- In the order they appear in the document.
- Sorted by the element name used in the selector.
- Sorted by the entire selector string representation.

You can synchronize the selection in the **Outline** view with the cursor moves or changes you make in the stylesheet document. When you select an entry from the **Outline** view, Oxygen XML Author highlights the corresponding import or selector in the CSS editor.

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

The selectors presented in this view can be found quickly using the key search field. When you press a sequence of character keys while the focus is in the view, the first selector that starts with that sequence is selected automatically.

**Folding in CSS Stylesheets**

In a large CSS stylesheet document, some styles can be collapsed so that only the styles that are needed remain in focus. The same folding features available for XML documents *(on page 782)* are also available in CSS stylesheets.

**Note:** To enhance your editing experience, you can select entire blocks (parts of text delimited by brackets) by double-clicking somewhere inside the brackets.
Formatting and Indenting CSS Stylesheets (Pretty Print)

If the edited CSS stylesheet becomes unreadable because of the bad alignment of the text lines, the format and indent operation available for XML documents (on page 805) is also available for CSS stylesheets. It works in the same way as for XML documents and is available as the same menu and toolbar action.

Minifying CSS Stylesheets

Minification (or compression) of a CSS document is the practice of removing unnecessary code without affecting the functionality of the stylesheet.

To minify a CSS, invoke the contextual menu anywhere in the edited document and choose the Minify CSS action. Oxygen XML Author opens a dialog box that allows you to:

- Set the location of the resulting CSS.
- Place each style rule on a new line.

After pressing OK, Oxygen XML Author performs the following actions:

- All spaces are normalized (all leading and trailing spaces are removed, while sequences of white spaces are replaced with single space characters).
- All comments are removed.

Note: The CSS minifier relies heavily upon the W3C CSS specification. If the content of the CSS file you are trying to minify does not conform with the specifications, an error dialog box will be displayed, listing all errors encountered during the processing.

The resulting CSS stylesheet gains a lot in terms of execution performance, but loses in terms of readability. The source CSS document is left unaffected.

Note: To restore the readability of a minified CSS, invoke the Format and Indent action from the Document > Source menu, the Source submenu from the contextual menu, or Source toolbar. However, this action will not recover any of the deleted comments.

Editing LESS Stylesheets

Oxygen XML Author provides support for stylesheets coded with the LESS dynamic stylesheet language. LESS extends the CSS language by adding features that allow mechanisms such as variables, nesting, mixins, operators, and functions. Oxygen XML Author offers additional LESS-editing features that include:
• **Create new LESS files and templates** - You can use the built-in new file wizards to create new LESS documents or templates (on page 619).

• **Open and Edit LESS files** - LESS files can be opened and edited in a source editing mode.

• **Validation** - Presents validation errors in LESS files.

• **Content completion** - Offers proposals for properties and the values that are available for each property.

• **Compile to CSS** - Options are available to compile LESS files to CSS.

• **Syntax highlighting** - Oxygen XML Author supports syntax highlighting in LESS files, although there may be some limitations in supporting all the LESS constructs.

• **Shortcut to open resources** - While editing LESS files, you can use Ctrl + Single-Click (Command + Single-Click on OS X) to open imported stylesheets or other resources (such as images) in the default system application for the particular type of resource.

For more information about LESS go to: [http://lesscss.org/](http://lesscss.org/).

**Related Information:**

• Customizing Author Mode Through CSS (on page 2048)

• Supported CSS Selectors (on page 2054)

• Supported CSS Properties (on page 2062)

• Oxygen CSS Extensions (on page 2072)

---

**Validating LESS Stylesheets**

Oxygen XML Author includes a built-in LESS CSS Validator, integrated with general validation support. The usual validation features (on page 1023) for presenting errors also available for LESS stylesheets.

Oxygen XML Author provides three validation methods:

• Automatic validation as you type - marks validation errors in the document as you are editing.

• Validation upon request, by pressing the Validate button from the Validation toolbar drop-down menu. An error list is presented in the message panel at the bottom of the editor.

• Validation scenarios, by selecting Configure Validation Scenario(s) from the Validation toolbar drop-down menu. Errors are presented in the message panel at the bottom of the editor.
This is useful when you need to validate the current file as part of a larger LESS import hierarchy (for instance, you may change the URL of the file to validate to the root of the hierarchy).

Content Completion in LESS Stylesheets

A *Content Completion Assistant (on page 2792)* offers the LESS properties and the values available for each property. It can be manually activated with the *Ctrl + Space (Command + Space on OS X)* shortcut and is context-sensitive when invoked for the value of a property in a LESS file. The *Content Completion Assistant* also includes *code templates that can be used to quickly insert code fragments (on page 797)* into LESS stylesheets. The code templates that are proposed include form controls, actions, and *Author* mode operations.

The properties and values available are dependent on the CSS Profile selected in the *CSS preferences (on page 182)*.

Syntax Highlighting in LESS Files

Oxygen XML Author supports syntax highlighting in *Text* mode to make it easier to read the semantics of the structured content by displaying each type of code in different colors and fonts.

To customize the colors or styles used for the syntax highlighting colors for LESS files, follow these steps:

1. Open the *Preferences* dialog box (*Options > Preferences*) *(on page 79)*.
2. Go to *Editor > Syntax Highlight* *(on page 173)*.
3. Select and expand the *LESS* section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.

You can see the effects of your changes in the *Preview* pane.

**Related Information:**

- *Syntax Highlight Preferences (on page 173)*

Compiling LESS Stylesheets to CSS

When editing LESS files, you can compile the files into CSS. Oxygen XML Author provides both manual and automatic options to compile LESS stylesheets into CSS.
Important: The LESS processor works well only with files having the **UTF-8** encoding. Thus, it is highly recommended that you always use the **utf-8** encoding when working with LESS files or the files they import (other LESS or CSS files). You can use the following directive at the beginning of your files:

```
@charset "utf-8";
```

You have two options for compiling LESS files to CSS:

1. Use the contextual menu in a LESS file and select **Compile to CSS** (**Ctrl + Shift + C** (**Command + Shift + C** on OS X)).
2. Select the **Automatically compile LESS to CSS when saving** option (**on page 154**) (in the **Save** preferences page). If selected, when you save a LESS file it will automatically be compiled to CSS (this option is deselected by default).

Important: If this option is selected, when you save a LESS file, the CSS file that has the same name as the LESS file is overwritten without warning. Make sure all your changes are made in the LESS file. Do not edit the CSS file directly, as your changes might be lost.

### Editing StratML Documents

Strategy Markup Language (StratML) is an XML vocabulary and schema for strategic plans. Oxygen XML Author supports StratML Part 1 (Strategic Plan) and StratML Part 2 (Performance Plans and Reports) and provides templates for the following documents:

- **Strategic Plan** (StratML Part 1)
- **Performance Plan** (StratML Part 2)
- **Performance Report** - (StratML Part 2)
- **Strategic Plan** - (StratML Part 2)

You can view the components of a StratML document in the **Outline view** (**on page 334**). Oxygen XML Author implements a default XML with XSLT transformation scenario for this document type, called StratML to HTML.

### Editing XLIFF Documents

XLIFF (**XML Localization Interchange File Format**) is an XML-based format that was designed to standardize the way multilingual data is passed between tools during a localization process. Oxygen XML Author provides the following support for editing XLIFF documents:

**XLIFF Version 1.2, 2.0, and 2.1 Support:**
• New document templates for XLIFF documents.
• A default CSS file (xliff.css) used for rendering XLIFF content in Author mode is stored in \[OXYGEN_INSTALL_DIR\]/frameworks/xliff/css/.
• Validation and content completion support using local catalogs.
  The default catalog (catalog.xml) for version 1.2 is stored in \[OXYGEN_INSTALL_DIR\]/frameworks/xliff/schemas/1.2, for version 2.0 in \[OXYGEN_INSTALL_DIR\]/frameworks/xliff/schemas/2.0, and for version 2.1 in \[OXYGEN_INSTALL_DIR\]/frameworks/xliff/schemas/2.1.

XLIFF Version 2.0 and 2.1 Enhanced Support:

Support for validating XLIFF 2.0 and 2.1 documents using modules. For version 2.0, the default modules are stored in \[OXYGEN_INSTALL_DIR\]/frameworks/xliff/schemas/2.0/modules and for version 2.1, they are stored in \[OXYGEN_INSTALL_DIR\]/frameworks/xliff/schemas/2.1.

Editing XLIFF Documents in Author Mode

By default, when you create a new XLIFF document from a template (on page 619), Oxygen XML Author opens it in Text mode. Aside from the normal editing features found in Text mode, you can also switch to Author mode where Oxygen XML Author offers some special form controls specifically for XLIFF documents. These form controls simply allow you to add or edit XLIFF attribute values and content in a visual mode.

For XLIFF version 2.0 and 2.1 documents, you can also change the style of the visual editing mode. The Styles drop-down menu on the toolbar offers the following styles that are specifically designed to render XLIFF 2.0 and 2.1 documents in Author mode:

• Default
• Classic
• Translate

Editing JavaScript Documents

This section explains the features of the Oxygen XML Author JavaScript Editor and how you can use them.
JavaScript Editing Actions

Oxygen XML Author allows you to create and edit JavaScript files and assists you with useful features such as syntax highlight, content completion, and outline view. To enhance your editing experience, you can select entire blocks (parts of text delimited by brackets) by double-clicking somewhere inside the brackets.

Figure 370. JavaScript Editor Text Mode

```javascript
function change_sides(front) {
    switch ($( '#version-switch' ).text()) {
    case 'Original':
        $('#holder').html($( '#div .original[id]' ).html());
        make_clickable();
        $('#version-switch').text('Translation 1');
        break;
    case 'Translation 1':
        $('#holder').html($( '#div .translation[id]' ).filter(':first').html());
        $('#version-switch').text('Translation 2');
        break;
    case 'Translation 2':
        $('#holder').html($( '#div .translation[id]' ).filter(':last').html());
        $('#version-switch').text('Original');
        break;
    }
}
```

The contextual menu of the JavaScript editor offers the following actions:

- **Cut**
  
  Allows you to cut fragments of text from the editing area.

- **Copy**
  
  Allows you to copy fragments of text from the editing area.

- **Paste**
  
  Allows you to paste fragments of text in the editing area.

- **Toggle Comment**
  
  Allows you to comment a line or a fragment of the JavaScript document you are editing. This option inserts a single comment for the entire fragment you want to comment.

- **Toggle Line Comment**
  
  Allows you to comment a line or a fragment of the JavaScript document you are editing. This option inserts a comment for each line of the fragment you want to comment.

**Go to Matching Bracket**

Use this option to find the closing, or opening bracket, matching the bracket at the cursor position. When you select this option, Oxygen XML Author moves the cursor
to the matching bracket, highlights its row, and decorates the initial bracket with a rectangle.

**Note:** A rectangle decorates the opening or closing bracket that matches the current one, at all times.

**Source**

Allows you to select one of the following actions:

- **To Lower Case**
  
  Converts the selection content to lower case characters.

- **To Upper Case**
  
  Converts the selection content to upper case characters.

- **Capitalize Lines**
  
  Converts to upper case the first character of every selected line.

- **Join and Normalize Lines**
  
  Joins all the rows you select to one row and normalizes the content.

- **Insert new line after**
  
  Inserts a new line after the line at the cursor position.

**Modify all matches**

Use this option to modify (in-place) all the occurrences of the selected content. When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

**Open**

Allows you to select one of the following actions:

- **Open File at Cursor** - select this action to open the source of the file located at the cursor position
- **Open File at Cursor in System Application** - select this action to open the source of the file located at the cursor position with the application that the system associates with the file

**Compare**

Select this option to open the **Compare Files** tool to compare the file you are editing with a file you choose in the dialog box.
Folding

When you invoke the contextual menu from the folding (on page 2794) triangles in the stripe on the left side of the editor, the following actions are available:

- **Collapse Other Folds (Ctrl + NumPad/ (Command + NumPad/ on OS X))**
  Folds all the elements except the current element.

- **Collapse Child Folds (Ctrl + NumPad. (Command + NumPad. on OS X))**
  Folds the elements indented with one level inside the current element.

- **Expand Child Folds**
  Unfolds all child elements of the currently selected element.

- **Expand All (Ctrl + NumPad* (Command + NumPad* on OS X))**
  Unfolds all elements in the current document.

Validating JavaScript Files

You have the possibility to validate the JavaScript document you are editing. Oxygen XML Author uses the Mozilla Rhino library for validation. For more information about this library, go to [http://www.mozilla.org/rhino/doc.html](http://www.mozilla.org/rhino/doc.html). The JavaScript validation process checks for errors in the syntax. Calling a function that is not defined is not treated as an error by the validation process. The interpreter discovers this error when executing the faulted line. Oxygen XML Author can validate a JavaScript document both on-request and automatically.

Content Completion in JavaScript Documents

When you edit a JavaScript document, the Content Completion Assistant (on page 2792) presents you a list of the elements you can insert at the cursor position. It can be manually activated with the Ctrl + Space (Command + Space on OS X) shortcut.

For an enhanced assistance, JQuery methods are also presented. The following icons decorate the elements in the content completion list of proposals depending on their type:

- ⬤ - function
- ⬤ - variable
- □ - object
- ◊ - property
- ⬤ - method

**Note:** These icons decorate both the elements from the content completion list of proposals and from the Outline view (on page 1117).
The Content Completion Assistant collects:

- Method names from the current file and from the library files.
- Functions and variables defined in the current file.

If you edit the content of a function, the content completion list of proposals contains all the local variables defined in the current function, or in the functions that contain the current one.

Syntax Highlighting in JavaScript Documents

Oxygen XML Author supports syntax highlighting in Text mode to make it easier to read the semantics of the structured content by displaying each type of code in different colors and fonts.

To customize the colors or styles used for the syntax highlighting colors for JavaScript files, follow these steps:

1. Open the Preferences dialog box (Options > Preferences) (on page 79).
2. Go to Editor > Syntax Highlight (on page 173).
3. Select and expand the JavaScript section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.

You can see the effects of your changes in the Preview pane.
JavaScript Outline View

Oxygen XML Author present a list of all the components of the JavaScript document you are editing in the **Outline** view. By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure 372. JavaScript Outline View

The following icons decorate the elements in the **Outline** view depending on their type:

- ⌂ - function
- ⚙ - variable
- □ - object
- ⚱ - property
- ⌫ - method

The contextual menu of the JavaScript **Outline** view contains the usual `Cut`, `Copy`, `Paste`, and `Delete` actions. From the **Settings** menu, you can select the **Update selection on cursor move** option to synchronize the **Outline** view with the editing area.
Editing SVG Files

SVG (Scalable Vector Graphics) is a platform for two-dimensional graphics. It has two parts: an XML-based file format and a programming API for graphical applications. Some of the key features include support for shapes, text, and embedded raster graphics with many painting styles, scripting through languages such as ECMAScript, and support for animation.

SVG is a vendor-neutral, open standard that has important industry support. Companies such as Adobe, Apple, and IBM have contributed to its W3C specifications. Many documentation frameworks (including DocBook) have support for SVG by defining the graphics directly in the document.

Oxygen XML Author adds SVG support by using the Batik distribution package (an open source project developed by the Apache Software Foundation) and the default XML Catalog resolves the SVG DTD.

**Note:** Batik partially supports SVG 1.1. For a detailed list of supported elements, attributes, and properties, see the Batik Implementation Status page.

How to Render SVG Images that Use Java Scripting

1. Copy the js.jar library from the Batik distribution into the Oxygen XML Author lib folder.
2. Restart the application.

SVG 1.2 Rendering Issues

Oxygen XML Author uses the Apache Batik open source library to render SVG images and it only has partial support for SVG 1.2. For more information, see [http://xmlgraphics.apache.org/batik/dev/svg12.html](http://xmlgraphics.apache.org/batik/dev/svg12.html).

This partial support could lead to some rendering issues in Oxygen XML Author. For example, if you are using the Inkscape SVG editor, it is possible for it to save the SVG as 1.1, while using SVG 1.2 elements (such as flowRoot) inside it. This means that the image will not be properly rendered inside the application.

**Note:** SVG images shown in the Author visual editing mode are rendered as static images, without support for animations and JavaScript.

Standalone SVG Viewer

Oxygen XML Author includes a simple SVG Viewer that allows you to work with SVG images.

To open the viewer, select SVG Viewer from the Tools menu.
You can browse for and open any SVG file that has the .svg or .svgz extension.

If the file is included in the current project, you can open it in the viewer by right-clicking the image file in the Project view (on page 320) and selecting Open with > SVG Viewer.

### Actions Available in the SVG Viewer

The following actions are available in the SVG Viewer:

#### Zoom in

To zoom in on an image, use any of the following methods:

- Scroll **forward** with the mouse wheel.
- Select **Zoom in** from the contextual menu.
- Use the **Ctrl + I (Command + I on OS X)** keyboard shortcut.

#### Zoom out

To zoom in on an image, use any of the following methods:

- Scroll **backward** with the mouse wheel.
- Use the **Ctrl + O (Command + O on OS X)** keyboard shortcut.
- Select **Zoom out** from the contextual menu.

#### Rotate

To rotate an image, use either of the following methods:

- Use the **Ctrl + Right-Click + Drag (Command + Right-Click + Drag on OS X)** shortcut.
• Select Rotate from the contextual menu. This rotates the image exactly 90 degrees clockwise.

**Refresh**

To refresh (or reset) an image, use either of the following methods:

• Use the Ctrl + T (Command + T on OS X) keyboard shortcut.
• Select Refresh from the contextual menu.

**Move**

To move an image, use either of the following methods:

• Use the Arrow Keys on your keyboard.
• Use the Shift + Left-Click + Drag shortcut.

**Pan**

To pan an image, click and drag the image with your mouse.

**Related Information:**

• Editing SVG Files (on page 1117)

### Integrated SVG Viewer in the Results Panel

Oxygen XML Author includes an integrated SVG Viewer that can render the results of an XSLT transformation scenario that generates SVG images in the Results panel (on page 343) at the bottom of the editor. This is useful for developing XSL stylesheets with the capability of producing SVG graphics.

To enable this feature, select Show in results view as > SVG in the Output tab of the XSLT transformation scenario configuration dialog box (on page 1302). When you run the transformation, the SVG result is then rendered in an integrated SVG viewer in the Results panel (on page 343).

**Example of a Use-Case**

Suppose you have an XML document that describes the evolution of your sales over a time period and you want to create a graphic for it. You could use the following steps to accomplish this task:

1. Start with a static SVG image, written directly in Oxygen XML Author or exported from a external graphics tool.
2. Extract the parts that are dependent upon the data from the XML document and create an XSL template to produce the image.

3. Create an XML transformation with XSLT scenario (on page 1292).

4. While configuring the transformation scenario, select Show in results view as > SVG in the Output tab (on page 1302) of the configuration dialog box.

5. Run the transformation.

The SVG image is rendered in an integrated SVG viewer in the Results panel (on page 343) at the bottom of the editor.

Figure 374. Integrated SVG Viewer

---

Editing HTML Documents

Oxygen XML Author provides a special framework for editing HTML files (html or htm file extensions) with a variety of specialized editing features, including validation, content completion, syntax highlighting, HTML-specific actions, and more.

Oxygen XML Author also includes a built-in XHTML framework (on page 1222) (files with the http://www.w3.org/1999/xhtml namespace or with the xhtml or xht file extension) that has a full set of features (full editing support, document templates, enhanced CSS rendering, specific actions, validation, content completion, transformation scenarios, and more). Oxygen XML Author also includes support for importing HTML files as an XML document (on page 1888).

Related Information:

- XHTML Document Type (Framework) (on page 1222)
HTML Editor

Oxygen XML Author includes a specialized HTML editor and various editing features for files that have the html or htm file extensions. The encoding is detected automatically based on the value specified in the charset attribute of the meta element.

New Document Template

Oxygen XML Author includes a new document template to help you get started creating HTML content. It is available when creating new documents from templates (on page 619) and can be found in the New Document folder or by typing html in the search field.

Text Mode Editor

You can edit HTML files in the Text editing mode (on page 770) using all of its useful features (on page 770). It includes content completion (on page 1123) based on a special HTML schema, syntax highlighting (on page 1123), a specialized Outline view (on page 1124) that presents the structure, and folding support (on page 1124).

In addition, there is a View in Browser/System Application action available when you right-click anywhere in an HTML document opened in Text mode and it opens the document in your default browser.

Grid Mode

You can use the Grid mode (on page 828) where the document is displayed as a structured grid of nested tables where the text content can be modified without directly interacting with the markup, but the documents must be XML well-formed.

Author Visual Editor

You can edit HTML files in the visual Author editing mode (on page 835) but in this mode, the documents must be XML well-formed because this editor uses the XHTML authoring features and actions (on page 1223).

HTML Validation

Oxygen XML Author includes a built-in validator used for validating HTML documents. It is based upon the W3C HTML Validator and the HTML documents are validated against the W3C HTML5 specification. The validator in Oxygen XML Author only supports HTML5 structure. It presents the
errors in the editor similar to XML documents (on page 350). It also checks the embedded CSS content and the warnings and errors are presented similar to the CSS editor (on page 1104).

By default, HTML documents are validated using the W3C HTML Validator engine, but you can create or edit a validation scenario (on page 1035) to specify that they are validated using the default engine that validates against the Relax NG-Compact Schema specified in the HTML framework.

### HTML Content Completion Assistant

Oxygen XML Author includes an intelligent Content Completion Assistant (on page 2792) that offers proposals for inserting HTML structures that are valid at the current editing location.

The Content Completion Assistant is enabled by default. To disable it, open the Preferences dialog box (Options > Preferences) (on page 79), go to Editor > Content Completion, and deselect the Enable content completion option (on page 163).

Figure 375. Content Completion Assistant in HTML

Using the Content Completion in HTML

For HTML documents, the Content Completion Assistant uses a built-in schema and the list of proposals depend on the RELAX NG schema specified in the HTML framework. Using the content completion feature is the same as with any other XML document. For more details, see:

- Using the Content Completion Assistant in Text Mode (on page 787)
- Using the Content Completion Assistant in Author Mode (on page 864)

### Syntax Highlighting in HTML Documents

Oxygen XML Author supports syntax highlighting in Text mode to make it easier to read the semantics of the structured content by displaying each type of code in different colors and fonts.

For HTML documents, it handles attributes without quotes, unclosed or void elements, and it also offers highlighting for embedded CSS or JavaScript content.

To customize the colors or styles used for the syntax highlighting colors for HTML files, follow these steps:
1. Open the Preferences dialog box (Options > Preferences) (on page 79).
2. Go to Editor > Syntax Highlight (on page 173).
3. Select and expand the XHTML section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.

You can see the effects of your changes in the Preview pane.

Related Information:

- Syntax Highlight Preferences (on page 173)

Folding in HTML

In a large HTML document, elements can be collapsed so that only the needed data remains in focus. The folding features available for XML documents (on page 782) are also available in HTML documents, but it also provides folding for nested elements that are not closed.

HTML Outline View

The Outline view for HTML documents displays the structure of the HTML document you are editing. By default, it is displayed on the left side of the editor. In addition to the normal features available in the Outline view for XML documents (on page 334), the HTML Outline view also handles void elements, elements that are not closed, or attributes without quotes, and presents the tree structure of the HTML document correctly.

Figure 376. HTML Outline View
Editing Markdown Documents

Markdown was created as a lightweight markup language with plain text formatting syntax designed to provide syntax that is very easy to read and write, and to convert it to HTML and other formats. It is often used by content contributors who want a quick and easy way to write content without having to take their fingers off the keyboard and without having to learn numerous codes or shortcuts, and it can easily be shared interchangeably between virtually any types of contributor and system.

Oxygen XML Author provides a built-in Markdown editor that allows you to convert Markdown syntax to HTML or DITA and it includes a preview panel to help you visualize the final output. Aside from the plain text syntax that is common among most Markdown applications, the editor in Oxygen XML Author also integrates many other powerful features that content authors are accustomed to using for other types of documents. Some of these additional unique features include:

- Additional toolbar and contextual menu actions.
- Automatic validation to help keep the syntax valid.
- Dedicated syntax highlighting to make Markdown documents even easier to read and write.
- Unique features for creating Markdown documents directly in DITA maps (on page 2793) and converting Markdown documents to DITA topics.
- Specialized syntax rules to combine popular syntax features from several specifications.

Markdown Editor

Oxygen XML Author provides an intuitive, dynamic, and easy-to-use Markdown editor for writing and converting Markdown documents. It is a split-screen editor with two panels that are synchronized in
real-time. The left side is a simple text editor that is specially designed for writing Markdown syntax. The right side is a WYSIWYG style preview of how changes will look in the output.

**Markdown Text Editor Pane (Left Side)**

The left pane is a simple text editor that is refined to accept Markdown syntax. At the same time, you still have many of the actions, options, and features that you are used to when editing any other type of document in Oxygen XML Author.

The features of this special editor that are unique for Markdown documents include:

- **Unique Markdown Syntax Rules** - The Markdown editor in Oxygen XML Author uses an integration of rules (on page 1140) that combine rules from common default Markdown syntax along with many of the rules used in the GitHub Flavored Markdown syntax.
- **Syntax Highlighting** - The Oxygen XML Author syntax highlighting feature is integrated into the Markdown text editor to make it easier to read and write Markdown syntax. You can even customize the colors and styles for the syntax highlighting (on page 1137).
- **Automatic Spell Checking** - The Markdown editor supports the Oxygen XML Author automatic spell checking feature (on page 706) that reports possible misspelled words as you type. You simply need to select the Automatic spell check option in the Spell Check preferences page (on page 178), then click the Select editors button and select Markdown Editor.
- **Helpful Toolbar and Contextual Menu Actions** - A variety of unique actions (on page 1128) are available from the toolbar to help you insert proper Markdown syntax. The contextual menu also includes some common editing actions, as well as unique actions to export (convert) Markdown documents to HTML or DITA.
- **Shortcut Keys** - Many of the shortcut keys that are most commonly used (on page 27) in Oxygen XML Author also work in the Markdown editor.

**WYSIWYG Preview Pane (Right Side)**

The right pane is a WYSIWYG Preview pane that shows a visual representation of how changes made in the left-side text editor will be converted to HTML or DITA output. The changes you make in the text editor are parsed continually and they are immediately visible in the Preview pane. There are two tabs available in the Preview pane, one for visualizing DITA output and one for visualizing HTML output. You can switch between the two tabs at the bottom of the pane.

The Preview pane includes the following unique features:

- **WYSIWYG Visualization** - This pane presents the Markdown syntax from the left-side text editor in a visual WYSIWYG style interface that is automatically synchronized as you type.
• **Export Options** - The DITA tab includes a contextual menu action to export (convert) the current Markdown document to a DITA topic (on page 1136). Similarly, the HTML tab includes a contextual menu action to export (convert) it to an XHTML document (on page 1136).

• **Automatic Validation** - As you edit Markdown documents, they are validated automatically (on page 1137). The conversion engine constantly tries to parse your changes and if a change results in an error that prevents the parser from converting the syntax, an error message will be displayed in the *Preview* pane or *Results view* (on page 343) at the bottom of the editor.

• **Print Feature** - The Markdown editor includes a Print action that is available in the contextual menu and it allows you to configure options for printing the current document as you see it in the *Preview* pane.

• **Preview Markup** - The Markdown editor includes a Tags Display Mode drop-down menu (on page 1130) that is available on the toolbar and it allows you to control the amount of markup that is displayed in the *Preview* pane.

• **Specialized DITA Features** - The Markdown editor includes some unique, specialized features to integrate it with the powerful DITA support (on page 1138) in Oxygen XML Author.

Creating New Markdown Documents

To create a new Markdown document in Oxygen XML Author, follow these steps:

1. Click the [New] button on the toolbar or select [File] > [New].
3. Click the [Create] button.

**Result:** A new Markdown document is created and it is opened in the specialized Markdown Editor (on page 1125).

Related Information:

- Markdown Editor (on page 1125)

Actions Available in the Markdown Editor

Aside from the actions that are available in Oxygen XML Author for any type of document (such as the actions in the various menus and the common sections of the toolbar), a variety of unique actions are also available in the Markdown editor, from the toolbar and contextual menu.

**Toolbar Actions**

The following default actions are readily available on the toolbar when editing Markdown documents:

- **Header (1st Level)**
  - Inserts an atx-style first level header (on page 1141) at the cursor position.

- **Header (2st Level)**
  - Inserts an atx-style second level header (on page 1141) at the cursor position.

- **Header (3rd Level)**
Inserts an *atx-style third level header (on page 1141)* at the cursor position.

— **Horizontal Rule**

Inserts a *horizontal rule (on page 1141)* at the cursor position.

** Bold (Strong)**

Marks the selected text with *bold (on page 1142)*.

**Italic (Emphasis)**

Marks the selected text with *italics (on page 1142)*.

(signature) **Strikethrough**

Marks the selected text with a *strikethrough (on page 1142)*.

{ } **Code Block**

Inserts (or surrounds selected text in) a *codeblock (on page 1147)*.

>> **Blockquote**

Inserts a *blockquote (on page 1146)* at the cursor position.

🔗 **Insert Link**

Opens the *Insert Link* dialog box that allows you to define a *link (on page 1143)* to insert at the cursor position.

Figure 378. Insert Link Dialog Box

![Insert Link Dialog Box](image)

** Insert Image**

Opens the *Insert Image* dialog box that allows you to define an *image (on page 1145)* to insert at the cursor position. You can type the URL of the image you want to insert or use browsing actions in the ➾ *Browse* drop-down menu.

Figure 379. Insert Link Dialog Box
Insert Ordered List

Inserts an ordered list (on page 1148) at the cursor position. Three child list items are also automatically inserted by default. You can also use this action to convert selected content to an ordered list.

Insert Unordered List

Inserts an unordered list (on page 1148) at the cursor position. Three child list items are also automatically inserted by default. You can also use this action to convert selected content to an unordered list.

Insert Task List

Inserts a task list (on page 1150) at the cursor position. Three child list items are also automatically inserted by default. You can also use this action to convert selected content to a task list.

Insert Table

Inserts a table (on page 1151) at the cursor position.

Tags Display Mode drop-down menu

Allows you to control the amount of markup that is displayed in the Preview pane and offers the following choices:

- **Full Tags with Attributes**
  
  Displays full tag names with attributes for both block and inline elements.

- **Full Tags**
  
  Displays full tag names without attributes for both block and inline elements.

- **Block Tags**
  
  Displays full tag names for block elements and simple tags without names for inline elements.

- **Inline Tags**
Displays full tag names for *inline elements*, while *block elements* are not displayed.

**Partial Tags**

Displays simple tags without names for *inline elements*, while *block elements* are not displayed.

**No Tags**

No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

**Configure Tags Display Mode**

Opens the *Author preferences page (on page 129)* where you can configure options regarding *tags*, such as the default *Tags Display Mode*, *Tags Background Color*, *Tags Foreground Color*, and *Tags Font*.

**Contextual Menu Actions**

The following default actions are available in the contextual menu when editing Markdown documents:

**Cut, Copy, Paste**

Use these actions to execute the typical editing actions on the currently selected content.

**Source submenu**

This submenu includes the following actions:

**To Upper Case**

Converts the content selection to upper case characters.

**To Lower Case**

Converts the content selection to lower case characters.

**Capitalize Lines**

It capitalizes the first letter found on every new line that is selected. Only the first letter is affected, the rest of the line remains the same. If the first character on the new line is not a letter then no changes are made.

**Convert Hexadecimal Sequence to Character** *(Ctrl + Shift + X (Command + Shift + X on OS X))*

Converts a sequence of hexadecimal characters to the corresponding *Unicode character (on page 712)*. The action can be invoked if there
is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the 0x or 0X prefix. Examples of valid sequences and the characters they will be converted to:

- 0x0045 will be converted to E
- 0X125 to #
- 265 to #
- 2190 to #

Note: For more information about finding the hexadecimal value of a character, see Finding the Decimal, Hexadecimal, or Character Entity Equivalent (on page 721).

**Base64 Encode/Decode submenu**

This submenu includes the following actions for encoding or decoding base 64 schemes:

**Import File to Encode and Insert**

Encodes a file and then inserts the encoded content into the current document at the cursor position.

**Decode Selection and Export to File**

Decodes a selection of text from the current document and then exports (saves) the result to another file.

**Encode Selection**

Replaces a selection of text with the result of encoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the Encoding for Base64, Base32, Hex conversions option in the Encoding preferences page (on page 124) will be used. Likewise, the same is true if the Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions option is not selected in the Messages preference page (on page 251).

**Decode Selection**
Replaces a selection of text with the result of decoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the **Encoding for Base64, Base32, Hex conversions** option in the **Encoding** preferences page *(on page 124)* will be used. Likewise, the same is true if the **Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions** option is not selected in the **Messages** preference page *(on page 251)*.

**Modify All Matches**

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

**Base32 Encode/Decode submenu**

This submenu includes the following actions for encoding or decoding **base32** schemes:

**Import File to Encode and Insert**

Encodes a file and then inserts the encoded content into the current document at the cursor position.

**Decode Selection and Export to File**

Decodes a selection of text from the current document and then exports (saves) the result to another file.

**Encode Selection**

Replaces a selection of text with the result of encoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the **Encoding for Base64, Base32, Hex conversions** option in the **Encoding** preferences page *(on page 124)* will be used. Likewise, the same is true if the **Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions** option is not selected in the **Messages** preference page *(on page 251)*.
Base64, Base 32, Hex conversions option is not selected in the Messages preference page (on page 251).

Decode Selection

Replaces a selection of text with the result of decoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the Encoding for Base64, Base32, Hex conversions option in the Encoding preferences page (on page 124) will be used. Likewise, the same is true if the Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions option is not selected in the Messages preference page (on page 251).

Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Hex Encode/Decode submenu

This submenu includes the following actions for encoding or decoding hex schemes:

Import File to Encode and Insert

Encodes a file and then inserts the encoded content into the current document at the cursor position.

Decode Selection and Export to File

Decodes a selection of text from the current document and then exports (saves) the result to another file.

Encode Selection

Replaces a selection of text with the result of encoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case,
the encoding that is specified in the **Encoding for Base64, Base32, Hex conversions** option in the **Encoding** preferences page (on page 124) will be used. Likewise, the same is true if the **Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions** option is not selected in the **Messages** preference page (on page 251).

**Decode Selection**

Replaces a selection of text with the result of decoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the **Encoding for Base64, Base32, Hex conversions** option in the **Encoding** preferences page (on page 124) will be used. Likewise, the same is true if the **Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions** option is not selected in the **Messages** preference page (on page 251).

**Modify All Matches**

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

**Join and Normalize Lines** (**Ctrl + J** (**Command + J** on **OS X**))

For the current selection, this action joins the lines by replacing the *line separator* with a single space character. It also normalizes the whitespaces by replacing a sequence of such characters with a single space.

**Insert new line after** (**Ctrl + Alt + Enter** (**Command + Alt + Enter** on **OS X**))

This action has the same result as moving the cursor to the end of the current line and pressing the *ENTER* key.

**Modify All Matches**

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with
different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Open submenu

The following actions are available in this submenu:

Open File at Cursor

Opens the file at the cursor position in a new panel. If the file path represents a directory path, it will be opened in system file browser. If the file at the specified location does not exist, an error dialog box is displayed and it includes a Create new file button that starts the New document wizard. This allows you to choose the type or the template for the file. If the action succeeds, the file is created with the referenced location and name and is opened in a new editor panel.

Open File at Cursor in System Application

Opens the file (identified by its link) or web page (identified by a web link) found at cursor position. The target is opened in the default system application associated with that file type.

Compare

Opens the current file in the Compare Files tool (on page 2284).

Show/Hide Preview

A toggle action that shows or hides the Preview pane.

Export as DITA Topic

Converts the current Markdown document into a DITA topic.

Export as HTML

Converts the current Markdown document into an XHTML document.

Print (Available in the Preview pane)

Opens a page setup dialog box that allows you to configure printing options for the current document.

Related Information:

- Working with Markdown Documents in DITA (on page 1138)
Syntax Highlighting in the Markdown Editor

Oxygen XML Author supports syntax highlighting in the Markdown editor to make it easier to read the semantics of the structured content by displaying each type of XML code in different colors and fonts.

To customize the colors or styles used for the syntax highlighting colors for Markdown documents, follow these steps:

1. Open the Preferences dialog box (Options > Preferences) (on page 79).
2. Go to Editor > Syntax Highlight (on page 173).
3. Select and expand the Markdown section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.

You can see the effects of your changes in the Preview pane.

Related Information:

- Syntax Highlight Preferences (on page 173)
- Markdown Editor (on page 1125)

Automatic Validation in Markdown Documents

Markdown documents are validated automatically as you type. The conversion engine constantly tries to parse your changes to display the results in the Preview pane. If a change results in an error that prevents the parser from converting the syntax, an error message will be displayed in the DITA tab or in the Results view (on page 343) at the bottom of the editor.

The types of errors that will be reported include the following:

- Improper order of headers.
- The syntax in a documents begins with something other than a 1st level header.
- Tags are not closed properly if XHTML markup is used in the document.
- Invalid tag names if XHTML markup is used in the document.
- Markup is not well formed if XHTML markup is used in the document.
Working with Markdown Documents in DITA

Oxygen XML Author includes some unique features that allow you to easily integrate Markdown documents in a DITA project. This is especially helpful for teams that have contributors who are familiar with the Markdown syntax, but they want their output to be generated from DITA projects. The integration between the Markdown editor and DITA includes actions to export or convert Markdown documents to DITA topics and the DITA tab in the Preview pane provides a visualization of how the topic will look after conversion.

Export Markdown as a DITA Topic

The Markdown editor includes an option to quickly convert the current Markdown document into a DITA topic. The Export as DITA Topic action is available in the contextual menu.

The conversion creates a new XML file that is defined as a DITA topic and opens it in the Text editing mode. You can then work with the document as you would with any other DITA topic, although you may need to manually correct some issues where the parser could not properly map Markdown syntax to DITA markup.

Working with Markdown Documents in the DITA Maps Manager

Oxygen XML Author has some specialized features that allow you to integrate Markdown documents directly into your DITA project using the DITA Maps Manager (on page 2503). The following features are available for Markdown documents in the DITA Maps Manager view:

- **Insert Reference to Markdown Document** - You can use the New, Reference, and Reference to the currently edited file actions from the Append Child, Insert Before, or Insert After submenu when invoking the contextual menu in the DITA Maps Manager to insert a reference to a Markdown document at the selected location in the map. Markdown documents will be inserted as a topic reference (topicref element) with the format attribute set to markdown.

- **Validate Markdown Documents in DITA Maps** - When you use the Validate and Check for Completeness action from the DITA Maps Manager toolbar to check the integrity of the structure of a DITA map, Markdown documents that are referenced in the DITA map will be converted to DITA topics in the background and validated the same as any other DITA topic.
• **Transforming DITA Maps with Markdown Documents** - When transforming DITA maps that have Markdown documents referenced, the transformation will convert the Markdown documents to normal DITA output without you needing to manually convert the Markdown documents to DITA topics.

• **Manually Convert Markdown Documents to DITA Topics** - If you need to use DITA semantics that are not possible in Markdown syntax (such as content references, related links, and other DITA-specific syntax), you can manually convert the Markdown document into a DITA topic. To do so, right-click the Markdown document in the DITA Maps Manager and select Refactoring > **Convert Markdown to DITA Topic**. This will open a dialog box that allows you to configure options for converting the document to an XML file that is defined as a DITA topic.

![Convert Markdown to DITA Topic Dialog Box](image)

This dialog box includes the following options:

**Destination**
- The destination path for the new DITA topic.

**File Name**
- Presents the current name and allows you to change it.

**Update references**
- Select this option to update all references of the file in the DITA map and in the files referenced from the DITA map.

**Delete Markdown file**
- If selected, the Markdown version of the file is deleted when the document is converted into a DITA file. If deselected (default value), when the document is converted into a DITA file, the original Markdown file is also preserved in its current location.

**Preview**
- Select this button to display a preview of the changes Oxygen XML Author is about to make.
Convert

Select this button to perform the conversion. If the Markdown file has format=“markdown”, it will be converted to a DITA topic. If it has format=“mdita”, it will be converted to a LightWeight DITA topic.

Tip: Oxygen XML Author comes with a sample ditamap project for converting Markdown to DITA. Go to the Project view (on page 320), open the sample.xpr project, and navigate to the dita/markdown-dita folder.

Converting Multiple Markdown Documents to DITA

Oxygen XML Author offers an add-on that contributes actions in the Tools menu and contextual menu to enable batch conversion between various formats, including Markdown to DITA. For more information and instructions for installing the add-on, see Batch Converter Add-on (on page 2248).

Related Information:

- Markdown Editor (on page 1125)
- Actions Available in the Markdown Editor (on page 1128)
- Markdown Editor Syntax Rules and Specifications (on page 1140)
- Automatic Validation in Markdown Documents (on page 1137)
- Markdown DITA Syntax Reference

Markdown Editor Syntax Rules and Specifications

The Markdown editor in Oxygen XML Author uses rules that were integrated from the most common set of default Markdown syntax rules along with many of the GitHub Flavored Markdown rules.

This topic lists the Oxygen XML Author implementation of the most commonly used syntax rules.

Headers

The Markdown editor supports two styles of headers, Setext and Atx.

- Setext Style
Setext-style headers are underlined using equal signs (for first-level headers) and dashes (for second-level headers). Any number of equal signs or dashes will result in the same output.

**Example: Setext Style Headers**

```plaintext
First-Level Header (H1)
========

Second-Level Header (H2)
------------
```

- **Atx Style**

Atx-style headers use 1-6 hash characters at the start of the line, corresponding to header levels 1-6. Optionally, you may close atx-style headers. This is purely cosmetic and the closing hashes do not need to match the number of hashes used to open the header. It is the number of opening hashes that determines the header level.

**Example: Atx Style Headers**

```plaintext
# H1 text #
## H2 text
### H3 text ######
#### H4 text
##### H5 text ###
###### H6 text
```

**Horizontal Rules (for HTML output only)**

You can produce a horizontal rule tag (`<hr />`) by placing three or more hyphens, asterisks, or underscores on a line by themselves (they also need to be preceded and followed by a blank line). Optionally, they can be separated by spaces.

**Example: Horizontal Rules**

```plaintext
* * *
*****
```

```plaintext
_ _ _ _
```
Paragraphs and Line Breaks

A paragraph is simply one or more consecutive lines of text, separated by one or more blank lines. The text at the beginning of a paragraph should not be indented with spaces or tabs. To create a new paragraph, simply insert a blank line in between them.

⚠️ Important: When converting to HTML, if you break a paragraph on multiple lines (without a blank line in between them), it will create a break tag (`<br>`). When converting to DITA, the text is kept in a single paragraph in this case and a blank line is required to break a paragraph. This behavior differs slightly from the default Markdown rules.

Example: Paragraphs

This is a paragraph that contains two lines of text. (In HTML, a break tag is created in between the two lines)

This is a new paragraph.

Styling Text

The Markdown editor supports some syntax rules for styling text (such as bold, italic, or strikethrough).

• **Italic (Emphasis)** - Text wrapped with one asterisk or underscore produces an italic (emphasis) tag.

  *italic*
  _italic_

• **Bold (Strong)** - Text wrapped with two asterisks or underscores produces a bold (strong) tag.

  **bold**
  __bold__

• **Strikethrough** - In HTML only, text wrapped with two tildes (~~~~) produces a strikethrough tag.

  ~~strikethrough~~

Tip: You can also combine these styling rules. For example, **BoldText _ItalicText_ BoldText** would produce italicized text within bold text. Also, if you surround an asterisk or underscore with spaces, it will be treated as a literal asterisk or underscore. To produce a literal asterisk or underscore at a position where it would otherwise be used as a styling delimiter, you can escape it with a backslash (for example, \\literal asterisks\\).
Links

The Markdown editor supports two types of links, *inline* and *reference*. In both cases, it begins with link text that is delimited by [square brackets].

- **Inline Links**

  To create an inline link, use a set of regular parentheses immediately after the closing square bracket for the link text. Inside the parentheses, put the URL where you want the link to point, and optionally a title surrounded in quotes. Also, if you reference a local resource on the same server, you can use relative paths.

  **Examples: Inline Link**

  With a title:

  ```markdown
  Text with [example link text](http://www.example.com/path "Title") inline link and title.
  ```

  Without a title:

  ```markdown
  Text with [example link text](http://www.example.com/path) inline link without a title.
  ```

  Relative path:

  ```markdown
  Text with [example link text](/relative_path/) inline link with relative path.
  ```

- **Reference Links**

  Reference-type links use a second set of square brackets that include a label (link identifier) to identify the link (it may consist of letters, numbers, spaces, and punctuation and it is not case-sensitive). You can optionally use a space to separate the sets of brackets. The labels (link identifiers) are only used for creating the links and do not appear in the output.

  ```markdown
  Text with [link text1][id 1] a reference-type link and [link text2][id_2] another one.
  ```

  Then, somewhere in the document, you need to define your link label on a line by itself. The link identifier must be within square brackets followed by a colon, then after one or more spaces the URL for the link. Optionally this can be followed by a title enclosed in single quotes, double quotes, or parentheses. Also, the link may optionally be enclosed in angle brackets (< >).

  ```markdown
  [id 1]: http://example1.com/ "Optional Title"
  [id_2]: <http://example2.com/> "Optional Title2"
  ```
Other notes about Reference Links:

- You can put the title on a second line and use extra spaces or tabs for padding. This is useful for aesthetics when the URL is long.

```
[id]: http://example.com/long/path/to/resource/here
"Optional Title Here"
```

- The label (link identifier) can be missing, in which case the link text (in square brackets) is used as the name.

```
[My Link][]
```

and then defined as:

```
[My Link]: http://example.com/
```

## Automatic Links

The Markdown editor supports a shortcut style for creating automatic links for URLs and email addresses. You simply surround the URL or email address with angle brackets.

**Note:** These automatic links only work properly in HTML conversions. The Preview pane may display them properly in the DITA tab, but the DITA output will not properly recognize the format.

- **URLs**

  By surrounding a URL with angle brackets, you can show the actual text of the URL while also making it clickable in the output.

  ```
  <http://example.com/>
  ```

  For example, in HTML it is converted to:

  ```html
  <a href="http://example.com/">http://example.com/</a>
  ```

- **Email Addresses**

  Automatic links for email addresses work similarly, except that Markdown will also perform a bit of randomized decimal and hex entity-encoding to help obscure your address from address-harvesting spambots.

  ```
  <address@example.com>
  ```

  In HTML, it is converted to something like:

  ```html
  <a href="&#x6D;&lt;address@&lt;example.com&gcode;"&gt;address@example.com&lt;/a&gt;
  ```
Images

The Markdown editor uses an image syntax that is intended to resemble the syntax for links, allowing for the same two types: inline and reference. In both cases, the syntax for images begins with an exclamation mark, followed by `alt` attribute text surrounded by square brackets, and then followed by a set of parentheses that contain the URL or path to the image.

- **Inline Images**

  For inline images, use a set of regular parentheses immediately after the closing square bracket for the `alt` attribute text. Inside the parentheses, put the URL or path of the image, and optionally a title surrounded in quotes.

  **Examples: Inline Images**

  With a title:

  ```markdown
  Text with ![Alt text](/path/to/img.jpg "Optional title") inline image and a title.
  ```

  Without a title:

  ```markdown
  Text with ![Alt text](/path/to/img.jpg) inline link without a title.
  ```

- **Reference Images**

  For reference-type images, use a second set of square brackets that include a label (image identifier) to identify the image (it may consist of letters, numbers, spaces, and punctuation and it is not case-sensitive). You can optionally use a space to separate the sets of brackets. The labels (image identifiers) do not appear in the output.

  ```markdown
  Text with ![Alt text1][id] a reference-type image.
  ```

  Then, somewhere in the document, you need to define your image label on a line by itself. The image identifier must be within square brackets followed by a colon, then after one or more spaces the URL or path of the image. Optionally this can be followed by a title enclosed in single quotes, double quotes, or parentheses.

  ```markdown
  [id]: url/to/image "Optional Title"
  ```
Blockquotes

The Markdown editor uses email-style greater than characters (>) for blockquotes. You only need to put the > before the first line of a hard-wrapped paragraph, but it looks better (and is clearer) if you put a > before every line.

• **Example: Blockquotes**

```
> This is a blockquote with two paragraphs. Lorem ipsum dolor sit amet,
> consectetur adipiscing elit. Aliquam hendrerit mi posuere lectus.
> Vestibulum enim wisi, viverra nec, fringilla in, laoreet vitae, risus.
>
> Donec sit amet nisl. Aliquam semper ipsum sit amet velit. Suspendisse
> id sem consectetur libero luctus adipiscing.
```

• **Blockquotes** can be nested by adding additional levels of > characters.

**Example: Nested Blockquotes**

```
> This is the first level of quoting.
>
> > This is nested blockquote.
>
> Back to the first level.
```

• **Blockquotes** can also contain other Markdown elements (such as headers, lists, and code blocks).

**Example: Blockquotes with Other Markdown Elements**

```
> ## This is a header.
>
> 1.   This is the first list item.
> 2.   This is the second list item.
>
> Here's some example code:
>
>     return shell_exec("echo $input | $markdown_script")
```

Quoting Code (Inline and Code Blocks)

The Markdown editor supports quoting code or commands inline within a sentence or in distinct blocks.
• **Inline**

You can quote or emphasize code within a sentence (inline) with single backticks (single quotation marks). The text within the backticks will not be formatted.

**Example: Inline Code Emphasis**

```
This is a normal sentence with a `code` in the middle.
```

• **Code Blocks**

You can format code or text into its own distinct block by inserting a blank line before and after the content and using at least 4 spaces (or 1 tab), or by using opening and closing triple backticks (``` ```) on separate lines.

**Example: Code Block**

```text
This is a normal paragraph:

    This is a code block

This is a normal paragraph:

    ...
    This is a code block
    ...
```

One level of indentation is removed from each line of a codeblock and it continues until it reaches a line that is not indented (or until the closing backticks).

**Example: Code Block with Indentation**

```text
tell application "something"
    beep
end tell
```

For example, in HTML the result would look like this:

```html
<pre><code>tell application "Foo"
    beep
end tell</code></pre>

You can also add an optional language identifier to enable syntax highlighting in your code blocks. The Oxygen XML Author Markdown editor supports the following languages: Java, JavaScript, CSS, and Python.
Example: Syntax Highlighting in Code Block

```css
input[type="submit"] { 
  color: white; 
  font-weight: bold; 
... 
```

Inline XHTML (for HTML output only)

The Markdown editor supports writing inline XHTML. Since Markdown is just a writing format, it requires a conversion for publishing purposes. If you are using the HTML conversion, for any markup that is not covered by Markdown syntax, you can simply use XHTML syntax.

Example: Inline XHTML

This is a regular paragraph.

```html
<table>
  <tr>
    <td>Col 1</td>
    <td>Col 2</td>
  </tr>
</table>
```

This is another regular paragraph.

Lists

The Markdown editor supports ordered and unordered lists. You can also insert blockquotes (on page 1146) and code blocks (on page 1146) inside list items. List markers typically start at the left margin, but may be indented by up to three spaces.

• Unordered Lists

For unordered lists, you can use asterisks (*), plus signs (+), and hyphens (−) interchangeably.

* List item 1
+ List item 2
- List item 3

• Ordered Lists
For ordered lists, use numbers followed by periods. The actual numbers you use have no effect on the output. It simply converts them to list items within an ordered list and the actual number of list items will determine the numbers in the output.

1. List item 1
8. List item 2
5. List item 3

**Nested Lists**

You can create nested lists by indenting lines by two spaces.

1. Ordered list item 1
   1. Nested ordered list item 1
   2. Nested ordered list item 2
      * 2nd level nested unordered list item 1
      * 2nd level nested unordered list item 2
         * 3rd level nested unordered list item 1
   2. Ordered list item 2

**Paragraphs Inside Lists**

If list items are separated by blank lines, Markdown will wrap the items in a paragraph in the output.

* List item 1
* List item 2

For both DITA and HTML output, this would result in:

```html
<ul>
  <li><p>List item 1</p></li>
  <li><p>List item 2</p></li>
</ul>
```

**Multiple Paragraphs Inside Lists**

List items may consist of multiple paragraphs. Each subsequent paragraph in a list item must be indented by either 4 spaces or one tab. Optionally, you can also indent each line of a paragraph to make it look nicer.

1. This is a list item with two paragraphs. Lorem ipsum dolor sit amet, consectetuer adipiscing elit. Aliquam hendrerit mi posuere lectus.
Vestibulum enim wisi, viverra nec, fringilla in, laoreet vitae, risus. Donec sit amet nisl. Aliquam semper ipsum sit amet velit.

2. Suspendisse id sem consectetuer libero luctus adipiscing.

• **Blockquotes Inside Lists**

To put a *blockquote* within a list item, the blockquote delimiters (`>`) need to be indented so that it is under the first letter of the text after the list item marker.

```
* A list item with a blockquote:
  > This is a blockquote
  > inside a list item.
```

• **Code Blocks Inside Lists**

To put a code block within a list item, insert an empty line in between the list item and the code block, and the code block needs to be indented twice (with 8 spaces or 2 tabs), or if you are using the triple backticks method, the opening triple backtick needs to be indented with 4 spaces or 1 tab.

```
* A list item with a code block:

  This is a code block inside a list item

  ...

  This is a code block inside a list item using the backticks method

  ...
```

**Task Lists**

You can create task lists by prefacing list items with a hyphen followed by a space followed by square brackets (`- [ ]`). To mark a task as complete, use `-[x]`.

**Example: Task Lists**

```
- [ ] Unfinished task 1
- [x] Finished task 2
```

**Definition Lists**

You can create definition lists by using a colon plus a space for each list item.

**Example: Definition Lists**
Term 1
: Definition A
: Definition B

Tables

You can create tables in the Markdown editor by using pipes (|) and hyphens (-).

• Creating a Table

Pipes are used to separate each column, while hyphens are used to create column headers. The pipes on either end of the table are optional. Cells can vary in width and do not need to be perfectly aligned within columns, but there must be at least three hyphens in each column of the header row.

<table>
<thead>
<tr>
<th>First Header</th>
<th>Second Header</th>
</tr>
</thead>
<tbody>
<tr>
<td>------------</td>
<td>-------------</td>
</tr>
<tr>
<td>Column 1 Row 1 Cell</td>
<td>Column 2 Row 1 Cell</td>
</tr>
<tr>
<td>Column 1 Row 2 Cell</td>
<td>Column 2 Row 2 Cell</td>
</tr>
</tbody>
</table>

• Formatting Rules in Table Cells

You can use formatting rules inside the cells of the table (such as links, inline code blocks, and text styling).

<table>
<thead>
<tr>
<th>First Header</th>
<th>Second Header</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>inline code</code></td>
<td>Content with <strong>bold text</strong> inside cell</td>
</tr>
</tbody>
</table>

• Aligning Text in Tables

You can align text to the left, right, or center of a column by including colons (:) to the left, right, or on both sides of the hyphens within the header row.

<table>
<thead>
<tr>
<th>Left-aligned</th>
<th>Center-aligned</th>
<th>Right-aligned</th>
</tr>
</thead>
<tbody>
<tr>
<td>:---</td>
<td>:---:</td>
<td>---:</td>
</tr>
<tr>
<td>Content Cell</td>
<td>Content Cell</td>
<td>Content Cell</td>
</tr>
</tbody>
</table>

• Joining Cells (Span a Cell Over Multiple Columns)

You can join cells horizontally (span a cell over multiple columns) by using multiple consecutive pipe characters (|) to the right of the particular cell. The number of consecutive pipes indicate the number of columns the cell will span (|| for two, ||| for three, and so on).

<table>
<thead>
<tr>
<th>First Header</th>
<th>Second Header</th>
<th>Third Header</th>
<th>Fourth Header</th>
</tr>
</thead>
<tbody>
<tr>
<td>------------</td>
<td>--------------</td>
<td>-------------</td>
<td>--------------</td>
</tr>
</tbody>
</table>
Emoji

You can add *emoji* in the Markdown editor by surrounding the EMOJICODE with colons (`:EMOJICODE:`).

**Example: Emoji**

:smile:
:laughing:

The resulting emoticons will appear in the output, but they are not displayed in the *Preview* pane.

For a full list of available emoji codes, see [Emoji Cheat Sheet](#).

Backslash Escapes

You can ignore Markdown formatting by using backslash escapes (\) to generate literal characters that would otherwise have special meaning in the Markdown syntax. For example, if you want to surround a word with literal asterisks (instead of an italic or emphasis tag), you can use backslashes to escape the asterisks.

`\"literal asterisks\"`

The Markdown editor provides backslash escapes for the following characters:

| \   | backslash |
| `   | backtick  |
| *   | asterisk   |
| _   | underscore |
| {}  | curly braces |
| []  | square brackets |
| ()  | parentheses |
| #   | hash mark |
| +   | plus sign |
| -   | minus sign (hyphen) |
| .   | dot |
| !   | exclamation mark |

Automatic Escaping for Special Characters

The Markdown editor includes support for automatically escaping special characters such as angle brackets (< >) and ampersands (&). If you want to use them as literal characters, you must
escape them as entities, as in the table below. The exception to this is in HTML output, if the special characters for a valid tag (for example, `<b>`, `>`), they are treated as literal characters and escaping is not necessary.

<table>
<thead>
<tr>
<th>Literal Character</th>
<th>Escaping Code</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;</code></td>
<td><code>&amp;lt;</code></td>
</tr>
<tr>
<td><code>&gt;</code></td>
<td><code>&amp;gt;</code></td>
</tr>
<tr>
<td><code>&amp;</code></td>
<td><code>&amp;amp;</code></td>
</tr>
</tbody>
</table>

Footnotes

The Markdown editor in Oxygen XML Author supports normal and inline footnotes. The following examples show the required syntax.

- **Example: Normal Footnote**
  
  Here is a footnote reference,[^1]

  [^1]: Here is the footnote.

- **Example: Normal Footnote with Multiple Blocks**
  
  Here is a footnote reference,[^longnote]

  [^longnote]: Here is the footnote with multiple blocks.

  Subsequent paragraphs are indented with 4 spaces or 1 tab to show that they belong to the previous footnote.

- **Example: Inline Footnote**
  
  Here is an inline note.[^Inlines notes are easier to write, since you don't have to pick an identifier and move down to type the note.]

9. Built-in XML Frameworks (Document Types)

Oxygen XML Author includes a variety of specialized editors, views, and features that are dynamic according to the type of document that you open or create. Oxygen XML Author includes fully supported built-in frameworks (on page 2794) for the most popular XML document types (DITA, DocBook, TEI, XHTML, JATS) with a full set of features, as well as support for other document types with more generic features (on page 769).

The built-in frameworks (on page 2794) are defined according to a set of rules and a variety of settings that improve editing capabilities for its particular file type. These settings include:

- A default grammar used for validation and content completion in both Author mode and Text mode.
- CSS stylesheets for rendering XML documents in Author mode.
- User actions invoked from toolbars or menus in Author mode.
- Built-in transformation scenarios used for publishing XML documents.
- XML Catalogs (on page 2800) used for mapping resources.
- New document templates to make it easy to create XML documents.
- User-defined extensions for customizing the interaction with the content author in Author mode.

It is also possible to create and configure your own custom frameworks (document types). For more information, see the Creating and Configuring Custom Frameworks (on page 1893) section.

For extensive details about the DITA editing features included in Oxygen XML Author, see the DITA Authoring chapter (on page 2494).

DocBook 4 Document Type (Framework)

DocBook is a very popular set of tags for describing books, articles, and other prose documents, particularly technical documentation. DocBook provides a vast number of semantic element tags, divided into three broad categories: structural, block-level, and inline. DocBook content can then be published in a variety of formats, including HTML, PDF, WebHelp, and EPUB.

File Definition

A file is considered to be a DocBook 4 document when one of the following conditions are true:
The root element name is `book` or `article`.
The PUBLIC ID of the document contains the string `-//OASIS//DTD DocBook XML`.

**Default Document Templates**

There are a variety of default *DocBook 4* templates available when creating new documents from templates (on page 619) and they can be found in: Framework Templates > DocBook 4.

The default templates for DocBook 4 documents are located in the `[OXYGEN_INSTALL_DIR]/frameworks/docbook/templates/Docbook 4` folder.

**Default Schema for Validation and Content Completion**

The default schema that is used if one is not detected in the DocBook 4 file is `docbookxi.dtd` and it is stored in `[OXYGEN_INSTALL_DIR]/frameworks/docbook/4.5/dtd/`.

**Default CSS**

The default CSS files used for rendering DocBook content in Author mode are stored in `[OXYGEN_INSTALL_DIR]/frameworks/docbook/css/`.

By default, these default CSS files are merged with any that are specified in the document. For more information, see Configuring and Managing Multiple CSS Styles for a Framework (on page 1919).

**Default XML Catalog**

The default XML Catalog (on page 2800), `catalog.xml`, is stored in `[OXYGEN_INSTALL_DIR]/frameworks/docbook/`.

**Transformation Scenarios**

Oxygen XML Author includes numerous built-in DocBook transformation scenarios that allow you to transform DocBook 4 documents to a variety of outputs, such as WebHelp, PDF, HTML, HTML Chunk, XHTML, XHTML Chunk, and EPUB. All of them are listed in the DocBook 4 section in the Configure Transformation Scenario(s) dialog box (on page 1378).

For more information, see the DocBook Transformation Scenarios (on page 1285) section.

DocBook 4 Author Mode Actions

A variety of actions are available in the DocBook 4 framework (on page 2794) that can be added to the DocBook4 menu, the Author Custom Actions toolbar, the contextual menu, and the Content Completion Assistant (on page 2792).

DocBook 4 Toolbar Actions

The following default actions are readily available on the DocBook (Author Custom Actions) toolbar when editing in Author mode (by default, most of them are also available in the DocBook4 menu and in various submenus of the contextual menu):

- **Bold**
  Emphasizes the selected text by surrounding it with `<emphasis role="bold">` tag. You can use this action on multiple non-contiguous selections.

- **Italic**
  Emphasizes the selected text by surrounding it with `<emphasis role="italic">` tag. You can use this action on multiple non-contiguous selections.

- **Underline**
  Emphasizes the selected text by surrounding it with `<emphasis role="underline">` tag. You can use this action on multiple non-contiguous selections.

- **Link Actions Drop-Down Menu**
  The following link actions are available from this menu:
  
  - **Cross reference (link)**
    Opens a dialog box that allows you to select a target to insert as a hypertext link.
  
  - **Cross reference (xref)**
Inserts a cross reference to other parts of the document.

**Web Link (ulink)**

Inserts a link that addresses its target with a URL (Universal Resource Locator).

**Insert OLink**

Opens an OLink dialog box that allows you to insert a link that addresses its target indirectly, using the `targetdoc` and `targetptr` values that are present in a Targetset (on page 1190) file.

**Figure 381. Insert OLink Dialog Box**

![Insert OLink Dialog Box](image)

After you choose the Targetset URL, the structure of the target documents is presented. For each target document (`targetdoc`), its content is displayed allowing you to easily identify the `targetptr` for the `olink` element that will be inserted. You can also use the search fields to quickly identify a target. If you already know the values for `targetdoc` and `targetptr`, you can insert them directly in the corresponding fields. You can also edit an `olink` using the Edit OLink action that is available on the contextual menu. The last used Targetset URL will be used to identify the edited target.
To insert XREF text into the olink, enter the text in the xreftext field and make sure the Insert xreftext in the OLink option is selected.

**Insert URI**

Inserts a URI element. The URI identifies a Uniform Resource Identifier (URI) in content.

![Insert Image]

Opens a dialog box that allows you to select the path of an image to insert at the cursor position (on page 963). Depending on the current location, an image-type element is inserted. If the action is invoked between two block elements (such as paragraphs), the dialog box also allows you to provide a title.

![Insert Media Resource]

Opens a Choose Media dialog box (on page 997) that allows you to select the URL of a media object to be inserted into a document at the cursor position. The result will be that a reference to the specified video, audio, or embedded HTML frame is inserted and rendered in Author mode so that it can be played directly from there.

![Insert XInclude]

Opens a dialog box that allows you to browse and select content to be included and automatically generates the corresponding XInclude instruction.

§ - Section Drop-Down Menu

The following actions are available from this menu:

- **Insert Section**
  
  Inserts a new section or subsection in the document, depending on the current context. For example, if the current context is sect1, then a sect2 is inserted. By default, this action also inserts a para element as a child node. The para element can be deleted if it is not needed.

- **Promote Section** (Ctrl + Alt + LeftArrow (Command + Alt + LeftArrow on OS X))
  
  Promotes the current node as a sibling of the parent node.

- **Demote Section** (Ctrl + Alt + RightArrow (Command + Alt + RightArrow on OS X))
  
  Demotes the current node a child of the previous node.

- **Insert Paragraph**
  
  Insert a new paragraph element at current cursor position.

- **Insert Equation**
Opens the **XML Fragment Editor** that allows you to insert and edit MathML notations (*on page 999*).

- **Insert List Item**
  
  Inserts a list item in the current list type.

- **Insert Ordered List**
  
  Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

- **Insert Itemized List**
  
  Inserts an itemized list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an itemized list.

- **Insert Variable List**
  
  Inserts a DocBook variable list. A child list item is also inserted automatically by default. You can also use this action to convert selected paragraphs or other types of lists to a variable list.

- **Insert Procedure List**
  
  Inserts a DocBook *procedure* element. A *step* child item is also inserted automatically. You can also use this action to convert selected paragraphs or other types of lists to a procedure list.

- **Sort**
  
  Sorts cells or list items in a table.

- **Insert Table**
  
  Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a block element (*on page 2792*)) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

  **Note:** If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that **Only lists, paragraphs, or inline content can be converted to tables.**

- **Insert Row Below**
Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

**Delete Row(s)**

Deletes the table row located at cursor position or multiple rows in a selection.

**Insert Column After**

Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

**Delete Column(s)**

Deletes the table column located at cursor position or multiple columns in a selection.

**Table Properties**

Opens the Table properties dialog box that allows you to configure properties of a table (such as frame borders).

**Join Cells**

Joins the content of the selected cells (both horizontally and vertically).

**Split Cell**

Splits the cell at the cursor location. If Oxygen XML Author detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

**DocBook4 Menu Actions**

The following additional actions can be found in the DocBook4 menu when editing in Author mode:

**Paste special submenu**

This submenu includes the following special paste actions that are specific to the DocBook 4 framework:

**Paste As XInclude**

Allows you to create an `xi:include` element that references a DocBook element copied from Author mode. The operation fails if the copied element does not have a declared ID.

**Paste as link**

Allows you to create a `link` element that references a DocBook element copied from Author mode. The operation fails if the copied element does not have a declared ID.
Paste as xref

Allows you to create an `<xref>` element that references a DocBook element copied from Author mode. The operation fails if the copied element does not have a declared ID.

Subscript

Surrounds the selected text with a `subscript` tag, used for inserting a character (number, letter, or symbol) that will appear slightly below the baseline and slightly smaller than the rest of the text.

Superscript

Surrounds the selected text with a `superscript` tag, used for inserting a character (number, letter, or symbol) that will appear slightly above the baseline and slightly smaller than the rest of the text.

Table submenu

In addition to the table actions available on the toolbar, the following actions are available in this submenu:

- **Insert Row Above**
  
  Inserts a new table row with empty cells above the current row. This action is available when the cursor is positioned inside a table.

- **Insert Rows**
  
  Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (`Above` or `Below` the current row).

- **Insert Column Before**
  
  Inserts a column before the current one.

- **Insert Columns**
  
  Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (`Above` or `Below` the current column).

- **Insert Cell**
  
  Inserts a new empty cell depending on the current context. If the cursor is positioned between two cells, Oxygen XML Author a new cell at cursor position. If the cursor is inside a cell, the new cell is created after the current cell.

ID Options
Opens the ID Options dialog box that allows you to configure options for generating IDs in Author mode. The dialog box includes the following:

**ID Pattern**

The pattern for the ID values that will be generated. This text field can be customized using constant strings or any of the Oxygen XML Author Editor Variables (on page 266).

**Element name or class value to generate ID for**

The elements for which ID values will be generated, specified using class attribute values. To customize the list, use the Add, Edit, or Remove buttons.

**Auto generate IDs for elements**

If selected, Oxygen XML Author will automatically generate unique IDs for the elements listed in this dialog box when they are created in Author mode.

**Remove IDs when copying content**

This option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs. If this option is not selected, IDs are always retained when you copy or cut content and paste it in the same document or other documents. If this option is selected, IDs are never retained for copied content, but if you cut the content, they are preserved for the first paste action (and not retained for any subsequent paste actions).

**Generate IDs**

Oxygen XML Author generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the ID Options dialog box that are found in the current selection.

**Note:** The Generate IDs action does not overwrite existing ID values. It only affects elements that do not already have an id attribute.
You can use this action to manually trigger a refresh and update of all referenced resources.

**Tags display mode Submenu**

- **Full Tags with Attributes**
  Displays full tag names with attributes for both *block (on page 2792)* and *inline elements (on page 2795).*

- **Full Tags**
  Displays full tag names without attributes for both *block* and *inline elements*.

- **Block Tags**
  Displays full tag names for *block elements* and simple tags without names for *inline elements*.

- **Inline Tags**
  Displays full tag names for *inline elements*, while *block elements* are not displayed.

- **Partial Tags**
  Displays simple tags without names for *inline elements*, while *block elements* are not displayed.

- **No Tags**
  No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

**Configure Tags Display Mode**

Use this option to go to the **Author preferences page (on page 129)** where you can configure the **Tags Display Mode** options.

**Profiling/Conditional Text Submenu**

- **Edit Profiling Attributes**
  Allows you to configure the *profiling attributes (on page 911)* and their values.

- **Show Profiling Colors and Styles**
  Select this option to turn on conditional styling.

- **Show Profiling Attributes**
Select this option to turn on conditional text markers. They are displayed at the end of conditional text blocks, as a list of attribute name and their currently set values.

Show Excluded Content

When this option is selected, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, deselect this option.

List of all profiling condition sets that match the current document type

You can click a listed condition set (on page 917) to activate it.

Profiling Settings

Opens the profiling options preferences page (on page 142), where you can manage profiling attributes and profiling conditions sets. You can also configure the profiling styles and colors options from the colors/styles preferences page (on page 144) and the attributes rendering preferences page (on page 146).

DocBook 4 Contextual Menu Actions

In addition to many of the DocBook 4 toolbar actions (on page 1157) and the general Author mode contextual menu actions (on page 1007), the following DocBook 4 framework-specific actions are also available in the contextual menu when editing in Author mode:

Paste special submenu

This submenu includes the following special paste actions that are specific to the DocBook 4 framework:

Paste As XInclude

Allows you to create an xi:include element that references a DocBook element copied from Author mode. The operation fails if the copied element does not have a declared ID.

Paste as link

Allows you to create a link element that references a DocBook element copied from Author mode. The operation fails if the copied element does not have a declared ID.

Paste as xref
Allows you to create an \texttt{xref} element that references a DocBook element copied from Author mode. The operation fails if the copied element does not have a declared ID.

**Image Map Editor**

This action is available in the contextual menu when it is invoked on an image. This action applies an image map to the current image (if one does not already exist) and opens the Image Map Editor dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.

**Table Actions**

The following table editing actions are available in the contextual menu when it is invoked on a table:

**Insert Rows**

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (Above or Below the current row).

**Delete Row(s)**

Deletes the table row located at cursor position or multiple rows in a selection.

**Insert Columns**

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (Above or Below the current column).

**Delete Column(s)**

Deletes the table column located at cursor position or multiple columns in a selection.

**Join Cells**

Joins the content of the selected cells (both horizontally and vertically).

**Split Cell**

Splits the cell at the cursor location. If Oxygen XML Author detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

**Sort**

Sorts cells or list items in a table.

**Table Properties**
Opens the Table properties dialog box that allows you to configure properties of a table (such as frame borders).

**Other Actions submenu**

This submenu gives you access to all the usual contextual menu actions.

🔗 Link > Edit OLink

Opens a dialog box that allows you to edit an existing OLink. See the **Insert OLink** action for more information.

**Generate IDs**

Oxygen XML Author generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the **ID Options** dialog box that are found in the current selection.

**Note:** The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

**DocBook 4 Drag/Drop (or Copy/Paste) Actions**

Dragging a file from the **Project view (on page 320)** or **DITA Maps Manager view (on page 2503)** and dropping it into a DocBook 4 document that is edited in **Author** mode, creates a link to the dragged file (the `ulink` DocBook element) at the drop location. Copy and paste actions work the same.

You can also drag images or media files from your system explorer or the **Project view (on page 320)** and drop them into a DocBook 4 document (or copy and paste). This will insert the appropriate element at the drop or paste location (for example, dropping/pasting an image will insert the `inlinegraphic` DocBook element with a `fileref` attribute).

**Tip:** For information about customizing **Author** mode actions for a particular **framework (on page 2794)** (document type), see the Configuring Actions, Menus, Toolbars, Content Completion for a Framework (on page 1894) section.

**Related Information:**

- Configuring Actions, Menus, Toolbars, Content Completion for a Framework (on page 1894)
Inserting an Olink in DocBook Documents

The `olink` element is used for linking to resources outside the current DocBook document. The `targetdoc` attribute is used for the document ID that contains the target element and the `targetptr` attribute for the ID of the target element (the value of an `id` or `xml:id` attribute). The combination of those two attributes provides a unique identifier to locate cross references.

For example, a *Mail Administrator Guide* with the document ID `MailAdminGuide` might contain a chapter about user accounts, like this:

```xml
<chapter id="user_accounts">
  <title>Administering User Accounts</title>
  <para>blah blah</para>
</chapter>
```

You can form a cross reference to that chapter by adding an `olink`, as in the following example:

```xml
<olink targetdoc="MailAdminGuide" targetptr="user_accounts">user accounts</olink>
```

You may need to update your `olink` when you get a new machine.

To use an `olink` to create links between documents, follow these steps:

1. Decide which documents are to be included in the domain for cross referencing. A unique ID must be assigned to each document that will be referenced with an `olink`. It is usually added as an `id` (or `xml:id` for DocBook5) attribute to the root element of the document.

2. Decide on your output hierarchy. For creating links between documents, the relative locations of the output documents must be known. Before going further you must decide the names and locations of the output directories for all the documents from the domain. Each directory will be represented by an element `<dir name="directory_name">`, in the target database document.

3. Create the target database document. Each collection of documents has a master target database document that is used to resolve all `olinks` from that collection. The target database document is an XML file that is created once. It provides a means for pulling in the target data for each document. The database document is static and all the document data is pulled in dynamically.

   **Tip:** Oxygen XML Author includes a built-in new document template called **DocBook Targetset Map** available in the **New document wizard (on page 619)** that will help you get started.

   **Example:** The following is an example of a target database document. It structures a collection of documents in a `sitemap` element that provides the relative locations of the outputs (HTML in
this example). Then it pulls in the individual target data using system entity references to target data files that will be created in the next step.

