extract Global Type**

Action used to extract an anonymous simple type or an anonymous complex type as global. For anonymous complex types, the action is available on the parent element.

**Figure 400: Extracting a Global Simple Type**

![Diagram](image)

If you use the action on the `union` component and choose `numericST` for the new global simple type name, the result is:

**Figure 401: Extracting a Global Simple Type on a `union` Component**

![Diagram](image)
If you use the action on a `person` element and choose `person_type` for the new complex type name, the result is:

Rename Component in

Rename the selected component.

Cut `Ctrl + X (Command + X on OS X)`

Cut the selected component(s).

Copy `Ctrl + C (Command + C on OS X)`

Copy the selected component(s).
Copy XPath

This action copies an XPath expression that identifies the selected element or attribute in an instance XML document of the edited schema and places it in the clipboard.

Paste Ctrl + V (Command + V on OS X)

Paste the component(s) from the clipboard as children of the selected component.

Paste as Reference

Create references to the copied component(s). If not possible a warning message is displayed.

Remove (Delete)

Remove the selected component(s).

Override component

Copies the overridden component in the current XML Schema. This option is available for xs:override components.

Redefine component

The referenced component is added in the current XML Schema. This option is available for xs:redefine components.

Optional

Can be performed on element/attribute/group references, local attributes, elements, compositors, and element wildcards. The minOccurs property is set to 0 and the use property for attributes is set to optional.

Unbounded

Can be performed on element/attribute/group references, local attributes, elements, compositors, and element wildcards. The maxOccurs property is set to unbounded and the use property for attributes is set to required.

Search

Can be performed on local elements or attributes. This action makes a reference to a global element or attribute.

Search References

Searches all references of the item found at current cursor position in the defined scope if any.

Search References in

Searches all references of the item found at current cursor position in the specified scope.
Search Occurrences in File

Searches all occurrences of the item found at current cursor position in the current file.

Component Dependencies

Opens the Component Dependencies view (page 1064) that allows you to see the dependencies for the current selected component.

Resource Hierarchy

Opens the Resource Hierarchy / Dependencies view (page 1061) that allows you to see the hierarchy for the current selected resource.

Flatten Schema

Recursively adds the components of included Schema files to the main one. It also flattens every imported XML Schema from the hierarchy.

Resource Dependencies

Allows you to see the dependencies for the current selected resource.

Expand All

Recursively expands all sub-components of the selected component.

Collapse All

Recursively collapses all sub-components of the selected component.

Save as Image

Save the diagram as image, in JPEG, BMP, SVG or PNG format.

Generate Sample XML Files

Generate XML files using the current opened schema. The selected component is the XML document root. See more in the Generate Sample XML Files (page 1070) section.

Options

Show the Schema preferences panel (page 133).

XML Schema Components

A schema diagram contains a series of interconnected components. To quickly identify the relation between two connected components, the connection is represented as:

- A thick line to identify a connection with a required component (in the following image, family is a required element).

Figure 404: Example: Required Component
A thin line to identify a connection with an optional component (in the following image, `email` is an optional element).

**Figure 405: Example: Optional Component**

The following topics explain in detail all available components and their symbols as they appear in an XML schema diagram.

**xs:schema**

**Figure 406: The xs:schema Component**

Defines the root element of a schema. A schema document contains representations for a collection of schema components, such as type definitions and element declarations, that have a common target namespace. See more info at [http://www.w3.org/TR/xmlschema11-1/#element-schema](http://www.w3.org/TR/xmlschema11-1/#element-schema).

By default, it displays the `targetNamespace` property when rendered.

**xs:element**

*Figure 407: The xs:element Component*

Defines an element. An element declaration is an association of a name with a type definition, either simple or complex, an (optional) default value and a (possibly empty) set of identity-constraint definitions. See more info at http://www.w3.org/TR/xmlschema11-1/#element-element.

An element by default displays the following properties when rendered in the diagram: default, fixed, abstract and type. When referenced or declared locally, the element graphical representation also contains the value for the minOccurs and maxOccurs properties (for 0..1 and 1..1 occurs the values are implied by the connector style) and the connectors to the element are drawn using dotted lines if the element is optional.

### xs:attribute

*Figure 408: The xs:attribute Component*

Defines an attribute. See more info at [http://www.w3.org/TR/xmlschema11-1/#element-attribute](http://www.w3.org/TR/xmlschema11-1/#element-attribute).

An attribute by default displays the following properties when rendered in the diagram: default, fixed, use and type. Connectors to the attribute are drawn using dotted lines if the attribute use is optional. The attribute name is stroked out if prohibited.

**Inheritable** | Specifies if the attribute is inheritable. Inheritable attributes can be used by `<alternative>` element on descendant elements. | `true/false` | For all local or global attributes. The default value is false. This property is available for XML Schema 1.1.  
**Target Namespace** | Specifies the target namespace for local attribute declarations. The namespace URI may be different from the schema target namespace. | Any URI | Setting a target namespace for local attribute is useful only when restricts attributes of a complex type that is declared in other schema with a different target namespace. This property is available for XML Schema 1.1.

- Constraining element information items by providing Attribute Declarations governing the appearance and content of attributes.
- Constraining element information item children to be empty, or to conform to a specified element-only or mixed content model, or else constraining the character information item children to conform to a specified simple type definition.
- Using the mechanisms of Type Definition Hierarchy to derive a complex type from another simple or complex type.
- Specifying post-schema-validation infoset contributions for elements.
- Limiting the ability to derive additional types from a given complex type.
- Controlling the permission to substitute, in an instance, elements of a derived type for elements declared in a content model to be of a given complex type.

### xs:simpleType

*Figure 411: The xs:simpleType Component*

![Image](none)

This component defines a simple type. A simple type definition is a set of constraints on strings and information about the values they encode, applicable to the normalized value of an attribute information item or of an element information item with no element children. Informally, it applies to the values of attributes and the text-only content of elements. See more info at [http://www.w3.org/TR/xmlschema11-1/#element-simpleType](http://www.w3.org/TR/xmlschema11-1/#element-simpleType).

Tip: A simple type that is a base type to another type will be rendered with yellow background.

**xs:assert**

Assertions provide a flexible way to control the occurrence and values of elements and attributes available in an XML Schema.

The openContent element enables instance documents to contain extension elements to be inserted amongst the elements declared by the schema. You can declare open content for your elements at one place (within the complexType definition) or at the schema level.

### Constructs Used to Group Schema Components

This section explains the components that can be used for grouping other schema components:

- Attributes (page 1046)
- Constraints (page 1047)
- Substitutions (page 1047)

### Attributes

**Constraints**

Schema Validation

Validation for the Design mode is seamlessly integrated in the Oxygen XML Editor plugin XML documents validation (page 854) capability.

Figure 434: XML Schema Validation

A schema validation error is presented by highlighting the invalid component:

- In the Attributes View (page 510).
- In the diagram by surrounding the component that has the error with a red border.

Invalid facets for a component are highlighted in the Facets View (page 511).

Components with invalid properties are rendered with a red border. This is a default color, but you can customize it in the Document checking user preferences (page 108). When hovering an invalid component, the tooltip will present the validation errors associated with that component.

When editing a value that is supposed to be a qualified or unqualified XML name, the application provides automatic validation of the entered value. This proves to be very useful in avoiding setting invalid XML names for the given property.
If you validate the entire schema using the ✔️ Validate action from the XML menu or from the ✔️ Validation toolbar drop-down menu, all validation errors will be presented in the Errors tab. To resolve an error, just click it (or double-click for errors located in other schemas) and the corresponding schema component will be displayed as the diagram root so that you can easily correct the error.

⚠️ **Important:** If the schema imports only the namespace of other schema without specifying the schema location and a catalog is set-up (page 897) that maps the namespace to a certain location both the validation and the diagram will correctly identify the imported schema.

⚠️ **Tip:** If the validation action finds that the schema contains unresolved references, the application will suggest the use of validation scenarios, but only if the current edited schema is an XML Schema module.

Edit Schema Namespaces

You can use the XML Schema Namespaces dialog box to easily set a target namespace and define namespace mappings for a newly created XML Schema. In the Design mode these namespaces can be modified anytime by choosing Edit Schema Namespaces from the contextual menu. You can also do this by double-clicking the schema root in the diagram.

The XML Schema Namespaces dialog box allows you to edit the following information:

- **Target namespace** - The target namespace of the schema.
- **Prefixes** - The dialog box displays a table with namespaces and the mapped prefixes. You can add a new prefix mapping or remove an already existing one.

Editing XML Schema in Text Editing Mode

The Oxygen XML Editor plugin Text editing mode can be used for editing XML Schema in a source editing mode. It offers powerful content completion support, a synchronized Outline view, and multiple refactoring actions (page 1066). The Outline view has two display modes: the standard outline (page 257) mode and the components (page 507) mode.

A diagram of the XML Schema can be presented side by side with the text. To activate the diagram presentation, select the Show Full Model XML Schema diagram option (page 134) in the Diagram preferences page (page 134).

Editing XML Schema in the Master Files Context
Smaller interrelated modules that define a complex XML Schema cannot be correctly edited or validated individually, due to their interdependency with other modules. For example, an element defined in a main schema document is not visible when you edit an included module. Oxygen XML Editor plugin provides the support for defining the main module (or modules), thus allowing you to edit any of the imported/included schema files in the context of the larger schema structure.

You can set a main XML document either using the master files support from the Navigator view (page 581), or using a validation scenario.

To set a master file using a validation scenario, add validation units that point to the main schemas. Oxygen XML Editor plugin warns you if the current module is not part of the dependencies graph computed for the main schema. In this case, it considers the current module as the main schema.

The advantages of editing in the context of a master file (page 2708) include:

- Correct validation of a module in the context of a larger schema structure.
- Content Completion Assistant (page 2704) displays all the referable components valid in the current context. This include components defined in modules other than the currently edited one.
- The Outline view (page 507) displays the components collected from the entire schema structure.

Validating XML Schema Documents

By default, XML Schema files are validated as you type. To change this, open the Preferences dialog box (page 55), go to Editor > Document Checking, and deselect the Enable automatic validation option (page 109).

To validate an XML Schema document manually, select the Validate action from the Validation toolbar drop-down menu or the XML menu. When Oxygen XML Editor plugin validates an XML Schema file, it expands all the included modules so the entire schema hierarchy is validated. The validation problems are highlighted directly in the editor, making it easy to locate and fix any issues.

Validation of an XML Schema containing a type definition with a minOccurs or maxOccurs attribute having a value larger than 256 limits the value to 256 and issues a warning about this restriction in the Message panel at the bottom of the Oxygen XML Editor plugin window. Otherwise, for large values of the minOccurs and maxOccurs attributes, the validator fails with an OutOfMemory error that might make Oxygen XML Editor plugin unusable without restarting the entire application.

Important: If the schema imports only a namespace without specifying the schema location and a catalog is set up (page 897) to map the namespace to a certain location, both validation and the schema components will correctly identify the imported schema.
Quick Fixes for DTD, XSD, and Relax NG Errors

Oxygen XML Editor plugin offers *Quick Fixes* for common errors that appear in XML documents that are validated against DTD, XSD, or Relax NG schemas.

**Note:** For XML documents validated against XSD schemas, the *Quick Fixes* are only available if you use the default Xerces validation engine.

Quick Fixes are available in **Text** mode and **Author** mode.

Oxygen XML Editor plugin provides *Quick Fixes* for numerous types of problems, including the following:

<table>
<thead>
<tr>
<th>Problem Type</th>

**Content Completion in XML Schema**

The intelligent *Content Completion Assistant* *(page 2704)* allows you to quickly identify and insert elements, attributes, and attribute values that are valid in the current editing context. All available proposals are listed in a pop-up menu displayed at the current cursor position.

The *Content Completion Assistant* is enabled by default. To disable it, open the *Preferences* dialog box *(page 55)*, go to Editor > Content Completion, and deselect the *Enable content completion* option *(page 101)*.

When active, the *Content Completion Assistant* displays a list of context-sensitive proposals valid at the current cursor position. It can be manually activated with the *Ctrl + Space* *(Command + Space on OS X)* shortcut. You can navigate through the list of proposals by using the *Up* and *Down* keys on your keyboard. For each selected item in the list, the *Content Completion Assistant* displays a documentation window. You can customize the size of the documentation window by dragging its top, right, and bottom borders.

To insert the selected proposal in *Text* mode, do one of the following:
- Press *Enter* or *Tab* to insert both the start and end tags and position the cursor inside the start tag in a position suitable for inserting attributes.
- Press *Ctrl + Enter* *(Command + Enter on OS X)* to insert both the start and end tags and positions the cursor between the tags in a position where you can start typing content.

Depending on the *selected schema version* *(page 1098)*, Oxygen XML Editor plugin populates the proposals list with information taken either from XML Schema 1.0 or 1.1.

Oxygen XML Editor plugin helps you to easily reference a component by providing the list of proposals (complex types, simple types, elements, attributes, groups, attribute groups, or notations) valid in the current context. The components are collected from the current file or from the imported/included schemas.
When editing `xs:annotation/xs:appinfo` elements of an XML Schema, the *Content Completion Assistant* proposes elements and attributes from a custom schema (by default ISO Schematron). This feature can be configured from the *XSD Content Completion (page 104)* preferences page.

### Syntax Highlighting in XML Schema

Oxygen XML Editor plugin supports syntax highlighting in Text mode to make it easier to read the semantics of the structured content by displaying each type of code in different colors and fonts.

To customize the colors or styles used for the syntax highlighting colors for XML Schema files, follow these steps:

1. Open the *Preferences* dialog box (page 55).
2. Go to *Editor > Syntax Highlight* (page 149).
3. Select and expand the *XML* section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.
5. Select the *XSD* tab in the *Preview* pane to see the effects of your changes.

**Tip:** Oxygen XML Editor plugin also allows you to specify syntax highlighting colors for specific XML elements and attributes with specific namespace prefixes. This can be done in the *Editor > Syntax Highlight > Elements/Attributes by Prefix* preferences page (page 150).

**Related Information:**
- Customize Syntax Highlight colors (page 149)

### XML Schema Outline View

The Outline view for XML Schemas presents all the global components grouped by their location, namespace, or type. By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the *Window > Show View* menu.

*Figure 435: Outline View for XML Schema*
The Outline view provides the following options in the View Menu on the Outline view action bar:

**Filter returns exact matches**
- The text filter of the Outline view returns only exact matches;

**Selection update on cursor move**
- Allows a synchronization between Outline view and schema diagram. The selected view from the diagram is also selected in the Outline view.

**Sort**
- Allows you to sort alphabetically the schema components.

**Show all components**
- Displays all components that were collected starting from the master files (page 2708). Components that are not referable from the current file are marked with an orange underline. To reference them, add an import directive with the componentNS namespace.

**Show referable components**
- Displays all components (collected starting from the master files (page 2708)) that can be referenced from the current file. This option is set by default.

**Show only local components**
- Displays the components defined in the current file only.
Group by location/namespace/type

These three operations allow you to group the components by location, namespace, or type. When grouping by namespace, the main schema target namespace is the first presented in the Outline view.

The following contextual menu actions are available in the Outline view:

- **Remove (Delete)**
  Removes the selected item from the diagram.

- **Search References**
  Searches all references of the item found at current cursor position in the defined scope, if any.

- **Search References in**
  Searches all references of the item found at current cursor position in the specified scope.

- **Component Dependencies**
  Opens the Component Dependencies view (page 1064) that allows you to see the dependencies for the current selected component.

- **Resource Hierarchy**
  Opens the Resource Hierarchy / Dependencies view (page 904) that allows you to see the hierarchy for the current selected resource.

- **Resource Dependencies**
  Opens the Resource Hierarchy / Dependencies view (page 904) that allows you to see the dependencies for the current selected resource.

- **Rename Component in**
  Renames the selected component.

- **Generate Sample XML Files**
  Generate XML files using the current opened schema. The selected component is the XML document root.

The upper part of the Outline view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (such as *, ?) and separate multiple patterns with commas.

**Tip:** The search filter is case insensitive. The following wildcards are accepted:
• * - any string
• ? - any character
• , - patterns separator

If no wildcards are specified, the string to search will be searched as a partial match.

The content of the **Outline** view and the editing area are synchronized. When you select a component in the **Outline** view, its definition is highlighted in the editing area.

## XML Schema Attributes View

The **Attributes** view for XML Schemas presents the properties for the selected component in the schema diagram. By default, it is displayed on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

*Figure 436: Attributes View*
The default value of a property is presented in the **Attributes** view with blue foreground. The properties that can not be edited are rendered with gray foreground. A non-editable category that contains at least one child is rendered with bold. Bold properties are properties with values set explicitly to them.

Properties for components that do not belong to the current edited schema are read-only but if you double-click them you can choose to open the corresponding schema and edit them.

You can edit a property by double-clicking by pressing Enter. For most properties you can choose valid values from a list or you can specify another value. If a property has an invalid value or a warning, it will be highlighted in the table with the corresponding foreground color. By default, properties with errors are highlighted with red and the properties with warnings are highlighted with yellow. You can customize these colors from the **Document checking user preferences** (page 108).

For imports, includes and redefines, the properties are not edited directly in the **Attributes** view. A dialog box will open that allows you to specify properties for them.

The schema namespace mappings are not presented in **Attributes** view. You can view/edit these by choosing **Edit Schema Namespaces** from the contextual menu on the schema root. See more in the **Edit Schema Namespaces** (page 1049) section.

The **Attributes** view has five actions available on the toolbar and also on the contextual menu:

- **Add**
  
  Allows you to add a new member type to an union's member types category.

- **Remove**
  
  Allows you to remove the value of a property.
Move Up

 Allows you to move up the current member to an union's member types category.

Move Down

 Allows you to move down the current member to an union's member types category.

Copy

 Copy the attribute value.

Go to Definition

 Shows the definition for the selected type.

Show Facets

 Allows you to edit the facets for a simple type.

XML Schema Palette View

The Palette view is designed to offer quick access to XML Schema components and to improve the usability of the XML Schema diagram builder. You can use the Palette to drag and drop components in the Design mode. The components offered in the Palette view depend on the XML schema version set in the XML Schema preferences page (page 176). If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

Figure 437: Palette View

Figure 438: Palette View

Components are organized functionally into 4 collapsible categories:
• Basic components: elements, group, attribute, attribute group, complex type, simple type, type alternative.
• Compositors and Wildcards: sequence, choice, all, any, any attribute, open content.
• Directives: import, include, redefine, override.
• Identity constraints: key, keyref, unique, selector, field, assert.

Note: The type alternative, open content, override, and assert components are available for XML Schema 1.1.

To add a component to the edited schema:

• Click and hold a graphic symbol from the Palette view, then drag the component into the Design view.
• A line dynamically connects the component with the XML schema structure.
• Release the component into a valid position.

Note: You cannot drop a component into an invalid position. When you hover the component into an invalid position, the mouse cursor changes its shape into . Also, the connector line changes its color from the usual dark gray to the color defined in the Validation error highlight color option (page 108) (default color is red).

For more information about the Schema palette, watch our video demonstration:

https://www.youtube.com/embed/KalHUXmpuAA

XML Schema Facets View

The Facets view for XML Schemas presents the facets for the selected component, if available. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

Figure 439: Facets View
The default value of a facet is rendered in the **Facets** view with a blue color. The facets that can not be edited are rendered with a gray color. The grouping categories (for example: **Enumerations** and **Patterns**) are not editable. If these categories contain at least one child they are rendered with bold. Bold facets are facets with values set explicitly to them.

⚠️ **Important:** Usually inherited facets are presented as default in the **Facets** view but if patterns are inherited from a base type and also specified in the current simple type only the current specified patterns will be presented. You can see the effective pattern value obtained by combining the inherited and the specified patterns as a tooltip on the **Patterns** category.

Facets for components that do not belong to the current edited schema are read-only but if you double-click them you can choose to open the corresponding schema and edit them.

You can edit a facet by double-clicking it or by pressing Enter, when that facet is selected. For some facets you can choose valid values from a list or you can specify another value. If a facet has an invalid value or a warning, it will be highlighted in the table with the corresponding foreground color. By default, facets with errors are presented with red and the facets with warnings with yellow. You can customize the error colors from the **Document Checking user preferences** *(page 108)*.

The **Facets** view provides the following actions in its toolbar and contextual menu:

- **Add**
  - Allows you to add a new enumeration or a new pattern.

- **Remove**
  - Allows you to remove the value of a facet.

- **Edit Annotations**
  - Allows you to edit an annotation for the selected facet.

- **Move Up**
  - Allows you to move up the current enumeration/pattern in **Enumerations/Patterns** category.
Move Down

Allows you to move down the current enumeration/pattern in **Enumerations/Patterns** category.

Copy

Copy the attribute value.

Open in Regular Expressions Builder

Rather than editing regular expressions manually, this action allows you to open the pattern in the **XML Schema Regular Expressions Builder** (*page 1094*) that guides you through the process of testing and constructing the pattern.

Facets can be fixed to prevent a derivation from modifying its value. To fix a facet value just press the Pin button.

XML Schema Resource Hierarchy / Dependencies View

The **Resource Hierarchy / Dependencies** view allows you to easily see the hierarchy / dependencies for an XML Schema, a **Relax NG schema** (*page 1161*) or an **XSLT stylesheet** (*page 980*). If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

The **Resource Hierarchy / Dependencies** is useful when you want to start from an XML Schema (XSD) file and build and review the hierarchy of all the other XSD files that are imported, included or redefined in the given XSD file. The view is also able to build the tree structure, that is the structure of all other XSD files that import, include or redefine the given XSD file. The scope of the search is configurable (the current project, a set of local folders, etc.)

The build process for the hierarchy view is started with the **Resource Hierarchy** action available on the contextual menu of the editor panel.

*Figure 440: Resource Hierarchy/Dependencies View - Hierarchy for xhtml11.xsd*
The build process for the dependencies view is started with the **Resource Dependencies** action available on the contextual menu.

*Figure 441: Resource Hierarchy/Dependencies View - Dependencies for xhtml-param-1.xsd*

The following actions are available in the **Resource Hierarchy/Dependencies** view:

- **Refresh**
  
  Refreshes the Hierarchy/Dependencies structure.

- **Stop**
  
  Stops the hierarchy/dependencies computing.

- **Show Hierarchy**
  
  Allows you to choose a resource to compute the hierarchy structure.

- **Show Dependencies**
Allows you to choose a resource to compute the dependencies structure.

**Configure**

Allows you to configure a scope to compute the dependencies structure. There is also an option for automatically using the defined scope for future operations.

**History**

Provides access to the list of previously computed dependencies. Use the **Clear history** button to remove all items from this list.

The contextual menu contains the following actions:

**Open**

Opens the resource. You can also double-click a resource in the Hierarchy/Dependencies structure to open it.

**Copy location**

Copies the location of the resource.

**Move resource**

Moves the selected resource.

**Rename resource**

Renames the selected resource.

**Show Resource Hierarchy**

Shows the hierarchy for the selected resource.

**Show Resource Dependencies**

Shows the dependencies for the selected resource.

**Add to Master Files**

Adds the currently selected resource in the **Master Files** directory (page 581).

**Expand All**

Expands all the children of the selected resource from the Hierarchy/Dependencies structure.

**Collapse All**

Collapses all children of the selected resource from the Hierarchy/Dependencies structure.

**Tip:** When a recursive reference is encountered in the Hierarchy view, the reference is marked with a special icon ⚠.
Note: The Move resource or Rename resource actions give you the option to update the references to the resource (page 1064).

Related Information:

- Search and Refactor Operations Scope (page 904)

Moving/Renaming XML Schema Resources

You can move and rename a resource presented in the Resource/Hierarchy Dependencies view, using the Rename resource and Move resource refactoring actions from the contextual menu.

When you select the Rename action in the contextual menu of the Resource/Hierarchy Dependencies view, the Rename resource dialog box is displayed. The following fields are available:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references** - Select this option to update the references to the resource you are renaming.

When you select the Move action from the contextual menu of the Resource/Hierarchy Dependencies view, the Move resource dialog box is displayed. The following fields are available:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - Select this option to update the references to the resource you are moving, in accordance with the new location and name.

If the Update references of the moved resource(s) option is selected, a Preview option (which opens the Preview dialog box) is available for both actions. The Preview dialog box presents a list with the resources that are updated.

XML Schema Component Dependencies View

The Component Dependencies view allows you to see the dependencies for a selected component. This is helpful if you want to see where components are used in the entire hierarchy. For example, if you want to find all the references where a given component is used.

If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.
To see the dependencies of an XML Schema component:

1. Right-click the desired component in the editor or Outline view.
2. Select the Component Dependencies action from the contextual menu.

The action is available for all named components (for example, elements or attributes).

If a component contains multiple references, a small table is displayed at the bottom of the view that contains all the references. When a recursive reference is encountered, it is marked with a special icon.

![Component Dependencies View - Hierarchy for xhtml11.xsd](image)

The Component Dependencies view includes the following toolbar actions:

- **Refresh**
  Refreshes the dependencies structure.

- **Stop**
  Stops the dependency computation.

- **Configure**
  Allows you to choose the search scope for computing the dependencies structure. This is helpful for making sure all imported/included resources are computed.

- **History**
Allows you to select from a list of the most recently used dependency computations.

In addition, the following actions are available in the contextual menu:

**Go to First Reference**

Selects the first reference of the currently selected component in the dependencies tree.

**Go to Component**

Shows the definition of the currently selected component in the dependencies tree.

### Highlight Component Occurrences

When a component (for example types, elements, attributes) is found at current cursor position, Oxygen XML Editor plugin performs a search over the entire document to find the component declaration and all its references. When found, they are highlighted both in the document and in the stripe bar, at the right side of the document. Customizable colors are used: one for the component definition and another one for component references. Occurrences are displayed until another component is selected and a new search is performed. All occurrences are removed when you start to edit the document.

This feature is on by default. To configure it, open the *Preferences* dialog box (page 55) and go to **Editor > Mark Occurrences**. A search can also be triggered with the **Search > Search Occurrences in File** contextual menu action. All matches are displayed in a separate tab of the *Results view* (page 267).

### Searching and Refactoring Actions in XML Schemas
Search Actions

The following search actions can be applied on attribute, attributeGroup, element, group, key, unique, keyref, notation, simple, or complex types and are available from the Search submenu in the contextual menu of the current editor:

- **Search References**
  Searches all references of the item found at current cursor position in the defined scope, if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box is displayed and you have the possibility to define another search scope.

- **Search References in**
  Searches all references of the item found at current cursor position in the file or files that you specify when define a scope in the Search References dialog box.

- **Search Declarations**
  Searches all declarations of the item found at current cursor position in the defined scope if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box will be displayed and you have the possibility to define another search scope.

- **Search Declarations in**
  Searches all declarations of the item found at current cursor position in the file or files that you specify when you define a scope for the search operation.

- **Search Occurrences in File**
  Searches all occurrences of the item at the cursor position in the currently edited file.

The following action is available from the XSL menu:

- **Go to Definition**
  Moves the cursor to the definition of the referenced XML Schema item.

  **Note:** You can also use the Ctrl + Single-Click (Command + Single-Click on OS X) shortcut on a reference to display its definition.

Refactoring Actions

The following refactoring actions can be applied on attribute, attributeGroup, element, group, key, unique, keyref, notation, simple, or complex types and are available from the Refactoring submenu in the contextual menu of the current editor:
**Rename Component**

Allows you to rename the current component (in-place). The component and all its references in the document are highlighted with a thin border and the changes you make to the component at the cursor position are updated in real time to all occurrences of the component. To exit the in-place editing, press the Esc or Enter key on your keyboard.

**Rename Component in**

Opens a dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the Preview button, you can view the files to be affected by the action.

**XML Schema Quick Assist Support**

The *Quick Assist support* (page 2710) improves the development workflow, offering fast access to the most commonly used actions when you edit schema documents.

The *Quick Assist feature* (page 2710) is activated automatically when the cursor is positioned over the name of a component. It is accessible via a yellow bulb icon (💡) placed at the current line in the
stripe on the left side of the editor. Also, you can invoke the quick assist menu by using the Ctrl + 1 (Meta 1 on Mac OS X) keyboard shortcuts.

**Figure 444: Quick Assist Support**

![Quick Assist Support](https://www.youtube.com/embed/X-2-gkrFSGU)

The **Quick Assist** support offers direct access to the following actions:

- **Rename Component in**
  Renames the component and all its dependencies.

- **Search Declarations**
  Searches the declaration of the component in a predefined scope. It is available only when the context represents a component name reference.

- **Search References**
  Searches all references of the component in a predefined scope.

- **Component Dependencies**
  Searches the component dependencies in a predefined scope.

- **Change Scope**
  Configures the scope that will be used for future search or refactor operations.

- **Rename Component**
  Allows you to rename the current component in-place.

- **Search Occurrences**
  Searches all occurrences of the component within the current file.

Generating Sample XML Files

Oxygen XML Editor plugin offers support to generate sample XML files both from XML schema 1.0 and XML schema 1.1, depending on the XML schema version set in XML Schema preferences page (page 177).

To generate sample XML files from an XML Schema, use the Generate Sample XML Files action from the XML Tools menu. This action is also available in the contextual menu of the schema Design mode (page 1015). The action opens the Generate Sample XML Files dialog box that allows you to configure a variety of options for generating the files.

The Generate Sample XML Files dialog box contains three tabs with various configurable options. Default values for these options can be set in the Sample XML Files Generator preferences page (page 168).

Schema Tab (Generate Sample XML Files Tool)

The Generate Sample XML Files tool includes a dialog box that allows you to configure a variety of options for generating the XML files. The first set of options are found in the Schema tab.

Figure 445: Generate Sample XML Files Dialog Box (Schema Tab)
This tab includes the following options:

**URL**

Specifies the URL of the Schema location. You can specify the path by using the text field, the history drop-down menu, or the browsing actions in the Browse drop-down list.

**Namespace**

Displays the namespace of the selected schema.

**Root Element**

After the schema is selected, this drop-down menu is populated with all root candidates gathered from the schema. Choose the root of the output XML documents.

**Output folder**

Path to the folder where the generated XML instances will be saved.

**Filename prefix and Extension**

You can specify the prefix and extension for the file name that will be generated. Generated file names have the following format: `prefixN.extension`, where `N` represents an incremental number from 0 up to the specified Number of instances (page 1071).

**Number of instances**

The number of XML files to be generated.
Open first instance in editor

When selected, the first generated XML file is opened in the editor.

Namespaces section

You can specify the Default Namespace, as well as the prefixes for the namespaces.

Export settings

Use this button to save the current settings for future use.

Import settings

Use this button to load previously exported settings.

You can click OK at any point to generate the sample XML files.

Options Tab (Generate Sample XML Files Tool)

The Generate Sample XML Files tool includes a dialog box that allows you to configure a variety of options for generating the XML files. The Options tab allows you to set specific options for namespaces and elements.

Figure 446: Generate Sample XML Files Dialog Box (Options Tab)
This tab includes the following options:

**Namespace / Element table**

Allows you to set a namespace for each element name that appears in an XML document instance. The following prefix-to-namespace associations are available:

- All elements from all namespaces (<ANY> - <ANY>). This is the default setting.
- All elements from a specific namespace.
- A specific element from a specific namespace.

**Settings subtab**

- **Namespace**
  Displays the namespace specified in the table at the top of the dialog box.

- **Element**
  Displays the element specified in the table at the top of the dialog box.

- **Generate optional elements**
  When selected, all elements are generated, including the optional ones (having the `minOccurs` attribute set to 0 in the schema).

- **Generate optional attributes**
  When selected, all attributes are generated, including the optional ones (having the `use` attribute set to `optional` in the schema).

- **Values of elements and attributes**
  Controls the content of generated attribute and element values. The following choices are available:

  - **None** - No content is inserted.
  - **Default** - Inserts a default value depending of data type descriptor of the particular element or attribute. The default value can be either the data type name or an incremental name of the attribute or element (according to the global option from the Sample XML Files Generator preferences page). Note that type restrictions are ignored when this option is selected. For example, if an element is of a type that restricts an `xs:string` with the `xs:maxLength` facet to allow strings with a maximum length of 3, the XML instance generator tool may generate string element values longer than 3 characters.
  - **Random** - Inserts a random value depending of data type descriptor of the particular element or attribute.
**Important:** If all of the following are true, the Generate Sample XML Files tool outputs invalid values:
- At least one of the restrictions is a regexp.
- The value generated after applying the regexp does not match the restrictions imposed by one of the facets.

**Preferred number of repetitions**

Allows you to set the preferred number of repeating elements related to minOccurs and maxOccurs facets defined in the XML Schema.

- If the value set here is between minOccurs and maxOccurs, then that value is used.
- If the value set here is less than minOccurs, then the minOccurs value is used.
- If the value set here is greater than maxOccurs, then maxOccurs is used.

**Maximum recursion level**

If a recursion is found, this option controls the maximum allowed depth of the same element.

**Type alternative strategy**

Used for the xs:alternative element from XML Schema 1.1. The possible strategies are:

- **First** - The first valid alternative type is always used.
- **Random** - A random alternative type is used.

**Choice strategy**

Used for xs:choice or substitutionGroup elements. The possible strategies are:

- **First** - The first branch of xs:choice or the head element of substitutionGroup is always used.
- **Random** - A random branch of xs:choice or a substitute element or the head element of a substitutionGroup is used.

**Generate the other options as comments**

If selected, generates the other possible choices or substitutions (for xs:choice and substitutionGroup). These alternatives are generated
inside comments groups so you can uncomment and use them later. Use this option with care (for example, on a restricted namespace and element) as it may generate large result files.

**Element values subtab**

Allows you to add values that are used to generate the content of elements. If there are multiple values, then the values are used in a random order.

**Attribute values subtab**

Allows you to add values that are used to generate the content of attributes. If there are multiple values, then the values are used in a random order.

**Export settings**

Use this button to save the current settings for future use.

**Import settings**

Use this button to load previously exported settings.

You can click **OK** at any point to generate the sample XML files.