```xml
<?xml version="1.0" encoding="utf-8"?>
<!DOCTYPE targetset [ 
<!ENTITY ugtargets SYSTEM "file:///doc/userguide/target.db">
<!ENTITY agtargets SYSTEM "file:///doc/adminguide/target.db">
<!ENTITY reftargets SYSTEM "file:///doc/man/target.db">
]>
<targetset>
  <targetsetinfo>
    Description of this target database document, which is for the examples in olink doc.
  </targetsetinfo>

<!-- Site map for generating relative paths between documents -->
<sitemap>
  <dir name="documentation">
    <dir name="guides">
      <dir name="mailuser">
        <document targetdoc="MailUserGuide" baseuri="userguide.html">
          &ugtargets;
        </document>
      </dir>
    </dir>
  </dir>
  <dir name="mailadmin">
    <document targetdoc="MailAdminGuide">
      &agtargets;
    </document>
  </dir>
  <dir name="reference">
    <dir name="mailref">
      <document targetdoc="MailReference">
        &reftargets;
      </document>
    </dir>
  </dir>
</sitemap>
</targetset>
4. Generate the target data files by executing a DocBook transformation scenario. 
Before applying the transformation, you need to edit the transformation scenario, go to the Parameters tab, and make sure the value of the collect.xref.targets parameter is set to yes. The default name of a target data file is target.db, but it can be changed by setting an absolute file path in the targets.filename parameter.

**Example:** An example of a target.db file:

```xml
<book element="book" href="#MailAdminGuide" number="1" targetptr="user_accounts">
  <part element="part" href="#d5e4" number="I">
    <chapter element="chapter" href="#d5e6" number="1" targetptr="src_chapter">
      <sect1 element="sect1" href="#src_chapter" number="1" targetptr="src_chapter">
        <xreftext>Section1 Title</xreftext>
        <xreftext>xreflabel_here</xreftext>
      </sect1>
    </chapter>
  </part>
</book>
```

When editing a DocBook XML document in Author mode, the Insert OLink action is available in the Link drop-down menu from the toolbar. This action opens the Insert OLink dialog box that allows you to select the target of an olink from the list of all possible targets from a specified target database document (specified in the Targetset URL field). Once a Targetset URL is selected, the structure of the target documents is presented. For each target document (targetdoc), its content is displayed, allowing you to easily identify the appropriate targetptr. You can also use the search fields to quickly identify a target. If you already know the values for the targetdoc and targetptr attributes, you can insert them directly in the corresponding fields.

**Example:** In the following image, the target database document is called target.xml, dbadmin is selected for the target document (targetdoc), and bldinit is selected as the value for the targetptr attribute. Notice that you can also add XREF text into the olink by using the xreftext field.

Figure 382. Insert OLink Dialog Box
6. Process a DocBook transformation for each document to generate the output.
   a. Edit the transformation scenario and set the value of the `target.database.document` parameter to be the URL of the target database document.
   b. Apply the transformation scenario.

DocBook 5 Document Type (Framework)

*DocBook* is a very popular set of tags for describing books, articles, and other prose documents, particularly technical documentation. DocBook provides a vast number of semantic element tags, divided into three broad categories: structural, *block-level*, and *inline*. DocBook content can then be published in a variety of formats, including HTML, PDF, WebHelp, and EPUB.

**File Definition**

A file is considered to be a DocBook 5 document when the namespace is `http://docbook.org/ns/docbook`. 
Default Document Templates

There are a variety of default DocBook 5 templates available when creating new documents from templates (on page 619) and they can be found in: Framework Templates > DocBook 5 > DocBook 5.0 and Framework Templates > DocBook 5 > DocBook 5.1.

New document templates for both DocBook 5 documents are located in the [OXYGEN_INSTALL_DIR]/frameworks/docbook/templates/Docbook5.0 folder.

New document templates for both DocBook 5.1 documents are located in the [OXYGEN_INSTALL_DIR]/frameworks/docbook/templates/Docbook5.1 folder.

Default Schema for Validation and Content Completion

The default schema that is used if one is not detected is docbookxi.rng and it is stored in [OXYGEN_INSTALL_DIR]/frameworks/docbook/5.0/rng/ (or for DocBook 5.1 in [OXYGEN_INSTALL_DIR]/frameworks/docbook/5.1/rng/). Other types of schemas for various DocBook versions are also located in various folders inside the [OXYGEN_INSTALL_DIR]/frameworks/docbook/ directory.

Default CSS

The default CSS files used for rendering DocBook content in Author mode is stored in [OXYGEN_INSTALL_DIR]/frameworks/docbook/css/.

By default, these default CSS files are merged with any that are specified in the document. For more information, see Configuring and Managing Multiple CSS Styles for a Framework (on page 1919).

Transformation Scenarios

Oxygen XML Author includes numerous built-in DocBook transformation scenarios that allow you to transform DocBook 5 documents to a variety of outputs, such as WebHelp, PDF, HTML, HTML Chunk, XHTML, XHTML Chunk, and EPUB. Oxygen XML Author also includes a DocBook 5.1 transformation scenario for Assembly documents (on page 1187). All of them are listed in the DocBook 5 section in the Configure Transformation Scenario(s) dialog box (on page 1378).

For more information, see the DocBook Transformation Scenarios (on page 1285) section.

Resources

- Oxygen Video Tutorial: Editing DocBook Documents in Author Mode
- DocBook 5.0 (and older) Specifications
DocBook 5 Author Mode Actions

A variety of actions are available in the DocBook 5 framework (on page 2794) that can be added to the DocBook5 menu, the Author Custom Actions toolbar, the contextual menu, and the Content Completion Assistant (on page 2792).

DocBook 5 Toolbar Actions

The following default actions are readily available on the DocBook (Author Custom Actions) toolbar when editing in Author mode (by default, most of them are also available in the DocBook5 menu and in various submenus of the contextual menu):

- **Bold**
  Emphasizes the selected text by surrounding it with \texttt{<emphasis role="bold">} tag. You can use this action on multiple non-contiguous selections.

- **Italic**
  Emphasizes the selected text by surrounding it with \texttt{<emphasis role="italic">} tag. You can use this action on multiple non-contiguous selections.

- **Underline**
  Emphasizes the selected text by surrounding it with \texttt{<emphasis role="underline">} tag. You can use this action on multiple non-contiguous selections.
Link Actions Drop-Down Menu

The following link actions are available from this menu:

**Cross reference (link)**

Opens a dialog box that allows you to select a target to insert as a hypertext link.

**Cross reference (xref)**

Inserts a cross reference to other parts of the document.

**Web Link (ulink)**

Inserts a link that addresses its target with a URL (Universal Resource Locator).

**Insert OLink**

Opens an OLink dialog box that allows you to insert a link that addresses its target indirectly, using the `targetdoc` and `targetptr` values that are present in a Targetset (on page 1190) file.

Figure 383. Insert OLink Dialog Box

After you choose the Targetset URL, the structure of the target documents is presented. For each target document (targetdoc), its content is displayed allowing you to easily identify the targetptr for the olink.
element that will be inserted. You can also use the search fields to quickly identify a target. If you already know the values for targetdoc and targetptr, you can insert them directly in the corresponding fields. You can also edit an olink using the Edit OLink action that is available on the contextual menu. The last used Targetset URL will be used to identify the edited target.

To insert XREF text into the olink, enter the text in the xreftext field and make sure the Insert xreftext in the OLink option is selected.

Insert URI

Inserts a URI element. The URI identifies a Uniform Resource Identifier (URI) in content.

Insert Image

Opens a dialog box that allows you to select the path of an image to insert at the cursor position (on page 963). Depending on the current location, an image-type element is inserted. If the action is invoked between two block elements (such as paragraphs), the dialog box also allows you to provide a title.

Insert Media Resource

Opens a Choose Media dialog box (on page 997) that allows you to select the URL of a media object to be inserted into a document at the cursor position. The result will be that a reference to the specified video, audio, or embedded HTML frame is inserted and rendered in Author mode so that it can be played directly from there.

Insert XInclude

Opens a dialog box that allows you to browse and select content to be included and automatically generates the corresponding XInclude instruction.

Section Drop-Down Menu

The following actions are available from this menu:

Insert Section

Inserts a new section or subsection in the document, depending on the current context. For example, if the current context is sect1, then a sect2 is inserted. By default, this action also inserts a para element as a child node. The para element can be deleted if it is not needed.

Promote Section (Ctrl + Alt + LeftArrow (Command + Alt + LeftArrow on OS X))

Promotes the current node as a sibling of the parent node.
Demote Section (Ctrl + Alt + RightArrow (Command + Alt + RightArrow on OS X))

Demotes the current node a child of the previous node.

Insert Paragraph

Insert a new paragraph element at current cursor position.

Insert Equation

Opens the XML Fragment Editor that allows you to insert and edit MathML notations (on page 999).

Insert List Item

Inserts a list item in the current list type.

Insert Ordered List

Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

Insert Itemized List

Inserts an itemized list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an itemized list.

Insert Variable List

Inserts a DocBook variable list. A child list item is also inserted automatically by default. You can also use this action to convert selected paragraphs or other types of lists to a variable list.

Insert Procedure List

Inserts a DocBook procedure element. A step child item is also inserted automatically. You can also use this action to convert selected paragraphs or other types of lists to a procedure list.

Sort

Sorts cells or list items in a table.

Insert Table

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a block element
(on page 2792) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

Note: If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that Only lists, paragraphs, or inline content can be converted to tables.

Insert Row Below
Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

Delete Row(s)
Deletes the table row located at cursor position or multiple rows in a selection.

Insert Column After
Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

Delete Column(s)
Deletes the table column located at cursor position or multiple columns in a selection.

Table Properties
Opens the Table properties dialog box that allows you to configure properties of a table (such as frame borders).

Join Cells
Joins the content of the selected cells (both horizontally and vertically).

Split Cell
Splits the cell at the cursor location. If Oxygen XML Author detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

DocBook5 Menu Actions
The following additional actions can be found in the DocBook5 menu when editing in Author mode:

Paste special submenu
This submenu includes the following special paste actions that are specific to the DocBook 5 framework:

Paste As XInclude
Allows you to create an `xi:include` element that references a DocBook element copied from Author mode. The operation fails if the copied element does not have a declared ID.

**Paste as link**

Allows you to create a `link` element that references a DocBook element copied from Author mode. The operation fails if the copied element does not have a declared ID.

**Paste as xref**

Allows you to create an `xref` element that references a DocBook element copied from Author mode. The operation fails if the copied element does not have a declared ID.

**Subscript**

Surrounds the selected text with a `subscript` tag, used for inserting a character (number, letter, or symbol) that will appear slightly below the baseline and slightly smaller than the rest of the text.

**Superscript**

Surrounds the selected text with a `superscript` tag, used for inserting a character (number, letter, or symbol) that will appear slightly above the baseline and slightly smaller than the rest of the text.

**Table submenu**

In addition to the table actions available on the toolbar, the following actions are available in this submenu:

- **Insert Row Above**
  
  Inserts a new table row with empty cells above the current row. This action is available when the cursor is positioned inside a table.

- **Insert Rows**
  
  Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (`Above` or `Below` the current row).

- **Insert Column Before**
  
  Inserts a column before the current one.

- **Insert Columns**
Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (Above or Below the current column).

**Insert Cell**

Inserts a new empty cell depending on the current context. If the cursor is positioned between two cells, Oxygen XML Author creates a new cell at cursor position. If the cursor is inside a cell, the new cell is created after the current cell.

**ID Options**

Opens the ID Options dialog box that allows you to configure options for generating IDs in Author mode. The dialog box includes the following:

**ID Pattern**

The pattern for the ID values that will be generated. This text field can be customized using constant strings or any of the Oxygen XML Author Editor Variables (on page 266).

**Element name or class value to generate ID for**

The elements for which ID values will be generated, specified using class attribute values. To customize the list, use the Add, Edit, or Remove buttons.

**Auto generate IDs for elements**

If selected, Oxygen XML Author will automatically generate unique IDs for the elements listed in this dialog box when they are created in Author mode.

**Remove IDs when copying content**

This option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs. If this option is not selected, IDs are always retained when you copy or cut content and paste it in the same document or other documents. If this option is selected, IDs are never retained for copied content, but if you cut the content, they are preserved for the first paste action (and not retained for any subsequent paste actions).

**Generate IDs**

Oxygen XML Author generates unique IDs for the current element (or elements), depending on how the action is invoked:
• When invoked on a single selection, an ID is generated for the selected element at
the cursor position.
• When invoked on a block of selected content, IDs are generated for all top-level
elements and elements from the list in the ID Options dialog box that are found in
the current selection.

![Note:](image) The Generate IDs action does not overwrite existing ID values. It only affects
elements that do not already have an id attribute.

**Refresh References**

You can use this action to manually trigger a refresh and update of all referenced
resources.

**Tags display mode Submenu**

- **Full Tags with Attributes**
  Displays full tag names with attributes for both block (on page 2792) and
  inline elements (on page 2795).

- **Full Tags**
  Displays full tag names without attributes for both block and inline
  elements.

- **Block Tags**
  Displays full tag names for block elements and simple tags without names
  for inline elements.

- **Inline Tags**
  Displays full tag names for inline elements, while block elements are not
displayed.

- **Partial Tags**
  Displays simple tags without names for inline elements, while block
  elements are not displayed.

- **No Tags**
  No tags are displayed. This is the most compact mode and is as close as
  possible to a word-processor view.

**Configure Tags Display Mode**

Use this option to go to the Author preferences page (on page 129) where
you can configure the Tags Display Mode options.
Profiling/Conditional Text Submenu

Edit Profiling Attributes

Allows you to configure the profiling attributes (on page 911) and their values.

Show Profiling Colors and Styles

Select this option to turn on conditional styling.

Show Profiling Attributes

Select this option to turn on conditional text markers. They are displayed at the end of conditional text blocks, as a list of attribute name and their currently set values.

Show Excluded Content

When this option is selected, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, deselect this option.

List of all profiling condition sets that match the current document type

You can click a listed condition set (on page 917) to activate it.

Profiling Settings

Opens the profiling options preferences page (on page 142), where you can manage profiling attributes and profiling conditions sets. You can also configure the profiling styles and colors options from the colors/styles preferences page (on page 144) and the attributes rendering preferences page (on page 146).

DocBook 5 Contextual Menu Actions

In addition to many of the DocBook 5 toolbar actions (on page 1173) and the general Author mode contextual menu actions (on page 1007), the following DocBook 5 framework-specific actions are also available in the contextual menu when editing in Author mode:

Paste special submenu

This submenu includes the following special paste actions that are specific to the DocBook 5 framework:

Paste As XInclude

Allows you to create an xi:include element that references a DocBook element copied from Author mode. The operation fails if the copied element does not have a declared ID.
Paste as link

Allows you to create a `<link>` element that references a DocBook element copied from Author mode. The operation fails if the copied element does not have a declared ID.

Paste as xref

Allows you to create an `<xref>` element that references a DocBook element copied from Author mode. The operation fails if the copied element does not have a declared ID.

Image Map Editor

This action is available in the contextual menu when it is invoked on an image. This action applies an image map to the current image (if one does not already exist) and opens the Image Map Editor dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.

Table Actions

The following table editing actions are available in the contextual menu when it is invoked on a table:

Insert Rows

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (Above or Below the current row).

Delete Row(s)

Deletes the table row located at cursor position or multiple rows in a selection.

Insert Columns

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (Above or Below the current column).

Delete Column(s)

Deletes the table column located at cursor position or multiple columns in a selection.

Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell
Splits the cell at the cursor location. If Oxygen XML Author detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

Sort

Sorts cells or list items in a table.

Table Properties

Opens the Table properties dialog box that allows you to configure properties of a table (such as frame borders).

Other Actions submenu

This submenu give you access to all the usual contextual menu actions.

Link > Edit OLink

Opens a dialog box that allows you edit an existing OLink. See the Insert OLink action for more information.

Generate IDs

Oxygen XML Author generates unique IDs for the current element (or elements), depending on how the action is invoked:

• When invoked on a single selection, an ID is generated for the selected element at the cursor position.
• When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the ID Options dialog box that are found in the current selection.

Note: The Generate IDs action does not overwrite existing ID values. It only affects elements that do not already have an id attribute.

DocBook 5 Drag/Drop (or Copy/Paste) Actions

Dragging a file from the Project view (on page 320) or DITA Maps Manager view (on page 2503) and dropping it into a DocBook 5 document that is edited in Author mode, creates a link to the dragged file (the link DocBook element) at the drop location. Copy and paste actions work the same.

You can also drag images or media files from your system explorer or the Project view (on page 320) and drop them into a DocBook 5 document (or copy and paste). This will insert the appropriate element at the drop or paste location (for example, dropping/pasting an image will insert the imageobject DocBook element with an imagedata child element and a fileref attribute).
Tip: For information about customizing Author mode actions for a particular framework (on page 2794) (document type), see the Configuring Actions, Menus, Toolbars, Content Completion for a Framework (on page 1894) section.

Related Information:

- Configuring Actions, Menus, Toolbars, Content Completion for a Framework (on page 1894)

Inserting an Olink in DocBook Documents

The olink element is used for linking to resources outside the current DocBook document. The targetdoc attribute is used for the document ID that contains the target element and the targetptr attribute for the ID of the target element (the value of an id or xml:id attribute). The combination of those two attributes provides a unique identifier to locate cross references.

For example, a Mail Administrator Guide with the document ID MailAdminGuide might contain a chapter about user accounts, like this:

```xml
<chapter id="user_accounts">
  <title>Administering User Accounts</title>
  <para>blah blah</para>
</chapter>
```

You can form a cross reference to that chapter by adding an olink, as in the following example:

```xml
<olink targetdoc="MailAdminGuide" targetptr="user_accounts">user accounts
</olink>
```

You may need to update your

To use an olink to create links between documents, follow these steps:

1. Decide which documents are to be included in the domain for cross referencing.
   A unique ID must be assigned to each document that will be referenced with an olink. It is usually added as an id (or xml:id for DocBook5) attribute to the root element of the document.

2. Decide on your output hierarchy.
   For creating links between documents, the relative locations of the output documents must be known. Before going further you must decide the names and locations of the output directories for all the documents from the domain. Each directory will be represented by an element: <dir name="directory_name">, in the target database document.

3. Create the target database document.
Each collection of documents has a master target database document that is used to resolve all olinks from that collection. The target database document is an XML file that is created once. It provides a means for pulling in the target data for each document. The database document is static and all the document data is pulled in dynamically.

**Tip:** Oxygen XML Author includes a built-in new document template called **DocBook Targetset Map** available in the **New document wizard (on page 619)** that will help you get started.

**Example:** The following is an example of a target database document. It structures a collection of documents in a sitemap element that provides the relative locations of the outputs (HTML in this example). Then it pulls in the individual target data using system entity references to target data files that will be created in the next step.

```xml
<?xml version="1.0" encoding="utf-8"?>
<!DOCTYPE targetset [
<!ENTITY ugtargets SYSTEM "file:///doc/userguide/target.db">
<!ENTITY agtargets SYSTEM "file:///doc/adminguide/target.db">
<!ENTITY reftargets SYSTEM "file:///doc/man/target.db">
]

<targetset>
  <targetsetinfo>
    Description of this target database document, which is for the examples in olink doc.
  </targetsetinfo>

  <!-- Site map for generating relative paths between documents -->
  <sitemap>
    <dir name="documentation">
      <dir name="guides">
        <dir name="mailuser">
          <document targetdoc="MailUserGuide" baseuri="/userguide.html">
            &ugtargets;
          </document>
        </dir>
        <dir name="mailadmin">
          <document targetdoc="MailAdminGuide">
            &agtargets;
          </document>
        </dir>
      </dir>
    </dir>
  </sitemap>
</targetset>
```
4. Generate the target data files by executing a DocBook transformation scenario.
Before applying the transformation, you need to edit the transformation scenario, go to the Parameters tab, and make sure the value of the collect.xref.targets parameter is set to yes. The default name of a target data file is target.db, but it can be changed by setting an absolute file path in the targets.filename parameter.

**Example:** An example of a target.db file:

```xml
<dir name="mailref">
  <document targetdoc="MailReference">
    &reftargets;
  </document>
</dir>
</dir>
</sitemap>
</targetset>
```

When editing a DocBook XML document in Author mode, the Insert OLink action is available in the Link drop-down menu from the toolbar. This action opens the Insert OLink dialog box that allows you to select the target of an olink from the list of all possible targets from a specified target database document (specified in the Targetset URL field). Once a Targetset URL is selected, the structure of the target documents is presented. For each target document
(targetdoc), its content is displayed, allowing you to easily identify the appropriate targetptr. You can also use the search fields to quickly identify a target. If you already know the values for the targetdoc and targetptr attributes, you can insert them directly in the corresponding fields.

**Example:** In the following image, the target database document is called target.xml, dbadmin is selected for the target document (targetdoc), and blinit is selected as the value for the targetptr attribute. Notice that you can also add XREF text into the olink by using the xreftext field.

Figure 384. Insert OLink Dialog Box

6. Process a DocBook transformation for each document to generate the output.
   a. Edit the transformation scenario and set the value of the target.database.document parameter to be the URL of the target database document.
   b. Apply the transformation scenario.
DocBook 5.1 Assembly

The DocBook Assembly document type was introduced with DocBook 5.1 and it is used to define the hierarchy and relationships for a collection of resources. It is especially helpful for topic-oriented authoring scenarios since it assembles a set of resources (such as DocBook 5.1 topics) to form a hierarchical structure for a larger publication.

An Assembly document usually has four major parts:

- **Resources** - Identifies a collection of resources (such as topics). An Assembly may identify one or more collections.
- **Structure** - Identifies an artifact to be assembled. A document in this case is the particular collection of resources (such as topics) that forms the documentation. Within the structure element, an output element can be used to identify the type of output to be generated and module elements can be used to identify the resources to be included. An Assembly may identify one or more structures.
- **Relationships** - Identifies relationships between resources. These relationships may be manifested in any number of structures during assembly. An Assembly may identify any number of relationships.
- **Transformations** - Identifies transformations that can be applied during assembly. An Assembly may identify any number of transformations.

For detailed information about the DocBook Assembly document type, see DocBook 5.1: The Definitive Guide - DocBook Assemblies.

File Definition

A file is considered to be an Assembly when the root name is assembly.

Default Document Templates

A default Assembly document template is available when creating new documents from templates (on page 619) and it can be found in: Framework Templates > DocBook 5 > DocBook 5.1.

The default template for DocBook Assembly documents is located in the \[OXYGEN_INSTALL_DIR\]/frameworks/docbook/templates/Docbook5.1 folder.

Default Schema for Validation and Content Completion

The default schema that is used if one is not detected is docbookxi.rng and it is stored in \[OXYGEN_INSTALL_DIR\]/frameworks/docbook/5.1/rng/.
Transformation Scenarios

Oxygen XML Author includes a built-in transformation scenario that can be applied on an Assembly file to generate an *assembled* (merged) DocBook file. The scenario is called DocBook Assembly and is found in the DocBook 5 section in the Configure Transformation Scenario(s) dialog box (on page 1378).

Resources

- DocBook 5.1: The Definitive Guide - DocBook Assemblies
- DocBook 5.1 Specifications
- Sample files: [OXYGEN_INSTALL_DIR]/samples/docbook/v5/assembly/

DocBook 5.1 Topic

The DocBook Topic document type was introduced with DocBook 5.1 and it is used as a modular unit of documentation. It is similar to the concept of the DITA Topic and can be used as modular resources in conjunction with DocBook 5.1 Assembly (on page 1187) documents.

File Definition

A DocBook file is considered to be a Topic when the root name is `topic`.

Default Document Templates

A default Topic document template is available when creating new documents from templates (on page 619) and it can be found in: Framework Templates > DocBook 5 > DocBook 5.1.

The default template for DocBook Assembly documents is located in the [OXYGEN_INSTALL_DIR]/frameworks/docbook/templates/Docbook5.1 folder.

Default Schema for Validation and Content Completion

The default schema that is used if one is not detected is `docbookxi.rng` and it is stored in [OXYGEN_INSTALL_DIR]/frameworks/docbook/5.1/rng/.
Transformation Scenarios

Since DocBook Topics are modular resources, they are assembled and transformed in the DocBook Assembly transformation process (on page 1189). You can also use any of the built-in DocBook transformation scenarios to transform individual DocBook Topics to a variety of outputs, such as PDF, HTML, EPUB, and more. They are found in the DocBook 5 section in the Configure Transformation Scenario(s) dialog box (on page 1378).

Resources

- DocBook 5.1: The Definitive Guide - Topic
- DocBook 5.1 Specifications
- Sample files: $OXYGEN_INSTALL_DIR$/samples/docbook/v5/assembly/

Related Information:

- DocBook 5.1 Assembly (on page 1187)

DocBook Targetset Document Type (Framework)

DocBook Targetset documents are used to resolve cross references with the DocBook olink.

File Definition

A file is considered to be a Targetset when the root name is targetset.

Default Document Templates

A default DocBook Targetset Map document template is available when creating new documents from templates (on page 619) and it can be found in: Framework Templates > DocBook Targetset.

The default template for DocBook Targetset documents is located in the $OXYGEN_INSTALL_DIR$/frameworks/docbook/templates/Targetset folder.

Default Schema for Validation and Content Completion

The default schema, targetdatabase.dtd, for this type of document is stored in $OXYGEN_INSTALL_DIR$/frameworks/docbook/xsl/common/.
DITA Topics Document Type (Framework)

The Darwin Information Typing Architecture (DITA) is an XML-based architecture for authoring, producing, and delivering technical information. It divides content into small, self-contained topics that you can reuse in various deliverables. The extensibility of DITA permits organizations to define specific information structures while still using standard tools to work with them. DITA content is created as topics, each an individual XML file. Typically, each topic has a defined primary objective and structure, and DITA also includes several specialized topic types (task, concept, reference, glossary entry).

For much more detailed information, resources, and instructions, see the DITA Authoring (on page 2494) chapter.

File Definition

A file is considered to be a DITA topic document when one of the following conditions are true:

- The root element name is one of the following: concept, task, reference, dita, or topic.
- The PUBLIC ID of the document is a PUBLIC ID for the elements listed above.
- The root element of the file has an attribute named DITAArchVersion for the "http://dita.oasis-open.org/architecture/2005/" namespace. This enhanced case of matching is only applied when the Enable DTD/XML Schema processing in document type detection option (on page 93) is selected from the Document Type Association preferences page (on page 92).

Default Document Templates

There are a variety of default DITA topic templates available when creating new documents from templates (on page 619) and they can be found in various folders inside: Framework Templates > DITA.

The default templates for DITA topic documents are located in the [OXYGEN_INSTALL_DIR]/frameworks/dita/templates/topic folder.
Default Schema for Validation and Content Completion

Default schemas that are used if one is not detected in the DITA documents are stored in the various folders inside `DITA-OT-DIR/dtd/` or `DITA-OT-DIR/schema/`.

Default CSS

The default CSS files used for rendering DITA content in Author mode are stored in the various folders inside: `[OXYGEN_INSTALL_DIR]/frameworks/dita/css/`.

By default, these default CSS files are merged with any that are specified in the document. For more information, see Configuring and Managing Multiple CSS Styles for a Framework (on page 1919).

Default XML Catalogs

The default XML Catalogs (on page 2800) for the DITA topic document type are as follows:

- `DITA-OT-DIR/catalog-dita.xml`
- `[OXYGEN_INSTALL_DIR]/frameworks/dita/catalog.xml`
- `[OXYGEN_INSTALL_DIR]/frameworks/dita/plugin/catalog.xml`
- `[OXYGEN_INSTALL_DIR]/frameworks/dita/styleguide/catalog.xml`

Transformation Scenarios

Oxygen XML Author includes built-in transformation scenarios that allow you to transform individual DITA Topics to a XHTML or PDF output. They can be found in the DITA section in the Configure Transformation Scenario(s) dialog box (on page 1378).

DITA Topic Author Mode Actions

A variety of actions are available for the DITA framework (on page 2794) that can be found on the toolbar, the contextual menu, or the DITA menu.

DITA Toolbar Actions

The following default actions are readily available on the DITA (Author Custom Actions) toolbar when editing in Author mode (by default, most of them are also available in the DITA menu and in various submenus of the contextual menu):

- **Bold**
  
  Surrounds the selected text with a \texttt{b} tag. You can use this action on multiple non-contiguous selections.

- **Italic**
  
  Surrounds the selected text with an \texttt{i} tag. You can use this action on multiple non-contiguous selections.

- **Underline**
  
  Surrounds the selected text with a \texttt{u} tag. You can use this action on multiple non-contiguous selections.

Link Actions Drop-Down Menu

The following link actions are available from this menu:

- **Cross Reference**
  
  Opens the Cross Reference (xref) dialog box (on page 2676) that allows you to insert a link to a target DITA resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map (on page 2793) structure. Once the target resource has been selected, you can also target specific elements within that resource. For more information, see Linking in DITA Topics (on page 2675).

- **File Reference**
Opens the **File Reference** dialog box (on page 2676) that allows you to insert a link to a target non-DITA file resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. For more information, see Linking in DITA Topics (on page 2675).

**Web Link**

Opens the **Web Link** dialog box (on page 2676) that allows you to insert a link to a target web-related resource at the current location within a document. The target resource can be a URL or a key that is already defined in your DITA map structure. For more information, see Linking in DITA Topics (on page 2675).

**Related Link to Topic**

Opens the **Cross Reference (xref)** dialog box (on page 2677) that allows you to insert a link to a target DITA resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. Once the target resource has been selected, you can also target specific elements within that resource. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics (on page 2675).

![Tip:](image)

You can use the **Find Similar Topics** action that available in the DITA menu to quickly find related topics that can be added as related links. It opens the Open/Find Resource view and performs a search using text content from the `<title>`, `<shortdesc>`, `<keyword>`, and `<indexterm>` elements.

**Related Link to File**

Opens the **File Reference** dialog box (on page 2677) that allows you to insert a link to a target non-DITA file resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics (on page 2675).

**Related Link to Web Page**

Opens the **Web Link** dialog box (on page 2677) that allows you to insert a link to a target web-related resource in a related links section at the bottom of the current document. The target resource can be a URL or a key that
is already defined in your DITA map structure. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics (on page 2675).

**Insert Image**

Opens the Insert Image dialog box (on page 2574) that allows you to configure the properties of an image to be inserted into a DITA document at the cursor position.

**Insert Media Resource**

Opens the Insert Media dialog box (on page 2578) that allows you to select and configure the properties of a media object to be inserted into a DITA document at the cursor position. The result will be that a reference to the specified video, audio, or embedded HTML frame is inserted in an object element and it is rendered in Author mode so that it can be played directly from there.

§ • Insert Section Drop-Down Menu

The following insert actions are available from this menu:

- **Insert Section**

  Inserts a new section element in the document, depending on the current context.

- **Insert Concept**

  Inserts a new concept element, depending on the current context. Concepts provide background information that users must know before they can successfully work with a product or interface.

- **Insert Task**

  Inserts a new task element, depending on the current context. Tasks are the main building blocks for task-oriented user assistance. They generally provide step-by-step instructions that will help a user to perform a task.

- **Insert Topic**

  Inserts a new topic element, depending on the current context. Topics are the basic units of DITA content and are usually organized around a single subject.

- **Insert Reference**

  Inserts a new reference element, depending on the current context. A reference is a top-level container for a reference topic.

- **Insert Paragraph**

  Inserts a new paragraph at current cursor position.
**Reuse Content**

This action provides a mechanism for reusing content fragments. It opens the Reuse Content dialog box (on page 2647) that allows you to insert several types of references to reusable content at the cursor position. The types of references that you can insert using this dialog box include content references (conref) (on page 2648), content key references (conkeyref) (on page 2649), or key references to metadata (keyref) (on page 2653).

**Insert step or list item**

Inserts a new list or step item in the current list type.

**Insert Unordered List**

Inserts an unordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an unordered list.

**Insert Ordered List**

Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

**Sort**

Sorts cells or list items in a table.

**Insert Table**

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a block element (on page 2792)) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

**Note:** If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that Only lists, paragraphs, or inline content can be converted to tables.

**Insert Row Below**

Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

**Delete Row(s)**

Deletes the table row located at cursor position or multiple rows in a selection.
Insert Column After

Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

Delete Column(s)

Deletes the table column located at cursor position or multiple columns in a selection.

Table Properties

Opens the Table properties dialog box that allows you to configure properties of a table (such as frame borders).

Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell

Splits the cell at the cursor location. If Oxygen XML Author detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

DITA Contextual Menu Actions

In addition to many of the DITA toolbar actions (on page 1193) and the general Author mode contextual menu actions (on page 1007), there are numerous DITA-specific actions that are available in the contextual menu when editing DITA documents in Author mode (most of them are also available in the DITA menu at the top of the interface):

Add File to Review Task

This action can be used to add the current document to a task in the Content Fusion Tasks Manager view. Oxygen Content Fusion is a flexible, intuitive collaboration platform designed to adapt to any type of documentation review workflow. This functionality is available through a pre-installed connector add-on (on page 2250). To fully take advantage of all of the benefits and features of Content Fusion, your organization will need an Oxygen Content Fusion Enterprise Server. For more information, see the Oxygen Content Fusion website.

Edit Attributes

Displays an in-place attributes editor (on page 415) that allows you to manage the attributes of an element.

Edit Profiling Attributes

Allows you to change the profiling attributes (on page 911) defined on all selected elements.
Cut (Ctrl + X (Command + X on OS X))

Removes the current selected content from the document and places it in the clipboard.

Copy (Ctrl + C (Command + C on OS X))

Places a copy of the current selected content in the clipboard.

Paste (Ctrl + V (Command + V on OS X))

Inserts the current clipboard content into the document at the cursor position.

Paste special submenu

This submenu includes the following special paste actions that are specific to the DITA framework:

Paste as content reference

Inserts a content reference (a DITA element with a conref attribute) to the DITA XML element from the clipboard. An entire DITA XML element with an ID attribute must be present in the clipboard when the action is invoked. The conref attribute will point to this ID value.

Paste as content key reference

Allows you to indirectly reference content using the conkeyref attribute. When the DITA content is processed, the key references are resolved using key definitions from DITA maps (on page 2793). To use this action, you must first do the following:

1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
2. In the DITA Maps Manager view, make sure that the Root map combo box (on page 2508) points to the correct map that stores the keys.
3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the DITA Maps Manager, select Edit Properties, and enter a value in the Keys field.

Paste as link

Looks for the first element with an ID value in the clipboard and inserts an xref that points to that element. If no elements with an ID value are found, a message will appear that informs you that to use this action, the clipboard contents must include at least one element with a declared ID.

Paste as link (keyref)
Inserts a link to the element that you want to reference. To use this action, you must first do the following:

1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
2. In the DITA Maps Manager view, make sure that the Root map combo box (on page 2508) points to the correct map that stores the keys.
3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the DITA Maps Manager, select Edit Properties, and enter a value in the Keys field.

Insert submenu

This submenu includes the following insert actions that are specific to the DITA framework:

- **Insert Table**
  Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a block element (on page 2792)) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

  **Note:** If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that Only lists, paragraphs, or inline content can be converted to tables.

- **Insert Image**
  Inserts an image reference (on page 963) at the cursor position. Depending on the current location, an image-type element is inserted.

- **Insert Media Resource**
  Opens a Choose Media dialog box (on page 997) that allows you to select the URL of a media object to be inserted into a document at the cursor position. The result will be that a reference to the specified video, audio, or embedded HTML frame is inserted and rendered in Author mode so that it can be played directly from there.

- **Insert Equation**
Opens the XML Fragment Editor that allows you to insert and edit MathML notations (on page 999).

Insert Paragraph
Inserts a new paragraph at current cursor position.

Insert Section
Inserts a new section element in the document, depending on the current context.

Insert Topic
Inserts a new topic element, depending on the current context. Topics are the basic units of DITA content and are usually organized around a single subject.

Insert Entity
Allows you to insert a predefined entity or character entity. Surrogate character entities (range #x10000 to #x10FFFF) are also accepted. Character entities can be entered in one of the following forms:

- #<decimal value>- e.g. #65
- &#<decimal value>;- e.g. &#65
- #x<hexadecimal value>- e.g. #x41
- &#x<hexadecimal value>;- e.g. &#x41

Image Map Editor
This action is available in the contextual menu when it is invoked on an image. This action applies an image map to the current image (if one does not already exist) and opens the Image Map Editor dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.

Table Actions
The following table editing actions are available in the contextual menu when it is invoked on a table:

Insert Rows
Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (Above or Below the current row).

Delete Row(s)
Deletes the table row located at cursor position or multiple rows in a selection.

**Insert Columns**

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (Above or Below the current column).

**Delete Column(s)**

Deletes the table column located at cursor position or multiple columns in a selection.

**Join Cells**

Joins the content of the selected cells (both horizontally and vertically).

**Split Cell**

Splits the cell at the cursor location. If Oxygen XML Author detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

**Sort**

Sorts cells or list items in a table.

**Table Properties**

Opens the Table properties dialog box that allows you to configure properties of a table (such as frame borders).

**Other Actions submenu**

This submenu give you access to all the usual contextual menu actions.

**Link submenu**

The following link actions are available from this submenu:

**Cross Reference**

Opens the Cross Reference (xref) dialog box (on page 2676) that allows you to insert a link to a target DITA resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map (on page 2793) structure. Once the target resource has been selected, you can also target specific elements within that resource. For more information, see Linking in DITA Topics (on page 2675).

**File Reference**
Opens the **File Reference** dialog box ([on page 2676](#)) that allows you to insert a link to a target non-DITA file resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your *DITA map* structure. For more information, see [Linking in DITA Topics (on page 2675)](#).

**Web Link**

Opens the **Web Link** dialog box ([on page 2676](#)) that allows you to insert a link to a target web-related resource at the current location within a document. The target resource can be a URL or a key that is already defined in your *DITA map* structure. For more information, see [Linking in DITA Topics (on page 2675)](#).

**Related Link to Topic**

Opens the **Cross Reference (xref)** dialog box ([on page 2677](#)) that allows you to insert a link to a target DITA resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your *DITA map* structure. Once the target resource has been selected, you can also target specific elements within that resource. If a related links section does not already exist, this action creates one. For more information, see [Linking in DITA Topics (on page 2675)](#).

**Tip:** You can use the **Find Similar Topics** action that available in the DITA menu to quickly find related topics that can be added as related links. It opens the **Open/Find Resource** view and performs a search using text content from the `<title>`, `<shortdesc>`, `<keyword>`, and `<indexterm>` elements.

**Related Link to File**

Opens the **File Reference** dialog box ([on page 2677](#)) that allows you to insert a link to a target non-DITA file resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your *DITA map* structure. If a related links section does not already exist, this action creates one. For more information, see [Linking in DITA Topics (on page 2675)](#).

**Related Link to Web Page**

Opens the **Web Link** dialog box ([on page 2677](#)) that allows you to insert a link to a target web-related resource in a related links section at the bottom of the current document. The target resource can be a URL or a key that
is already defined in your DITA map structure. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics (on page 2675).

**Sort**

Available when invoked on a list, it opens a dialog box where you can configure a sorting operation for an entire list or a selection of list items.

**Generate IDs**

Oxygen XML Author generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the ID Options dialog box that are found in the current selection.

**Note:** The Generate IDs action does not overwrite existing ID values. It only affects elements that do not already have an id attribute.

**Reuse submenu**

This submenu includes the following actions regarding reusing content in DITA:

**Reuse Content**

This action provides a mechanism for reusing content fragments. It opens the Reuse Content dialog box (on page 2647) that allows you to insert several types of references to reusable content at the cursor position. The types of references that you can insert using this dialog box include content references (conref) (on page 2648), content key references (conkeyref) (on page 2649), or key references to metadata (keyref) (on page 2653).

**Push Current Element**

Opens the Push current element dialog box (on page 2656) that allows content from a source topic to be inserted into another topic without any special coding in the topic where the content will be re-used.

**Edit Content Reference**

This action is available for elements with a conref or conkeyref attribute. It opens the Edit Content Reference dialog box that allows you to edit the source location (or key) and source element of a content reference
(or content key reference), and the reference details (conref / conkeyref and conrefend attributes). For more information, see Reuse Content Dialog Box (on page 2647).

Replace Reference with Content

Replaces the referenced fragment (conref or conkeyref) at the cursor position with its content from its source. This action is useful if you want to make changes to the content in the currently edited document without changing the referenced fragment in its source location. If the source content includes references to other topics/resources (hrefs), the operation also resolves those references relative to the new location. Attributes are preserved according to the following priority:

1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a –dita-use-conref-target value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for id attributes.

Replace All References with Content

Replaces all referenced fragments (keyref, conref, or conkeyref) in the current document with the content. Attributes are preserved according to the following priority:

1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a –dita-use-conref-target value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for id attributes.

For keyrefs inside xref or link elements, the keyref attribute is changed to an href attribute, while the rest of the content for the keyref is replaced with its source content.

If the source content includes references to other topics/resources (hrefs), the operation also resolves those references relative to the new location.

Remove Content Reference

Removes the content reference (conref or conkeyref) inside the element at the cursor position.

Create Reusable Component
Creates a reusable component from the selected fragment of text. For more information, see Creating a Reusable Content Component (on page 2659).

**Insert Reusable Component**

Inserts a reusable component at cursor location. For more information, see Inserting a Reusable Content Component (on page 2660).

**Search References (Ctrl + Shift + G)**

Finds the references to the *id* attribute value for the element at the current cursor position, in all the topics contained in the current DITA map (on page 2793) (opened in the DITA Maps Manager view (on page 2503)). If no references are found for the current element, a dialog box will be displayed that offers you the option of searching for references to its ancestor elements.

![Figure 385. Search References to Ancestors Dialog Box](image)

**Tip:** If you are invoking the action on an image, see Searching for References to Images (on page 2577) for details about what will be reported.

**Show Key Definition**

Available for elements that have a `conkeyref` or `keyref` attribute set (or elements with an ancestor element that has a `conkeyref` or `keyref` attribute). It computes the key name and opens the DITA map (on page 2793) that contains the definition of the key with the element that defines that key selected.

**About Element submenu**

This submenu includes the following actions:

**Style Guide**

Opens the DITA Style Guide Best Practices for Authors in your browser and displays a topic that is relevant to the element at the cursor position. When editing DITA documents, this action is available in the contextual menu of the editing area (under the About Element sub-menu), in the DITA menu, and in some of the documentation tips that are displayed by the Content Completion Assistant (on page 2792).
**Browse reference manual**

Opens a reference to the documentation of the XML element closest to the cursor position in a web browser.

**Go to Definition**

Moves the cursor to the definition of the current element.

**Select submenu**

This submenu allows you to select the following:

**Element**

Selects the entire element at the current cursor position.

**Content**

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

**Parent**

Selects the entire parent element at the current cursor position.

**Text submenu**

This submenu contains the following actions:

**To Lower Case**

Converts the selected content to lower case characters.

**To Upper Case**

Converts the selected content to upper case characters.

**Capitalize Sentences**

Converts to upper case the first character of every selected sentence.

**Capitalize Words**

Converts to upper case the first character of every selected word.

**Count Words**

Counts the number of words and characters (no spaces) in the entire document or in the selection for regular content and read-only content.

**Note:** The content marked as deleted with [change tracking (on page 2800)](#) is ignored when counting words.
Convert Hexadecimal Sequence to Character (Ctrl + Shift + X (Command + Shift + X on OS X))

Converts a sequence of hexadecimal characters to the corresponding Unicode character (on page 712). The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the 0x or 0X prefix. Examples of valid sequences and the characters they will be converted to:

- \( 0\text{x}0045 \) will be converted to E
- \( 0\text{X}0125 \) to 
- 265 to 
- 2190 to 

Note: For more information about finding the hexadecimal value of a character, see Finding the Decimal, Hexadecimal, or Character Entity Equivalent (on page 721).

Refactoring submenu

Contains a series of actions designed to alter the XML structure of the document:

**+! Toggle Comment**

Encloses the currently selected text in an XML comment, or removes the comment if it is commented.

**Move Up (Alt + UpArrow)**

Moves the current node or selected nodes in front of the previous node.

**Move Down (Alt + DownArrow)**

Moves the current node or selected nodes after the subsequent node.

**Split Element (Alt + Shift + D (Ctrl + Alt + D on OS X))**

Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

**Join Elements**

Joins two adjacent block elements (on page 2792) that have the same name. The action is available only when the cursor position is between the two adjacent block elements. Also, joining two block elements can be done
by pressing the **Delete** or **Backspace** keys and the cursor is positioned between the boundaries of these two elements.

**Surround with Tags (Ctrl + E (Command + E on OS X))**

Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

- If the **Position cursor between tags** option *(on page 164)* is selected in the **Content Completion** preferences page, the cursor is placed between the start and end tag.
- If the **Position cursor between tags** option *(on page 164)* is not selected in the **Content Completion** preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

**Surround with '[tag]' (Ctrl + ForwardSlash (Command + ForwardSlash on OS X))**

Surround the selected content with the last tag used.

**Rename Element**

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the **Rename** dialog box.

**Delete Element Tags**

Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the **Delete** or **Backspace** keys.

**Remove All Markup**

Removes all the XML markup inside the selected block of content and keeps only the text content.

**Remove Text**

Removes the text content of the selected block of content and keeps the markup intact with empty elements.

**DITA Refactoring Actions**

A variety of built-in XML refactoring operations that pertain to DITA documents with some of the information preconfigured based upon the current context.

**Change Topic ID to File Name**
Use this operation to change the ID of a topic to be the same as its file name.

**Convert CALS Tables to Simple Tables**

Use this operation to convert DITA CALS tables to simple tables. If you invoke this operation from a nested table (a table inside a table), only the nested table will be affected. If it is invoked on a parent table that contains nested tables, all of the contained tables will be converted.

**Convert conrefs to conkeyrefs**

Use this operation to convert **conref** attributes to **conkeyref** attributes.

**Convert Simple Tables to CALS Tables**

Use this operation to convert DITA simple tables to CALS tables. If you invoke this operation from a nested table (a table inside a table), only the nested table will be affected. If it is invoked on a parent table that contains nested tables, all of the contained tables will be converted.

**Convert to Concept**

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

**Convert to General Task**

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA **General Task** is a less restrictive alternative to the **Strict Task** information type.

**Convert to Reference**

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

**Convert to Task**

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

**Convert to Topic**

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

**Convert to Troubleshooting**
Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

**Rename Key**
Available when invoked on a key, and can be used to quickly rename a key. It also updates all references to it. Note that it does not work on DITA 1.3 key scopes.

**Attributes Refactoring Actions**
Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

**Add/Change attribute**
Allows you to change the value of an attribute or insert a new one.

**Convert attribute to element**
Allows you to change an attribute into an element.

**Delete attribute**
Allows you to remove one or more attributes.

**Rename attribute**
Allows you to rename an attribute.

**Replace in attribute value**
Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

**Comments Refactoring Actions**
Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

**Delete comments**
Allows you to delete comments found inside one or more elements.

**Elements Refactoring Actions**
Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

**Delete element**
Allows you to delete elements.

**Delete element content**

Allows you to delete the content of elements.

**Insert element**

Allows you to insert new elements.

**Rename element**

Allows you to rename elements.

**Unwrap element**

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

**Wrap element**

Allows you to surround elements with element tags.

**Wrap element content**

Allows you to surround the content of elements with element tags.

**Fragments Refactoring Actions**

Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

**Insert XML fragment**

Allows you to insert an XML fragment.

**Replace element content with XML fragment**

Allows you to replace the content of elements with an XML fragment.

**Replace element with XML fragment**

Allows you to replace elements with an XML fragment.

**Review submenu**

This submenu includes the following actions:

- **Track Changes**

  Enables or disables the *Track Changes (on page 2800)* support for the current document.

- **Accept Change(s) and Move to Next**
Accepts the *Tracked Change (on page 2800)* located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a *deletion or insertion* change, only the selected content is accepted.

**Accept All Changes**

Accepts all *Tracked Changes (on page 2800)* in the current document.

**Reject Change(s) and Move to Next**

Rejects the *Tracked Change (on page 2800)* located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a *deletion or insertion* change, only the selected content is rejected.

**Reject All Changes**

 Rejects all *Tracked Changes (on page 2800)* in the current document.

**Comment Change**

Opens a dialog box that allows you to add a comment to an existing *Tracked Change (on page 2800)*. The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

**Highlight**

Enables the highlighting tool that allows you to mark text in your document.

**Colors**

Allows you to select the color for highlighting text.

**Stop highlighting**

Use this action to deactivate the highlighting tool.

**Remove highlight(s)**

Use this action to remove highlighting from the document.

**Add Comment**

Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).

**Show/Edit Comment**

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the
author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

- **Remove Comment**
  
  Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

- **Manage Reviews**
  
  Opens the **Review view (on page 906)**.

**Folding submenu**

This submenu includes the following actions:

- **Toggle Fold**
  
  Toggles the state of the current fold.

- **Collapse Other Folds (Ctrl + NumPad/ (Command + NumPad/ on OS X))**
  
  Folds all the elements except the current element.

- **Collapse Child Folds (Ctrl + NumPad. (Command + NumPad. on OS X))**
  
  Folds the elements indented with one level inside the current element.

- **Expand Child Folds**
  
  Unfolds all child elements of the currently selected element.

- **Expand All (Ctrl + NumPad* (Command + NumPad* on OS X))**
  
  Unfolds all elements in the current document.

**Inspect Styles**

Opens the **CSS Inspector view (on page 425)** that allows you to examine the CSS rules that match the currently selected element.

**Options**

Opens the **Author mode preferences page (on page 129)** where you can configure various options in regards to the **Author editing mode**.

**DITA Drag/Drop (or Copy/Paste) Actions**

Dragging a file from the **Project view (on page 320)** or **DITA Maps Manager view (on page 2503)** and dropping it into a DITA document that is edited in **Author** mode, creates a link to the dragged file (the `xref` DITA element with the `href` attribute) at the drop location. Copy and paste actions work the same.
You can also drag images or media files from your system explorer or the Project view (on page 320) and drop them into a DITA document (or copy and paste). This will insert the appropriate element at the drop or paste location (for example, dropping/pasting an image will insert the DITA image element with an href attribute).

Tip: For information about customizing Author mode actions for a particular framework (on page 2794) (document type), see the Configuring Actions, Menus, Toolbars, Content Completion for a Framework (on page 1894) section.

Related Information:

- Configuring Actions, Menus, Toolbars, Content Completion for a Framework (on page 1894)

DITA Map Document Type (Framework)

DITA maps (on page 2793) are documents that collect and organize references to DITA topics to indicate the relationships between the topics. They can be used as a container for topics used to transform a collection of content into a publication and they offer a sequence and structure to the topics. They can also serve as outlines or tables of contents for DITA deliverables and as build manifests for DITA projects. DITA maps allow scalable reuse of content across multiple contexts. Maps can reference topics or other maps, and can contain a variety of content types and metadata.

For much more detailed information, resources, and instructions, see the DITA Authoring (on page 2494) chapter.

File Definition

A file is considered to be a DITA map document when one of the following conditions are true:

- The root element name is one of the following: map, bookmap.
- The public ID of the document is -//OASIS//DTD DITA Map or -//OASIS//DTD DITA BookMap.
- The root element of the file has an attribute named class that contains the value map/ and a DITAArchVersion attribute from the http://dita.oasis-open.org/architecture/2005/ namespace. This enhanced case of matching is only applied when the Enable DTD/XML Schema processing in document type detection option (on page 93) from the Document Type Association preferences page (on page 92) is selected.
Default Document Templates

There are a variety of default DITA map templates available when creating new documents from templates (on page 619) and they can be found in various folders inside: Framework Templates > DITA Map.

The default templates for DITA map documents are located in the \[OXYGEN_INSTALL_DIR\]/frameworks/sita/templates/map folder.

Default Schema for Validation and Content Completion

Default schemas that are used if one is not detected in the DITA map document are stored in the various folders inside DITA-OT-DIR/dtd/ or DITA-OT-DIR/schema/.

Default CSS

The default CSS files used for rendering DITA content in Author mode are stored in the various folders inside: \[OXYGEN_INSTALL_DIR\]/frameworks/dita/css/.

By default, these default CSS files are merged with any that are specified in the document. For more information, see Configuring and Managing Multiple CSS Styles for a Framework (on page 1919).

Default XML Catalogs

The default XML Catalogs (on page 2800) for the DITA map document type are as follows:

- \[OXYGEN_INSTALL_DIR\]/frameworks/dita/catalog.xml
- DITA-OT-DIR/catalog-dita.xml

Transformation Scenarios

Oxygen XML Author includes numerous built-in transformation scenarios that allow you to transform DITA maps to a variety of outputs, such as WebHelp, PDF, ODF, XHTML, EPUB, and CHM. All of them are listed in the DITA Map section in the Configure Transformation Scenario(s) dialog box (on page 1378).

For more information, see the DITA Map Transformation Scenarios (on page 1260) section.

Resources

- DITA Specifications
- DITA Style Guide Best Practices for Authors
DITA Map Author Mode Actions

A variety of actions are available in the DITA map (on page 2793) framework (on page 2794) that can be added to the DITA menu, the Author Custom Actions toolbar, the contextual menu, and the Content Completion Assistant (on page 2792).

DITA Map Toolbar and Menu Actions

When a DITA map is opened in Author mode, the following default actions are available on the DITA Map Author Custom Actions toolbar (by default, they are also available in the DITA menu and in various submenus of the contextual menu):

- **Insert New DITA Resource**
  
  Opens a New DITA file dialog box (on page 2562) where you can choose the type of DITA document to create and inserts a reference to it at the current position within the map.

- **Insert Topic Reference**
  
  Opens the Insert Reference dialog box (on page 2530) where you can configure a topic reference and inserts it at the current position within the map.

- **Reuse Content**
Opens the Reuse Content dialog box (on page 2647) that allows you to insert and configure a content reference (`<conref>`), or a content key reference (`<conkeyref>`) at the cursor position.

### Insert Topic Heading

Opens the Insert Reference dialog box (on page 2530) that allows you to insert a topic heading at the cursor position.

### Insert Topic Group

Opens the Insert Reference dialog box (on page 2530) that allows you to insert a topic group at the cursor position.

### Insert Relationship Table

Opens a dialog box that allows you to configure the relationship table to be inserted. The dialog box allows you to configure the number of rows and columns of the relationship table, if the header will be generated and if the title will be added.

### Relationship Table Properties

Allows you to change the properties of rows in relationship tables.

### Insert Relationship Row

Inserts a new table row with empty cells. The action is available when the cursor position is inside a table.

### Insert Relationship Column

Inserts a new table column with empty cells after the current column. The action is available when the cursor position is inside a table.

### Delete Relationship Column

Deletes the table column where the cursor is located.

### Delete Relationship Row

Deletes the table row where the cursor is located.

### Move Up

Moves the selected node up one position on its same level.

### Move Down

Moves the selected node down one position on its same level.

### Promote (Alt + LeftArrow)

Moves the selected node up one position to the level of its parent node.

### Demote (Alt + RightArrow)
Moves the selected node down one level to the level of its child nodes.

DITA Menu Actions

The following additional actions can be found in the DITA menu when editing a DITA map in Author mode:

- Refresh References
  You can use this action to manually trigger a refresh and update of all referenced resources.

Tags display mode Submenu

- Full Tags with Attributes
  Displays full tag names with attributes for both block (on page 2792) and inline elements (on page 2795). Oxygen XML Author

- Full Tags
  Displays full tag names without attributes for both block and inline elements.

- Block Tags
  Displays full tag names for block elements and simple tags without names for inline elements.

- Inline Tags
  Displays full tag names for inline elements, while block elements are not displayed.

- Partial Tags
  Displays simple tags without names for inline elements, while block elements are not displayed.

- No Tags
  No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

Configure Tags Display Mode

Use this option to go to the Author preferences page (on page 129) where you can configure the Tags Display Mode options.

Profiling/Conditional Text Submenu

- Edit Profiling Attributes
Allows you to configure the profiling attributes (on page 911) and their values.

**Show Profiling Colors and Styles**
Select this option to turn on conditional styling.

**Show Profiling Attributes**
Select this option to turn on conditional text markers. They are displayed at the end of conditional text blocks, as a list of attribute name and their currently set values.

**Show Excluded Content**
When this option is selected, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, deselect this option.

**List of all profiling condition sets that match the current document type**
You can click a listed condition set (on page 917) to activate it.

**Profiling Settings**
Opens the profiling options preferences page (on page 142), where you can manage profiling attributes and profiling conditions sets. You can also configure the profiling styles and colors options from the colors/styles preferences page (on page 144) and the attributes rendering preferences page (on page 146).

**ID Options**
Opens the **ID Options** dialog box that allows you to configure options for generating IDs in Author mode. The dialog box includes the following:

**ID Pattern**
The pattern for the ID values that will be generated. This text field can be customized using constant strings or any of the Oxygen XML Author Editor Variables (on page 266).

**Element name or class value to generate ID for**
The elements for which ID values will be generated, specified using class attribute values. To customize the list, use the Add, Edit, or Remove buttons.

**Auto generate IDs for elements**
If selected, Oxygen XML Author will automatically generate unique IDs for the elements listed in this dialog box when they are created in Author mode.
Remove IDs when copying content in the same document

When copying and pasting content in the same document, this option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs. To retain the element IDs, deselect this option.

**Note:** This option does not have an effect on content that is **cut** and **pasted**.

Generate IDs

Oxygen XML Author generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the **ID Options** dialog box that are found in the current selection.

**Note:** The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an **id** attribute.

DITA Map Contextual Menu Actions

In addition to many of the **DITA Map toolbar actions** (on page 1216) and the **general Author mode contextual menu actions** (on page 1007), the following **DITA map framework**-specific actions are also available in the contextual menu when editing in **Author mode**:

**Add File to Review Task**

This action can be used to add the current document to a task in the **Content Fusion Tasks Manager** view. **Oxygen Content Fusion** is a flexible, intuitive collaboration platform designed to adapt to any type of documentation review workflow. This functionality is available through a pre-installed **connector add-on** (on page 2250). To fully take advantage of all of the benefits and features of **Content Fusion**, your organization will need an **Oxygen Content Fusion Enterprise Server**. For more information, see the **Oxygen Content Fusion website**.

**Edit Properties**

Opens the **Edit Properties** dialog box that allows you to configure the properties of a selected node. For more details about this dialog box, see **Edit Properties Dialog Box** (on page 2540).
Generate IDs

Oxygen XML Author generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the ID Options dialog box that are found in the current selection.

**Note:** The Generate IDs action does not overwrite existing ID values. It only affects elements that do not already have an id attribute.

Search References

Finds the references to the href or keys attribute value of the topic/map reference element at the current cursor position, in all the topics from the current DITA map (opened in the DITA Maps Manager view (on page 2503)). The current topic/map reference element must have an href or keys attribute defined to complete the search.

Show Key Definition

Available for elements that have a conkeyref or keyref attribute set (or elements with an ancestor element that has a conkeyref or keyref attribute). It computes the key name and opens the DITA map (on page 2793) that contains the definition of the key with the element that defines that key selected.

DITA Map Drag/Drop Actions

Dragging a file from the Project view (on page 320) or DITA Maps Manager view (on page 2503) and dropping it into a DITA map document that is edited in Author mode creates a link to the dragged file (a topicref element, chapter, part, etc.) at the drop location.

Open Topic from DITA Map in Author Mode

When a DITA map is opened in Author mode, you can click the icon to the left of a topic to open that particular topic in the editor.

**Tip:** For information about customizing Author mode actions for a particular framework (on page 2794) (document type), see the Configuring Actions, Menus, Toolbars, Content Completion for a Framework (on page 1894) section.
XHTML Document Type (Framework)

The Extensible HyperText Markup Language (XHTML), is a markup language that has the same depth of expression as HTML, but also conforms to XML syntax.

File Definition

A file is considered to be an XHTML document when the root element name is `html`.

Default Document Templates

There are a variety of default XHTML templates available when creating new documents from templates (on page 619) and they can be found in: Framework Templates > XHTML.

The default templates for XHTML documents are located in the `[OXYGEN_INSTALL_DIR]/frameworks/xhtml/templates/` folder.

Default Schema for Validation and Content Completion

Default schemas that are used if one is not detected in the XHTML file are stored in the following locations:

- XHTML 1.0 - `[OXYGEN_INSTALL_DIR]/frameworks/xhtml/dtd/` or `[OXYGEN_INSTALL_DIR]/frameworks/xhtml/nvdl/`.
- XHTML 1.1 - `[OXYGEN_INSTALL_DIR]/frameworks/xhtml11/dtd/` or `[OXYGEN_INSTALL_DIR]/frameworks/xhtml11/schema/`.
- XHTML 5 - `[OXYGEN_INSTALL_DIR]/frameworks/xhtml/xhtml5 (epub3)/`.

Default CSS

The default CSS files used for rendering XHTML content in Author mode are stored in `[OXYGEN_INSTALL_DIR]/frameworks/xhtml/css/`.

By default, these default CSS files are merged with any that are specified in the document. For more information, see Configuring and Managing Multiple CSS Styles for a Framework (on page 1919).
Default XML Catalogs

The default XML Catalogs (on page 2800) for the XHTML document type are as follows:

- \([OXYGEN\_INSTALL\_DIR]/frameworks/xhtml/dtd/xhtmlcatalog.xml\)
- \([OXYGEN\_INSTALL\_DIR]/frameworks/relaxng/catalog.xml\)
- \([OXYGEN\_INSTALL\_DIR]/frameworks/nvdl/catalog.xml\)
- \([OXYGEN\_INSTALL\_DIR]/frameworks/xhtml11/dtd/xhtmlcatalog.xml\)
- \([OXYGEN\_INSTALL\_DIR]/frameworks/xhtml11/schema/xhtmlcatalog.xml\)
- \([OXYGEN\_INSTALL\_DIR]/xhtml5 (epub3)/catalog-compat.xml\)

Transformation Scenarios

Oxygen XML Author includes built-in transformation scenarios that allow you to transform XHTML documents to several types of DITA document types (topic, task, concept, reference). They can be found in the XHTML section in the Configure Transformation Scenario(s) dialog box (on page 1378).

- XHTML Specifications

XHTML Author Mode Actions

A variety of actions are available in the XHTML framework (on page 2794) that can be added to the XHTML menu, the Author Custom Actions toolbar, the contextual menu, and the Content Completion Assistant (on page 2792).
XHTML Toolbar Actions

The following default actions are readily available on the XHTML (Author Custom Actions) toolbar when editing in Author mode (by default, they are also available in the XHTML menu and some of them are in various submenus of the contextual menu):

**Bold**
Changes the style of the selected text to **bold** by surrounding it with `b` tag. You can use this action on multiple non-contiguous selections.

**Italic**
Changes the style of the selected text to *italic* by surrounding it with `i` tag. You can use this action on multiple non-contiguous selections.

**Underline**
Changes the style of the selected text to *underline* by surrounding it with `u` tag. You can use this action on multiple non-contiguous selections.

**Link**
Inserts an `a` element with an `href` attribute at the cursor position. You can type the URL of the reference you want to insert or use the browsing actions in the `Browse` drop-down menu.

**Insert Image**
Inserts a graphic object at the cursor position. This is done by inserting an `img` element regardless of the current context. The following graphical formats are supported: GIF, JPG, JPEG, BMP, PNG, SVG.

**Insert Media Resource**
Opens a Choose Media dialog box (on page 997) that allows you to select the URL of a media object to be inserted into a document at the cursor position. The result will be that a reference to the specified video, audio, or embedded HTML frame is inserted and rendered in Author mode so that it can be played directly from there.

**Headings Drop-down Menu**
A drop-down menu that includes actions for inserting `h1`, `h2`, `h3`, `h4`, `h5`, `h6` elements.

**Insert Paragraph**
Insert a new paragraph element at current cursor position.

**Insert Equation**
Opens the XML Fragment Editor that allows you to insert and edit MathML notations (on page 999).

- **Insert List Item**
  Inserts a list item in the current list type.

- **Insert Unordered List**
  Inserts an unordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an unordered list.

- **Insert Ordered List**
  Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

- **Insert a definition list at the cursor position**
  Inserts a definition list (dl element) with one list item (a dt child element and a dd child element). You can also use this action to convert selected paragraphs or other types of lists to a definition list.

- **Sort**
  Sorts cells or list items in a table.

- **Insert Table**
  Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a block element (on page 2792)) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

  **Note:** If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that Only lists, paragraphs, or inline content can be converted to tables.

- **Insert Row Below**
  Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

- **Insert Row Above**
  Inserts a new table row with empty cells above the current row. This action is available when the cursor is positioned inside a table.
Insert Column After

Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

Insert Cell

Inserts a new empty cell depending on the current context. If the cursor is positioned between two cells, Oxygen XML Author a new cell at cursor position. If the cursor is inside a cell, the new cell is created after the current cell.

Delete Column(s)

Deletes the table column located at cursor position or multiple columns in a selection.

Delete Row(s)

Deletes the table row located at cursor position or multiple rows in a selection.

Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell

Splits the cell at the cursor location. If Oxygen XML Author detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

XHTML Menu Actions

The following additional actions can be found in the XHTML menu when editing in Author mode (some of them are also available in the contextual menu):

Table submenu

In addition to the table actions available on the toolbar, the following actions are available in this submenu:

Insert Rows

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (Above or Below the current row).

Insert Column Before

Inserts a column before the current one.

Insert Columns
Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (Above or Below the current column).

Refresh References

You can use this action to manually trigger a refresh and update of all referenced resources.

Tags display mode Submenu

- **Full Tags with Attributes**
  Displays full tag names with attributes for both block and inline elements.

- **Full Tags**
  Displays full tag names without attributes for both block and inline elements.

- **Block Tags**
  Displays full tag names for block elements and simple tags without names for inline elements.

- **Inline Tags**
  Displays full tag names for inline elements, while block elements are not displayed.

- **Partial Tags**
  Displays simple tags without names for inline elements, while block elements are not displayed.

- **No Tags**
  No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

Configure Tags Display Mode

Use this option to go to the Author preferences page where you can configure the Tags Display Mode options.

Profiling/Conditional Text Submenu

- **Edit Profiling Attributes**
  Allows you to configure the profiling attributes and their values.

- **Show Profiling Colors and Styles**
Select this option to turn on conditional styling.

**Show Profiling Attributes**

Select this option to turn on conditional text markers. They are displayed at the end of conditional text blocks, as a list of attribute name and their currently set values.

**Show Excluded Content**

When this option is selected, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, deselect this option.

**List of all profiling condition sets that match the current document type**

You can click a listed condition set *(on page 917)* to activate it.

**Profiling Settings**

Opens the profiling options preferences page *(on page 142)*, where you can manage profiling attributes and profiling conditions sets. You can also configure the profiling styles and colors options from the colors/styles preferences page *(on page 144)* and the attributes rendering preferences page *(on page 146)*.

**XHTML Contextual Menu Actions**

In addition to many of the XHTML toolbar actions *(on page 1224)* and the general Author mode contextual menu actions *(on page 1007)*, the following XHTML framework-specific actions are also available in the contextual menu when editing in Author mode:

**Image Map Editor**

This action is available in the contextual menu when it is invoked on an image. This action applies an image map to the current image (if one does not already exist) and opens the Image Map Editor dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.

**Table Actions**

The following table editing actions are available in the contextual menu when it is invoked on a table:

**Insert Rows**

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted *(Above or Below the current row)*.
Delete Row(s)

Deletes the table row located at cursor position or multiple rows in a selection.

Insert Columns

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (Above or Below the current column).

Delete Column(s)

Deletes the table column located at cursor position or multiple columns in a selection.

Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell

Splits the cell at the cursor location. If Oxygen XML Author detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

Sort

Sorts cells or list items in a table.

Table Properties

Opens the Table properties dialog box that allows you to configure properties of a table (such as frame borders).

Other Actions submenu

This submenu gives you access to all the usual contextual menu actions.

XHTML Drag/Drop (or Copy/Paste) Actions

Dragging a file from the Project view (on page 320) or DITA Maps Manager view (on page 2503) and dropping it into an XHTML document that is edited in Author mode, creates a link to the dragged file (the a element with the href attribute) at the drop location. Copy and paste actions work the same.

You can also drag images or media files from your system explorer or the Project view (on page 320) and drop them into an XHTML document (or copy and paste). This will insert the appropriate element at the drop or paste location (for example, dropping/pasting an image will insert the img element with the src attribute).
Tip: For information about customizing Author mode actions for a particular framework (on page 2794) (document type), see the Configuring Actions, Menus, Toolbars, Content Completion for a Framework (on page 1894) section.

Related Information:

- Configuring Actions, Menus, Toolbars, Content Completion for a Framework (on page 1894)

TEI P5 Document Type (Framework)

The TEI (Text Encoding Initiative) document type is an international and interdisciplinary standard that enables libraries, museums, publishers, and individual scholars to represent a variety of literary and linguistic texts for online research, teaching, and preservation.

File Definition

A file is considered to be a TEI P5 document when one of the following conditions are true:

- The document namespace is http://www.tei-c.org/ns/1.0.
- The public ID of the document is -//TEI P5.

Default Document Templates

There are a variety of default TEI P5 templates available when creating new documents from templates (on page 619) and they can be found in: Framework Templates > TEI P5.

The default templates for TEI P5 documents are located in the [OXYGEN_INSTALL_DIR]/frameworks/tei/templates/TEI P5 folder.

Default Schema for Validation and Content Completion

The default schema that is used if one is not detected in the TEI P5 document is tei_all.rng and it is stored in [OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/custom/schema/relaxng/.

Default CSS

The default CSS files used for rendering TEI content in Author mode are stored in [OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/css/.
By default, these default CSS files are merged with any that are specified in the document. For more information, see Configuring and Managing Multiple CSS Styles for a Framework (on page 1919).

Default XML Catalogs

The default XML Catalogs (on page 2800) for the TEI P5 document type are as follows:

- `{OXYGEN_INSTALL_DIR}/frameworks/tei/xml/tei/schema/dtd/catalog.xml`
- `{OXYGEN_INSTALL_DIR}/frameworks/tei/xml/tei/custom/schema/dtd/catalog.xml`
- `{OXYGEN_INSTALL_DIR}/frameworks/tei/xml/tei/stylesheet/catalog.xml`

Transformation Scenarios

Oxygen XML Author includes built-in transformation scenarios that allow you to transform TEI P5 documents to a variety of outputs, such as PDF, XHTML, EPUB, DOCX, and ODT. They can be found in the TEI P5 section in the Configure Transformation Scenario(s) dialog box (on page 1378).

TEI P5 Author Mode Actions

A variety of actions are available in the TEI P5 framework (on page 2794) that can be added to the TEI P5 menu, the Author Custom Actions toolbar, the contextual menu, and the Content Completion Assistant (on page 2792).
TEI P5 Toolbar Actions

The following default actions are readily available on the TEI P5 (Author Custom Actions) toolbar when editing in Author mode (by default, they are also available in the TEI P5 menu and some of them are in various submenus of the contextual menu):

**Bold**

Changes the style of the selected text to `bold` by surrounding it with `hi` tag and setting the `rend` attribute to `bold`. You can use this action on multiple non-contiguous selections.

**Italic**

Changes the style of the selected text to `italic` by surrounding it with `hi` tag and setting the `rend` attribute to `italic`. You can use this action on multiple non-contiguous selections.

**Underline**

Changes the style of the selected text to `underline` by surrounding it with `hi` tag and setting the `rend` attribute to `ul`. You can use this action on multiple non-contiguous selections.

**Insert Section**

Inserts a new section or subsection, depending on the current context. For example, if the current context is `div1`, then a `div2` is inserted. By default, this action also inserts a paragraph element as a child node.

**Insert Paragraph**

Insert a new paragraph element at current cursor position.

**Insert Image**

Inserts an image reference (on page 963) at the cursor position. Depending on the current location, an image-type element is inserted.

**Insert List Item**

Inserts a list item in the current list type.

**Insert Ordered List**

Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

**Insert Itemized List**
Inserts an itemized list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an itemized list.

Sort

Sorts cells or list items in a table.

Insert Table

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a block element (on page 2792)) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

Note: If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that Only lists, paragraphs, or inline content can be converted to tables.

Insert Row Below

Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

Insert Column After

Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

Insert Cell

Inserts a new empty cell depending on the current context. If the cursor is positioned between two cells, Oxygen XML Author a new cell at cursor position. If the cursor is inside a cell, the new cell is created after the current cell.

Delete Column(s)

Deletes the table column located at cursor position or multiple columns in a selection.

Delete Row(s)

Deletes the table row located at cursor position or multiple rows in a selection.

Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell
Splits the cell at the cursor location. If Oxygen XML Author detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

**TEI P5 Menu Actions**

The following additional actions can be found in the **TEI P5** menu when editing in **Author** mode (some of them are also available in the contextual menu):

**Table submenu**

In addition to the table actions available on the toolbar, the following actions are available in this submenu:

- **Insert Row Above**
  
  Inserts a new table row with empty cells above the current row. This action is available when the cursor is positioned inside a table.

- **Insert Rows**

  Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (**Above** or **Below** the current row).

- **Insert Column Before**

  Inserts a column before the current one.

- **Insert Columns**

  Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (**Above** or **Below** the current column).

**ID Options**

Opens the **ID Options** dialog box that allows you to configure options for generating IDs in **Author** mode. The dialog box includes the following:

- **ID Pattern**

  The pattern for the ID values that will be generated. This text field can be customized using constant strings or any of the Oxygen XML Author Editor Variables (**on page 266**).

- **Element name or class value to generate ID for**

  The elements for which ID values will be generated, specified using class attribute values. To customize the list, use the **Add**, **Edit**, or **Remove** buttons.
Auto generate IDs for elements

If selected, Oxygen XML Author will automatically generate unique IDs for the elements listed in this dialog box when they are created in Author mode.

Remove IDs when copying content in the same document

When copying and pasting content in the same document, this option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs. To retain the element IDs, deselect this option.

Note: This option does not have an effect on content that is cut and pasted.

Generate IDs

Oxygen XML Author generates unique IDs for the current element (or elements), depending on how the action is invoked:

• When invoked on a single selection, an ID is generated for the selected element at the cursor position.
• When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the ID Options dialog box that are found in the current selection.

Note: The Generate IDs action does not overwrite existing ID values. It only affects elements that do not already have an id attribute.

Refresh References

You can use this action to manually trigger a refresh and update of all referenced resources.

Tags display mode Submenu

• Full Tags with Attributes

  Displays full tag names with attributes for both block (on page 2792) and inline elements (on page 2795). Oxygen XML Author

• Full Tags

  Displays full tag names without attributes for both block and inline elements.

• Block Tags
Displays full tag names for block elements and simple tags without names for inline elements.

**Inline Tags**

Displays full tag names for inline elements, while block elements are not displayed.

**Partial Tags**

Displays simple tags without names for inline elements, while block elements are not displayed.

**No Tags**

No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

**Configure Tags Display Mode**

Use this option to go to the Author preferences page (on page 129) where you can configure the Tags Display Mode options.

### Profiling/Conditional Text Submenu

**Edit Profiling Attributes**

Allows you to configure the profiling attributes (on page 911) and their values.

**Show Profiling Colors and Styles**

Select this option to turn on conditional styling.

**Show Profiling Attributes**

Select this option to turn on conditional text markers. They are displayed at the end of conditional text blocks, as a list of attribute name and their currently set values.

**Show Excluded Content**

When this option is selected, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, deselect this option.

**List of all profiling condition sets that match the current document type**

You can click a listed condition set (on page 917) to activate it.

**Profiling Settings**

Opens the profiling options preferences page (on page 142), where you can manage profiling attributes and profiling conditions sets. You can also
configure the profiling styles and colors options from the colors/styles preferences page (on page 144) and the attributes rendering preferences page (on page 146).

### TEI Contextual Menu Actions

In addition to many of the TEI toolbar actions (on page 1232) and the general Author mode contextual menu actions (on page 1007), the following TEI framework-specific actions are also available in the contextual menu when editing in Author mode:

#### Image Map Editor

This action is available in the contextual menu when it is invoked on an image. This action applies an image map to the current image (if one does not already exist) and opens the Image Map Editor dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.

#### Table Actions

The following table editing actions are available in the contextual menu when it is invoked on a table:

- **Insert Rows**
  
  Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (Above or Below the current row).

- **Delete Row(s)**
  
  Deletes the table row located at cursor position or multiple rows in a selection.

- **Insert Columns**
  
  Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (Above or Below the current column).

- **Delete Column(s)**
  
  Deletes the table column located at cursor position or multiple columns in a selection.

- **Join Cells**
  
  Joins the content of the selected cells (both horizontally and vertically).

- **Split Cell**
Splits the cell at the cursor location. If Oxygen XML Author detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

Sort

Sorts cells or list items in a table.

Table Properties

Opens the Table properties dialog box that allows you to configure properties of a table (such as frame borders).

Other Actions submenu

This submenu gives you access to all the usual contextual menu actions.

TEI P5 Drag/Drop Actions

Dragging a file from the Project view (on page 320) or DITA Maps Manager view (on page 2503) and dropping it into a TEI P5 document that is edited in Author mode, creates a link to the dragged file (the ptr element with the target attribute) at the drop location. Dragging an image file from the default file system application (Windows Explorer on Windows or Finder on Mac OS X, for example) and dropping it into a TEI P5 document inserts a graphic element (the graphic element with the url attribute) at the drop location, similar to the Insert Image toolbar action.

Tip: For information about customizing Author mode actions for a particular framework (on page 2794) (document type), see the Configuring Actions, Menus, Toolbars, Content Completion for a Framework (on page 1894) section.

Related Information:

- Configuring Actions, Menus, Toolbars, Content Completion for a Framework (on page 1894)

Customization of TEI Frameworks Using the Latest Sources

The TEI P5 (on page 1230) framework (on page 2794) is available as a public project at the following SVN repository: https://github.com/TEIC/oxygen-tei. This project is the base for customizing a TEI framework.

To customize a TEI framework, follow this procedure:

1. Check out the project on a local computer from the SVN repository.
This action is done with an SVN client application that creates a working copy of the SVN repository on a local computer.

2. Customize the TEI framework in Oxygen XML Author.

   a. Set the Oxygen XML Author frameworks folder to the oxygen/frameworks subfolder of the folder of the SVN working copy.
      Open the Preferences dialog box (Options > Preferences) (on page 79), go to Global, and set the path of the SVN working copy in the Use custom frameworks option.

   b. Open the Preferences dialog box (Options > Preferences) (on page 79), go to Document Type Association > Locations, and select Custom.

3. Build a JAR file with the TEI framework.
   The SVN project includes a build.xml file that can be used for building a JAR file using the Ant tool. The command that should be used:

   ```
   ant -f build.xml
   ```

4. Distribute the JAR file to the users that need the customized TEI framework.
   The command from the above step creates a file tei.zip in the dist subfolder of the SVN project. Each user that needs the customized TEI framework will receive the tei.zip file and will unzip it in the frameworks folder of the Oxygen XML Author install folder.

---

Customization of TEI Frameworks Using the Compiled Sources

The following procedure describes how to update to the latest stable version of TEI Schema and TEI XSL, already integrated in the TEI framework (on page 2794) for Oxygen XML Author.

1. Go to https://code.google.com/p/oxygen-tei/;
2. Go to Downloads;
3. Download the latest uploaded .zip file;
4. Unpack the .zip file and copy its content in the Oxygen XML Author frameworks folder.

---

TEI ODD Document Type (Framework)

The TEI ODD (Text Encoding Initiative - One Document Does it all) document type is a TEI XML-conformant specification format that allows you to create a custom TEI P5 schema in a literate programming fashion. A system of XSLT stylesheets called Roma was created by the TEI Consortium for manipulating the ODD files.
File Definition

A file is considered to be a TEI ODD document when the following conditions are true:

- The file extension is `.odd`.
- The document namespace is `http://www.tei-c.org/ns/1.0`.

Default Document Templates

There is a default TEI ODD document template available when creating new documents from templates (on page 619) and they can be found in: Framework Templates > TEI ODD.

The default template is located in the `[OXYGEN_INSTALL_DIR]/frameworks/tei/templates/TEI ODD` folder.

Default Schema for Validation and Content Completion

The default schema that is used if one is not detected in the TEI ODD document is `tei_odds.rng` and it is stored in `[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/custom/schema/relaxng/`.

Default CSS

The default CSS files used for rendering TEI ODD content in Author mode are stored in `[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/css/`.

By default, these default CSS files are merged with any that are specified in the document. For more information, see Configuring and Managing Multiple CSS Styles for a Framework (on page 1919).

Default XML Catalogs

The default XML Catalogs (on page 2800) for the TEI ODD document type are as follows:

- `[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/custom/schema/catalog.xml`
- `[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/schema/catalog.xml`

Transformation Scenarios

Oxygen XML Author includes built-in transformation scenarios that allow you to transform TEI ODD documents to a variety of outputs, such as PDF, XHTML, EPUB, DOCX, ODT, RNG, DTD, and XML Schema. They can be found in the TEI ODD section in the Configure Transformation Scenario(s) dialog box (on page 1378).

TEI ODD Author Mode Actions

A variety of actions are available in the TEI ODD framework (on page 2794) that can be added to the TEI ODD menu, the Author Custom Actions toolbar, the contextual menu, and the Content Completion Assistant (on page 2792).

TEI ODD Toolbar Actions

The following default actions are readily available on the TEI ODD (Author Custom Actions) toolbar when editing in Author mode (by default, they are also available in the TEI ODD menu and some of them are in various submenus of the contextual menu):

- **Bold**
  Changes the style of the selected text to **bold** by surrounding it with `<hi>` tag and setting the `rend` attribute to `bold`. You can use this action on multiple non-contiguous selections.

- **Italic**
  Changes the style of the selected text to *italic* by surrounding it with `<hi>` tag and setting the `rend` attribute to `italic`. You can use this action on multiple non-contiguous selections.

- **Underline**
  Changes the style of the selected text to `underline` by surrounding it with `<hi>` tag and setting the `rend` attribute to `ul`. You can use this action on multiple non-contiguous selections.

- **Insert Section**
Inserts a new section or subsection, depending on the current context. For example, if the current context is `div1`, then a `div2` is inserted. By default, this action also inserts a paragraph element as a child node.

**Insert Paragraph**

Insert a new paragraph element at current cursor position.

**Insert Image**

Inserts an image reference (*on page 963*) at the cursor position. Depending on the current location, an image-type element is inserted.

**Insert List Item**

Inserts a list item in the current list type.

**Insert Ordered List**

Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

**Insert Itemized List**

Inserts an itemized list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an itemized list.

**Insert Table**

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a block element (*on page 2792*)) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

**Note:** If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that *Only lists, paragraphs, or inline content can be converted to tables.*

**Insert Row Below**

Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

**Insert Column After**

Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.
Insert Cell

Inserts a new empty cell depending on the current context. If the cursor is positioned between two cells, Oxygen XML Author a new cell at cursor position. If the cursor is inside a cell, the new cell is created after the current cell.

Delete Column(s)

Deletes the table column located at cursor position or multiple columns in a selection.

Delete Row(s)

Deletes the table row located at cursor position or multiple rows in a selection.

Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell

Splits the cell at the cursor location. If Oxygen XML Author detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

TEI ODD Menu Actions

The following additional actions can be found in the TEI ODD menu when editing in Author mode (some of them are also available in the contextual menu):

Table submenu

In addition to the table actions available on the toolbar, the following actions are available in this submenu:

Insert Row Above

Inserts a new table row with empty cells above the current row. This action is available when the cursor is positioned inside a table.

Insert Rows

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (Above or Below the current row).

Insert Column Before

Inserts a column before the current one.
Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (Above or Below the current column).

**ID Options**

Opens the **ID Options** dialog box that allows you to configure options for generating IDs in **Author** mode. The dialog box includes the following:

**ID Pattern**

The pattern for the ID values that will be generated. This text field can be customized using constant strings or any of the Oxygen XML Author Editor Variables (on page 266).

**Element name or class value to generate ID for**

The elements for which ID values will be generated, specified using class attribute values. To customize the list, use the **Add**, **Edit**, or **Remove** buttons.

**Auto generate IDs for elements**

If selected, Oxygen XML Author will automatically generate unique IDs for the elements listed in this dialog box when they are created in **Author** mode.

**Remove IDs when copying content in the same document**

When copying and pasting content in the same document, this option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs. To retain the element IDs, deselect this option.

*Note:* This option does not have an effect on content that is *cut* and *pasted*.

**Generate IDs**

Oxygen XML Author generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the **ID Options** dialog box that are found in the current selection.
**Note:** The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

### Refresh References

You can use this action to manually trigger a refresh and update of all referenced resources.

### Tags display mode Submenu

- **Full Tags with Attributes**
  
  Displays full tag names with attributes for both *block* (on page 2792) and *inline elements* (on page 2795).

- **Full Tags**
  
  Displays full tag names without attributes for both *block* and *inline elements*.

- **Block Tags**
  
  Displays full tag names for *block elements* and simple tags without names for *inline elements*.

- **Inline Tags**
  
  Displays full tag names for *inline elements*, while *block elements* are not displayed.

- **Partial Tags**
  
  Displays simple tags without names for *inline elements*, while *block elements* are not displayed.

- **No Tags**
  
  No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

### Configure Tags Display Mode

Use this option to go to the **Author preferences page** (on page 129) where you can configure the **Tags Display Mode** options.

### Profiling/Conditional Text Submenu

- **Edit Profiling Attributes**
  
  Allows you to configure the profiling attributes (on page 911) and their values.

- **Show Profiling Colors and Styles**
Select this option to turn on conditional styling.

**Show Profiling Attributes**

Select this option to turn on conditional text markers. They are displayed at the end of conditional text blocks, as a list of attribute name and their currently set values.

**Show Excluded Content**

When this option is selected, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, deselect this option.

**List of all profiling condition sets that match the current document type**

You can click a listed condition set *(on page 917)* to activate it.

🔗 **Profiling Settings**

Opens the profiling options preferences page *(on page 142)*, where you can manage profiling attributes and profiling conditions sets. You can also configure the profiling styles and colors options from the colors/styles preferences page *(on page 144)* and the attributes rendering preferences page *(on page 146)*.

**TEI Contextual Menu Actions**

In addition to many of the TEI toolbar actions *(on page 1241)* and the general Author mode contextual menu actions *(on page 1007)*, the following TEI framework-specific actions are also available in the contextual menu when editing in **Author mode**:

**Table Actions**

The following table editing actions are available in the contextual menu when it is invoked on a table:

**Insert Rows**

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted *(Above or Below the current row)*.

**Delete Row(s)**

Deletes the table row located at cursor position or multiple rows in a selection.

**Insert Columns**
Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (Above or Below the current column).

Delete Column(s)

Deletes the table column located at cursor position or multiple columns in a selection.

Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell

Splits the cell at the cursor location. If Oxygen XML Author detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

Sort

Sorts cells or list items in a table.

Table Properties

Opens the Table properties dialog box that allows you to configure properties of a table (such as frame borders).

Other Actions submenu

This submenu give you access to all the usual contextual menu actions.

TEI ODD Drag/Drop Actions

Dragging a file from the Project view (on page 320) or DITA Maps Manager view (on page 2503) and dropping it into a TEI ODD document that is edited in Author mode, creates a link to the dragged file (the ptr element with the target attribute) at the drop location.

Tip: For information about customizing Author mode actions for a particular framework (on page 2794) (document type), see the Configuring Actions, Menus, Toolbars, Content Completion for a Framework (on page 1894) section.

Related Information:

- Configuring Actions, Menus, Toolbars, Content Completion for a Framework (on page 1894)
jTEI Document Type (Framework)

The jTEI (Journal of the Text Encoding Initiative) document type is a highly restrictive customization (only about 80 elements are included) of the TEI P5 framework.

File Definition

A file is considered to be a jTEI document when the root element is named TEI, it is in the namespace http://www.tei-c.org/ns/1.0, and the @rend attribute is set to "jTEI".

Default Document Templates

There is a default jTEI Article template available when creating new documents from templates (on page 619) and they can be found in: Framework Templates > TEI JTEI.

The default template is located in the [OXYGEN_INSTALL_DIR]/frameworks/tei/templates/TEI jTEI folder.

Default Schema for Validation and Content Completion

The default schema that is used if one is not detected is tei_jtei.rng and it is stored in [OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/custom/schema/relaxng/.

Default CSS

The default CSS file (jtei.css) that is used for rendering jTEI in Author mode is stored in [OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/css/.

By default, these default CSS files are merged with any that are specified in the document. For more information, see Configuring and Managing Multiple CSS Styles for a Framework (on page 1919).

Default XML Catalogs

The default XML Catalogs (on page 2800) for jTEI are as follows:

- [OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/schema/dtd/catalog.xml
- [OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/custom/schema/dtd/catalog.xml
- [OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/stylesheet/catalog.xml
Transformation Scenarios

Oxygen XML Author includes built-in transformation scenarios that allow you to transform jTEI documents to PDF and ODT. They can be found in the TEI JTEI section in the Configure Transformation Scenario(s) dialog box (on page 1378).

JATS Document Type (Framework)

The JATS (NISO Journal Article Tag Suite) document type is a technical standard that defines an XML format for scientific literature.

File Definition

A file is considered to be a JATS document when the PUBLIC ID of the document contains the string -//NLM//DTD.

Default Document Templates

There are some default JATS templates available when creating new documents from templates (on page 619) and they can be found in: Framework Templates > JATSKit - NISO JATS and NLM BITS

The default templates for JATS documents are located in the [OXYGEN_INSTALL_DIR]/frameworks/jats/templates/ folder.
Default Schema for Validation and Content Completion

Default schemas that are used if one is not detected in the JATS document are stored in 

\[OXYGEN_INSTALL_DIR]/frameworks/jats/lib/schemas/.

Default CSS

The default CSS files used for rendering JATS content in Author mode are stored in 

\[OXYGEN_INSTALL_DIR]/frameworks/jats/lib/author-css/.

By default, these default CSS files are merged with any that are specified in the document. For more information, see Configuring and Managing Multiple CSS Styles for a Framework (on page 1919).

Default XML Catalog

The default XML Catalog (on page 2800), jatskit-catalog.xml, is stored in 

\[OXYGEN_INSTALL_DIR]/frameworks/jats/lib/schemas/.

Transformation Scenarios

Oxygen XML Author includes built-in transformation scenarios that allow you to transform JATS documents to a variety of outputs, such as PDF, HTML, and EPUB. They can be found in the JATSKit section in the Configure Transformation Scenario(s) dialog box (on page 1378).

JATS Author Mode Actions

A variety of actions are available in the JATS framework (on page 2794) that can be added to the JATS menu, the Author Custom Actions toolbar, the contextual menu, and the Content Completion Assistant (on page 2792).

JATS Toolbar Actions

The following default actions are readily available on the JATS (Author Custom Actions) toolbar when editing in Author mode (by default, they are also available in the JATS menu and in various submenus of the contextual menu):

Paragraph Level Drop-Down Menu

- Insert Paragraph
  Insert a new paragraph element at current cursor position.

- Insert Unordered List
  Inserts an unordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an unordered list.

- Insert Ordered List
  Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

- Boxed Text
  Inserts or wraps content in a box with a shaded background.

- Code
  Inserts or wraps content in a code element.

- Display Quote
  Inserts or wraps content in a disp-quote element.

- Figure
  Inserts a fig element with a title (inside a caption element). This action opens a dialog box that allows you to enter the text for the title for the figure.

- Graphic Figure
Inserts a `fig` element with a `title` (inside a `caption` element), and a `graphic` element. A dialog box is displayed that allows you to enter the title for the figure, followed by a dialog box that allows you to select the URL of the graphic to be inserted.

**Bold**

Surrounds the selected text with a `bold` tag. You can use this action on multiple non-contiguous selections.

**Italic**

Surrounds the selected text with an `italic` tag. You can use this action on multiple non-contiguous selections.

**Underline**

Surrounds the selected text with an `underline` tag. You can use this action on multiple non-contiguous selections.

**Monospace**

Inserts or wraps content with a `monospace` element.

**Insert Image**

Inserts an image reference *(on page 963)* at the cursor position. Depending on the current location, an image-type element is inserted.

**Insert List Item**

Inserts a list item in the current list type.

**Insert MathML**

Opens the XML Fragment Editor that allows you to insert and edit MathML notations *(on page 999)*.

**Subscript**

Surrounds the selected text with a `subscript` tag, used for inserting a character (number, letter, or symbol) that will appear slightly below the baseline and slightly smaller than the rest of the text.

**Superscript**

Surrounds the selected text with a `superscript` tag, used for inserting a character (number, letter, or symbol) that will appear slightly above the baseline and slightly smaller than the rest of the text.
JATS Menu Actions

The following additional actions can be found in the JATS menu when editing in Author mode:

- **Refresh References**
  
  You can use this action to manually trigger a refresh and update of all referenced resources.

**Tags display mode Submenu**

- **Full Tags with Attributes**
  
  Displays full tag names with attributes for both block (on page 2792) and inline elements (on page 2795).

- **Full Tags**
  
  Displays full tag names without attributes for both block and inline elements.

- **Block Tags**
  
  Displays full tag names for block elements and simple tags without names for inline elements.

- **Inline Tags**
  
  Displays full tag names for inline elements, while block elements are not displayed.

- **Partial Tags**
  
  Displays simple tags without names for inline elements, while block elements are not displayed.

- **No Tags**
  
  No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

**Configure Tags Display Mode**

Use this option to go to the Author preferences page (on page 129) where you can configure the Tags Display Mode options.

**Profiling/Conditional Text Submenu**

- **Edit Profiling Attributes**
  
  Allows you to configure the profiling attributes (on page 911) and their values.
Show Profiling Colors and Styles

Select this option to turn on conditional styling.

Show Profiling Attributes

Select this option to turn on conditional text markers. They are displayed at the end of conditional text blocks, as a list of attribute name and their currently set values.

Show Excluded Content

When this option is selected, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, deselect this option.

List of all profiling condition sets that match the current document type

You can click a listed condition set (on page 917) to activate it.

Profiling Settings

Opens the profiling options preferences page (on page 142), where you can manage profiling attributes and profiling conditions sets. You can also configure the profiling styles and colors options from the colors/styles preferences page (on page 144) and the attributes rendering preferences page (on page 146).

JATS Drag/Drop Actions

Dragging a file from the Project view (on page 320) or DITA Maps Manager view (on page 2503) and dropping it into a JATS document that is edited in Author mode, creates a link to the dragged file (the ext-link element with the xlink:href attribute) at the drop location. Dragging an image file from the default file system application (Windows Explorer on Windows or Finder on Mac OS X, for example) and dropping it into a JATS document inserts an image element (the inline-graphic element with the xlink:href attribute) at the drop location, similar to the Insert Image toolbar action.

Tip: For information about customizing Author mode actions for a particular framework (on page 2794) (document type), see the Configuring Actions, Menus, Toolbars, Content Completion for a Framework (on page 1894) section.

Related Information:

• Configuring Actions, Menus, Toolbars, Content Completion for a Framework (on page 1894)
EPUB Document Type (Framework)

EPUB is an e-book file format that is a ZIP archive and can be downloaded and read on devices such as phones, tablets, computers, or e-readers. Oxygen XML Author includes an Archive Browser view (on page 1807) that allows you to view the contents and structure of this type of file.

Three distinct frameworks (on page 2794) are supported for the EPUB document type:

- **NCX** - A declarative global navigation definition.
- **OCF** - The Open Container Format (OCF) defines a mechanism by which all components of an Open Publication Structure (OPS) can be combined into a single file system entity.
- **OPF** - The Open Packaging Format (OPF) defines the mechanism by which all components of a published work that conforms to the Open Publication Structure (OPS) standard (including metadata, reading order, and navigational information) are packaged in an OPS Publication.

Note: Oxygen XML Author supports OPF 2.0, OPF 3.0, and OPF 3.1.

File Definition

A file is considered to be an EPUB document if it has a file extension of .epub.

Default Document Templates

There are a variety of default EPUB templates available when creating new documents from templates (on page 619) and they can be found the following folders in Framework Templates: NCX, OCF, OPF 2.0, OPF 3.0, and OPF 3.1.

- The default templates for the NCX document types are located in the \[OXYGEN_INSTALL_DIR\]/frameworks/ncx/templates folder.
- The default templates for the OCF document types are located in the \[OXYGEN_INSTALL_DIR\]/frameworks/ocf/templates folder.
- The default template for the OPF 2.0 document type is located in the \[OXYGEN_INSTALL_DIR\]/frameworks/opf/templates/2.0 folder.
- The default template for the OPF 3.0 document type is located in the \[OXYGEN_INSTALL_DIR\]/frameworks/opf/templates/3.0 folder.
- The default template for the OPF 3.1 document type is located in the \[OXYGEN_INSTALL_DIR\]/frameworks/opf/templates/3.1 folder.

Default Schema

The default schema files for the various types of EPUB document types are located in the following directories:
• The default schema files for the **NCX** document types are located in the
  \texttt{\{OXYGEN\_INSTALL\_DIR\}/frameworks/ncx/schemas} folder.
• The default schema files for the **OCF** document types are located in the
  \texttt{\{OXYGEN\_INSTALL\_DIR\}/frameworks/ocf/schemas} folder.
• The default schema files for the **OPF 2.0** document type is located in the
  \texttt{\{OXYGEN\_INSTALL\_DIR\}/frameworks/opf/schemas/2.0} folder.
• The default schema files for the **OPF 3.0** document type is located in the
  \texttt{\{OXYGEN\_INSTALL\_DIR\}/frameworks/opf/schemas/3.0} folder.
• The default schema files for the **OPF 3.1** document type is located in the
  \texttt{\{OXYGEN\_INSTALL\_DIR\}/frameworks/opf/schemas/3.1} folder.

Related Information:

• Working with Archive Files (on page 1810)

Other Supported Document Types

Along with the fully supported built-in frameworks (document types) (on page 1155), Oxygen XML Author also provides limited support (including document templates) for editing a variety of other document types. All the specialized views, editors, actions, and options are dynamic according to the type of file that is opened or created. Other document types that are supported in Oxygen XML Author include:

• **EPUB (NCX, OCF, OPF 2.0, 3.0, & 3.1)** (on page 1254) - A standard for e-book files.
• **OOXML** (on page 1810) - An XML-based file format for representing spreadsheets, charts, presentations, and word processing documents.
• **ODF** (on page 1810) - An free and open-source XML-based file format for electronic office documents, such as spreadsheets, charts, presentations, and word processing documents.
• **DocBook Targetset** (on page 1190) - For resolving cross-references when using olinks.
• **Schematron Quick Fixes (SQF)** (on page 1053) - An extension of the ISO standard Schematron, allows developers to define Quick Fixes (on page 2798) for Schematron errors.
• **StratML (Part 1 & 2)** (on page 1111) - Part 1 and 2 of the Strategy Markup Language specification.
• **SVG** (on page 1117) - Scalable Vector Graphics is a language for describing two-dimensional graphics in XML.
• **MathML** (on page 999) - Mathematical Markup Language (2.0 and 3.0) is an application of XML for describing mathematical notations.
• **XLIFF (1.2, 2.0, 2.1) (on page 1111)** - XML Localization Interchange File Format is a standard for passing data between tools during a localization process.

• **CSS (on page 1104)** - Cascading Style Sheets is a language used for describing the look and formatting of a document.

• **LESS (on page 1108)** - A dynamic style sheet language that can be compiled into CSS.

• **Markdown (on page 1125)** - A lightweight markup language with plain text formatting syntax that can be converted to HTML or DITA.

• **JavaScript (on page 1112)** - Programming language of HTML and the Web.

• **XMLSpec** - A markup language for W3C specifications and other technical reports.

• **DITAVAL** - DITA conditional processing profile to identify the values you want to conditionally process for a particular output, build, or other purpose.

• **Daisy** - A technical standard for digital audio books, periodicals, and computerized text. It is designed to be an audio substitute for print material.

• **EAD** - Encoded Archival Description is an XML standard for encoding archival finding aids.

• **KML** - Keyhole Markup Language is an XML notation for expressing geographic visualization in maps and browsers.

• **Maven Project & Settings** - Project or settings file for Maven build automation tool that is primarily used for Java projects.

• **Oasis XML Catalog** - An XML Catalog (on page 2800) document that describes a mapping between external entity references and locally-cached equivalents.

• **Other Non-XML Files (on page 649)** - Oxygen XML Author also includes a simple text editor and a variety of helpful features for creating and editing non-XML files.
10.

Publishing

XML documents can be transformed into a variety of user-friendly output formats that can be viewed by end users. This process is known as a *transformation*.

Oxygen XML Author includes numerous built-in transformation possibilities to publish XML content in various output formats (such as WebHelp, PDF, CHM, EPUB, JavaHelp, Eclipse Help, XHTML, etc.)

For transformations that are not included in your installed version of Oxygen XML Author, simply install the tool chain required to perform the specific transformation and process the files in accordance with the processor instructions. A multitude of target formats are possible. The basic condition for a transformation to any format is that your source document is well-formed.

Transformation Scenarios

A transformation scenario is a set of complex operations and settings that gives you the possibility to obtain outputs of multiple types (XML, HTML, PDF, EPUB, etc.) from the same source of XML files and stylesheets.

*Note:* You need to use the appropriate stylesheet according to the source definition and the desired output. For example, if you want to transform into an HTML format using a DocBook stylesheet, your source XML document should conform with the DocBook DTD.

Executing a transformation scenario implies multiple actions, such as:

- Validating the input file.
- Obtaining intermediate output files (for example, formatting objects for the XML to PDF transformation).
- Using transformation engines to produce the output.

Before transforming an XML document in Oxygen XML Author, you need to define a transformation scenario to apply to that document. A scenario is a set of values for various parameters that define a transformation. It is not related to a particular document, but rather to a document type. Oxygen XML Author included *preconfigured built-in transformation scenarios (on page 1259)*, but you can also *create new transformation scenarios (on page 1292)*.

When creating new transformation scenarios, the types that are available include:
• **Scenarios that Apply to XML Files** - This type of scenario contains the location of an XSLT stylesheet that is applied on the edited XML document, as well as other transformation parameters. For more information, see [XML Transformation with XSLT](on page 1292) and [XML Transformation with XQuery](on page 1308).

• **Scenarios that Apply to XSLT Files** - This type of scenario contains the location of an XML document that the edited XSLT stylesheet is applied to, as well as other transform parameters. For more information, see [XSLT Transformation](on page 1339).

• **Scenarios that Apply to XQuery Files** - This type of scenario contains the location of an XML source, that the edited XQuery file is applied to, as well as other transform parameters. When the XML source is a native XML database, the XML source field of the scenario is empty because the XML data is read with XQuery-specific functions, such as `document()`. When the XML source is a local XML file, the URL of the file is specified in the XML input field of the scenario. For more information, see [XQuery Transformation](on page 1365).

• **Scenarios that Apply to SQL Files** - This type of scenario specifies a database connection for the database server that runs the SQL file that is associated with the scenario. The data processed by the SQL script is located in the database.

• **Scenarios that Apply to XProc Files** - This type of scenario contains the location of an XProc script, as well as other transform parameters. For more information, see [SQL Transformation](on page 1373).

• **DITA-OT Scenarios** - This type of scenario provides the parameters for an Ant transformation that executes a DITA-OT build script. Oxygen XML Author includes a built-in version of Ant and a built-in version of DITA-OT, although you can also set other versions in the scenario. For more information, see [DITA OT Transformation](on page 1319).

• **ANT Scenarios** - This type of scenario contains the location of an Ant build script, as well as other transform parameters. For more information, see [Ant Transformation](on page 1335).

**Note:**
Status messages generated during the transformation process are displayed in the [Information view](on page 764).

### Built-in Transformation Scenarios

Oxygen XML Author includes preconfigured built-in transformation scenarios that are used for common transformations. They can be found in the various sections in the [Configure Transformation Scenario(s)](on page 1378) or [Transformation Scenarios view](on page 1384). All the built-in [document types (frameworks)](on page 2794) that are included in Oxygen XML Author have various transformation scenarios in their specific sections, including the most popular frameworks, such as DITA, DocBook, TEI, XHTML, JATS, OXXML, and more.
To obtain the desired output, use one of the following actions from the toolbar or Transform submenu in the contextual menu of the Project view (on page 320):

- **Apply Transformation Scenario(s)** (Ctrl + Shift + T (Command + Shift + T on OS X)) - If you have associated transformation scenarios for the current document, this action will simply apply the association (on page 1377) and begin the transformation process. If an association is not detected, this action will open the Configure Transformation Scenario(s) dialog box (on page 1378) where you can choose the scenarios you want to apply.

- **Configure Transformation Scenario(s)** (Ctrl + Shift + C (Command + Shift + C on OS X)) - This action will open the Configure Transformation Scenario(s) dialog box (on page 1378) where you can choose the scenarios you want to apply.

**Note:**

- You can apply a transformation even if the current document is not associated with a transformation scenario.
- If the document contains an `xml-stylesheet` processing instruction that references an XSLT stylesheet (commonly used to display the document in web browsers), Oxygen XML Author prompts you to associate the document with a built-in transformation scenario.
- The default transformation scenario is suggested based on the processing instruction from the edited document.

Related Information:

- Creating New Transformation Scenarios (on page 1292)
- Editing a Transformation Scenario (on page 1374)
- Configure Transformation Scenario(s) Dialog Box (on page 1378)
- Applying Associated Transformation Scenarios (on page 1377)
- Transformation Scenarios View (on page 1384)

DITA Map Transformation Scenarios

Built-in transformation scenarios allow you to transform DITA maps (on page 2793) to a variety of outputs, such as WebHelp, PDF, ODF, XHTML, EPUB, CHM, Kindle, and MS Word. Oxygen XML Author also includes a special Run DITA-OT Integrator (on page 1283) that can be used to integrate a DITA-
OT plugin and a **DITA Map Metrics Report** transformation that generates a statistics report for your DITA map. All of them are listed in the **DITA Map** section in the **Configure Transformation Scenario(s)** dialog box (on page 1378).

A variety of transformations scenarios are available for **DITA maps** (on page 2793):

- Built-in transformation scenarios allow you to transform a **DITA map** to a variety of outputs, such as WebHelp, PDF, ODF, XHTML, EPUB, CHM, Kindle, and MS Word.
- **Run DITA-OT Integrator** (on page 1283) - Use this transformation scenario if you want to integrate a DITA-OT plugin (on page 2768). This scenario runs an Ant task that integrates all the plugins from the DITA-OT/plugins directory.
- **DITA Map Metrics Report** - Use this type of transformation scenario if you want to generate a **DITA map** statistics report. It contains information such as:
  - The number of processed maps and topics.
  - Content reuse percentage.
  - Number of elements, attributes, words, and characters used in the entire **DITA map** structure.
  - DITA conditional processing attributes used in the **DITA maps**.
  - Processing instructions.
  - External links.
  - All `@outputclass` attribute values gathered from the DITA project.

⚠️ **Important:** If you have cross references that point to content outside the scope of the DITA map, that referenced content will not be counted. For example, if you have links to topics that are not included in the DITA map hierarchy, the content in those topics is ignored when generating the statistics.

**DITA Map to WebHelp Responsive Transformation**

DITA content can be transformed into several types of WebHelp Responsive systems (with or without a feedback section). The **WebHelp Responsive layout and features** (on page 1474) are designed to adapt to any device and screen size to provide an optimal viewing and interaction experience. Oxygen
XML Author also provides numerous possibilities for customizing the WebHelp Responsive output (on page 1551).

**WebHelp Responsive Transformation Scenario**

To publish a *DITA map (on page 2793)* as WebHelp Responsive output, follow these steps:

1. Select the \[Configure Transformation Scenario(s)\] action from the *DITA Maps Manager (on page 2503)* toolbar.
2. Select the *DITA Map WebHelp Responsive* scenario from the *DITA Map* section.
3. If you want to configure the transformation, click the *Edit* button.

**Step Result:** This opens an *Edit scenario* configuration dialog box that allows you to configure various options in the following tabs:

- **Templates Tab (on page 2711)** - This tab contains a set of built-in publishing templates (on page 1508) that you can use for the layout of your WebHelp system output. You can also create your own publishing templates or edit existing ones (on page 1551).
- **Parameters Tab (on page 2717)** - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the Parameters section (on page 1263) below for details about the most commonly used parameters for WebHelp Responsive transformations.
- **Filters Tab (on page 2719)** - This tab allows you to filter certain content elements from the generated output.
- **Advanced Tab (on page 2720)** - This tab allows you to specify some advanced options for the transformation scenario.
- **Output Tab (on page 2722)** - This tab allows you to configure options that are related to the location where the output is generated.

4. Click *Apply associated* to process the transformation.

When the *DITA Map WebHelp Responsive* transformation is complete, the output is automatically opened in your default browser.

**WebHelp Responsive with Feedback Transformation Scenario**

To publish a *DITA map (on page 2793)* as a WebHelp Responsive with Feedback system, follow these steps:

1. Select the \[Configure Transformation Scenario(s)\] action from the *DITA Maps Manager (on page 2503)* toolbar.
2. Select the *DITA Map WebHelp Responsive with Feedback* scenario from the *DITA Map* section.
3. If you want to configure the transformation, click the *Edit* button.
Step Result: This opens an Edit scenario configuration dialog box that allows you to configure various options in the following tabs:

- **Templates Tab (on page 2711)** - This tab contains a set of built-in publishing templates (on page 1508) that you can use for the layout of your WebHelp system output. You can also create your own publishing templates or edit existing ones (on page 1551).
- **Parameters Tab (on page 2717)** - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the Parameters section (on page 1263) below for details about the most commonly used parameters for WebHelp Responsive transformations.
- **Filters Tab (on page 2719)** - This tab allows you to filter certain content elements from the generated output.
- **Advanced Tab (on page 2720)** - This tab allows you to specify some advanced options for the transformation scenario.
- **Output Tab (on page 2722)** - This tab allows you to configure options that are related to the location where the output is generated.

4. Click **Apply associated** to begin the transformation.

5. Enter the documentation product ID (value for the `webhelp.product.id` parameter) and the documentation version (value for the `webhelp.product.version` parameter).

When the DITA Map WebHelp Responsive with Feedback transformation is complete, your default browser opens the `installation.html` file. This file contains information about the output location, system requirements, installation instructions, and deployment of the output. Follow the instructions to complete the system deployment (on page 1489).

Parameters for Customizing WebHelp Responsive Output

To customize a transformation scenario, you can edit various parameters, including the following most commonly used ones:

**default.language**

This parameter is used if the language is not detected in the DITA map. The default value is `en-us`.

**clean.output**

Deletes all files from the output folder before the transformation is performed (only `no` and `yes` values are valid and the default value is `no`).

**editlink.remote.ditamap.url**

Use this parameter in conjunction with `editlink.web.author.url` to add an Edit link next to the topic title in the WebHelp output. When a user clicks the link, the topic is opened in Oxygen XML Web Author where they can make changes that can be saved
to a file server. The value should be set as the custom URL of the main DITA map. For example, a GitHub custom URL might look like this: https://getFileContent/oxyengxml/userguide/master/UserGuide.ditamap.

**editlink.web.author.url**

This parameter needs to be used in conjunction with **editlink.remote.ditamap.url** to add an **Edit** link next to the topic title in the WebHelp output. When a user clicks the link, the topic is opened in Oxygen XML Web Author where they can make changes that can be saved to a file server. The value should be set as the URL of the Web Author installation. For example: https://www.oxygenxml.com/oxygen-xml-web-author/.

**editlink.present.only.path.to.topic**

When this parameter is set to "true", the DITA topic path is displayed to the right of each topic title in the WebHelp Responsive output. Also, when this parameter is used, the **editlink.remote.ditamap.url** and **editlink.web.author.url** parameters are ignored.

**fix.external.refs.com.oxygenxml** (Only supported when the DITA OT transformation process is started from Oxygen XML Author)

The DITA Open Toolkit usually has problems processing references that point to locations outside of the directory of the processed DITA map. This parameter is used to specify whether or not the application should try to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content. Allowed values: `true` or `false` (default).

**force.unique**

When set to `true` (default value), the transformation will be forced to create unique output files for each instance of a resource when a map contains multiple references to a single topic.

**use.stemming**

Controls whether or not you want to include stemming search algorithms into the published output (default setting is `false`).

**webhelp.custom.resources**

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

**webhelp.favicon**

The file path that points to an image to be used as a *favicon* in the WebHelp output.

**webhelp.reload.stylesheet**
Set this parameter to true if you have out of memory problems when generating WebHelp. It will increase processing time but decrease the memory footprint. The default value is false.

**webhelp.search.custom.excludes.file**

The path of the file that contains name patterns for HTML files that should not be indexed by the WebHelp search engine. Each exclude pattern must be on a new line. The patterns are considered to be relative to the output directory, and they accept wildcards such as ‘*’ (matches zero or more characters) or ‘?’ (matches one character). For more information about the patterns, see https://ant.apache.org/manual/dirtasks.html#patterns.

**webhelp.search.japanese.dictionary**

The file path of the dictionary that will be used by the Kuromoji morphological engine for indexing Japanese content in the WebHelp pages. The encoding for the dictionary must be UTF8.

**webhelp.search.enable.pagination**

Specifies whether or not search results will be displayed on multiple pages. Allowed values are yes or no.

**webhelp.search.page.numberOfItems**

Specifies the number of search results items displayed on each page. This parameter is only used when the webhelp.search.enable.pagination parameter is enabled.

**webhelp.search.ranking**

If this parameter is set to false then the 5-star rating mechanism is no longer included in the search results that are displayed on the Search tab (default setting is true).

**webhelp.show.changes.and.comments**

When set to yes, user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is no.

**webhelp.sitemap.base.url**

Base URL for all the loc elements in the generated sitemap.xml file. The value of a loc element is computed as the relative file path from the href attribute of a topicref element from the DITA map, appended to this base URL value. The loc element is mandatory in sitemap.xml. If you leave this parameter set to its default empty value, then the sitemap.xml file is not generated.

**webhelp.sitemap.change.frequency**

The value of the changefreq element in the generated sitemap.xml file. The changefreq element is optional in sitemap.xml. If you leave this parameter set to its default empty value, then the changefreq element is not added in sitemap.xml.
Allowed values: <empty string> (default), always, hourly, daily, weekly, monthly, yearly, never.

**webhelp.sitemap.priority**

The value of the `priority` element in the generated `sitemap.xml` file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The `priority` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `priority` element is not added in `sitemap.xml`.

**Parameters Specific to WebHelp Responsive Output**

**webhelp.default.collection.type.sequence**

Specifies if the `sequence` value will be used by default when the `collection-type` attribute is not specified. This option is helpful if you want to have Next and Previous navigational buttons generated for all HTML pages. Allowed values are no (default) and yes.

**webhelp.enable.search.autocomplete**

Specifies if the Autocomplete feature is enabled in the WebHelp search text field. The default value is yes.

**webhelp.fragment.after.body**

In the generated output it displays a given XHTML fragment after the page body. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.logo_and_title**

In the generated output it displays a given XHTML fragment after the logo and title. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.main.page.search**

In the generated output it displays a given XHTML fragment after the search field. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.toc_or_tiles**

In the generated output it displays a given XHTML fragment after the table of contents or tiles in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.top_menu**
In the generated output it displays a given XHTML fragment after the top menu. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.body
In the generated output it displays a given XHTML fragment before the page body. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.logo_and_title
In the generated output it displays a given XHTML fragment before the logo and title. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.main.page.search
In the generated output it displays a given XHTML fragment before the search field. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.toc_or_tiles
In the generated output it displays a given XHTML fragment before the table of contents or tiles in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.top_menu
In the generated output it displays a given XHTML fragment before the top menu. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.footer
In the generated output it displays a given XHTML fragment as the page footer. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.head
In the generated output it inserts a given XHTML fragment in the <head> element. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.welcome
In the generated output it displays a given XHTML fragment as a welcome message (or title). The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.
**webhelp.merge.nested.topics.related.links**

Specifies if the related links from nested topics will be merged with the links in the parent topic. Thus the links will be moved from the topic content to the related links component and all of the links from the same group (for example, Related Tasks, Related References, Related Information) are merged into a single group. The default value is yes.

**webhelp.search.stop.words.exclude**

Specifies a list of words that will be excluded from the default list of stop words that are filtered out before the search processing. Use comma separators to specify more than one word (for example: if, for, is).

**webhelp.show.breadcrumb**

Specifies if the breadcrumb component will be presented in the output. The default value is yes.

**webhelp.show.child.links**

Specifies if child links will be generated in the output for all topics that have subtopics. The default value is no.

**webhelp.show.indexterms.link**

Specifies if an icon that links to the index will be presented in the output. The default value is yes.

**webhelp.show.main.page.tiles**

Specifies if the tiles component will be presented in the main page of the output. For a tree style layout, this parameter should be set to no.

**webhelp.show.main.page.toc**

Specifies if the table of contents will be presented in the main page of the output. The default value is yes.

**webhelp.show.navigation.links**

Specifies if navigation links will be presented in the output. The default value is yes.

**webhelp.show.print.link**

Specifies if a print link or icon will be presented within each topic in the output. The default value is yes.

**webhelp.show.related.links**

Specifies if the related links component will be presented in the WebHelp Responsive output. The default value is yes. The `webhelp.merge.nested.topics.related.links` parameter can be used in conjunction with this one to merge the related links from nested topics into the links in the parent topic.
webhelp.show.publication.toc

Specifies if a table of contents will be presented on the left side of each topic in the output. The default value is yes.

webhelp.show.topic.toc

Specifies if a topic table of contents will be presented on the right side of each topic in the output. This table of contents contains links to each `<section>` within the current topic that contains an `@id` attribute and the section corresponding to the current scroll position is highlighted. The default value is yes.

webhelp.show.top.menu

Specifies if a menu will be presented at the topic of the main page in the output. The default value is yes.

webhelp.publication.toc.hide.chunked.topics

Specifies if the table of contents will contain links for chunked topics. The default value is yes.

webhelp.publication.toc.links

Specifies which links will be included in the table of contents. The possible values are:

- chapter (default) - The TOC will include links for the current topic, its children, its siblings, and its direct ancestor (including the direct ancestor's siblings), and the parent chapter.
- topic - The TOC will only include links for the current topic and its direct children.
- all - The TOC will include all links.

webhelp.publication.toc.tooltip.position

By default, if a topic contains a `shortdesc` element, its content is displayed in a tooltip when the user hovers over its link in the table of contents. This parameter controls whether or not this tooltip is displayed and its position relative to the link. The possible values are:

- left (default)
- right
- top
- bottom
- hidden - The tooltip will not be displayed.

webhelp.top.menu.depth

Specifies the maximum depth level of the topics that will be included in the top menu. The default value is 3. A value of 0 means that the menu has unlimited depth.
webhelp.topic.collapsible.elements.initial.state

Specifies the initial state of collapsible elements (tables with titles, nested topics with titles, sections with titles, index term groups). The possible values are collapsed or expanded (default value).

DITA Map to WebHelp Classic Transformation

DITA content can be transformed into several types of WebHelp Classic systems (with or without a feedback section). The WebHelp Classic layout and features (on page 1389) are designed for desktop systems and include a familiar classical style. Oxygen XML Author also provides numerous possibilities for customizing the WebHelp Classic output (on page 1422).

WebHelp Classic Transformation Scenario

To publish a DITA map (on page 2793) as a WebHelp Classic system, follow these steps:

1. Select the Configure Transformation Scenario(s) action from the DITA Maps Manager (on page 2503) toolbar.
2. Select the DITA Map WebHelp Classic scenario from the DITA Map section.
3. If you want to configure the transformation, click the Edit button.

Step Result: This opens an Edit scenario configuration dialog box that allows you to configure various options in the following tabs:

- Skins Tab (on page 2709) - This tab contains a set of built-in skins that you can use for the layout of your WebHelp system output.
- Parameters Tab (on page 2717) - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the Parameters section (on page 1272) below for details about the most commonly used parameters for WebHelp Responsive transformations.
- Filters Tab (on page 2719) - This tab allows you to filter certain content elements from the generated output.
- Advanced Tab (on page 2720) - This tab allows you to specify some advanced options for the transformation scenario.
4. Click **Apply associated** to process the transformation.

When the DITA Map WebHelp Classic transformation is complete, the output is automatically opened in your default browser.

**WebHelp Classic with Feedback Transformation Scenario**

To publish a DITA map (on page 2793) as a WebHelp Classic with Feedback system, follow these steps:

1. Select the **Configure Transformation Scenario(s)** action from the DITA Maps Manager (on page 2503) toolbar.
2. Select the DITA Map WebHelp Classic with Feedback scenario from the DITA Map section.
3. If you want to configure the transformation, click the **Edit** button.

**Step Result:** This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:

- **Skins Tab (on page 2709)** - This tab contains a set of built-in skins that you can use for the layout of your WebHelp system output.
- **Parameters Tab (on page 2717)** - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the **Parameters section (on page 1272)** below for details about the most commonly used parameters for WebHelp Responsive transformations.
- **Filters Tab (on page 2719)** - This tab allows you to filter certain content elements from the generated output.
- **Advanced Tab (on page 2720)** - This tab allows you to specify some advanced options for the transformation scenario.
- **Output Tab (on page 2722)** - This tab allows you to configure options that are related to the location where the output is generated.

4. Click **Apply associated** to begin the transformation.

5. Enter the documentation product ID (value for the webhelp.product.id parameter) and the documentation version (value for the webhelp.product.version parameter).

When the DITA Map WebHelp Classic with Feedback transformation is complete, your default browser opens the installation.html file. This file contains information about the output location, system requirements, installation instructions, and deployment of the output. Follow the instructions to complete the system deployment (on page 1489).

For more information about the feedback-enabled WebHelp system, watch our video demonstration:
Parameters for Customizing WebHelp Classic Output

To customize a transformation scenario, you can edit various parameters, including the following most commonly used ones:

**default.language**

This parameter is used if the language is not detected in the DITA map. The default value is en-us.

**clean.output**

Deletes all files from the output folder before the transformation is performed (only no and yes values are valid and the default value is no).

**fix.external.refs.com.oxygenxml** (Only supported when the DITA OT transformation process is started from Oxygen XML Author)

The DITA Open Toolkit usually has problems processing references that point to locations outside of the directory of the processed DITA map. This parameter is used to specify whether or not the application should try to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content. Allowed values: true or false (default).

**force.unique**

When set to true (default value), the transformation will be forced to create unique output files for each instance of a resource when a map contains multiple references to a single topic.

**use.stemming**

Controls whether or not you want to include stemming search algorithms into the published output (default setting is false).

**webhelp.body.script**

URL value that specifies the location of a well-formed XHTML file containing the custom script that will be copied in the <body> section of every WebHelp page.

**webhelp.copyright**

Adds a small copyright text that appears at the end of the Table of Contents pane.

**webhelp.custom.resources**

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

**webhelp.favicon**
The file path that points to an image to be used as a favicon in the WebHelp output.

**webhelp.footer.file**

Path to an XML file that includes the footer content for your WebHelp output pages. You can use this parameter to integrate social media features (such as widgets for Facebook™, Twitter™, Google Analytics, or Google+™). The file must be well-formed, each widget must be in separate `div` or `span` element, and the code for each `script` element is included in an XML comment (also, the start and end tags for the XML comment must be on a separate line). The following code exert is an example for adding a Facebook™ widget:

```xml
<div id="facebook">
  <div id="fb-root"></div>
  <script>
    <!-- (function(d, s, id) {
      var js, fjs = d.getElementsByTagName(s)[0];
      if (d.getElementById(id)) return;
      js = d.createElement(s); js.id = id;
      js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
      fjs.parentNode.insertBefore(js, fjs);
    })
    (document, 'script', 'facebook-jssdk'); -->
  </script>
  <div data-share="true" data-show-faces="true" data-action="like"
       data-layout="standard" class="fb-like"/>
</div>
```

**webhelp.footer.include**

Specifies whether or not to include footer in each WebHelp page. Possible values: `yes`, `no`. If set to `no`, no footer is added to the WebHelp pages. If set to `yes` and the `webhelp.footer.file` parameter has a value, then the content of that file is used as footer. If the `webhelp.footer.file` has no value then a default Oxygen footer is inserted in each WebHelp page.

**webhelp.google.search.results**

A file path that specifies the location of a well-formed XHTML file containing the Google Custom Search Engine element `gcse:searchresults-only`. You can use all supported attributes for this element. It is recommend to set the `linkTarget` attribute to `frm` for frameless (iframe) version of WebHelp or to `contentWin` for the frameset version of WebHelp. The default value for this attribute is `_blank` and the search results will be loaded in a new window. If this parameter is not specified, the following code will be used:

```xml
<gcse:searchresults-only linkTarget="frm"></gcse:searchresults-only>
```

**webhelp.google.search.script**
A file path that specifies the location of a well-formed XHTML file containing the Custom Search Engine script from Google.

**webhelp.head.script**

URL value that specifies the location of a well-formed XHTML file containing the custom script that will be copied in the `<head>` section of every WebHelp page.

**webhelp.logo.image.target.url**

Specifies a target URL that is set on the logo image. When you click the logo image, you will be redirected to this address.

**webhelp.logo.image**

Specifies a path to an image displayed as a logo in the left side of the output header.

**webhelp.reload.stylesheet**

Set this parameter to `true` if you have out of memory problems when generating WebHelp. It will increase processing time but decrease the memory footprint. The default value is `false`.

**webhelp.search.custom.excludes.file**

The path of the file that contains name patterns for HTML files that should not be indexed by the WebHelp search engine. Each exclude pattern must be on a new line. The patterns are considered to be relative to the output directory, and they accept wildcards such as `*` (matches zero or more characters) or `?` (matches one character). For more information about the patterns, see [https://ant.apache.org/manual/dirtasks.html#patterns](https://ant.apache.org/manual/dirtasks.html#patterns).

**webhelp.search.japanese.dictionary**

The file path of the dictionary that will be used by the Kuromoji morphological engine for indexing Japanese content in the WebHelp pages. The encoding for the dictionary must be `UTF8`.

**webhelp.search.ranking**

If this parameter is set to `false` then the 5-star rating mechanism is no longer included in the search results that are displayed on the Search tab (default setting is `true`).

**webhelp.show.changes.and.comments**

When set to `yes`, user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is `no`.

**webhelp.sitemap.base.url**

Base URL for all the `loc` elements in the generated `sitemap.xml` file. The value of a `loc` element is computed as the relative file path from the `href` attribute of a `topicref` element from the `DITA map`, appended to this base URL value. The `loc`
element is mandatory in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `sitemap.xml` file is not generated.

**webhelp.sitemap.change.frequency**

The value of the `changefreq` element in the generated `sitemap.xml` file. The `changefreq` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `changefreq` element is not added in `sitemap.xml`. Allowed values: `<empty string>` (default), `always`, `hourly`, `daily`, `weekly`, `monthly`, `yearly`, `never`.

**webhelp.sitemap.priority**

The value of the `priority` element in the generated `sitemap.xml` file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The `priority` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `priority` element is not added in `sitemap.xml`.

### DITA Map to PDF - based on HTML5 and CSS Transformation

Oxygen XML Author includes a built-in DITA Map PDF - based on HTML5 & CSS transformation scenario based on a DITA-OT CSS-based PDF Publishing plugin that converts DITA maps to PDF using a CSS-based processing engine and an HTML5 intermediate format. Oxygen XML Author comes bundled with a built-in CSS-based PDF processing engine called Oxygen PDF Chemistry. Oxygen XML Author also supports some third-party processors.

For those who are familiar with CSS, this makes it very easy to style and customize the PDF output of your DITA projects without having to work with `xsl:fo` customizations. This transformation also includes some built-in publishing templates that you can use for the layout of your PDF output and you can create your own templates or edit existing ones.

The following CSS-based PDF processors can be used:

- **Oxygen PDF Chemistry** - A built-in processor that is bundled with Oxygen XML Author. For more information, see the Oxygen PDF Chemistry User Guide. This is the supported processor.
• **Prince Print with CSS** (not included in the Oxygen XML Author installation kit) - A third-party component that needs to be purchased from http://www.princexml.com.

• **Antenna House Formatter** (not included in the Oxygen XML Author installation kit) - A third-party component that needs to be purchased from http://www.antennahouse.com/antenna1/formatter/.

### How to Create the Transformation Scenario

To create a DITA Map PDF - based on HTML5 & CSS transformation scenario, follow these steps:

1. Click the Configure Transformation Scenario(s) button from the DITA Maps Manager (on page 2503) toolbar.
2. Select DITA Map PDF - based on HTML5 & CSS.
3. If you want to configure the transformation, click the Edit button.

**Step Result:** This opens an Edit scenario configuration dialog box that allows you to configure various options in the following tabs:

- **Templates Tab (on page 2711)** - This tab contains a set of built-in publishing templates that you can use for the layout of your WebHelp system output. You can also create your own publishing templates by saving one from the gallery and changing it.

- **CSS Processor Tab** - This is where you choose the processor type. You can select between Oxygen PDF Chemistry, Prince XML, or Antenna House.

- **Parameters Tab (on page 2717)** - This tab includes numerous parameters that can be set to customize your WebHelp system output.

- **Filters Tab (on page 2719)** - This tab allows you to filter certain content elements from the generated output.

- **Advanced Tab (on page 2720)** - This tab allows you to specify some advanced options for the transformation scenario.

- **Output Tab (on page 2722)** - This tab allows you to configure options that are related to the location where the output is generated.

4. In the **Parameters** tab, configure any of the following parameters (if applicable):

- **args.css** - Specifies a path to a custom CSS to be used in addition to those specified in the publishing template. The files must have URL syntax and be separated using semicolons. Also, the dita.css.list parameter must be left empty to use these files in addition to the selection in the Styles drop-down menu.

- **css.processor.path.chemistry** (if you are using the Oxygen PDF Chemistry processor) - Specifies the path to the Oxygen PDF Chemistry executable file that will be run to generate the PDF. If this parameter is not set, the transformation will use the processor specified in the CSS-based Processors preferences page (on page 210).
• **css.processor.path.prince** (if you are using the Prince Print with CSS processor) - Specifies the path to the Prince executable file that will be run to produce the PDF. If you installed Prince using its default settings, you can leave this blank.

• **css.processor.path.antenna-house** (if you are using the Antenna House Formatter processor) - Specifies the path to the Antenna House executable file that will be run to produce the PDF. If you installed Antenna House using its default settings, you can leave this blank.

• **show.changes.and.comments** - When set to *yes*, user comments, replies to comments, and tracked changes are published in the PDF output. The default value is *no*.

• **figure.title.placement** - Controls the position of the figure title relative to the image. Allowed values are "top" and "bottom"; "top" is the default.

5. Click **OK** and run the transformation scenario.

### Customizing the Output

For information about customizing the output, see **CSS-based DITA to PDF Customization** *(on page 1629)*.

### Related Information:

- Editing a Transformation Scenario *(on page 1374)*

- Configure Transformation Scenario(s) Dialog Box *(on page 1378)*

- CSS-based DITA to PDF Customization *(on page 1629)*

### DITA Map to PDF - based on DITA and CSS (WYSIWYG) (Deprecated)

⚠ **Attention:** This transformation scenario was deprecated starting with version 21.0. If you have configured scenarios associated to your project based on this transformation scenario, you will still be able to use them, but for new transformations, it is recommended to use the **DITA Map PDF - based on HTML5 & CSS** transformation scenario *(on page 1275)* instead.

Oxygen XML Author includes a built-in **DITA Map to PDF - based on DITA & CSS (WYSIWYG)** transformation scenario based on a **DITA-OT CSS-based PDF Publishing plugin** that convert DITA maps to PDF using a CSS-based processing engine. Oxygen XML Author also comes bundled with a built-in CSS-based PDF processing engine called **Oxygen PDF Chemistry**. For those who are familiar
with CSS, this makes it very easy to style and customize the PDF output of your DITA projects without having to work with \texttt{xsl:fo} customizations. Oxygen XML Author also supports some third-party processors.

The following processors are supported:

- **Oxygen PDF Chemistry** - A built-in processor that is bundled with Oxygen XML Author. For more information, see the Oxygen PDF Chemistry User Guide.
- **Prince XML** (not included in the Oxygen XML Author installation kit) - A third-party component that needs to be purchased from \url{http://www.princexml.com}.
- **Antenna House Formatter** (not included in the Oxygen XML Author installation kit) - A third-party component that needs to be purchased from \url{http://www.antennahouse.com/antenna1/formatter}.

**DITA Map to PDF - based on DITA and CSS (WYSIWYG) Transformation Scenario**

To create a DITA Map to PDF - based on DITA & CSS (WYSIWYG) transformation scenario, follow these steps:

1. Click the \faStripChart \ Configure Transformation Scenario(s) button from the DITA Maps Manager (on page 2503) toolbar.
2. Select DITA Map to PDF - based on DITA & CSS (WYSIWYG).
3. If you want to configure the transformation, click the Edit button.

**Step Result:** This opens an Edit scenario configuration dialog box that allows you to configure various options in the following tabs:

- **CSS Processor Tab** - This is where you choose the processor type. You can select between Oxygen PDF Chemistry, Prince XML, or Antenna House.
- **Parameters Tab** (on page 2717) - This tab includes numerous parameters that can be set to customize your WebHelp system output.
- **Filters Tab** (on page 2719) - This tab allows you to filter certain content elements from the generated output.
- **Advanced Tab** (on page 2720) - This tab allows you to specify some advanced options for the transformation scenario.
- **Output Tab** (on page 2722) - This tab allows you to configure options that are related to the location where the output is generated.

4. In the Parameters tab, configure any of the following parameters (if applicable):
   - **args.css** - Specifies a path to a custom CSS (on page 1657) to be used in addition to those specified in the \texttt{dita.css.list} parameter OR in addition to the CSS that is currently selected in the Styles drop-down menu. The files must have URL syntax and be separated
using semicolons. Also, the dita.css.list parameter must be left empty to use these files in addition to the selection in the Styles drop-down menu.

- **dita.css.list** - Specifies a list of CSS URLs to be used by the PDF processor (instead of the default CSS files). The files must have URL syntax and be separated using semicolons. If the value is empty, the CSS associated with the current selection from the Styles drop-down menu is used.

- **css.processor.path.chemistry** (if you are using the Oxygen PDF Chemistry processor) - Specifies the path to the Oxygen PDF Chemistry executable file that will be run to generate the PDF. If this parameter is not set, the transformation will use the processor specified in the CSS-based Processors preferences page (on page 210).

- **css.processor.path.prince** (if you are using the Prince Print with CSS processor) - Specifies the path to the Prince executable file that will be run to produce the PDF. If you installed Prince using its default settings, you can leave this blank.

- **css.processor.path.antenna-house** (if you are using the Antenna House Formatter processor) - Specifies the path to the Antenna House executable file that will be run to produce the PDF. If you installed Antenna House using its default settings, you can leave this blank.

- **show.changes.and.comments** - When set to yes, user comments, replies to comments, and tracked changes are published in the PDF output. The default value is no.

- **figure.title.placement** - Controls the position of the figure title relative to the image. Allowed values are "top" and "bottom", "top" is the default.

5. Click OK and run the transformation scenario.

**Customizing the Output**

The DITA-OT CSS-based PDF Publishing plugin makes it very easy to style and customize the PDF output of your DITA projects without having to work with xsl:fo customizations. You can style the PDF output by simply using a custom CSS to change the styling and then re-running the transformation scenario until you get the desired result.

For more information about customizing the output, see: CSS-based DITA to PDF Customization (on page 1629).

**Changing the Style of an Element**

To change the style of a particular element, you need to create an additional CSS file that will store the customization rules. Once you have created this file, you need to instruct the editor how to use this additional CSS. This can be done in two ways:

- Specify the path to your custom CSS using the args.css parameter:
  1. Edit a DITA Map to PDF - based on DITA & CSS (WYSIWYG) transformation scenario.
2. In the **Parameters** tab, specify the path to your custom CSS files in the `args.css` parameter.

3. Click **OK** and run the transformation scenario.

This method is appropriate if you just want to apply the styling customization to the output.

• Create an alternate CSS for the DITA document type:
  1. Follow the procedure for adding an alternate CSS file in [Customizing Author Mode Using CSS Files Associated with a Framework](#).
  2. Once you have configured your CSS as an additional layer, you can select it from the **Styles** drop-down menu (on the toolbar) (**on page 1919**).
  3. Run the **DITA Map to PDF - based on DITA & CSS (WYSIWYG)** transformation scenario and the customization rules from the additional CSS will be visible in the produced PDF.

This method allows you to have many customization CSS files and simply select the one that you need at any time for both the output and the rendering in **Author** mode.

**DITA Map to PDF - based on XSL-FO Transformation**

Oxygen XML Author comes bundled with the DITA Open Toolkit that provides a mechanism for converting **DITA maps (on page 2793)** to PDF output.

**Creating a DITA Map to PDF - based on XSL-FO Transformation Scenario**

To create a **DITA Map to PDF - based on XSL-FO** transformation scenario, follow these steps:
1. Click the \textcolor[RGB]{red}{Configure Transformation Scenario(s)} button from the \textcolor[RGB]{blue}{DITA Maps Manager (on page 2503)} toolbar.

2. Select \textcolor[RGB]{blue}{DITA Map PDF - based on XSL-FO} and click the \textcolor[RGB]{green}{Edit} button (or use the \textcolor[RGB]{purple}{Duplicate} button if your \textcolor[RGB]{blue}{framework (on page 2794)} is read-only).

3. Use the various tabs to configure the transformation scenario. In the \textcolor[RGB]{blue}{Parameters} tab, you can use a variety of parameters to customize the output. For example, the following parameters are just a few of the most commonly used ones:
   - \textcolor[RGB]{blue}{show.changes.and.comments} - If set to \textcolor[RGB]{blue}{yes}, user comments, replies to comments, and \textcolor[RGB]{blue}{tracked changes} are published in the PDF output.
   - \textcolor[RGB]{blue}{customization.dir} - Specifies the path to a customization directory.
   - \textcolor[RGB]{blue}{editlink.remote.ditamap.url} - When this parameter is set to “true”, the DITA topic path is displayed to the right of each topic title in the PDF output.

4. Click \textcolor[RGB]{green}{OK} and then the \textcolor[RGB]{green}{Apply Associated} button to run the transformation scenario.

**Related Information:**
- \textcolor[RGB]{blue}{XSL FO-based DITA to PDF Customization (on page 1783)}

**DITA Map to MS Office Word Transformation**

Oxygen XML Author comes bundled with a transformation scenario that allows you to convert \textcolor[RGB]{blue}{DITA maps (on page 2793)} to Microsoft Office Word documents. It utilizes the \textcolor[RGB]{blue}{DITA to Word plugin created by Jarno Elovirta}. This \textcolor[RGB]{blue}{plugin} contains a Word document named \textcolor[RGB]{blue}{Normal.docx} (located in: \textcolor[RGB]{blue}{[OXYGEN_INSTALL_DIR]/frameworks/dita/DITA-OT3.x/plugins/com.elovirta.ooxml/resources}) that is used by the transformation scenario as a template to generate the final Word document.

\textcolor[RGB]{blue}{Tip:} You can make general modifications to the \textcolor[RGB]{blue}{Normal.docx} template file to alter the published output.