Advanced Tab (Generate Sample XML Files Tool)

The Generate Sample XML Files tool includes a dialog box that allows you to configure a variety of options for generating the XML files. The Advanced tab allows you to set some options regarding output values and performance.

*Figure 447: Generate Sample XML Files Dialog Box (Advanced Tab)*

This tab includes the following options:

**Use incremental attribute / element names as default**

If selected, the value of an element or attribute starts with the name of that element or attribute. For example, for an `a` element the generated values are: `a1`, `a2`, `a3`, and so on. If not selected, the value is the name of the type of that element / attribute (for example: `string`, `decimal`, etc.)
Maximum length

The maximum length of string values generated for elements and attributes.

Discard optional elements after nested level

The optional elements that exceed the specified nested level are discarded. This option is useful for limiting deeply nested element definitions that can quickly result in very large XML documents.

Export settings

Use this button to save the current settings for future use.

Import settings

Use this button to load previously exported settings.

Generating Documentation for an XML Schema

Oxygen XML Editor plugin can generate detailed documentation for the components of an XML Schema in HTML, PDF, DocBook, or other custom formats. You can select the components and the level of detail. The components are hyperlinked in both HTML and DocBook documents.

Note: You can generate documentation for both XML Schema version 1.0 and 1.1.

To generate documentation for an XML Schema document, select XML Schema Documentation from the XML Tools > Generate Documentation menu or from the Generate XML Schema Documentation action from the contextual menu of the Navigator view (page 250).

Figure 448: XML Schema Documentation Dialog Box
The **Schema URL** field of the dialog box must contain the full path to the XML Schema (XSD) file for which you want to generate documentation. The schema may be a local or a remote file. You can specify the path to the schema by entering it in the text field, or by using the **Insert Editor Variables** button or the options in the **Browse** drop-down menu.

### Output Tab

The following options are available in the **Output** tab:

- **Format** - Allows you to choose between the following formats:
  - **HTML** - The documentation is generated in **HTML output format (page 1080)**.
  - **PDF** - The documentation is generated in **PDF output format (page 1083)**.
  - **DocBook** - The documentation is generated in **DocBook output format (page 1084)**.
  - **DITA** - The documentation is generated in **DITA output format (page 1084)**.
  - **Custom** - The documentation is generated in a **custom output format (page 1084)**, allowing you to control the output. Click the **Options** button to open a **Custom format options** dialog box where you can specify a custom stylesheet for creating the output. There is also an option to **Copy additional resources to the output folder** and you can select the path to the additional **Resources** that you want to copy. You can also choose to keep the intermediate XML files created during the documentation process by deselecting the **Delete intermediate XML file** option.
• **Output file** - You can specify the path of the output file by entering it in the text field, or by using the ✉️ **Insert Editor Variables** button or the options in the ✋ • **Browse** drop-down menu.

• **Split output into multiple files** - Instructs the application to split the output into multiple files. You can choose to split them by namespace, location, or component name.

• **Open in Browser/System Application** - Opens the result in the system application associated with the output file type. For DITA and DocBook documents, this option appears as **Open in Editor** and the result will be opened in Oxygen XML Editor plugin (in the current editor).

**Note:** To set the browser or system application that will be used, go to Window > Preferences > General > Web Browser and specify it there. This will take precedence over the default system application settings.

• **Keep only the annotations with xml:lang set to** - The generated output will contain only the annotations with the xml:lang attribute set to the selected language. If you choose a primary language code (for example, `en` for English), this includes all its possible variations (`en-us`, `en-uk`, etc.).

### Settings Tab

When you generate documentation for an XML schema you can choose what components to include in the output and the details to be included in the documentation.

*Figure 449: Settings Tab of the XML Schema Documentation Dialog Box*
The **Settings** tab allows you to choose whether or not to include the following components: **Global elements**, **Global attributes**, **Local elements**, **Local attributes**, **Simple Types**, **Complex Types**, **Groups**, **Attribute Groups**, **Redefines**, **Referenced schemas**, and **Include notations**.

You can choose whether or not to include the following other details:

- **Diagram** - Displays the diagram for each component. You can choose the image format (JPEG, PNG, SVG) to use for the diagram section. The generated diagrams are dependent on the options from the **Schema Design Properties** (page 134) page.

- **Diagram annotations** - This option controls whether or not the annotations of the components presented in the diagram sections are included.

- **Namespace** - Displays the namespace for each component.

- **Location** - Displays the schema location for each component.

- **Type** - Displays the component type if it is not an anonymous one.

- **Type hierarchy** - Displays the types hierarchy.

- **Model** - Displays the model (sequence, choice, all) presented in BNF form. The separator characters that are used depend upon the information item used:
  - `xs:all` - Its children will be separated by space characters.
  - `xs:sequence` - Its children will be separated by comma characters.
  - `xs:choice` - Its children will be separated by `/` characters.

- **Children** - Displays the list of component's children.
• **Instance** - Displays an XML instance generated based on each schema element.
• **Used by** - Displays the list of all the components that reference the current one. The list is sorted by component type and name.
• **Properties** - Displays some of the component's properties.
• **Facets** - Displays the facets for each simple type
• **Identity constraints** - Displays the identity constraints for each element. For each constraint there are presented the name, type (unique, key, keyref), reference attribute, selector and field(s).
• **Attributes** - Displays the attributes for the component. For each attribute there are presented the name, type, fixed or default value, usage and annotation.
• **Asserts** - Displays the assert elements defined in a complex type. The test, XPath default namespace, and annotation are presented for each assert.
• **Annotations** - Displays the annotations for the component. If you choose **Escape XML Content**, the XML tags are present in the annotations.
• **Source** - Displays the text schema source for each component.
• **Generate index** - Displays an index with the components included in the documentation.
  ◦ **Include local elements and attributes** - If selected, local elements and attributes are included in the documentation index.
  ◦ **Include resource hierarchy** - Specifies whether or not the resource hierarchy for an XML Schema documentation is generated. It is deselected by default.

**Export settings** - Save the current settings in a settings file for further use (for example, with the exported settings file you can generate the same documentation from the command line interface (page 1086).)

**Import settings** - Reloads the settings from the exported file.

**Generate** - Use this button to generate the XML Schema documentation.

**Related Information:**

- Customizing PDF or DocBook Output of Generated XML Schema Documentation (page 1085)

**Output Formats for Generating XML Schema Documentation**

XML Schema documentation can be generated in HTML, PDF, DocBook, or a custom format. You can choose the format from the Schema Documentation (page 1076) dialog box. For the PDF and DocBook formats, the option to split the output in multiple files is not available.
**HTML Output Format**

The XML Schema documentation generated in HTML format contains images corresponding to the same schema definitions as the ones displayed by the schema diagram editor. (page 505) These images are divided in clickable areas that are linked to the definitions of the names of types or elements. The documentation of a definition includes a **Used By** section with links to the other definitions that reference it. If the **Escape XML Content** option is unchecked, the HTML or XHTML tags used inside the `xs:documentation` elements of the input XML Schema for formatting the documentation text (for example, `<b>`, `<i>`, `<u>`, `<ul>`, `<li>`, etc.) are rendered in the generated HTML documentation.

The generated images format is **PNG**. The image of an XML Schema component contains the graphical representation of that component as it is rendered in the schema diagram panel of the Oxygen XML Editor plugin XSD editor panel. (page 505)

*Figure 450: XML Schema Documentation Example*

The generated documentation includes a table of contents. You can group the contents by namespace, location, or component type. After the table of contents there is some information about the main, imported, included, and redefined schemas. This information contains the schema target.
namespace, schema properties (attribute form default, element form default, version), and schema location.

**Figure 451: Information About a Schema**

<table>

<td>Properties</td>
<td>Attribute Form Default: unqualified</td>
</tr>
<tr>

<td>Element Form Default: unqualified</td>
</tr>
<tr>

</tbody>
</table>

If you choose to split the output into multiple files, the table of contents is displayed in the left frame. The contents are grouped in the same mode. If you split the output by location, each file contains a schema description and the components that you have chosen to include. If you split the output by namespace, each file contains information about schemas from that namespace and the list with all included components. If you choose to split the output by component, each file contains information about a schema component.

After the documentation is generated, you can collapse or expand details for some schema components by using the **Showing** options or the **Collapse** or **Expand** buttons.

**Figure 452: Showing Options**

For each component included in the documentation, the section presents the component type follow by the component name. For local elements and attributes, the name of the component is specified as `parent name/component name`. You can easily go to the parent documentation by clicking the parent name.

**Figure 453: Documentation for a Schema Component**
If the schema contains imported or included modules, their dependencies tree is generated in the documentation.

Figure 454: Example: Generated Documentation
PDF Output Format

For the PDF output format, the documentation is generated in DocBook format and a transformation using the FOP processor is applied to obtain the PDF file. To configure the FOP processor, see the FO Processors (page 164) preferences page.

For information about customizing the PDF output, see Customizing PDF or DocBook Output of Generated XML Schema Documentation (page 1085).

DocBook Output Format

If you generate the documentation in DocBook output format, the documentation is generated as a DocBook XML file. You can then apply a built-in DocBook transformation scenario (page 1409) (such as, DocBook PDF or DocBook HTML) on the output file, or configure your own transformation scenario (page 1415) to convert it into whatever format you desire.

For information about customizing the DocBook output, see Customizing PDF or DocBook Output of Generated XML Schema Documentation (page 1085).

DITA Output Format

If you generate the documentation in DITA output format, each element of the schema is converted to a DITA Topic and all the generated topics are referenced in a DITA map (page 2705) file. You can then apply a built-in DITA transformation scenario (page 1383) (such as, DITA Map PDF or DITA Map XHTML), or configure your own DITA OT transformation scenario (page 1444) to convert it into whatever format you desire.

For information about customizing the DITA output, see Customizing DITA Output of Generated XML Schema (page 1086).

Custom Output Format

For the custom format, you can specify a stylesheet to transform the intermediary XML file generated in the documentation process. You have to edit your stylesheet based on the schema xsdDocSchema.xsd from [OXYGEN_INSTALL_DIR]/frameworks/schema_documentation. You can create a custom format starting from one of the stylesheets used in the built-in HTML, PDF, DocBook, and DITA formats. These stylesheets are available in [OXYGEN_INSTALL_DIR]/frameworks/schema_documentation/xsl.

When using a custom format you can also copy additional resources into the output folder and choose to keep the intermediate XML files created during the documentation process.
**Important:** If you create a custom format for DITA, you must select the *Split output into multiple files* option in the Output tab (page 1078) and choose *Split by component*.

Customizing PDF or DocBook Output of Generated XML Schema Documentation

To customize the PDF or DocBook output of the generated XML Schema documentation, use the following procedure:

1. Customize the \([OXYGEN\_INSTALL\_DIR]/frameworks/schema\_documentation/xsl/xsdDocDocbook.xsl\) stylesheet to include the content that you want to add in the PDF or DocBook output. Add the content in the XSLT template with the `match="schemaDoc"` attribute between the `info` and `xsl:apply-templates` elements, as commented in the following example:

   ```xml
   <info>
     <pubdate>
       <xsl:value-of select="format-date(current-date(),
       '([Mn] [D], [Y]', 'en', (), ())'/></pubdate>
     </info>
   <!-- Add the XSLT template content with match="schemaDoc" attribute here -->

   <xsl:apply-templates select="schemaHierarchy"/>
   ```

2. Create an intermediary file that holds the content of your XML Schema documentation by following these steps:
   a. Go to *Tools > Generate Documentation > XML Schema Documentation*.
   b. Select *Custom* for the output format and click the *Options* button.
   c. In the *Custom format options* dialog box, do the following:
      i. Enter the customized stylesheet in the *Custom XSL* field (`\([OXYGEN\_INSTALL\_DIR]/frameworks/schema\_documentation/xsl/xsdDocDocbook.xsl\)`).
      ii. Select the *Copy additional resources to the output folder* option and leave the default selection in the *Resources* field.
      iii. Click *OK*.
   d. When you return to the *XML Schema Documentation* dialog box, just press the *Generate* button to generate a DocBook XML file with an intermediary form of the Schema documentation.

3. If you want the DocBook file to be transformed into a PDF document, follow these steps:
   a. Use the *Configure Transformation Scenario(s)* action from the toolbar or the *XML* menu, click *New*, and select *XML transformation with XSLT*.
   b. In the *New Scenario* dialog box, go to the *XSL URL* field and choose the `\([OXYGEN\_INSTALL\_DIR]/frameworks/docbook/oxygen/xsdDocDocbookCustomizationFO.xsl\)` file.
c. Go to the **FO Processor** tab and select the **Perform FO Processing and XSLT result as input** options.
d. Go to the **Output** tab and select the directory where you want to store the XML Schema documentation output and click **OK**.
e. Click **Apply Associated**.

**Customizing DITA Output of Generated XML Schema**

To customize the DITA output of the generated XML Schema documentation, use the following procedure:

1. Customize the `{OXYGEN_INSTALL_DIR}/frameworks/schema_documentation/xsl/xsdDocDita.xsl` stylesheet to incorporate your desired changes.
2. Create an intermediary file that holds the content of your XML Schema documentation by following these steps:
   a. Go to **Tools > Generate Documentation > XML Schema Documentation**.
   b. Select **Custom** for the output format and click the **Options** button.
   c. In the **Custom format options** dialog box, do the following:
      i. Enter the customized stylesheet in the **Custom XSL** field (`{OXYGEN_INSTALL_DIR}/frameworks/schema_documentation/xsl/xsdDocDita.xsl`).
      ii. Select the **Copy additional resources to the output folder** option and leave the default selection in the **Resources** field.
      iii. Click **OK**.
   d. Make sure the **Split output into multiple files** option (page 1078) is selected and choose **Split by component**.
   e. When you return to the **XML Schema Documentation** dialog box, just press the **Generate** button to generate a DITA map file that contains the XML Schema documentation.

**Generating XML Schema Documentation From the Command-Line Interface**

You can export the settings of the **XML Schema Documentation** dialog box (page 1076) to an XML file by pressing the **Export settings** button. With the exported configuration file, you can generate the same documentation from the command-line interface by running the following script:

- `schemaDocumentation.bat` on Windows.
- `schemaDocumentation.sh` on OS X / Linux.

The script is located in the Oxygen XML Editor plugin installation folder. The script can be integrated in an external batch process launched from the command-line interface. The script accepts a variety of command-line arguments that allow you to configure the documentation.
The accepted syntax and arguments are as follows:

```
```

- **schemaFile**
  The XML Schema file.

- **-cfg:configFile**
  The exported configuration file. It contains the output file, output format options, split method, and some advanced options regarding the included components and components details. If an external configuration file is specified, all other supplied arguments except for the XML Schema file will be ignored.

- **-out:outputFile**
  The file where the generated documentation will be saved. By default, it is the name of the schema file with an *html* extension.

- **-format:<value>**
  The output format type used when generating the documentation. Possible values are as follows:

  - *html* - To generate documentation in HTML format.
  - *pdf* - To generate documentation in PDF format.
  - *docbook* - To generate documentation in DocBook format.
  - *custom* - To generate documentation in a custom format.

- **-xsl:<xslFile>**
  The XSL file to be applied on the intermediate XML format. If there is no XSL file provided, the result will be in the HTML format.

- **-split:<value>**
  The split method used when generating the documentation. Splitting is recommended for large schemas. Possible values are as follows:

  - *none* (default value) - To generate one single output file.
  - *namespace* - To generate an output file for every namespace in the schema.
  - *component* - To generate an output file for every component in the schema.
  - *location* - To generate an output file for every schema location.

- **-openInBrowser:<value>**
Opens the result of the transformation in a browser or system application. Possible values are true or false (default value).

--help | -help | --h | -h

Displays the available options.