**Configuring the Transformation Scenario**

To configure an \textcolor[RGB]{blue}{DITA Map to MS Office Word} transformation scenario, follow these steps:

1. Open the DITA map in the \textcolor[RGB]{blue}{DITA Maps Manager (on page 2503)}.

2. Click the \textcolor[RGB]{red}{Configure Transformation Scenario(s)} button from the \textcolor[RGB]{blue}{DITA Maps Manager (on page 2503)} toolbar.

3. Select \textcolor[RGB]{blue}{DITA Map MS Office Word}. 
4. For advanced customizations, in the **Parameters** tab you can use any of the following parameters that are unique to this transformation scenario to specify paths to files that affect the output in various ways:

- **dotx.file** - Specifies the path to a Word template file (.docx) that will be used in the transformation to generate the final Word document. Set this parameter if you want to use a different template file other than the **Normal.docx** file that is used by default.
- **document.flat.xsl** - Specifies the path to a pre-process clean-up stylesheet.
- **core.xsl** - Specifies the path to a core metadata stylesheet.
- **custom.xsl** - Specifies the path to a custom metadata stylesheet.
- **document.xsl** - Specifies the path to a main document stylesheet.
- **comments.xsl** - Specifies the path to a comments stylesheet.
- **numbering.xsl** - Specifies the path to a list and title numbering stylesheet.
- **footnotes.xsl** - Specifies the path to a footnote stylesheet.
- **document.xml.xsl** - Specifies the path to a document relations metadata stylesheet.
- **inkscape.exec** - Specifies the path to an Inkscape (open-source vector graphics editor) executable file.

5. Click **OK** and run the transformation scenario.

**Result:** The result of the transformation will automatically be opened in your system's default word processing application (such as Microsoft Word).

**DITA Map to CHM (Compiled HTML Help) Transformation**

To perform a *Compiled HTML Help (CHM)* transformation, Oxygen XML Author needs [Microsoft HTML Help Workshop](https://www.microsoft.com) to be installed on your computer. Oxygen XML Author automatically detects [HTML Help Workshop](https://www.microsoft.com) and uses it.

**Note:** [HTML Help Workshop](https://www.microsoft.com) might fail if the files used for transformation contain accents in their names, due to different encodings used when writing the `.hhp` and `.hcc` files. If the transformation fails to produce the CHM output but the `.hhp` (HTML Help Project) file is already generated, you can manually try to build the CHM output using [HTML Help Workshop](https://www.microsoft.com).
Changing the Output Encoding

Oxygen XML Author uses the `htmlhelp.locale` parameter to correctly display specific characters of different languages in the output of the Compiled HTML Help (CHM) transformation. By default, the DITA Map CHM transformation scenario that comes bundled with Oxygen XML Author has the `htmlhelp.locale` parameter set to `en-US`.

To customize this parameter, follow this procedure:

1. Use the Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on OS X)) action from the toolbar or the Document > Transformation menu.
2. Select the DITA Map CHM transformation scenario and click the Edit button.
3. In the Parameter tab, search for the `htmlhelp.locale` parameter and change its value to the desired language tag.

Note: The format of the `htmlhelp.locale` parameter is `LL-CC`, where `LL` represents the language code (`en`, for example) and `CC` represents the country code (`us`, for example). The language codes are contained in the ISO 639-1 standard and the country codes are contained in the ISO 3166-1 standard. For further details about language tags, go to [http://www.rfc-editor.org/rfc/rfc5646.txt](http://www.rfc-editor.org/rfc/rfc5646.txt).

DITA Map to Kindle Transformation

Oxygen XML Author requires KindleGen to generate Kindle output from DITA maps (on page 2793). To install KindleGen for use by Oxygen XML Author, follow these steps:

1. Go to [www.amazon.com/kindleformat/kindlegen](http://www.amazon.com/kindleformat/kindlegen) and download the zip file that matches your operating system.
2. Unzip the file on your local disk.
3. Start Oxygen XML Author and open a DITA map in the DITA Maps Manager view (on page 2503).
4. Click the Configure Transformation Scenario(s) button.
5. Select the DITA Map Kindle transformation and press the Edit button to edit it.
6. Go to Parameters tab and set the `kindlegen.executable` parameter as the path to the KindleGen directory.
7. Accept the changes.

Run DITA OT Integrator Transformation

Oxygen XML Author comes bundled with a transformation scenario designed to integrate DITA-OT plugins (on page 2797). These DITA-OT plugins are used for various customizations. It is called
Run DITA-OT Integrator and is found in the DITA Map section of the Configure Transformation Scenario(s) dialog box (on page 1378).

⚠️ Attention: The integration will be performed on the DITA-OT version specified in the DITA Open Toolkit section of the DITA preferences page (on page 214).

Running the Transformation Scenario

To integrate a DITA OT plugin, follow these steps:

1. If Oxygen XML Author was installed in the default location, you may need to restart and run it as an administrator.
2. Select the Apply Transformation Scenario(s) or Configure Transformation Scenario(s) (on page 1378) action from the DITA Maps Manager toolbar (you could also use the same action on the main toolbar or open the Transformation Scenarios view (on page 1384)).
3. Select the Run DITA-OT Integrator transformation scenario. If the integrator is not visible, select the Show all scenarios action that is available in the Settings drop-down menu.
4. Apply the scenario (on page 1377).
5. Check the Results panel at the bottom of the application to make sure the build was successful.
6. Restart Oxygen XML Author with your normal permissions.

Solving DITA Transformation Errors

If a DITA transformation results in errors or warnings, the information is displayed in the message panel at the bottom of the editor. The information includes the severity, description of the problem, the name of the resource, and the path of the resource.

To help prevent and solve DITA transformation problems, follow these steps:
1. **Validate the DITA map (on page 2549)** by using the Validate and Check for Completeness action that is available on the DITA Maps Manager (on page 2503) toolbar and in the DITA Maps menu.

2. If this action results in validation errors, solve them prior to executing the transformation. Also, you should pay attention to the warning messages because they may identify problems in the transformation.

3. **Run the DITA transformation scenario (on page 1319).**

4. If the transformation results in errors or warnings, they are displayed in the Results panel (on page 343) at the bottom of the editor. The following information is presented to help you troubleshoot the problems:
   - **Severity** - The first column displays the following icons that indicate the severity of the problem:
     - Informational - The transformation encountered a condition of which you should be aware.
     - Warning - The transformation encountered a problem that should be corrected.
     - Error - The transformation encountered a more severe problem, and the output is affected or cannot be generated.

   - **Info** - You can click the See More icon to open a web page that contains details about DITA-OT error messages.

   - **Description** - A description of the problem.

   - **Resource** - The name of the transformation resource.

   - **System ID** - The path of the transformation resource.

5. Use this information or other resources from the online DITA-OT community to solve the transformation problems before re-executing the transformation scenario.

6. If you need to contact the Oxygen technical support team, they will need you to send the entire transformation scenario execution log. To obtain it:
   a. Go to the Options > Preferences > DITA preferences page and set the Show console output option to Always.
   b. Execute the transformation scenario again. The console output messages are displayed in the DITA OT view.
   c. Copy the entire log, save it in a text file, then send it to the Oxygen technical support team.
   d. After your issue has been solved, go back to the Options > Preferences > DITA preferences page and set the Show console output option to When build fails.

**Related Information:**

DocBook Transformation Scenarios

Built-in transformation scenarios allow you to transform DocBook documents to a variety of outputs, such as WebHelp, PDF, HTML, HTML Chunk, XHTML, XHTML Chunk, and EPUB. Oxygen XML Author also includes a DocBook 5.1 transformation scenario for Assembly documents. All of them are listed in the DocBook 4 and DocBook 5 sections in the Configure Transformation Scenario(s) dialog box (on page 1378).

Related Information:

DocBook to WebHelp Classic Transformation

DocBook documents can be transformed into several types of WebHelp systems (with or without a feedback section). The WebHelp Classic layout and features (on page 1389) are designed for desktop systems and include a familiar classical style. Oxygen XML Author also provides numerous possibilities for customizing the WebHelp Classic output (on page 1422).

WebHelp Classic Transformation Scenario

To publish a DocBook document as a WebHelp Classic system, follow these steps:

1. Click the Configure Transformation Scenario(s) action from the toolbar (or the Document > Transformation menu).
2. Select the DocBook WebHelp Classic scenario from the DocBook 4 or DocBook 5 section.
3. Click Apply associated.

When the DocBook WebHelp Classic transformation is complete, the output is automatically opened in your default browser.

WebHelp Classic with Feedback Transformation Scenario

To publish a DocBook document as a WebHelp Classic with Feedback system, follow these steps:

1. Click Configure Transformation Scenarios.
2. Select the **DocBook WebHelp Classic with Feedback** scenario from the **DocBook 4** or **DocBook 5** section.

3. Click **Apply associated**.

4. Enter the documentation product ID and the documentation version.

When the **DocBook WebHelp Classic with Feedback** transformation is complete, your default browser opens the installation.html file. This file contains information about the output location, system requirements, installation instructions, and deployment of the output. Follow the instructions to complete the system deployment. For more information, see Deploying a Feedback-Enabled System (on page 1489).

For more information about the feedback-enabled WebHelp system, watch our video demonstration:

[https://www.youtube.com/embed/eoQ2uxHvppE](https://www.youtube.com/embed/eoQ2uxHvppE)

**Customizing DocBook WebHelp Transformation Scenarios**

To customize a DocBook WebHelp transformation scenario, you can edit various parameters, including the following most commonly used ones:

- **default.language**
  This parameter is used if the language is not detected in the DITA map. The default value is `en-us`.

- **clean.output**
  Deletes all files from the output folder before the transformation is performed (only no and yes values are valid and the default value is no).

- **l10n.gentext.default.language**
  This parameter is used to identify the correct stemmer that differs from language to language. For example, for English the value of this parameter is `en` or for French it is `fr`, and so on.

- **use.stemming**
  Controls whether or not you want to include stemming search algorithms into the published output (default setting is false).

- **webhelp.copyright**
  Adds a small copyright text that appears at the end of the Table of Contents pane.

- **webhelp.custom.resources**
  The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.
webhelp.favicon

The file path that points to an image to be used as a favicon in the WebHelp output.

webhelp.footer.file

Path to an XML file that includes the footer content for your WebHelp output pages. You can use this parameter to integrate social media features (such as widgets for Facebook™, Twitter™, Google Analytics, or Google+™). The file must be well-formed, each widget must be in separate div or span element, and the code for each script element is included in an XML comment (also, the start and end tags for the XML comment must be on a separate line). The following code excerpt is an example for adding a Facebook™ widget:

```html
<div id="facebook">
  <div id="fb-root"/>
  <script>
    <!-- (function(d, s, id) {
      var js, fjs = d.getElementsByTagName(s)[0];
      if (d.getElementById(id)) return;
      js = d.createElement(s); js.id = id;
      js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
      fjs.parentNode.insertBefore(js, fjs); 
      (document, 'script', 'facebook-jssdk')); -->
    </script>
  <div data-share="true" data-show-faces="true" data-action="like"
    data-layout="standard" class="fb-like"/>
  </div>
</div>
```

webhelp.footer.include

Specifies whether or not to include footer in each WebHelp page. Possible values: yes, no. If set to no, no footer is added to the WebHelp pages. If set to yes and the webhelp.footer.file parameter has a value, then the content of that file is used as footer. If the webhelp.footer.file has no value then a default Oxygen footer is inserted in each WebHelp page.

webhelp.logo.image.target.url

Specifies a target URL that is set on the logo image. When you click the logo image, you will be redirected to this address.

webhelp.logo.image

Specifies a path to an image displayed as a logo in the left side of the output header.

webhelp.product.id (available only for Feedback-enabled systems)
This parameter specifies a short name for the documentation target, or product (for example, mobile-phone-user-guide, hvac-installation-guide).

**Note:** You can deploy documentation for multiple products on the same server.

**Restriction:** The following characters are not allowed in the value of this parameter: `<>\'{}()=;*%+&`

**webhelp.product.version (available only for Feedback-enabled systems)**

Specifies the documentation version number (for example, 1.0, 2.5, etc.). New user comments are bound to this version.

**Note:** Multiple documentation versions can be deployed on the same server.

**Restriction:** The following characters are not allowed in the value of this parameter: `<>\'{}()=;*%+&`

**webhelp.search.ranking**

If this parameter is set to `false` then the 5-star rating mechanism is no longer included in the search results that are displayed on the Search tab (default setting is `true`).

**webhelp.skin.css**

Path to a CSS file that sets the style theme in the WebHelp Classic output. It can be one of the built-in skin CSS from the `OXYGEN_INSTALL_DIR\frameworks\docbook\xsl\com.oxygenxml.webhelp.classic\predefined-skins` directory, or it can be a custom skin CSS generated with the Oxygen Skin Builder web application.

**Related Information:**

- DITA Map to WebHelp Classic Transformation *(on page 1270)*
- Customizing WebHelp Classic Output *(on page 1422)*

**DocBook to DITA Transformation**

Oxygen XML Author includes a built-in transformation scenario that is designed to convert DocBook content to DITA. This transformation scenario is based upon a DITA Open Toolkit plugin that is available at [sourceforge.net](http://sourceforge.net).
To convert a DocBook document to DITA, follow these steps:

1. Use one of the following two methods to begin the transformation process:
   • To apply the transformation scenario to a newly opened file, use the **Apply Transformation Scenario(s)** (Ctrl + Shift + T (Command + Shift + T on OS X)) action from the toolbar or the Document > Transformation menu.
   • To customize the transformation or change the scenario that is associated with the document, use the **Configure Transformation Scenario(s)** (Ctrl + Shift + C (Command + Shift + C on OS X)) action from the toolbar or the Document > Transformation menu.
2. Select the DocBook to DITA transformation scenario in the DocBook 4 or DocBook 5 section.
3. Click the **Apply associated** button to run the transformation.

**Step Result:** The transformation will convert as many of the DocBook elements into equivalent DITA elements as it can recognize in its mapping process. For elements that cannot be mapped, the transformation will insert XML comments so that you can see which elements could not be converted.
4. Adjust the resulting DITA composite to suit your needs. You may have to remove comments, fix validation errors, adjust certain attributes, or split the content into individual topics.

**Related Information:**
- Editing a Transformation Scenario (on page 1374)
- Configure Transformation Scenario(s) Dialog Box (on page 1378)

**DocBook to PDF Transformation**

Oxygen XML Author includes a built-in transformation scenario that is designed to convert DocBook content to PDF.

To convert a DocBook document to PDF, follow these steps:

1. Use one of the following two methods to begin the transformation process:
   • To apply the transformation scenario to a newly opened file, use the **Apply Transformation Scenario(s)** (Ctrl + Shift + T (Command + Shift + T on OS X)) action from the toolbar or the Document > Transformation menu.
   • To customize the transformation or change the scenario that is associated with the document, use the **Configure Transformation Scenario(s)** (Ctrl + Shift + C (Command + Shift + C on OS X)) action from the toolbar or the Document > Transformation menu.
2. Select the DocBook PDF transformation scenario in the DocBook 4 or DocBook 5 section.
3. Click the **Apply associated** button to run the transformation.

For information about customizing the PDF output for DocBook content, see *DocBook to PDF Output Customization (on page 1796)*.

**Related Information:**

- *Editing a Transformation Scenario (on page 1374)*
- *Configure Transformation Scenario(s) Dialog Box (on page 1378)*
- *DocBook to PDF Output Customization (on page 1796)*

---

**DocBook to EPUB Transformation**

Oxygen XML Author includes a built-in transformation scenario that is designed to convert DocBook content to EPUB. The EPUB specification recommends the use of *OpenType* fonts (recognized by their `.otf` file extension) whenever possible. To use a specific font, follow these steps:

1. Declare it in your CSS file, as in the following example:

   ```
   @font-face {
   font-family: "MyFont";
   font-weight: bold;
   font-style: normal;
   src: url(fonts/MyFont.otf);
   }
   ```

2. In the CSS, specify where this font is used. To set it as default for `h1` elements, use the `font-family` rule, as in the following example:

   ```
   h1 {
   font-size: 20pt;
   margin-bottom: 20px;
   font-weight: bold;
   font-family: "MyFont";
   text-align: center;
   }
   ```

3. Open the *Configure Transformation Scenario(s) dialog box (on page 1378)*, select the **DocBook EPUB** transformation scenario in the **DocBook 4 or DocBook 5** section, and click **Edit**.
4. In the Parameters tab, set the `epub.embedded.fonts` parameter to `fonts/MyFont.otf`. If you need to provide more files, use commas to separate their file paths.

   **Note:** The `html.stylesheet` parameter allows you to include a custom CSS in the output EPUB.

5. Run the transformation scenario.

**DocBook PDF (Show Change Tracking and Comments)**

Oxygen XML Author includes a built-in transformation scenario that is designed to show tracked changes and comment in DocBook to PDF output.

To include comments and tracked changes (stored within your DocBook 5 documents) in the PDF output, follow these steps:

1. Click the **Configure Transformation Scenario(s)** button.
2. Select **DocBook PDF (Show Change Tracking and Comments)** in the DocBook 5 section.
3. If you need to configure the transformation, click the **Edit (on page 1374)** or **Duplicate (on page 1376)** button, make your changes to the scenario, and click **OK**.
4. Click the **Apply Associated** button to run the transformation scenario.

   **Result:** Comment threads and tracked changes will now appear in the PDF output. Details about each comment or change will be available in the footer section for each page.

**Creating New Transformation Scenarios**

Defining a transformation scenario is the first step in the process of transforming a document. This section includes information on the types of new scenarios that are available in Oxygen XML Author and how to create each type of transformation.

**XML Transformation with XSLT**

This type of transformation specifies the transformation parameters and location of an XSLT stylesheet that is applied to the edited XML document. This scenario is useful when you develop an XML document and the XSLT document is in its final form.

To create an **XML transformation with XSLT** scenario, use one of the following methods:

- Use the **Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on OS X))** action from the toolbar or the **Document > Transformation** menu. Then click the **New** button and select **XML transformation with XSLT**.
• Go to Window > Show View and select Transformation Scenarios to display this view (on page 1384). Click the ✦ New Scenario drop-down menu button and select XML transformation with XSLT.

Both methods open the New Scenario dialog box.

The upper part of the dialog box allows you to specify the Name of the transformation scenario and the following Storage options:

• Project Options (on page 2798) - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.

• Global Options (on page 2795) - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

XSLT Tab

When you create a new transformation scenario (on page 1292) or edit an existing one (on page 1374), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The XSLT tab contains the following options:

**XML URL**

Specifies the source XML file. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 266) button, or the browsing actions in the Browse drop-down list. You can also use the Open in editor button to open the specified file in the editor panel. This URL is resolved through the catalog resolver.

If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.

**Note:** If the transformer engine is Saxon 9.x and a custom URI resolver is configured in the advanced Saxon preferences page (on page 195), the XML input of the transformation is passed to that URI resolver. If the transformer engine is one of the built-in XSLT 2.0 / 3.0 engines and the name of an initial template (on page 1294) is specified in the scenario, the XML URL field can be empty.

The XML URL field can also be empty if you use external XSLT processors (on page 1307). Otherwise, a value is mandatory in this field.

**XSL URL**
Specifies the source XSL file that the transformation will use. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 266) button, or the browsing actions in the Browse drop-down list. You can also use the Open in editor button to open the specified file in the editor panel. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

Use "xml-stylesheet" declaration

If selected, the scenario applies the stylesheet specified explicitly in the XML document with the xml-stylesheet processing instruction. By default, this option is deselected and the transformation applies the XSLT stylesheet that is specified in the XSL URL field.

Transformer

This drop-down menu presents all the transformation engines available to Oxygen XML Author for performing a transformation. These include the built-in engines and the external engines defined in the Custom Engines preferences page (on page 204). The engine you choose is used as the default transformation engine. Also, if an XSLT or XQuery document does not have an associated validation scenario, this transformation engine is used in the validation process (if it provides validation support).

Advanced options

Allows you to configure the advanced options of the Saxon HE/PE/EE engine (on page 1297) for the current transformation scenario. To configure the same options globally, go to the Saxon-HE/PE/EE preferences page (on page 193). For the current transformation scenario, these Advanced options override the options configured in that preferences page.

Parameters

Opens a Configure parameters dialog box (on page 1295) that allows you to configure the XSLT parameters used in the current transformation. In this dialog box, you can also configure the parameters for additional XSLT stylesheets (on page 1294). If the XSLT transformation engine is custom-defined, you can not use this dialog box to configure the parameters sent to the custom engine. Instead, you can copy all parameters from the dialog box using contextual menu actions and edit the custom XSLT engine to include the necessary parameters in the command line that starts the transformation process.

Extensions

Opens a dialog box for configuring the XSLT extension JARS or classes (on page 1296) that define extension Java functions or extension XSLT elements used in the transformation.

Additional XSLT stylesheets
Opens a dialog box for adding XSLT stylesheets (on page 1296) that are applied on the main stylesheet specified in the XSL URL field. This is useful when a chain of XSLT stylesheets must be applied to the input XML document.

XSLT Parameters

The global parameters of the XSLT stylesheet used in a transformation scenario can be configured by using the Parameters button in the XSLT tab of a new or edited transformation scenario dialog box.

The resulting dialog box includes a table that displays all the parameters of the current XSLT stylesheet, all imported and included stylesheets, and all additional stylesheets (on page 1296), along with their descriptions and current values. You can also add, edit, and remove parameters, and you can use the Filter text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

If the XPath column is selected, the parameter value is evaluated as an XPath expression before starting the XSLT transformation.

Example:

For example, you can use expressions such as:

```
<code>doc('test.xml')//entry
//person[@atr='val']</code>
```

Note:

1. The `doc` function solves the argument relative to the XSL stylesheet location. You can use full paths or editor variables (on page 266) (such as `$cfdu` [current file directory]) to specify other locations: `doc('${cfdu}/test.xml')/*`
2. You cannot use XSLT Functions. Only XPath functions are allowed.

Below the table, the following actions are available for managing the parameters:

**New**

Opens the Add Parameter dialog box that allows you to add a new parameter to the list. An editor variable (on page 266) can be inserted in the text box using the Insert Editor Variables button. If the Evaluate as XPath option is selected, the parameter will be evaluated as an XPath expression.

**Edit**

Opens the Edit Parameter dialog box that allows you to edit the selected parameter. An editor variable (on page 266) can be inserted in the text box using the Insert Editor Variables button.
Variables button. If the Evaluate as XPath option is selected, the parameter will be evaluated as an XPath expression.

Unset

Resets the selected parameter to its default value. Available only for edited parameters with set values.

Delete

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

The bottom panel presents the following:

• The default value of the parameter selected in the table.
• A description of the parameter, if available.
• The system ID of the stylesheet that declares it.

Related Information:

• Editor Variables (on page 266)

XSLT Extensions

The Extensions button opens a dialog box that allows you to specify the JARS (on page 2795) and classes that contain extension functions called from the XSLT file of the current transformation scenario. You can use the Add, Edit, and Remove buttons to configure the extensions.

Tip: You can specify the path to the resources using wildcards (for example, ${oxygenHome}/lib/*.jar).

An extension function called from the XSLT file of the current transformation scenario will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item to be moved and press the Move up or Move down buttons.

Additional XSLT Stylesheets

Use the Additional XSLT Stylesheets button in the XSLT tab to display a list of additional XSLT stylesheets to be used in the transformation and you can add files to the list or edit existing entries. The following actions are available:

Add
Adds a stylesheet in the **Additional XSLT stylesheets** list using a file browser dialog box. You can type an [editor variable](on page 266) in the file name field of the browser dialog box. The name of the stylesheet will be added in the list after the current selection.

**Remove**

Deletes the selected stylesheet from the **Additional XSLT stylesheets** list.

**Open**

Opens the selected stylesheet in a separate view.

**Up**

Moves the selected stylesheet up in the list.

**Down**

Moves the selected stylesheet down in the list.

**Advanced Saxon HE/PE/EE XSLT Transformation Options**

The XSLT transformation scenario allows you to configure advanced options that are specific for the Saxon HE (Home Edition), PE (Professional Edition), and EE (Enterprise Edition) engines. They are the same options as those in the [Saxon HE/PE/EE preferences page](on page 193) but they are configured as a specific set of transformation options for each transformation scenario, while the values set in the preferences page apply as global options. The advanced options configured in a transformation scenario override the [global options](on page 2795) defined in the preferences page.

**Saxon-HE/PE/EE Options**

The advanced options for Saxon 9.8.0.12 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE) are as follows:

**Mode ("-im")**

A Saxon-specific option that sets the initial mode for the transformation. If this value is also specified in a [configuration file](on page 1297), the value in this option takes precedence.

**Template ("-it")**

A Saxon-specific option that sets the name of the initial XSLT template to be executed. If this value is also specified in a [configuration file](on page 1297), the value in this option takes precedence.

**Use a configuration file ("-config")**

Select this option if you want to use a Saxon 9.8.0.12 configuration file that will be executed for the XSLT transformation and validation processes. You can specify the
path to the configuration file by entering it in the **URL** field, or by using the 📋 *Insert Editor Variables* button, or using the browsing actions in the **Browse** drop-down list.

**Enable Optimizations ("-opt")**

This option is selected by default, which means that optimization is enabled. If not selected, the optimization is suppressed, which is helpful when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

**Line numbering ("-l")**

Line numbers where errors occur are included in the output messages.

**Expand attributes defaults ("-expand")**

Specifies whether or not the attributes defined in the associated DTD or XML Schema are expanded in the output of the transformation you are executing.

**DTD validation of the source ("-dtd")**

Specifies whether or not the source document will be validated against their associated DTD. You can choose from the following:

- **On** - Requests DTD validation of the source file and of any files read using the `document()` function.
- **Off** - (default setting) Suppresses DTD validation.
- **Recover** - Performs DTD validation but treats the errors as non-fatal.

**Note:** Any external DTD is likely to be read even if not used for validation, since DTDs can contain definitions of entities.

**Recoverable errors ("-warnings")**

Specifies how dynamic errors are handled. The following options can be selected:

- **Recover silently ("silent")** - Continues processing without reporting the error.
- **Recover with warnings ("recover")** - Issues a warning but continues processing.
- **Signal the error and do not attempt recovery ("fatal")** - Issues an error and stops processing.

**Strip whitespaces ("-strip")**

Specifies how the `strip whitespaces` operation is handled. You can choose one of the following values:

- **All ("all")** - Strips all whitespace text nodes from source documents before any further processing, regardless of any `xml:space` attributes in the source document.
- **Ignore** ("ignorable") - Strips all *ignorable* whitespace text nodes from source documents before any further processing, regardless of any *xml:space* attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
- **None** ("none") - Strips no whitespace before further processing.

**Saxon-PE/EE Options**

The following advanced options are specific for Saxon 9.8.0.12 Professional Edition (PE) and Enterprise Edition (EE) only:

**Register Saxon-JS extension functions and instructions**

Registers the Saxon-CE extension functions and instructions when compiling a stylesheet using the Saxon 9.8.0.12 processors.

**Allow calls on extension functions ("-ext")**

If selected, the stylesheet is allowed to call external Java functions. This does not affect calls on integrated extension functions, including Saxon and EXSLT extension functions. This option is useful when loading an untrusted stylesheet (such as from a remote site using `http://[URL]`). It ensures that the stylesheet cannot call arbitrary Java methods and thus gain privileged access to resources on your machine.

**Enable assertions ("-ea")**

In XSLT 3.0, you can use the `xsl:assert` element to make assertions in the form of XPath expressions, causing a dynamic error if the assertion turns out to be false. If this option is selected, XSLT 3.0 `xsl:assert` instructions are enabled. If it is not selected (default), the assertions are ignored.

**Saxon-EE Options**

The advanced options that are specific for Saxon 9.8.0.12 Enterprise Edition (EE) are as follows:

**XML Schema version**

Use this option to change the default XML Schema version for this transformation. To change the default XML Schema version globally, open the Preferences dialog box (Options > Preferences) (on page 79) and go to XML > XML Parser > XML Schema and use the Default XML Schema version option (on page 187).

**Validation of the source file ("-val")**

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:
• **Schema validation** ("strict") - This mode requires an XML Schema and allows for parsing the source documents with strict schema-validation enabled.

• **Lax schema validation** ("lax") - If an XML Schema is provided, this mode allows for parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.

• **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

**Validation errors in the result tree treated as warnings** ("-outval")

Normally, if validation of result documents is requested, a validation error is fatal. Selecting this option causes such validation failures to be treated as warnings.

**Write comments for non-fatal validation errors of the result document**

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

**Enable streaming mode**

Selecting this option will allow an XSLT to run in streaming mode. It is not selected by default.

**Other Options**

**Initializer class**

Equivalent to the `-init` Saxon command-line argument. The value is the name of a user-supplied class that implements the `net.sf.saxon.lib.Initializer` interface. This initializer is called during the initialization process, and may be used to set any options required on the configuration programmatically. It is particularly useful for tasks such as registering extension functions, collations, or external object models, especially in Saxon-HE where the option cannot be set via a configuration file. Saxon only calls the initializer when running from the command line, but the same code may be invoked to perform initialization when running user application code.

**Using Saxon Integrated Extension Functions**

Saxon, the transformation and validation engine used by Oxygen XML Author, can be customized by adding custom functions (called **Integrated Extension Functions**) that can be called from XPath.

To define such a function, follow these steps:

1. Create a file with a Java class that extends `net.sf.saxon.lib.ExtensionFunctionDefinition`
   
   Here is an example:
private static class ShiftLeft extends ExtensionFunctionDefinition {
    @Override
    public StructuredQName getFunctionQName() {
        return new StructuredQName("eg", "http://example.com/saxon-extension", "shift-left");
    }
}

@Override
public SequenceType[] getArgumentTypes() {
    return new SequenceType[] {SequenceType.SINGLE_INTEGER,
                                SequenceType.SINGLE_INTEGER};
}

@Override
public SequenceType getResultType(SequenceType[] suppliedArgumentTypes) {
    return SequenceType.SINGLE_INTEGER;
}

@Override
public ExtensionFunctionCall makeCallExpression() {
    return new ExtensionFunctionCall() {
        public SequenceIterator call(SequenceIterator[] arguments, XPathContext context)
            throws XPathException {
            long v0 = ((IntegerValue)arguments[0].next()).longValue();
            long v1 = ((IntegerValue)arguments[1].next()).longValue();
            long result = v0<<v1;
            return Value.asIterator(Int64Value.makeIntegerValue(result));
        }
    };
}
}

2. Compile the class and add it to a JAR file.

3. Add a file called net.sf.saxon.lib.ExtensionFunctionDefinition that contains the fully qualified name of the Java class in the META-INF/services/ folder of the JAR file.

Note: To add more function definitions in the same JAR file, you need to add their fully qualified names on different lines.
To enable Oxygen XML Author to pick up your custom function definition, the JAR file should be added to the classpath of the transformer. Here are some possibilities:

- If you develop a framework, you just need to link the JAR file in the Classpath tab (on page 98).
- In a validation scenario (on page 1036), you can use the Extensions button to open a dialog box where you can add libraries.
- In a transformation scenario, you can use the Extensions button in the XSLT tab (on page 1294) to open a dialog box where you can add libraries.
- You can also create a plugin that contributes such a JAR file in the classpath (on page 2151).

FO Processor Tab (XSLT Transformations)

When you create a new transformation scenario (on page 1292) or edit an existing one (on page 1374), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The FO Processor tab contains the following options:

**Perform FO Processing**

Specifies whether or not an FO processor is applied (either the built-in Apache FOP engine or an external engine defined in Preferences) during the transformation.

**Input**

Choose between the following options to specify which input file to use:

- **XSLT result as input** - The FO processor is applied to the result of the XSLT transformation that is defined in the XSLT tab.
- **XML URL as input** - The FO processor is applied to the input XML file.

**Method**

The output format of the FO processing. The available options depend on the selected processor type.

**Processor**

Specifies the FO processor to be used for the transformation. It can be the built-in Apache FOP processor or an external processor (on page 206).

Output Tab (XSLT Transformations)

When you create a new transformation scenario (on page 1292) or edit an existing one (on page 1374), a configuration dialog box allows you to customize the transformation with various options in several tabs.
The **Output** tab contains the following options:

**Prompt for file**

At the end of the transformation, a file browser dialog box is displayed for specifying the path and name of the file that stores the transformation result.

**Save As**

The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the [Insert Editor Variables](on page 266) button, or the `Browse` button.

**Open in Browser/System Application**

If selected, Oxygen XML Author automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows PDF files are often opened in Acrobat Reader).

*Note:* To set the web browser that is used for displaying HTML/XHTML pages, go to Options > Preferences > Global, and set it in the Default Internet browser field.

- **Output file** - When Open in Browser/System Application is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When Open in Browser/System Application is selected, you can use this option to open the file specified in this field at the end of the transformation.
  
  You can specify the path by using the text field, the [Insert Editor Variables](on page 266) button, or the `Browse` button.

**Open in editor**

When this is option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

**Show in results view as**

You can choose to view the results in one of the following:

- **XML** - If this is selected, Oxygen XML Author displays the transformation result in an XML viewer panel at the bottom of the application window with syntax highlighting (on page 173).
- **SVG** - If this is selected, Oxygen XML Author displays the transformation result in an integrated SVG viewer in the Results panel (on page 1120) at the bottom of the application window and renders the result as an SVG image.
• **XHTML** - This option is only available if **Open in Browser/System Application** is not selected. If selected, Oxygen XML Author displays the transformation result in a built-in XHTML browser panel at the bottom of the application window.

⚠️ **Important:** When transforming very large documents, you should be aware that selecting this option may result in very long processing times. This drawback is due to the built-in Java XHTML browser implementation. To avoid delays for large documents, if you want to see the XHTML result of the transformation, you should use an external browser by selecting the **Open in Browser/System Application** option instead.

• **Image URLs are relative to** - If **Show in results view as XHTML** is selected, this option specifies the path used to resolve image paths contained in the transformation result. You can specify the path by using the text field, the 📋 **Insert Editor Variables (on page 266)** button, or the 🔍 **Browse** button.

⚠️ **Attention:** If your input XSLT contains `<xsl:result-document>` elements, then the secondary results will be saved to the specified URIs while the principal result is specified in this **Output** tab. For more information, see: [https://www.w3.org/TR/xslt-30/#element-result-document](https://www.w3.org/TR/xslt-30/#element-result-document).

### Configuring an XSLT Processor for Generating Output

This section explains how to configure an XSLT processor and extensions for such a processor in Oxygen XML Author.

#### Supported XSLT Processors

Oxygen XML Author includes the following XSLT processors:

• **Xalan 2.7.2** - Xalan-Java is an XSLT processor for transforming XML documents into HTML, text, or other XML document types. It implements XSL Transformations (XSLT) Version 1.0 and XML Path Language (XPath) Version 1.0.

• **Saxon 6.5.5** - Saxon 6.5.5 is an XSLT processor that implements the Version 1.0 XSLT and XPath with a number of powerful extensions. This version of Saxon also includes many of the new features that were first defined in the XSLT 1.1 working draft, but for conformance and portability reasons these are not available if the stylesheet header specifies `version="1.0"`.

• **Saxon 9.8.0.12 Home Edition (HE), Professional Edition (PE)** - Saxon-HE/PE implements the basic conformance level for XSLT 2.0 / 3.0 and XQuery 1.0. The term **basic XSLT 2.0 / 3.0 processor** is defined in the draft XSLT 2.0 / 3.0 specifications. It is a conformance level that requires support for all features of the language other than those that involve schema processing. The HE product remains open source, but removes some of the more advanced features that are present in Saxon-PE.
**Saxon 9.8.0.12 Enterprise Edition (EE)** - Saxon EE is the schema-aware edition of Saxon and it is one of the built-in processors included in Oxygen XML Author. Saxon EE includes an XML Schema processor, and schema-aware XSLT, XQuery, and XPath processors.

The validation in schema aware transformations is done according to the XML Schema 1.0 or 1.1. This can be configured in Preferences (on page 186).

**Note:** Oxygen XML Author implements a Saxon framework that allows you to create Saxon configuration files. Two templates are available: Saxon collection catalog and Saxon configuration. Both of these templates support content completion, element annotation, and attribute annotation.

**Note:** Saxon can use the ICU-J localization library (saxon9-icu.jar) to add support for sorting and date/number formatting in a wide variety of languages. This library is not included in the Oxygen XML Author installation kit. However, Saxon will use the default collation and localization support available in the currently used JRE. To enable this capability, follow these steps:

2. Unpack the downloaded archive.
3. Create a new XSLT transformation scenario (or edit an existing one). In the XSLT tab, click the Extensions button to open the list of additional libraries used by the transformation process.
4. Click Add and browse to the folder where you unpacked the downloaded archive and choose the saxon9-icu.jar file.

Note that the saxon9-icu.jar should NOT be added to the application library folder because it will conflict with another version of the ICU-J library that comes bundled with Oxygen XML Author.

**Xsltproc (libxslt)** - Libxslt is the XSLT C library developed for the Gnome project. Libxslt is based on libxml2, the XML C library developed for the Gnome project. It also implements most of the EXSLT set of processor-portable extensions, functions, and some of Saxon's evaluate and expression extensions.

Oxygen XML Author uses Libxslt through its command-line tool (Xsltproc). Depending on your operating system, you must download the Libxslt libraries on your machine from http://xmlsoft.org/XSLT/downloads.html and place them in a local folder. Then you need to update the PATH environmental variable to contain the parent folder where the xsltproc executable is located.

**Tip:** As an example, a Windows installation of the Xsltproc engine would follow these steps:
2. Unzip all of them into the same folder of your choice.
3. Edit the PATH environment variable and add the bin folder for all four archives:

   ![Edit environment variable]

   **Result:** You can now use the `xsltproc` processor as an XSLT engine in the XSLT transformation scenario.

   **Note:** The Xsltproc processor can be configured from the XSLTPROC options page (on page 196).

   **CAUTION:** There is a known problem where file paths that contain spaces are not handled correctly in the LIBXML processor. For example, the built-in XML Catalog (on page 2800) files of the built-in document types (DocBook, TEI, DITA, etc.) are not handled properly by LIBXML if Oxygen XML Author is installed in the default location on Windows (C:\Program Files). This is because the built-in XML catalog files are stored in the \[OXYGEN_INSTALL_DIR\]/frameworks subdirectory of the installation directory, and in this case it contains a space character.

   • **MSXML 4.0** - MSXML 4.0 is available only on Windows platforms. It can be used for transformation (on page 1292).

Oxygen XML Author uses the Microsoft XML parser through its command-line tool msxsl.exe.

Since msxsl.exe is only a wrapper, Microsoft Core XML Services (MSXML) must be installed on the computer. Otherwise, you will get a corresponding warning. You can get the latest Microsoft XML parser from Microsoft web-site.

• **MSXML .NET** - MSXML .NET is available only on Windows platforms. It can be used for transformation (on page 1292).

Oxygen XML Author performs XSLT transformations and validations using the .NET Framework XSLT implementation (System.Xml.Xsl.XsltTransform class) through the nxslt command-line utility. The nxslt version included in Oxygen XML Author is 1.6.
You should have the .NET Framework version 1.0 already installed on your system. Otherwise, you will get the following warning: MSXML.NET requires .NET Framework version 1.0 to be installed. Exit code: 128.

You can get the .NET Framework version 1.0 from the Microsoft website.

• .NET 1.0 - A transformer based on the System.Xml 1.0 library available in the .NET 1.0 and .NET 1.1 frameworks from Microsoft (http://msdn.microsoft.com/xml/). It is available only on Windows.

You should have the .NET Framework version 1.0 or 1.1 already installed on your system. Otherwise, you will get the following warning: MSXML.NET requires .NET Framework version 1.0 to be installed. Exit code: 128.

You can get the .NET Framework version 1.0 from the Microsoft website.

• .NET 2.0 - A transformer based on the System.Xml 2.0 library available in the .NET 2.0 Framework from Microsoft. It is available only on Windows.

You should have the .NET Framework version 2.0 already installed on your system. Otherwise, you will get the following warning: MSXML.NET requires .NET Framework version 2.0 to be installed. Exit code: 128.

You can get the .NET Framework version 2.0 from the Microsoft website.

For information about configuring the XSLT preferences, see the XSLT options (on page 192) section.

Configuring Custom XSLT Processors

Oxygen XML Author allows you to configure custom processors to be used for running XSLT and XQuery transformations.

To add a new custom processor, follow these steps:

1. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to XML > XSLT-FO-XQuery > Custom Engines.
2. Click the New button at the bottom of the dialog box.
3. Configure the parameters for the custom engine (on page 204).
4. Click OK.

Note:

The output messages of a custom processor are displayed in an output view at the bottom of the application window. If an output message follows the format of an Oxygen XML Author linked message (on page 1033), clicking it highlights the location of the message in an editor panel containing the file referenced in the message.
Configuring the XSLT Processor Extensions Paths

The Xalan and Saxon processors support the use of extension elements and extension functions. Unlike a literal result element, which the stylesheet simply transfers to the result tree, an extension element performs an action. The extension is usually used because the XSLT stylesheet fails in providing adequate functions for accomplishing a more complex task.

For more information about how to use extensions, see the following links:

- Saxon 6.5.5 - [http://saxon.sourceforge.net/saxon6.5.5/extensions.html](http://saxon.sourceforge.net/saxon6.5.5/extensions.html)

To set an XSLT processor extension (a directory or a jar file), use the Extensions button (on page 1294) in the Edit scenario dialog box.

XML Transformation with XQuery

This type of transformation specifies the transform parameters and location of an XQuery file that is applied to the edited XML document.

Use the XML transformation with XQuery scenario to apply a transformation in which an XQuery file queries an XML file for the output results.

To create an XML transformation with XQuery scenario, use one of the following methods:

- Use the Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on OS X)) action from the toolbar or the Document > Transformation menu. Then click the New button and select XML transformation with XQuery.
- Go to Window > Show View and select Transformation Scenarios to display this view (on page 1384). Click the New Scenario drop-down menu button and select XML transformation with XQuery.

Both methods open the New Scenario dialog box.

The upper part of the dialog box allows you to specify the Name of the transformation scenario and the following Storage options:
• **Project Options (on page 2798)** - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.

• **Global Options (on page 2795)** - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

**XQuery Tab**

When you create a new transformation scenario (on page 1292) or edit an existing one (on page 1374), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **XQuery** tab contains the following options:

**XML URL**

Specifies the source XML file. You can specify the path by using the text field, its history drop-down, the ➔ **Insert Editor Variables (on page 266)** button, or the browsing actions in the ➔ **Browse** drop-down list. You can also use the ➔ **Open in editor** button to open the specified file in the editor panel. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.

**Note:** If the transformer engine is Saxon 9.x and a custom URI resolver is configured in the advanced Saxon preferences page (on page 195), the XML input of the transformation is passed to that URI resolver.

**XQuery URL**

Specifies the source XQuery file to be used for the transformation. You can specify the path by using the text field, its history drop-down, the ➔ **Insert Editor Variables (on page 266)** button, or the browsing actions in the ➔ **Browse** drop-down list. You can also use the ➔ **Open in editor** button to open the specified file in the editor panel. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

**Transformer**

This drop-down menu presents all the transformation engines available to Oxygen XML Author for performing a transformation. These include the built-in engines and the external engines defined in the Custom Engines preferences page (on page 204).
The engine you choose is used as the default transformation engine. Also, if an XSLT or XQuery document does not have an associated validation scenario, this transformation engine is used in the validation process (if it provides validation support).

**Advanced options**

Allows you to configure the advanced options of the Saxon HE/PE/EE engine *(on page 1312)* for the current transformation scenario. To configure the same options globally, go to the Saxon-HE/PE/EE preferences page *(on page 193)*. For the current transformation scenario, these Advanced options override the options configured in that preferences page.

**Parameters**

Opens the Configure parameters dialog box *(on page 1310)* for configuring the XQuery parameters. You can use the buttons in this dialog box to add, edit, or remove parameters. If the XQuery transformation engine is custom-defined, you can not use this dialog box to set parameters. Instead, you can copy all parameters from the dialog box using contextual menu actions and edit the custom XQuery engine to include the necessary parameters in the command line that starts the transformation process.

**Extensions**

Opens a dialog box for configuring the XQuery extension JARS or classes *(on page 1312)* that define extension Java functions or extension XSLT elements used in the transformation.

**XQuery Parameters**

The global parameters of the XQuery file used in a transformation scenario can be configured by using the Parameters button in the XQuery tab.

The resulting dialog box includes a table that displays all the parameters of the current XQuery file, along with their descriptions and current values. You can also add, edit, and remove parameters, and use the Filter text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

If the XPath column is selected, the parameter value is evaluated as an XPath expression before starting the XQuery transformation.

**Example:**

For example, you can use expressions such as:

```xml
doc('test.xml')//entry
//person[@atr='val']
```
Note:

1. The `doc` function solves the argument relative to the XQuery file location. You can use full paths or editor variables (on page 266) (such as `${cfdu}` [current file directory]) to specify other locations: `doc('${cfdu}/test.xml')//`
2. Only XPath functions are allowed.

Below the table, the following actions are available for managing the parameters:

**New**

Opens the Add Parameter dialog box that allows you to add a new parameter to the list. An editor variable (on page 266) can be inserted in the text box using the Insert Editor Variables button. If the Evaluate as XPath option is selected, the parameter will be evaluated as an XPath expression.

**Edit**

Opens the Edit Parameter dialog box that allows you to edit the selected parameter. An editor variable (on page 266) can be inserted in the text box using the Insert Editor Variables button. If the Evaluate as XPath option is selected, the parameter will be evaluated as an XPath expression.

**Unset**

Resets the selected parameter to its default value. Available only for edited parameters with set values.

**Delete**

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

The bottom panel presents the following:

- The default value of the parameter selected in the table.
- A description of the parameter, if available.
- The system ID of the stylesheet that declares it.

Related Information:

- Editor Variables (on page 266)
XQuery Extensions

The Extensions button is used to specify the JAR (on page 2795) and classes that contain extension functions called from the XQuery file of the current transformation scenario. You can use the Add, Edit, and Remove buttons to configure the extensions.

An extension function called from the XQuery file of the current transformation scenario will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item to be moved and press the ↑ Move up or ↓ Move down buttons.

Advanced Saxon HE/PE/EE XQuery Transformation Options

The XQuery transformation scenario allows you to configure advanced options that are specific for the Saxon HE (Home Edition), PE (Professional Edition), and EE (Enterprise Edition) engines.

Saxon-HE/PE/EE Options

The advanced options for Saxon 9.8.0.12 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE) are as follows:

- **Use a configuration file ("-config")**
  
  Sets a Saxon 9.8.0.12 configuration file that is used for XQuery transformation and validation scenarios.

- **Enable Optimizations ("-opt")**
  
  This option is selected by default, which means that optimization is enabled. If not selected, the optimization is suppressed, which is helpful when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

- **Use linked tree model ("-tree:linked")**
  
  This option activates the linked tree model.

- **Recoverable errors ("-warnings")**
  
  Specifies how dynamic errors are handled. The following options can be selected:

  - Recover silently ("silent") - Continues processing without reporting the error.
  - Recover with warnings ("recover") - Issues a warning but continues processing.
  - Signal the error and do not attempt recovery ("fatal") - Issues an error and stops processing.

- **Strip whitespaces ("-strip")**
Specifies how the *strip whitespaces* operation is handled. You can choose one of the following values:

- **All** (*`all`*) - Strips *all* whitespace text nodes from source documents before any further processing, regardless of any `xml:space` attributes in the source document.
- **Ignore** (*`ignorable`*) - Strips all *ignorable* whitespace text nodes from source documents before any further processing, regardless of any `xml:space` attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
- **None** (*`none`*) - Strips *no* whitespace before further processing.

**Saxon-PE/EE Options**

The following advanced options are specific for Saxon 9.8.0.12 Professional Edition (PE) and Enterprise Edition (EE) only:

**Allow calls on extension functions** (*`-ext`*)

If selected, calls on external functions are allowed. Selecting this option is recommended in an environment where untrusted stylesheets may be executed. It also disables user-defined extension elements and the writing of multiple output files, both of which carry similar security risks.

**Saxon-EE Options**

The advanced options that are specific for Saxon 9.8.0.12 Enterprise Edition (EE) are as follows:

**Validation of the source file** (*`-val`*)

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

- **Schema validation** (*`strict`*) - This mode requires an XML Schema and allows for parsing the source documents with strict schema-validation enabled.
- **Lax schema validation** (*`lax`*) - If an XML Schema is provided, this mode allows for parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

**Validation errors in the result tree treated as warnings** (*`-outval`*)

Normally, if validation of result documents is requested, a validation error is fatal. Selecting this option causes such validation failures to be treated as warnings.
Write comments for non-fatal validation errors of the result document

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

**Enable XQuery update ("-update:(on|off)")**

This option controls whether or not XQuery update syntax is accepted. The default value is off.

**Backup files updated by XQuery ("-backup:(on|off)")**

If selected, backup versions for any XML files updated with an XQuery Update are generated. This option is available when the Enable XQuery update option is selected.

**Other Options**

**Initializer class**

Equivalent to the `-init` Saxon command-line argument. The value is the name of a user-supplied class that implements the `net.sf.saxon.lib.Initializer` interface. This initializer is called during the initialization process, and may be used to set any options required on the configuration programmatically. It is particularly useful for tasks such as registering extension functions, collations, or external object models, especially in Saxon-HE where the option cannot be set via a configuration file. Saxon only calls the initializer when running from the command line, but the same code may be invoked to perform initialization when running user application code.

**FO Processor Tab (XQuery Transformations)**

When you create a new transformation scenario (on page 1292) or edit an existing one (on page 1374), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **FO Processor** tab contains the following options:

**Perform FO Processing**

Specifies whether or not an FO processor is applied (either the built-in Apache FOP engine or an external engine defined in Preferences) during the transformation.

**Input**

Choose between the following options to specify which input file to use:

- **XQuery result as input** - The FO processor is applied to the result of the XQuery transformation that is defined in the XQuery tab.
- **XML URL as input** - The FO processor is applied to the input XML file.

**Method**

The output format of the FO processing. The available options depend on the selected processor type.

**Processor**

Specifies the FO processor to be used for the transformation. It can be the built-in Apache FOP processor or an external processor (on page 206).

**Output Tab (XQuery Transformations)**

When you create a new transformation scenario (on page 1292) or edit an existing one (on page 1374), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Output** tab contains the following options:

**Present as a sequence**

Selecting this option will reduce the time necessary to fetch the full results, as it will only fetch the first chunk of the results.

**Prompt for file**

At the end of the transformation, a file browser dialog box is displayed for specifying the path and name of the file that stores the transformation result.

**Save As**

The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the Insert Editor Variables (on page 266) button, or the Browse button.

**Open in Browser/System Application**

If selected, Oxygen XML Author automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows PDF files are often opened in Acrobat Reader).

**Note:** To set the web browser that is used for displaying HTML/XHTML pages, go to Options > Preferences > Global, and set it in the Default Internet browser field.

- **Output file** - When Open in Browser/System Application is selected, you can use this button to automatically open the default output file at the end of the transformation.

- **Other location** - When Open in Browser/System Application is selected, you can use this option to open the file specified in this field at the end of the transformation.
You can specify the path by using the text field, the Insert Editor Variables button, or the Browse button.

Open in editor

When this is option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

Show in results view as

You can choose to view the results in one of the following:

- **XML** - If this is selected, Oxygen XML Author displays the transformation result in an XML viewer panel at the bottom of the application window with syntax highlighting.
- **SVG** - If this is selected, Oxygen XML Author displays the transformation result in an integrated SVG viewer in the Results panel at the bottom of the application window and renders the result as an SVG image.
- **XHTML** - This option is only available if Open in Browser/System Application is not selected. If selected, Oxygen XML Author displays the transformation result in a built-in XHTML browser panel at the bottom of the application window.

⚠️ **Important:** When transforming very large documents, you should be aware that selecting this option may result in very long processing times. This drawback is due to the built-in Java XHTML browser implementation. To avoid delays for large documents, if you want to see the XHTML result of the transformation, you should use an external browser by selecting the Open in Browser/System Application option instead.

- **Image URLs are relative to** - If Show in results view as XHTML is selected, this option specifies the path used to resolve image paths contained in the transformation result. You can specify the path by using the text field, the Insert Editor Variables button, or the Browse button.

XML to PDF Transformation with CSS

This type of transformation uses the Oxygen PDF Chemistry processing engine to obtain PDF output by applying CSS styling to the edited XML document. This scenario is useful for those who are familiar with CSS and want to obtain PDF output as its final form.

To create an XML to PDF transformation with CSS scenario, use one of the following methods:
• Use the Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on OS X)) action from the toolbar or the Document > Transformation menu. Then click the New button and select XML to PDF transformation with CSS.

• Go to Window > Show View and select Transformation Scenarios to display this view (on page 1384). Click the New Scenario drop-down menu button and select XML to PDF transformation with CSS.

Both methods open the New Scenario dialog box.

The upper part of the dialog box allows you to specify the Name of the transformation scenario and the following Storage options:

• Project Options (on page 2798) - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.

• Global Options (on page 2795) - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

For more information about the Oxygen PDF Chemistry processing engine and numerous tips for customizing the output, see the Oxygen Chemistry User Guide.

CSS Tab (XML to PDF Transformation with CSS)

When you create a new transformation scenario (on page 1292) or edit an existing one (on page 1374), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The CSS tab contains the following options:

XML URL

Specifies the source XML file. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 266) button, or the browsing actions in the Browse drop-down list. You can also use the Open in editor button to open the specified file in the editor panel. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.

CSS URL
Optionally, you can use this option to specify the location of a custom CSS file to be applied to the transformation. If this option is left blank, only the CSS referenced directly from the document will be applied. You can specify the path by using the text field, its history drop-down, the ![Insert Editor Variables (on page 266)](on page 266) button, or the browsing actions in the ![Browse](on page 266) drop-down list. You can also use the ![Open in editor](on page 266) button to open the specified file in the editor panel.

**Apply CSS stylesheets set in the current framework**

If selected, CSS stylesheets that are specified in the framework (in the Document Type configuration CSS subtab (on page 100)) are applied to the transformation in addition to any CSS referenced directly in the document or specified in the CSS URL field (on page 1317).

**Note:** If CSS files are specified in multiple ways, the transformation applies the CSS in the following order (from lowest priority to highest):

- CSS files that are specified in the framework (in the Document Type configuration CSS subtab (on page 100)).
- CSS files referenced directly in the document.
- CSS files specified in the CSS URL field (on page 1317).

**Processor options link**

Opens the CSS-based Processors preferences page (on page 210) where you can configure some options for generating PDF output.

**Output Tab (XML to PDF Transformation with CSS)**

When you create a new transformation scenario (on page 1292) or edit an existing one (on page 1374), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Output** tab contains the following options:

**Output File section**

**Save As**

The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the ![Insert Editor Variables (on page 266)](on page 266) button, or the ![Browse](on page 266) button.

**Open in Browser/System Application**
If selected, Oxygen XML Author automatically opens the result of the transformation in a system application associated with the PDF file type (for example, in Windows PDF files are often opened in Acrobat Reader).

**Debugging section**

**Dump the intermediate annotated XML**

Select this option to include (dump) the intermediate, annotated XML file in the same location as the output file. This can be used for debugging purposes.

**Dump the FO file**

Select this option to include (dump) the FO file (before it is converted to PDF) in the same location as the output file. This can be used for debugging purposes.

**Console options link**

Opens the CSS-based Processors preferences page (on page 210) where you can configure some options for generating PDF output.

**DITA OT Transformation**

This type of transformation specifies the parameters for an Ant transformation that executes a DITA-OT build script. Oxygen XML Author includes a built-in version of Ant and a built-in version of DITA-OT, but other versions can be set in the scenario.

To create a DITA OT Transformation scenario, use one of the following methods:

- Use the Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on OS X)) action from the DITA Maps Manager toolbar, main toolbar, or the Document > Transformation menu. Then click the New button and select DITA OT Transformation.
- Go to Window > Show View and select Transformation Scenarios to display this view (on page 1384). Click the New Scenario drop-down menu button and select DITA OT Transformation.

Both methods open the DITA Transformation Type dialog box that presents the list of possible outputs.

Figure 386. DITA Transformation Type Dialog Box
Select the desired type of output and click **OK**. This opens the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario and the following **Storage** options:

- **Project Options** *(on page 2798)* - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.
- **Global Options** *(on page 2795)* - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation. Some of these tabs are only available for certain output types (for example, a **Skins** tab is only available for **WebHelp Classic** and **WebHelp Classic with Feedback** output types, a **Templates** tab is available only for **WebHelp Responsive** and **WebHelp Responsive with Feedback**, and a **FO Processor** tab is available for PDF output).

**Skins Tab (DITA OT Transformations)**

When you **create a new transformation scenario** *(on page 1292)* or **edit an existing one** *(on page 1374)*, a configuration dialog box allows you to customize the transformation with various options in several tabs.
The **Skins** tab is available for DITA OT transformations with **WebHelp Classic** or **WebHelp Classic with Feedback** output types and it provides a set of built-in skins that you can use as a base for your WebHelp system output.

A **skin** is a collection of CSS properties that can alter the look of the output by changing colors, font types, borders, margins, and paddings. This allows you to rapidly adapt the look and feel of your output.

Figure 387. Skins Tab

The **Skins** tab includes the following sections:

**Built-in Skins**

This sections presents the built-in skins that are included in Oxygen XML Author. The built-in skins cover a wide range of chromatic themes, ranging from a very light one to a high-contrast variant. To see how the skin looks when applied on a sample documentation project that is stored on the Oxygen XML Author website, press the **Online preview** link.

**Custom Skins**

You can use this section to customize the look of the output.

**CSS File**

You can set this field to point to a custom CSS stylesheet or customized skin. A custom CSS file will overwrite a skin selection.
Note: The output can also be styled by setting the `args.css` parameter in the Parameters tab. The properties taken from the stylesheet referenced in this parameter take precedence over the properties declared in the skin set in the Skins tab.

Create custom skin

Use this link to open the WebHelp Skin Builder (on page 1422) tool.

Templates Tab (DITA OT Transformations)

When you create a new transformation scenario (on page 1292) or edit an existing one (on page 1374), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The Templates tab is available for DITA OT transformations with WebHelp Responsive, WebHelp Responsive with Feedback, or PDF - based on HTML5 & CSS output types and it provides a set of built-in publishing templates (on page 1508). You can use one of them to publish your documentation or as a starting point for a new publishing template.

Figure 388. Templates Tab

Filtering and Previewing Templates

You can click on the tags at the top of the pane to filter the templates and narrow your search. Each built-in template also includes an Online preview icon in the bottom-right corner that opens
a webpage in your default browser providing a sample of how the main page will look when that particular template is used to generate the output.

**Built-in Templates Locations**

Oxygen XML Author scans the following locations to find the built-in templates to display in the dialog box:

- **WebHelp Responsive Templates** - All built-in WebHelp Responsive publishing templates are stored in the following directory: `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/templates`.
- **PDF - based on HTML5 & CSS** - All built-in PDF publishing templates are stored in the following directories:
  - `DITA-OT-DIR/plugins/com.oxygenxml.pdf.css/templates`
  - `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/templates`

**Custom Templates Locations**

Oxygen XML Author scans the locations specified in the DITA > Publishing preferences page (on page 218) to find custom templates to display in the dialog box. You can access that preferences page directly from the Template tab by clicking on the Configure Publishing Templates Gallery link.

**Selecting Custom Templates**

Once you are finished configuring your template, you can click the Choose Custom Publishing Template link to select your template.

You can also add your custom templates (on page 1554) to the list of templates displayed in the Templates tab. To do this, store them in a directory, then click the Configure Publishing Templates Gallery link to open the DITA > Publishing preferences page (on page 218) where you can add that directory to the list. All the templates contained in your template directory will be displayed in the preview pane along with all the built-in templates.

**Save Template As Button**

You can use the Save template as button (at the bottom-left of the transformation dialog box) to export the currently selected template into a new template package that can be used as a starting point to create your own custom template (on page 1645). Clicking this button will open a template package configuration dialog box (on page 1324) that contains some options and displays the parameters that will be exported to your template package.
Template Errors

When the Templates tab is opened, all templates (built-in and custom) are loaded and validated. Specifically, certain elements in the template descriptor file are checked for validity. If errors are encountered that prevents the template from loading, the following message will be displayed toward the bottom of the dialog box:

![Some templates could not be loaded. More details]

If you click the More details link, a window will open with more information about the encountered error. For example, it might offer a hint for which element is missing from the expected descriptor file structure.

Also, if a template could be loaded, but certain elements could not be found in the descriptor file, a warning icon (⚠️) will be displayed on the template's image (in the Templates tab of the transformation dialog box). For example, this happens if a valid preview-image element cannot be found.

Sharing Publishing Template

To share a publishing template with others, following these steps:

1. Copy your template in a new folder.
2. Go to Options > Preferences > DITA > Publishing (on page 218) and add that new folder to the list.
3. Switch the option as the bottom of that preferences page to Project Options.
4. Share your project file (.xpr).

For more information about customizing publishing templates, watch our video demonstration:

https://www.youtube.com/embed/zNmXfKWXwO8

Related Information:

- Publishing Templates (on page 1508)
- Publishing Template Package Contents for PDF Customizations (on page 1639)
- Publishing Template Package Contents for WebHelp Responsive Customizations (on page 1511)
Template Package Configuration Dialog Box

The **Save template as** button (at the bottom-left of the transformation dialog box for WebHelp Responsive or PDF - based on HTML5 & CSS transformations) can be used to export the currently selected template into a new template package that can be used as a starting point to create your own custom template (on page 1645). The result will be a ZIP archive that contains a template descriptor file and other resources (such as CSS files) that were attached to the selected template.

Clicking the **Save template as** button opens a template package configuration dialog box contains the following options and components:

**Name**

Required field used to specify the name for the new template. This will become the text value of the name element in the template descriptor file. This information is displayed as the name of the template in the transformation scenario dialog box.

**Description**

Optional field used to specify a template description. This will become the text value of the description element in the template descriptor file. This information is displayed when the user hovers over the template in the transformation scenario dialog box.

**Parameter Table**

This table displays the parameters that will be exported. Only relevant parameters are exported. The parameters and their values will be inserted in the parameters section of the template descriptor file. If any of the parameter values point to a file path that references a template resource (such as CSS files, custom HTML fragments, images), those resources will automatically be copied to the new template package and their references will be changed accordingly.

**Note:** Additional resources that are referenced in CSS files or other resources will not be copied to the new template package, so you will need to copy them manually and update their references in the template descriptor file.

**Include WebHelp Customization**

The same publishing template package can contain both a WebHelp Responsive and PDF customization and you can use the same template in both types of transformations (DITA Map WebHelp Responsive (on page 1261) or DITA Map to PDF - based on HTML5 & CSS (on page 1275)). This option specifies that the custom template will include a WebHelp Responsive customization.

**Include HTML Page Layout Files**

For WebHelp Responsive customizations, select this option if you want to copy the default HTML Page Layout Files (on page 1525) into your
template package. They are helpful if you want to change the structure of the generated HTML pages.

**Include PDF Customization**

The same publishing template package can contain both a WebHelp Responsive and PDF customization and you can use the same template in both types of transformations ([DITA Map WebHelp Responsive](on page 1261)) or [DITA Map to PDF - based on HTML5 & CSS](on page 1275)). This option specifies that the custom template will include a PDF customization.

**Save as**

Use this field to specify the name and path of the ZIP file where the template will be saved.

Figure 389. Template Package Configuration Dialog Box

| Save Template As
| Name: |
| Description: |

The following parameters will be set in the new template package:

- Name: Value
- force-unique: true

- Include WebHelp customization
- Include HTML Page Layout files
- Include PDF customization

FO Processor Tab (DITA OT Transformations)

When you create a new transformation scenario (on page 1292) or edit an existing one (on page 1374), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The FO Processor tab is available for DITA OT transformations with a PDF output type.

This tab allows you to select an FO Processor to be used for the transformation.

Figure 390. FO Processor Configuration Tab

You can choose one of the following processors:

Apache FOP

The default processor that comes bundled with Oxygen XML Author.

XEP

The RenderX XEP processor. If XEP is already installed, Oxygen XML Author displays the detected installation path under the drop-down menu. XEP is considered installed if it was detected in one of the following sources:

- XEP was configured as an external FO Processor in the FO Processors option page (on page 206).
- The system property com.oxygenxml.xep.location was set to point to the XEP executable file for the platform (for example: xep.bat on Windows).
- XEP was installed in the DITA-OT-DIR/plugins/org.dita.pdf2/lib directory of the Oxygen XML Author installation directory.

Antenna House
The **Antenna House** (AH Formatter) processor. If Antenna House is already installed, Oxygen XML Author displays the detected installation path under the drop-down menu. Antenna House is considered installed if it was detected in one of the following sources:

- Environment variable set by Antenna House installation (the newest installation version will be used).
- Antenna House was added as an external FO Processor in the Oxygen XML Author preferences pages.

To further customize the PDF output obtained from the Antenna House processor, follow these steps:

1. **Edit** the transformation scenario.
2. Open the **Parameters tab** *(on page 2717)*.
3. Add the `env.AXF_OPT` parameter and point to the Antenna House configuration file.

**Related Information:**

- FO Processors Preferences *(on page 206)*
- XSL-FO (Apache FOP) Processor for Generating PDF Output *(on page 1354)*

**Parameters Tab (DITA OT Transformations)**

When you **create a new transformation scenario** *(on page 1292)* or **edit an existing one** *(on page 1374)*, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Parameters** tab allows you to configure the parameters sent to the DITA-OT build file.

The table in this tab displays all the parameters that the DITA-OT documentation specifies as available for each chosen type of transformation (for example, XHTML or PDF), along with their description and current values. You can find more information about each parameter in the **DITA OT Documentation**. You can also add, edit, and remove parameters, and you can use the text box to filter or search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

Depending on the type of a parameter, its value can be one of the following:

- A simple text field for simple parameter values.
- A combo box with some predefined values.
• A file chooser and an editor variable (on page 266) selector to simplify setting a file path as the value of a parameter.

Note: To input parameter values at runtime, use the ask editor variable (on page 267) in the Value column.

Below the table, the following actions are available for managing parameters:

New
Opens the Add Parameter dialog box that allows you to add a new parameter to the list. You can specify the Value of the parameter by using the Insert Editor Variables (on page 266) button or the Browse button.

Unset
Resets the selected parameter to its default value. Available only for edited parameters with set values.

Edit
Opens the Edit Parameter dialog box that allows you to change the value of the selected parameter or its description.

Delete
Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

Parameters Contributed by an Oxygen Publishing Template
Transformation parameters that are defined in an Oxygen Publishing Template (on page 1637) descriptor file are displayed in italics. After creating a publishing template (on page 1645) and adding it to the templates gallery (on page 1554), when you select the template in the Templates tab (on page 2711), the Parameters tab will automatically be updated to include the parameters defined in the template descriptor file.

Related Information:

• DITA Open Toolkit Documentation
Feedback Tab (DITA OT Transformations)

When you create a new transformation scenario (on page 1292) or edit an existing one (on page 1374), a configuration dialog box allows you to customize the transformation with various options in several tabs.

⚠️ Attention: This tab is for a feature that has not yet been implemented. To check the progress of the feature, see https://feedback.oxygenxml.com/.

The Feedback tab is available for the WebHelp Responsive transformation type and can be used to connect the published WebHelp Responsive output to an Oxygen Feedback server to provide a comment section in the output where users can offer feedback and ask questions.

When you configure the Oxygen Feedback server, you will retrieve an HTML fragment during site creation procedure. Click the Edit button at the bottom-right of this tab to open a dialog box where you will paste the HTML fragment (using keyboard shortcut keys or contextual menu actions).

Filters Tab (DITA Transformations)

When you create a new transformation scenario (on page 1292) or edit an existing one (on page 1374), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The Filters tab allows you to add filters to remove certain content elements from the generated output.

Figure 391. Edit Filters Tab
You can choose one of the following options to define filters:

**Use DITAVAL file**

If you already have a DITAVAL file associated with the DITA map (on page 2793), you can specify the file to be used when filtering content. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 266) button, or the browsing actions in the Browse drop-down list. You can find out more about constructing a DITAVAL file in the DITA Documentation.

⚠️ Attention: If a filter file is specified in the args.filter parameter (in the Parameters tab (on page 2717)), that file takes precedence over a DITAVAL file specified here.

**Use profiling condition set**

Sets the profiling condition set (on page 2746) that will be applied to your transformation.

**Exclude from output all elements with any of the following attributes**

By using the New, Edit, or Delete buttons at the bottom of the pane, you can configure a list of attributes (name and value) to exclude all elements that contain any of these attributes from the output.

**Advanced Tab (DITA OT Transformations)**

When you create a new transformation scenario (on page 1292) or edit an existing one (on page 1374), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The Advanced tab allows you to specify advanced options for the transformation scenario.

Figure 392. Advanced Settings Tab
You can specify the following parameters:

**Custom build file**

If you use a custom DITA-OT build file, you can specify the path to the customized build file. If empty, the build.xml file from the dita.dir parameter that is configured in the Parameters tab (on page 2717) is used. You can specify the path by using the text field, the . Insert Editor Variables (on page 266) button, or the Browse button.

**Build target**

Optionally, you can specify a build target for the build file. If no target is specified, the default init target is used.

**Additional arguments**

You can specify additional command-line arguments to be passed to the transformation (such as -verbose).

**Ant Home**

You can choose between the default or custom Ant installation to run the transformation. The default path can be configured in the Ant preferences page (on page 211).

**Java Home**
You can choose between the default or custom Java installation to run the transformation. The default path is the Java installation that is used by Oxygen XML Author.

**Note:** It may be possible that the used Java version is incompatible with the DITA Open Toolkit engine. For example, DITA-OT 2.0 and newer requires Java 1.7 or newer. Thus, if you encounter related errors running the transformation, consider installing a Java VM that is supported by the DITA OT publishing engine and using it in the **Java Home** text field.

**JVM Arguments**

This parameter allows you to set specific parameters for the Java Virtual Machine used by Ant. For example, if it is set to `-Xmx384m`, the transformation process is allowed to use 384 megabytes of memory. When performing a large transformation, you may want to increase the memory allocated to the Java Virtual Machine. This will help avoid **Out of Memory** error messages (**OutOfMemoryError**).

**Libraries**

By default, Oxygen XML Author adds libraries (as high priority) that are not transformation-dependent and also patches for certain DITA Open Toolkit bugs. You can use this button to specify additional libraries (**JAR** *(on page 2795)* files or additional class paths) to be used by the transformer.

**Tip:** You can specify the path to the additional libraries using wildcards (for example, `${oxygenHome}/lib/*`).

**Output Tab (DITA OT Transformations)**

When you create a new transformation scenario *(on page 1292)* or edit an existing one *(on page 1374)*, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Output** tab allows you to configure options that are related to the location where the output is generated.

Figure 393. Output Settings Tab
You can specify the following parameters:

**Base directory**

All the relative paths that appear as values in parameters are considered relative to the base directory. The default value is the directory where the transformed map is located. You can specify the path by using the text field, the `Insert Editor Variables (on page 266)` button, or the `Browse` button.

**Temporary files directory**

This directory is used to store pre-processed temporary files until the final output is obtained. You can specify the path by using the text field, the `Insert Editor Variables (on page 266)` button, or the `Browse` button.

**Output directory**

The folder where the content of the final output is stored. You can specify the path by using the text field, the `Insert Editor Variables (on page 266)` button, or the `Browse` button.

**Note:** If the *DITA map (on page 2793)* or topic is opened from a remote location or a ZIP file, the parameters must specify absolute paths.

**Open in Browser/System Application**
If selected, Oxygen XML Author automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows PDF files are often opened in Acrobat Reader).

Note: To set the web browser that is used for displaying HTML/XHTML pages, go to Options > Preferences > Global, and set it in the Default Internet browser field.

- **Output file** - When Open in Browser/System Application is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When Open in Browser/System Application is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the Insert Editor Variables (on page 266) button, or the Browse button.

**Open in editor**

When this is option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

At the bottom of the pane there is a link to the Console options (on page 218) preferences page that contains options to control the display of the console output received from the publishing engine.

**Ant Transformation**

This type of transformation allows you to configure the options and parameters of an Ant build script.

An Ant transformation scenario is usually associated with an Ant build script. Oxygen XML Author runs an Ant transformation scenario as an external process that executes the Ant build script with the built-in Ant distribution (Apache Ant (on page 2791) version 1.9.8) that is included with the application, or optionally with a custom Ant distribution configured in the scenario.

Tip: Certain Ant tasks require additional JAR libraries (for example, Ant mail tasks). The additional libraries can be added by editing the Ant transformation scenario, and in the Output tab, click the Libraries button (on page 1336) in the bottom right corner. This opens a dialog box where you can add JAR libraries. For a list of library dependencies, see https://ant.apache.org/manual/install.html#librarydependencies.

To create an Ant transformation scenario, use one of the following methods:
• Use the Configure Transformation Scenario(s) (\texttt{Ctrl + Shift + C (Command + Shift + C on OS X)}) action from the toolbar or the Document > Transformation menu. Then click the New button and select \textbf{ANT transformation}.

• Go to Window > Show View and select Transformation Scenarios to display this view (on page 1384). Click the New Scenario drop-down menu button and select \textbf{ANT transformation}.

Both methods open the transformation configuration dialog box.

The upper part of the dialog box allows you to specify the Name of the transformation scenario and the following Storage options:

* **Project Options (on page 2798)** - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.

* **Global Options (on page 2795)** - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

**Options Tab (Ant Transformations)**

When you create a new transformation scenario (on page 1292) or edit an existing one (on page 1374), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Options** tab allows you to specify the following options:

**Working directory**

The path of the current directory of the Ant external process. You can specify the path by using the text field, the Insert Editor Variables (on page 266) button, or the Browse button.

**Build file**

The Ant script file that is the input of the Ant external process. You can specify the path by using the text field, the Insert Editor Variables (on page 266) button, or the Browse button.

**Build target**

Optionally, you can specify a build target for the Ant script file. If no target is specified, the Ant target that is specified as the default in the Ant script file is used.
Additional arguments

You can specify additional command-line arguments to be passed to the transformation (such as `-verbose`).

Ant Home

You can choose between the default or custom Ant installation to run the transformation. The default path can be configured in the Ant preferences page (on page 211).

Java Home

You can choose between the default or custom Java installation to run the transformation. The default path is the Java installation that is used by Oxygen XML Author.

JVM Arguments

This parameter allows you to set specific parameters for the Java Virtual Machine used by Ant. For example, if it is set to `-Xmx384m`, the transformation process is allowed to use 384 megabytes of memory. When performing a large transformation, you may want to increase the memory allocated to the Java Virtual Machine. This will help avoid Out of Memory error messages (OutOfMemoryError).

Libraries

By default, Oxygen XML Author adds libraries (as high priority) that are not transformation-dependent and also patches for certain DITA Open Toolkit bugs. You can use this button to specify additional libraries (JAR files or additional class paths) to be used by the transformer.

Tip: You can specify the path to the additional libraries using wildcards (for example, `$\{oxygenHome\}/lib/*.jar`).

Parameters Tab (Ant Transformations)

When you create a new transformation scenario (on page 1292) or edit an existing one (on page 1374), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The Parameters tab allows you to configure the parameters that are accessible as Ant properties in the Ant build script.

The table displays all the parameters that are available in the Ant build script, along with their description and current values. You can also add, edit, and remove parameters, and use the Filter text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.
Depending on the type of a parameter, its value can be one of the following:

- A simple text field for simple parameter values.
- A combo box with some predefined values.
- A file chooser and an editor variable (on page 266) selector to simplify setting a file path as the value of a parameter.

Note: To input parameter values at runtime, use the ask editor variable (on page 267) in the Value column.

Below the table, the following actions are available for managing parameters:

New
Opens the Add Parameter dialog box that allows you to add a new parameter to the list. You can specify the Value of the parameter by using the Insert Editor Variables (on page 266) button or the Browse button.

Edit
Opens the Edit Parameter dialog box that allows you to change the value of the selected parameter or its description.

Delete
Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

Output Tab (Ant Transformations)
When you create a new transformation scenario (on page 1292) or edit an existing one (on page 1374), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The Output tab contains the following options:

Open
Allows you to specify the file to open automatically when the transformation is finished. This is usually the output file of the Ant process. You can specify the path by using the text field, the Insert Editor Variables (on page 266) button, or the Browse button.

- In System Application - The file specified in the Open text box is opened in the system application that is set in the operating system as the default application for that type of file (for example, in Windows PDF files are often opened in Acrobat Reader).
• **In Editor** - The file specified in the **Open** text box is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor).

**Show console output**

Allows you to specify when to display the console output log in the message panel at the bottom of the editor. The following options are available:

• **When build fails** - Displays the console output log only if the build fails.
• **Always** - Displays the console output log, regardless of whether or not the build fails.

**XSLT Transformation**

This type of transformation specifies the parameters and location of an XML document that the edited XSLT stylesheet is applied on. This scenario is useful when you develop an XSLT document and the XML document is in its final form.

To create an **XSLT transformation** scenario, use one of the following methods:

• Use the **Configure Transformation Scenario(s)** (**Ctrl + Shift + C** (**Command + Shift + C on OS X**) action from the toolbar or the **Document > Transformation** menu. Then click the **New** button and select **XSLT transformation**.

• Go to **Window > Show View** and select **Transformation Scenarios** to display this view (**on page 1384**). Click the **+ • New Scenario** drop-down menu button and select **XSLT transformation**.

Both methods open the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario and the following **Storage** options:

• **Project Options** (**on page 2798**) - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.

• **Global Options** (**on page 2795**) - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.
When you create a new transformation scenario (on page 1292) or edit an existing one (on page 1374), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The XSLT tab contains the following options:

**XML URL**

- Specifies the source XML file. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables button, or the browsing actions in the Browse drop-down list. You can also use the Open in editor button to open the specified file in the editor panel. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.

**Note:** If the transformer engine is Saxon 9.x and a custom URI resolver is configured in the advanced Saxon preferences page (on page 195), the XML input of the transformation is passed to that URI resolver. If the transformer engine is one of the built-in XSLT 2.0 / 3.0 engines and the name of an initial template (on page 1294) is specified in the scenario, the XML URL field can be empty. The XML URL field can also be empty if you use external XSLT processors (on page 1307). Otherwise, a value is mandatory in this field.

**XSL URL**

- Specifies the source XSL file that the transformation will use. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables button, or the browsing actions in the Browse drop-down list. You can also use the Open in editor button to open the specified file in the editor panel. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

**Use "xml-stylesheet" declaration**

- If selected, the scenario applies the stylesheet specified explicitly in the XML document with the xml-stylesheet processing instruction. By default, this option is deselected and the transformation applies the XSLT stylesheet that is specified in the XSL URL field.

**Transformer**

- This drop-down menu presents all the transformation engines available to Oxygen XML Author for performing a transformation. These include the built-in engines and the external engines defined in the Custom Engines preferences page (on page 204). The engine you choose is used as the default transformation engine. Also, if an XSLT or...
XQuery document does not have an associated validation scenario, this transformation engine is used in the validation process (if it provides validation support).

Advanced options

Allows you to configure the advanced options of the Saxon HE/PE/EE engine (on page 1297) for the current transformation scenario. To configure the same options globally, go to the Saxon-HE/PE/EE preferences page (on page 193). For the current transformation scenario, these Advanced options override the options configured in that preferences page.

Parameters

Opens a Configure parameters dialog box (on page 1295) that allows you to configure the XSLT parameters used in the current transformation. In this dialog box, you can also configure the parameters for additional XSLT stylesheets (on page 1294). If the XSLT transformation engine is custom-defined, you cannot use this dialog box to configure the parameters sent to the custom engine. Instead, you can copy all parameters from the dialog box using contextual menu actions and edit the custom XSLT engine to include the necessary parameters in the command line that starts the transformation process.

Extensions

Opens a dialog box for configuring the XSLT extension JARS or classes (on page 1296) that define extension Java functions or extension XSLT elements used in the transformation.

Additional XSLT stylesheets

Opens a dialog box for adding XSLT stylesheets (on page 1296) that are applied on the main stylesheet specified in the XSL URL field. This is useful when a chain of XSLT stylesheets must be applied to the input XML document.

XSLT Parameters

The global parameters of the XSLT stylesheet used in a transformation scenario can be configured by using the Parameters button in the XSLT tab of a new or edited transformation scenario dialog box.

The resulting dialog box includes a table that displays all the parameters of the current XSLT stylesheet, all imported and included stylesheets, and all additional stylesheets (on page 1296), along with their descriptions and current values. You can also add, edit, and remove parameters, and you can use the Filter text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

If the XPath column is selected, the parameter value is evaluated as an XPath expression before starting the XSLT transformation.
**Example:**

For example, you can use expressions such as:

```xml
doc('test.xml')//entry
//person[@atr='val']
```

---

**Note:**

1. The `doc` function solves the argument relative to the XSL stylesheet location. You can use full paths or editor variables *(on page 266)* (such as `$cfdu` [current file directory]) to specify other locations: `doc('${cfdu}/test.xml')//*`

2. You cannot use XSLT Functions. Only XPath functions are allowed.

Below the table, the following actions are available for managing the parameters:

- **New**
  
  Opens the Add Parameter dialog box that allows you to add a new parameter to the list. An editor variable *(on page 266)* can be inserted in the text box using the **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

- **Edit**
  
  Opens the Edit Parameter dialog box that allows you to edit the selected parameter. An editor variable *(on page 266)* can be inserted in the text box using the **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

- **Unset**
  
  Resets the selected parameter to its default value. Available only for edited parameters with set values.

- **Delete**
  
  Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

The bottom panel presents the following:

- The default value of the parameter selected in the table.
- A description of the parameter, if available.
- The system ID of the stylesheet that declares it.
XSLT Extensions

The **Extensions** button opens a dialog box that allows you to specify the [JARS](on page 2795) and classes that contain extension functions called from the XSLT file of the current transformation scenario. You can use the Add, Edit, and Remove buttons to configure the extensions.

**Tip:** You can specify the path to the resources using wildcards (for example, `{$oxygenHome}/lib/*.*.jar`).

An extension function called from the XSLT file of the current transformation scenario will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item to be moved and press the **Move up** or **Move down** buttons.

Additional XSLT Stylesheets

Use the **Additional XSLT Stylesheets** button in the XSLT tab to display a list of additional XSLT stylesheets to be used in the transformation and you can add files to the list or edit existing entries. The following actions are available:

**Add**

Adds a stylesheet in the **Additional XSLT stylesheets** list using a file browser dialog box. You can type an [editor variable](on page 266) in the file name field of the browser dialog box. The name of the stylesheet will be added in the list after the current selection.

**Remove**

Deletes the selected stylesheet from the **Additional XSLT stylesheets** list.

**Open**

Opens the selected stylesheet in a separate view.

**Up**

Moves the selected stylesheet up in the list.

**Down**

Moves the selected stylesheet down in the list.

Advanced Saxon HE/PE/EE XSLT Transformation Options

The XSLT transformation scenario allows you to configure advanced options that are specific for the Saxon HE (Home Edition), PE (Professional Edition), and EE (Enterprise Edition) engines. They are the same options as those in the [Saxon HE/PE/EE preferences page](on page 193) but they are
configured as a specific set of transformation options for each transformation scenario, while the
dvalues set in the preferences page apply as global options. The advanced options configured in a
transformation scenario override the global options (on page 2795) defined in the preferences page.

Saxon-HE/PE/EE Options

The advanced options for Saxon 9.8.0.12 Home Edition (HE), Professional Edition (PE), and Enterprise
Edition (EE) are as follows:

Mode ("-im")
A Saxon-specific option that sets the initial mode for the transformation. If this value
is also specified in a configuration file (on page 1297), the value in this option takes precedence.

Template ("-it")
A Saxon-specific option that sets the name of the initial XSLT template to be executed. If
this value is also specified in a configuration file (on page 1297), the value in this option takes precedence.

Use a configuration file ("-config")
Select this option if you want to use a Saxon 9.8.0.12 configuration file that will be
executed for the XSLT transformation and validation processes. You can specify the
path to the configuration file by entering it in the URL field, or by using the Insert
Editor Variables button, or using the browsing actions in the Browse drop-down list.

Enable Optimizations ("-opt")
This option is selected by default, which means that optimization is enabled. If not
selected, the optimization is suppressed, which is helpful when reducing the compiling
time is important, optimization conflicts with debugging, or optimization causes
extension functions with side-effects to behave unpredictably.

Line numbering ("-l")
Line numbers where errors occur are included in the output messages.

Expand attributes defaults ("-expand")
Specifies whether or not the attributes defined in the associated DTD or XML Schema
are expanded in the output of the transformation you are executing.

DTD validation of the source ("-dtd")
Specifies whether or not the source document will be validated against their associated
DTD. You can choose from the following:
• **On** - Requests DTD validation of the source file and of any files read using the `document()` function.

• **Off** - (default setting) Suppresses DTD validation.

• **Recover** - Performs DTD validation but treats the errors as non-fatal.

**Note:** Any external DTD is likely to be read even if not used for validation, since DTDs can contain definitions of entities.

Recoverable errors (“-warnings”)

Specifies how dynamic errors are handled. The following options can be selected:

• **Recover silently (“silent”)** - Continues processing without reporting the error.

• **Recover with warnings (“recover”)** - Issues a warning but continues processing.

• **Signal the error and do not attempt recovery (“fatal”)** - Issues an error and stops processing.

Strip whitespaces (“-strip”)

Specifies how the `strip whitespaces` operation is handled. You can choose one of the following values:

• **All (“all”)** - Strips all whitespace text nodes from source documents before any further processing, regardless of any `xml:space` attributes in the source document.

• **Ignore (“ignorable”)** - Strips all ignorable whitespace text nodes from source documents before any further processing, regardless of any `xml:space` attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.

• **None (“none”)** - Strips no whitespace before further processing.

Saxon-PE/EE Options

The following advanced options are specific for Saxon 9.8.0.12 Professional Edition (PE) and Enterprise Edition (EE) only:

**Register Saxon-JS extension functions and instructions**

Registers the Saxon-CE extension functions and instructions when compiling a stylesheet using the Saxon 9.8.0.12 processors.

**Allow calls on extension functions (“-ext”)**

If selected, the stylesheet is allowed to call external Java functions. This does not affect calls on integrated extension functions, including Saxon and EXSLT extension functions. This option is useful when loading an untrusted stylesheet (such as from a remote site.
using `http://[URL]`). It ensures that the stylesheet cannot call arbitrary Java methods and thus gain privileged access to resources on your machine.

**Enable assertions ("-ea")**

In XSLT 3.0, you can use the `xsl:assert` element to make assertions in the form of XPath expressions, causing a dynamic error if the assertion turns out to be false. If this option is selected, XSLT 3.0 `xsl:assert` instructions are enabled. If it is not selected (default), the assertions are ignored.

**Saxon-EE Options**

The advanced options that are specific for Saxon 9.8.0.12 Enterprise Edition (EE) are as follows:

**XML Schema version**

Use this option to change the default XML Schema version for this transformation. To change the default XML Schema version globally, open the Preferences dialog box (Options > Preferences) (on page 79) and go to XML > XML Parser > XML Schema and use the Default XML Schema version option (on page 187).

**Validation of the source file ("-val")**

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

- **Schema validation ("strict")** - This mode requires an XML Schema and allows for parsing the source documents with strict schema-validation enabled.
- **Lax schema validation ("lax")** - If an XML Schema is provided, this mode allows for parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

**Validation errors in the result tree treated as warnings ("-outval")**

Normally, if validation of result documents is requested, a validation error is fatal. Selecting this option causes such validation failures to be treated as warnings.

**Write comments for non-fatal validation errors of the result document**

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

**Enable streaming mode**

Selecting this option will allow an XSLT to run in streaming mode. It is not selected by default.
Other Options

Initializer class

Equivalent to the -init Saxon command-line argument. The value is the name of a user-supplied class that implements the net.sf.saxon.lib.Initializer interface. This initializer is called during the initialization process, and may be used to set any options required on the configuration programmatically. It is particularly useful for tasks such as registering extension functions, collations, or external object models, especially in Saxon-HE where the option cannot be set via a configuration file. Saxon only calls the initializer when running from the command line, but the same code may be invoked to perform initialization when running user application code.

Using Saxon Integrated Extension Functions

Saxon, the transformation and validation engine used by Oxygen XML Author, can be customized by adding custom functions (called Integrated Extension Functions) that can be called from XPath.

To define such a function, follow these steps:

1. Create a file with a Java class that extends net.sf.saxon.lib.ExtensionFunctionDefinition.

Here is an example:

```java
private static class ShiftLeft extends ExtensionFunctionDefinition {
    @Override
    public StructuredQName getFunctionQName() {
        return new StructuredQName("eg", "http://example.com/saxon-extension", "shift-left");
    }

    @Override
    public SequenceType[] getArgumentTypes() {
        return new SequenceType[] {SequenceType.SINGLE_INTEGER, SequenceType.SINGLE_INTEGER};
    }

    @Override
    public SequenceType getResultType(SequenceType[] suppliedArgumentTypes) {
        return SequenceType.SINGLE_INTEGER;
    }
}
```
```java
@override
public ExtensionFunctionCall makeCallExpression() {
    return new ExtensionFunctionCall() {
        public SequenceIterator call(SequenceIterator[] arguments, XPathContext context)
            throws XPathException {
            long v0 = ((IntegerValue)arguments[0].next()).longValue();
            long v1 = ((IntegerValue)arguments[1].next()).longValue();
            long result = v0 << v1;
            return Value.asIterator(Int64Value.makeIntegerValue(result));
        }
    };
}
```

2. Compile the class and add it to a JAR file.
3. Add a file called `net.sf.saxon.lib.ExtensionFunctionDefinition` that contains the fully qualified name of the Java class in the `META-INF/services/` folder of the JAR file.

Note: To add more function definitions in the same JAR file, you need to add their fully qualified names on different lines.

To enable Oxygen XML Author to pick up your custom function definition, the JAR file should be added to the classpath of the transformer. Here are some possibilities:

- If you develop a framework, you just need to link the JAR file in the Classpath tab (on page 98).
- In a validation scenario (on page 1036), you can use the Extensions button to open a dialog box where you can add libraries.
- In a transformation scenario, you can use the Extensions button in the XSLT tab (on page 1294) to open a dialog box where you can add libraries.
- You can also create a plugin that contributes such a JAR file in the classpath (on page 2151).

FO Processor Tab (XSLT Transformations)

When you create a new transformation scenario (on page 1292) or edit an existing one (on page 1374), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The FO Processor tab contains the following options:

- Perform FO Processing
Specifies whether or not an FO processor is applied (either the built-in Apache FOP engine or an external engine defined in Preferences) during the transformation.

**Input**

Choose between the following options to specify which input file to use:

- **XSLT result as input** - The FO processor is applied to the result of the XSLT transformation that is defined in the XSLT tab.
- **XML URL as input** - The FO processor is applied to the input XML file.

**Method**

The output format of the FO processing. The available options depend on the selected processor type.

**Processor**

Specifies the FO processor to be used for the transformation. It can be the built-in Apache FOP processor or an external processor (on page 206).

**Output Tab (XSLT Transformations)**

When you create a new transformation scenario (on page 1292) or edit an existing one (on page 1374), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Output** tab contains the following options:

**Prompt for file**

At the end of the transformation, a file browser dialog box is displayed for specifying the path and name of the file that stores the transformation result.

**Save As**

The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the 📁 Insert Editor Variables (on page 266) button, or the 📥 Browse button.

**Open in Browser/System Application**

If selected, Oxygen XML Author automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows PDF files are often opened in Acrobat Reader).

**Note:** To set the web browser that is used for displaying HTML/XHTML pages, go to Options > Preferences > Global, and set it in the Default Internet browser field.
• **Output file** - When *Open in Browser/System Application* is selected, you can use this button to automatically open the default output file at the end of the transformation.

• **Other location** - When *Open in Browser/System Application* is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the ✉️ *Insert Editor Variables (on page 266)* button, or the 📦 *Browse* button.

**Open in editor**

When this is option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

**Show in results view as**

You can choose to view the results in one of the following:

• **XML** - If this is selected, Oxygen XML Author displays the transformation result in an XML viewer panel at the bottom of the application window with syntax highlighting *(on page 173)*.

• **SVG** - If this is selected, Oxygen XML Author displays the transformation result in an integrated SVG viewer in the Results panel *(on page 1120)* at the bottom of the application window and renders the result as an SVG image.

• **XHTML** - This option is only available if *Open in Browser/System Application* is not selected. If selected, Oxygen XML Author displays the transformation result in a built-in XHTML browser panel at the bottom of the application window.

⚠️ **Important**: When transforming very large documents, you should be aware that selecting this option may result in very long processing times. This drawback is due to the built-in Java XHTML browser implementation. To avoid delays for large documents, if you want to see the XHTML result of the transformation, you should use an external browser by selecting the *Open in Browser/System Application* option instead.

• **Image URLs are relative to** - If *Show in results view as XHTML* is selected, this option specifies the path used to resolve image paths contained in the transformation result. You can specify the path by using the text field, the ✉️ *Insert Editor Variables (on page 266)* button, or the 📦 *Browse* button.

⚠️ **Attention**: If your input XSLT contains `<xsl:result-document>` elements, then the secondary results will be saved to the specified URIs while the principal result is specified in this Output tab. For more information, see: https://www.w3.org/TR/xslt-30/#element-result-document.
Configuring an XSLT Processor for Generating Output

This section explains how to configure an XSLT processor and extensions for such a processor in Oxygen XML Author.

Supported XSLT Processors

Oxygen XML Author includes the following XSLT processors:

- **Xalan 2.7.2** - Xalan-Java is an XSLT processor for transforming XML documents into HTML, text, or other XML document types. It implements XSL Transformations (XSLT) Version 1.0 and XML Path Language (XPath) Version 1.0.

- **Saxon 6.5.5** - Saxon 6.5.5 is an XSLT processor that implements the Version 1.0 XSLT and XPath with a number of powerful extensions. This version of Saxon also includes many of the new features that were first defined in the XSLT 1.1 working draft, but for conformance and portability reasons these are not available if the stylesheet header specifies `version="1.0"`.

- **Saxon 9.8.0.12 Home Edition (HE), Professional Edition (PE)** - Saxon-HE/PE implements the basic conformance level for XSLT 2.0 / 3.0 and XQuery 1.0. The term `basic XSLT 2.0 / 3.0 processor` is defined in the draft XSLT 2.0 / 3.0 specifications. It is a conformance level that requires support for all features of the language other than those that involve schema processing. The HE product remains open source, but removes some of the more advanced features that are present in Saxon-PE.

- **Saxon 9.8.0.12 Enterprise Edition (EE)** - Saxon EE is the schema-aware edition of Saxon and it is one of the built-in processors included in Oxygen XML Author. Saxon EE includes an XML Schema processor, and schema-aware XSLT, XQuery, and XPath processors.

The validation in schema aware transformations is done according to the XML Schema 1.0 or 1.1. This can be configured in Preferences (on page 186).

**Note:** Oxygen XML Author implements a Saxon framework that allows you to create Saxon configuration files. Two templates are available: Saxon collection catalog and Saxon configuration. Both of these templates support content completion, element annotation, and attribute annotation.

**Note:** Saxon can use the **ICU-J localization library** (saxon9-icu.jar) to add support for sorting and date/number formatting in a wide variety of languages. This library is not included in the Oxygen XML Author installation kit. However, Saxon will use the default collation and localization support available in the currently used JRE. To enable this capability, follow these steps:

2. Unpack the downloaded archive.
3. Create a new XSLT transformation scenario (or edit an existing one). In the **XSLT** tab, click the **Extensions** button to open the list of additional libraries used by the transformation process.

4. Click **Add** and browse to the folder where you unpacked the downloaded archive and choose the `saxon9-icu.jar` file.

   Note that the `saxon9-icu.jar` should **NOT** be added to the application library folder because it will conflict with another version of the ICU-J library that comes bundled with Oxygen XML Author.

- **Xsltproc (libxslt)** - Libxslt is the XSLT C library developed for the Gnome project. Libxslt is based on libxml2, the XML C library developed for the Gnome project. It also implements most of the EXSLT set of processor-portable extensions, functions, and some of Saxon's evaluate and expression extensions.

Oxygen XML Author uses Libxslt through its command-line tool (`xsltproc`). Depending on your operating system, you must download the Libxslt libraries on your machine from [http://xmlsoft.org/XSLT/downloads.html](http://xmlsoft.org/XSLT/downloads.html) and place them in a local folder. Then you need to update the `PATH` environmental variable to contain the parent folder where the `xsltproc` executable is located.

**Tip:** As an example, a Windows installation of the Xsltproc engine would follow these steps:

2. Unzip all of them into the same folder of your choice.

3. Edit the `PATH` environment variable and add the `bin` folder for all four archives:

   ```
   Edit environment variable
   ```
   ```
   D:\apache-maven-3.1.1\bin
   D:\Python27
   %PATH%
   C:\Users\Desktop\libxslt-1.1.26.win32\bin
   C:\Users\Desktop\libxml2-2.7.8.win32\bin
   C:\Users\Desktop\iconv-1.9.2.win32\bin
   C:\Users\Desktop\zlib-1.2.5\bin
   ```

**Result:** You can now use the `xsltproc` processor as an XSLT engine in the XSLT transformation scenario.

**Note:** The Xsltproc processor can be configured from the **XSLTPROC** options page (on page 196).
CAUTION: There is a known problem where file paths that contain spaces are not handled correctly in the LIBXML processor. For example, the built-in XML Catalog (on page 2800) files of the built-in document types (DocBook, TEI, DITA, etc.) are not handled properly by LIBXML if Oxygen XML Author is installed in the default location on Windows (C:\Program Files). This is because the built-in XML catalog files are stored in the \OXYGEN_INSTALL_DIR\frameworks subdirectory of the installation directory, and in this case it contains a space character.

- **MSXML 4.0** - MSXML 4.0 is available only on Windows platforms. It can be used for transformation (on page 1292).

Oxygen XML Author uses the Microsoft XML parser through its command-line tool msxsl.exe.

Since msxsl.exe is only a wrapper, Microsoft Core XML Services (MSXML) must be installed on the computer. Otherwise, you will get a corresponding warning. You can get the latest Microsoft XML parser from Microsoft web-site.

- **MSXML .NET** - MSXML .NET is available only on Windows platforms. It can be used for transformation (on page 1292).

Oxygen XML Author performs XSLT transformations and validations using the .NET Framework XSLT implementation (System.Xml.Xsl.XslTransform class) through the nxslt command-line utility. The nxslt version included in Oxygen XML Author is 1.6.

You should have the .NET Framework version 1.0 already installed on your system. Otherwise, you will get the following warning: MSXML.NET requires .NET Framework version 1.0 to be installed. Exit code: 128.

You can get the .NET Framework version 1.0 from the Microsoft website.

- **.NET 1.0** - A transformer based on the System.Xml 1.0 library available in the .NET 1.0 and .NET 1.1 frameworks from Microsoft (http://msdn.microsoft.com/xml/). It is available only on Windows.

You should have the .NET Framework version 1.0 or 1.1 already installed on your system. Otherwise, you will get the following warning: MSXML.NET requires .NET Framework version 1.0 to be installed. Exit code: 128.

You can get the .NET Framework version 1.0 from the Microsoft website.

- **.NET 2.0** - A transformer based on the System.Xml 2.0 library available in the .NET 2.0 Framework from Microsoft. It is available only on Windows.

You should have the .NET Framework version 2.0 already installed on your system. Otherwise, you will get the following warning: MSXML.NET requires .NET Framework version 2.0 to be installed. Exit code: 128.

You can get the .NET Framework version 2.0 from the Microsoft website.
For information about configuring the XSLT preferences, see the XSLT options (on page 192) section.

Configuring Custom XSLT Processors

Oxygen XML Author allows you to configure custom processors to be used for running XSLT and XQuery transformations.

To add a new custom processor, follow these steps:

1. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to XML > XSLT-FO-XQuery > Custom Engines.
2. Click the New button at the bottom of the dialog box.
3. Configure the parameters for the custom engine (on page 204).
4. Click OK.

Note:
The output messages of a custom processor are displayed in an output view at the bottom of the application window. If an output message follows the format of an Oxygen XML Author linked message (on page 1033), clicking it highlights the location of the message in an editor panel containing the file referenced in the message.

Related Information:

- Custom Engines Preferences (on page 204)

Configuring the XSLT Processor Extensions Paths

The Xalan and Saxon processors support the use of extension elements and extension functions. Unlike a literal result element, which the stylesheet simply transfers to the result tree, an extension element performs an action. The extension is usually used because the XSLT stylesheet fails in providing adequate functions for accomplishing a more complex task.

For more information about how to use extensions, see the following links:

- Saxon 6.5.5 - http://saxon.sourceforge.net/saxon6.5.5/extensions.html

To set an XSLT processor extension (a directory or a jar file), use the Extensions button (on page 1294) in the Edit scenario dialog box.
XSL-FO (Apache FOP) Processor for Generating PDF Output

The Oxygen XML Author installation package is distributed with the Apache FOP that is a Formatting Objects processor for transforming your XML documents to PDF. FOP is a print and output independent formatter driven by XSL Formatting Objects. FOP is implemented as a Java application that reads a formatting object tree and renders the resulting pages to a specified output.

To see the version of the built-in XSL-FO processor for your installation, go to Help > About > Libraries and search for Apache FOP.

Other FO processors can be configured in the FO Processors preferences page (on page 206).

Add a Font to the Built-in FO Processor - Simple Version

If the font that must be set to Apache FOP is one of the fonts that are installed in the operating system you should follow the next steps for creating and setting a FOP configuration file that looks for the font that it needs in the system fonts. It is a simplified version of the procedure for setting a custom font in Apache FOP (on page 1356).

1. Register the font in FOP configuration. (This is not necessary for DITA PDF transformations, skip to the next step)
   a. Create a FOP configuration file that specifies that FOP should look for fonts in the installed fonts of the operating system.

   ```xml
   <fop version="1.0">
     <renderers>
       <renderer mime="application/pdf">
         <fonts>
           <auto-detect/>
         </fonts>
       </renderer>
     </renderers>
   </fop>
   ```

   b. Open the Preferences dialog box (Options > Preferences) (on page 79), go to XML > XSLT/FO/XQuery > FO Processors, and enter the path of the FOP configuration file in the Configuration file text field.

2. Set the font on the document content.
   This is done usually with XSLT stylesheet parameters and depends on the document type processed by the stylesheet.
• For DocBook documents you can start with the built-in scenario called DocBook PDF, edit the XSLT parameters (on page 1292) and set the font name (for example, Arial Unicode MS) to the parameters body.font.family and title.font.family.

• For TEI documents you can start with the built-in scenario called TEI PDF, edit the XSLT parameters (on page 1292) and set the font name (for example, Arial Unicode MS) to the parameters bodyFont and sansFont.

• For DITA transformations to PDF using DITA-OT you should modify the following two files:
  * `DITA-OT-DIR/plugins/org.dita.pdf2/cfg/fo/font-mappings.xml` - The font-face element included in each element physical-font having the attribute char-set="default" must contain the name of the font (for example, Arial Unicode MS)
  * `DITA-OT-DIR/plugins/org.dita.pdf2.fop/fop/conf/fop.xconf` - An element auto-detect must be inserted in the element fonts, which is inside the element renderer that has the attribute mime="application/pdf":

```xml
<renderer mime="application/pdf">
  . .
  <fonts>
    <auto-detect/>
  </fonts>
  . .
</renderer>
```

Add a Font to the Built-in FO Processor - Advanced Version

If an XML document is transformed to PDF using the built-in Apache FOP processor but it contains some Unicode characters that cannot be rendered by the default PDF fonts, then a special font that is capable to render these characters must be configured and embedded in the PDF result.

⚠️ Important: On Windows, fonts are located into the C:\Windows\Fonts directory. On Mac, they are placed in /Library/Fonts. To install a new font on your system, it is enough to copy it in the Fonts directory. If a special font is installed in the operating system, there is a simple way of telling FOP to look for it. See the simplified procedure for adding a font to FOP (on page 1355).

1. Locate the font.

   First, find out the name of a font that has the glyphs for the special characters you used. One font that covers most characters, including Japanese, Cyrillic, and Greek, is Arial Unicode MS.

2. Register the font in the FOP configuration.
**Note:** DITA PDF transformations have their own `fop.xconf` ([DITA-OT-DIR/plugins/org.dita.pdf2.fop/fop/conf/fop.xconf](https://xmlgraphics.apache.org/fop/2.3/fonts.html)). If the font is not installed in the system, it needs to be referenced in the `fop.xconf`.

a. For information about registering the font in the FOP Configuration, see: [https://xmlgraphics.apache.org/fop/2.3/fonts.html](https://xmlgraphics.apache.org/fop/2.3/fonts.html).

b. Open the Preferences dialog box (Options > Preferences) (on page 79), go to XML > XSLT/FO/XQuery > FO Processors, and enter the path of the FOP configuration file in the Configuration file text field.

3. Set the font on the document content. This is usually done with XSLT stylesheet parameters and depends on the document type processed by the stylesheet.

**DocBook Example:** For DocBook documents, you can start with the built-in scenario called DocBook PDF, edit the XSLT parameters (on page 1292), and set the font name (for example, Arialuni) to the parameters `body.font.family` and `title.font.family`.

**TEI Example:** For TEI documents, you can start with the built-in scenario called TEI PDF, edit the XSLT parameters (on page 1292), and set the font name (for example, Arialuni) to the parameters `bodyFont` and `sansFont`.

**DITA Example:** For DITA to PDF transformations using DITA-OT modify the following two files:

- **DITA-OT-DIR/plugins/org.dita.pdf2/cfg/fo/font-mappings.xml** - The `font-face` element included in each element `physical-font` having the attribute `charset="default"` must contain the name of the font.
- **DITA-OT-DIR/plugins/org.dita.pdf2/fop/conf/fop.xconf** - An element `font` must be inserted in the element `fonts`, which is inside the element `renderer` that has the attribute `mime="application/pdf"`.

For more information, see: [https://xmlgraphics.apache.org/fop/2.1/fonts.html](https://xmlgraphics.apache.org/fop/2.1/fonts.html).

### Adding Libraries to the Built-in FO Processor (XML with XSLT and FO)

Starting with Oxygen XML Author version 20.0, both hyphenation and PDF image support are enabled by default in the built-in Apache FO processor. For older version of Oxygen XML Author, use the following procedures to enable such support.

### Adding Hyphenation Support for XML with XSLT Transformation Scenarios

If you want to add newer hyphenation libraries or you are using an older version of Oxygen XML Author, follow this procedure:
1. Create a folder called \texttt{fop} in the \texttt{[OXYGEN\_INSTALL\_DIR]/lib} folder.
2. Download the compiled \texttt{JAR} \texttt{(on page 2795)} from OFFO.
3. Copy the \texttt{fop-hyph.jar} file into the \texttt{[OXYGEN\_INSTALL\_DIR]/lib/fop} folder.

**Adding Support for PDF Images**

To add support for PDF images in an older version of Oxygen XML Author, follow these steps:

1. Create a folder called \texttt{fop} in the \texttt{[OXYGEN\_INSTALL\_DIR]/lib} folder.
2. Download the \texttt{fop-pdf-images} \texttt{JAR} libraries.
3. Copy the libraries into the \texttt{[OXYGEN\_INSTALL\_DIR]/lib/fop} folder.

**How to Enable Debugging for FO Processor Transformations**

If you encounter errors when running PDF transformations that use an FO processor, it is possible to enable debugging/logging to help you identify the problem. To enable debugging/logging for FO processing, follow this procedure:

1. Locate and edit the following configuration file: \texttt{[OXYGEN\_INSTALL\_DIR]/tools/config/log4j.xml}.

   \begin{itemize}
   \item \textbf{Note:} You need write access to this folder, so if you do not have administrator permissions, you may first need to copy the file to another location where you have write access.
   \item Edit the \texttt{priority} element (inside the \texttt{root} element) and change its value to \texttt{debug}.
   \item Save the file in the original location.
   \item Restart Oxygen XML Author and re-run the transformation.
   \end{itemize}

   \begin{itemize}
   \item \textbf{Tip:} It is recommended that you use a small input file when trying to reproduce the problem, to make it easier to analyze the data in the log.
   \item Once you are finished with the debugging session, remember to edit the \texttt{log4j.xml} file and change the \texttt{priority} element back to its original value. Otherwise, performance could be affected.
   \end{itemize}

**XProc Transformation**

This type of transformation specifies the parameters and location of an XProc script.

A sequence of transformations described by an XProc script can be executed with an XProc transformation scenario. To create an \textbf{XProc transformation} scenario, use one of the following methods:
• Use the Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on OS X)) action from the toolbar or the Document > Transformation menu. Then click the New button and select XProc transformation.

• Go to Window > Show View and select Transformation Scenarios to display this view (on page 1384). Click the New Scenario drop-down menu button and select XProc transformation.

Both methods open the New Scenario dialog box.

The upper part of the dialog box allows you to specify the Name of the transformation scenario and the following Storage options:

• Project Options (on page 2798) - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.

• Global Options (on page 2795) - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

Related Information:

• Integrating an External XProc Engine (on page 1363)

XProc Tab

When you create a new transformation scenario (on page 1292) or edit an existing one (on page 1374), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The XProc tab contains the following options:

XProc URL

Specify the source XSL file to be used by the transformation. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 266) button, or the browsing actions in the Browse drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

Processor
Allows you to select the XProc engine to be used for the transformation. You can select the Add-on for Calabash XProc engine or a custom engine that is configured in the XProc Preferences page (on page 190).

Inputs Tab (XProc Transformations)

When you create a new transformation scenario (on page 1292) or edit an existing one (on page 1374), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The Inputs tab contains a list with the ports that the XProc script uses to read input data. Use the Filter text box to search for a specific term in the entire ports collection.

Each input port has an assigned name in the XProc script. The XProc engine reads data from the URL specified in the URL column.

The following actions are available for managing the input ports:

**New**

Opens an Edit dialog box that allows you to add a new port and its URL. The built-in editor variables (on page 266) and custom editor variables (on page 274) can be used to specify the URL.

**Edit**

Opens an Edit dialog box that allows you to modify the selected port and its URL. The built-in editor variables (on page 266) and custom editor variables (on page 274) can be used to specify the URL.

**Delete**

Removes the selected port from the list. It is available only for new ports that have been added to the list.

Parameters Tab (XProc Transformations)

When you create a new transformation scenario (on page 1292) or edit an existing one (on page 1374), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The Parameters tab presents a list of ports and parameters collected from the XProc script. The tab is divided into three sections:

**List of Ports**

In this section, you can use the New and Delete buttons to add or remove ports.

**List of Parameters**
This section presents a list of parameters for each port and includes columns for the parameter name, namespace URI, and its value. Use the Filter text box to search for a specific term in the entire parameters collection. You can use the New and Delete buttons to add or remove parameters. You can edit the value of each cell in this table by double-clicking the cell. You can also sort the parameters by clicking the column headers.

**Editor Variable Information**

The built-in editor variables (on page 266) and custom editor variables (on page 274) can be used for specifying the URI. The message pane at the bottom of the dialog box provides more information about the editor variables that can be used.

**Outputs Tab (XProc Transformations)**

When you create a new transformation scenario (on page 1292) or edit an existing one (on page 1374), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The Outputs tab displays a list of output ports (along with the URL) collected from the XProc script. Use the Filter text box to search for a specific term in the entire ports collection. You can also sort the columns by clicking the column headers.

The following actions are available for managing the output ports:

- **New**
  
  Opens an Edit dialog box that allows you to add a new output port and its URL. An editor variable (on page 266) can be inserted for the URL by using the Insert Editor Variables button. There is also a Show in transformation results view option that allows you to select whether or not the results will be displayed in the output Results view (on page 343).

- **Edit**
  
  Opens an Edit dialog box that allows you to edit an existing output port and its URL. An editor variable (on page 266) can be inserted for the URL by using the Insert Editor Variables button. There is also a Show in transformation results view option that allows you to select whether or not the results will be displayed in the output Results view (on page 343).

- **Delete**
  
  Removes the selected output port from the list. It is available only for new ports that have been added to the list.

Additional options that are available at the bottom of this tab include:
Open in Editor

If this option is selected, the XProc transformation result is automatically opened in an editor panel.

Open in Browser/System Application

If this option is selected, you can specify a file to be opened at the end of the XProc transformation in the browser or system application that is associated with the file type. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 266) button, or the browsing actions in the Browse drop-down list.

Results

The result of the XProc transformation can be displayed as a sequence in an output view with two sections:

- A list with the output ports on the left side.
- The content that correspond to the selected output port on the right side.

Figure 394. XProc Transformation Results View

Options Tab (XProc Transformations)

When you create a new transformation scenario (on page 1292) or edit an existing one (on page 1374), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The Options tab displays a list of the options collected from the XProc script. The tab is divided into two sections:

List of Options

This section presents a list of options and includes columns for the option name, namespace URI, and its value. Use the Filter text box to search for a specific term in the entire options collection. You can use the New and Delete buttons to add or remove
options. You can edit the value of each cell in this table by double-clicking the cell. You can also sort the parameters by clicking the column headers. The names of edited options are displayed in bold.

**Editor Variable Information**

The built-in editor variables *(on page 266)* and custom editor variables *(on page 274)* can be used for specifying the URI. This section provides more information about the editor variables that can be used.

**Calabash XProc Processor for Generating PDF Output**

To generate PDF output from your XProc pipeline (when using the Calabash XProc processor), follow these steps:

1. Open the `{OXYGEN_INSTALL_DIR}/lib/xproc/calabash/engine.xml` file.
2. Uncomment the `<system-property name="com.xmlcalabash.fo-processor" value="com.xmlcalabash.util.FoXEP"/>` system property.
3. Uncomment the `<system-property name="com.renderx.xep.CONFIG" file="../../../tools/xep/xep.xml"/>` system property. Edit the `file` attribute to point to the configuration file that is usually located in the XEP installation folder.
4. Uncomment the references to the XEP libraries. Edit them to point to the matching library names from the XEP installation directory.
5. Restart Oxygen XML Author.

**Integrating an External XProc Engine**

Oxygen XML Author includes a bundled version of the Calabash XProc engine that can be used for XProc transformations and validation, but you can also integrate other external XProc engines. When you edit an XProc transformation scenario, there is a Processor drop-down menu where you can select the XProc engine to be used for the transformation.

If you do not need the external XProc engine to be used for automatic validation or pass parameters/ports and it is not Java-based, you can simply add the external engine by using the XProc preferences page *(on page 190)*. Otherwise, if the external engine is Java-based, or it has validation support, or it has the ability to receive parameters or ports passed from the transformation, you need to integrate it using the plugin extension procedure below.

For example, there is a public project on GitHub that is an implementation for integrating Morgana XProc with Oxygen XML Author: [https://github.com/xml-project/support-for-xmlleditor](https://github.com/xml-project/support-for-xmlleditor). Also, the Javadoc documentation of the XProc API is available for download from the application website as a zip file: `xprocAPI.zip`.

To create an XProc integration project, follow these steps:
1. Move the oxygen.jar file from `{OXYGEN_INSTALL_DIR}/lib` to the lib folder of your project.

2. Implement the `ro.sync.xml.transformer.xproc.api.XProcTransformerInterface` interface.

3. Create a Java archive (JAR) (on page 2795) from the classes you created.

4. Create an engine.xml file according to the engine.dtd file. The attributes of the engine element are as follows:
   a. name - The name of the XProc engine.
   b. description - A short description of the XProc engine.
   c. class - The complete name of the class that implements `ro.sync.xml.transformer.xproc.api.XProcTransformerInterface`.
   d. version - The version of the integration.
   e. engineVersion - The version of the integrated engine.
   f. vendor - The name of the vendor / implementer.
   g. supportsValidation - true if the engine supports validation (otherwise, false).

   The engine element has only one child, runtime. The runtime element contains several library elements with the name attribute containing the relative or absolute location of the libraries necessary to run this integration.

5. Create a new folder (for example, named MyXprocEngine) and place the engine.xml and all the libraries necessary to run the new integration in that folder.

6. Place that new folder (e.g. MyXprocEngine) inside a new plugin folder. This new plugin folder should also contain a plugin.xml file that points to the new engine folder (e.g. MyXprocEngine).

   The plugin.xml file would look like this (it is based on the AdditionalXProcEngine extension (on page 2162)):

   ```xml
   <plugin
     id="morgana.xproc.addon"
     name="Contribute Morgana XProc"
     description="Contribute Morgana XProc"
     version="1.0"
     vendor="Syncro Soft"
     class="ro.sync.exml.plugin.Plugin"
     classLoaderType="preferReferencedResources">
     <extension type="AdditionalXProcEngine" path="MyXprocEngine/"/>
   </extension>
   </plugin>
   ```

Related Information:
XQuery Transformation

This type of transformation specifies the parameters and location of an XML source that the edited XQuery file is applied on.

**Note:** When the XML source is a native XML database, the source field of the scenario is empty because the XML data is read with XQuery-specific functions, such as `document()` . When the XML source is a local XML file, the URL of the file is specified in the input field of the scenario.

To create an **XQuery transformation** scenario, use one of the following methods:

- Use the ✉️ Configure Transformation Scenario(s) ([Ctrl + Shift + C](https://www.xmethods.net/OSX)) action from the toolbar or the **Document > Transformation** menu. Then click the **New** button and select **XQuery transformation**.
- Go to **Window > Show View** and select ✉️ **Transformation Scenarios** to display this view ([on page 1384](page-1384)). Click the ✗ • **New Scenario** drop-down menu button and select **XQuery transformation**.

Both methods open the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario and the following **Storage** options:

- **Project Options ([on page 2798](page-2798))** - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.
- **Global Options ([on page 2795](page-2795))** - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

**XQuery Tab**

When you create a new transformation scenario ([on page 1292](page-1292)) or edit an existing one ([on page 1374](page-1374)), a configuration dialog box allows you to customize the transformation with various options in several tabs.
The **XQuery** tab contains the following options:

**XML URL**

Specifies the source XML file. You can specify the path by using the text field, its history drop-down, the 📝 **Insert Editor Variables** ([on page 266](#)), or the browsing actions in the 🏫 - **Browse** drop-down list. You can also use the 📡 **Open in editor** button to open the specified file in the editor panel. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.

**Note:** If the transformer engine is Saxon 9.x and a custom URI resolver is configured in the advanced Saxon preferences page ([on page 195](#)), the XML input of the transformation is passed to that URI resolver.

**XQuery URL**

Specifies the source XQuery file to be used for the transformation. You can specify the path by using the text field, its history drop-down, the 📝 **Insert Editor Variables** ([on page 266](#)), or the browsing actions in the 🏫 - **Browse** drop-down list. You can also use the 📡 **Open in editor** button to open the specified file in the editor panel. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

**Transformer**

This drop-down menu presents all the transformation engines available to Oxygen XML Author for performing a transformation. These include the built-in engines and the external engines defined in the Custom Engines preferences page ([on page 204](#)). The engine you choose is used as the default transformation engine. Also, if an XSLT or XQuery document does not have an associated validation scenario, this transformation engine is used in the validation process (if it provides validation support).

**Advanced options**

Allows you to configure the advanced options of the Saxon HE/PE/EE engine ([on page 1312](#)) for the current transformation scenario. To configure the same options globally, go to the Saxon-HE/PE/EE preferences page ([on page 193](#)). For the current transformation scenario, these **Advanced options** override the options configured in that preferences page.

**Parameters**

Opens the Configure parameters dialog box ([on page 1310](#)) for configuring the XQuery parameters. You can use the buttons in this dialog box to add, edit, or remove parameters. If the XQuery transformation engine is custom-defined, you cannot use this dialog box to set parameters. Instead, you can copy all parameters from the dialog...
box using contextual menu actions and edit the custom XQuery engine to include the necessary parameters in the command line that starts the transformation process.

**Extensions**

Opens a dialog box for configuring the XQuery extension JARS or classes *(on page 1312)* that define extension Java functions or extension XSLT elements used in the transformation.

**XQuery Parameters**

The global parameters of the XQuery file used in a transformation scenario can be configured by using the **Parameters** button in the **XQuery** tab.

The resulting dialog box includes a table that displays all the parameters of the current XQuery file, along with their descriptions and current values. You can also add, edit, and remove parameters, and use the **Filter** text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

If the **XPath** column is selected, the parameter value is evaluated as an XPath expression before starting the XQuery transformation.

**Example:**

For example, you can use expressions such as:

```xml
doc('test.xml')//entry
//person[@atr='val']
```

**Note:**

1. The `doc` function solves the argument relative to the XQuery file location. You can use full paths or *editor variables*(on page 266) (such as `$cfdu` [current file directory]) to specify other locations: `doc('${cfdu}/test.xml')/*`
2. Only XPath functions are allowed.

Below the table, the following actions are available for managing the parameters:

**New**

Opens the **Add Parameter** dialog box that allows you to add a new parameter to the list. An *editor variable*(on page 266) can be inserted in the text box using the **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

**Edit**
Opens the **Edit Parameter** dialog box that allows you to edit the selected parameter. An *editor variable (on page 266)* can be inserted in the text box using the **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

**Unset**

Resets the selected parameter to its default value. Available only for edited parameters with set values.

**Delete**

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

The bottom panel presents the following:

- The default value of the parameter selected in the table.
- A description of the parameter, if available.
- The system ID of the stylesheet that declares it.

**Related Information:**

- Editor Variables *(on page 266)*

**XQuery Extensions**

The **Extensions** button is used to specify the *JAR (on page 2795)* and classes that contain extension functions called from the XQuery file of the current transformation scenario. You can use the **Add**, **Edit**, and **Remove** buttons to configure the extensions.

An extension function called from the XQuery file of the current transformation scenario will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item to be moved and press the **Move up** or **Move down** buttons.

**Advanced Saxon HE/PE/EE XQuery Transformation Options**

The XQuery transformation scenario allows you to configure advanced options that are specific for the Saxon HE (Home Edition), PE (Professional Edition), and EE (Enterprise Edition) engines.
Saxon-HE/PE/EE Options

The advanced options for Saxon 9.8.0.12 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE) are as follows:

**Use a configuration file (“-config”)**

Sets a Saxon 9.8.0.12 configuration file that is used for XQuery transformation and validation scenarios.

**Enable Optimizations (“-opt”)**

This option is selected by default, which means that optimization is enabled. If not selected, the optimization is suppressed, which is helpful when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

**Use linked tree model (“-tree:linked”)**

This option activates the linked tree model.

**Recoverable errors (“-warnings”)**

Specifies how dynamic errors are handled. The following options can be selected:

- **Recover silently (“silent”)** - Continues processing without reporting the error.
- **Recover with warnings (“recover”)** - Issues a warning but continues processing.
- **Signal the error and do not attempt recovery (“fatal”)** - Issues an error and stops processing.

**Strip whitespaces (“-strip”)**

Specifies how the *strip whitespaces* operation is handled. You can choose one of the following values:

- **All (“all”)** - Strips all whitespace text nodes from source documents before any further processing, regardless of any `xml:space` attributes in the source document.
- **Ignore (“ignorable”)** - Strips all ignorable whitespace text nodes from source documents before any further processing, regardless of any `xml:space` attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
- **None (“none”)** - Strips no whitespace before further processing.

Saxon-PE/EE Options

The following advanced options are specific for Saxon 9.8.0.12 Professional Edition (PE) and Enterprise Edition (EE) only:
Allow calls on extension functions ("-ext")

If selected, calls on external functions are allowed. Selecting this option is recommended in an environment where untrusted stylesheets may be executed. It also disables user-defined extension elements and the writing of multiple output files, both of which carry similar security risks.

Saxon-EE Options

The advanced options that are specific for Saxon 9.8.0.12 Enterprise Edition (EE) are as follows:

Validation of the source file ("-val")

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

- **Schema validation ("strict")** - This mode requires an XML Schema and allows for parsing the source documents with strict schema-validation enabled.
- **Lax schema validation ("lax")** - If an XML Schema is provided, this mode allows for parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

Validation errors in the result tree treated as warnings ("-outval")

Normally, if validation of result documents is requested, a validation error is fatal. Selecting this option causes such validation failures to be treated as warnings.

Write comments for non-fatal validation errors of the result document

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

Enable XQuery update ("-update:(on|off)")

This option controls whether or not XQuery update syntax is accepted. The default value is off.

Backup files updated by XQuery ("-backup:(on|off)")

If selected, backup versions for any XML files updated with an XQuery Update are generated. This option is available when the **Enable XQuery update** option is selected.
Other Options

Initializer class

Equivalent to the `-init` Saxon command-line argument. The value is the name of a user-supplied class that implements the `net.sf.saxon.lib.Initializer` interface. This initializer is called during the initialization process, and may be used to set any options required on the configuration programmatically. It is particularly useful for tasks such as registering extension functions, collations, or external object models, especially in Saxon-HE where the option cannot be set via a configuration file. Saxon only calls the initializer when running from the command line, but the same code may be invoked to perform initialization when running user application code.

FO Processor Tab (XQuery Transformations)

When you create a new transformation scenario (on page 1292) or edit an existing one (on page 1374), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The FO Processor tab contains the following options:

**Perform FO Processing**

Specifies whether or not an FO processor is applied (either the built-in Apache FOP engine or an external engine defined in Preferences) during the transformation.

**Input**

Choose between the following options to specify which input file to use:

- **XQuery result as input** - The FO processor is applied to the result of the XQuery transformation that is defined in the XQuery tab.
- **XML URL as input** - The FO processor is applied to the input XML file.

**Method**

The output format of the FO processing. The available options depend on the selected processor type.

**Processor**

Specifies the FO processor to be used for the transformation. It can be the built-in Apache FOP processor or an external processor (on page 206).
Output Tab (XQuery Transformations)

When you create a new transformation scenario (on page 1292) or edit an existing one (on page 1374), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The Output tab contains the following options:

**Present as a sequence**

Selecting this option will reduce the time necessary to fetch the full results, as it will only fetch the first chunk of the results.

**Prompt for file**

At the end of the transformation, a file browser dialog box is displayed for specifying the path and name of the file that stores the transformation result.

**Save As**

The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the **Insert Editor Variables** (on page 266) button, or the **Browse** button.

**Open in Browser/System Application**

If selected, Oxygen XML Author automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows PDF files are often opened in Acrobat Reader).

**Note:** To set the web browser that is used for displaying HTML/XHTML pages, go to Options > Preferences > Global, and set it in the Default Internet browser field.

- **Output file** - When Open in Browser/System Application is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When Open in Browser/System Application is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the **Insert Editor Variables** (on page 266) button, or the **Browse** button.

**Open in editor**

When this option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).
Show in results view as

You can choose to view the results in one of the following:

- **XML** - If this is selected, Oxygen XML Author displays the transformation result in an XML viewer panel at the bottom of the application window with [syntax highlighting](on page 173).
- **SVG** - If this is selected, Oxygen XML Author displays the transformation result in an integrated SVG viewer in the Results panel ([on page 1120](#)) at the bottom of the application window and renders the result as an SVG image.
- **XHTML** - This option is only available if [Open in Browser/System Application](#) is not selected. If selected, Oxygen XML Author displays the transformation result in a built-in XHTML browser panel at the bottom of the application window.

⚠️ **Important**: When transforming very large documents, you should be aware that selecting this option may result in very long processing times. This drawback is due to the built-in Java XHTML browser implementation. To avoid delays for large documents, if you want to see the XHTML result of the transformation, you should use an external browser by selecting the Open in Browser/System Application option instead.

- **Image URLs are relative to** - If Show in results view as XHTML is selected, this option specifies the path used to resolve image paths contained in the transformation result. You can specify the path by using the text field, the ❯ Insert Editor Variables ([on page 266](#)) button, or the ☐ Browse button.

SQL Transformation

This type of transformation specifies a database connection for the database server that runs the SQL file associated with the scenario. The data processed by the SQL script is located in the database.

To create an SQL transformation scenario, use one of the following methods:

- Use the ✉ Configure Transformation Scenario(s) ([Ctrl + Shift + C](Command + Shift + C on OS X)) action from the toolbar or the Document > Transformation menu. Then click the New button and select SQL transformation.
- Go to Window > Show View and select ✉ Transformation Scenarios to display this view ([on page 1384](#)). Click the ✉ New Scenario drop-down menu button and select SQL transformation.

Both methods open the New Scenario dialog box. This dialog box allows you to configure the following options that control the transformation:

Name
The unique name of the SQL transformation scenario.

**Storage**

Allows you to select one of the following storage options:

- **Project Options** (on page 2798) - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.

- **Global Options** (on page 2795) - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.

**SQL URL**

Allows you to specify the URL of the SQL script. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 266) button, or the browsing actions in the Browse drop-down list. You can also use the Open in editor button to open the specified file in the editor panel.

**Connection**

Allows you to select a connection from a drop-down list. To configure a connection, use the Advanced options button to open the Data Source preferences page (on page 218).

**Parameters**

Allows you to add or configure parameters for the transformation.

### Editing a Transformation Scenario

Editing a transformation scenario is useful if you need to configure some of its parameters.

**Note:** Since transformation scenarios that are associated with built-in frameworks (on page 2794) are read-only, to edit one of these scenarios you will need to duplicate it and edit the duplicated scenario (on page 1376).

To configure an existing transformation scenario, follow these steps:

1. Select the Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on OS X)) action from the toolbar or the Document > Transformation menu.

   **Step Result:** The Configure Transformation Scenario(s) dialog box (on page 1378) is opened.

2. Select the particular transformation scenario and click the Edit button at the bottom of the dialog box or from the contextual menu.
Tip: You could also select the scenario and the Edit button in the Transformation Scenarios view (on page 1384) to achieve the same result.

Result: This will open an Edit scenario configuration dialog box that allows you to configure various options in several tabs, depending on the type of transformation scenario that was selected.

Figure 395. Edit Scenarios Configuration Dialog Box

Transformation Types

The Configure Transformation Scenario(s) dialog box (on page 1378) contains a Type column that shows you the transformation type for each of the listed scenarios. Each type of transformation contains includes some tabs with various configuration options.

The following is a list of the transformation types and their particular tabs (click the name of each tab below to see details about all the options that are available):

- **DITA OT** - This type of transformation includes configurable options in the following tabs:
  - Skins Tab (on page 2709) (Available for WebHelp Classic and WebHelp Classic with Feedback)
  - Templates Tab (on page 2711) (Available for WebHelp Responsive and WebHelp Responsive with Feedback)
  - FO Processor Tab (on page 2715) (Available for PDF output)
  - Parameters Tab (on page 2717)
  - Filters Tab (on page 2719)
  - Advanced Tab (on page 2720)
  - Output Tab (on page 2722)

- **ANT** - This type of transformation includes configurable options in the following tabs:
  - Options Tab (on page 1336)
  - Parameters Tab (on page 1337)
  - Output Tab (on page 1338)
• **XSLT** - This type of transformation includes configurable options in the following tabs:
  ◦ XSLT Tab ([on page 1293](#))
  ◦ FO Processor Tab ([on page 1302](#))
  ◦ Output Tab ([on page 1302](#))

• **XProc** - This type of transformation includes configurable options in the following tabs:
  ◦ XProc Tab ([on page 1359](#))
  ◦ Inputs Tab ([on page 1360](#))
  ◦ Parameters Tab ([on page 1360](#))
  ◦ Outputs Tab ([on page 1361](#))
  ◦ Options Tab ([on page 1362](#))

• **XQuery** - This type of transformation includes configurable options in the following tabs:
  ◦ XQuery Tab ([on page 1309](#))
  ◦ FO Processor Tab ([on page 1314](#))
  ◦ Output Tab ([on page 1315](#))

### Related Information:

• Creating New Transformation Scenarios ([on page 1292](#))

• Duplicating a Transformation Scenario ([on page 1376](#))

• Configure Transformation Scenario(s) Dialog Box ([on page 1378](#))

• Applying Associated Transformation Scenarios ([on page 1377](#))

### Duplicating a Transformation Scenario

Duplicating a transformation scenario is useful for creating a scenario that is similar to an existing one or to edit a built-in transformation scenario.

To configure an existing transformation scenario, follow these steps:

1. Select the **Configure Transformation Scenario(s)** (Ctrl + Shift + C (Command + Shift + C on **OS X**)) action from the toolbar or the **Document > Transformation** menu.

   **Step Result:** The **Configure Transformation Scenario(s)** dialog box ([on page 1378](#)) is opened.

2. Select the particular transformation scenario and click the **Duplicate** button at the bottom of the dialog box or from the contextual menu.
**Tip:** You could also select the scenario and the Duplicate button in the Transformation Scenarios view (on page 1384) to achieve the same result.

**Result:** This will open an Edit scenario configuration dialog box that allows you to configure various options in several tabs, depending on the type of transformation scenario that was selected. For information about all the specific options in the various tabs, see the Transformation Types section (on page 1375).

Related Information:

- Creating New Transformation Scenarios (on page 1292)
- Editing a Transformation Scenario (on page 1374)

### Applying Associated Transformation Scenarios

If you have associated transformation scenarios for the current document (in the Configure Transformation Scenario(s) dialog box (on page 1378) or Transformation Scenarios view (on page 1384)), Oxygen XML Author included an Apply Transformation Scenario(s) action that allows you to quickly apply the associated transformation scenarios on the current document. Note that if an association is not detected, this action will open the Configure Transformation Scenario(s) dialog box (on page 1378) where you can choose the scenarios you want to apply.

The Apply Transformation Scenario(s) action can be initiated from any of the following methods:

- Use the Ctrl + Shift + T (Command + Shift + T on OS X)) keyboard shortcut.
- Click the Apply Transformation Scenario(s) button on the main toolbar.
- Click the Apply Transformation Scenario(s) button on the toolbar in the Transformation Scenarios view (on page 1384).
- Right-click a file in the Project view (on page 320) and select Transform > Apply Transformation Scenario(s).
- Use the Apply Associated button in the Configure Transformation Scenario(s) dialog box (on page 1378).

Related Information:

- Creating New Transformation Scenarios (on page 1292)
Configure Transformation Scenario(s) Dialog Box

You can use the Configure Transformation Scenario(s) dialog box for editing existing transformation scenarios (on page 1374) or creating new ones (on page 1292).

To open this dialog box, use the Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on OS X)) action from the toolbar or the Document > Transformation menu.

Figure 396. Configure Transformation Scenario(s) Dialog Box

Top Section

The top section of the dialog box contains a filter that allows you to search through the scenarios list and the Settings button allows you to configure the following options:

Show all scenarios
Select this option to display all the available scenarios, regardless of the document they are associated with.

**Show only the scenarios available for the editor**

Select this option to only display the scenarios that Oxygen XML Author can apply for the current document type.

**Show associated scenarios**

Select this option to only display the scenarios associated with the document you are editing.

**Export selected scenarios**

Use this option to export selected scenarios individually. Oxygen XML Author creates a scenarios file that contains the scenarios that you export. This is useful if you want to share scenarios with others or export them to another computer.

**Middle Section**

The middle section of the dialog box displays the scenarios that you can apply to the current document. You can view both the scenarios associated with the current document type and the scenarios defined at project level (on page 2798). The following columns are used to display the transformation scenarios:

- **Association** - The checkboxes in this column mark whether or not a transformation scenario is associated with the current document.
- **Scenario** - This column presents the names of the transformation scenarios.
- **Type** - If the Show Type contextual menu option is selected, this column displays the type of the transformation scenario. For further details about the types of transformation scenarios that are available in Oxygen XML Author, see the Transformation Types section (on page 1375).
- **Storage** - If the Show Storage contextual menu option is selected, this column displays where a transformation scenario is stored.

To sort each column you can left-click its header. The contextual menu of each header also includes the following actions:

**Show Type**
- Use this option to display the transformation type of each scenario.

**Show Storage**
- Use this option to display the storage location of the scenarios.

**Group by Association**
- Select this option to group the scenarios depending on whether or not they are associated with the current document.

**Group by Type**
- Select this option to group the scenarios by their type.

**Group by Storage**
- Select this option to group the scenarios by their storage location.

**Ungroup all**
- Select this option to ungroup all the scenarios.

**Reset Layout**
- Select this option to restore the default settings of the layout.

Each transformation scenario listed in the middle section of the dialog box also includes the following contextual menu actions:

**Edit**
- This button opens the Edit Scenario configuration dialog box (on page 1374) that allows you to configure the options of the transformations scenario.

**Duplicate**
- Use this button to create a duplicate transformation scenario (on page 1376).

**Remove**
- Use this button to remove custom transformation scenarios.

**Change storage**
- Allows you to change the storage location of a transformation scenario to Project Options (on page 2798) or Global Options (on page 2795). You are also able to keep
the original storage location and make a copy of the selected scenario in the new storage location.

**Import scenarios**

This option opens the **Import scenarios** dialog box that allows you to select the scenarios file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Author ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

- Keep or replace the existing scenario.
- Keep both scenarios.

**Note:** When you keep both scenarios, Oxygen XML Author adds *imported* to the name of the imported scenario.

**Export selected scenarios**

Use this option to export selected scenarios individually. Oxygen XML Author creates a scenarios file that contains the scenarios that you export. This is useful if you want to share scenarios with others or export them to another computer.

**Bottom Section**

The bottom section of the dialog box contains the following actions and information:

**Association follows selection**

Select this checkbox to automatically associate selected transformation scenarios with the current document. This option can also be used for multiple selections.

**Note:** When this option is selected, the **Association** column is hidden.

**New**

This button allows you to create a new transformation scenario *(on page 1292).*

**Edit**

This button opens the **Edit Scenario** dialog box that allows you to configure the options of the transformations scenario. For information about all the specific options in the various tabs, see the **Transformation Types section** *(on page 1375).*

**Note:** If you try to edit a transformation scenario associated with a defined document type, Oxygen XML Author displays a warning message to inform you that this is not possible and gives you the option to create a duplicate transformation scenario *(on page 1376)* to edit instead.
Duplicate

Use this button to create a duplicate transformation scenario (on page 1376).

Remove

Use this button to remove transformation scenarios.

Note: Removing scenarios associated with a defined document type is not allowed.

Associated scenarios section

Displays the scenarios that are associated with the current document. Selecting a checkbox in the Association column (on page 1379) in the list of scenarios will add that scenario to this section. To remove a scenario from being associated with the current document, simply click the remove icon (×) to the right of the scenario name.

Save and close

Saves the current configuration and closes the dialog box.

Apply associated

Use this button to apply the associated scenarios and run the transformation on the current document.

Cancel

Cancels any changes made in the dialog box and reverts to the previously saved association.

Your selections in the Configure Transformation Scenarios(s) dialog box are persistent so the configured associations for the current document will be remembered after the dialog box is closed.

Related Information:

- Editing a Transformation Scenario (on page 1374)
- Duplicating a Transformation Scenario (on page 1376)
- Applying Associated Transformation Scenarios (on page 1377)
- Creating New Transformation Scenarios (on page 1292)
- Sharing Transformation Scenarios (on page 1384)
Batch Transformations

A transformation action can be applied on a batch of selected files from the contextual menu of the Project view (on page 326) without having to open the files involved in the transformation. You can apply the same scenario to a batch of files or multiple scenarios to a single file or batch of files.

1. (Optional, but recommended) Organize the files you want to transform in logical folders.
   a. Create a logical folder in the Project view (on page 320) by using the New > Logical Folder action from the contextual menu of the root file.
   b. Add files you want to transform to the logical folder by using the Add Files or Add Edited File actions from the contextual menu of the logical folder.

   Note: You can skip this step if the files are already in a dedicated folder that does not include any additional files or folders. You can also manually select the individual files in the Project view (on page 320) each time you want to transform them, but this can be tedious.

2. Select the files you want to transform (or the newly created logical folder) and from the contextual menu, select Transform > Configure Transformation Scenario(s) to choose one or more transformation scenarios to be applied on all the files in the logical folder.

3. Use Oxygen XML Author editor variables (on page 266) to specify the input and output files. This ensures that each file from the selected set of resources is processed and that the output is not overwritten by the subsequent processing.
   a. Edit the transformation scenario to make sure the appropriate editor variable (on page 266) is assigned for the input file. For example, for a DocBook PDF transformation, make sure the XML URL input box is set to the $currentFileURL editor variable (on page 271). For a DITA PDF transformation, make sure the args.input parameter is set to the $cf editor variable (on page 271).
   b. Edit the transformation scenario to make sure the appropriate editor variable is assigned for the output file. For example, for an XML transformation with XSLT, switch to the Output tab and set the path of the output file using a construct of editor variables (on page 266), such as ${cfd}/${cfn}.html.

4. Now that logical folder has been associated with one or more transformation scenarios, whenever you want to apply the same batch transformation you can select Transform > Transform with from the contextual menu and the same previously associated scenario(s) will be applied.

5. If you want a different type of transformation to be applied to each file inside the logical folder, associate individual scenarios for each file and select Transform > Apply Transformation Scenario(s) from the contextual menu of the logical folder.

Related Information:
Sharing Transformation Scenarios

The transformation scenarios and their settings can be shared with other users by saving them at project level (on page 2798) or by exporting them to a specialized scenarios file (on page 266) that can then be imported. When you create a new transformation scenario or edit an existing one, there is a Storage option to control whether the scenarios are stored in Project Options (on page 2798) or Global Options (on page 2795).

Selecting Project Options (on page 2798) stores the scenario in the project file and can be shared with other users that have access to the project. If your project is saved on a source versioning system (CVS, SVN, Source Safe, etc.) then your team will have access to the scenarios that you define. When you create a scenario at the project level, the URLs from the scenario become relative to the project URL.

Selecting Global Options (on page 2795) stores the scenario in the global options that are stored in the user home directory.

You can also change the storage options on existing transformation scenarios by using the Change storage action (on page 1378) from the contextual menu of the list of scenarios.

Related Information:

- Sharing Application Settings (on page 256)

Transformation Scenarios View

You can manage the transformation scenarios by using the Transformation Scenarios view. To open this view, select Window > Show View > Transformation Scenarios.

Figure 397. Transformation Scenarios view
Oxygen XML Author supports multiple scenarios association. To associate multiple scenarios with a document, select the checkboxes in front of each scenario. You can also associate multiple scenarios with a document from the **Configure Transformation Scenario(s)** dialog box (on page 1378).

The **Transformation Scenarios** view presents both global and project-level (on page 2798) scenarios. By default, Oxygen XML Author presents the items in the following order:

1. Scenarios that match the current framework (on page 2794).
2. Scenarios that match the current project.
3. Scenarios that match other frameworks.

**Toolbar/Contextual Menu Actions and Options**

The following actions and options are available on the toolbar or in the contextual menu:

- **Apply selected scenarios**
  Select this option to run the current transformation scenario.