Example:

Example of the script in a Windows command line:

```

   -format:custom -xsl:example.xsl -split:namespace

Converting Schema to Another Schema Language

The Generate/Convert Schema tool allows you to convert a DTD or Relax NG (full or compact syntax) schema or a set of XML files to an equivalent XML Schema, DTD or Relax NG (full or compact syntax) schema. Where perfect equivalence is not possible due to limitations of the target language, Oxygen XML Editor plugin generates an approximation of the source schema. Oxygen XML Editor plugin uses Trang multiple format converter to perform the actual schema conversions.

To use this tool, select the Generate/Convert Schema (Ctrl + Shift + BackSlash (Command + Shift + BackSlash on OS X)) action from the XML Tools menu. This action opens the Generate/Convert Schema dialog box that allows you to configure various options for conversion.

Figure 455: Generate/Convert Schema Dialog Box
The **Generate/Convert Schema** dialog box includes the following options:

**Input section**

Allows you to select the language of the source schema. If the conversion is based on a set of XML files, rather than just a single XML file, select the **XML Documents** option and use the file selector to add the XML files involved in the conversion.

**Output section**

Allows you to select the language of the target schema.

**Options**

You can choose the **Encoding**, the maximum **Line width**, and the **Indent size** (in number of spaces) for one level of indentation.

**Output file**

Specifies the path for the output file that will be generated.

**Close dialog when finished**

If you deselect this option, the dialog box will remain opened after the conversion so that you can easily continue to convert more files.

**Advanced options**

If you select **XML 1.0 DTD** for the input, you can click this button to access more advance options to further fine-tune the conversion. The following advanced options are available:

**XML 1.0 DTD Input section**

These options apply to the source DTD:

- **xmlns** - Specifies the default namespace, that is the namespace used for unqualified element names.
- **attlist-define** - Specifies how to construct the name of the definition representing an attribute list declaration from the name of the element. The specified value must contain exactly one percent character. This percent character is replaced by the name of element (after colon replacement) and the result is used as the name of the definition.
- **colon-replacement** - Replaces colons in element names with the specified chars when constructing the names of definitions used to represent the element declarations and attribute list declarations in the DTD.
• **any-name** - Specifies the name of the definition generated for the content of elements declared in the DTD as having a content model of ANY.

• **element-define** - Specifies how to construct the name of the definition representing an element declaration from the name of the element. The specified value must contain exactly one percent character. This percent character is replaced by the name of element (after colon replacement) and the result is used as the name of the definition.

• **annotation-prefix** - Default values are represented using an annotation attribute `prefix:defaultValue` where prefix is the specified value and is bound to `http://relaxng.org/ns/compatibility/annotations/1.0` as defined by the RELAX NG DTD Compatibility Committee Specification. By default, the conversion engine will use a for prefix unless that conflicts with a prefix used in the DTD.

• **inline-attlist** - Instructs the application not to generate definitions for attribute list declarations, but instead move attributes declared in attribute list declarations into the definitions generated for element declarations. This is the default behavior when the output language is XSD.

• **strict-any** - Preserves the exact semantics of ANY content models by using an explicit choice of references to all declared elements. By default, the conversion engine uses a wildcard that allows any element.

• **generate-start** - Specifies whether or not the conversion engine should generate a start element. DTD's do not indicate what elements are allowed as document elements. The conversion engine assumes that all elements that are defined but never referenced are allowed as document elements.

• **xmlns mappings** table - Each row specifies the prefix used for a namespace in the input schema.

**W3C XML Schema Output section**

This section is available if you select **W3C XML Schema** for the output.

• **disable-abstract-elements** - Disables the use of abstract elements and substitution groups in the generated XML Schema. This can also be controlled using an annotation attribute.

• **any-process-contents** - One of the values: strict, lax, skip. Specifies the value for the `processContents` attribute of any elements. The default is skip (corresponding to RELAX NG semantics) unless the
input format is DTD, in which case the default is strict (corresponding to DTD semantics).

• **any-attribute-process-contents** - Specifies the value for the processContents attribute of anyAttribute elements. The default is skip (corresponding to RELAX NG semantics).

Converting Database to XML Schema

Oxygen XML Editor plugin includes a tool that allows you to create an XML Schema from the structure of a database.

To convert a database structure to an XML Schema, use the following procedure:

1. Select the **Convert DB Structure to XML Schema** action from the **Tools** menu.

   **Result:** The **Convert DB Structure to XML Schema** dialog box is opened and your current database connections are displayed in the **Connections** section.

2. If the database source is not listed, click the **Configure Database Sources** button to open the **Data Sources preferences page (page 60)** where you can configure data sources and connections.

3. In the **Format for generated schema** section, select one of the following formats:

   • **Flat schema** - A flat structure that resembles a tree-like view of the database without references to elements.

   • **Hierarchical schema** - Display the table dependencies visually, in a type of tree view where dependent tables are shown as indented child elements in the content model. Select this option if you want to configure the database columns of the tables to be converted.

4. Click **Connect**.

   **Result:** The database structure is listed in the **Select database tables** section according to the format you chose.

5. Select the database tables that you want to be included in the XML Schema.

6. If you selected **Hierarchical schema** for the format, you can configure the database columns.
   
   a. Select the database column you want to configure.
   
   b. In the **Criterion** section you can choose to convert the selected database column as an **Element**, **Attribute**, or to be **Skipped** in the resulting XML Schema.

   c. You can also change the name of the selected database column by changing it in the **Name** text field.

7. Click **Generate XML Schema**.

   **Result:** The database structure is converted to an XML Schema and it is opened for viewing and editing.
Flatten an XML Schema

You can organize an XML schema linked by `xs:include` and `xs:import` statements on several levels. In some cases, working on such a schema as if it were a single file is more convenient than working on multiple files separately. The **Flatten Schema** operation allows you to flatten an entire hierarchy of XML schemas. Starting with the main XML schema, Oxygen XML Editor plugin calculates its hierarchy by processing the `xs:include` and `xs:import` statements.

The **Flatten Schema** action is available from the **Refactoring** submenu in the contextual menu in **Text** mode. The action opens the **Flatten Schema** dialog box that allows you to configure the operation.

![Flatten Schema Dialog Box](image)

For the main schema file and for each imported schema, a new flattened schema is generated in the specified output folder. These schemas have the same name as the original ones.

**Note:** If necessary, the operation renames the resulted schemas to avoid duplicated file names.

A flattened XML schema is obtained by recursively adding the components of the included schemas into the main one. This means Oxygen XML Editor plugin replaces the `xs:include`, `xs:redefine`, and `xs:override` elements with the ones coming from the included files.
Options in the Flatten Schema Dialog Box

The following options are available in the Flatten Schema dialog box:

**File name**

The name of the output file.

**Output directory**

The path of the output directory where the flattened schema file will be saved.

**Open the flattened XML Schema file in editor**

Opens the main flattened schema in the editing area after the operation completes.

**Use the XML Catalogs when collecting the referenced XML Schemas**

Enables the imported and included schemas to be resolved through the available XML Catalogs (page 2712).

[Note: Changing this option triggers the recalculation of the dependencies graph for the main schema.]

**Process the imported XML Schemas resolved through the XML Catalogs**

Specifies whether or not the imported schemas that were resolved through an XML Catalog (page 2712) are also processed.

**Flatten the imported XML Schema(s)**

Specifies whether or not the imported schemas are flattened.

[Note: For the schemas skipped by the flatten operation, no files are created in the output folder and the corresponding import statements remain unchanged.]

Flatten Schema from the Command Line

The Flatten Schema tool can be also ran from command line by using the following command:

- `flattenSchema.bat` on Windows
- `sh flattenSchema.sh` on OS X and Linux

The command line accepts the following parameters:

- `-in:inputSchemaURL` - The input schema URL.
- `-outDir:outputDirectory` - The directory where the flattened schemas should be saved.
- `-flattenImports:<boolean_value>` - Controls whether or not the imported XML Schemas should be flattened. The default value `true`.
• `-useCatalogs:<boolean_value>` - Controls if the references to other XML Schemas should be resolved through the available XML Catalogs (page 2712). The default value is `false`.
• `-flattenCatalogResolvedImports:<boolean_value>` - Controls whether or not the imported schemas that were resolved through the XML Catalogs (page 2712) should be flattened. The default value is `true`.

**Note:** This option is used only when `-useCatalogs` is set to `true`.

• `-verbose` - Provides information about the current flatten XML Schema operation.
• `--help | -help | --h | -h` - Prints the available parameters for the operation.

**Example: Command-Line Example for Windows**

```
flattenSchema.bat -in:http://www.w3.org/MarkUp/SCHEMA/xhtml11.xsd
   -outDir:mySchemas/flattened/xhtml -flattenImports:true -useCatalogs:true
   -flattenCatalogResolvedImports:true -verbose
```

**Example: Command-Line Example for OS X**

```
sh flattenSchema.sh -in:http://www.w3.org/MarkUp/SCHEMA/xhtml11.xsd
   -outDir:mySchemas/flattened/xhtml -flattenImports:true -useCatalogs:true
   -flattenCatalogResolvedImports:true -verbose
```

**Example: Command-Line Example for Unix/Linux**

```
sh flattenSchema.sh -in:http://www.w3.org/MarkUp/SCHEMA/xhtml11.xsd
   -outDir:mySchemas/flattened/xhtml -flattenImports:true -useCatalogs:true
   -flattenCatalogResolvedImports:true -verbose
```

**XML Schema Regular Expressions Builder**

The XML Schema regular expressions builder allows you to test regular expressions on a fragment of text as they are applied to an XML instance document. Start the tool by selecting XML Schema Regular Expressions Builder from the XML Tools menu.

**Figure 457: XML Schema Regular Expressions Builder Dialog Box**
The dialog box contains the following:

**Regular expressions editor**

Allows you to edit the regular expression to be tested and used. Content completion is available and presents a list with all the predefined expressions. It is triggered by pressing **Ctrl + Space (Command + Space on OS X)**.

**Error display area**

If the edited regular expression is incorrect, an error message will be displayed here. The message contains the description and the exact location of the error. Also, clicking the quick navigation button (†) highlights the error inside the regular expression.

**Category**

You can choose from several categories of predefined expressions. The selected category influences the displayed expressions in the **Available expressions** table.

**Available expressions**

This table includes the available regular expressions and a short description for each of them. The set of expressions depends on the category selected in the previous **Category** combo box. You can add an expression in the **Regular expressions editor** by double-clicking the expression row in the table. You will notice that in the case of **Character categories** and **Block names**, the expressions are also listed in complementary format.
Evaluate expression on

You can choose between two options:

- **Evaluate expression on each line** - The edited expression will be applied on each line in the Test area.
- **Evaluate expression on all text** - The edited expression will be applied on the whole text.

Test

A text editor that allows you to enter a text sample for which the regular expression will be applied. All matches of the edited regular expression will be highlighted.

After editing and testing your regular expression you can insert it in the current editor. The Insert button will become active when an editor is opened in the background and there is an expression in the Regular expressions editor.

The regular expression builder cannot be used to insert regular expressions in the Grid mode (page 292) or schema Design mode (page 505). Accordingly, the Insert button will be not available if the current document is edited in these modes.

⚠️ **Note:** Some regular expressions may indefinitely block the Java Regular Expressions engine. If the execution of the regular expression does not end in about five seconds, the application displays a dialog box that allows you to interrupt the operation.

XML Schema 1.1

Oxygen XML Editor plugin offers full support for XML Schema 1.1, including:

- XML Documents Validation (page 854) and Content Completion (page 627) based on XML Schema 1.1.
- XML Schema 1.1 Validation (page 1050) and Content Completion (page 1052).
- Editing XML Schema 1.1 files in the Schema Design mode (page 505).
- The Flatten Schema (page 1092) action.
- Resource Hierarchy/Dependencies (page 1061) and Refactoring Actions (page 1066).
- Master files (page 2708).
- Support for generating XML instances based on XML Schema.
- Support for validating XML documents with an NVDL schema that contains an XML Schema 1.1 validation step.
**Note:** To enable XML Schema 1.1 validation in NVDL, you need to pass the following option to the validation engine to specify the schema version: http://www.thaiopensource.com/validate/xsd-version (the possible values are 1.0 or 1.1).

**Tip:** To enable the full XPath expression in assertions and type alternatives, you need to set the http://www.thaiopensource.com/validate/full-xpath option.

XML Schema 1.1 is a superset of XML Schema 1.0, that offers lots of new powerful capabilities.

*Figure 458: XML Schema 1.1*

![XML Schema 1.1 diagram]

The significant new features in XSD 1.1 are:

- **Assertions** - Support to define assertions against the document content using XPath 2.0 expressions (an idea borrowed from Schematron).
- **Conditional type assignment** - The ability to select the type of schema an element is validated against, based on the values of the attribute of the element.
- **Open content** - Content models can use the `openContent` element to specify content models with `open content`. These content models allow elements not explicitly mentioned in the content model to appear in the document instance. It is as if wildcards were automatically inserted at appropriate points within the content model. A default may be set that causes all content models to be open unless specified otherwise.

To see the complete list with changes since version 1.0, go to http://www.w3.org/TR/xmlschema11-1/#ch_specs.

XML Schema 1.1 is intended to be mostly compatible with XML Schema 1.0 and to have approximately the same scope. It also addresses bug fixes and brings improvements that are consistent with the constraints on scope and compatibility.
**Note:** An XML document conforming to a 1.0 schema can be validated using a 1.1 validator, but an XML document conforming to a 1.1 schema may not validate using a 1.0 validator.

If you are constrained to use XML Schema 1.0 (for example, if you develop schemas for a server that uses an XML Schema 1.0 validator that cannot be updated), change the default XML Schema version to 1.0. If you keep the default XML Schema version set to 1.1, the *Content Completion Assistant* (page 2704) presents XML Schema 1.1 elements that you can insert accidentally in an 1.0 XML Schema. So even if you make a document invalid conforming with XML Schema 1.0, the validation process does not signal any issues.

To change the default XML Schema version, open the **Preferences** dialog box (page 55) and go to **XML > XML Parser > XML Schema**.

### Setting the XML Schema Version

Oxygen XML Editor plugin lets you set the version of the XML Schema you are editing either in the **XML Schema** preferences page, or through the versioning attributes. If you want to use the versioning attributes, set the `minVersion` and `maxVersion` attributes, from the `http://www.w3.org/2007/XMLSchema-versioning` namespace, on the `schema` root element.

**Note:** The versioning attributes take priority over the XML Schema version defined in the preferences page.

<table>
<thead>
<tr>
<th>Versioning Attributes</th>
<th>XML Schema Version</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>minVersion = &quot;1.0&quot;</code></td>
<td>1.0</td>
</tr>
<tr>
<td><code>maxVersion = &quot;1.1&quot;</code></td>
<td>1.1</td>
</tr>
<tr>
<td><code>minVersion = &quot;1.0&quot;</code></td>
<td>The XML Schema version defined in the XML Schema preferences page (page 176)</td>
</tr>
<tr>
<td><code>maxVersion = greater than &quot;1.1&quot;</code></td>
<td>The XML Schema version defined in the XML Schema preferences page (page 176)</td>
</tr>
<tr>
<td>Not set in the XML Schema document</td>
<td>The XML Schema version defined in the XML Schema preferences page (page 176)</td>
</tr>
</tbody>
</table>
To change the XML Schema version of the current document, use the **Change XML Schema version** action from the contextual menu. This is available both in the **Text** mode, and in the **Design** mode and opens the **Change XML Schema version** dialog box. The following options are available:

- **XML Schema 1.0** - Inserts the `minVersion` and `maxVersion` attributes on the `schema` element and gives them the values "1.0" and "1.1" respectively. Also, the namespace declaration (`xmlns:vc=http://www.w3.org/2007/XMLSchema-versioning`) is inserted automatically if it does not exist.

- **XML Schema 1.1** - Inserts the `minVersion` attribute on the `schema` element and gives it the value "1.1". Also, removes the `maxVersion` attribute if it exists and adds the versioning namespace (`xmlns:vc=http://www.w3.org/2007/XMLSchema-versioning`) if it is not declared.

- **Default XML Schema version** - Removes the `minVersion` and `maxVersion` attributes from the `schema` element. The default schema version, defined in the **XML Schema** preferences page, is used.

**Note:** The **Change XML Schema version** action is also available in the informative panel presented at the top of the edited XML Schema. If you close this panel, it will no longer appear until you restore Oxygen XML Editor plugin to its default options.

Oxygen XML Editor plugin automatically uses the version set through the versioning attributes, or the default version if the versioning attributes are not declared, when proposing content completion elements and validating an XML Schema. Also, the XML instance validation against an XML Schema is aware of the versioning attributes defined in the XML Schema.

When you generate sample XML files from an XML Schema, Oxygen XML Editor plugin takes into account the `minVersion` and `maxVersion` attributes defined in the XML Schema.

**Editing XQuery Documents**

XQuery is the query language for XML and is officially defined by a [W3C Recommendation document](https://www.w3.org/TR/xquery/). Oxygen XML Editor plugin provides support for XQuery 3.1, which is also backwards compatible with XQuery 3.0 and 1.0.

The many benefits of XQuery include:
• XQuery allows you to work in one common model no matter what type of data you are working with: relational, XML, or object data.
• XQuery is ideal for queries that must represent results as XML, to query XML stored inside or outside the database, and to span relational and XML sources.
• XQuery allows you to create many different types of XML representations of the same data.
• XQuery allows you to query both relational sources and XML sources, and create one XML result.

XQuery Validation

With Oxygen XML Editor plugin, you can validate your documents before using them in your transformation scenarios. The validation uses the Saxon 9.8.0.12 PE, EE, or HE processor, or you can use some database engines (such as MarkLogic or eXist) if you installed them. Any other XQuery processor that offers an XQJ API implementation (page 1973) can also be used. This is in conformance with the XQuery Working Draft. The processor is used in two cases: validation of the expression and execution. Although the execution implies a validation, it is faster to check the expression syntactically, without executing it. The errors that occurred in the document are presented in the messages view at the bottom of editor window, with a full description message. As with all error messages, if you click an entry, the line where the error appeared is highlighted.

Figure 459: XQuery Validation
Note: If you choose a processor that does not support XQuery validation, Oxygen XML Editor plugin displays a warning when trying to validate.

When you open an XQuery document from a connection that supports validation (for example, MarkLogic, or eXist), by default Oxygen XML Editor plugin uses this connection for validation. If you open an XQuery file using a MarkLogic connection, the validation resolves imports better.

Content Completion in XQuery

Oxygen XML Editor plugin provides content completion for keywords and all known XQuery functions and operators. The Content Completion Assistant (page 2704) can be manually activated with the (Ctrl (Meta on Mac OS)+Space) shortcut. The functions and operators are presented together with a description of the parameters and functionality, depending on the validation or transformation engine.

For some supported database engines such as MarkLogic, eXist, and Berkeley DB, the content completion list offers the specific XQuery functions implemented by that engine. This feature is available when the XQuery file has an associated transformation scenario that uses one of these database engines or the XQuery validation engine is set to one of them via a validation scenario or in the XQuery Preferences (page 185) page. For more information about the support for working with XQuery with regards to databases, see XQuery and Databases (page 1980).

The extension functions included in the Saxon engine are available on content completion if one of the following conditions are true:

- The edited file has a transformation scenario associated that uses as transformation engine Saxon 9.8.0.12 PE or Saxon 9.8.0.12 EE.
- The edited file has a validation scenario associated that use as validation engine Saxon 9.8.0.12 PE or Saxon 9.8.0.12 EE.
- The validation engine specified in Preferences (page 185) is Saxon 9.8.0.12 PE or Saxon 9.8.0.12 EE.

If the Saxon namespace (http://saxon.sf.net) is mapped to a prefix, the functions are presented using this prefix. Otherwise, the default prefix for the Saxon namespace (saxon) is used.

If you want to use a function from a namespace mapped to a prefix, just type that prefix and the content completion displays all the XQuery functions from that namespace. When the default namespace is mapped to a prefix, the XQuery functions from this namespace offered by content completion are also prefixed. Otherwise, only the function name being used.

The content completion pop-up window presents all the variables and functions from both the edited XQuery file and its imports.
Syntax Highlighting in XQuery

Oxygen XML Editor plugin supports syntax highlighting in Text mode to make it easier to read the semantics of the structured content by displaying each type of code in different colors and fonts.

To customize the colors or styles used for the syntax highlighting colors for XQuery files, follow these steps:

1. Open the Preferences dialog box (page 55).
2. Go to Editor > Syntax Highlight (page 149).
3. Select and expand the XQuery/XPath section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.

You can see the effects of your changes in the Preview pane.

Related Information:

- Customize Syntax Highlight colors (page 149)

Formatting and Indenting XQuery Documents

Editing XQuery documents may lead to large chunks of content that are not easily readable by human audience. Also, each developer may have a particular way of writing XQuery code. Oxygen XML Editor plugin assists you in maintaining a consistent code writing style with the Format and Indent action that is available in the Document > Source menu and also on the toolbar.

The Format and Indent action achieves this by performing the following steps:

- Manages whitespaces, by collapsing or inserting space characters where needed.
• Formats complex expressions on multiple, more readable lines by properly indenting each of them. The amount of whitespaces that form an indent unit is controlled through one of the **Indent with tabs** and **Indent size** options from the **Format Preferences** page (page 135).

**Note:** These operations can be performed only if your XQuery document conforms with XQuery 1.0, 3.0, 3.1, or XQuery Update Facility 1.0 specifications. If the **Format and Indent** operation fails, the document is left unaltered and an error message is presented in the **Results view** (page 267).

### Folding in XQuery Documents

In a large XQuery document, the instructions enclosed in the '{' and '}' characters can be collapsed so that only the needed instructions remain in focus. The same **folding features available for XML documents** (page 625) are also available in XQuery documents.

**Figure 461: Folding in XQuery Documents**