- **Debug selected scenario**
  Select this option to switch to the Debugger perspective (on page 2797) and initialize it with the parameters from the scenario (the XML, XSLT, or XQuery input, the transformation engine, the XSLT parameters).
New

This drop-down menu contains a list of the scenarios that you can create (on page 1292). Oxygen XML Author determines the most appropriate scenarios for the current type of file and displays them at the beginning of the list, followed by the rest of the scenarios.

Duplicate

Adds a new scenario to the list that is a duplicate of the current scenario. It is useful for creating a scenario that is similar to an existing one.

Edit

Opens the dialog box that allows you to configure various options in several tabs, depending on the type of transformation scenario that was selected. For information about all the specific options in the various tabs, see the Transformation Types section (on page 1375).

Remove

Removes the current scenario from the list. This action is also available by using the Delete key.

Change storage

Use this option to change the storage location of the selected scenario. You are also able to keep the original storage location and make a copy of the selected scenario in the target storage location.

Import scenarios

This option opens the Import scenarios dialog box that allows you to select the scenarios file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Author ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

- Keep or replace the existing scenario.
- Keep both scenarios.

Note: When you keep both scenarios, Oxygen XML Author adds imported to the name of the imported scenario.

Export selected scenarios

Use this option to export transformation and validation scenarios individually. Oxygen XML Author creates a scenarios file that contains the scenarios that you export.
Settings

This drop-down menu allows you to configure the following options (many of these options are also available if you right-click the name of a column):

Show all scenarios

Select this option to display all the available scenarios, regardless of the document they are associated with.

Show only the scenarios available for the editor

Select this option to only display the scenarios that Oxygen XML Author can apply for the current document type.

Show associated scenarios

Select this option to only display the scenarios associated with the document you are editing.

Change storage

Use this option to change the storage location of the selected scenario to Project Options (on page 2798) or Global Options (on page 2795). You are also able to keep the original storage location and make a copy of the selected scenario in the new storage location.

Import scenarios

This option opens the Import scenarios dialog box that allows you to select the scenarios file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Author ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

• Keep or replace the existing scenario.
• Keep both scenarios.

Note: When you keep both scenarios, Oxygen XML Author adds imported to the name of the imported scenario.

Export selected scenarios

Use this option to export selected scenarios individually. Oxygen XML Author creates a scenarios file that contains the scenarios that you export. This is useful if you want to share scenarios with others or export them to another computer.

Show Type
Use this option to display the transformation type of each scenario.

**Show Storage**

Use this option to display the storage location of the scenarios.

**Group by Association**

Select this option to group the scenarios depending on whether or not they are associated with the current document.

**Group by Type**

Select this option to group the scenarios by their type.

**Group by Storage**

Select this option to group the scenarios by their storage location.

**Ungroup all**

Select this option to ungroup all the scenarios.

**Reset Layout**

Select this option to restore the default settings of the layout.

Your selections in the **Transformation Scenarios** view are persistent so the configured associations for the current document will be remembered whenever the document is opened.

### WebHelp Classic Output

The **WebHelp Classic** variant is designed for desktop systems when feedback from users is not necessary and it is available for DocBook and DITA document types. The **WebHelp Classic with Feedback** variant also includes a feedback system that allows your users to make comments and allows you to manage and reply to them. This section contains information about configuring a WebHelp Classic system and customizing the output.

This type of WebHelp system can be generated by using one of the following transformation scenarios:

- **DITA Map WebHelp Classic** transformation scenario *(on page 1270)*
- **DITA Map WebHelp Classic with Feedback** transformation scenario *(on page 1271)*
- **DocBook WebHelp Classic** transformation scenario *(on page 1286)*
- **DocBook WebHelp Classic with Feedback** transformation scenario *(on page 1286)*

### WebHelp Classic Output Layout and Features

#### Layout of the WebHelp Classic System Interface

The layout of the **WebHelp Classic** system is comprised of the following components:

**Left Pane or Frame**

This section on the left side of the help system includes the following tabs:
Content

A typical table of contents style presentation of your content. You can use the Expand all/Collapse all buttons to expand or collapse all the topics presented in the Table of Contents.

Note: You can enhance the appearance of items in the Table of Contents. See the Customizing WebHelp Classic Output chapter (on page 1422) for more details.

Index

Presents the index terms for your content. If your content does not contain any indexterm elements, this tab is not generated.

Search Results

This tab is generated when the Search field is used. It presents the search results in the form of links to topics where the search terms are found, along with a rating scheme for each result. For more details, see the Search Feature section (on page 1393).

Upper Pane or Frame

The upper section of the help system includes the following features:

Search Field

Use this feature to perform searches in your content. When you enter search terms in this field, the results are displayed in the Search Results tab in the left section of the help system, along with a rating scheme for each result. For more details, see the Search Feature section (on page 1393).

Frames Option

Click on this option to display the output rendered in HTML frames.

Print Option

Opens a dialog box with various printing options and a print preview.

Navigation Links

You can navigate through the content of your output using the navigation links or arrows in the upper-right part of the page. These arrows allow you to move to the Parent topic, Previous topic, or Next topic. Links to the parent topics of the currently opened topic are also presented at the top of the page. For DITA output, these navigation links are controlled by the collection-type attribute. For example, if you set collection-
type="sequence" on a parent topic reference, navigation links will be generated in the output for that topic and all of its child topics.

**Tip:** To hide the Parent, Next, and Previous links, you can edit the transformation scenario and set the value of the `args.hide.parent.link` parameter to `yes`.

**Main Pane or Frame**

The content of the help pages are rendered and displayed in this main section.

Figure 398. WebHelp Classic Output

**WebHelp Classic with Feedback Enabled**

The **WebHelp Classic with Feedback** variant also contains a Comments section at the bottom of each topic. This section is where you can interact with users through a comment system. For information about deploying a feedback-enabled system, see Deploying a Feedback-Enabled System *(on page 1489)*.

Figure 399. WebHelp Classic with Feedback Comments Section
To add a new comment, click the Add New Comment button, or click Reply to add a comment to an existing thread. You can click on the Log in button on the right side of this bar to be authenticated as a user and your user name will be included in any comments that you add. If you do not have a user name, you can click on the Sign Up button to create a new user.

After you log in, your name and user name are displayed in the Comments bar, along with the Log off and Edit buttons. Click the Edit button to open the User Profile dialog box where you can customize the following options:

- **Your Name** - You can use this field to edit the initial name that you used to create your user profile.

- **Your email address** - You can use this field to edit the initial email address that you used to create your profile.

- You can choose to receive an email in the following situations:
  - When a comment is left on a page that you commented on.
  - When a comment is left on any topic in the WebHelp Classic system.
  - When a reply is left to one of my comments.

- **New Password** - Allows you to enter a new password for your user account.

Note: The Current Password field from the top of the User Profile is mandatory if you want to save the changes you make.
If you are an administrator, you can manage user information and comments. For more information, see Managing Users and Comments in a Feedback-Enabled System (on page 1493).

**WebHelp Classic Search Engine**

**Search Rules**

Rules that are applied during a search include:

- You can use quotes to perform an exact search for multiple word phrases (for example, "grow flowers" will only return results if both words are found consecutively and exactly as they are typed in the search field). This type of search is known as a **phrase search**.
- **Boolean Search** is supported using the following operators: *and*, *or*, *not*. When there are two adjacent search terms without an operator, *or* is used as the default search operator (for example, *grow flowers* is the same as *grow or flowers*).
- The space character separates keywords (an expression such as *grow flowers* counts as two separate keywords: *grow* and *flowers*).
- *indexterm* and *keywords* DITA elements are an effective way to increase the ranking of a page (for example, content inside a *keywords* element weighs more than an *H1* HTML element).
- Words composed by merging two or more words with colon (""), minus (""), underline (""), or dot ("" characters count as a single word.
- Your search terms should contain two or more characters (note that stop words will be ignored). This rule does not apply to CJK (Chinese, Japanese, Korean) languages.
- When searching for multi-word phrases in CJK (Chinese, Japanese, Korean) languages that often have multiple words appear in strings without a space separator, you need to add a space to separate the words. Otherwise WebHelp will not find results. For example, Chinese uses a specialized character for space separators, but the current WebHelp implementation cannot detect such specialized characters, so to search for #### (it translates as "before you begin" or "before start"), you have to enter ## ## (notice the space between the second and third symbols) in the search field.

**5-Star Rating Mechanism and Sorting**

The **Search** feature is also enhanced with a rating mechanism that computes scores for every result that matches the search criteria. These scores are then translated into a 5-star rating scheme and the stars are displayed to the right of each result. The search results are sorted depending on the following:

- Search entries that satisfy the phrase search criterion are presented first.
- The number of keywords found in a single page (the higher the number, the better).
- The context (for example, a word found in a title, scores better than a word found in unformatted text). The search ranking order, sorted by relevance is as follows:
The search term is included in a meta keyword.
The search term is in the title of the page.
The search term is in bold text in a paragraph.
The search term is in normal text in a paragraph.

Excluded Terms

To improve performance, the **Search** feature excludes certain *stop words*. For example, the English version of the *stop words* includes: *a, an, and, are, as, at, be, but, by, for, if, in, into, is, it, no, not, of, on, or, such, that, the, their, then, there, these, they, this, to, was, will, with.*

WebHelp Classic Search Results Tab

When you enter search terms in the **Search** field at the top of the help system, the results are displayed in the **Search Results** tab in the left section. When you click on a result in the **Search Results** tab, that result is displayed in the main pane with the search terms highlighted. If you press **Enter** with the **Search** field empty, the highlights are removed.

Figure 400. WebHelp Classic Search Results Tab
Missing Terms

If you enter multiple search terms (other than stop words), for any result that the search engine found at least one term but not one or more of the other terms, the Missing terms will be listed below each result.

Tag Element Scoring Values

HTML tag elements are also assigned a scoring value and these values are evaluated for the search results. For information about editing these values, see How to Change Element Scoring in Search Results (on page 1441).

Browser Compatibility

This output format is compatible with the most recent versions of the following common browsers:

- Edge
- Internet Explorer (IE 10 or newer)
• Chrome
• Firefox
• Safari
• Opera

⚠️ **Important**: Due to some security restrictions in certain browsers (Google Chrome and Internet Explorer), WebHelp Classic pages loaded from the local system (through URLs of the `file:///...` format) may not work properly. It is recommended that you load WebHelp Classic pages in Google Chrome or Internet Explorer only from a web server (with a URL such as `http://your.server.com/webhelp/index.html` or `http://localhost/web_pages/index.html`).

⚠️ **Warning**: Due to some restrictions in web browsers regarding JavaScript code, the *frameless* version (`index.html` start page) of the WebHelp Classic system should only be loaded from a web server (with a URL such as `http://your.server.com/webhelp/index.html` or `http://localhost/web_pages/index.html`). When loading WebHelp Classic pages from the local file system, the *frameset* version (`index_frames.html` start page) of the WebHelp Classic system should be used instead (`file:///...`).

Deploying a Feedback-Enabled System

**System Requirements**

The feedback-enabled WebHelp system requires a standard server deployment. You can request this from your server administrator and it requires the following system components:

• A Web server (such as *Apache Web Server*)
• A *MySQL* or *MariaDB* database server
• A database admin tool (such as *phpMyAdmin*)
• PHP Version 5.1.6 or later

The WebHelp system supports most of the recent versions of the following browsers: Chrome, Firefox, Edge, Internet Explorer, Safari, Opera.

**Create WebHelp with Feedback Database**

The *WebHelp with Feedback* system needs a database to store user details and the actual feedback, and a user added to it with all privileges. After this is created, you should have the following information:

• Database name
• Username
Exactly how you create the database and user depends on your web host and your particular needs.

**Example:**

The following procedure uses *phpMyAdmin* to create a MySQL database for the feedback system and a MySQL user with privileges for that database. The feedback system uses these credentials to connect to the database.

Using *phpMyAdmin* to create a database:

1. Access the *phpMyAdmin* instance running on your server.
2. Click *Databases* (in the right frame) and then create a *database*. You can give it any name you want (for example *comments*).
3. Create a user with connection privileges for this database.
4. Under *localhost*, in the right frame, click *Privileges* and then at the bottom of the page click the *reload the privileges* link.

**Deploying the WebHelp with Feedback Output**

If you have a web server configured with PHP and MySQL, you can deploy the WebHelp with Feedback output by following these steps:

1. Connect to your server using an FTP client.
2. Locate the home directory (from now on, referred to as *DOCUMENT_ROOT*) of your server.
3. Copy the transformation output folder into the *DOCUMENT_ROOT* folder.
4. Rename it to something relevant (for example, *myProductWebHelp*).
5. Open the output folder (for example, *http://[YOUR_SERVER]/myProductWebHelp/*). You are redirected to the installation wizard. Proceed with the installation as follows:
   a. Verify that the prerequisites are met.
   b. Press *Start Installation*.
   c. Configure the **Deployment Settings** section. Default values are provided, but you should adjust them as needed.

   **Tip:** You can change some of the options later. The installation creates a *config.php* file in *[OXYGEN_WEBHELP_INSTALL_DIR]/feedback/resources/php/config/config.php* where all your configuration options are stored.

   d. Configure the **MySQL Database Connection Settings** section. Use the information (database name, username, password) from the Create WebHelp with Feedback Database section (on page 1490) to fill-in the appropriate text boxes.
Warning: Selecting the Create new database structure option will overwrite any existing data in the selected database, if it already exists. Therefore, it is useful the first time you install the WebHelp with Feedback system, but you do not want to select this option on subsequent deployments.

e. If you are using a domain (such as OpenLDAP or Active Directory) to manage users in your organization, select the Enable LDAP Authentication option. This will allow you to configure the LDAP server, which will provide information and credentials for users who will access the WebHelp system. Also, this will allow you to choose which of the domain users will have administrator privileges.

f. If the Create new database structure option is selected, the Create WebHelp Administrator Account section becomes available. Here you can set the administrator account data. The administrator is able to moderate new posts and manage WebHelp users.

The same database can be used to store comments for multiple WebHelp with Feedback deployments. If a topic is available in multiple deployments and there are comments associated with it, you can choose to display the comments in all deployments that share the database. To do this, select the Display comments from other products option. In the Display comments from section, a list with the deployments sharing the same database is displayed. Select the deployments allowed to share common feedback.

Note: You can restrict the displayed comments of a product depending on its version. If you have two products that use the same database and you restrict one of them to display comments starting from a certain version, the comments of the other product are also displayed from the specified version onwards.

g. Press Next Step.
h. Remove the installation folder from your web server.

Important: When you publish subsequent iterations of your WebHelp with Feedback system, you will not upload the /install folder in the output, as you only need it uploaded the first time you create the installation. On subsequent uploads, you will just upload the other output files.

i. In your Web browser, go to your WebHelp with Feedback system main page.

Testing Your WebHelp with Feedback System

To test your system, create a user and post a comment. Check to see if the notification emails are delivered to your email inbox.

Note: To read debug messages generated by the system:

1. Enable JavaScript logging by doing one of the following:
• Open the `log.js` file, locate the `var log= new Log(Level.NONE);` line, and change the logging level to: `Level.INFO`, `Level.DEBUG`, `Level.WARN`, or `Level.ERROR`.

• Append `?log=true` to the WebHelp URL.

2. Inspect the PHP and Apache server log files.

Documentation Product ID and Version

When you run a WebHelp with Feedback transformation scenario, by default you are prompted for a documentation product ID and version number. This is needed when multiple WebHelp systems are deployed on the same server. Think of your WebHelp output as a product. If you have three different WebHelp outputs, you have three different products (each with their own unique documentation product ID). This identifier is included in a configuration file so that comments are tied to a particular output (product ID and version number).

Note: The WebHelp with Feedback installation includes a configuration option (Display comments from other products) that allows you to choose to have comments visible in other specified products.

Related Information:

- Managing Users and Comments in a Feedback-Enabled System (on page 1493)

Refreshing the Content of a Feedback-Enabled System

It is common to update the content of an existing installation of a WebHelp with Feedback system on a regular basis. In this case, reinstalling the whole system is not a viable option since it might result in the loss of the comments associated with your topics. Also, reconfiguring the system every time you want to refresh it may be time consuming.

Fortunately, you can refresh just the content without losing the comments or the initial system configuration. To do so, follow these steps:

1. Execute the transformation scenario that produces the WebHelp with Feedback output directory.
2. Go to the output directory (specified in the Output tab of the transformation scenario), locate the `\feedback\resources\php\config\config.php` file, and delete it.
3. Locate the `\feedback\install` directory and delete it.
4. Copy the remaining structure of the output folder and paste it into your WebHelp with Feedback system installation directory, overwriting the existing content.
Managing Users and Comments in a Feedback-Enabled System

When you installed the WebHelp with Feedback system the first time (assuming the Create new database structure option (on page 1491) was selected), you should have been prompted to create an administrator account (or a user named administrator was created by default). As an administrator, you have access to manage comments posted in your feedback-enabled WebHelp system. You can also manage the user information (such as role, status, or notification options).

To manage comments and user information, follow these steps:

1. At the bottom of each specific topic there is a Comments navigation bar and on the right side there is a Log in button. Click this button and log in with your administrator credentials. This gives you access to an Admin Panel button.
2. Click the Admin Panel button to display an administration page.

Figure 401. Administrative Page

3. Use this page to manage the following options:

   **Delete Orphaned Comments**
   
   Allows you to delete comments that are no longer associated with a topic in your WebHelp system.

   **Delete Pending Users**
   
   Allows you to delete user accounts that you do not wish to activate.

   **View All Posts**
   
   Allows you to view all the comments that are associated with topics in your WebHelp system.

   **Export Comments**
   
   Allows you to export all posts associated with topics in your WebHelp system into an XML file.

   **Set Version**
   
   Use this action to display comments starting with a particular version.
Manage User Information

To edit the details for a user, click on the corresponding row. This opens a window that allows you to customize the following information associated with the user:

**Name**

The full name of the user.

**Level**

Use this field to modify the privilege level (role) for the selected user. You can choose from the following:

- **User** - Regular user, able to post comments and receive e-mail notifications.
- **Moderator** - In addition to the regular User rights, this type of user has access to the Admin Panel where a moderator can view, delete, export comments, and set the version of the feedback-enabled WebHelp system.
- **Admin** - Full administrative privileges. Can manage WebHelp-specific settings, users, and their comments.

**Company**

The name of the organization associated with the user.

**E-Mail**

The contact email address for the user. This is also the address where the WebHelp system sends notifications.

**WebHelp Notification**

When selected, the user receives notifications when comments are posted anywhere in your feedback-enabled WebHelp system.

**Reply Notification**

When selected, the user receives notifications when comments are posted as a reply to one of their comments.

**Page Notification**

When selected, the user receives notifications when comments are posted on a topic where they previously posted a comment.

**Date**

The date the user registered is displayed.

**Status**
Use this drop-down list to change the status of the user. You can choose from the following:

- **Created** - The user is created but does not yet have any rights for the feedback-enabled WebHelp system.
- **Validated** - The user is able to use the feedback-enabled WebHelp system.
- **Suspended** - The user has no rights for the feedback-enabled WebHelp system.

⚠️ **Warning:** The key used for identifying the page a comment is attached to is the relative file path to the output page. Since the output file and folder names mirror the source, any change to the file name (or its folder) in the source will affect the comments associated with that WebHelp page. If you change the file name or path, the comment history for that topic will become orphaned (a change to the topic ID does not affect the comment history).

**Context-Sensitive WebHelp Classic System**

Context-sensitive help systems assist users by providing specific informational topics for certain components of a user interface, such as a button or window. This mechanism works based on mappings between a unique ID defined in the topic and a corresponding HTML page.

**Generating Context-Sensitive Help**

When WebHelp Classic output is generated, the transformation process produces an XML mapping file called `context-help-map.xml` and copies it in the output folder of the transformation. This XML file maps an ID to a corresponding HTML page through an `appContext` element, as in the following example:

```xml
<map productID="oxy-webhelp" productVersion="1.1">
  <appContext helpID="myapp-functionid1" path="tasks/app-help1.html"/>
  <appContext helpID="myapp-functionid2" path="tasks/app-help1.html"/>
  ...
</map>
```

The possible attributes are as follows:

- **helpID**
  
  A Unique ID provided by a topic from two possible sources (`resourcemodelement` element or the `id` attribute that is set on the topic root element):

- **resourcemodelement**
The `resourceid` element is mapped into the `appContext` element and can be specified in either the `topicref` within a DITA map or in a `prolog` within a DITA topic. The `resourceid` element accepts the following attributes:

- **appname** - A name for the external application that references the topic. If this attribute is not specified, its value is considered to be empty (""").
- **appid** - An ID used by an application to identify the topic.
- **id** - Specifies a value that is used by a specific application to identify the topic, but this attribute is ignored if an `appid` attribute is used. Also, starting with DITA 1.3, the `id` attribute was deprecated in favor of the `appid` attribute.

**Note:** Multiple `appid` values can be associated with a single `appname` value (and multiple `appname` values can be associated with a single `appid` value), but the values for both attributes work in combination to specify a specific ID for a specific application, and therefore each combination of values for the `appid` and `appname` attributes should be unique within the context of a single root map (on page 2799). For example, suppose that you need two different functions of an application to both open the same WebHelp page.

**Example: `resourceid` Specified in a DITA Map**

The `resourceid` element can be specified in a `topicmeta` element within a `topicref`.

```xml
<map title="App Help">
  <topicref href="app-help1.dita" type="task">
    <topicmeta>
      <resourceid appname="myapp" appid="functionid1"/>
      <resourceid appname="myapp" appid="functionid2"/>
    </topicmeta>
  </topicref>
</map>
```

**Example: `resourceid` Specified in a DITA Topic**

The `resourceid` element can be specified in a `prolog` element within a DITA topic.

```xml
<task id="app-help1">
```
For more information about the resourceid element, see DITA Specifications: <resourceid>.

id

If a resourceid element is not declared in the DITA map or DITA topic (as described above), the id attribute that is set on the topic root element is mapped into the appContext element.

⚠️ Important: You should ensure that these defined IDs are unique in the context of the entire DITA project. If the IDs are not unique, the transformation scenario will display warning messages in the transformation console output and the help system will not work properly.

path

The path to a corresponding WebHelp page. This path is relative to the location of the context-help-map.xml mapping file.

productID (Applicable only if you are using the WebHelp Classic with Feedback transformation scenario)

The ID of the product for your documentation project.

productVersion (Applicable only if you are using the WebHelp Classic with Feedback transformation scenario)

The version of the product for your documentation project.

There are two ways of implementing context-sensitive help in your system:

- The XML mapping file can be loaded by a PHP script on the server side. The script receives the contextId value and will look it up in the XML file.
- Invoke one of the WebHelp system files index.html or index_frames.html and pass the contextId parameter with a specific value. The WebHelp system will automatically open the help page associated with the value of the contextId parameter.

⚠️ Note: The contextId parameter is not case-sensitive.
The following example will open a *frameless* version of the WebHelp system showing the page associated with the ID *dialog1ID*:

```html
index.html?contextId=dialog1ID
```

The following example will open a *frameset* version of the WebHelp system showing the page associated with the ID *view1ID*:

```html
index_frames.html?contextId=view1ID
```

**Tip:** You can use an anchor *(on page 2791)* in the `contextId` parameter to jump to a specific section in a document. For example, `contextId=topicID#anchor`.

**Context-Sensitive Queries**

You can use the URL field in your browser to search for topics in a context-sensitive WebHelp system with the assistance of the following parameters:

- **contextId** - The WebHelp JavaScript engine will look for this value in the `context-help-map.xml` mapping file and load the corresponding help page.

  **Note:** You can use an anchor *(on page 2791)* in the `contextId` parameter to jump to a specific section in a document. For example, `contextId=topicID#anchor`.

- **appname** - You can use this parameter in conjunction with `contextId` to search for this value in the corresponding `appname attribute value *(on page 1403)*` in the mapping file.

  ```html
  http://localhost/webhelp/index.html?contextId=topicID&appname=myApplication
  ```

**Generating WebHelp Classic Output for DITA**

The publishing process can be initiated from a transformation scenario within Oxygen XML Editor/Author, from a command line outside Oxygen XML Editor/Author, or from an integration server.

**Running from Oxygen XML Editor/Author**

To publish DITA content to WebHelp Classic output from a transformation scenario inside Oxygen XML Editor/Author, use one of the following procedures, depending on whether or not you want a feedback section in your output.

**WebHelp Classic Output**

To publish a *DITA map *(on page 2793)* as a *WebHelp Classic* system, follow these steps:
1. Select the Configure Transformation Scenario(s) action from the DITA Maps Manager toolbar.
2. Select the DITA Map WebHelp Classic scenario from the DITA Map section.
3. If you want to configure the transformation, click the Edit button.

**Step Result:** This opens an Edit scenario configuration dialog box that allows you to configure various options in the following tabs:

- **Templates Tab** - This tab contains a set of built-in skins that you can use for the layout of your WebHelp system output.
- **Parameters Tab** - This tab includes numerous transformation parameters that can be set to customize your WebHelp system output.
- **Filters Tab** - This tab allows you to filter certain content elements from the generated output.
- **Advanced Tab** - This tab allows you to specify some advanced options for the transformation scenario.
- **Output Tab** - This tab allows you to configure options that are related to the location where the output is generated.

4. Click **Apply associated** to process the transformation.

When the DITA Map WebHelp Classic transformation is complete, the output is automatically opened in your default browser.

To further customize this transformation, you can edit various parameters, including the following most commonly used ones:

**WebHelp Classic with Feedback Output**

To publish a DITA map (on page 2793) as a WebHelp Classic with Feedback system, follow these steps:

1. Select the Configure Transformation Scenario(s) action from the DITA Maps Manager toolbar.
2. Select the DITA Map WebHelp Classic with Feedback scenario from the DITA Map section.
3. If you want to configure the transformation, click the Edit button.

**Step Result:** This opens an Edit scenario configuration dialog box that allows you to configure various options in the following tabs:

- **Templates Tab** - This tab contains a set of built-in skins that you can use for the layout of your WebHelp system output.
- **Parameters Tab** - This tab includes numerous transformation parameters that can be set to customize your WebHelp system output.
- **Filters Tab** - This tab allows you to filter certain content elements from the generated output.
- **Advanced Tab** - This tab allows you to specify some advanced options for the transformation scenario.
• **Output Tab** - This tab allows you to configure options that are related to the location where the output is generated.

4. Click **Apply associated** to begin the transformation.

5. Enter the documentation product ID (value for the `webhelp.product.id` parameter) and the documentation version (value for the `webhelp.product.version` parameter).

When the DITA Map WebHelp Classic with Feedback transformation is complete, your default browser opens the `installation.html` file. This file contains information about the output location, system requirements, installation instructions, and deployment of the output. Follow the instructions to complete the system deployment (*on page 1489*).

For more information about the feedback-enabled WebHelp system, watch our video demonstration:

https://www.youtube.com/embed/eoQ2uxHvppE

**Running from Command Line**

To publish to the **WebHelp Classic** output from a command line outside of Oxygen XML Editor/Author, you can use the `dita` startup script that comes bundled with DITA Open Toolkit distribution.

**Required Arguments for the dita Command Startup Script:**

```
DITA-OT-DIR (on page 2794)\bin\[executable] -i [path_to_input.ditamap] -f [transformation_type]
```

**executable**

- **Windows** - The `dita.bat` script located in: `DITA-OT-DIR (on page 2794)\bin\`.

- **Linux/Mac OS X** - The `dita` script file located in: `DITA-OT-DIR (on page 2794)/bin/`.

**-i / -input**

Specifies the master file for your DITA documentation project. Typically this is a DITA map.

**-f / -format**

Specifies the transformation type. The Oxygen XML WebHelp Plugin contributes the following transformation types for DITA:

- **webhelp** - The transformation that produces WebHelp Classic output for desktop.

- **webhelp-feedback** - The transformation that produces feedback-enabled WebHelp Classic with Feedback for desktop.

**Additional Options or Parameters:**
You can also use DITA-OT options to modify the command behavior or additional configuration parameters that are contributed by the Oxygen XML WebHelp Plugin (on page 1408).

DITA-OT-DIR (on page 2794) \bin\[executable] -i [path_to_input.ditamap] -f [transformation_type] [option] -D[parameter=value]

Command Line Examples:

• Windows: dita.bat -i c:\mySample.ditamap -f webhelp-responsive -o c:\output - Dwebhelp.logo.image=C:\images\myLogo.jpg

• Linux/Mac OS X: dita -i /mySample.ditamap -f webhelp-responsive -o /output - Dwebhelp.logo.image=/images/myLogo.jpg

Additional WebHelp Parameters for DITA

You can append the following parameters to the command line that runs the transformation:

-Dwebhelp.copyright (not available for WebHelp Responsive systems)

Adds a small copyright text that appears at the end of the Table of Contents pane.

-Dwebhelp.custom.resources

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

-Dwebhelp.favicon

The file path that points to an image to be used as a favicon in the WebHelp output.

-Dwebhelp.footer.file (not available for WebHelp Responsive systems)

Path to an XML file that includes the footer content for your WebHelp output pages. You can use this parameter to integrate social media features (such as widgets for Facebook™, Twitter™, Google Analytics, or Google+™). The file must be well-formed, each widget must be in separate div or span element, and the code for each script element is included in an XML comment (also, the start and end tags for the XML comment must be on a separate line). The following code exert is an example for adding a Facebook™ widget:

```xml
<div id="facebook">
  <div id="fb-root"/>
  <script>

    <!-- (function(d, s, id) { var js, fjs = d.getElementsByTagName(s)[0];
    if (d.getElementById(id)) return;
    js = d.createElement(s); js.id = id;
    js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
```
webhelp.footer.include (not available for WebHelp Responsive systems)

Specifies whether or not to include footer in each WebHelp page. Possible values:

- yes, if set to yes, the footer is added to the WebHelp pages.
- no, if set to no, no footer is added to the WebHelp pages. If set to yes and the webhelp.footer.file parameter has a value, then the content of that file is used as footer. If the webhelp.footer.file has no value then a default Oxygen footer is inserted in each WebHelp page.

webhelp.google.search.results

A file path that specifies the location of a well-formed XHTML file containing the Google Custom Search Engine element gcse:searchresults-only. You can use all supported attributes for this element. It is recommend to set the linkTarget attribute to frm for frameless (iframe) version of WebHelp or to contentWin for the frameset version of WebHelp. The default value for this attribute is _blank and the search results will be loaded in a new window. If this parameter is not specified, the following code will be used:

```html
<gcse:searchresults-only linkTarget="frm"></gcse:searchresults-only>
```

webhelp.google.search.script

A file path that specifies the location of a well-formed XHTML file containing the Custom Search Engine script from Google.

webhelp.logo.image.target.url

Specifies a target URL that is set on the logo image. When you click the logo image, you will be redirected to this address.

webhelp.logo.image

Specifies a path to an image displayed as a logo in the left side of the output header.

webhelp.product.id (available only for Feedback-enabled systems)

This parameter specifies a short name for the documentation target, or product (for example, mobile-phone-user-guide, hvac-installation-guide).

Note: You can deploy documentation for multiple products on the same server.

Restriction: The following characters are not allowed in the value of this parameter:

`< > / \ ' ( ) [ ] { } = ; * % + & .`
-Dwebhelp.product.version (available only for Feedback-enabled systems)

Specifies the documentation version number (for example, 1.0, 2.5, etc.). New user comments are bound to this version.

**Note:** Multiple documentation versions can be deployed on the same server.

**Restriction:** The following characters are not allowed in the value of this parameter: `< > / \ ' ( ) { } = ; * % + & .

- Dwebhelp.search.japanese.dictionary

The file path of the dictionary that will be used by the *Kuromoji* morphological engine for indexing Japanese content in the WebHelp pages. The encoding for the dictionary must be UTF8.

- Dwebhelp.search.ranking

If this parameter is set to false then the 5-star rating mechanism is no longer included in the search results that are displayed on the Search tab (default setting is true).

- Dwebhelp.show.changes.and.comments

When set to yes, user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is no.

- Dwebhelp.sitemap.base.url

Base URL for all the loc elements in the generated sitemap.xml file. The value of a loc element is computed as the relative file path from the href attribute of a topicref element from the DITA map, appended to this base URL value. The loc element is mandatory in sitemap.xml. If you leave this parameter set to its default empty value, then the sitemap.xml file is not generated.

- Dwebhelp.sitemap.change.frequency

The value of the changefreq element in the generated sitemap.xml file. The changefreq element is optional in sitemap.xml. If you leave this parameter set to its default empty value, then the changefreq element is not added in sitemap.xml. Allowed values: <empty string> (default), always, hourly, daily, weekly, monthly, yearly, never.

- Dwebhelp.sitemap.priority

The value of the priority element in the generated sitemap.xml file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The priority element is optional in sitemap.xml. If you leave this parameter set to its default empty value, then the priority element is not added in sitemap.xml.
-Dwebhelp.skin.css  (available only for WebHelp Classic and WebHelp Classic with Feedback systems)

Path to a CSS file that sets the style theme in the WebHelp Classic output. It can be one of the built-in skin CSS from the DITA-OT-DIR/plugins/com.oxygenxml.webhelp.classic/predefined-skins directory, or it can be a custom skin CSS generated with the Oxygen Skin Builder web application.

Parameters Specific to WebHelp Responsive Output (available only for WebHelp Responsive and WebHelp Responsive with Feedback systems)

-Dbwebhelp.default.collection.type.sequence

Specifies if the sequence value will be used by default when the collection-type attribute is not specified. This option is helpful if you want to have Next and Previous navigational buttons generated for all HTML pages. Allowed values are no (default) and yes.

-Dbwebhelp.enable.search.autocomplete

Specifies if the Autocomplete feature is enabled in the WebHelp search text field. The default value is yes.

-Dbwebhelp.fragment.after.body

In the generated output it displays a given XHTML fragment after the page body. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

-Dbwebhelp.fragment.after.logo_and_title

In the generated output it displays a given XHTML fragment after the logo and title. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

-Dbwebhelp.fragment.after.main.page.search

In the generated output it displays a given XHTML fragment after the search field. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

-Dbwebhelp.fragment.after.toc_or_tiles

In the generated output it displays a given XHTML fragment after the table of contents or tiles in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

-Dbwebhelp.fragment.after.top_menu
In the generated output it displays a given XHTML fragment after the top menu. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

-Dwebhelp.fragment.before.body

In the generated output it displays a given XHTML fragment before the page body. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

-Dwebhelp.fragment.before.logo_and_title

In the generated output it displays a given XHTML fragment before the logo and title. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

-Dwebhelp.fragment.before.main.page.search

In the generated output it displays a given XHTML fragment before the search field. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

-Dwebhelp.fragment.before.toc_or_tiles

In the generated output it displays a given XHTML fragment before the table of contents or tiles in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

-Dwebhelp.fragment.before.top_menu

In the generated output it displays a given XHTML fragment before the top menu. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

-Dwebhelp.fragment.footer

In the generated output it displays a given XHTML fragment as the page footer. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

-Dwebhelp.fragment.head

In the generated output it inserts a given XHTML fragment in the `<head>` element. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

-Dwebhelp.fragment.welcome

In the generated output it displays a given XHTML fragment as a welcome message (or title). The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.
-Dwebhelp.merge.nested.topics.related.links

Specifies if the related links from nested topics will be merged with the links in the parent topic. Thus the links will be moved from the topic content to the related links component and all of the links from the same group (for example, Related Tasks, Related References, Related Information) are merged into a single group. The default value is yes.

-Dwebhelp.search.enable.pagination

Specifies whether or not search results will be displayed on multiple pages. Allowed values are yes or no.

-Dwebhelp.search.page.numberOfItems

Specifies the number of search results items displayed on each page. This parameter is only used when the webhelp.search.enable.pagination parameter is enabled.

-Dwebhelp.search.stop.words.exclude

Specifies a list of words that will be excluded from the default list of stop words that are filtered out before the search processing. Use comma separators to specify more than one word (for example: if,for,is).

-Dwebhelp.show.breadcrumb

Specifies if the breadcrumb component will be presented in the output. The default value is yes.

-Dwebhelp.show.child.links

Specifies if child links will be generated in the output for all topics that have subtopics. The default value is no.

-Dwebhelp.show.indexterms.link

Specifies if an icon that links to the index will be presented in the output. The default value is yes.

-Dwebhelp.show.main.page.tiles

Specifies if the tiles component will be presented in the main page of the output. For a tree style layout, this parameter should be set to no.

-Dwebhelp.show.main.page.toc

Specifies if the table of contents will be presented in the main page of the output. The default value is yes.

-Dwebhelp.show.navigation.links

Specifies if navigation links will be presented in the output. The default value is yes.

-Dwebhelp.show.print.link
Specifies if a print link or icon will be presented within each topic in the output. The default value is *yes*.

-Dwebhelp.show.publication.toc

Specifies if a table of contents will be presented on the left side of each topic in the output. The default value is *yes*.

-Dwebhelp.show.topic.toc

Specifies if a topic table of contents will be presented on the right side of each topic in the output. This table of contents contains links to each `<section>` within the current topic that contains an `@id` attribute and the section corresponding to the current scroll position is highlighted. The default value is *yes*.

-Dwebhelp.show.top.menu

Specifies if a menu will be presented at the topic of the main page in the output. The default value is *yes*.

-Dwebhelp.publication.toc.hide.chunked.topics

Specifies if the table of contents will contain links for *chunked* topics. The default value is *yes*.

-Dwebhelp.publication.toc.links

Specifies which links will be included in the table of contents. The possible values are:

- **chapter** (default) - The TOC will include links for the current topic, its children, its siblings, and its direct ancestor (including the direct ancestor’s siblings), and the parent chapter.
- **topic** - The TOC will only include links for the current topic and its direct children.
- **all** - The TOC will include all links.

-Dwebhelp.publication.toc.tooltip.position

By default, if a topic contains a `<shortdesc>` element, its content is displayed in a tooltip when the user hovers over its link in the table of contents. This parameter controls whether or not this tooltip is displayed and its position relative to the link. The possible values are:

- **left** (default)
- **right**
- **top**
- **bottom**
- **hidden** - The tooltip will not be displayed.

-Dwebhelp.top.menu.depth
Specifies the maximum depth level of the topics that will be included in the top menu. The default value is 3. A value of 0 means that the menu has unlimited depth.

-Dwebhelp.topic.collapsible.elements.initial.state

Specifies the initial state of collapsible elements (tables with titles, nested topics with titles, sections with titles, index term groups). The possible values are collapsed or expanded (default value).

Note: Note that the fix.external.refs.com.oxygenxml parameter is not supported. This parameter is normally used to specify whether or not the application tries to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references.

Further Customization

If you need to further customize the transformation process, you can append other DITA-OT parameters as well. Any parameter that you want to append must follow the -D model of the above parameters. For example, to append the args.csspath parameter, use:

-Dargs.csspath=[CSS_FILE_PATH]

where [CSS_FILE_PATH] is the location of the directory that contains the CSS file.

Related Information:

- Setting DITA-OT Parameters

Running from an Integration Server

Oxygen XML Author can be processed from an automatic publishing system, such as Jenkins or Travis.

Automating DITA to WebHelp Output with Jenkins

To integrate WebHelp output with the Jenkins continuous integration tool, follow these steps:

1. Create a Maven project to incorporate the DITA-OT that already integrates Oxygen XML Author.
2. Go to the root of your Maven project and edit the pom.xml file to include the following fragment:

```xml
<properties>
    <oxygen-webhelp>${basedir}/tools/plugins/com.oxygenxml.webhelp.responsive</oxygen-webhelp>
</properties>
```
3. Go to the Jenkins top page and create a new Jenkins job. Configure this job to suit your particular requirements, such as the build frequency and location of the Maven project.

Automating DITA to WebHelp Output with Travis CI

This topic assumes you have a DITA project hosted on a GitHub public or private repository.

The goal of this tutorial is to help you set up a Travis continuous integration job that automatically publishes your DITA project to GitHub pages after every commit. The published website will contain a feedback link on each page that would allow a contributor to easily suggest changes to the documentation by creating a pull request on GitHub with just a few clicks.

Enable the Travis CI Build

1. Sign in to Travis CI with your GitHub account, accepting the GitHub access permissions confirmation.
2. Once you are signed in, and you have synchronized your GitHub repositories, go to your profile page and enable Travis CI for the repository you want to build.

Configure the Travis CI Build in your GitHub Project

1. Checkout your GitHub project locally.
2. Copy the .travis folder from here to the root directory of your project.
3. In the root of your GitHub project, add a file called `.travis.yml` with the following content:

```plaintext
language: dita
install:
  - echo "Installed"
script:
  - sh .travis/publish.sh
after_success:
  - sh .travis/deploy.sh
env:
  global:
    - DITAMAP=/path/to/your/ditamap/file
    - DITAVAL=/path/to/your/ditaval/file
    - ANT_OPTS=-Xmx1024M

Note: Replace `/path/to/your/ditamap/file` and `/path/to/your/ditaval/file` with the appropriate paths to your DITA map and ditaval files.
```

4. Create a GitHub personal access token by following this procedure.

5. Define an environment variable in the repository settings that has the name `GH_TOKEN` and the value equal with the GitHub personal access token created earlier.

### Register Your License Key

1. Edit your `.gitignore` file (or create it if it does not already exist) and add the following line:

   ```plaintext
   licenseKey.txt
   ```

2. Copy your WebHelp license to the root of your GitHub project in a file called `licenseKey.txt`.

   `Important:` The `licenseKey.txt` file should not be committed to GitHub as it contains a license key that is issued only to you.

3. Encrypt the license key file and add it to the `.travis.yml` configuration file. This way only the Travis CI server will be able to decrypt it during the build process.

### Commit to GitHub

1. Commit the following files and folders and push the commit to GitHub:

   ```plaintext
   git add .gitignore licenseKey.txt.enc .travis.yml .travis/
git commit -m "Set up the Travis CI publishing system"
git push
   ```
2. Create a `gh-pages` branch in your GitHub project where the WebHelp output will be published. You can follow the procedure here.

Generating WebHelp Classic Output for DocBook

The publishing process can be initiated from a transformation scenario within Oxygen XML Editor/Author or from a command line outside Oxygen XML Editor/Author.

Running from Oxygen XML Editor/Author

To publish DocBook content to WebHelp Classic output from a transformation scenario inside Oxygen XML Editor/Author, use one of the following procedures, depending on whether or not you want a feedback section in your output.

**WebHelp Classic Output**

To publish a DocBook document as a WebHelp Classic system, follow these steps:

1. Click the Configure Transformation Scenario(s) action from the toolbar (or the Document > Transformation menu).
2. Select the DocBook WebHelp Classic scenario from the DocBook 4 or DocBook 5 section.
3. Click Apply associated.

When the DocBook WebHelp Classic transformation is complete, the output is automatically opened in your default browser.

**WebHelp Classic with Feedback Output**

To publish a DocBook document as a WebHelp Classic with Feedback system, follow these steps:

1. Click Configure Transformation Scenarios.
2. Select the DocBook WebHelp Classic with Feedback scenario from the DocBook 4 or DocBook 5 section.
3. Click Apply associated.
4. Enter the documentation product ID and the documentation version.

When the DocBook WebHelp Classic with Feedback transformation is complete, your default browser opens the installation.html file. This file contains information about the output location, system requirements, installation instructions, and deployment of the output. Follow the instructions to complete the system deployment. For more information, see Deploying a Feedback-Enabled System (on page 1489).
For more information about the feedback-enabled WebHelp system, watch our video demonstration:

https://www.youtube.com/embed/eoQ2uxHyppE

Running from Command Line

⚠️ PREREQUISITES: Before you begin, the WebHelp DocBook distribution must be integrated into a DocBook XSL installation.

To run a DocBook to WebHelp transformation outside of Oxygen XML Editor/Author, use the following script file:

- **Windows** - `[DocBook XSL directory]\com.oxygenxml.webhelp.classic\docbook.bat`
- **Linux/Mac OS X** - `[DocBook XSL directory]/com.oxygenxml.webhelp.classic/docbook.sh`

Before running the script to generate output, you must customize it to specify various paths and transformation type. To do this, open the script file and edit the following variables:

- **JVM_INSTALL_DIR** - Specifies the path to the Java Virtual Machine installation directory on your disk.
- **ANT_INSTALL_DIR** - Specifies the path to the installation directory of Ant.
- **SAXON_6_DIR** - Specifies the path to the installation directory of Saxon 6.5.5.
- **SAXON_9_DIR** - Specifies the path to the installation directory of Saxon 9.1.0.8.
- **DOCBOOK_XSL_DIR** - Specifies the path to the installation directory of the DocBook XSL distribution.
- **TRANSTYPE** - Specifies the type of the transformation you want to apply. The Oxygen XML WebHelp Plugin contributes the following transformation types for DocBook:
  - **webhelp** - The transformation that produces WebHelp Classic output for desktop.
  - **webhelp-feedback** - The transformation that produces feedback-enabled WebHelp Classic with Feedback for desktop.
- **INPUT_DIR** - Specifies the path to the input directory, containing the input XML file.
- **XML_INPUT_FILE** - Specifies the name of the input XML file.
- **OUTPUT_DIR** - Specifies the path to the output directory where the transformation output is generated.
- **DOCBOOK_XSL_DIR_URL** - Specifies the path to the directory of the DocBook XSL distribution in URL format.

You can also add additional configuration parameters that are contributed by the Oxygen XML WebHelp Plugin (on page 1420).
Additional WebHelp Parameters for DocBook

You can use various parameters in the command line to customize the transformation. Some of the most commonly used parameters include:

- **-Ddefault.language**
  
  This parameter is used if the language is not detected in the DITA map. The default value is en-us.

- **-Dclean.output**
  
  Deletes all files from the output folder before the transformation is performed (only no and yes values are valid and the default value is no).

- **-Dl10n.gentext.default.language**
  
  This parameter is used to identify the correct stemmer that differs from language to language. For example, for English the value of this parameter is en or for French it is fr, and so on.

- **-Duse.stemming**
  
  Controls whether or not you want to include stemming search algorithms into the published output (default setting is false).

- **-Dwebhelp.copyright**
  
  Adds a small copyright text that appears at the end of the Table of Contents pane.

- **-Dwebhelp.custom.resources**
  
  The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

- **-Dwebhelp/favicon**
  
  The file path that points to an image to be used as a favicon in the WebHelp output.

- **-Dwebhelp/footer.file**
  
  Path to an XML file that includes the footer content for your WebHelp output pages. You can use this parameter to integrate social media features (such as widgets for Facebook™, Twitter™, Google Analytics, or Google+™). The file must be well-formed, each widget must be in separate div or span element, and the code for each script element is included in an XML comment (also, the start and end tags for the XML comment must be on a separate line). The following code exert is an example for adding a Facebook™ widget:

```xml
<div id="facebook">
  <div id="fb-root"/>
</div>
```
-Dwebhelp.footer.include

Specifies whether or not to include footer in each WebHelp page. Possible values:

yes, no. If set to no, no footer is added to the WebHelp pages. If set to yes and the webhelp.footer.file parameter has a value, then the content of that file is used as footer. If the webhelp.footer.file has no value then a default Oxygen footer is inserted in each WebHelp page.

-Dwebhelp.logo.image.target.url

Specifies a target URL that is set on the logo image. When you click the logo image, you will be redirected to this address.

-Dwebhelp.logo.image

Specifies a path to an image displayed as a logo in the left side of the output header.

-Dwebhelp.product.id (available only for Feedback-enabled systems)

This parameter specifies a short name for the documentation target, or product (for example, mobile-phone-user-guide, hvac-installation-guide).

Note: You can deploy documentation for multiple products on the same server.

Restriction: The following characters are not allowed in the value of this parameter:

< > / \ { } [ ] ! * % + .

-Dwebhelp.product.version (available only for Feedback-enabled systems)

Specifies the documentation version number (for example, 1.0, 2.5, etc.). New user comments are bound to this version.

Note: Multiple documentation versions can be deployed on the same server.

Restriction: The following characters are not allowed in the value of this parameter:

< > / \ { } [ ] ! * % + .
If this parameter is set to `false` then the 5-star rating mechanism is no longer included in the search results that are displayed on the Search tab (default setting is `true`).

Path to a CSS file that sets the style theme in the WebHelp Classic output. It can be one of the built-in skin CSS from the `OXYGEN_INSTALL_DIR\frameworks\docbook\xsl\com.oxygenxml.webhelp.classic\predefined-skins` directory, or it can be a custom skin CSS generated with the Oxygen Skin Builder web application.

If you need to further customize your transformation, other DocBook XSL parameters can be appended. Any parameter that you want to append must follow the `-D` model of the above parameters. For example, you can append the `html.stylesheet` parameter in the following form:

```
-Dhtml.stylesheet=/path/to/directory/of.stylesheet.css
```

Customizing WebHelp Classic Output

Oxygen XML WebHelp provides support for customizing the WebHelp Classic output to suit your specific needs. The WebHelp Classic type of output is designed for desktop systems and features a familiar tri-pane layout. You can use this system to publish DITA and DocBook document types. The WebHelp Classic with Feedback variant allows your users to add comments to your output.

To change the overall appearance of the WebHelp Classic output, you can use the visual WebHelp Skin Builder tool (on page 1422), which does not require knowledge of CSS language. If you are familiar with CSS and coding, you can style your WebHelp output through your own custom stylesheets. You can also customize your output by modifying option and parameters in the transformation scenario.

This section includes topics that explain various ways to customize your WebHelp system output, such as how to improve the appearance of the Table of Contents, add logo images in the title area, integrate with social media, add custom headers and footers, and much more.

Changing the Layout and Styles

This section contains some topics that explain how to customize the layout and style of your WebHelp Classic output using custom CSS, inserting custom HTML content, and more.

WebHelp Skin Builder

The WebHelp Skin Builder is a simple, easy-to-use tool, specially designed to assist users to visually customize the look and feel of the WebHelp output. It is implemented as an online tool hosted
on the Oxygen XML website and allows you to experiment with various styles and colors over a documentation sample.

To be able to use the Skin Builder, you need:

- An Internet connection and unrestricted access to Oxygen XML website.
- A late version web browser.

To start the Skin Builder, do one of the following:

- For DocBook or DITA WebHelp systems, use a web browser to go to https://www.oxygenxml.com/webhelp-skin-builder.
- For DITA WebHelp systems, you can click the Online preview link in the Skins tab (on page 2709) of a DITA OT transformation scenario. In the upper section of the preview, click the Select Skin button, then choose Customize Skin.

Skin Builder Layout

The left side panel of the Skin Builder is divided into 3 sections:

- **Actions** - Contains the following two buttons:
  - **Import** - Opens an Import CSS dialog box that allows you to load a CSS stylesheet and apply it over the documentation sample.
  - **Export** - Saves all properties as a CSS file.
- **Settings** - Includes a Highlight selection option that helps you identify the areas affected by a particular element customization.
  - When hovering an item in the customizable elements menu, the affected sample area is highlighted with a dotted blue border.
  - When an item in the customizable elements menu is selected, the affected sample area is highlighted with a solid red border.
- **Customize** - Provides a series of customizable elements organized under four main categories:
  - Header
  - TOC Area
  - Vertical Splitter
  - Content

For each customizable element, you can alter properties such as background color or font face. Any alteration made in the customizable elements menu is applied in real time over the sample area.
Creating a Customization Skin

1. You can start with one of the built-in skins or a CSS stylesheet applied over the sample using the Import button.
2. Use the elements in the Customize section to set properties that modify the look of the skin. By default, all customizable elements display a single property, but you can make more visible by clicking the + Add button and choosing from the available properties.

Note: If you want to revert a particular property to its initial value, press the Reset button.
3. When you are happy with the skin customizations you have made, press the Export button. All settings will be saved in a CSS file.

Applying a Custom Skin to a DITA Map to WebHelp Classic Transformation Scenario

1. Start Oxygen XML Author.
2. Load the DITA map (on page 2793) you want to produce as a WebHelp output.
3. Edit a DITA Map to WebHelp transformation scenario. Set the previously exported CSS file in the Custom section of the Skins tab.
4. Run the transformation to obtain the WebHelp output.

Apply a Customization Skin to a DocBook to WebHelp Classic Transformation Scenario

1. Start Oxygen XML Author.
2. Load the DocBook file you want to produce as a WebHelp output.
3. In the Parameters tab, set the webhelp.skin.css parameter to point to the previously exported CSS.
4. To customize the logo, use the following parameters: webhelp.logo.image and webhelp.logo.image.target.url.
5. Run the transformation to obtain the WebHelp output.

For more information about using the WebHelp Skin Builder, watch our video demonstration:

https://www.youtube.com/embed/32PGX–PQx0

Related Information:
How to Use CSS Styling to Customize WebHelp Output

The most common way to customize the look and style of your WebHelp output is to use custom CSS styling. This method can be used to make small, simple styling changes or more advanced, precise changes. To implement the styling in your WebHelp output, you simply need to create the custom CSS file and reference it in your transformation scenario or script. This custom file will be the final CSS to be applied so its content will override the styles in the other pre-existing CSS files.

Using the CSS Inspector to Identify Content for Custom CSS File

You can use your browser's CSS inspector to identify the pertinent code in the current CSS files and you can even make changes directly in the CSS inspector to test the results so that you know exactly what content to use in your custom CSS file.

In most popular browsers (such as Chrome, Firefox, and Edge), you can access the CSS inspector by using F12 or by selecting Inspect Element (or simply Inspect) from the contextual menu.

⚠️ Tip: When using Safari on Mac OS X, you must first enable the Develop menu by going to the Advanced settings and selecting Show Develop menu in menu bar. Then you can select Show Web Inspector from the Develop menu or click Command + Option + I.

Referencing the Custom CSS Using Oxygen XML Editor/Author

To use a custom CSS to style WebHelp output and use a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Create your custom CSS file.
2. Edit the WebHelp transformation scenario and open the Parameters tab.
   • For a DITA transformation, set the args.css parameter to the path of your custom CSS file. Also, set the args.copycss parameter to yes to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
   • For a DocBook transformation, set the html.stylesheet parameter to the path of your custom CSS file.
3. Run the WebHelp transformation scenario to generate the output.

Referencing the Custom CSS Using a Script Outside of Oxygen XML Editor/Author

⚠️ Important: Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:
• You must have a valid license for the **Oxygen XML WebHelp Plugin** ([https://www.oxygenxml.com/buy_webhelp.html](https://www.oxygenxml.com/buy_webhelp.html)).

• The **Oxygen XML WebHelp Plugin** must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To use a custom CSS to style WebHelp output and use a script outside of **Oxygen XML Editor/Author (on page 1405)**, follow this procedure:

1. Create your custom CSS file.
2. Reference your custom CSS file:
   - For DITA transformations, use the `args.css` parameter in your transformation script and set its value to the path of your custom CSS file. Also, set the `args.copycss` parameter to `yes` to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
   - For DocBook transformations, use the `html.stylesheet` parameter in your transformation script and set its value to the path of your custom CSS file.
3. Execute the transformation script.

For example, a DITA script might look like this:

   - **Windows**:
     ```
     dita.bat -i c:\mySample.ditamap -f webhelp -Dargs.css=c:\myFile.css -Dargs.copycss=yes
     ```
   - **Mac OS X/ Linux**:
     ```
     dita -i /mySample.ditamap -f webhelp -Dargs.css=/myFile.css -Dargs.copycss=yes
     ```

How to Add Custom HTML Content in WebHelp Classic Output

You can add custom HTML content in the WebHelp Classic output by inserting it in a well-formed XML file that will be referenced in the transformation. This content may include references to additional JavaScript, CSS, and other types of resources, or such resources can be inserted inline within the HTML content that is inserted in the XML file.

**Using Oxygen XML Editor/Author**

To include custom HTML content in the WebHelp Classic output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Insert the HTML content in a well-formed XML file considering the following notes:
• **Well-Formedness** - If the file is not a *Well-formed XML document (on page 1021)* (or fragments are not well-formed), the transformation will fail.

A common use case is if you want to include several `script` or `link` elements. In this case, the XML fragment has multiple root elements and to make it well-formed, you can wrap it in an `html` element. This element tag will be filtered out and only its children will be copied to the output documents. Similarly, you can wrap your content in `head`, `body`, `html/head`, or `html/body` elements.

• **Referencing Resources in the XML File** - You can include references to local resources (such as JavaScript or CSS files) by using the built-in `${oxygen-webhelp-output-dir}` macro to specify their paths relative to the output directory:

```html
<html>
<script type="text/javascript" src="${oxygen-webhelp-output-dir}/js/test.js"></script>

<link rel="stylesheet" type="text/css" href="${oxygen-webhelp-output-dir}/css/test.css" />
</html>
```

To copy the referenced resources to the output directory, follow the procedure in: *How to Copy Additional Resources to Output Directory (on page 1439)*.

• **Inline JavaScript or CSS Content:**

**JavaScript:**

```html
<script type="text/javascript">
    /* Include JavaScript code here. */

    function myFunction() {
        return true;
    }
</script>
```

**CSS:**

```html
<style>
    /* Include CSS style rules here. */

    *{
        color:red
    }
</style>
```
**Note:** If you have special characters (for example, ``, `<`) that break the well-formedness of the XML fragment, it is important to place this content inside an XML comment:

```html
<script type="text/javascript">
<!--
/* Include JavaScript code here. */

function myFunction() {
    return true;
}
-->
</script>
```

2. Edit the WebHelp Classic transformation scenario.
3. Go to the Parameters tab.
4. Edit the value of the `webhelp.head.script` parameter and set it to reference the URL of the XML file created in step 1. Your additional content will be included at the end of the `head` element of your output document.

**Note:** If you want to include the content in the `body` element, use the `webhelp.body.script` parameter instead.

5. Click OK to save the changes and run the transformation scenario.

**Using a Script Outside of Oxygen XML Editor/Author**

**Important:** Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin ([https://www.oxygenxml.com/buy_webhelp.html](https://www.oxygenxml.com/buy_webhelp.html)).
- The Oxygen XML WebHelp Plugin must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To include custom HTML content in the WebHelp Classic output using a script outside of Oxygen XML Editor/Author (on page 1405), follow this procedure:

1. Insert the HTML content in a well-formed XML file considering the following notes:

   - **Well-Formedness** - If the file is not a Well-formed XML document (on page 1021) (or fragments are not well-formed), the transformation will fail.

     A common use case is if you want to include several `script` or `link` elements. In this case, the XML fragment has multiple root elements and to make it well-formed, you can wrap it in...
an html element. This element tag will be filtered out and only its children will be copied to the output documents. Similarly, you can wrap your content in head, body, html/head, or html/body elements.

- **Referencing Resources in the XML File** - You can include references to local resources (such as JavaScript or CSS files) by using the built-in \${oxygen-webhelp-output-dir} macro to specify their paths relative to the output directory:

  ```html
  <html>
    <script type="text/javascript" src="\${oxygen-webhelp-output-dir}/js/test.js">
      function myFunction() {
        return true;
      }
    </script>
    <link rel="stylesheet" type="text/css" href="\${oxygen-webhelp-output-dir}/css/test.css" />
  </html>
  ```

To copy the referenced resources to the output directory, follow the procedure in: How to Copy Additional Resources to Output Directory (on page 1439).

- **Inline JavaScript or CSS Content**:

  **JavaScript**:

  ```javascript
  /* Include JavaScript code here. */

  function myFunction() {
    return true;
  }
  ```

  **CSS**:

  ```css
  /* Include CSS style rules here. */

  *{
    color:red
  }
  ```

  **Note**: If you have special characters (for example, &amp;, &lt;) that break the well-formedness of the XML fragment, it is important to place this content inside an XML comment:

  ```xml
  <!--
  /* Include JavaScript code here. */

  function myFunction() {
    return true;
  }
  -->
  ```
2. Use the `webhelp.head.script` parameter in your transformation script and set its value to reference the URL of the XML file created in step 1. Your additional content will be included at the end of the `head` element of your output document.

**Note:** If you want to include the content in the `body` element, use the `webhelp.body.script` parameter instead.

3. Execute the transformation script.

For example, a DITA script might look like this::

- **Windows:**
  ```
  dita.bat -i c:\mySample.ditamap -f webhelp -Dwebhelp.head.script=c:\myFile.xml
  ```

- **Mac OS X/ Linux:**
  ```
  dita -i /mySample.ditamap -f webhelp -Dwebhelp.head.script=/myFile.xml
  ```

Related Information:

- [How to Copy Additional Resources to Output Directory](on page 1439)

**How to Change Number Styles for Ordered Lists**

Ordered lists (`ol`) are usually numbered in XHTML output using numerals. If you want to change the numbering to alphabetical, follow these steps:

1. Define a custom `outputclass` value and set it as an attribute of the ordered list, as in the following example:

```xml
<ol outputclass="number-alpha">
  <li>A</li>
  <li>B</li>
  <li>C</li>
</ol>
```
2. Add the following code snippet in a custom CSS file:

```css
ol.number-alpha{
    list-style-type:lower-alpha;
}
```

3. Edit the WebHelp transformation scenario and open the **Parameters** tab.
   a. For a DITA transformation, set the `args.css` parameter to the path of your custom CSS file.
      Also, set the `args.copycss` parameter to `yes` to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
   b. For a DocBook transformation, set the `html.stylesheet` parameter to the path of your custom CSS file.

4. Run the transformation scenario.

**How to Change the Icons in a WebHelp Classic Table of Contents**

You can change the icons that appear in a WebHelp Classic table of contents by assigning new image files in a custom CSS file. By default, these icons are defined with the following CSS codes (the first example is the icon that appears for a collapsed menu and the second for an expanded menu):

```css
.hasSubMenuClosed{
    background: url('..//img/book_closed16.png') no-repeat;
    padding-left: 16px;
    cursor: pointer;
}

.hasSubMenuOpened{
    background: url('..//img/book_opened16.png') no-repeat;
    padding-left: 16px;
    cursor: pointer;
}
```

**Using Oxygen XML Editor/Author**

To assign other icons and use a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Create a custom CSS file that assigns your desired icons to the `.hasSubMenuClosed` and `.hasSubMenuOpened` properties.
2. It is recommended that you store the image files in the same directory as the default icons.
   • For DITA transformations: `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\img`.
   • For DocBook transformations: `[OXYGEN_INSTALL_DIR]\frameworks\docbook\xsl\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\img`.

3. Edit the WebHelp transformation scenario and open the Parameters tab.
   • For a DITA transformation, set the `args.css` parameter to the path of your custom CSS file. Also, set the `args.copycss` parameter to `yes` to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
   • For a DocBook transformation, set the `html.stylesheet` parameter to the path of your custom CSS file.

4. Run the WebHelp transformation scenario to generate the output.

**Using a Script Outside of Oxygen XML Editor/Author**

⚠️ **Important:** Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin (https://www.oxygenxml.com/buy_webhelp.html).
- The Oxygen XML WebHelp Plugin must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To assign other icons and use a script outside of Oxygen XML Editor/Author (on page 1405), follow this procedure:

1. Create a custom CSS file that assigns your desired icons to the `.hasSubMenuClosed` and `.hasSubMenuOpened` properties.

```
.hasSubMenuClosed{
    background: url('TOC-my-closed-button.png') no-repeat;
}
```

```
.hasSubMenuOpened{
    background: url('TOC-my-opened-button.png') no-repeat;
}
```
2. It is recommended that you store the image files in the same directory as the default icons.
   • For DITA transformations: `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\img\`
   • For DocBook transformations: `[DocBook XSL directory]\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\img\`

3. Reference your custom CSS file:
   • For DITA transformations, use the `args.css` parameter in your transformation script and set its value to the path of your custom CSS file. Also, set the `args.copycss` parameter to `yes` to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
   • For DocBook transformations, use the `html.stylesheet` parameter in your transformation script and set its value to the path of your custom CSS file.

4. Execute the transformation script.

For example, a DITA script might look like this:

- **Windows**:
  ```
  dita.bat -i c:\mySample.ditamap -f webhelp -Dargs.css=c:\myFile.css -Dargs.copycss=yes
  ```
- **Mac OS X/ Linux**:
  ```
  dita -i /mySample.ditamap -f webhelp -Dargs.css=/myFile.css -Dargs.copycss=yes
  ```

**How to Customize the Appearance of Selected Items in the Table of Contents**

The appearance of selected items in the table of contents of WebHelp Classic output can be enhanced.

For example, to highlight the background of the selected item, follow these steps:

1. Locate the `toc.css` file in the following directory:
   a. For DITA transformations: `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\css`
   b. For DocBook transformations: `[DocBook XSL directory]\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\css`

2. Edit that CSS file, find the `menuItemSelected` class, and change the value of the `background` property.

3. Run the transformation.
Note: You can also overwrite the same value from your own custom CSS and then specify the path to your CSS in the transformation scenario by doing one of the following:

- For DITA transformations, use the `args.css` parameter and set its value to the path of your custom CSS file. Also, set the `args.copycss` parameter to `yes` to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
- For DocBook transformations, use the `html.stylesheet` parameter and set its value to the path of your custom CSS file.

How to Generate or Hide Navigation Links in WebHelp Classic Output

The WebHelp Classic output can contain navigation links (Previous / Next / Parent topic arrows) that can be used to navigate to the previous, next, or parent topic.

How to Generate Navigation Links in WebHelp Classic Output

The navigation links are controlled by the `collection-type` attribute. For example, if you set `collection-type="sequence"` on a parent topic reference in your DITA map, navigation links will be generated in the output for all of its child topics (from children to parent, and from child to previous sibling and next sibling).

```xml
<map id="example_map" title="Example Map">
  <topicref href="../topics/ParentTopic.dita" collection-type="sequence">
    <topicref href="../topics/Childtopic.dita"/>
  </topicref>
</map>
```

How to Hide All Navigation Links in WebHelp Classic Output

To hide all navigation links, use the `args.hide.parent.link` parameter in the transformation and set its value to `no`.

Adding Graphics and Media Resources

This section contains topics that explain how to add media resources to the published WebHelp Class output or to the output directory.

How to Add a Favicon in WebHelp Systems

You can add a custom favicon to your WebHelp output by simply using a parameter in the transformation scenario to point to your favicon image. This is available for DITA and DocBook WebHelp output using WebHelp Classic or WebHelp Classic with Feedback transformations.
Using Oxygen XML Editor/Author

To add a favicon to your WebHelp output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Edit the WebHelp transformation scenario and open the **Parameters** tab.
2. Locate the `webhelp.favicon` parameter and enter the file path that points to the image that will be used as the favicon.
3. Run the transformation scenario.

**Result:** Browsers that provide favicon support will display the favicon (typically in the browser’s address bar, in the list of bookmarks, and in the history).

Using a Script Outside of Oxygen XML Editor/Author

⚠️ **Important:** Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin (https://www.oxygenxml.com/buy_webhelp.html).
- The Oxygen XML WebHelp Plugin must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To add a favicon to your WebHelp output using a script outside of Oxygen XML Editor/Author, follow this procedure:

1. Specify the file path that points to the image that will be used as the favicon using the `webhelp.favicon` parameter.
2. Execute the transformation script.

**Result:** Browsers that provide favicon support will display the favicon (typically in the browser’s address bar, in the list of bookmarks, and in the history).

For example:

- **Windows:**

  dita.bat -i c:\mySample.ditamap -f webhelp -Dwebhelp.favicon=c:\myFavicon.jpg

- **Mac OS X/ Linux:**

  dita -i /mySample.ditamap -f webhelp -Dwebhelp.favicon=/myFavicon.jpg
How to Add a Logo Image in the Title Area

You can customize WebHelp Classic output to include a logo in the title area. It will be displayed before the publication title. You can also specify a URL that can be used to send users to a specific website when they click the logo image.

This customization can be done using a transformation scenario from within Oxygen XML Editor/Author or using a command-line script outside of Oxygen XML Editor/Author.

Using Oxygen XML Editor/Author

To add a logo in the title area of your WebHelp output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Edit a WebHelp Classic transformation scenario, then open the Parameters tab.
2. Specify the path to your logo in the webhelp.logo.image parameter.
3. If you also want to add a link to your website when you click the logo image, set the URL in the webhelp.logo.image.target.url parameter.
4. Run the transformation scenario.

Using a Script Outside of Oxygen XML Editor/Author

⚠️ Important: Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin (https://www.oxygenxml.com/buy_webhelp.html).
- The Oxygen XML WebHelp Plugin must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To add a logo in the title area of your WebHelp output using a script outside of Oxygen XML Editor/Author, follow this procedure:

1. Specify the path to your logo using the webhelp.logo.image parameter.
2. If you also want to add a link to your website when you click the logo image, set the URL using the webhelp.logo.image.target.url parameter.
3. Execute the transformation script.

For example:

- Windows:
How to Add Video and Audio Objects in DITA WebHelp Classic

You can insert references to video and audio media resources (such as videos, audio clips, or embedded HTML frames) in your DITA topics and then publish them to WebHelp output. The media objects can be played directly in all HTML5-based outputs, including WebHelp systems.

To add media objects in the WebHelp output generated from DITA documents, follow the procedures below.

**Adding Videos to DITA WebHelp Output**

1. Edit the DITA topic and insert a reference to the video through one of the following methods:
   - Use the [Insert Media Object](on page 2578).
   - Drag (or copy) the video file from your system explorer or the Project view (on page 320) and drop (or paste) it into your document.
   - Manually add an object element, as in one of the following examples:

   ```xml
   <object outputclass="video" type="video/mp4" data="MyVideo.mp4"/>
   ```

   or, instead of the data attribute, you can specify the video using a parameter like this:

   ```xml
   <object outputclass="video">
     <param name="src" value="videos/MyVideo.mp4"/>
   </object>
   ```

2. Apply a DITA to WebHelp transformation to obtain the output.

   **Result:** The transformation converts the object element to an HTML5 video element.

   ```xml
   <video controls="controls"><source type="video/mp4" src="MyVideo.mp4"></source></video>
   ```

**Adding Audio Clips to DITA WebHelp Output**

1. Edit the DITA topic and insert a reference to the audio clip through one of the following methods:
   - Use the [Insert Media Object](on page 2578).
• Drag (or copy) the audio file from your system explorer or the Project view (on page 320) and drop (or paste) it into your document.
• Manually add an object element, as in one of the following examples:

```xml
<object outputclass="audio" type="audio/mpeg" data="MyClip.mp3"/>
```

or, instead of the data attribute, you can specify the video using a parameter like this:

```xml
<object outputclass="audio">
  <param name="src" value="audio/MyClip.mp3"/>
</object>
```

2. Apply a DITA to WebHelp transformation to obtain the output.

Result: The transformation converts the object element to an HTML5 audio element.

```
<audio controls="controls">
  <source type="audio/mpeg" src="MyClip.mp3"/>
</audio>
```

---

Adding Embedded HTML Frames (such as YouTube videos) to DITA WebHelp Output

1. Edit the DITA topic and insert a reference to the embedded object by using the Insert Media Object toolbar action (on page 2578) or by manually adding an object element, as in one of the following examples:

```xml
<object outputclass="iframe" data="https://www.youtube.com/embed/m_vv2s5Trn4"/>
```

or, instead of the data attribute, you can specify the object using a parameter like this:

```xml
<object outputclass="iframe">
  <param name="src" value="http://www.youtube.com/embed/m_vv2s5Trn4"/>  
</object>
```

2. If you want the video to be allowed to play in full screen mode once the document is converted to XHTML output, also add an allowfullscreen parameter and set its value to true:

```xml
<object outputclass="iframe" data="https://www.youtube.com/embed/m_vv2s5Trn4"/>
  <param name="allowfullscreen" value="true"/>
</object>
```

Tip: If you copy the embed code from the source and paste it into the Insert Media dialog box (see the specific instructions: here (on page 2580)), the allowfullscreen parameter will automatically be added and all you have to do is set the value to true.

3. Apply a DITA to WebHelp transformation to obtain the output.

Result: The transformation converts the object element to an HTML5 iframe element.
For more information, see the following video demonstration:

https://www.youtube.com/embed/llX11gS4WaU

Related Information:

- Adding Video, Audio, and Embedded HTML Resources in DITA Topics (on page 2578)

How to Add Videos in DocBook WebHelp Classic Output

You can insert references to videos in your DocBook topics and then publish them to WebHelp Classic output. The videos can be played directly in all HTML5-based outputs, including WebHelp systems.

To add videos in the WebHelp Classic output generated from DocBook documents, follow these steps:

1. Edit the DocBook document and reference the video using an `mediaobject` element, as in the following example:

   ```xml
   <mediaobject>
     <videoobject>
       <videodata fileref="http://www.youtube.com/watch?v/VideoName"/>
     </videoobject>
   </mediaobject>
   ```

2. Apply a WebHelp or WebHelp with Feedback transformation scenario to obtain the output.

How to Copy Additional Resources to Output Directory

You can copy additional resources (such as JavaScript, CSS or other resources) to the output directory of a WebHelp system by using the `webhelp.custom.resources` parameter.

Using Oxygen XML Editor/Author

To copy additional resources to the output directory using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Place all your resources in the same directory.
2. Edit the WebHelp transformation scenario, then open the Parameters tab.
3. Edit the value for the `webhelp.custom.resources` parameter and set it to the absolute path of the directory in step 1.
4. Click OK to save the changes to the transformation scenario.
5. Run the transformation scenario.

**Result:** All files from the new directory will be copied to the root of the WebHelp output directory.

### Using a Script Outside of Oxygen XML Editor/Author

⚠️ **Important:** Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin (https://www.oxygenxml.com/buy_webhelp.html).
- The Oxygen XML WebHelp Plugin must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To copy additional resources to the output directory using a script outside of Oxygen XML Editor/Author (on page 1405), follow this procedure:

1. Place all your resources in the same directory.
2. Specify the absolute path to that directory using the `webhelp.custom.resources` parameter.
3. Execute the transformation script.

**Result:** All files from the new directory will be copied to the root of the WebHelp output directory.

For example:

- **Windows:**
  ```bash
dita.bat -i c:\mySample.ditamap -f webhelp-responsive -Dwebhelp.custom.resources=c:\resources
  
  \resources
  ```
- **Mac OS X/ Linux:**
  ```bash
dita -i /mySample.ditamap -f webhelp-responsive -Dwebhelp.custom.resources=/resources
  ```

### How to Publish MathML Formulas when Generating WebHelp from a Command Line

The DITA-OT distribution that comes bundled with Oxygen includes some additional pre-installed DITA-OT plugins that add support for properly displaying MathML formulas in the WebHelp output. However, if you are generating your WebHelp output from a command line, MathML formulas will not be displayed properly unless you install these plugins manually.
These plugins can be downloaded and installed from DITA 1.3 Support for Open Toolkit (https://github.com/dita-community/dita13-dita-ot-1.x-support). This plugin package adds DITA 1.3 support, including MathML.

**How to Add Support for MathML when Generating WebHelp from a Command Line**

1. Download and unzip the DITA 1.3 Support for Open Toolkit 1.x distribution package. It includes 4 DITA-OT plugins.
2. Copy the four plugin directories to your DITA-OT-DIR/plugins directory.
3. In the home directory of your DITA-OT installation, run the ant -f integrator.xml command.

**Searching the Output**

This section contains topics that explain how to customize some of the search features in WebHelp Classic output.

**How to Change Element Scoring in Search Results**

The WebHelp Search feature is enhanced with a rating mechanism that computes scores for every page that matches the search criteria. HTML tag elements are assigned a scoring value and these values are evaluated for the search results. The WebHelp directory includes a properties file that defines the scoring values for tag elements and this file can be edited to customize the values according to your needs.

To edit the scoring values of HTML tag element for enhancing WebHelp search results, follow these steps:

1. Edit the scoring properties file for DITA or DocBook WebHelp systems. The properties file includes instructions and examples to help you with your customization.
   a. For DITA WebHelp Classic systems, edit the following file: DITA-OT-DIR/plugins/com.oxygenxml.webhelp.classic/indexer/scoring.properties.
   b. For DocBook WebHelp system, edit the following file: [DocBook XSL directory]\com.oxygenxml.webhelp.classic/indexer/scoring.properties.

The values that can be edited in the scoring.properties file:

```plaintext
h1  = 10
h2  = 9
h3  = 8
h4  = 7
h5  = 6
h6  = 5
b   = 5
```
How to Exclude Certain DITA Topics from Search Results

There are several ways to exclude certain DITA resources from your WebHelp system's search results. This is useful if you have topics in your DITA map (on page 2793) structure that you do not want to be included in search results for your WebHelp system. The first method involves setting a parameter in the WebHelp transformation scenario and the second involves setting an attribute for each DITA topic reference that you want to exclude.

Transformation Parameter Method

To exclude DITA topics from WebHelp search results using a transformation parameter, follow these steps:

1. Create a simple text file that will contain your excluded file patterns. Each pattern must be on a new line. The patterns are considered to be relative to the output directory and they accept wildcards such as `*` (matches zero or more characters) or `?` (matches one character). For more information about the patterns, see https://ant.apache.org/manual/dirtasks.html#patterns.

   **Example:** Suppose that in your project, you want to exclude all files located in the `resources` directory and all files located in the `topics` directory that have a `.bak` file extension. You could create a simple text file (for example, named `exclude.properties`), and add the following lines:

   ```
   resources/*
   topics/*.bak
   ```

2. Edit the WebHelp transformation scenario and open the Parameters tab.
3. Set the `webhelp.search.custom.excludes.file` parameter to specify the path to the file that contains the excluded file patterns (for example, `exclude.properties` in step 1).
4. Run the transformation scenario.

Search Attribute Method

The WebHelp Search engine does not index DITA topics that have the `@search` attribute set to `no`.

To exclude DITA topics from WebHelp search results using this attribute, follow these steps:

1. Edit the DITA map and for any `topicref` that you want to exclude from search results, set the `search` attribute to `no`. For example:

   ```xml
   <topicref href="../topics/internal-topic1.dita" search="no"/>
   ```

2. Save your changes to the DITA map.
3. Run your WebHelp system transformation scenario.

How to Optimize Search Results in WebHelp Classic

A DITA Map WebHelp transformation scenario can be configured to produce a `sitemap.xml` file that is used by search engines to aid crawling and indexing mechanisms. A sitemap lists all pages of a WebHelp system and allows webmasters to provide additional information about each page, such as the date it was last updated, change frequency, and importance of each page in relation to other pages in your WebHelp deployment.

The structure of the `sitemap.xml` file looks like this:

```xml
<urlset xmlns="http://www.sitemaps.org/schemas/sitemap/0.9">
  <url>
    <loc>http://www.example.com/topics/introduction.html</loc>
    <lastmod>2014-10-24</lastmod>
    <changefreq>weekly</changefreq>
    <priority>0.5</priority>
  </url>
  <url>
    <loc>http://www.example.com/topics/care.html#care</loc>
    <lastmod>2014-10-24</lastmod>
    <changefreq>weekly</changefreq>
    <priority>0.5</priority>
  </url>
  . . .
</urlset>
```
Each page has a `<url>` element structure containing additional information, such as:

- **loc** - the URL of the page. This URL must begin with the protocol (such as `http`), if required by your web server. It is constructed from the value of the `webhelp.sitemap.base.url` parameter from the transformation scenario and the relative path to the page (collected from the `href` attribute of a `topicref` element in the DITA map).

**Note:** The value must have fewer than 2,048 characters.

- **lastmod** (optional) - the date when the page was last modified. The date format is `YYYY-MM-DD`.

- **changefreq** (optional) - indicates how frequently the page is likely to change. This value provides general information to assist search engines, but may not correlate exactly to how often they crawl the page. Valid values are: always, hourly, daily, weekly, monthly, yearly, and never. The first time the `sitemap.xml` file is generated, the value is set based upon the value of the `webhelp.sitemap.change.frequency` parameter in the DITA WebHelp transformation scenario. You can change the value in each `url` element by editing the `sitemap.xml` file.

**Note:** The value `always` should be used to describe documents that change each time they are accessed. The value `never` should be used to describe archived URLs.

- **priority** (optional) - the priority of this page relative to other pages on your site. Valid values range from 0.0 to 1.0. This value does not affect how your pages are compared to pages on other sites. It only lets the search engines know which pages you deem most important for the crawlers. The first time the `sitemap.xml` file is generated, the value is set based upon the value of the `webhelp.sitemap.priority` parameter in the DITA WebHelp transformation scenario. You can change the value in each `url` element by editing the `sitemap.xml` file.

### Creating and Editing the `sitemap.xml` File

Follow these steps to produce a `sitemap.xml` file for your WebHelp system, which can then be edited to fine-tune search engine optimization:

1. **Edit** the transformation scenario you currently use for obtaining your WebHelp output. This opens the **Edit DITA Scenario** dialog box.

2. **Open** the **Parameters** tab and set a value for the following parameters:
   - **webhelp.sitemap.base.url** - the URL of the location where your WebHelp system is deployed
     
     **Note:** This parameter is required for Oxygen XML Author to generate the `sitemap.xml` file.
   - **webhelp.sitemap.change.frequency** - how frequently the WebHelp pages are likely to change (accepted values are: always, hourly, daily, weekly, monthly, yearly, and never)
   - **webhelp.sitemap.priority** - the priority of each page (value ranging from 0.0 to 1.0)

3. **Run** the transformation scenario.
4. Look for the `sitemap.xml` file in the transformation's output folder. Edit the file to fine-tune the parameters of each page, according to your needs.

**How to Index Japanese Content in WebHelp Classic**

To optimize the indexing of Japanese content in WebHelp pages, the Lucene Kuromoji Japanese analyzer can be used. This analyzer is included in the **Oxygen XML Editor/Author** installation kit.

**Using Oxygen XML Editor/Author**

To activate the Japanese indexing in your WebHelp output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Set the language for your content to Japanese (depending on your framework):
   - **DITA**: Edit a DITA to WebHelp transformation scenario and in the **Parameters** tab, set the value of the `default.language` parameter to `ja-jp`.
     
     📌 Note: Alternatively, you could set the `xml:lang` attribute on the root of the DITA map (on page 2793) and the referenced topics to `ja-jp`. Another alternative for DITA output is to use the `webhelp.search.japanese.dictionary` parameter to specify a path to a Japanese dictionary that will be used by the Kuromoji morphological engine (note that the encoding for the dictionary must be UTF8).

   - **DocBook**: Edit a DocBook to WebHelp transformation scenario and in the **Parameters** tab, set the value of the `l10n.gentext.default.language` parameter to `ja`.

2. Run the WebHelp transformation scenario to generate the output.

**Using a Script Outside of Oxygen XML Editor/Author**

⚠️ **Important**: Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:

- You must have a valid license for the **Oxygen XML WebHelp Plugin** (https://www.oxygenxml.com/buy_webhelp.html).
- The **Oxygen XML WebHelp Plugin** must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To activate the Japanese indexing in your WebHelp output using a script outside of **Oxygen XML Editor/Author**, follow this procedure:

1. Set the language for your content to Japanese (depending on your framework):
   - **DITA**: Use the `args.default.language` parameter in your transformation script and set its value to `ja-jp`.

Note: Alternatively, you could set the xml:lang attribute on the root of the DITA map (on page 2793) and the referenced topics to ja-jp. Another alternative for DITA output is to use the webhelp.search.japanese.dictionary parameter to specify a path to a Japanese dictionary that will be used by the Kuromoji morphological engine (note that the encoding for the dictionary must be UTF8).

- DocBook: Use the l10n.gentext.default.language parameter in your transformation script and set its value to ja.

2. Execute the transformation script.

For example, a DITA script might look like this:

- **Windows:**
  
  ```
  dita.bat -i c:\mySample.ditamap -f webhelp -Dargs.default.language=ja-jp
  ```

- **Mac OS X/ Linux:**
  
  ```
  dita -i /mySample.ditamap -f webhelp -Dargs.default.language=ja-jp
  ```

- How to Localize the Interface of DocBook to WebHelp Classic Output (on page 1451)

Localization in WebHelp Classic Output

This section contains topics that explain the localization support for DITA or DocBook WebHelp Classic transformations.

How to Localize Email Notifications of WebHelp Classic with Feedback Output

The feedback-enabled WebHelp systems use emails to notify users when comments are posted. These emails are based on templates stored in the WebHelp directory. The default messages are in English, French, German, and Japanese. These messages are copied into the WebHelp system deployment directory during the execution of the corresponding transformation scenario.

Using Oxygen XML Editor/Author

To change the language of the emails for WebHelp Classic with Feedback output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:
1. Create the following directory, depending on your framework:
   - **DITA**: `DITA-OT-DIR/plUGINS/com.oxygenxml.webhelp.classic/oxygen-webhelp/resources/php/templates/[Language code]` (where the *Language code* is the 2-digit code, such as `nl` for Dutch)
   - **DocBook**: `[DocBook XSL directory]/com.oxygenxml.webhelp.classic/oxygen-webhelp/resources/php/templates/[Language code]` (where the *Language code* is the 2-digit code, such as `nl` for Dutch)

2. Copy all English template files from the following directory (depending on your framework) and paste them into the directory you just created.

3. Edit the HTML files from the following directory (depending on your framework) and translate the content into your language.
   - **DITA**: `DITA-OT-DIR/plUGINS/com.oxygenxml.webhelp.classic/oxygen-webhelp/resources/php/templates/[Language code]` (where the *Language code* is the 2-digit code, such as `nl` for Dutch)
   - **DocBook**: `[DocBook XSL directory]/com.oxygenxml.webhelp.classic/oxygen-webhelp/resources/php/templates/[Language code]` (where the *Language code* is the 2-digit code, such as `nl` for Dutch)

4. Edit a **WebHelp Classic with Feedback** transformation scenario and open the **Parameters** tab.

5. In the **Parameters** tab, look for the `default.language` parameter and set its value to the appropriate language code (for example, `nl` for Dutch).

   **Note:** If you set the parameter to a value such as `LanguageCode-CountryCode` (for example, `en-us`), the transformation scenario will only use the language code.

6. Run the transformation scenario.

### Using a Script Outside of Oxygen XML Editor/Author

**Important:** Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the [Oxygen XML WebHelp Plugin](https://www.oxygenxml.com/buy_webhelp.html).
- The [Oxygen XML WebHelp Plugin](https://www.oxygenxml.com/buy_webhelp.html) must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To change the language of the emails for WebHelp Classic with Feedback output using a script outside of Oxygen XML Editor/Author (*on page 1405*), follow this procedure:
1. Create the following directory, depending on your framework:
   - **DITA**: `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\php\templates\[Language code]` (where the *Language code* is the 2-digit code, such as `nl` for Dutch)
   - **DocBook**: `[DocBook XSL directory]\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\php\templates\[Language code]` (where the *Language code* is the 2-digit code, such as `nl` for Dutch)

2. Copy all English template files from the following directory (depending on your framework) and paste them into the directory you just created.
   - **DITA**: `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\php\templates\en`
   - **DocBook**: `[DocBook XSL directory]\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\php\templates\en`

3. Edit the HTML files from the following directory (depending on your framework) and translate the content into your language.
   - **DITA**: `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\php\templates\[Language code]` (where the *Language code* is the 2-digit code, such as `nl` for Dutch)
   - **DocBook**: `[DocBook XSL directory]\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\php\templates\[Language code]` (where the *Language code* is the 2-digit code, such as `nl` for Dutch)

4. Use the `args.default.language` parameter in your transformation script and set its value to the appropriate language code (for example, `nl` for Dutch).

   **Note**: If you set the parameter to a value such as `LanguageCode-CountryCode` (for example, `en-us`), the transformation scenario will only use the language code.

5. Execute the transformation script.

For example, a DITA to WebHelp Classic with Feedback script might look like this:

   - **Windows**:
     ```
     dita.bat -i c:\mySample.ditamap -f webhelp-feedback -Dargs.default.language=nl
     ```
   - **Mac OS X/Linux**:
     ```
     dita -i /mySample.ditamap -f webhelp-feedback -Dargs.default.language=nl
     ```

**How to Localize the Interface of DITA Map to WebHelp Classic Output**

Static labels used in the WebHelp output are stored in translation files that have the `strings-lang1-lang2.xml` name format, where `lang1` and `lang2` are ISO language codes. For example, the US English labels are kept in the `strings-en-us.xml` file.
These translation files are collected from two locations:

- **DITA-OT-DIR/xsl/common folder** - DITA-OT’s default translations (generated text for `note`, `fig`, and `table` elements).
- **DITA-OT-DIR/plugins/com.oxygenxml.webhelp.classic/oxygen-webhelp/resources/localization folder** - These translations are contributed by the WebHelp plugin and extend the default ones provided by DITA-OT. The labels defined in this folder take precedence over the DITA-OT defaults.

There are two major reasons you may want to use modify the translation files: to modify the existing strings or to translate to a new language.

### Modifying the Existing Strings

To modify the generated text for WebHelp transformations, you need to create a DITA-OT extension plugin that uses the `dita.xsl.messages` extension point. The following procedure is for changing English labels, but you can adapt it for any language:

1. Create a `com.oxygenxml.webhelp.localization` plugin directory inside the `DITA-OT-DIR/plugins/location`.  
2. Create a `plugin.xml` file inside that `com.oxygenxml.webhelp.localization` directory with the following content:

   ```xml
   <plugin id="com.oxygenxml.webhelp.localization">
     <require plugin="com.oxygenxml.webhelp.classic"/>
     <require plugin="com.oxygenxml.webhelp.responsive"/>
     <feature extension="dita.xsl.strings" file="webhelp-extension-strings.xml"/>
   </plugin>
   ```

3. Create a `webhelp-extension-strings.xml` file with the following content:

   ```xml
   <langlist>
     <lang xml:lang="en" filename="strings-en-us.xml"/>
     <lang xml:lang="en-us" filename="strings-en-us.xml"/>
   </langlist>
   ```

4. Copy the strings you want to change from the translation files (on page 1449) to the `strings-en-us.xml` file. Make sure you leave the name attribute unchanged because this is the key used to look up the string. A sample content might be:

   ```xml
   <strings xml:lang="en-US">
     <str name="Figure">Fig</str>
     <str name="Draft comment">ADDRESS THIS DRAFT COMMENT</str>
   </strings>
   ```
5. Use the Run DITA-OT Integrator transformation scenario (on page 1283) found in the DITA Map section in the Configure Transformation Scenario(s) dialog box (on page 1378).

Adding a New Language

To add a new language for WebHelp transformations, you need to create a DITA-OT extension plugin that uses the dita.xsl.messages extension point. The following sample procedure is for adding translation files for the Polish language, but you can adapt it for any language:

1. Create a com.oxygenxml.webhelp.localization plugin directory inside the DITA-OT-DIR/plugins/ location.
2. Create a plugin.xml file inside that com.oxygenxml.webhelp.localization directory with the following content:

   ```xml
   <plugin id="com.oxygenxml.webhelp.localization">
     <require plugin="com.oxygenxml.webhelp.classic"/>
     <require plugin="com.oxygenxml.webhelp.responsive"/>
     <feature extension="dita.xsl.strings" file="webhelp-extension-strings.xml"/>
   </plugin>
   ```

3. Create a webhelp-extension-strings.xml file with the following content:

   ```xml
   <langlist>
   <lang xml:lang="pl" filename="strings-pl-pl.xml"/>
   <lang xml:lang="pl-PL" filename="strings-pl-pl.xml"/>
   </langlist>
   ```

5. In the strings-pl-pl.xml file, change the @xml:lang attribute on the root element that conforms with the new language.

   ```xml
   <strings xml:lang="pl-PL">
   ...
   </strings>
   ```

6. Translate the content of each <str> element (make sure to leave the name attribute unchanged).

   Result:

   ```xml
   <strings xml:lang="pl-PL">
   ...
   ```
7. Copy the common DITA-OT strings defined in the `DITA-OT-DIR/xsl/common/strings-en-us.xml` file. It defines a set generated text available for HTML based transformations (such as `note`, `fig`, and `table` elements). Translate the content of each `<str>` element.

**Result:**

```xml
<strings xml:lang="pl-PL">
    ...
    <str name="webhelp.content" js="true" php="false">Polish translation for "Content".</str>
    <str name="webhelp.search" js="true" php="false">Polish translation for "Search"</str>
    ...
</strings>
```

8. Use the Run DITA-OT Integrator transformation scenario (on page 1283) found in the DITA Map section in the Configure Transformation Scenario(s) dialog box (on page 1378).

**Related Information:**

How to Localize the Interface of DocBook to WebHelp Classic Output

Static labels that are used in the WebHelp output are kept in translation files in the [DocBook XSL directory]/com.oxygenxml.webhelp.classic/oxygen-webhelp/resources/localization folder. Translation files have the `strings-lang1-lang2.xml` name format, where `lang1` and `lang2` are ISO language codes. For example, the US English text is kept in the `strings-en-us.xml` file.

To localize the interface of the WebHelp output for DocBook transformations, follow these steps:
1. Look for the `strings-[lang1]-[lang2].xml` file in `
   [DocBook XSL directory]/com.oxygenxml.webhelp.classic/oxygen-webhelp/resources/localization`
directory (for example, the Canadian French file would be: `strings-fr-ca.xml`). If it does not exist, create one starting from the `strings-en-us.xml` file.

2. Translate all the labels from the above language file. Labels are stored in XML elements that have
   the following format: `<str name="Label name">Caption</str>.

3. Make sure that the new XML file that you created in the previous two steps is listed in the file
   `
   [DocBook XSL directory]/com.oxygenxml.webhelp.classic/oxygen-webhelp/resources/localization/strings.xml`
   For example, a Canadian French file would be
   listed as: `<lang xml:lang="fr-ca" filename="strings-fr-ca.xml"/>`

4. Edit any of the DocBook to WebHelp transformation scenarios (with or without feedback) and set
   the `l10n.gentext.default.language` parameter to the code of the language you want to localize
   (for example, `fr-ca` for Canadian French).

5. Run the transformation scenario to produce the WebHelp output.

Related Information:

- How to Index Japanese Content in WebHelp Classic (on page 1445)

How to Activate Support for Right-to-Left (RTL) Languages

To activate support for RTL (right-to-left) languages in WebHelp output, edit the `DITA map (on page 2793)` and set the `xml:lang` attribute on its root element (`map`). The corresponding attribute value can be set for following RTL languages:

- ar-eg - Arabic
- he-il - Hebrew
- ur-pk - Urdu

Integrating Social Media and Google Tools in the WebHelp Classic Output

Oxygen XML Author includes support for integrating some of the most popular social media sites in
WebHelp output.

How to Add a Facebook Like Button in WebHelp Classic Output

It is possible to integrate Facebook™ into your WebHelp Classic output and the widget will appear in
the footer sections of your WebHelp page.
Using Oxygen XML Editor/Author

To add a Facebook Like widget to your WebHelp output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Go to the Facebook Developers website.
2. Fill-in the displayed form, then click the Get Code button.
3. Copy the two code snippets and paste them into a `<div>` element inside an XML file called `facebook-widget.xml`. Make sure you follow these rules:
   - The file must be well-formed.
   - The code for each `<script>` element must be included in an XML comment.
   - The start and end tags for the XML comment must be on a separate line.

   The content of the XML file should look like this:

   ```xml
   <div id="facebook">
   <div id="fb-root"/>
   <script>
   <!--
   (function(d, s, id) {
   var js, fjs = d.getElementsByTagName(s)[0];
   if (d.getElementById(id)) return;
   js = d.createElement(s); js.id = id;
   js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
   fjs.parentNode.insertBefore(js, fjs);
   })(document, 'script', 'facebook-jssdk');
   -->
   </script>
   <div class="fb-like" data-layout="standard" data-action="like"
    data-show-faces="true" data-share="true"/>
   </div>
   ```

4. In Oxygen XML Editor/Author, click the Configure Transformation Scenario(s) action from the toolbar (or the Document > Transformation menu).
5. Select an existing WebHelp Classic transformation scenario (depending on your needs, it may be with or without feedback) and click the Duplicate button to open the Edit Scenario dialog box.
6. Switch to the Parameters tab and edit the `webhelp.footer.file` parameter to reference the `facebook-widget.xml` file that you created earlier.
7. Click Ok and run the transformation scenario.
Using a Script Outside of Oxygen XML Editor/Author

⚠️ **Important:** Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the **Oxygen XML WebHelp Plugin** (https://www.oxygenxml.com/buy_webhelp.html).
- The **Oxygen XML WebHelp Plugin** must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To add a Facebook *Like* widget to your WebHelp output using a script outside of Oxygen XML Editor/Author *(on page 1405)*, follow this procedure:

1. Go to the Facebook Developers website.
2. Fill-in the displayed form, then click the Get Code button.
3. Copy the two code snippets and paste them into a `<div>` element inside an XML file called `facebook-widget.xml`. Make sure you follow these rules:
   - The file must be well-formed.
   - The code for each `<script>` element must be included in an XML comment.
   - The start and end tags for the XML comment must be on a separate line.

   The content of the XML file should look like this:

   ```xml
   <div id="facebook">
     <div id="fb-root"/>
     <script>
       <!--
         (function(d, s, id) {
           var js, fjs = d.getElementsByTagName(s)[0];
           if (d.getElementsByTagName(s).length === 0) return;
           js = d.createElement(s); js.id = id;
           js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
           fjs.parentNode.insertBefore(js, fjs);
         }(document, 'script', 'facebook-jssdk'));
       -->
     </script>
     <div class="fb-like" data-layout="standard" data-action="like"
      data-show-faces="true" data-share="true"/>
   </div>
   ```

4. Use the `webhelp.footer.file` parameter in your transformation script and set its value to reference the `facebook-widget.xml` file that you created earlier.
5. Execute the transformation script.

For example:

- **Windows**:

  dita.bat -i c:\mySample.ditamap -f webhelp -Dwebhelp.footer.file=c:\facebook-widget.xml

- **Mac OS X/ Linux**:

  dita -i /mySample.ditamap -f webhelp -Dwebhelp.footer.file=/facebook-widget.xml

How to Add a Google+ Button in WebHelp Classic Output

It is possible to integrate Google into your WebHelp Classic output and the widget will appear in the footer section of your WebHelp page.

Using Oxygen XML Editor/Author

To add a Google+ widget to your WebHelp Classic output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Go to the Google Developers website.
2. Fill-in the displayed form. The preview area on the right side displays the code and a preview of the widget.
3. Copy the code snippet displayed in the preview area and paste it into a `div` element inside an XML file called `google-plus-button.xml`. Make sure that the content of the file is well-formed. The content of the XML file should look like this:

   ```xml
   <div id="google-plus">
     <!-- Place this tag in your head or just before your close body tag. -->
     <script src="https://apis.google.com/js/platform.js" async defer></script>
     <!-- Place this tag where you want the +1 button to render. -->
     <div class="g-plusone" data-annotation="inline" data-width="300"></div>
   </div>
   ```

4. In Oxygen XML Editor/Author, click the  Configure Transformation Scenario(s)  action from the toolbar (or the Document > Transformation menu).
5. Select an existing WebHelp Responsive transformation scenario (depending on your needs, it may be with or without feedback) and click the Duplicate button to open the Edit Scenario dialog box.
6. Switch to the Parameters tab and edit the webhelp.footer.file parameter to reference the `google-plus-button.xml` file that you created earlier.
7. Click **Ok** and run the transformation scenario.

### Using a Script Outside of Oxygen XML Editor/Author

**Important:** Running WebHelp transformations from a script outside of *Oxygen XML Editor/Author* requires an additional license and some additional setup:

- You must have a valid license for the **Oxygen XML WebHelp Plugin** ([https://www.oxygenxml.com/buy_webhelp.html](https://www.oxygenxml.com/buy_webhelp.html)).
- The **Oxygen XML WebHelp Plugin** must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To add a **Google+** widget to your WebHelp Classic output using a script outside of *Oxygen XML Editor/Author* (on page 1405), follow this procedure:

1. Go to the **Google Developers** website.
2. Fill-in the displayed form. The preview area on the right side displays the code and a preview of the widget.
3. Copy the code snippet displayed in the preview area and paste it into a `div` element inside an XML file called **google-plus-button.xml**. Make sure that the content of the file is well-formed. The content of the XML file should look like this:

```xml
<div id="google-plus">
  <!-- Place this tag in your head or just before your close body tag. -->
  <script src="https://apis.google.com/js/platform.js" async defer></script>

  <!-- Place this tag where you want the +1 button to render. -->
  <div class="g-plusone" data-annotation="inline" data-width="300"></div>
</div>
```

4. Use the `webhelp.footer.file` parameter in your transformation script and set its value to reference the **google-plus-button.xml** file that you created earlier.

5. Execute the transformation script.

   For example:
   - **Windows:**
     ```
     dita.bat -i c:\mySample.ditamap -f webhelp -Dwebhelp.footer.file=c:\google-plus-button.xml
     ```
   - **Mac OS X/ Linux:**
     ```
     dita -i /mySample.ditamap -f webhelp -Dwebhelp.footer.file=/google-plus-button.xml
     ```
How to Add Tweet Button in WebHelp Classic Output

It is possible to integrate Twitter into your WebHelp Classic output and the widget will appear in the footer section of your WebHelp page.

Using Oxygen XML Editor/Author

To add a Twitter Tweet widget to your WebHelp Classic output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Go to the Tweet button generator page.
2. Fill-in the displayed form. The Preview and code area displays the code that you will need.
3. Copy the code snippet displayed in the Preview and code area and paste it into a div element inside an XML file called tweet-button.xml. Make sure you follow these rules:
   - The file must be well-formed.
   - The code for each script element must be included in an XML comment.
   - The start and end tags for the XML comment must be on a separate line.
   The content of the XML file should look like this:

   ```xml
   <div id="twitter">
     <a href="https://twitter.com/share" class="twitter-share-button">Tweet</a>
     <script>
       !function(d, s, id) {
         var js, fjs = d.getElementsByTagName(s)[0], p = /^http:/.test(d.location) ? 'http' : 'https';
         if (! d.getElementById(id)) {
           js = d.createElement(s);
           js.id = id;
           js.src = p + '://platform.twitter.com/widgets.js';
           fjs.parentNode.insertBefore(js, fjs);
         }
         {document, 'script', 'twitter-wjs'};
     }()
   </script>
   </div>
   ```

4. In Oxygen XML Editor/Author, click the Configure Transformation Scenario(s) action from the toolbar (or the Document > Transformation menu).
5. Select an existing WebHelp Responsive transformation scenario (depending on your needs, it may be with or without feedback) and click the Duplicate button to open the Edit Scenario dialog box.

6. Switch to the Parameters tab and edit the `webhelp.footer.file` parameter to reference the `tweet-button.xml` file that you created earlier.

7. Click Ok and run the transformation scenario.

**Using a Script Outside of Oxygen XML Editor/Author**

⚠️ **Important:** Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin (https://www.oxygenxml.com/buy_webhelp.html).
- The Oxygen XML WebHelp Plugin must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To add a Twitter Tweet widget to your WebHelp Classic output using a script outside of Oxygen XML Editor/Author (on page 1405), follow this procedure:

1. Go to the Tweet button generator page.
2. Fill-in the displayed form. The Preview and code area displays the code that you will need.
3. Copy the code snippet displayed in the Preview and code area and paste it into a `<div>` element inside an XML file called `tweet-button.xml`. Make sure you follow these rules:
   - The file must be well-formed.
   - The code for each `<script>` element must be included in an XML comment.
   - The start and end tags for the XML comment must be on a separate line.

The content of the XML file should look like this:

```xml
<div id="twitter">
  <a href="https://twitter.com/share" class="twitter-share-button">Tweet</a>
</div>
```

```javascript
<!--
!function (d, s, id) {
  var js, fjs = d.getElementsByTagName(s)[0], p = /^http:/.test(d.location) ? 'http': 'https';
  if (! d.getElementById(id)) {
    js = d.createElement(s);
    js.id = id;
    js.src = p + '://platform.twitter.com/widgets.js';
    fjs.parentNode.insertBefore(js, fjs);
  }
}(d, "script", "twitter-script");
```

4. Use the `webhelp.footer.file` parameter in your transformation script and set its value to reference the `tweet-button.xml` file that you created earlier.

5. Execute the transformation script.

For example:

- **Windows:**
  
  ```bash
  dita.bat -i c:\mySample.ditamap -f webhelp -Dwebhelp.footer.file=c:\tweet-button.xml
  ```

- **Mac OS X/ Linux:**
  
  ```bash
  dita -i /mySample.ditamap -f webhelp -Dwebhelp.footer.file=/tweet-button.xml
  ```

---

**How to Integrate Google Analytics in WebHelp Classic Output**

You can use [Google Analytics](https://developers.google.com/analytics/) to track and report site data for your WebHelp Classic output.

**Using Oxygen XML Editor/Author**

To integrate Google Analytics into your WebHelp Classic output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Create a new Google Analytics account (if you do not already have one) and log on.
2. Choose the Analytics solution that best fits the needs of your website.
3. Follow the on-screen instructions to obtain a **Tracking Code** that contains your **Tracking ID**. A Tracking Code looks like this:

```javascript
(function(i,s,o,g,r,a,m){i['GoogleAnalyticsObject']=r;i[r]=i[r]||function(){
 (i[r].q=i[r].q||[]).push(arguments)},i[r].l=1*new Date();a=s.createElement(o),
m=s.getElementsByTagName(o)[0];a.async=1;a.src=g;m.parentNode.insertBefore(a,m)
 })(window,document,'script','//www.google-analytics.com/analytics.js','ga');

ga('create', 'UA-XXXXXXXX-X', 'auto');
```
4. Save the Tracking Code (obtained in the previous step) in a new XML file called `googleAnalytics.xml`. Note that the file should only contain the tracking code.

5. In Oxygen XML Editor/Author, click the Configure Transformation Scenario(s) action from the toolbar (or the Document > Transformation menu).

6. Select an existing WebHelp Responsive transformation scenario (depending on your needs, it may be with or without feedback) and click the Duplicate button to open the Edit Scenario dialog box.

7. Switch to the Parameters tab and edit the `webhelp.footer.file` parameter to reference the `googleAnalytics.html` file that you created earlier.

8. Click Ok and run the transformation scenario.

Using a Script Outside of Oxygen XML Editor/Author

⚠️ Important: Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin (https://www.oxygenxml.com/buy_webhelp.html).
- The Oxygen XML WebHelp Plugin must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To integrate Google Analytics into your WebHelp Classic output using a script outside of Oxygen XML Editor/Author (on page 1405), follow this procedure:

1. Create a new Google Analytics account (if you do not already have one) and log on.
2. Choose the Analytics solution that best fits the needs of your website.
3. Follow the on-screen instructions to obtain a Tracking Code that contains your Tracking ID. A Tracking Code looks like this:

```html
<script>
(function(i,s,o,g,r,a,m){i['GoogleAnalyticsObject']=r;i[r]=i[r]||function()
(i[r].q=i[r].q||[]).push(arguments)},i[r].l=1*new Date();a=s.createElement(o),
m=s.getElementsByTagName(o)[0];a.async=1;a.src=g;m.parentNode.insertBefore(a,m)
}('script','//www.google-analytics.com/analytics.js','ga'));

ga('create', 'UA-XXXXXXXX-X', 'auto');
ga('send', 'pageview');
</script>
```
4. Save the Tracking Code (obtained in the previous step) in a new XML file called `googleAnalytics.xml`. Note that the file should only contain the tracking code.

5. Use the `webhelp.footer.file` parameter in your transformation script and set its value to reference the `googleAnalytics.html` file that you created earlier.

6. Execute the transformation script.

For example:

- **Windows:**

  ```bash
dita.bat -i c:\mySample.ditamap -f webhelp -Dwebhelp.footer.file=c:\googleAnalytics.xml
  
  dita.bat -i c:\mySample.ditamap -f webhelp -Dwebhelp.footer.file=c:\googleAnalytics.xml
  ```

- **Mac OS X/ Linux:**

  ```bash
dita -i /mySample.ditamap -f webhelp -Dwebhelp.footer.file=/googleAnalytics.xml
  
  dita -i /mySample.ditamap -f webhelp -Dwebhelp.footer.file=/googleAnalytics.xml
  ```

---

**How to Integrate Google Search in WebHelp Classic Output**

It is possible to integrate the *Google Search Engine* into your *WebHelp Classic* output and you can specify where you want the results to appear in your WebHelp page.

**Using Oxygen XML Editor/Author**

To integrate the *Google Search Engine* into your WebHelp Responsive output using a transformation scenario from within *Oxygen XML Editor/Author*, follow this procedure:

1. Go to the *Google Custom Search Engine page* using your Google account.
2. Select the *Create a custom search engine* button.
3. Follow the on-screen instructions to create a search engine for your site. At the end of this process you should obtain a code snippet that looks like this:

```javascript
(function() {
  var cx = '000888210889775888983:8mn4x_mf-yg';
  var gcse = document.createElement('script');
  gcse.type = 'text/javascript';
  gcse.async = true;

  var s = document.getElementsByTagName('script')[0];
  s.parentNode.insertBefore(gcse, s);
})
```
4. Save the script into a well-formed HTML file called googlecse.html.

5. In Oxygen XML Editor/Author, click the Configure Transformation Scenario(s) action from the toolbar (or the Document > Transformation menu).

6. Select an existing WebHelp Responsive transformation scenario (depending on your needs, it may be with or without feedback) and click the Duplicate button to open the Edit Scenario dialog box.

7. Switch to the Parameters tab and edit the webhelp.google.search.script parameter to reference the googlecse.html file that you created earlier.

8. You can also use the webhelp.google.search.results parameter to choose where to display the search results.
   a. Create an HTML file with the following content:
      ```html
      <div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>
      ```
      You must use the HTML5 version for the GCSE. For more information about other supported attributes, see Google Custom Search: Supported Attributes.
   b. Set the value of the webhelp.google.search.results parameter to the file path of the file you just created. If this parameter is not specified, the following code is used:
      ```html
      <div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>
      ```

9. Click Ok and run the transformation scenario.

Using a Script Outside of Oxygen XML Editor/Author

⚠️ **Important:** Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin (https://www.oxygenxml.com/buy_webhelp.html).
- The Oxygen XML WebHelp Plugin must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To integrate the Google Search Engine into your WebHelp Classic output using a script outside of Oxygen XML Editor/Author (on page 1405), follow this procedure:

1. Go to the Google Custom Search Engine page using your Google account.
2. Select the Create a custom search engine button.
3. Follow the on-screen instructions to create a search engine for your site. At the end of this process you should obtain a code snippet that looks like this:

   ```html
   <script>
   ```
4. Save the script into a well-formed HTML file called `googlecse.html`.

5. Use the `webhelp.google.search.script` parameter in your transformation script and set its value to reference the `googlecse.html` file that you created earlier.

6. You can also use the `webhelp.google.search.results` parameter to choose where to display the search results.
   a. Create an HTML file with the following content:
      ```html
      <div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>
      ```
      (you must use the HTML5 version for the GCSE). For more information about other supported attributes, see [Google Custom Search: Supported Attributes](#).
   b. Set the value of the `webhelp.google.search.results` parameter to the file path of the file you just created. If this parameter is not specified, the following code is used:
      ```html
      <div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>
      ```

7. Execute the transformation script.

   For example:
   - **Windows:**
     ```cmd
     dita bat -i c:\mySample.ditamap -f webhelp -Dwebhelp.google.search.script=c:\googlecse.html -Dwebhelp.google.search.results=c:\myFile.html
     ```
   - **Mac OS X/ Linux:**
     ```cmd
     dita -i /mySample.ditamap -f webhelp -Dwebhelp.google.search.script=/googlecse.html -Dwebhelp.google.search.results=/myFile.html
     ```
Overriding XSLT Processing Step of DITA WebHelp Classic Transformations

Since WebHelp output is primarily obtained by running XSLT transformations over the DITA input files (through the DITA Map WebHelp Classic transformation scenarios), one customization method would be to override the default XSLT templates that are used by the WebHelp transformations.

There are two methods available to override the XSLT stylesheets implied by the WebHelp transformation.

- The first method is to use one of the WebHelp XSLT-import extension points (on page 1464) that allow you to import an XSLT stylesheet so that it becomes part of the normal build. This method uses the same mechanism as the DITA-OT XSLT-import extension points. Note that this method will affect all the outputs generated with the WebHelp system.
- The second method implies that you will create a DITA-OT extension plugin (on page 1466) with a custom transtype and use an Ant build file to define the transformation process. The main difference from the first customization method is that you will not affect all WebHelp transformations. Only the transformations that use the declared plugin transtype will be affected.

WebHelp Classic XSLT-Import and XSLT-Parameter Extension Points

The WebHelp XSLT-Import extension points allows you to extend the XSLT stylesheets associated with some of the WebHelp transformation steps. The DITA-OT plug-in installer adds an XSLT import statement in the default WebHelp XSLT so that the XSLT stylesheet referenced by the extension point becomes part of the normal build.

Example:

```xml
<plugin id="com.oxygenxml.webhelp.classic.extension">
  <feature extension="com.oxygenxml.webhelp.classic.xsl.dita2webhelp"
    file="xsl/fixup.xsl"/>
</plugin>
```

⚠️ Attention: The customizations you make by using this extension point will affect all WebHelp transformations. If you want to have a customization that is only available for a certain transformation, use the Overriding a WebHelp XSLT Stylesheet from an Ant Build File (on page 1466) method.

XSLT-Import Extension Points

The following extension points are available:

`com.oxygenxml.webhelp.classic.xsl.dita2webhelp`
Extension point to override the XSLT stylesheet (dita2webhelpImpl.xsl) that produces an HTML file for each DITA topic. The path to this stylesheet is: DITA-OT-DIR\plugins\com.oxygenxml.webhelp.classic\xsl\dita\desktop\dita2webhelpImpl.xsl

com.oxygenxml.webhelp.classic.xsl.createMainFiles

Extension point to override the XSLT stylesheet (createMainFilesImpl.xsl) that produces the WebHelp main HTML page (index.html). The path to this stylesheet is: DITA-OT-DIR\plugins\com.oxygenxml.webhelp.classic\xsl\dita\desktop\createMainFilesImpl.xsl

com.oxygenxml.webhelp.classic.xsl.createTocXML

Extension point to override the XSLT stylesheet (tocDita.xsl) that produces the toc.xml file. This file contains information extracted from the DITA map (on page 2793) and it is mainly used to construct the WebHelp Table of Contents and navigational links. The path to this stylesheet is: DITA-OT-DIR\plugins\com.oxygenxml.webhelp.classic\xsl\dita\tocDita.xsl.

XSLT-Parameter Extension Points

If your customization stylesheet declares one or more XSLT parameters and you want to control their values from the transformation scenario, you can use one of the following XSLT parameter extension points:

com.oxygenxml.webhelp.classic.xsl.dita2webhelp.param

Use this extension point to pass parameters to the stylesheet specified using the com.oxygenxml.webhelp.classic.xsl.dita2webhelp extension point (on page 1464).

com.oxygenxml.webhelp.classic.xsl.createMainFiles.param

Use this extension point to pass parameters to the stylesheet specified using the com.oxygenxml.webhelp.classic.xsl.createMainFiles extension point (on page 1465).

com.oxygenxml.webhelp.classic.xsl.createTocXML.param

Use this extension point to pass parameters to the stylesheet specified using the com.oxygenxml.webhelp.classic.xsl.createTocXML extension point (on page 1465).

Related Information:

• [DITA-OT] XSLT-Import Extension Points
How to Override a WebHelp Classic XSLT Stylesheet from an Ant Build File

To create a WebHelp XSLT customization that is only available for a certain DITA OT transformation, the extension plugin should declare a custom transtype. The WebHelp XSLT stylesheets can be overridden from an ANT file provided by the DITA-OT extension plugin. From the Ant target associated with the plugin, you will specify a custom XSLT stylesheet that imports the original WebHelp stylesheet and add some customization templates.

The following procedure explains how to create a DITA-OT extension plugin that uses this extension method:

1. In the DITA-OT-DIR\plugins\ folder, create a folder for this plugin (for example, com.oxygenxml.webhelp.classic.custom).
2. Create a plugin.xml file (in the folder you created in step 1) that specifies a new DITA-OT transtype and the build file associated with the plugin. For example:

   ```xml
   <plugin id="com.oxygenxml.webhelp.classic.custom">
     <feature extension="dita.conductor.target.relative" file="integrator.xml"/>
     <transtype name="webhelp-classic-custom" extends="webhelp"
       desc="WebHelp Classic Customization"/>
   </plugin>
   ```

3. Create the integrator.xml file that will import the actual plugin Ant build file.

   ```xml
   <project basedir="." name="Webhelp Classic Customization">
     <import file="build.xml"/>
   </project>
   ```

4. Create the build.xml file that overrides the value of properties associated with the XSLT stylesheets used to produce HTML files (on page 1468). The following Ant properties can be overridden to specify your customization stylesheets:

   ```xml
   <args.wh.classic.topic.xsl>
     Specify this property if you want to customize the XSLT stylesheet used to produce an HTML file for each topic (on page 1468).
   </args.wh.classic.topic.xsl>
   
   <args.wh.classic.create.main.files.xsl>
     Specify this property if you want to customize the XSLT stylesheet used to produce the main HTML files (on page 1468).
   </args.wh.classic.create.main.files.xsl>
   
   <args.wh.classic.createTocXML.xsl>
     Specify this property if you want to customize the XSLT stylesheet used to produce the TOC XML file (on page 1468).
   </args.wh.classic.createTocXML.xsl>
   ```
Specify this property if you want to customize the XSLT stylesheet used to produce the toc.xml file (on page 1469). The toc.xml file contains information extracted from DITA map and it is mainly used to create the WebHelp TOC.

For example, to customize a WebHelp Classic transformation type, the build file should look like:

```xml
<project basedir="." name="Webhelp Classic Customization">
  <target name="dita2webhelp-classic-custom">
    <!--
    Override this property if you want to customize the XSLT stylesheet
    used to produce an HTML file for each topic
    -->
    <property
      name="args.wh.classic.topic.xsl"
      value="${dita.plugin.com.oxygenxml.webhelp.classic.custom.dir}/xsl/dita2webhelpCustom.xsl"/>
    <!--
    Override this property if you want to customize the XSLT stylesheet
    used to produce the main HTML file.
    -->
    <property
      name="args.wh.classic.create.main.files.xsl"
      value="${dita.plugin.com.oxygenxml.webhelp.classic.custom.dir}/xsl/createMainFilesCustom.xsl"/>
    <!--
    Override this property if you want to customize the XSLT stylesheet
    used to produce the toc.xm file.
    -->
    <property
      name="args.wh.classic.createTocXML.xsl"
      value="${dita.plugin.com.oxygenxml.webhelp.classic.custom.dir}/xsl/createTocXMLCustom.xsl"/>
    <!--
    You need to delegate the build target:
    * dita2webhelp - for WebHelp Classic
    -->
    <antcall target="dita2webhelp"/>
  </target>
</project>
```

5. Create an xsl directory in the plugin customization directory (that you created in step 1) to store the customized XSLT stylesheets.
6. Now that the extension plugin is created, install it in the DITA Open Toolkit (on page 2768).

Referencing the WebHelp XSLT Stylesheets from Your Customizations

Note that your customization style sheets should import the original style sheets that they override. To reference the WebHelp style sheets, you can use the `plugin:com.oxygenxml.dita-ot.plugin.webhelp` prefix. This prefix is rewritten by an XML catalog to the WebHelp root directory.

**Customizing the `dita2webhelp.xsl` Stylesheet**

The XSLT style sheet that customizes the WebHelp `dita2webhelp.xsl` style sheet should look like:

```xml
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
                 xmlns:xs="http://www.w3.org/2001/XMLSchema"
                 xmlns:math="http://www.w3.org/2005/xpath-functions/math"
                 exclude-result-prefixes="xs math"
                 version="2.0">
     <!-- Import the original style sheet used to produce an HTML file for each topic. -->
     <!-- Add your customization templates here. -->
     </xsl:stylesheet>
```

You need to import the following XSLT style sheet:

```xml
```

**Customizing the `createMainFiles.xsl` Stylesheet**

The XSLT style sheet that customizes the WebHelp `createMainFiles.xsl` style sheet should look like:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
                 xmlns:xs="http://www.w3.org/2001/XMLSchema"
                 xmlns:math="http://www.w3.org/2005/xpath-functions/math"
                 exclude-result-prefixes="xs math"
                 version="2.0">
     <!-- Import the original style sheet used to produce the main HTML file. -->
     </xsl:stylesheet>
```
You need to import the following XSLT stylesheet:

```xml
<xsl:import href="plugin:com.oxygenxml.webhelp.classic:xsl/dita/desktop/createMainFiles.xsl"/>
```

Customizing the `tocDita.xsl` File

The XSLT stylesheet that customizes the WebHelp `tocDita.xsl` stylesheet should look like:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    xmlns:math="http://www.w3.org/2005/xpath-functions/math"
    exclude-result-prefixes="xs math"
    version="2.0">
    <!-- Import the original stylesheet used to produce the toc.xml file. -->
    <!-- Add your customization templates here. -->
</xsl:stylesheet>
```

Miscellaneous Customization Topics

This section contains miscellaneous topics about how to customize the WebHelp Classic output.

How to Disable Caching in WebHelp Classic Output

In cases where a set of WebHelp Classic pages need to be updated on a regular basis to deliver the latest version of the documentation, the WebHelp pages should always be requested from the server upon re-loading it in a Web browser on the client side, rather than re-using an outdated cached version in the browser.
To disable caching in WebHelp Classic output, follow this procedure:

1. Edit the following XSL file for DITA or DocBook WebHelp systems:
   - For DITA WebHelp systems, edit the following file: `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.classic\xsl\createMainFiles.xsl`
   - For DocBook WebHelp system, edit the following file: `{OXYGEN_INSTALL_DIR}\frameworks\docbook\xsl\com.oxygenxml.webhelp.classic\xsl\createMainFiles.xsl`

2. Locate the following template in the XSL file: `<xsl:template name="create-toc-common-file">` and add the following code snippet:

```xml
<meta http-equiv="Pragma" content="no-cache" />
<meta http-equiv="Expires" content="-1" />
```

**Note:** The code should look like this:

```xml
<html>
  <head>
    <xsl:if test="$withFrames">
      <base target="contentwin"/>
    </xsl:if>
    <meta http-equiv="Content-Type" content="text/html; charset=utf-8"/>
    <!-- Disable caching of WebHelp pages in web browser. -->
    <meta http-equiv="Pragma" content="no-cache" />
    <meta http-equiv="Expires" content="-1" />
  </head>
  ....
</html>
```

3. Save your changes to the file.
4. Re-run your WebHelp transformation scenario.

**How to Flag DITA Content in WebHelp Output**

Flagging content in WebHelp output involves defining a set of images that will be used for marking content across your information set.

To flag DITA content, you need to create a filter file that defines properties that will be applied on elements to be flagged. Generally, flagging is supported for *block elements (on page 2792)* (such as paragraphs), but not for phrase-level elements within a paragraph. This ensures that the images that will flag the content are easily scanned by the reader, instead of being buried in the text.
Using Oxygen XML Editor/Author

To flag content in the DITA Map to WebHelp output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Create a DITA filter file (DITAVAL) and add it in a directory of your choice (for example, named myFile.ditaval).
2. Define the property for the elements you want to be flagged. For example, if you want to flag any element that has the audience attribute set to programmer, the content of the DITAVAL file should look like this:

   ```xml
   <?xml version="1.0" encoding="UTF-8"?>
   <val>
     <prop att="audience" val="programmer" action="flag"
           img="D:\resource\delta.gif" alt="sample alt text"/>
   </val>
   ```

   Note that for an element to be flagged, at least one attribute-value pair needs to have a property declared in the DITAVAL file.
3. Edit a DITA Map to WebHelp transformation scenario.
4. Specify the DITAVAL file in the Filters tab (with the Use DITAVAL File option).
5. Run the transformation scenario.

Using a Script Outside of Oxygen XML Editor/Author

⚠️ Important: Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin (https://www.oxygenxml.com/buy_webhelp.html).
- The Oxygen XML WebHelp Plugin must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To flag content in the DITA Map to WebHelp output using a script outside of Oxygen XML Editor/Author, follow this procedure:

1. Create a DITA filter file (DITAVAL) and add it in a directory of your choice (for example, named myFile.ditaval).
2. Define the property for the elements you want to be flagged. For example, if you want to flag any element that has the audience attribute set to programmer, the content of the DITAVAL file should look like this:
<?xml version="1.0" encoding="UTF-8"?>
<val>
  <prop att="audience" val="programmer" action="flag"
    img="D:\resource\delta.gif" alt="sample alt text"/>
</val>

Note that for an element to be flagged, at least one attribute-value pair needs to have a property declared in the DITAVAL file.

3. Use the args.filter parameter in your transformation script and set its value to the path of the DITAVAL file you created.

4. Execute the transformation script.

For example:

- Windows:
  
  dita.bat -i c:\mySampleMap.ditamap -f webhelp -Dargs.filter=c:\myFile.ditaval

- Mac OS X/ Linux:
  
  dita -i /mySampleMap.ditamap -f webhelp -Dargs.filter=/myFile.ditaval

How to Publish WebHelp Classic Output on a SharePoint Site

Since WebHelp output must be published locally, on the same machine where the WebHelp process is running, to publish your files directly to a SharePoint library you need to map a network drive to connect to SharePoint and change your file extensions to .aspx, as described in the steps below.

Using Oxygen XML Editor/Author

To publish WebHelp Classic output on a SharePoint site and use a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Map a network drive to connect to your SharePoint library. For more information, see: https://support.microsoft.com/en-us/kb/2616712.

2. Edit the WebHelp transformation scenario and open the Parameters tab.

   • For a DITA transformation, set the args.outext parameter to .aspx.
   • For a DocBook transformation, set the html.ext parameter to .aspx.

3. Run the WebHelp transformation scenario to generate the output.
Using a Script Outside of Oxygen XML Editor/Author

**Important:** Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the **Oxygen XML WebHelp Plugin** ([https://www.oxygenxml.com/buy_webhelp.html](https://www.oxygenxml.com/buy_webhelp.html)).
- The **Oxygen XML WebHelp Plugin** must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To publish WebHelp Classic output on a SharePoint site and use a script outside of Oxygen XML Editor/Author *(on page 1405)*, follow this procedure:

1. Map a network drive to connect to your SharePoint library. For more information, see: [https://support.microsoft.com/en-us/kb/2616712](https://support.microsoft.com/en-us/kb/2616712).
2. Use the following parameter to change your file extensions to `.aspx`:
   - For DITA transformations, use the `args.outext` parameter in your transformation script and set its value to `.aspx`.
   - For DocBook transformations, use the `html.ext` parameter in your transformation script and set its value to `.aspx`.
3. Execute the transformation script.

For example, a DITA script might look like this:

   - **Windows:**
     ```bash
dita.bat -i c:\mySample.ditamap -f webhelp -Dargs.outext=.aspx
     ```
   - **Mac OS X/ Linux:**
     ```bash
dita -i /mySample.ditamap -f webhelp -Dargs.outext=.aspx
     ```

WebHelp Responsive Output

The **WebHelp Responsive** features a very flexible layout, is designed to adapt to any screen size to provide an optimal viewing and interaction experience. It is based upon the *Bootstrap* responsive front-end framework and is available for DITA document types.

The **WebHelp Responsive with Feedback** variant also includes a feedback system that allows your users to add comments and allows you to manage and reply to them.

WebHelp Responsive output can be generated by using the **DITA Map WebHelp Responsive** *(on page 1262)* or **DITA Map WebHelp Responsive with Feedback** transformation scenario *(on page 1262)*.
WebHelp Responsive Output Layout and Features

This section contains information about the layout and features of the WebHelp Responsive output.

Layout of the Responsive Page Types

You can select from several different styles of layouts (for example, by default, you can select either a tiles or tree style of layout). Furthermore, each layout includes a collection of skins that you can choose from, or you can customize your own.

Figure 402. WebHelp Responsive Output on a Normal Screen

Figure 403. WebHelp Responsive Output on a Narrow Screen
Main Page

The Main Page is the home page generated in the WebHelp Responsive output. The main function of the home page is to display top-level information and provide links that help you easily navigate to any of the top-level topics of the publication. These links can be rendered in either a Tiles or Tree style of layout. The main page also consists of various other components, such as a logo, title, menu, search field, or index link.

Main Page - Tiles Layout

In the tiles presentation mode, a tile component is created for each chapter (first-level topic) in the publication. The tile presents a link to the topic and its short description.

Figure 404. Main Page - Tiles Layout
Main Page - Tree Layout

In the tree presentation mode, links to the first and second level topics in the publication are displayed using a tree-like component.

Figure 405. Main Page - Tree Layout
Main Page Components

The layout components displayed in the main page are:

**Publication Title**

The title of the publication. It is usually taken from the DITA map title.

**Logo**
Displays a logo associated with the publication. Additionally you can set a target URL that will be opened when you click on the logo image.

The logo image can be specified using the `webhelp.logo.image` transformation parameter (on page 1620). For the target URL, use the `webhelp.logo.image.target.url` parameter (on page 1620).

**Menu**

Helps you to navigate to your documentation. This component presents a set of links to all topics from your publication. For information about customizing the menu, see How to Customize the Menu (on page 1570) topic.

**Index Terms Link**

Presents a link to the index terms page. You can control if this component is displayed by using the `webhelp.show.indexterms.link` parameter (on page 1623).

**Search Input**

Input text field allowing you to easily enter your search queries.

**Topic Tiles**

A tile associated with a main topic. Each topic tile has three sections that correspond to the topic title, short description, and image.

**Topic Tile Title**

Presents the navigation title of the associated topic.

**Topic Tile Short Description**

Presents the short description of the topic. It may be collected either from the topic or from the DITA map topic meta.

**Topic Tile Image**

Presents an image associated with the topic. The image association (on page 1570) is done in the DITA map.

**Tree Table of Contents**

An area containing topic titles from first and second level of your publication.

**Page Footer**

WebHelp Responsive output footer.
The **Topic Page** is the page generated for each DITA topic in the WebHelp Responsive output. The HTML pages produced for each topic consist of the topic content along with various other additional components, such as a title, menu, navigation breadcrumb, print icon, or side table of contents.

**Figure 406. Topic Page**

---

**Logo Component** *(on page 1480)*

**Title Component** *(on page 1480)*

**Search Input Component** *(on page 1480)*

**Menu Component** *(on page 1480)*

**Index Terms Link Component** *(on page 1480)*

**Expand/Collapse All Sections Component** *(on page 1481)*

**Navigation Links Component** *(on page 1480)*
Topic Page Components

The layout components displayed in this page are:

Publication Title

The title of the publication. It is usually taken from the DITA map title.

Logo

Displays a logo associated with the publication. Additionally you can set a target URL that will be opened when you click on the logo image.

The logo image can be specified using the webhelp.logo.image transformation parameter (on page 1620). For the target URL, use the webhelp.logo.image.target.url parameter (on page 1620).

Menu

Helps you to navigate to your documentation. This component presents a set of links to all topics from your publication. For information about customizing the menu, see How to Customize the Menu (on page 1570) topic.

Index Terms Link

Presents a link to the index terms page. You can control if this component is displayed by using the webhelp.show.indexterms.link parameter (on page 1623).

Search Input

Input text field allowing you to easily enter your search queries.

Navigation Links
The navigation links (Previous / Next arrows) can be used to navigate to the previous or next topic. These navigation links are controlled by the collection-type attribute. For example, if you set collection-type="sequence" on a parent topic reference, navigation links will be generated in the output for that topic and all of its child topics. You can also use the webhelp.default.collection.type.sequence parameter and set its value to yes to generate navigation links for all topics, regardless of whether or not the collection-type attribute is present.

Tip: To hide the navigation links, you can edit the transformation scenario and set the value of the webhelp.show.navigation.links parameter to no.

Expand/Collapse Sections Button

Icon that expands or collapses sections listed in the side table of contents within a topic.

Print Link

A print icon that opens the print dialog box for your particular browser.

Breadcrumb

Presents the path of the current displayed DITA topic in documentation.

Topic Content

Presents the content of the associated DITA topic.

Publication Table of Contents

A Table of Content for the publication displayed in the left side.

Topic Table of Contents (On this page links)

A table of contents for the topic displayed on the right side with a heading named On this page and it contains links to each section within the current topic and the section corresponding to the current scroll position is highlighted. This component is generated for any topic that contains at least two <section> elements and each <section> must have an @id attribute.

Page Footer

WebHelp Responsive output footer.

Search Page

The Search Page presents search results in the WebHelp Responsive output. The HTML page consists of a search results component along with various other additional components, such as a title, menu, or index link.
When you enter search terms in the **Search** field, the results are displayed in a results page. When you click on a result, the topic is opened in the main pane and the search results are highlighted. If you want to remove the colored highlights, click the 🔄 **Toggle Highlights** button at the top-right side of the page. The **Search** field also includes an **autocomplete** feature.

**Figure 407. Search Results Page**
Search Page Components

The layout components displayed in the search page are:

Publication Title

The title of the publication. It is usually taken from the DITA map title.

Logo

Displays a logo associated with the publication. Additionally you can set a target URL that will be opened when you click on the logo image.

The logo image can be specified using the `webhelp.logo.image` transformation parameter (on page 1620). For the target URL, use the `webhelp.logo.image.target.url` parameter (on page 1620).

Menu

Helps you to navigate to your documentation. This component presents a set of links to all topics from your publication. For information about customizing the menu, see How to Customize the Menu (on page 1570) topic.

Index Terms Link

Presents a link to the index terms page. You can control if this component is displayed by using the `webhelp.show.indexterms.link` parameter (on page 1623).

Search Input

Input text field allowing you to easily enter your search queries.

Search Results

Each result includes the topic title that can be clicked to open that page. Under the title, a breadcrumb is displayed that shows the path of the topic and you can click any of the topics in the breadcrumb to open that particular page.

Page Footer

WebHelp Responsive output footer.

Autocomplete Suggestions in the Search Text Field

When you are typing in the search text field, proposals are presented to help you to compute the search query. The information proposed when you are typing is collected from:

- The search queries from the history of the previous searches.
- The titles collected from your documentation.
• Documentation index terms and keywords. For example, in a DITA topic, the keywords and index terms are specified in the topic prolog section like this:

```xml
<prolog>
  <metadata>
    <keywords>
      <indexterm>databases</indexterm>
    </keywords>
    <keyword>installing</keyword>
    <keyword>uninstalling</keyword>
    <keyword>prerequisites</keyword>
  </metadata>
</prolog>
```

**Missing Terms**

If you enter multiple search terms (other than *stop words*), for any result that the search engine found at least one term but not one or more of the other terms, the **Missing** terms will be listed below each result.

**Related Information:**

• [WebHelp Responsive Search Engine (on page 1486)]

**Index Terms Page**

The *Index Terms Page* page consists of an index terms section along with various other additional components, such as a title, menu, or search field.

An alphabet that contains the first letter of the documentation index terms is generated at the top of the index page. Each letter represents a link to a specific indices section. The indexes are presented in multiple columns to make it easier to read this page.

**Figure 408. Index Terms Page**
The layout components displayed in this page are:

**Publication Title**

The title of the publication. It is usually taken from the DITA map title.

**Logo**

Displays a logo associated with the publication. Additionally you can set a target URL that will be opened when you click on the logo image.
The logo image can be specified using the `webhelp.logo.image` transformation parameter (on page 1620). For the target URL, use the `webhelp.logo.image.target.url` parameter (on page 1620).

**Menu**

Helps you to navigate to your documentation. This component presents a set of links to all topics from your publication. For information about customizing the menu, see How to Customize the Menu (on page 1570) topic.

**Index Terms Link**

Presents a link to the index terms page. You can control if this component is displayed by using the `webhelp.show.indextermstable.link` parameter (on page 1623).

**Index Terms Alphabet**

An alphabet that contains the first letter of index terms. Each letter represents a link to a specific indices section.

**Index Terms**

The first letter of the index along with the list of index terms.

**Page Footer**

WebHelp Responsive output footer.

**Search Engine**

Search engine has two main components:

**Search indexer**

It is also known as a spider. This component is active when you publish your documentation to WebHelp and it is responsible for creating the search index. This component traverses all HTML pages (for DITA topics) to gather information.

**Search interface**

This component is an interface between the user and the search index. It helps the user to search through the search index and displays results in the search page.

**Search Field and Results Page**

When you enter search terms in the Search field, the results are displayed in a results page. When you click on a result, the topic is opened in the main pane and the search results are highlighted. If you want to remove the colored highlights, click the Toggle Highlights button at the top-right side of the page. The Search field also includes an autocomplete feature.
Each result includes the topic title that can be clicked to open that page. Under the title, a breadcrumb is displayed that shows the path of the topic and you can click any of the topics in the breadcrumb to open that particular page.

If you enter multiple search terms (other than stop words), for any result that the search engine found at least one term but not one or more of the other terms, the Missing terms will be listed below each result.

5-Star Rating Mechanism and Sorting

The Search feature is also enhanced with a rating mechanism that computes scores for every result that matches the search criteria. These scores are then translated into a 5-star rating scheme and the stars are displayed to the right of each result. The search results are sorted depending on the following:

• Search entries that satisfy the phrase search criterion are presented first.
• The number of keywords found in a single page (the higher the number, the better).
• The context (for example, a word found in a title, scores better than a word found in unformatted text). The search ranking order, sorted by relevance is as follows:
  ◦ The search term is included in a meta keyword.
  ◦ The search term is in the title of the page.
  ◦ The search term is in bold text in a paragraph.
  ◦ The search term is in normal text in a paragraph.

Tag Element Scoring Values

HTML tag elements are also assigned a scoring value and these values are evaluated for the search results. For information about editing these values, see How to Change Element Scoring in Search Results (on page 1583).

Search Rules

Rules that are applied during a search include:

• You can use quotes to perform an exact search for multiple word phrases (for example, "grow flowers" will only return results if both words are found consecutively and exactly as they are typed in the search field). This type of search is known as a phrase search.
• Boolean Search is supported using the following operators: and, or, not. When there are two adjacent search terms without an operator, or is used as the default search operator (for example, grow flowers is the same as grow or flowers).
The space character separates keywords (an expression such as \textit{grow flowers} counts as two separate keywords: \textit{grow} and \textit{flowers}).

\textbf{indexterm} and \textbf{keywords} DITA elements are an effective way to increase the ranking of a page (for example, content inside a \texttt{keywords} element weighs more than an \textit{H1} HTML element).

Words composed by merging two or more words with colon (":") minus ("-"), underline ("_"), or dot ("." ) characters count as a single word.

Your search terms should contain two or more characters (note that stop words will be ignored). This rule does not apply to CJK (Chinese, Japanese, Korean) languages.

When searching for multi-word phrases in CJK (Chinese, Japanese, Korean) languages that often have multiple words appear in strings without a space separator, you need to add a space to separate the words. Otherwise WebHelp will not find results. For example, Chinese uses a specialized character for space separators, but the current WebHelp implementation cannot detect such specialized characters, so to search for "####" (it translates as "before you begin" or "before start"), you have to enter "## ##" (notice the space between the second and third symbols) in the search field.

**Excluded Terms**

To improve performance, the \textbf{Search} feature excludes certain \textit{stop words}. For example, the English version of the \textit{stop words} includes: \textit{a, an, and, are, as, at, be, but, by, for, if, in, into, is, it, no, not, of, on, or, such, that, the, their, then, there, these, they, this, to, was, will, with}.

**Related Information:**

- WebHelp Responsive HTML5 Pages: Search Page \textit{(on page 1481)}

**Feedback System**

The \textbf{WebHelp Responsive with Feedback} variant contains a \textbf{Comments} section at the bottom of each topic. This section is where you can interact with users through a comment system. For information about deploying a feedback-enabled system, see \textit{Deploying a Feedback-Enabled System (on page 1489)}.

Figure 409. WebHelp Responsive with Feedback Comments Section
To add a new comment, click the **Add New Comment** button, or click **Reply** to add a comment to an existing thread. You can click on the **Log in** button on the right side of this bar to be authenticated as a user and your user name will be included in any comments that you add. If you do not have a user name, you can click on the **Sign Up** button to create a new user.

After you log in, your name and user name are displayed in the **Comments** bar, along with the **Log off** and **Edit** buttons. Click the **Edit** button to open the **User Profile** dialog box where you can customize the following options:

- **Your Name** - You can use this field to edit the initial name that you used to create your user profile.
- **Your email address** - You can use this field to edit the initial email address that you used to create your profile.
- You can choose to receive an email in the following situations:
  - When a comment is left on a page that you commented on.
  - When a comment is left on any topic in the WebHelp Classic system.
  - When a reply is left to one of my comments.
- **New Password** - Allows you to enter a new password for your user account.

**Note:** The **Current Password** field from the top of the **User Profile** is mandatory if you want to save the changes you make.

If you are an administrator, you can manage user information and comments. For more information, see **Managing Users and Comments in a Feedback-Enabled System (on page 1493)**.

**Related Information:**

- **Deploying a Feedback-Enabled System (on page 1489)**
Deploying a Feedback-Enabled System

System Requirements

The feedback-enabled WebHelp system requires a standard server deployment. You can request this from your server administrator and it requires the following system components:

- A Web server (such as Apache Web Server)
- A MySQL or MariaDB database server
- A database admin tool (such as phpMyAdmin)
- PHP Version 5.1.6 or later

The WebHelp system supports most of the recent versions of the following browsers: Chrome, Firefox, Edge, Internet Explorer, Safari, Opera.

Create WebHelp with Feedback Database

The WebHelp with Feedback system needs a database to store user details and the actual feedback, and a user added to it with all privileges. After this is created, you should have the following information:

- Database name
- Username
- Password

Exactly how you create the database and user depends on your web host and your particular needs.

Example:

The following procedure uses phpMyAdmin to create a MySQL database for the feedback system and a MySQL user with privileges for that database. The feedback system uses these credentials to connect to the database.

Using phpMyAdmin to create a database:

1. Access the phpMyAdmin instance running on your server.
2. Click Databases (in the right frame) and then create a database. You can give it any name you want (for example comments).
3. Create a user with connection privileges for this database.
4. Under localhost, in the right frame, click Privileges and then at the bottom of the page click the reload the privileges link.
Deploying the WebHelp with Feedback Output

If you have a web server configured with PHP and MySQL, you can deploy the WebHelp with Feedback output by following these steps:

1. Connect to your server using an FTP client.
2. Locate the home directory (from now on, referred to as DOCUMENT_ROOT) of your server.
3. Copy the transformation output folder into the DOCUMENT_ROOT folder.
4. Rename it to something relevant (for example, myProductWebHelp).
5. Open the output folder (for example, http://[YOUR_SERVER]/myProductWebHelp/). You are redirected to the installation wizard. Proceed with the installation as follows:
   a. Verify that the prerequisites are met.
   b. Press Start Installation.
   c. Configure the Deployment Settings section. Default values are provided, but you should adjust them as needed.