```xml
let $mainRating := min($review/reviews/review[$movie-id = $movie-id]/rating)
return
<movie id="{$movie/@id}" >
  {$movie/title}
  {$movie/year}
  <avgRating>
    { if ($avgRating) then $avgRating else "not rated" }
  </avgRating>
  <maxRating> <value> </value> </maxRating>
  <minRating> <value> </value> </minRating>
</movie>
```

There is available the action **Go to Matching Bracket** `Ctrl + Shift + G` on contextual menu of XQuery editor for going to matching character when cursor is located at '{' character or '}' character. It helps for finding quickly matching character of current **folding element** (page 2706).

### XQuery Outline View

The XQuery document structure is presented in the **Outline** view. The outline tree presents the list of all the components (namespaces, imports, variables, and functions) from both the edited XQuery file and its imports and it allows quick access to components. By default, it is displayed on the left side of
the editor. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

**Figure 462: XQuery Outline View**

![Image of XQuery Outline View]

The following actions are available in the View menu on the Outline view action bar:

- **Selection update on cursor move**
  Controls the synchronization between Outline view and source document. The selection in the Outline view can be synchronized with the cursor moves or the changes performed in the XQuery editor. Selecting one of the components from the Outline view also selects the corresponding item in the source document.

- **Sort**
  Allows you to alphabetically sort the XQuery components.

- **Show all components**
  Displays all collected components starting from the current file. This option is set by default.

- **Show only local components**
  Displays the components defined in the current file only.

- **Group by location/namespace/type**
  Allows you to group the components by location, namespace, and type. When grouping by namespace, the main XQuery module namespace is presented first in the Outline view.
If you know the component name, you can search it in the Outline view by typing its name in the filter text field from the top of the view or directly on the tree structure. When you type the component name in the filter text field you can switch to the tree structure using the arrow keys of the keyboard, (Enter), (Tab), (Shift-Tab). To switch from tree structure to the filter text field, you can use (Tab), (Shift-Tab).

**Tip:** The search filter is case insensitive. The following wildcards are accepted:

- `*` - any string
- `?` - any character
- `,` - patterns separator

If no wildcards are specified, the string to search is used as a partial match.

The upper part of the Outline view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (such as `*`, `?`) and separate multiple patterns with commas.

**XQuery Builder View**

The XPath/XQuery Builder view allows you to compose complex XQuery expressions and execute them over the currently edited XML document. You can use the `doc()` function to specify the source file for which the expressions are executed. When you connect to a database, the expressions are executed over that database. If you are using the XPath/XQuery Builder view and the current file is an XSLT document, Oxygen XML Editor plugin executes the expressions over the XML document in the associated scenario.

If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

The upper part of the view contains the following actions:

**XPath version chooser drop-down menu**

A drop-down menu that allows you to select the type of the expression you want to execute. You can choose between:

- XPath 1.0 (Xerces-driven)
- XPath 2.0, XPath 2.0SA, XPath 3.0, XPath 3.0SA, Saxon-HE XQuery, Saxon-PE XQuery, or Saxon-EE XQuery (all of them are Saxon-driven)
- Custom connection to XML databases that can execute XQuery expressions
Note: The results returned by XPath 2.0 SA and XPath 3.0 SA have a location limited to the line number of the start element (there are no column information and no end specified).

Note: Oxygen XML Editor plugin uses Saxon to execute XPath 3.0 expressions. Since Saxon implements a part of the 3.0 functions, when using a function that is not implemented, Oxygen XML Editor plugin returns a compilation error.

Execute XPath button

Use this button to start the execution of the XPath or XQuery expression you are editing. The result of the execution is displayed in the Results view (page 267).

Favorites button

Allows you to save certain expressions that you can later reuse. To add an expression as a favorite, press the star button and enter a name for it. The star turns yellow to confirm that the expression was saved. Expand the drop-down menu next to the star button to see all your favorites. Oxygen XML Editor plugin automatically groups favorites in folders named after the method of execution.

History drop-down menu

Keeps a list of the last 15 executed XPath or XQuery expressions. Use the Clear history action from the bottom of the list to remove them.

Settings drop-down menu

Contains the following three options:

- Update on cursor move
  
  When selected and you navigate through a document, the XPath expression corresponding to the XML node at the current cursor position is displayed. For JSON documents, it displays the XPath expression for the current property.

- Evaluate as you type
  
  When you select this option, the XPath expression you are composing is evaluated in real time.

  Note: This option and the automatic validation are disabled when the scope is other than Current file.

Options
Opens the Preferences page of the currently selected processing engine.

**XPath scope menu**

Oxygen XML Editor plugin allows you to define a scope for which the XPath operation will be executed. You can choose where the XPath expression will be executed:

- **Current file** - Current selected file only.
- **Enclosing project** - All the files of the project that encloses the current edited file.
- **Workspace selected files** - The files selected in the workspace. The files are collected from the last selected resource provider view (Navigator (page 250), Project Explorer or Package Explorer).
- **All opened files** - All files opened in the application.
- **Current DITA Map hierarchy** - All resources referenced in the currently selected DITA map, opened in the DITA Maps Manager view (page 2400).
- **Opened archive** - Files open in the Archive Browser view (page 1910).
- **Working sets** - The selected working sets (page 2712).

At the bottom of the scope menu the following scope configuration actions are available:

- **Configure XPath working sets** - Allows you to configure and manage collections of files and folders, encapsulated in logical containers called working sets (page 2712).
- **XPath file filter** - You can filter the files from the selected scope for which the XPath expression will be executed. By default, the XPath expression will be executed only on XML or JSON files, but you can also define a set of patterns that will filter out files from the current scope.

*Figure 463: XPath/XQuery Builder View*
When you hover your cursor over the version icon (\(\text{\textcopyright}\)), a tooltip is displayed to let you know what engine Oxygen XML Editor plugin is currently using.

While you edit an XPath or XQuery expression, Oxygen XML Editor plugin assists you with the following features:

- **Content Completion Assistant (page 2704)** - It offers context-dependent proposals and takes into account the cursor position in the document you are editing. The set of functions proposed by the Content Completion Assistant also depends on the engine version. Select the engine version from the drop-down menu available in the toolbar.

- Syntax Highlighting - Allows you to identify the components of an expression. To customize the colors of the components of the expression, open the Preferences dialog box (page 55) and go to Editor > Syntax Highlight (page 149).

- Automatic validation of the expression as you type.

\[\text{Note:}\] When you type invalid syntax, a red serrated line underlines the invalid fragments.

- Function signature and documentation balloon, when the cursor is located inside a function.
XSLT/XQuery Input View

The structure of the XML document associated to the edited XSLT stylesheet, or the structure of the source documents of the edited XQuery is displayed in a tree form in a view called the XSLT/XQuery Input view. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu. The tree nodes represent the elements of the documents.

XSLT

If you click a node in the XSLT/XQuery Input view, the corresponding template from the stylesheet is highlighted. A node can be dragged from this view and dropped in the editor area for quickly inserting xsl:template, xsl:for-each, or other XSLT elements that have the match, select, or test attribute already completed. The value of the attribute is the correct XPath expression that refers to the dragged tree node. This value is based on the current editing context of the drop spot.

Figure 464: XSLT Input View

XSLT Example:

For the following XML document:

```xml
<personnel>
    <person id="Big.Boss">
        <name>
            <family>Boss</family>
            <given>Big</given>
        </name>
        <email>chief@oxygenxml.com</email>
        <link subordinates="one.worker"/>
    </person>
    <person id="one.worker">
        <name>
```
and the following XSLT stylesheets:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    version="2.0">
  <xsl:template match="personnel">
    <xsl:for-each select="*">
    </xsl:for-each>
  </xsl:template>
</xsl:stylesheet>
```

if you drag the `given` element and drop it inside the `xsl:for-each` element, the following pop-up menu is displayed:

**Figure 465: XSLT Input Drag and Drop Pop-up Menu**

| 1 | `<xml version="1.0" encoding="UTF-8"?>` |
| 2 | `<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform" version="2.0">` |
| 3 | `<xsl:template match="personnel">
    <xsl:for-each select="*">
    </xsl:for-each>
  </xsl:template>` |
| 4 | `<xsl:for-each select="name/given">` |
| 5 | `<xsl:copy-of>` |
| 6 | `Insert xsl:for-each` |
| 7 | `Insert xsl:apply-templates` |
| 8 | `Insert xsl:if` |
| 9 | `Insert xsl:choose` |
| 10 | `Insert personnel` |

If you select **Insert xsl:copy-of** (for example), the resulting document will look like this:

**Figure 466: XSLT Input Drag and Drop Result**

```xml
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform" version="2.0">
  <xsl:template match="personnel">
    <xsl:for-each select="*">
    </xsl:for-each>
  </xsl:template>
  <xsl:copy-of select="name/given"/>
</xsl:stylesheet>
```
XQuery

You can also use the XSLT/XQuery Input view to drag and drop a node into the editing area to quickly insert XQuery expressions.

Figure 467: XQuery Input View

XQuery Example:

For the following XML documents:

```
<movies>
  <movie id="1">
    <title>The Green Mile</title>
    <year>1999</year>
  </movie>
  <movie id="2">
    <title>Taxi Driver</title>
    <year>1976</year>
  </movie>
</movies>

<reviews>
  <review id="100" movie-id="1">
    <rating>5</rating>
    <comment>It is made after a great Stephen King book.</comment>
    <author>Paul</author>
  </review>
  <review id="101" movie-id="1">
```

```
```
and the following XQuery:

```xml
<review id="104" movie-id="2">
  <rating>4</rating>
  <comment>Robert De Niro is my favorite actor.</comment>
  <author>Maria</author>
</review>
</reviews>
```

and the following XQuery:

```xml
let $review := doc("reviews.xml")
for $movie in doc("movies.xml")/movies/movie
  let $movie-id := $movie/@id
  return <movie id="{$movie/@id}"
    title="{$movie/title}" year="{$movie/year}"
    maxRating="{
      return null;
    }"></maxRating>
</movie>
```

If you drag the `review` element and drop it between the braces, the following pop-up menu is displayed:

**Figure 468: XQuery Input Drag and Drop Pop-up Menu**

Select **FLWOR review**, the resulting document will look like this:

**Figure 469: XQuery Input Drag and Drop Result**
Generating HTML Documentation for an XQuery Document

To generate HTML documentation for an XQuery document, use the XQuery Documentation dialog box. It is opened with the XQuery Documentation action that is available from the XML Tools > Generate Documentation menu or from the Generate XQuery Documentation action from the contextual menu of the Navigator view (page 250).

The dialog box allows you to configure a set of parameters for the process of generating the HTML documentation.

**Figure 470: XQuery Documentation Dialog Box**

The following options are available:

- **Input** - The full path to the XQuery file must be specified in one of the two fields in this section:
  - **URL File** - The URL of the file in which you want to generate the documentation.

```
{ for $review in doc("reviews.xml")/reviews/review
  return
  where (\$review/rating/text(), string(@minRating) | eq 0|
  and (\$review/BookID = \$bookID))
  return $review/author
}
```
- **Folder** - The directory that contains the files for which you want to generate the documentation. You can also specify the XQuery file extensions to be searched for in the specified directory.

- **Default function namespace** - Optional URI for the default namespace for the submitted XQuery.

- **Predefined function namespaces** - Optional, engine-dependent, predefined namespaces that the submitted XQuery refers to. They allow the conversion to generate annotation information to support the presentation component hypertext linking (only if the predefined modules have been loaded into the local xqDoc XML repository).

- **Open in Browser/System Application** - Select this option if you want the result to be opened in the system application associated with that file type.

  **Note:** To set the browser or system application that will be used, go to **Window > Preferences > General > Web Browser** and specify it there. This will take precedence over the default system application settings.

- **Output** - Allows you to specify where the generated documentation is saved on disk.

### Transforming XML Documents Using XQuery

XQuery is similar to XSL stylesheets, both being capable of transforming an XML input into another format. You specify the input URL when you define the transformation scenario (page 1415). The result can be saved and opened in the associated application. You can even run a FO processor (page 1479) on the output of an XQuery. The transformation scenarios may be shared between many XQuery files, are exported (page 200) together with the XSLT scenarios and can be managed in the **Configure Transformation Scenario** dialog box (page 1502), or in the Scenarios view (page 1507). The transformation can be performed on the XML document specified in the XML URL field, or, if this field is empty, the documents referenced from the query expression. The parameters of XQuery transforms must be set in the **Parameters** dialog box (page 1416). Parameters that are in a namespace must be specified using the qualified name (for example, a param parameter in the http://www.oxygenxml.com/ns namespace must be set with the name {http://www.oxygenxml.com/ns}param).

The transformation uses one of the Saxon 9.8.0.12 HE, Saxon 9.8.0.12 PE, Saxon 9.8.0.12 EE processors, a database connection (details can be found in the Working with Databases (page 1916) chapter - in the XQuery transformation (page 1981) section) or any XQuery processor that provides an XQJ API implementation.

The Saxon 9.8.0.12 EE processor also supports XQuery 3.1 transformations.
Display XQuery Result in Sequence View

The result of an XQuery executed on a database can be very large and sometimes only a part of the full result is needed. To avoid the long time necessary for fetching the full result, select the **Present as a sequence option (page 1440)** in the **Output** tab of the **Edit scenario** dialog box. This option fetches only the first chunk of the result. Clicking the **More results available** label that is displayed at the bottom of the **Sequence** view fetches the next chunk of results.

The size of a chunk can be set with the **Size limit of Sequence view option (page 185)**. The **XQuery options** button from the **More results available** label provides a quick access to this option by opening the **XQuery preferences page (page 185)** where the option can be modified.

**Figure 471: XQuery transformation result displayed in Sequence view**

A chunk of the XQuery transformation result is displayed in the **Sequence** view.

**Figure 472: XQuery transformation result displayed in Sequence view**
Tip: You can right-click the results in the Sequence view and if the item is an XML element, the Go to definition action will open the XML file from where the queried node was obtained.

Advanced Saxon HE/PE/EE XQuery Transformation Options

The XQuery transformation scenario allows you to configure advanced options that are specific for the Saxon HE (Home Edition), PE (Professional Edition), and EE (Enterprise Edition) engines. They are the same options as those in the Saxon HE/PE/EE preferences page (page 186) but they are configured as a specific set of transformation options for each transformation scenario, while the values set in the preferences page apply as global options. The advanced options configured in a transformation scenario override the global options defined in the preferences page.

Saxon-HE/PE/EE Options

The advanced options for Saxon 9.8.0.12 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE) are as follows:

Use a configuration file ("-config")

Sets a Saxon 9.8.0.12 configuration file that is used for XQuery transformation and validation scenarios.

Enable Optimizations ("-opt")

This option is selected by default, which means that optimization is enabled. If not selected, the optimization is suppressed, which is helpful when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

Use linked tree model ("-tree:linked")

This option activates the linked tree model.

Recoverable errors ("-warnings")

Specifies how dynamic errors are handled. The following options can be selected:
• **Recover silently** ("silent") - Continues processing without reporting the error.
• **Recover with warnings** ("recover") - Issues a warning but continues processing.
• **Signal the error and do not attempt recovery** ("fatal") - Issues an error and stops processing.

**Strip whitespaces** ("-strip")

Specifies how the *strip whitespaces* operation is handled. You can choose one of the following values:

• **All** ("all") - Strips *all* whitespace text nodes from source documents before any further processing, regardless of any xml:space attributes in the source document.
• **Ignore** ("ignorable") - Strips all *ignorable* whitespace text nodes from source documents before any further processing, regardless of any xml:space attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
• **None** ("none") - Strips *no* whitespace before further processing.

**Saxon-PE/EE Options**

The following advanced options are specific for Saxon 9.8.0.12 Professional Edition (PE) and Enterprise Edition (EE) only:

**Allow calls on extension functions** ("-ext")

If selected, calls on external functions are allowed. Selecting this option is recommended in an environment where untrusted stylesheets may be executed. It also disables user-defined extension elements and the writing of multiple output files, both of which carry similar security risks.

**Saxon-EE Options**

The advanced options that are specific for Saxon 9.8.0.12 Enterprise Edition (EE) are as follows:

**Validation of the source file** ("-val")

Requests schema-based validation of the source file and of any files read using document() or similar functions. It can have the following values:

• **Schema validation** ("strict") - This mode requires an XML Schema and allows for parsing the source documents with strict schema-validation enabled.
• **Lax schema validation** ("lax") - If an XML Schema is provided, this mode allows for parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
• **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

**Validation errors in the result tree treated as warnings ("-outval")**

Normally, if validation of result documents is requested, a validation error is fatal. Selecting this option causes such validation failures to be treated as warnings.

**Write comments for non-fatal validation errors of the result document**

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

**Enable XQuery update ("-update:(on|off)")**

This option controls whether or not XQuery update syntax is accepted. The default value is off.

**Backup files updated by XQuery ("-backup:(on|off)")**

If selected, backup versions for any XML files updated with an XQuery Update are generated. This option is available when the Enable XQuery update option is selected.

**Other Options**

**Initializer class**

Equivalent to the \(-init\) Saxon command-line argument. The value is the name of a user-supplied class that implements the net.sf.saxon.lib.Initializer interface. This initializer is called during the initialization process, and may be used to set any options required on the configuration programatically. It is particularly useful for tasks such as registering extension functions, collations, or external object models, especially in Saxon-HE where the option cannot be set via a configuration file. Saxon only calls the initializer when running from the command line, but the same code may be invoked to perform initialization when running user application code.

**Updating XML Documents using XQuery Update 1.0**

Using the bundled Saxon 9.8.0.12 EE XQuery processor Oxygen XML Editor plugin offers support for XQuery Update 1.0. The XQuery Update Facility provides expressions that can be used to make persistent changes to instances of the XQuery 1.0 and XPath 2.0 Data Model. Thus, besides querying XML documents, you can modify them using the various insert/delete/modify/create methods available in the XQuery Update 1.0 standard.
Choose Saxon 9.8.0.12 EE as a transformer in the scenario associated with the XQuery files containing update statements and Oxygen XML Editor plugin will notify you if the update was successful.

**Example: Using XQuery Update to modify a tag name in an XML file**

```
rename node doc("books.xml")//publisher[1]/book[1] as "firstBook"
```

**Editing WSDL Documents**

WSDL is an XML format for describing network services as a set of endpoints operating on messages containing either document-oriented or procedure-oriented information. The operations and messages are described abstractly, and then bound to a concrete network protocol and message format to define an endpoint. Related concrete endpoints are combined into abstract endpoints (services).

Oxygen XML Editor plugin provides a special type of editor dedicated to WSDL documents. The WSDL editor offers support for validation, a specialized *Content Completion Assistant (page 2704)*, a component oriented *Outline view (page 1122)*, searching and refactoring operations, and support to generate documentation.

Both WSDL version 1.1 and 2.0 are supported and SOAP versions 1.1 and 1.2. That means that in the location where a SOAP extension can be inserted the *Content Completion Assistant* offers elements from both SOAP 1.1 and SOAP 1.2. Validation of SOAP requests is executed first against a SOAP 1.1 schema and then against a SOAP 1.2 schema. In addition to validation against the XSD schemas, Oxygen XML Editor plugin also checks if the WSDL file conforms with the WSDL specification (available only for WSDL 1.1 and SOAP 1.1).

In the following example you can see how the errors are reported.

Editing WSDL Documents in the Master Files Context

Smaller interrelated modules that define a complex WSDL structure cannot be correctly edited or validated individually, due to their interdependency with other modules. Oxygen XML Editor plugin provides the support for defining the main module (or modules), allowing you to edit any of the imported/included files in the context of the larger WSDL structure.

You can set a main WSDL document either using the master files support from the Navigator view (page 581), or using a validation scenario.

To set a master file using a validation scenario, add validation units that point to the main modules. Oxygen XML Editor plugin warns you if the current module is not part of the dependencies graph computed for the main WSDL document. In this case, it considers the current module as the main WSDL document.

The advantages of editing in the context of a master file (page 2708) include:

- Correct validation of a module in the context of a larger WSDL structure.
- Content Completion Assistant (page 2704) displays all components valid in the current context.
- The Outline view (page 1122) displays the components collected from the entire WSDL structure.

Note: When you edit an XML schema document that has a WSDL document set as master, the validation operation is performed over the master WSDL document.

For more information about editing WSDL documents in the master files context, watch our video demonstration:

https://www.youtube.com/embed/gn_YPD5xDCo

Validating WSDL Documents
By default, WSDL files are validated as you type. To change this, open the Preferences dialog box (page 55), go to Editor > Document Checking, and deselect the Enable automatic validation option (page 109).

To validate a WSDL document manually, select the Validate action from the Validation toolbar drop-down menu or the XML menu. The validation problems are highlighted directly in the editor, making it easy to locate and fix any issues.

Content Completion Assistance in WSDL Documents

The Content Completion Assistant (page 2704) is a powerful feature that enhances the editing of WSDL documents. It helps you define WSDL components by proposing context-sensitive element names. It can be manually activated with the Ctrl + Space (Command + Space on OS X) shortcut.

Another important capability of the Content Completion Assistant is to propose references to the defined components when you edit attribute values. For example, when you edit the type attribute of a binding element, the Content Completion Assistant proposes all the defined port types. Each proposal that the Content Completion Assistant offers is accompanied by a documentation hint.

Note: XML schema specific elements and attributes are offered when the current editing context is the internal XML schema of a WSDL document.

Figure 474: WSDL Content Completion Assistant

Note: If you are using the concept of master files (page 2708) to import/include modules, the Content Completion Assistant collects its components starting from the master files. The master files can be defined in the project or in the associated validation scenario. For more information about the Master Files support in Oxygen XML Editor plugin, see Defining Master Files at Project Level (page 581).

Namespace prefixes in the scope of the current context are presented at the top of the content completion assistance window to speed up the insertion into the document of prefixed elements.
For the common namespaces, such as XML Schema namespace (http://www.w3.org/2001/XMLSchema) or SOAP namespace (http://schemas.xmlsoap.org/wsdl/soap/), Oxygen XML Editor plugin provides an easy mode to declare them by proposing a prefix for these namespaces.

**WSDL Syntax Highlighting**

Oxygen XML Editor plugin supports syntax highlighting in **Text** mode to make it easier to read the semantics of the structured content by displaying each type of code in different colors and fonts.

To customize the colors or styles used for the syntax highlighting colors for WSDL files, follow these steps:

1. Open the **Preferences** dialog box *(page 55)*.
2. Go to **Editor > Syntax Highlight** *(page 149)*.
3. Select and expand the **XML** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.
5. Select the **XML** tab in the **Preview** pane to see the effects of your changes.

**Tip:** Oxygen XML Editor plugin also allows you to specify syntax highlighting colors for specific XML elements and attributes with specific namespace prefixes. This can be done in the **Editor > Syntax Highlight > Elements/Attributes by Prefix** preferences page *(page 150)*.

**Related Information:**

- Customize Syntax Highlight colors *(page 149)*
The **Outline** view for WSDL documents displays the list of all the components (services, bindings, port types and so on) of the currently open WSDL document along with the components of its imports.

If you use the [Master Files support](page 581), the **Outline** view collects the components of a WSDL document starting from the *master files* of the current document.

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

*Figure 476: WSDL Outline View*

The **Outline** view can display both the components of the current document and its XML structure, organized in a tree-like fashion. You can switch between the display modes by using the [*Show XML structure*](page 581) and [*Show components*](page 581) actions in the **View menu** on the **Outline** view action bar. The following actions are available:

- **Filter returns exact matches**
  
  The text filter of the **Outline** view returns only exact matches.

- **Selection update on cursor move**

  Controls the synchronization between the **Outline** view and the current document. The selection in the **Outline** view can be synchronized with the cursor moves or the changes in the WSDL editor. Selecting one of the components from the **Outline** view also selects the corresponding item in the current document.

When the [*Show components*](page 581) option is selected, the following actions are available:
Show XML structure
Displays the XML structure of the current document in a tree-like manner.

Sort
Sorts the components in the Outline view alphabetically.

Show all components
Displays all the components that were collected starting from current document or from the main document, if it is defined.

Show referable components
Displays all the components that you can reference from the current document.

Show only local components
Displays the components defined in the current file only.

Group by location
Groups the WSDL components by their location.

Group by type
Groups the WSDL components by their type.

Group by namespace
Groups the WSDL components by their namespace.

Note: By default, all the three grouping criteria are active.

When the Show XML structure option is selected, the following actions are available:

Show components
Switches the Outline view to the components display mode.

Flat presentation mode of the filtered results
When active, the application flattens the filtered result elements to a single level.

Show comments and processing instructions
Show/hide comments and processing instructions in the Outline view.

Show element name
Show/hide element name.

Show text
Show/hide additional text content for the displayed elements.
Show attributes

Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from the Outline preferences panel (page 197).

Configure displayed attributes

Displays the XML Structured Outline preferences page (page 197).

The following contextual menu actions are available in the Outline view when the Show components option is selected in the View menu:

- Edit Attributes
  Open a dialog box that allows you to edit the attributes of the currently selected component.

- Cut
  Cuts the currently selected component.

- Copy
  Copies the currently selected component.

- Delete
  Deletes the currently selected component.

- Search references
  Searches for the references of the currently selected component.

  Search references in
  Searches for the references of the currently selected component in the context of a scope that you define.

Component dependencies

Opens the Component Dependencies view (page 1130) that displays the dependencies of the currently selected component.

Resource Hierarchy

Opens the Resource Hierarchy/Dependencies view (page 1127) that displays the hierarchy for the currently selected resource.

Resource Dependencies

Opens the Resource Hierarchy/Dependencies view (page 1127) that displays the dependencies of the currently selected resource.

Rename Component in
Renames the currently selected component in the context of a scope that you define.

The following contextual menu actions are available in the Outline view when the Show XML structure option is selected in the View menu:

- **Append Child**
  Displays a list of elements that you can insert as children of the current element.

- **Insert Before**
  Displays a list of elements that you can insert as siblings of the current element, before the current element.

- **Insert After**
  Displays a list of elements that you can insert as siblings of the current element, after the current element.

- **Edit Attributes**
  Opens a dialog box that allows you to edit the attributes of the currently selected component.

- **Toggle Comment**
  Comments/uncomments the currently selected element.

- **Search references**
  Searches for the references of the currently selected component.

- **Search references in**
  Searches for the references of the currently selected component in the context of a scope that you define.

- **Component dependencies**
  Opens the Component Dependencies view (page 1130) that displays the dependencies of the currently selected component.

- **Rename Component in**
  Renames the currently selected component in the context of a scope that you define.

- **Cut**
  Cuts the currently selected component.

- **Copy**
  Copies the currently selected component.

- **Delete**
Deletes the currently selected component.

- **Expand All**
  Expands the structure of a component in the **Outline** view.

- **Collapse All**
  Collapses the structure of all the component in the **Outline** view.

To switch from the tree structure to the text filter, use **Tab** and **Shift-Tab**.

**Tip:** The search filter is case insensitive. The following wildcards are accepted:

- * - any string
- ? - any character
- , - patterns separator

If no wildcards are specified, the string to search is used as a partial match.

The content of the **Outline** view and the editing area are synchronized. When you select a component in the **Outline** view, its definition is highlighted in the editing area.

### WSDL Resource Hierarchy/Dependencies View in WSDL Documents

The **Resource Hierarchy/Dependencies** view allows you to see the hierarchy/dependencies for a WSDL resource. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

**Note:** The hierarchy of a WSDL resource includes the hierarchy of imported XML Schema resources. The dependencies of an XML Schema resource present the WSDL documents that import the schema.

To view the hierarchy of a WSDL document, select the document in the **Navigator view** (page 250) and choose **Resource Hierarchy** from the contextual menu.

*Figure 477: Resource Hierarchy/Dependencies View*
If you want to see the dependencies of a WSDL document, select the document in the Navigator view (page 250) and choose Resource Dependencies from the contextual menu.

Figure 478: Resource Hierarchy/Dependencies View

The following actions are available in the Resource Hierarchy/Dependencies view:

- **Refresh**
  
  Refreshes the Hierarchy/Dependencies structure.

- **Stop**
Stops the hierarchy/dependencies computing.

Show Hierarchy
Allows you to choose a resource to compute the hierarchy structure.

Show Dependencies
Allows you to choose a resource to compute the dependencies structure.

Configure
Allows you to configure a scope to compute the dependencies structure. There is also an option for automatically using the defined scope for future operations.

History
Provides access to the list of previously computed dependencies. Use the Clear history button to remove all items from this list.

The contextual menu contains the following actions:

Open
Opens the resource. You can also double-click a resource in the Hierarchy/Dependencies structure to open it.

Copy location
Copies the location of the resource.

Move resource
Moves the selected resource.

Rename resource
Renames the selected resource.

Show Resource Hierarchy
Shows the hierarchy for the selected resource.

Show Resource Dependencies
Shows the dependencies for the selected resource.

Add to Master Files
Adds the currently selected resource in the Master Files directory (page 581).

Expand All
Expands all the children of the selected resource from the Hierarchy/Dependencies structure.

Collapse All
Collapses all children of the selected resource from the Hierarchy/Dependencies structure.

Tip: When a recursive reference is encountered in the Hierarchy view, the reference is marked with a special icon 🡳.

Note: The Move resource or Rename resource actions give you the option to update the references to the resource (page 1130).

Related Information:

- Search and Refactor Operations Scope (page 904)

Moving/Renaming WSDL Resources

You can move and rename a resource presented in the Resource/Hierarchy Dependencies view, using the Rename resource and Move resource refactoring actions from the contextual menu.

When you select the Rename action in the contextual menu of the Resource/Hierarchy Dependencies view, the Rename resource dialog box is displayed. The following fields are available:

- New name - Presents the current name of the edited resource and allows you to modify it.
- Update references - Select this option to update the references to the resource you are renaming.

When you select the Move action from the contextual menu of the Resource/Hierarchy Dependencies view, the Move resource dialog box is displayed. The following fields are available:

- Destination - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- New name - Presents the current name of the moved resource and gives you the option to change it.
- Update references of the moved resource(s) - Select this option to update the references to the resource you are moving, in accordance with the new location and name.

If the Update references of the moved resource(s) option is selected, a Preview option (which opens the Preview dialog box) is available for both actions. The Preview dialog box presents a list with the resources that are updated.

WSDL Component Dependencies View
The Component Dependencies view allows you to see the dependencies for a selected component. This is helpful if you want to see where components are used in the entire hierarchy. For example, if you want to find all the references where a given component is used.

If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

To see the dependencies of a WSDL component:

1. Right-click the desired component in the editor or Outline view.
2. Select the Component Dependencies action from the contextual menu.

This action is available for all WSDL components (messages, port types, operations, bindings, and so on).

If a component contains multiple references, a small table is displayed at the bottom of the view that contains all the references. When a recursive reference is encountered, it is marked with a special icon.

Figure 479: Component Dependencies View

The Component Dependencies view includes the following toolbar actions:

- **Refresh**
  
  Refreshes the dependencies structure.

- **Stop**
  
  Stops the dependency computation.

- **Configure**
  
  Allows you to choose the search scope for computing the dependencies structure. This is helpful for making sure all imported/included resources are computed.

- **History**
  
  Allows you to select from a list of the most recently used dependency computations.
In addition, the following actions are available in the contextual menu:

**Go to First Reference**

Selects the first reference of the currently selected component in the dependencies tree.

**Go to Component**

Shows the definition of the currently selected component in the dependencies tree.

**Related Information:**

---

**Highlight Component Occurrences in WSDL Documents**

When you position your mouse cursor over a component in a WSDL document, Oxygen XML Editor plugin searches for the component declaration and all its references and highlights them automatically.

Customizable colors are used: one for the component definition and another one for component references. Occurrences are displayed until another component is selected.

To change the default behavior of Highlight Component Occurrences, open the Preferences dialog box *(page 55)* and go to **Editor > Mark Occurrences**. You can also trigger a search using the **Search > Search Occurrences in File** action from contextual menu. Matches are displayed in separate tabs of the **Results view** *(page 267)*.

**Searching and Refactoring Operations in WSDL Documents**

**Search Actions**

The following search actions are available from the **Search** submenu in the contextual menu of the current editor:

- **Search References**

Searches all references of the item found at current cursor position in the defined scope, if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box is displayed and you have the possibility to define another search scope.
Search References in

Searches all references of the item found at current cursor position in the file or files that you specify when define a scope in the Search References dialog box.

Search Declarations

Searches all declarations of the item found at current cursor position in the defined scope if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box will be displayed and you have the possibility to define another search scope.

Search Declarations in

Searches all declarations of the item found at current cursor position in the file or files that you specify when you define a scope for the search operation.

Search Occurrences in File

Searches all occurrences of the item at the cursor position in the currently edited file.

The following action is available from the WSDL menu:

Go to Definition

Takes you to the location of the definition of the current item.

Note: You can also use the Ctrl + Single-Click (Command + Single-Click on OS X) shortcut on a reference to display its definition.

Refactoring Actions

The following refactoring actions are available from the Refactoring submenu in the contextual menu of the current editor:

Rename Component

Allows you to rename the current component (in-place). The component and all its references in the document are highlighted with a thin border and the changes you make to the component at the cursor position are updated in real time to all occurrences of the component. To exit the in-place editing, press the Esc or Enter key on your keyboard.

Rename Component in

Opens a dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the Preview button, you can view the files to be affected by the action.

Figure 480: Rename Identity Constraint Dialog Box
Searching and Refactoring Operations Scope in WSDL Documents

The scope is a collection of documents that define the context of a search and refactor operation. To control it you can use the Change scope operation, available in the Quick Fix action set or on the Resource Hierarchy/Dependency View toolbar. You can restrict the scope to the current project or to one or multiple working sets (page 2712). The Use only Master Files, if enabled checkbox allows you to restrict the scope of the search and refactor operations to the resources from the Master Files directory. Click read more for details about the Master Files support (page 581).

Figure 481: Change Scope Dialog Box

The scope you define is applied to all future search and refactor operations until you modify it. Contextual menu actions allow you to add or delete files, folders, and other resources to the working set (page 2712) structure.

Quick Assist Support in WSDL Documents
The **Quick Assist feature** (page 2710) is activated automatically when the cursor is positioned over the name of a component. It is accessible via a yellow bulb icon (💡) placed at the current line in the stripe on the left side of the editor. Also, you can invoke the *quick assist* menu by using the **Ctrl + 1** (Meta 1 on Mac OS X) keyboard shortcuts.

**Figure 482: WSDL Quick Assist Support**

The **Quick Assist** support offers direct access to the following actions:

- **Rename Component in**
  
  Renames the component and all its dependencies.

- **Search Declarations**
  
  Searches the declaration of the component in a predefined scope. It is available only when the context represents a component name reference.

- **Search References**
  
  Searches all references of the component in a predefined scope.

- **Component Dependencies**
  
  Searches the component dependencies in a predefined scope.

- **Change Scope**
  
  Configures the scope that will be used for future search or refactor operations.

- **Rename Component**
  
  Allows you to rename the current component in-place.

- **Search Occurrences**
  
  Searches all occurrences of the component within the current file.

Generating Documentation for WSDL Documents
You can use Oxygen XML Editor plugin to generate detailed documentation for the components of a WSDL document in HTML format. You can select the WSDL components to include in your output and the level of details to present for each of them. Also, the components are hyperlinked. You can also generate the documentation in a custom output format (page 1140) by using a custom stylesheet.

**Note:** The WSDL documentation includes the XML Schema components that belong to the internal or imported XML schemas.

To generate documentation for a WSDL document, select **WSDL Documentation** from the **XML Tools > Generate Documentation** menu or from the **Generate WSDL Documentation** action from the contextual menu of the **Navigator view** (page 250).

**Figure 483: WSDL Documentation Dialog Box**

The **Input URL** field of the dialog box must contain the full path to the WSDL document that you want to generate documentation for. The WSDL document may be a local or a remote file. You can specify the path to the WSDL file by entering it in the text field, or by using the **Insert Editor Variables** button or the options in the **Browse** drop-down menu.

**Output Tab**

The following options are available in the **Output tab**:

- **Format** - Allows you to choose between the following formats:
  - **HTML** - The documentation is generated in **HTML output format** (page 1139).
• **Custom** - The documentation is generated in a custom output format (page 1140), allowing you to control the output. Click the **Options** button to open a Custom format options dialog box where you can specify a custom stylesheet for creating the output. There is also an option to Copy additional resources to the output folder and you can select the path to the additional Resources that you want to copy. You can also choose to keep the intermediate XML files created during the documentation process by deselecting the Delete intermediate XML file option.

• **Output file** - You can specify the path of the output file by entering it in the text field, or by using the Insert Editor Variables button or the options in the Browse drop-down menu.

• **Split output into multiple files** - Instructs the application to split the output into multiple files. For large WSDL documents, choosing a different split criterion may generate smaller output files providing a faster documentation browsing. You can choose to split them by namespace, location, or component name.

• **Open in Browser/System Application** - Opens the result in the system application associated with the output file type.

[Note: To set the browser or system application that will be used, go to Window > Preferences > General > Web Browser and specify it there. This will take precedence over the default system application settings.]

• **Keep only the annotations with xml:lang set to** - The generated output will contain only the annotations with the xml:lang attribute set to the selected language. If you choose a primary language code (for example, en for English), this includes all its possible variations (en-us, en-uk, etc.).

### Setting Tab

When you generate documentation for a WSDL document, you can choose what components to include in the output and the details to be included in the documentation.

*Figure 484: Settings Tab of the WSDL Documentation Dialog Box*
The **Settings** tab allows you to choose whether or not to include the following:

- **Components**
  - **Services** - Specifies whether or not the generated documentation includes the WSDL services.
  - **Bindings** - Specifies whether or not the generated documentation includes the WSDL bindings.
  - **Port Types** - Specifies whether or not the generated documentation includes the WSDL port types.
  - **Messages** - Specifies whether or not the generated documentation includes the WSDL messages.
  - **XML Schema Components** - Specifies whether or not the generated documentation includes the XML Schema components.
  - **Only global elements and types** - Specifies whether or not the generated documentation includes only global elements and types.

- **Component Details**
  - **Namespace** - Presents the namespace information for WSDL or XML Schema components.
  - **Location** - Presents the location information for each WSDL or XML Schema component.
  - **Used by** - Presents the list of components that reference the current one.
  - **Documentation** - Presents the component documentation. If you choose **Escape XML Content**, the XML tags are presented in the documentation.
  - **Source** - Presents the XML fragment that defines the current component.
  - **Instance** - Generates a sample XML instance for the current component.
Note: This option applies to the XML Schema components only.

- **XML Schema Diagram** - Displays the diagram for each XML Schema component. You can choose the image format (JPEG, PNG, SVG) to use for the diagram section.
- **Diagram annotations** - Specifies whether or not the annotations of the components presented in the diagram sections are included.
- **Generate index** - Displays an index with the components included in the documentation.
  - **Include local elements and attributes** - If selected, local elements and attributes are included in the documentation index.
  - **Include resource hierarchy** - Specifies whether or not the resource hierarchy for an XML Schema documentation is generated. It is deselected by default.

**Export settings** - Save the current settings in a settings file for further use (for example, with the exported settings file you can generate the same documentation from the command-line interface (page 1141).)

**Import settings** - Reloads the settings from the exported file.

**Generate** - Use this button to generate the WSDL documentation.

Generating WSDL Documentation in HTML Format

The WSDL documentation generated in HTML format is presented in a visual diagram style with various sections, hyperlinks, and options.

*Figure 485: WSDL Documentation in HTML Format*
The documentation of each component is presented in a separate section. The title of the section is composed of the component type and the component name. The component information (namespace, documentation, etc.) is presented in a tabular form.

If you choose to split the output into multiple files, the table of contents is displayed in the left frame and is divided in two tabs: Components and Resource Hierarchy.

The Components tab allows you to group the contents by namespace, location, or component type. The WSDL components from each group are sorted alphabetically. The Resource Hierarchy tab displays the dependencies between WSDL and XML Schema modules in a tree-like fashion. The root of the tree is the WSDL document that you generate documentation for.

After the documentation is generated, you can collapse or expand details for some WSDL components by using the Showing options or the Collapse or Expand buttons.

Figure 486: Showing Options

Generating WSDL Documentation in a Custom Format

To obtain the default HTML documentation output from a WSDL document, Oxygen XML Editor plugin uses an intermediary XML document to which it applies an XSLT stylesheet. To create a custom output from your WSDL document, edit the wsdldocHtml.xsl XSLT stylesheet or create your own.

Note: The wsdldocHtml.xsl stylesheet that is used to obtain the HTML documentation is located in the \[OXYGEN_INSTALL_DIR\]/frameworks/wsdl_documentation/xsl folder.

Note: The intermediary XML document complies with the wsdldocSchema.xsd XML Schema. This schema is located in the \[OXYGEN_INSTALL_DIR\]/frameworks/wsdl_documentation folder.
When using a custom format, you can also copy additional resources into the output folder or choose to keep the intermediate XML files created during the documentation process.

Generating WSDL Documentation from the Command-Line Interface

To generate documentation for a WSDL document from the command line, open the WSDL Documentation dialog box and click Export settings. Using the exported settings file you can generate the same documentation from the command line by running the following scripts:

- `wsdlDocumentation.bat` on Windows.
- `wsdlDocumentation.sh` on Mac OS X and Linux.

The scripts are located in the installation folder of Oxygen XML Editor plugin. You can integrate the scripts in an external batch process launched from the command-line interface.

WSDL SOAP Analyzer

WSDL SOAP Analyzer is a tool that helps you test if the messages defined in a Web Service Descriptor (WSDL) are accepted by a Web Services server.

After you edit and validate your Web service descriptor against a mix of the XML Schemas for WSDL and SOAP, it is easy to check if the defined SOAP messages are accepted by the remote Web Services server by using the integrated WSDL SOAP Analyzer tool (available from the toolbar or WSDL menu).

Oxygen XML Editor plugin provides two ways of testing, one for the currently edited WSDL document and another for the remote WSDL documents that are published on a web server. To open the WSDL SOAP Analyzer tool for the currently edited WSDL document do one of the following:

- Click the WSDL SOAP Analyzer toolbar button.
- Use the WSDL SOAP Analyzer action from the WSDL menu.
- Go to Open with > WSDL Editor in the contextual menu of the Navigator (page 250) view.

Figure 488: WSDL SOAP Analyzer View
This tool contains a SOAP analyzer and sender for Web Services Description Language file types. The analyzer fields are as follows:

- **Services** - The list of services defined by the WSDL file.
- **Ports** - The ports for the selected service.
- **Operations** - The list of available operations for the selected service.
- **Action URL** - The script that serves the operation.
- **SOAP Action** - Identifies the action performed by the script.
- **Version** - Choose between 1.1 and 1.2. The SOAP version is selected automatically depending on the selected port.
- **Request Editor** - It allows you to compose the web service request. When an action is selected, Oxygen XML Editor plugin tries to generate as much content as possible for the SOAP request. The envelope of the SOAP request has the correct namespace for the selected SOAP version, that is `http://schemas.xmlsoap.org/soap/envelope/` for SOAP 1.1 or `http://www.w3.org/2003/05/soap-envelope` for SOAP 1.2. Usually you just have to change a few values for the request to be valid. The **Content Completion Assistant (page 2704)** is available for this editor and is driven by the schema that defines the type of the current message. While selecting various operations, Oxygen XML Editor plugin remembers the modified request for each one. You can press the **Regenerate** button to overwrite your modifications for the current request with the initial generated content.
- **Attachments List** - You can define a list of file URLs to be attached to the request.
- **Response Area** - Initially it displays an auto generated server sample response so you can have an idea about how the response looks like. After pressing the **Send** button, it presents the message received from the server in response to the Web Service request. It may show also error messages. If the response message contains attachments, Oxygen XML Editor plugin prompts you to save them, then tries to open them with the associated system application.
- **Errors List** - There may be situations where the WSDL file is respecting the WSDL XML Schema, but it fails to be valid (for example, in the case of a message that is defined by means of an
element that is not found in the types section of the WSDL). In such a case, the errors are listed here. This list is presented only when there are errors.

- **Send Button** - Executes the request. A status dialog box is displayed when Oxygen XML Editor plugin is connecting to the server.

The testing of a WSDL file is straight-forward: click the WSDL analysis button, then select the service, the port, and the operation. The editor generates the skeleton for the SOAP request. You can edit the request, eventually attach files to it and send it to the server. Watch the server response in the response area. You can find more details in the Testing Remote WSDL Files (page 1143) section.

**Note:** SOAP requests and responses are automatically validated in the WSDL SOAP Analyzer using the XML Schemas specified in the WSDL file.

Once defined, a request derived from a Web Service descriptor can be saved with the Save button to a Web Service SOAP Call (WSSC) file for later reuse. In this way, you save time in configuring the URLs and parameters.

You can open the result of a Web Service call in an editor panel using the Open button.

### Testing Remote WSDL Files

To open and test a remote WSDL file the steps are the following:

1. Go to **Window > Show View > Other > Oxygen XML Editor plugin > 🔄 WSDL SOAP Analyzer**.

2. Press the **Choose WSDL** button and enter the URL of the remote WSDL file.

   You enter the URL:
   - by typing
   - by browsing the local file system
   - by browsing a remote file system
   - by browsing a UDDI Registry (page 1143)

3. Press the **OK** button.

   This will open the **WSDL SOAP Analyzer tool (page 1141)**. In the **Saved SOAP Request** tab you can open directly a previously saved Web Service SOAP Call (WSSC) file, thus skipping the analysis phase.

### UDDI Registry Browser

Pressing the 🔄 button in the **WSDL File Opener** dialog box (menu **Tools > WSDL SOAP Analyzer**) opens the **UDDI Registry Browser** dialog box.
The fields of the dialog box are as follows:

- **URL** - Type the URL of an UDDI registry or choose one from the default list.
- **Keywords** - Enter the string you want to be used when searching the selected UDDI registry for available Web services.
- **Rows to fetch** - The maximum number of rows to be displayed in the result list.
- **Search by** - You can choose to search either by company or by provided service.
- **Case sensitive** - When selected, the search takes into account the keyword case.
- **Search** - The WSDL files that matched the search criteria are added in the result list.

When you select a WSDL from the list and click the OK button, the **UDDI Registry Browser** dialog box is closed and you are returned to the **WSDL File Opener** dialog box.

Editing CSS Stylesheets
Oxygen XML Editor plugin includes a built-in editor for CSS stylesheets. This section presents the features of the CSS editor and how these features should be used. The features of the CSS editor include:

- **Create new CSS files and templates** - You can use the built-in new file wizards to create new CSS documents or templates (page 549).
- **Open and Edit CSS files** - CSS files can be opened and edited in a source editing mode.
- **Validation** - Presents validation errors in CSS files.
- **Content completion** - Offers proposals for properties and the values that are available for each property.
- **Syntax highlighting** - The syntax highlighting in Oxygen XML Editor plugin makes CSS files more readable.
- **Shortcut to open resources** - You can use Ctrl + Single-Click (Command + Single-Click on OS X) to open imported stylesheets or other resources (such as images) in the default system application for the particular type of resource.

### Related Information:

### Validating CSS Stylesheets

Oxygen XML Editor plugin includes a built-in CSS Validator, integrated with general validation support. This makes the usual validation features (page 856) for presenting errors also available for CSS stylesheets.

The CSS properties accepted by the validator are those included in the current CSS profile that is selected in the CSS validation preferences (page 58). The CSS 3 with Oxygen extensions profile includes all the CSS 3 standard properties plus the CSS extensions specific for Oxygen (page 2215) that can be used in Author mode (page 303). That means all Oxygen specific extensions are accepted in a CSS stylesheet by the built-in CSS validator (page 1145) when this profile is selected.
Specify Custom CSS Properties

To specify custom CSS properties, follow these steps:

1. Create a file named `CustomProperties.xml` that has the following structure:

   ```xml
   <?xml version="1.0" encoding="UTF-8"?>
   <css_keywords
     xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
     xsi:schemaLocation="http://www.oxygenxml.com/ns/css
     http://www.oxygenxml.com/ns/css/CssProperties.xsd"
     xmlns="http://www.oxygenxml.com/ns/css">
     <property name="custom">
       <summary>Description for custom property.</summary>
       <value name="customValue"/>
       <value name="anotherCustomValue"/>
     </property>
   </css_keywords>
   ``

2. Go to your desktop and create the `builtin/css-validator/` folder structure.

3. Press and hold Shift and right-click anywhere on your desktop. From the contextual menu, select Open Command Window Here.

4. In the command line, run the `jar cvf custom_props.jar builtin/` command.
   The `custom_props.jar` file is created.

5. Go to `{OXYGEN_INSTALL_DIR}/lib` and create the `endorsed` folder. Copy the `custom_props.jar` file to `{OXYGEN_INSTALL_DIR}/lib/endorsed`.

Content Completion in CSS Stylesheets

A Content Completion Assistant (page 2704), similar to the one available for XML documents (page 627) offers the CSS properties and the values available for each property. It can be manually activated with the Ctrl + Space (Command + Space on OS X) shortcut and is context-sensitive when invoked for the value of a property. The Content Completion Assistant also includes code templates that can be used to quickly insert code fragments (page 639) into CSS stylesheets. The code templates that are proposed include form controls, actions, and Author mode operations.

*Figure 490: Content Completion in CSS Stylesheets*
The properties and values available are dependent on the CSS Profile selected in the CSS preferences (page 58). The CSS 2.1 set of properties and property values is used for most of the profiles. However, with CSS 1 and CSS 3 specific proposal sets are used.

The profile CSS 3 with Oxygen extensions includes all the CSS 3 standard properties plus the CSS extensions specific for Oxygen XML Editor plugin (page 2215) that can be used in Author mode (page 303).

Proposals for CSS Selectors - After inserting a CSS selector, the content completion assistance will propose a list of pseudo-elements and pseudo-classes that are available for the selected CSS profile.

Proposals for @media and @import Rules - After inserting @media or @import <url> rules, the content completion assistance will propose a list of supported media types.

Syntax Highlighting in CSS Files

Oxygen XML Editor plugin supports syntax highlighting in Text mode to make it easier to read the semantics of the structured content by displaying each type of code in different colors and fonts.

To customize the colors or styles used for the syntax highlighting colors for CSS files, follow these steps:

1. Open the Preferences dialog box (page 55).
2. Go to Editor > Syntax Highlight (page 149).
3. Select and expand the CSS section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.

You can see the effects of your changes in the Preview pane.

Related Information:
CSS Outline View

The Outline view for CSS style sheets presents the import declarations for other CSS stylesheet files and all the selectors defined in the current CSS document. The selector entries can be presented as follows:

- In the order they appear in the document.
- Sorted by the element name used in the selector.
- Sorted by the entire selector string representation.

You can synchronize the selection in the Outline view with the cursor moves or changes you make in the stylesheet document. When you select an entry from the Outline view, Oxygen XML Editor plugin highlights the corresponding import or selector in the CSS editor.

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

Figure 491: CSS Outline View

The selectors presented in this view can be found quickly using the key search field. When you press a sequence of character keys while the focus is in the view, the first selector that starts with that sequence is selected automatically.
Folding in CSS Stylesheets

In a large CSS stylesheet document, some styles can be collapsed so that only the styles that are needed remain in focus. The same folding features available for XML documents (page 625) are also available in CSS stylesheets.

Note: To enhance your editing experience, you can select entire blocks (parts of text delimited by brackets) by double-clicking somewhere inside the brackets.

Formatting and Indenting CSS Stylesheets (Pretty Print)

If the edited CSS stylesheet becomes unreadable because of the bad alignment of the text lines, the format and indent operation available for XML documents (page 645) is also available for CSS stylesheets. It works in the same way as for XML documents and is available as the same menu and toolbar action.

Minifying CSS Stylesheets

Minification (or compression) of a CSS document is the practice of removing unnecessary code without affecting the functionality of the stylesheet.

To minify a CSS, invoke the contextual menu anywhere in the edited document and choose the Minify CSS action. Oxygen XML Editor plugin opens a dialog box that allows you to:

- Set the location of the resulting CSS.
- Place each style rule on a new line.

After pressing OK, Oxygen XML Editor plugin performs the following actions:

- All spaces are normalized (all leading and trailing spaces are removed, while sequences of white spaces are replaced with single space characters).
- All comments are removed.

Note: The CSS minifier relies heavily upon the W3C CSS specification. If the content of the CSS file you are trying to minify does not conform with the specifications, an error dialog box will be displayed, listing all errors encountered during the processing.

The resulting CSS stylesheet gains a lot in terms of execution performance, but loses in terms of readability. The source CSS document is left unaffected.
Note: To restore the readability of a minified CSS, invoke the Format and Indent action from the XML menu, the Source submenu from the contextual menu, or Source toolbar. However, this action will not recover any of the deleted comments.

Editing Relax NG Schemas

An XML Schema describes the structure of an XML document and is used to validate XML document instances against it, to check that the XML instances conform to the specified requirements. If an XML instance conforms to the schema then it is said to be valid. Otherwise, it is invalid.

Oxygen XML Editor plugin offers support for editing Relax NG schema files in the following editing modes:

- **Text editing mode** *(page 1049)* - Allows you to edit Relax NG schema files in a source editing mode, along with a schema design pane with two tabs that offer a Full Model View *(page 1151)* and Logical Model View *(page 1152)*.

- **Grid editing mode** *(page 292)* - Displays Relax NG schema files in a structured spreadsheet-like grid.

- **Author editing mode** *(page 672)* - The visual Author mode is also available for Relax NG schema files, presenting the schema similar to the Relax NG compact syntax. It links to imported schemas and external references. Embedded Schematron is also supported in Relax NG schemas with XML syntax.

For information about applying and detecting schemas, see Associating a Schema to XML Documents *(page 887)*.

Editing Relax NG Schema in the Master Files Context

Smaller interrelated modules that define a complex Relax NG Schema cannot be correctly edited or validated individually, due to their interdependency with other modules. For example, an element defined in a main schema document is not visible when you edit an included module. Oxygen XML Editor plugin provides the support for defining the main module (or modules), thus allowing you to edit any of the imported/included schema files in the context of the larger schema structure.
You can set a main Relax NG document either using the master files support from the Navigator view (page 581), or using a validation scenario.

To set a *master file* using a validation scenario, add validation units that point to the main schemas. Oxygen XML Editor plugin warns you if the current module is not part of the dependencies graph computed for the main schema. In this case, it considers the current module as the main schema.

The main advantage of editing in the context of a *master file* (page 2708) is that it provides correct validation of a module in the context of a larger schema structure.

### Relax NG Schema Diagram Editor

This section explains how to use the graphical diagram editor for Relax NG schemas.

**Introduction to Relax NG Schema Diagram Editor**

Oxygen XML Editor plugin provides a simple, expressive, and easy-to-read schema diagram editor for Relax NG schemas.

With this new feature you can easily develop complex schemas, print them on multiple pages or save them as JPEG, PNG, or BMP images. It helps both schema authors in developing the schema and content authors who are using the schema to understand it.

Oxygen XML Editor plugin is the only XML editor to provide a side by side source and diagram presentation and have them real-time synchronized:

- The changes you make in the Editor are immediately visible in the Diagram (no background parsing).
- Changing the selected element in the diagram selects the underlying code in the source editor.

**Full Model View**
When you create a new schema document or open an existing one, the editor panel is divided in two sections: one containing the schema diagram and the second the source code. The schema diagram editor has two tabs that offer a **Full Model View** and **Logical Model View** (page 1152).

*Figure 492: Relax NG Schema Editor - Full Model View*

The following references can be expanded in place: patterns, includes, and external references. This expansion mechanism, coupled with the synchronization support, makes the schema navigation easy.

All the element and attribute names are editable by double-clicking the names.

**Logical Model View**

The **Logical Model View** presents the compiled schema in the form of a single pattern. The patterns that form the element content are defined as top level patterns with generated names. These names are generated depending of the elements name class.

*Figure 493: Logical Model View for a Relax NG Schema*
Symbols Used in the Schema Diagram

The views in the schema diagram editor renders all the Relax NG schema patterns with the following intuitive symbols:

- **name** - define pattern with the name attribute set to the value shown inside the rectangle (in this example name).

- **attlist.person** - define pattern with the combine attribute set to interleave and the name attribute set to the value shown inside the rectangle (in this example attlist.person).

- **attlist.person** - define pattern with the combine attribute set to choice and the name attribute set to the value shown inside the rectangle (in this example attlist.person).

- **name** - element pattern with the name attribute set to the value shown inside the rectangle (in this example name).

- **note** - attribute pattern with the name attribute set to the value shown inside the rectangle (in this case note).

- **family** - ref pattern with the name attribute set to the value shown inside the rectangle (in this case family).
- `1..w` - oneOrMore pattern.
- `0..w` - zeroOrMore pattern.
- `0..1` - optional pattern.
- `±` - choice pattern.
- `true` - value pattern (for example, used inside a choice pattern).
- `-` - group pattern.
- `Doc` - A pattern from the Relax NG Annotations namespace (http://relaxng.org/ns/compatibility/annotations/1.0) that is treated as a documentation element in a Relax NG schema.
- `text` - text pattern.
- `∅` - empty pattern.

**Actions Available in the Schema Diagram Editor**

When editing Relax NG schemas in **Full Model View** *(page 1151)*, the contextual menu offers the following actions:

**Go to definition (Available for imported components)**

This action is available for imported components from other RNG files, and it shows where that component is defined.

**Append child**

Appends a child to the selected component.

**Insert Before**

Inserts a component before the selected component.

**Insert After**

Inserts a component after the selected component.

**Edit attributes**

Edits the attributes of the selected component.

**Remove**

Removes the selected component.
Show only the selected component

Depending on its state (selected/not selected), either the selected component or all the diagram components are shown.

Show Annotations

Depending on its state (selected/not selected), the documentation nodes are shown or hidden.

Auto expand to references

This option controls how the schema diagram is automatically expanded. If you select it and then edit a top-level element or you make a refresh, the diagram is expanded until it reaches referenced components. If this option is left unchecked, only the first level of the diagram is expanded, showing the top-level elements. For large schemas, the editor disables this option automatically.

Collapse Children

Collapses the children of the selected view.

Expand Children

Expands the children of the selected view.

Print Selection

Prints the selected view.

Refresh

Refreshes the schema diagram according to the changes in your code. They represent changes in your imported documents or changes that are not reflected automatically in the compiled schema).

If the schema is not valid, you see only an error message in the Logical Model View (page 1152) instead of the diagram.

Validating Relax NG Schema Documents

By default, Relax NG schema files are validated as you type. To change this, open the Preferences dialog box (page 55), go to Editor > Document Checking, and deselect the Enable automatic validation option (page 109).

To validate a Relax NG schema document manually, select the Validate action from the Validation toolbar drop-down menu or the XML menu. When Oxygen XML Editor plugin validates a
Relax NG schema file, it expands all the included modules so the entire schema hierarchy is validated. The validation problems are highlighted directly in the editor, making it easy to locate and fix any issues.

**Content Completion in Relax NG Schemas**

The intelligent *Content Completion Assistant* *(page 2704)* allows you to quickly identify and insert elements, attributes, and attribute values that are valid in the current editing context. All available proposals are listed in a pop-up menu displayed at the current cursor position.

The *Content Completion Assistant* is enabled by default. To disable it, open the **Preferences** dialog box *(page 55)*, go to **Editor > Content Completion**, and deselect the **Enable content completion** option *(page 101)*.

When active, the *Content Completion Assistant* displays a list of context-sensitive proposals valid at the current cursor position. It can be manually activated with the **Ctrl + Space** (**Command + Space** on **OS X**) shortcut. You can navigate through the list of proposals by using the **Up** and **Down** keys on your keyboard. For each selected item in the list, the *Content Completion Assistant* displays a documentation window. You can customize the size of the documentation window by dragging its top, right, and bottom borders.

To insert the selected proposal in **Text** mode, do one of the following:

- Press **Enter** or **Tab** to insert both the start and end tags and position the cursor inside the start tag in a position suitable for inserting attributes.
• Press **Ctrl + Enter (Command + Enter on OS X)** to insert both the start and end tags and positions the cursor between the tags in a position where you can start typing content.

If you are using the concept of *master files (page 2708)* to import/include modules, the **Content Completion Assistant** collects its components starting from the *master files*. The *master files* can be defined in the project or in the associated validation scenario. For more information about the **Master Files** support in Oxygen XML Editor plugin, see *Defining Master Files at Project Level (page 581)*.

The **Content Completion Assistant** also offers additional information for the element and attribute proposals in the form of schema annotations that is displayed in a tooltip.

Syntax Highlighting in Relax NG Schemas

Oxygen XML Editor plugin supports syntax highlighting in **Text** mode to make it easier to read the semantics of the structured content by displaying each type of code in different colors and fonts.

To customize the colors or styles used for the syntax highlighting colors for Relax NG schemas, follow these steps:

1. **Open the Preferences** dialog box  *(page 55).*
2. Go to **Editor > Syntax Highlight** *(page 149).*
3. Select and expand the **XML** section in the top pane (for RELAX NG Compact Syntax schemas, select and expand the **RNC** section).
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.
5. Select the **XML** tab in the **Preview** pane to see the effects of your changes (for RELAX NG Compact Syntax schemas, the tab is **RNC**).
Tip: Oxygen XML Editor plugin also allows you to specify syntax highlighting colors for specific XML elements and attributes with specific namespace prefixes. This can be done in the Editor > Syntax Highlight > Elements/Attributes by Prefix preferences page (page 150).

Quick Fixes for DTD, XSD, and Relax NG Errors

Oxygen XML Editor plugin offers Quick Fixes (page 2710) for common errors that appear in XML documents that are validated against DTD, XSD, or Relax NG schemas.

Note: For XML documents validated against XSD schemas, the Quick Fixes are only available if you use the default Xerces validation engine.

Quick Fixes are available in Text mode and Author mode.

Oxygen XML Editor plugin provides Quick Fixes for numerous types of problems, including the following:

<table>
<thead>
<tr>
<th>Problem Type</th>

Relax NG Outline View

The **Outline** view for Relax NG schemas presents a list with the patterns that appear in the diagram in both the [Full Model View](page 1151) and [Logical Model View](page 1152) cases and it allows for quick access to a component by name. By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

**Figure 495: Relax NG Outline View**

This view has two modes, with the tree showing either the XML structure or the defined pattern (components) collected from the current document. By default, the **Outline** view presents the components.

When the ![Show components](page 1151) option is selected in the **View menu** on the **Outline** view action bar, the following option is available:

- ![Show XML structure](page 1151) Shows the XML structure of the current document in a tree-like manner.

The following actions are available in the **View menu** on the **Outline** view action bar when the ![Show XML structure](page 1151) option is selected:

- **Filter returns exact matches**

  The text filter of the **Outline** view returns only exact matches.
Selection update on cursor move

Allows a synchronization between Outline view and schema diagram. The selected view from the diagram will be also selected in the Outline view.

Show components

Shows the defined pattern collected from the current document.

Flat presentation mode of the filtered results

When active, the application flattens the filtered result elements to a single level.

Show comments and processing instructions

Show/hide comments and processing instructions in the Outline view.

Show element name

Show/hide element name.

Show text

Show/hide additional text content for the displayed elements.

Show attributes

Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from the Outline preferences panel (page 197).

Configure displayed attributes

Displays the XML Structured Outline preferences page (page 197).

The following contextual menu actions are also available in the Outline view when the Show XML structure option is selected in the View menu:

Append Child

Displays a list of elements that you can insert as children of the current element.

Insert Before

Displays a list of elements that you can insert as siblings of the current element, before the current element.

Insert After

Displays a list of elements that you can insert as siblings of the current element, after the current element.

Edit Attributes

Opens a dialog box that allows you to edit the attributes of the currently selected component.
Toggle Comment
Comments/uncomments the currently selected element.

Search references
Searches for the references of the currently selected component.

Search references in
Searches for the references of the currently selected component in the context of a scope that you define.

Component dependencies
Opens the Component Dependencies view (page 1165) that displays the dependencies of the currently selected component.

Rename Component in
Renames the currently selected component in the context of a scope that you define.

Cut
Cuts the currently selected component.

Copy
Copies the currently selected component.

Delete
Deletes the currently selected component.

Expand All
Expands the structure of a component in the Outline view.

Collapse All
Collapses the structure of all the component in the Outline view.

The upper part of the Outline view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (such as *, ?) and separate multiple patterns with commas.

RNG Resource Hierarchy/Dependencies View
The Resource Hierarchy/Dependencies view allows you to see the hierarchy/dependencies for a schema. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.
If you want to see the hierarchy of a schema, select the desired schema in the Navigator view (page 250) and choose Resource Hierarchy from the contextual menu.