   **Tip:** You can change some of the options later. The installation creates a config.php file in [OXYGEN_WEBHELP_INSTALL_DIR]/feedback/resources/php/config/config.php where all your configuration options are stored.

   d. Configure the MySql Database Connection Settings section. Use the information (database name, username, password) from the Create WebHelp with Feedback Database section (on page 1490) to fill-in the appropriate text boxes.

   **Warning:** Selecting the Create new database structure option will overwrite any existing data in the selected database, if it already exists. Therefore, it is useful the first time you install the WebHelp with Feedback system, but you do not want to select this option on subsequent deployments.

   e. If you are using a domain (such as OpenLDAP or Active Directory) to manage users in your organization, select the Enable LDAP Authentication option. This will allow you to configure the LDAP server, which will provide information and credentials for users who will access the WebHelp system. Also, this will allow you to choose which of the domain users will have administrator privileges.

   f. If the Create new database structure option is selected, the Create WebHelp Administrator Account section becomes available. Here you can set the administrator account data. The administrator is able to moderate new posts and manage WebHelp users.

The same database can be used to store comments for multiple WebHelp with Feedback deployments. If a topic is available in multiple deployments and there are comments associated with it, you can choose to display the comments in all deployments that share the database. To do this, select the Display comments from other products option. In the Display
Comments from section, a list with the deployments sharing the same database is displayed. Select the deployments allowed to share common feedback.

**Note:** You can restrict the displayed comments of a product depending on its version. If you have two products that use the same database and you restrict one of them to display comments starting from a certain version, the comments of the other product are also displayed from the specified version onwards.

g. Press **Next Step**.
h. Remove the installation folder from your web server.

**Important:** When you publish subsequent iterations of your **WebHelp with Feedback** system, you will not upload the `/install` folder in the output, as you only need it uploaded the first time you create the installation. On subsequent uploads, you will just upload the other output files.

i. In your Web browser, go to your **WebHelp with Feedback** system main page.

### Testing Your WebHelp with Feedback System

To test your system, create a user and post a comment. Check to see if the notification emails are delivered to your email inbox.

**Note:** To read debug messages generated by the system:

1. Enable **JavaScript** logging by doing one of the following:
   - Open the `log.js` file, locate the `var log= new Log(Level.NONE);` line, and change the logging level to: `Level.INFO`, `Level.DEBUG`, `Level.WARN`, or `Level.ERROR`.
   - Append `?log=true` to the WebHelp URL.
2. Inspect the PHP and Apache server log files.

### Documentation Product ID and Version

When you run a **WebHelp with Feedback** transformation scenario, by default you are prompted for a documentation product ID and version number. This is needed when multiple WebHelp systems are deployed on the same server. Think of your WebHelp output as a **product**. If you have three different WebHelp outputs, you have three different **products** (each with their own unique documentation product ID). This identifier is included in a configuration file so that comments are tied to a particular output (product ID and version number).

**Note:** The **WebHelp with Feedback** installation includes a configuration option (**Display comments from other products**) that allows you to choose to have comments visible in other specified **products**.
Refreshing the Content of a Feedback-Enabled System

It is common to update the content of an existing installation of a WebHelp with Feedback system on a regular basis. In this case, reinstalling the whole system is not a viable option since it might result in the loss of the comments associated with your topics. Also, reconfiguring the system every time you want to refresh it may be time consuming.

Fortunately, you can refresh just the content without losing the comments or the initial system configuration. To do so, follow these steps:

1. Execute the transformation scenario that produces the WebHelp with Feedback output directory.
2. Go to the output directory (specified in the Output tab of the transformation scenario), locate the \feedback\resources\php\config\config.php file, and delete it.
3. Locate the \feedback\install directory and delete it.
4. Copy the remaining structure of the output folder and paste it into your WebHelp with Feedback system installation directory, overwriting the existing content.

Managing Users and Comments in a Feedback-Enabled System

When you installed the WebHelp with Feedback system the first time (assuming the Create new database structure option (on page 1491) was selected), you should have been prompted to create an administrator account (or a user named administrator was created by default). As an administrator, you have access to manage comments posted in your feedback-enabled WebHelp system. You can also manage the user information (such as role, status, or notification options).

To manage comments and user information, follow these steps:

1. At the bottom of each specific topic there is a Comments navigation bar and on the right side there is a Log in button. Click this button and log in with your administrator credentials. This gives you access to an Admin Panel button.
2. Click the Admin Panel button to display an administration page.
3. Use this page to manage the following options:

**Delete Orphaned Comments**

Allows you to delete comments that are no longer associated with a topic in your WebHelp system.

**Delete Pending Users**

Allows you to delete user accounts that you do not wish to activate.

**View All Posts**

Allows you to view all the comments that are associated with topics in your WebHelp system.

**Export Comments**

Allows you to export all posts associated with topics in your WebHelp system into an XML file.

**Set Version**

Use this action to display comments starting with a particular version.

**Manage User Information**

To edit the details for a user, click on the corresponding row. This opens a window that allows you to customize the following information associated with the user:

**Name**

The full name of the user.

**Level**

Use this field to modify the privilege level (role) for the selected user. You can choose from the following:

- **User** - Regular user, able to post comments and receive e-mail notifications.
- **Moderator** - In addition to the regular **User** rights, this type of user has access to the **Admin Panel** where a moderator can view,
delete, export comments, and set the version of the feedback-enabled WebHelp system.

- **Admin** - Full administrative privileges. Can manage WebHelp-specific settings, users, and their comments.

**Company**

The name of the organization associated with the user.

**E-Mail**

The contact email address for the user. This is also the address where the WebHelp system sends notifications.

**WebHelp Notification**

When selected, the user receives notifications when comments are posted anywhere in your feedback-enabled WebHelp system.

**Reply Notification**

When selected, the user receives notifications when comments are posted as a reply to one of their comments.

**Page Notification**

When selected, the user receives notifications when comments are posted on a topic where they previously posted a comment.

**Date**

The date the user registered is displayed.

**Status**

Use this drop-down list to change the status of the user. You can choose from the following:

- **Created** - The user is created but does not yet have any rights for the feedback-enabled WebHelp system.
- **Validated** - The user is able to use the feedback-enabled WebHelp system.
- **Suspended** - The user has no rights for the feedback-enabled WebHelp system.

**Warning:** The key used for identifying the page a comment is attached to is the relative file path to the output page. Since the output file and folder names mirror the source, any change to the file name (or its folder) in the source will affect the comments associated with that WebHelp page. If you change the file name or path, the comment history for that topic will become orphaned (a change to the topic ID does not affect the comment history).
Context-Sensitive WebHelp Responsive System

Context-sensitive help systems assist users by providing specific informational topics for certain components of a user interface, such as a button or window. This mechanism works based on mappings between a unique ID defined in the topic and a corresponding HTML page.

Generating Context-Sensitive Help

When WebHelp Responsive output is generated, the transformation process produces an XML mapping file called `context-help-map.xml` and copies it in the output folder of the transformation. This XML file maps an ID to a corresponding HTML page through an `appContext` element, as in the following example:

```xml
<map productID="oxy-webhelp" productVersion="1.1">
  <appContext helpID="myapp-functionid1" path="tasks/app-help1.html"/>
  <appContext helpID="myapp-functionid2" path="tasks/app-help1.html"/>
  ...
</map>
```

The possible attributes are as follows:

- **helpID**
  
  A Unique ID provided by a topic from two possible sources (`resourceid` element or `id` attribute):

  - **resourceid**
    
    The `resourceid` element is mapped into the `appContext` element and can be specified in either the `topicref` within a DITA map or in a `prolog` within a DITA topic. The `resourceid` element accepts the following attributes:
    
    - **appname** - A name for the external application that references the topic. If this attribute is not specified, its value is considered to be empty ("").
    - **appid** - An ID used by an application to identify the topic.
    - **id** - Specifies a value that is used by a specific application to identify the topic, but this attribute is ignored if an `appid` attribute is used.

  **Note:** Multiple `appid` values can be associated with a single `appname` value (and multiple `appname` values can be associated with a single `appid` value), but the values for both attributes work in combination to specify a specific ID for a specific application, and therefore each...
combination of values for the appid and appname attributes should be unique within the context of a single root map (on page 2799). For example, suppose that you need two different functions of an application to both open the same WebHelp page.

**Example: resourceid Specified in a DITA Map**

The resourceid element can be specified in a topicmeta element within a topicref.

```xml
<map title="App Help">
  <topicref href="app-help1.dita" type="task">
    <topicmeta>
      <resourceid appname="myapp" appid="functionid1"/>
      <resourceid appname="myapp" appid="functionid2"/>
    </topicmeta>
  </topicref>
</map>
```

**Example: resourceid Specified in a DITA Topic**

The resourceid element can be specified in a prolog element within a DITA topic.

```xml
<task id="app-help1">
  <title>My App Help</title>
  <prolog>
    <resourceid appname="myapp" appid="functionid1"/>
    <resourceid appname="myapp" appid="functionid2"/>
  </prolog>
  ...
</task>
```

For more information about the resourceid element, see DITA Specifications: <resourceid>.

**id**

If a resourceid element is not declared in the DITA map or DITA topic (as described above), the id attribute that is set on the topic root element is mapped into the appContext element.

⚠️ **Important:** You should ensure that these defined IDs are unique in the context of the entire DITA project. If the IDs are not unique,
the transformation scenario will display warning messages in the transformation console output and the help system will not work properly.

**path**

The path to a corresponding WebHelp page. This path is relative to the location of the context-help-map.xml mapping file.

**productID (Applicable only if you are using the WebHelp Responsive with Feedback transformation scenario)**

The ID of the product for your documentation project.

**productVersion (Applicable only if you are using the WebHelp Responsive with Feedback transformation scenario)**

The version of the product for your documentation project.

There are two ways of implementing context-sensitive help in your system:

- The XML mapping file can be loaded by a PHP script on the server side. The script receives the contextId value and will look it up in the XML file.
- Invoke the index.html WebHelp system file and pass the contextId parameter with a specific value. The WebHelp system will automatically open the help page associated with the value of the contextId parameter.

```html
index.html?contextId=myDITATopic
```

**Note:** The contextId parameter is not case-sensitive.

**Context-Sensitive Queries**

You can use the URL field in your browser to search for topics in a context-sensitive WebHelp system with the assistance of the following parameters:

**contextId**

The WebHelp JavaScript engine will look for this value in the context-help-map.xml mapping file and load the corresponding help page.

**Note:** You can use an anchor (on page 2791) in the contextId parameter to jump to a specific section in a document. For example, contextId=topicID#anchor.

**appname**

You can use this parameter in conjunction with contextId to search for this value in the corresponding appname attribute value in the mapping file.
Another parameter indicates the search query:

**searchQuery**

You can use this parameter to perform a search operation when WebHelp is loaded. For example, if you want to open WebHelp showing all search results for *growing flowers*, the URL should look like this: http://localhost/webhelp/index.html?searchQuery=growing%20flowers.

**Accessibility**

**Oxygen XML WebHelp Responsive** output is compliant with the Section 508 accessibility standard, making the output accessible for people with visual impairment and other disabilities. Documentation and interface components are considered accessible when they have support in place that allows those with disabilities to use assistive technologies to understand the content.

Generally speaking, the WebHelp Responsive output has two major parts: topic content and WebHelp Responsive-related components (publication TOC, breadcrumb, menu). While the WebHelp Responsive components are designed to comply with the accessibility rules, it is important to adhere to some rules when you write DITA topics so that the content is also accessible.

**Related Information:**

- DITA-OT Day 2017 Presentation: Accessibility in DITA-OT

**Writing Guidelines for Accessible Documentation**

To create accessible content, good authoring practices involve following guidelines, such as marking table headers, using semantic elements where available, and using alternative text for images.

**Accessible Images**

Images must have text alternatives that describe the information or function represented by them.

**Short Text Equivalents for Images**

When using the `<image>` element, specify a short alternative text with the `<alt>` element.

```xml
<image href="puffin.jpg">
  <alt>Puffin figure</alt>
</image>
```
Long Descriptions of Images

For complex images, when a short text equivalent does not suffice to adequately convey the function or role of an image, provide additional information in a file designated by the `<longdesc>` element.

```xml
<image href="puffin.jpg">
    <alt>Puffin figure</alt>
    <longdesc href="http://www.example.org/birds/puffin.html"
        scope="external"
        format="html"/>
</image>
```

Related Information:

- Darwin Information Typing Architecture (DITA) Specification `<image>` element
- Web Accessibility Tutorials: Alt Decision Tree

Accessible Image Maps

For image maps, text alternatives are needed on both the `<image>` element itself (to describe the informative context) and on each of the `<area>` elements (to convey the link destination or the action that will be initiated if the link is followed). The `<xref>` content within the `<area>` element contains the intended alternative text or hover text for that image map area.

```xml
<imagemap id="gear_pump_map">
    <image href="../images/Gear_pump_exploded.png" id="gear_pump_exploded">
        <alt>Gear Pump</alt>
    </image>

    <area>
        <shape>circle</shape>
        <coords>172, 265, 14</coords>
        <xref href="parts/bushings.dita#bushings_topic/bushings" format="dita">Bushings</xref>
    </area>

    <area>
        <shape>circle</shape>
        <coords>324, 210, 14</coords>
    </area>
</imagemap>
```
Accessible Tables

Accessible HTML tables need markup that indicates header cells and data cells and defines their relationship. Header cells must be marked with `<th>`, and data cells with `<td>`, to make tables accessible. For more complex tables, explicit associations may be needed using `@scope`, `@id`, and `@headers` attributes.

When you implement the table, it is best to use the `<table>` element (CALS table or OASIS Table Exchange Model). The `<table>` element includes all that you need to make a fully accessible table.

Table with Header Cells in the Top Row Only

For this type of table, you have to embed the table rows in the `<thead>` element.

Table 14. Example: Oxygen Events

<table>
<thead>
<tr>
<th>Event</th>
<th>Date</th>
<th>Location</th>
</tr>
</thead>
<tbody>
<tr>
<td>Evolution of TC 2018</td>
<td>May 31 - June 1, 2018</td>
<td>Sofia, Bulgaria</td>
</tr>
<tr>
<td>Markup UK</td>
<td>June 9 - 10, 2018</td>
<td>London, United Kingdom</td>
</tr>
<tr>
<td>Balisage 2018 - The Markup Conference</td>
<td>July 31 - August 3, 2018</td>
<td>Rockville, Maryland, USA</td>
</tr>
</tbody>
</table>
Table with Header Cells in the First Column Only

For this type of table, you have to set the @rowheader="firstcol" attribute on the <table> element to identify the header column.

Table 15. Example: Oxygen Events

<table>
<thead>
<tr>
<th>Event</th>
<th>Evolution of TC 2018</th>
<th>Markup UK</th>
<th>Balisage 2018 - The Markup Conference</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date</td>
<td>May 31 - June 1, 2018</td>
<td>June 9 - 10, 2018</td>
<td>July 31 - August 3, 2018</td>
</tr>
<tr>
<td>Location</td>
<td>Sofia, Bulgaria</td>
<td>London, United Kingdom</td>
<td>Rockville, Maryland, USA</td>
</tr>
</tbody>
</table>
Table with Header Cells in the Top Row and First Column

For this type of table, you can use `<thead>` to identify header rows and @rowheader to identify a header column.

**Table 16. Example: Bus Timetable**

<table>
<thead>
<tr>
<th>Time</th>
<th>Monday</th>
<th>Tuesday</th>
<th>Wednesday</th>
<th>Thursday</th>
<th>Friday</th>
</tr>
</thead>
<tbody>
<tr>
<td>09:00 - 11:00</td>
<td>Closed</td>

      <entry>Open</entry>
      <entry>Closed</entry>
      <entry>Closed</entry>
      <entry>Closed</entry>
    </row>
  </tbody>
</table>
```
WebHelp Responsive 508 VPAT

WebHelp Responsive was designed to adhere to the U.S. Government Section 508 accessibility standards. This document describes the accessibility features that address the Section 508 Standards. This VPAT (Voluntary Product Accessibility Template) is an informational tool developed by industry and government to help facilitate the understanding of compatibility issues under Section 508.

Table 17. 1194.22 Web-based intranet and internet information and applications.

<table>
<thead>
<tr>
<th>Criteria</th>
<th>Supporting Features</th>
<th>Remarks and Explanations</th>
</tr>
</thead>
<tbody>
<tr>
<td>(a) A text equivalent for every non-text element shall be provided (e.g., via “alt”, “longdesc”, or in element content)</td>
<td>Supported with exceptions</td>
<td>• The process that produces the WebHelp Responsive accessible output uses information extracted from the DITA topics. It is the technical writer’s responsibility to write accessible-friendly DITA topics (on page 1499).</td>

<td>given sufficient time to indicate more time is required</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Note:** This VPAT pertains only to the HTML output generated by the WebHelp Responsive plugin as shipped and not to any customization. It specifically applies to version 20.1 or above and it does not apply to any versions prior to this.
Supported Platforms

All accessibility tests have been carried out in the following environment:

- NVDA (Non Visual Desktop Access) version 2018.1.1 with Firefox version 60.0.1 and Chrome version 66.0.3359.181.
- Windows 10 Narrator with Microsoft Edge browser.

However, this does not mean that WebHelp Responsive-generated output has any issue with other modern, standards-compliant browsers and alternative screen reader solutions. In any case, if you encounter any accessibility-related issue while using WebHelp Responsive generated output, contact the Oxygen support team. All accessibility issues are treated with utmost attention.

Publishing Templates

An Oxygen Publishing Template defines all aspects of the layout and styles for output obtained from the following transformation scenarios:

- WebHelp Responsive
- WebHelp Responsive with Feedback
- DITA Map PDF - based on HTML5 & CSS

It is a self-contained customization package stored as a ZIP archive or folder that can easily be shared with others. It provides the primary method for customizing the output.

Some possible customization methods include:

- Add additional template resources to customize the output (such as logos, Favicon, or CSS files).
- Extend the default processing by specifying one or more XSLT extension points.
- Specify one or more transformation parameters to customize the output.
- Customize various aspects of the output through simple CSS styling.
- For WebHelp Responsive output, change the layout of the main page or topic pages by customizing which components will be displayed and where they will be positioned in the page.

The following graphics are possible sample structure for Oxygen Publishing Template packages:
For information about creating and customizing publishing templates, and how to adjust the WebHelp and PDF output through CSS styling and other customization methods, watch our Webinar: **Creating Custom Publishing Templates for WebHelp and PDF Output**. The Webinar slides and sample project are also available from that webpage.

- How to Edit a Packed Publishing Template *(on page 1553)*
- How to Add a Publishing Template to the Publishing Templates Gallery *(on page 1554)*
- How to Share a Publishing Template *(on page 1649)*
Publishing Templates Gallery

Oxygen XML Author comes bundled with a variety of built-in templates. You can use one of them to publish your documentation or as a starting point for a new publishing template.

**Built-in Templates**

There are two categories of templates, *Tiles* and *Tree*. You can see the built-in templates in the **Templates** tab when editing a WebHelp Responsive transformation scenario in Oxygen XML Editor/Author. Each one also includes an 🌐 Online preview icon in the bottom-right corner that opens a webpage in your default browser that provides a sample of how the main page will look when that particular template is used to generate the output.

**Tiles Templates**

The main page in the WebHelp output presents a tile for each main topic (chapter) of the documentation.

![Tiles Templates Examples](image)

**Tree Templates**

The main page in the WebHelp output presents a tree-like table of contents.
Built-in Templates Location

All built-in templates are stored in the following directory: DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/templates.

Custom Templates

You can use a built-in template as a starting point for creating your own custom template (on page 1645). You can store all of your custom templates in a particular directory. Then, go to Options > Preferences > DITA > Publishing and add your directory to the list, and all the templates stored in that directory will be displayed in the preview pane in the transformation scenario’s Template tab along with all the built-in templates.

Sharing Publishing Template

To share a publishing template with others, following these steps:

1. Copy your template in a new folder.
2. Go to Options > Preferences > DITA > Publishing and add that new folder to the list.
3. Switch the option as the bottom of that preferences page to Project Options.
4. Share your project file (.xpr).

Publishing Template Package Contents for WebHelp Responsive Customizations

An Oxygen Publishing Template package for WebHelp output must contain a template descriptor file and at least one CSS file, and may contain other resources (such as graphics, XHTML files, XSLT files, etc.). All the template resources can be stored in either a ZIP archive or in a folder. It is recommended to use a ZIP archive because it is easier to share with others.
Template Descriptor File

Each publishing template includes a descriptor file that defines the meta-data associated with template. It is an XML file with certain elements that defines all the resources included in a template (such as CSS files, images, JS files, and transformation parameters).

The template descriptor file must have the `.opt` file extension and must be located in the template's root folder.

A template descriptor might look like this:

```xml
<publishing-template>
  <name>Flowers</name>

  <webhelp>
    <tags>
      <tag>tree</tag>
      <tag>light</tag>
    </tags>
    <preview-image file="flowers-tree.png"/>
  </webhelp>

  <!-- Resources (CSS, favicon, logo and others) -->
  <resources>
    <!-- Main CSS file -->
    <css file="flowers.css"/>

    <!-- Resources to copy to the output folder -->
    <fileset>
      <include name="resources/**/*"/>
      <exclude name="resources/**/.svn"/>
      <exclude name="resources/**/.git"/>
    </fileset>
  </resources>

  <parameters>
    <parameter name="webhelp.show.main.page.tiles" value="no"/>
    <parameter name="webhelp.show.main.page.toc" value="yes"/>
    <parameter name="webhelp.top.menu.depth" value="3"/>
  </parameters>
</publishing-template>
```
Tip: It is recommended to edit the template descriptor in Oxygen XML Editor/Author because it provides content completion and validation support.

Template Name and Description

Each template descriptor file requires a name element. This information is displayed as the name of the template in the transformation scenario dialog box.

Optionally, you can include a description and it displayed when the user hovers over the template in the transformation scenario dialog box.

```xml
<publishing-template>
  <name>Lorem Ipsum</name>
  <description>Lorem ipsum dolor sit amet, consectetur adipiscing elit</description>
  ...
</publishing-template>
```

Template Author

Optionally, you can include author information in the descriptor file and it displayed when the user hovers over the template in the transformation scenario dialog box. This information might be useful if users run into an issue or have questions about a certain template.

If you include the author element, a name is required and optionally you can include email, organization, and organizationUrl information.

```xml
<publishing-template>
  ...
  <author>
    <name>John Doe</name>
    <email>jdoe@example.com</email>
    <organization>ACME</organization>
    <organizationUrl>http://www.example.com/jdoe</organizationUrl>
  </author>
  ...
</publishing-template>
```

Webhelp Element

The webhelp element contains various details that define the WebHelp Responsive output. It is a required element if you intend on using a WebHelp Responsive transformation scenario. The elements that are allowed in this webhelp section specify the template tags (on page 1514), template preview image (on page 1514), resources (on page 1515) (such as CSS, JS, fonts, logos), transformation
Template Tags

The tags section provides meta information about the template (such as layout type or color theme). Each tag is displayed at the top of the Templates tab window in the transformation scenario dialog box and they help the user filter and find particular templates.

Template Preview Image

The preview-image element is used to specify an image that will be displayed in the transformation scenario dialog box. It provides a visual representation of the template to help the user select the right
Template Resources

The resources section of the descriptor file specifies a set of resources (CSS, JS, fonts, logos, graphics, etc.) that are used to customize various components in generated output. These resources will be copied to the output folder during the transformation process. At least one CSS file must be included, while the other types of resources are optional.

This section is defined using the resources element and the types of resources that can be specified include:

- **CSS files** - One or more CSS files that will define the styles of all generated HTML pages. They are referenced using the css element.
- **Favicon** - You can specify the path to an image for the favicon associated with your website. It is referenced using the favicon element.
- **Logo** - You can specify the path to a logo image that will be displayed in the left side of the output header. It is referenced using the logo element. Optionally, you can also specify:
  - **target-url** - will redirect the user to the specified URL if they click the logo in the output.
  - **alt** - provides an alternate text for the logo image.
- **JavaScript AMD module** - The path to a JavaScript module that uses the AMD (Asynchronous Module Definition) format. This module will be loaded in the output HTML pages using the RequireJS library. It can be referenced using the js-amd-module element. For more information, see How to Insert JavaScript AMD Modules in WebHelp Responsive Output (on page 1565).
- **Additional Resources (graphics, JS, fonts)** - For other resources (such as images referenced in CSS, JS, fonts, etc.) that need to be included in the output, you need to instruct the transformation to include them in the output folder. You can specify one or more sets of additional resources to
be copied to the output folder by using the `fileset` element and you can use one or more `include` and `exclude` elements. This semantic is similar to the ANT FileSet.

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <resources>
      <css file="css/custom_styles.css"/>
      <css file="css/customFonts.css"/>

      <favicon file="images/favicon.png"/>

      <logo
        file="images/logo.png"
        target-url="http://www.example.com"
        alt="Alternate text for the logo image"/>

      <js-amd-module file="js/template-main.js"/>

      <fileset
        <include name="common/**/*"/>
        <include name="JS/**/*"/>
        <exclude name="**/*.svn"/>
        <exclude name="**/*.git"/>
      </fileset>
    </resources>
  </webhelp>
</publishing-template>
```

**Note:** All relative paths specified in the descriptor file are relative to the template root folder.

The resources specified in the template descriptor are copied to the following output folder: 
`[WebHelp_OUTPUT_DIR]/oxygen-webhelp/template`. The following graphic illustrates the mapping between the template resources and the location where they will be copied to the output folder:

Figure 413. Template Resources Mapping
Transformation Parameters

You can also set one or more WebHelp transformation parameters in the descriptor file.

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <parameters>
      <parameter
        name="webhelp.show.main.page.toc"
        value="yes"/>
      <parameter
        name="webhelp.top.menu.depth"
        value="3"/>
      <parameter
        name="webhelp.fragment.welcome"
        value="html-fragment/webhelp.fragment.welcome.html"
        type="filePath"/>
    </parameters>
  </webhelp>
</publishing-template>
```

The following information can be specified in the parameter element:

**Parameter name**

The name of the parameter. It may be one of the WebHelp Responsive transformation parameters (on page 1619) or a DITA-OT HTML-based output parameter.

**Note:** It is not recommended to specify an input/output parameter in the descriptor file (such as the input Map, DITAVAL file, or temporary directory).
Attention: JVM arguments like `-Xmx` cannot be specified as a transformation parameter.

Parameter Value

The value of the parameter. It should be a relative path to the template root folder for file paths parameters.

Parameter Type

The type of the parameter: `string` or `filepath`. The `string` value is default.

After creating a publishing template (on page 1645) and adding it to the templates gallery (on page 1554), when you select the template in the transformation scenario dialog box, the Parameters tab will automatically be updated to include the parameters defined in the descriptor file. These parameters are displayed in italics.

XSLT Extension Points

The publishing templates support one or more XSLT extension points. They are helpful when you want to change the structure of the HTML pages that are primarily generated from XSLT processing. They can be specified in the descriptor file using the following structure:

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <xslt>
      <extension
        id="com.oxygenxml.webhelp.xsl.dita2webhelp"
        file="xsl/customDita2webhelp.xsl"/>

      <extension
        id="com.oxygenxml.webhelp.xsl.createMainPage"
        file="xsl/customMainPage.xsl"/>
    </xslt>
  </webhelp>
  ...
</publishing-template>
```

For more information, and a full list of the available extension points, see: XSLT-Import and XSLT-Parameter Extension Points (on page 1626).

Note: You can read the value of a WebHelp transformation parameter from your XSLT extension stylesheets by using the `getParameter(param.name)` function from the `http://www.oxygenxml.com/functions` namespace.
HTML Fragment Extension Points

The HTML pages contain component placeholders that can be used to insert custom HTML fragments (either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment).

You can specify one or more HTML fragment extension points in the descriptor file using the following structure:

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <html-fragments>
      <fragment>
        file="html-fragments/webhelp_fragment_welcome.html"
        placeholder="webhelp.fragment.welcome"/>
      <fragment>
        file="html-fragments/webhelp_fragment_footer.html"
        placeholder="webhelp.fragment.footer"/>
      </html-fragments>
    </webhelp>
  ...
</publishing-template>
```

Some of these placeholders are left empty in the default output configurations, but you can use them to insert custom content.

Each placeholder has an associated parameter value in the transformation. These predefined placeholders are illustrated and described below.

Figure 414. Predefined Placeholders Diagram
Each of these placeholders can hold either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment:

1- **webhelp.fragment.head**

   In the generated output it inserts a given XHTML fragment in the `<head>` element. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

2- **webhelp.fragment.before.body**

   In the generated output it displays a given XHTML fragment before the page body. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.
3- webhelp.fragment.before.logo_and_title
In the generated output it displays a given XHTML fragment before the logo and title. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

4- webhelp.fragment.after.logo_and_title
In the generated output it displays a given XHTML fragment after the logo and title. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

5- webhelp.fragment.before.top_menu
In the generated output it displays a given XHTML fragment before the top menu. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

6- webhelp.fragment.after.top_menu
In the generated output it displays a given XHTML fragment after the top menu. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

7- webhelp.fragment.before.main.page.search
In the generated output it displays a given XHTML fragment before the search field. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

8- webhelp.fragment.welcome
In the generated output it displays a given XHTML fragment as a welcome message (or title). The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

9- webhelp.fragment.after.main.page.search
In the generated output it displays a given XHTML fragment after the search field. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

10- webhelp.fragment.before.toc_or_tiles
In the generated output it displays a given XHTML fragment before the table of contents or tiles in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

11- webhelp.fragment.after.toc_or_tiles
In the generated output it displays a given XHTML fragment after the table of contents or tiles in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

12- webhelp.fragment.footer

In the generated output it displays a given XHTML fragment as the page footer. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

13- webhelp.fragment.after.body

In the generated output it displays a given XHTML fragment after the page body. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

Related Information:

- How to Insert HTML Content in WebHelp Responsive Output (on page 1560)

WebHelp Responsive Macros

You can use the whc:macro layout component to specify a macro value (a variable that will be expanded when the output files are generated).

A macro has the following syntax:

${macro-name}

or

${macro-name(macro-parameter)}

A macro name can accept any alphanumeric characters, as well as the following characters: - (minus), _ (underscore), . (dot), : (colon). The value of a parameter may contain any character except the } (close curly bracket) character.

Implementations

The following macros are supported:

i18n

For localizing a string.

${i18n(string.id)}
param

Returns the value of a transformation parameter.

\${param(webhelp.show.main.page.tiles)}

echo

Returns the value of an environment variable.

\${env(JAVA_HOME)}

system-property

Returns the value of a system property.

\${system-property(os.name)}

timestamp

Can be used to format the current date and time. Accepts a string (as a parameter) that determines how the date and time will be formatted (format string or picture string as it is known in the XSLT specification). The format string must comply with the rules of the XSLT `format-dateTime` function specification.

\${timestamp([h1]:[m01] [P] [M01]/[D01]/[Y0001])}

path

Returns the path associated with the specified path ID. The following paths IDs are supported:

- `oxygen-webhelp-output-dir` - The path to the output directory. The path is relative to the current HTML file.
- `oxygen-webhelp-assets-dir` - The path to the `oxygen-webhelp` subdirectory from the output directory. The path is relative to the current HTML file.
- `oxygen-webhelp-template-dir` - The path to the template directory. The path is relative to the current HTML file.

\${path(oxygen-webhelp-template-dir)}

Note: New paths IDs can be added by overriding the `wh-macro-custom-path` template from `com.oxygenxml.webhelp.responsive\xsl\template \macroExpander.xsl`:

```xml
<!-- Extension template for expanding a custom path macro. -->
<xsl:template name="wh-macro-custom-path">
```
map-xpath

Can be used to execute an XPath expression over the DITA map file from the temporary directory.

ℹ️ Tip: Available in all template layout HTML pages.

${map-xpath(/map/title)}

topic-xpath

Can be used to execute an XPath expression over the current topic.

ℹ️ Tip: Available only in the topic HTML page template (wt_topic.html).

${topic-xpath(string-join(/shortdesc//text(), ' '))}

oxygen-webhelp-build-number

Returns the current WebHelp distribution ID (build number).

${oxygen-webhelp-build-number}

Extensibility

To add new macros, you can add an XSLT extension to overwrite the wh-macro-extension template from the com.oxygenxml.webhelp.responsive\xsl\template\macroExpander.xsl file.

<!-- Extension template for expanding custom macro constructs -->
<xsl:template name="wh-macro-extension">
  <xsl:param name="name"/>
  <xsl:param name="params"/>
  <xsl:param name="contextNode"/>
  <xsl:param name="matchedString"/>

  <xsl:choose>
    <xsl:when test="$contextNode instance of attribute()">
      <xsl:value-of select="$matchedString"/>
    </xsl:when>
    <xsl:otherwise>
      <xsl:message>Cannot expand macro:
        $name
```
The `wh-macro-extension` template has the following parameters:

- **name** - The name of the current *macro*.
- **params** - List of parameters of the current *macro* as *string* sequence. The current *macros* parsing mechanism only allows *macros* with a maximum of one parameter. Consequently, this list will contain at most one element.
- **contextNode** - The current element or attribute where the *macro* was declared.
- **matchedString** - The entire value of the matched *macro* as specified in the HTML template page.

### HTML Page Layout Files

The HTML page layout files define the default layout of the generated pages in the output for the built-in template. There are four types of pages (main, search, topic, index) and each type of page is a simple HTML file. Each page type has various components that appear by default and each component has a corresponding element and when that element is included in the HTML file, the corresponding components will appear in the output.

**Warning:** It is no longer recommended for you to customize these files because if you upgrade to a newer version of Oxygen, those files may no longer produce the desired results and if new components have been added, you won't have access to them.

If you do choose to customize these HTML files, each type of page is defined inside an `html-page-layout-files` element in the descriptor file.

```xml
<publishing-template>
  ...
  <webhelp>
  ...
  <!-- HTML page layout files -->
  <html-page-layout-files>
    <page-layout-file page="main" file="page-templates/wt_index.html"/>
    <page-layout-file page="search" file="page-templates/wt_search.html"/>
    <page-layout-file page="topic" file="page-templates/wt_topic.html"/>
    <page-layout-file page="index-terms" file="page-templates/wt_terms.html"/>
  </html-page-layout-files>
</publishing-template>
```
If you do use the `html-page-layout-files` element, you must specify all four types of pages (main, search, topic, index). When not specified, the files from the `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/page-templates` folder will be used to define the layout of each type of page.

**HTML Page Components**

Each type of page contains various components that control the layout of that page. The rendering of each component depends on the context where it is placed and its content depends on the transformed DITA map (on page 2793).

Some of the components can be used in all four types of pages, while some are only available for certain pages. For instance, the Publication Title component can be used in all pages, but the Navigation Breadcrumb component can only be used in the Topic Page.

To include a component in the output of a particular type of page, you have to reference a specific element in that particular HTML file. All the elements associated with a component should belong to the `http://www.oxygenxml.com/webhelp/components` namespace.

Every component can contain custom content or reference another component. To specify where the component content will be located in the output, you can use the `whc:component_content` element as a descendant of the component element. It can specify the location as before, after, or it can wrap the component content. The following snippet contains an example of each:

```xml
<whc:webhelp_search_input class="navbar-form wh_main_page_search">
  <role="form"/>
  <div class="custom-content-before">Enter search terms here:</div>
  <div class="custom-wrapper">
    <whc:component_content/>
  </div>
  <div class="custom-content-after">Results will be displayed in a new window.</div>
</whc:webhelp_search_input>
```

**Main Page**

The Main Page is the home page generated in the WebHelp Responsive output. The name of the HTML file that defines this page is `wt_index.html` and it is located in the following directory: `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/page-templates`.

The main function of the home page is to display top-level information and provide links that help you easily navigate to any of the top-level topics of the publication. These links can be rendered in either
a Tiles or Tree style of layout. The HTML page produced for the home page also consists of various other components, such as a logo, title, menu, search field, or index link.

Figure 415. Examples of Main Page Components for a Tiles Style of Layout

Figure 416. Examples of Main Page Components for a Tree Style of Layout
The following components can be referenced in the Main Page (wt_index.html) file:

**Publication Title (webhelp_publication_title)**

This component generates the publication title in the output. To generate this component, the `webhelp_publication_title` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_publication_title
```

In the output, you will find an element with the class: `wh_publication_title`.

**Publication Logo (webhelp_logo)**
This component generates a logo image in the output. To generate this component, the `webhelp_logo` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_logo
```

In addition, you must also specify the path of the logo image in the `webhelp.logo.image` transformation parameter (in the Parameters tab in the transformation scenario). You can set the `webhelp.logo.image.target.url` parameter to generate a link to a URL when you click the logo image.

In the output, you will find an element with the class: `wh_logo`.

**Search Input (webhelp_search_input)**

This component is used to generate the input widget associated with search function in the output. To generate this component, the `webhelp_search_input` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_search_input
```

In the output, you will find an element with the class: `wh_search_input`.

**Print Link (webhelp_print_link)**

This component is used to generate a print icon that opens the print dialog box for your particular browser. To generate this component, the `webhelp_print_link` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_print_link
```

In the output, you will find an element with the class: `wh_print_link`.

**Main Menu (webhelp_top_menu)**

This component generates a menu with all the documentation topics. To generate this component, the `webhelp_top_menu` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_top_menu
```

In the output, you will find an element with the class: `wh_top_menu`.
You can control the maximum level of topics that will be included in the menu using the `webhelp.top.menu.depth` transformation parameter (in the Parameters tab of the transformation scenario).

For information about customizing the menu, see How to Customize the Menu (on page 1570).

**Main Page Topic Tiles (webhelp_tiles)**

This component generates the tiles section in the main page. This section will contain a tile for each root topic of the published documentation. Each topic tile has three sections that correspond to the topic title, short description, and image. To generate this component, the `webhelp_tiles` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_tiles
```

In the output, you will find an element with the class: `wh_tiles`.

If you want to control the HTML structure that is generated for a WebHelp tile you can also specify the template for a tile by using the `whc:webhelp_tile` component, as in the following example:

```xml
<whc:webhelp_tile class="col-md-4">
  <!-- Place holder for tile's image -->
  <whc:webhelp_tile_image/>

  <div class="wh_tile_text">
    <!-- Place holder for tile's title -->
    <whc:webhelp_tile_title/>

    <!-- Place holder for tile's shordesc -->
    <whc:webhelp_tile_shortdesc/>
  </div>
</whc:webhelp_tile>
```

For information about customizing the tiles, see How to Configure the Tiles on the WebHelp Responsive Main Page (on page 1575).

**Main Page Table of Contents (webhelp_main_page_toc)**

This component generates a simplified Table of Contents. It is simplified because it contains only two levels from the documentation hierarchy. To generate this component,
the `webhelp_main_page_toc` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_main_page_toc
```

In the output, you will find an element with the class: `wh_main_page_toc`.

**Index Terms Link (`webhelp_indexterms_link`)**

This component can be used to generate a link to the index terms page (indexterms.html). If the published documentation does not contain any index terms, then the link will not be generated. To generate this component, the `webhelp_indexterms_link` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_indexterms_link
```

In the output, you will find an element with the class: `wh_indexterms_link`. This element will contain a link to the `indexterms.html` page.

**Link to Skins Resources (`webhelp_skin_resources`)**

This component can be used to add a link to resources for the current WebHelp skin (such as the CSS file). To generate this component, the `webhelp_skin_resources` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_skin_resources/>
```

In the output, you will find a link to the skin resources.

**Topic Page**

The *Topic Page* is the page generated for each DITA topic in the WebHelp Responsive output. The name of the HTML file that defines this page is `wt_topic.html` and it is located in the following directory: `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/page-templates`.

The HTML pages produced for each topic consist of the topic content along with various other additional components, such as a title, menu, navigation breadcrumb, print icon, or side table of contents.

Figure 417. Examples of Topic Page Components
Spring Flowers

Spring Time, the time of growth and renewal of new plant and animal life. Spring comes at different times in the North and South Hemispheres. Spring time in the Northern hemisphere is between March – May, and between September – November in the Southern hemisphere. Most flowering plants bloom during spring time. Therefore, flowers that bloom only during spring, Spring flowers, bloom at different times in the two hemispheres.

The following components can be referenced in the Topic Page (wt_topic.html) file:

**Publication Title (webhelp_publication_title)**

This component generates the publication title in the output. To generate this component, the `webhelp_publication_title` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_publication_title
```

In the output, you will find an element with the class: `wh_publication_title`.

**Publication Logo (webhelp_logo)**

This component generates a logo image in the output. To generate this component, the `webhelp_logo` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_logo
```

In addition, you must also specify the path of the logo image in the `webhelp.logo.image` transformation parameter (in the Parameters tab in the transformation scenario). You can set the `webhelp.logo.image.target.url` parameter to generate a link to a URL when you click the logo image.

In the output, you will find an element with the class: `wh_logo`.

**Search Input (webhelp_search_input)**

This component is used to generate the input widget associated with search function in the output. To generate this component, the `webhelp_search_input` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_search_input
```

In the output, you will find an element with the class: `wh_search_input`.

**Topic Breadcrumb (webhelp_breadcrumb)**

This component generates a breadcrumb that displays the path of the current topic. To generate this component, the `webhelp_breadcrumb` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_breadcrumb
```
In the output, you will find an element with the class: `wh_breadcrumb`. This element will contain a list with items that correspond to the topics in the path. The first item in the list has a link to the main page with the `home` class. The last item in the list corresponds to the current topic and has the `active` class set.

**Navigation Links (webhelp_navigation_links)**

This component generates navigation links to the next and previous topics. To generate this component, the `webhelp_navigation_links` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_navigation_links
```

In the output, you will find an element with the class: `wh_navigation_links`. This element will contain the links to the next and previous topics.

**Print Link (webhelp_print_link)**

This component is used to generate a print icon that opens the print dialog box for your particular browser. To generate this component, the `webhelp_print_link` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_print_link
```

In the output, you will find an element with the class: `wh_print_link`.

**Topic Content (webhelp_topic_content)**

This component generates the content of a topic and it represent the content of the HTML files as they are produced by the DITA-OT processor. To generate this component, the `webhelp_topic_content` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_topic_content
```

In the output, you will find an element with the class: `wh_topic_content`.

**Publication TOC (webhelp_publication_toc)**

This component generates a mini table of contents for the current topic (on the left side). It will contain links to the children of current topic, its siblings, and all of its ancestors. To generate this component, the `webhelp_publication_toc` element must be specified in the HTML file as in the following example:
In the output, you will find an element with the class: `wh_publication_toc`. This element will contain links to the topics that are close to the current topic.

**Topic TOC (webhelp_topic_toc)**

This component generates a topic table of contents for the current topic (on the right side) with a heading named **On this page**. It contains links to each section within the current topic and the section corresponding to the current scroll position is highlighted. The topic must contain at least two `<section>` elements and each `<section>` must have an `@id` attribute. To generate this component, the `webhelp_topic_toc` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_topic_toc
```

In the output, you will find an element with the class: `wh_topic_toc`. This element will contain links to the topics that are close to the current topic.

**Expand/Collapse Sections (webhelp_expandCollapseSections)**

This component is used to generate an icon that expands or collapses sections listed in the side table of contents within a topic. To generate this component, the `webhelp_expandCollapseSections` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_expandCollapseSections
```

In the output, you will find an element with the class: `webhelp_expandCollapseSections`.

**Topic Feedback (webhelp_feedback)**

This component generates a placeholder for where the comments section will be presented. To generate this component, the `webhelp_feedback` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_feedback
```

**Main Menu (webhelp_top_menu)**

This component generates a menu with all the documentation topics. To generate this component, the `webhelp_top_menu` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_top_menu
```

In the output, you will find an element with the class: `wh_top_menu`.

You can control the maximum level of topics that will be included in the menu using the `webhelp.top.menu.depth` transformation parameter (in the Parameters tab of the transformation scenario).

For information about customizing the menu, see How to Customize the Menu (on page 1570).

**Index Terms Link (webhelp_indexterms_link)**

This component can be used to generate a link to the index terms page (`indexterms.html`). If the published documentation does not contain any index terms, then the link will not be generated. To generate this component, the `webhelp_indexterms_link` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_indexterms_link
```

In the output, you will find an element with the class: `wh_indexterms_link`. This element will contain a link to the `indexterms.html` page.

**Child Links (webhelp_child_links)**

For all topics with subtopics (child topics), this component generates a list of links to each child topic. To generate this component, the `webhelp_child_links` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_child_links
```

**Related Links (webhelp_related_links)**

For all topics that contain related links, this component generates a list of related links that will appear in the output. To generate this component, the `webhelp_related_links` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_related_links
```
Link to Skins Resources (webhelp_skin_resources)

This component can be used to add a link to resources for the current WebHelp skin (such as the CSS file). To generate this component, the webhelp_skin_resources element must be specified in the HTML file as in the following example:

```html
<wch:webhelp_skin_resources/>
```

In the output, you will find a link to the skin resources.

Search Results Page

The Search Results Page is the page generated that present search results in the WebHelp Responsive output. The name of the HTML file that defines this page is wt_search.html and it is located in the following directory: DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/page-templates.

The HTML page that is produced consists of a search results component along with various other additional components, such as a title, menu, or index link.

Figure 418. Examples of Search Results Page Components
The following components can be referenced in the Search Results Page (wt_search.html) file:

**Publication Title (webhelp_publication_title)**

This component generates the publication title in the output. To generate this component, the `webhelp_publication_title` element must be specified in the HTML file as in the following example:

```html
<w hc:webhelp_publication_title
```

In the output, you will find an element with the class: `wh_publication_title`.

**Publication Logo (webhelp_logo)**

This component generates a logo image in the output. To generate this component, the `webhelp_logo` element must be specified in the HTML file as in the following example:

```html
<w hc:webhelp_logo
```

In addition, you must also specify the path of the logo image in the `webhelp.logo.image` transformation parameter (in the Parameters tab in the transformation scenario). You can set the `webhelp.logo.image.target.url` parameter to generate a link to a URL when you click the logo image.

In the output, you will find an element with the class: `wh_logo`.

**Search Input (webhelp_search_input)**

This component is used to generate the input widget associated with search function in the output. To generate this component, the `webhelp_search_input` element must be specified in the HTML file as in the following example:

```html
<w hc:webhelp_search_input
```
In the output, you will find an element with the class: wh_search_input.

Search Results (webhelp_search_results)

This component is used to generate a placeholder to signal where the search results will be presented in the output. To generate this component, the webhelp_search_results element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_search_results
```

In the output, you will find an element with the class: wh_search_results.

Print Link (webhelp_print_link)

This component is used to generate a print icon that opens the print dialog box for your particular browser. To generate this component, the webhelp_print_link element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_print_link
```

In the output, you will find an element with the class: wh_print_link.

Main Menu (webhelp_top_menu)

This component generates a menu with all the documentation topics. To generate this component, the webhelp_top_menu element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_top_menu
```

In the output, you will find an element with the class: wh_top_menu.

You can control the maximum level of topics that will be included in the menu using the webhelp.top.menu.depth transformation parameter (in the Parameters tab of the transformation scenario).

For information about customizing the menu, see How to Customize the Menu (on page 1570).

Index Terms Link (webhelp_indexterms_link)

This component can be used to generate a link to the index terms page (indexterms.html). If the published documentation does not contain any index terms, then the link will not be generated. To generate this component, the
webhelp_indexterms_link element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_indexterms_link
```

In the output, you will find an element with the class: wh_indexterms_link. This element will contain a link to the indexterms.html page.

**Link to Skins Resources (webhelp_skin_resources)**

This component can be used to add a link to resources for the current WebHelp skin (such as the CSS file). To generate this component, the webhelp_skin_resources element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_skin_resources/>
```

In the output, you will find a link to the skin resources.

**Index Terms Page**

The *Index Terms Page* is the page generated that presents index terms in the WebHelp Responsive output. The name of the HTML file that defines this page is wt_terms.html and it is located in the following directory: DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/page-templates.

The HTML page that is produced consists of an index terms section along with various other additional components, such as a title, menu, or search field.

An alphabet that contains the first letter of the documentation index terms is generated at the top of the index page. Each letter represents a link to a specific indices section.

Figure 419. Example of Index Terms Page Components
The following components can be referenced in the Index Terms Page (wt_terms.html) file:

**Publication Title** ([webhelp_publication_title](#))

This component generates the publication title in the output. To generate this component, the `webhelp_publication_title` element must be specified in the HTML file as in the following example:

```html
<whc:webhelp_publication_title
```

In the output, you will find an element with the class: `wh_publication_title`.

**Publication Logo** ([webhelp_logo](#))

This component generates a logo image in the output. To generate this component, the `webhelp_logo` element must be specified in the HTML file as in the following example:
In addition, you must also specify the path of the logo image in the `webhelp.logo.image` transformation parameter (in the Parameters tab in the transformation scenario). You can set the `webhelp.logo.image.target.url` parameter to generate a link to a URL when you click the logo image.

In the output, you will find an element with the class: `wh_logo`.

**Search Input** (webhelp_search_input)

This component is used to generate the input widget associated with search function in the output. To generate this component, the `webhelp_search_input` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_search_input
```

In the output, you will find an element with the class: `wh_search_input`.

**Print Link** (webhelp_print_link)

This component is used to generate a print icon that opens the print dialog box for your particular browser. To generate this component, the `webhelp_print_link` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_print_link
```

In the output, you will find an element with the class: `wh_print_link`.

**Main Menu** (webhelp_top_menu)

This component generates a menu with all the documentation topics. To generate this component, the `webhelp_top_menu` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_top_menu
```

In the output, you will find an element with the class: `wh_top_menu`.

You can control the maximum level of topics that will be included in the menu using the `webhelp.top.menu.depth` transformation parameter (in the Parameters tab of the transformation scenario).
For information about customizing the menu, see How to Customize the Menu (on page 1570).

**Index Terms Link (webhelp_indexterms_link)**

This component can be used to generate a link to the index terms page (indexterms.html). If the published documentation does not contain any index terms, then the link will not be generated. To generate this component, the `webhelp_indexterms_link` element must be specified in the HTML file as in the following example:

```xml
```

In the output, you will find an element with the class: `wh_indexterms_link`. This element will contain a link to the `indexterms.html` page.

**Link to Skins Resources (webhelp_skin_resources)**

This component can be used to add a link to resources for the current WebHelp skin (such as the CSS file). To generate this component, the `webhelp_skin_resources` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_skin_resources/>
```

In the output, you will find a link to the skin resources.

**Combining WebHelp Responsive and PDF Customizations in a Template Package**

An Oxygen Publishing Template package can contain both a WebHelp Responsive and PDF customization in the same template package and you can use that same template in both types of transformations. The template descriptor file can define the customization for both types by including both a `webhelp` and `pdf` element and some of the resources can be reused. Resources referenced in elements in the `webhelp` element will only be used for WebHelp transformations, and resources referenced in the elements in the `pdf` element will only be used in PDF transformations.

```xml
<publishing-template>
  <name>Flowers</name>
  <description>Flowers themed light-colored template</description>

  <webhelp>
    <tags>
      <tag>purple</tag>
      <tag>light</tag>
    </tags>
  </webhelp>
</publishing-template>
```
Generating WebHelp Responsive Output

The publishing process can be initiated from a transformation scenario within Oxygen XML Editor/Author, from a command line outside Oxygen XML Editor/Author, or from an integration server.

Running from Oxygen XML Editor/Author

To publish to the WebHelp Responsive output from a transformation scenario inside Oxygen XML Editor/Author, use one of the following procedures, depending on whether or not you want a feedback section in your output.
WebHelp Responsive Output

To publish a DITA map (on page 2793) as WebHelp Responsive output, follow these steps:

1. Select the Configure Transformation Scenario(s) action from the DITA Maps Manager toolbar.
2. Select the DITA Map WebHelp Responsive scenario from the DITA Map section.
3. If you want to configure the transformation, click the Edit button.

Step Result: This opens an Edit scenario configuration dialog box that allows you to configure various options in the following tabs:

- Templates Tab - This tab contains a set of built-in skins that you can use for the layout of your WebHelp system output.
- Parameters Tab - This tab includes numerous transformation parameters that can be set to customize your WebHelp system output.
- Filters Tab - This tab allows you to filter certain content elements from the generated output.
- Advanced Tab - This tab allows you to specify some advanced options for the transformation scenario.
- Output Tab - This tab allows you to configure options that are related to the location where the output is generated.

4. Click Apply associated to process the transformation.

When the DITA Map WebHelp Responsive transformation is complete, the output is automatically opened in your default browser.

WebHelp Responsive with Feedback Output

To publish a DITA map (on page 2793) as a WebHelp Responsive with Feedback system, follow these steps:

1. Select the Configure Transformation Scenario(s) action from the DITA Maps Manager toolbar.
2. Select the DITA Map WebHelp Responsive with Feedback scenario from the DITA Map section.
3. If you want to configure the transformation, click the Edit button.

Step Result: This opens an Edit scenario configuration dialog box that allows you to configure various options in the following tabs:

- Templates Tab - This tab contains a set of built-in skins that you can use for the layout of your WebHelp system output.
- Parameters Tab - This tab includes numerous transformation parameters that can be set to customize your WebHelp system output.
- Filters Tab - This tab allows you to filter certain content elements from the generated output.
• **Advanced Tab** - This tab allows you to specify some advanced options for the transformation scenario.

• **Output Tab** - This tab allows you to configure options that are related to the location where the output is generated.

4. Click **Apply associated** to begin the transformation.

5. Enter the documentation product ID (value for the `webhelp.product.id` parameter) and the documentation version (value for the `webhelp.product.version` parameter).

When the DITA Map WebHelp Responsive with Feedback transformation is complete, your default browser opens the `installation.html` file. This file contains information about the output location, system requirements, installation instructions, and deployment of the output. Follow the instructions to complete the system deployment *(on page 1489)*.

### Running from Command Line

To publish to the WebHelp Responsive output from a command line outside of Oxygen XML Editor/Author, you can use the `dita` startup script that comes bundled with DITA-OT distribution.

**dita Command Format**

**DITA-OT** dita command has the following format:

```
DITA-OT-DIR/bin/dita --format=webhelp-responsive --input=input-file options
```

where the arguments are as follows:

```
dita
```

**Windows** - The `dita.bat` script located in: DITA-OT-DIR *(on page 2794)*/bin/.

**Linux/Mac OS X** - The `dita` script file located in: DITA-OT-DIR *(on page 2794)/bin/.

`--format = webhelp-responsive`

Specifies the output format (transformation type) for WebHelp Responsive transformation.

`--input = input-file`

The `input-file` represents the path to the DITA map that you want to process.

**options**

`options` include the following optional build parameters:

```
--output =dir
-o dir
```
Specifies the path of the output directory; the path can be absolute or relative to the current directory. By default, the output is written to the `out` subdirectory of the current directory.

`--filter=file`

Specifies filter file(s) used to include, exclude, or flag content.

Relative paths are resolved against the current directory and internally converted to absolute paths.

`--temp=dir`

`-t dir`

Specifies the location of the temporary directory.

`--verbose`

`-v`

Verbose logging.

`--debug`

`-d`

Debug logging.

`--logfile=file`

`-l file`

Write logging messages to a file.

`--parameter=value`

`-D parameter=value`

Specify a value for a DITA-OT or Ant build parameter.

`--propertyfile=file`

Use build parameters defined in the referenced `.properties` file.

Build parameters specified on the command line override those set in the `.properties` file.

**WebHelp and DITA-OT parameters**

In addition to the transformation parameters that are specific to WebHelp Responsive (on page 1619), you can use the common DITA-OT transformation parameters and the HTML-based Output Parameters.
Command-Line Example

- Windows:

```
dita.bat
   --format=webhelp-responsive
   --input=c:\path\to\mySample.ditamap
   --output=c:\path\to\output
   -Dwebhelp.logo.image=myLogo.jpg
```

- Linux/Mac OS X:

```
dita
   --format=webhelp-responsive
   --input=/path/to/mySample.ditamap
   --output=/path/to/output
   -Dwebhelp.logo.image=myLogo.jpg
```

- DITA-OT Documentation: HTML-based output parameters
- WebHelp Responsive Output Parameters (on page 1619)

Running from an Integration Server

Oxygen XML Author can be processed from an automatic publishing system, such as Jenkins or Travis.

Automating DITA to WebHelp Output with Jenkins

To integrate WebHelp output with the Jenkins continuous integration tool, follow these steps:

1. Create a Maven project to incorporate the DITA-OT that already integrates Oxygen XML Author.
2. Go to the root of your Maven project and edit the pom.xml file to include the following fragment:

```xml
<properties>
```
3. Go to the Jenkins top page and create a new Jenkins job. Configure this job to suit your particular requirements, such as the build frequency and location of the Maven project.

Automating DITA to WebHelp Output with Travis CI

This topic assumes you have a DITA project hosted on a GitHub public or private repository.

The goal of this tutorial is to help you set up a Travis continuous integration job that automatically publishes your DITA project to GitHub pages after every commit. The published website will contain a feedback link on each page that would allow a contributor to easily suggest changes to the documentation by creating a pull request on GitHub with just a few clicks.

Enable the Travis CI Build

1. Sign in to Travis CI with your GitHub account, accepting the GitHub access permissions confirmation.
2. Once you are signed in, and you have synchronized your GitHub repositories, go to your profile page and enable Travis CI for the repository you want to build.
Configure the Travis CI Build in your GitHub Project

1. Checkout your GitHub project locally.
2. Copy the `.travis` folder from here to the root directory of your project.
3. In the root of your GitHub project, add a file called `.travis.yml` with the following content:

```yaml
language: dita
install:
  - echo "Installed"
script:
  - sh .travis/publish.sh
after_success:
  - sh .travis/deploy.sh
env:
  global:
    - DITAMAP=/path/to/your/ditamap/file
    - DITAVAL=/path/to/your/ditaval/file
    - ANT_OPTS=-Xmx1024M

[Note: Replace /path/to/your/ditamap/file and /path/to/your/ditaval/file with the appropriate paths to your DITA map and ditaval files.

4. Create a GitHub personal access token by following this procedure.
5. Define an environment variable in the repository settings that has the name `GH_TOKEN` and the value equal with the GitHub personal access token created earlier.

Register Your License Key

1. Edit your `.gitignore` file (or create it if it does not already exist) and add the following line:

```
licenseKey.txt
```
2. Copy your WebHelp license to the root of your GitHub project in a file called `licenseKey.txt`.

[Important: The `licenseKey.txt` file should not be committed to GitHub as it contains a license key that is issued only to you.

3. Encrypt the license key file and add it to the `.travis.yml` configuration file. This way only the Travis CI server will be able to decrypt it during the build process.

Commit to GitHub

1. Commit the following files and folders and push the commit to GitHub:
2. Create a `gh-pages` branch in your GitHub project where the WebHelp output will be published. You can follow the procedure [here](#).

**Customizing the WebHelp Responsive Output**

Oxygen XML Author provides support for customizing the **WebHelp Responsive** output to suit your specific needs. The **WebHelp Responsive** output is based upon the Bootstrap responsive front-end framework and is available for DITA document types. The **WebHelp Responsive with Feedback** variant allows your users to add comments to your output.

To change the overall appearance of your **WebHelp Responsive** output, you can use several different customization methods or a combination of methods. If you are familiar with CSS and coding, you can style your WebHelp output through your own custom stylesheets. You can also customize your output by modifying existing templates, create your own layout pages, or by configuring certain options and parameters in the transformation scenario.

This section includes topics that explain various ways to customize your WebHelp Responsive system output, such as how to configure the tiles on the main page, add logos in the title area, integrate with social media, localizing the interface, and much more.

**Working with Publishing Templates**

An **Oxygen Publishing Template** (on page 2797) defines all aspects of the layout and styles of the **WebHelp Responsive** output. It is a self-contained customization package stored as a ZIP archive or folder that can easily be shared with others. It provides the primary method for customizing the output. The recommended method for customizing the **WebHelp Responsive** output is to use a custom publishing template.

This section contains topics about how to create, edit, publish, and share publishing templates.

**Related Information:**

- [Publishing Template Package Contents for WebHelp Responsive Customizations](#) (on page 1511)
How to Create a Publishing Template

To create a customization, you can start from scratch or from an existing template, and then adapt it according to your needs.

Creating a Template Starting from Scratch

To create a new Oxygen Publishing Template, follow these steps:

1. Create a folder that will contain all the template files.
2. In Oxygen XML Editor/Author, open the new document wizard (use File > New or the New toolbar button), then choose the Publishing Template Descriptor template.

   Figure 420. Choosing the Publishing Template Descriptor Document Template

3. Save the .opt file into your customization directory.
4. Open the .opt file in the editor and customize it to suit your needs.

Creating a Template Starting from an Existing Template

If you are using a WebHelp Responsive or DITA Map PDF - based on HTML5 & CSS transformation, the easiest way to create a new Oxygen Publishing Template (on page 2797) is to select an existing template in the transformation scenario dialog box and use the Save template as button to save that template into a new template package that can be used as a starting point.

To create a new Oxygen Publishing Template, follow these steps:
1. Open the transformation scenario dialog box and select the publishing template you want to export and use as a starting point.

2. **Optional:** You can set one or more transformation parameters from the **Parameters** tab and the edited parameters will be exported along with the selected template. You will see which parameters will be exported in the dialog box that is displayed after the next step.

3. Click the **Save template as** button.

   **Step Result:** This opens a template package configuration dialog box that contains some options and displays the parameters that will be exported to your template package.

4. Specify a name for the new template.

5. **Optional:** Specify a template description.

6. **Optional:** The same publishing template package can contain both a WebHelp Responsive and PDF customization and you can use the same template in both types of transformations (DITA Map WebHelp Responsive or DITA Map to PDF - based on HTML5 & CSS). You can use the **Include WebHelp customization** and **Include PDF customization** options to specify whether your custom template will include both types of customizations.

7. **Optional:** For WebHelp Responsive customizations, you can select the **Include HTML Page Layout Files** option if you want to copy the default HTML Page Layout Files (on page 1525) in your template package. They are helpful if you want to change the structure of the generated HTML pages.

8. In the **Save as** field, specify the name and path of the ZIP file where the template will be saved.

   **Step Result:** A new ZIP archive will be created on disk in the specified location with the specified name.

9. Open the .opt file in the editor and customize it to suit your needs.

For more information about creating and customizing publishing templates, watch our video demonstration:

https://www.youtube.com/embed/zNmXfKWXwO8

How to Edit a Packed Publishing Template

To edit an existing *Oxygen Publishing Template (on page 2797)* package, follow these steps:

1. Unzip the ZIP archive associated with the *Oxygen Publishing Template* in a separate folder.
2. Link the folder associated with the template in the **Project** view.
3. Using the **Project** view, you can modify the resources (CSS, JS, fonts) within the *Oxygen Publishing Template* folder to fit your needs.
4. Open the publishing template descriptor file (.opt extension) in the editor and modify to suit your needs.
5. **Optional:** Once you finish your customization, you can archive the folder as a ZIP file.

Related Information:

- Publishing Template Package Contents for PDF Customizations *(on page 1639)*
- Publishing Template Package Contents for WebHelp Responsive Customizations *(on page 1511)*

How to Add a Publishing Template to the Publishing Templates Gallery

To add the publishing template to your templates gallery, follow these steps:

1. Open the transformation scenario dialog box by editing a WebHelp Responsive transformation.
2. In the **Templates** tab, click the **Configure Publishing Templates Gallery** link to.
   - This will open the preferences page.
3. Click the **Add** button and specify the location of your template directory.
   - Your template directory is now added to the **Additional Publishing Templates Galleries** list.
4. Click **OK** to return to the transformation scenario dialog box.
   - All the templates contained in your template directory will be displayed in the preview pane along with all the built-in templates.

How to Use a Publishing Template from a Command Line

Before you run the transformation, you need to know if the publishing template has a **single or multiple template descriptor files (on page 1511)**. If you don't know, open the ZIP archive or folder and check for files with the .opt extension.
Using a Publishing Template with a Single Descriptor

A template with a single descriptor is used for a single customization.

To run from a command line, you need to use the `webhelp.publishing.template` parameter (on page 1619). This parameter specifies the path to the ZIP archive (or root folder) that contains your custom WebHelp Responsive template.

**Command-Line Example:**

- **Windows**:
  ```
dita.bat
  --format=webhelp-responsive
  --input=c:\path\to\mySample.ditamap
  --output=c:\path\to\output
  -Dwebhelp.publishing.template=custom-template
  ```

- **Linux/Mac OS X**:
  ```
dita
  --format=webhelp-responsive
  --input=/path/to/mySample.ditamap
  --output=/path/to/output
  -Dwebhelp.publishing.template=custom-template
  ```

Using a Publishing Template with Multiple Descriptors

A template with multiple descriptors contains multiple customizations.

Because the publishing template is self-contained, it is used to reuse resources that are common to multiple publications.

To run from a command line, you need to use the `webhelp.publishing.template` (on page 1619) and `webhelp.publishing.template.descriptor` (on page 1620) parameters.

The `webhelp.publishing.template` (on page 1619) parameter specifies the path to the ZIP archive (or root folder) while the `webhelp.publishing.template.descriptor` (on page 1620) parameter specifies the name of the descriptor you want to use.

**Command-Line Example:**

- **Windows**:
  ```
dita.bat
  ```
How to Share a Publishing Template

To share a publishing template with others, following these steps:

1. Copy your template in a new folder in your project.
2. Go to Options > Preferences > DITA > Publishing and add that new folder to the list.
3. Switch the option as the bottom of that preferences page to Project Options.
4. Share your project file (.xpr).

Converting Old Templates to Version 20.0 and Newer

With the introduction of the Publishing Template concept in Oxygen XML Author version 20.0, the old WebHelp output template formats (version 19.1 and older) are no longer supported. However, they can be easily converted to the new format by following this procedure:

1. Set Oxygen XML Author to point to the DITA-OT distribution that contains your old template:
   a. Go to Options > Preferences > DITA.
   b. Select Custom in the DITA Open Toolkit section and specify the DITA-OT directory that contains your old template.
2. Edit a WebHelp Responsive transformation scenario.
3. Select your old custom template in the Templates tab.
4. Click on the Save Template as button, complete the required fields, and save the template.
5. Edit the WebHelp Responsive transformation scenario again.
6. This time, use the Choose custom template button to select your old template.
7. Save the scenario and use it to generate the WebHelp Responsive output.
Related Information:

Converting Old Templates with Custom HTML Page Layout Files to Version 21 (on page 1557)

Converting Old Templates with Custom HTML Page Layout Files to Version 21

If you have a custom Publishing Template that was created in Oxygen XML Author version 20.0 or 20.1 and it includes custom HTML page layout files (on page 1525), the following conversion procedure is required for the template to be compatible with Oxygen XML Author version 21.0:

1. In the Project view, add the root directory for your custom Publishing Template (you can use a linked folder (on page 22) and the easiest way to do this is to drag and drop the folder).

   □ Note: If your template is stored as a ZIP archive, you first need to unzip it.

2. Expand your template directory, right-click the page-templates subfolder, and select Refactoring > XML Refactoring.

3. In the XML Refactoring dialog box, scroll to the Publishing Template section and select Migrate HTML Page Layout Files to v21, then click Next.

4. The Scope should be left as Selected project resources.

5. You can use the Preview button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.

6. Click Finish to perform the conversion.

Related Information:

• Converting Old Templates to Version 20.0 and Newer (on page 1556)

Troubleshooting: Errors Encountered when Loading Templates

When the Templates tab of a WebHelp Responsive transformation scenario dialog box is opened, all templates (built-in and custom) are loaded and validated. Specifically, certain elements in the template descriptor file (on page 1511) are checked for validity. If errors are encountered that prevents the template from loading, the following message will be displayed toward the bottom of the dialog box:

⚠️ Some templates could not be loaded. More details
If you click the More details link, a window will open with more information about the encountered error. For example, it might offer a hint for which element is missing from the expected descriptor file structure (on page 1511).

Also, if a template could be loaded, but certain elements could not be found in the descriptor file (on page 1511), a warning icon (⚠️) will be displayed on the template's image (in the Templates tab of the transformation dialog box). For example, this happens if a valid preview-image element (on page 1514) cannot be found.

Changing the Layout and Styles

This section contains topics that explain how to customize the output using CSS, inserting HTML fragments, changing the layout of the main page, and more.

How to Use CSS Styling to Customize the Output

The most common way to customize WebHelp Responsive output is to use custom CSS styling. This method can be used to make small, simple styling changes or more advanced, precise changes. To implement the styling in your WebHelp output, you simply need to create the custom CSS file and reference it in your transformation scenario (using an Oxygen Publishing Templater (on page 2797) or a transformation parameter). This custom file will be the final CSS to be applied so its content will override the styles in the other pre-existing CSS files.

Using CSS Inspector to Identify Content for Custom CSS File

You can use your browser's CSS inspector to identify the pertinent code in the current CSS files and you can even make changes directly in the CSS inspector to test the results so that you know exactly what content to use in your custom CSS file.

In most popular browsers (such as Chrome, Firefox, and Edge), you can access the CSS inspector by using F12 or by selecting Inspect Element (or simply Inspect) from the contextual menu.

Tip: When using Safari on Mac OS X, you must first enable the Develop menu by going to the Advanced settings and selecting Show Develop menu in menu bar. Then you can select Show Web Inspector from the Develop menu or click Command + Option + I.

Create the Custom CSS

As a practical example, the following procedure would change the background color of the footer bar in the WebHelp output:

1. Use the browser's CSS inspector to identify the current CSS code that styles the footer bar. In this particular case, the pertinent code that would be identified is:
2. If you want to test the color you want to apply as the background of this particular element, use the browser’s CSS inspector to change the value of the `background-color` attribute. After you find a suitable color, copy that new code.

3. Create a custom CSS file and paste or enter the copied code. For example:

   ```css
   .wh_footer {
     background-color: #255890;
   }
   ```

4. Save the custom CSS file at a location of your convenience.

5. Reference the CSS file in a WebHelp Responsive transformation using an Oxygen Publishing Template (on page 1559) or the `args.css` parameter (on page 1560).

Referencing the CSS Using a Publishing Template

1. If you haven’t already created a Publishing Template, see Working with Publishing Templates (on page 1551).

2. Using the Project view, copy your custom CSS in a folder inside the publishing template root folder (for example, in the `custom_footer_template/resources` folder).

3. Open the template descriptor file (on page 1511) associated with your publishing template and add your custom CSS in the `resources` section.

4. Open the DITA Map WebHelp Responsive transformation scenario.

5. Click the Choose Custom Publishing Template link and select your template.

6. Click OK to save the changes to the transformation scenario.

7. Run the transformation scenario.

**Result:** Your custom CSS will be applied as a final layer on top of any existing CSS rules and the output will reflect the changes you made.
Referencing the CSS Using the args.css Parameter

1. Edit the DITA Map WebHelp Responsive transformation scenario and open the Parameters tab.
2. Set the args.css parameter to the path of your custom CSS file.
3. Set the args.copycss parameter to yes to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
4. Click OK to save the changes to the transformation scenario.
5. Run the transformation scenario.

Result: Your custom CSS will be applied as a final layer on top of any existing CSS rules and the output will reflect the changes you made.

How to Insert HTML Content in WebHelp Responsive Output

You can add custom HTML content in the WebHelp Responsive output by inserting it in a well-formed XML file that will be referenced in the transformation (either from an Oxygen Publishing Template (on page 2797) or using one of the HTML fragment parameters (on page 1621)). This content may include references to additional JavaScript, CSS, and other types of resources, or such resources can be inserted inline within the HTML content that is inserted in the XML file.

The XML File

There are several things to consider regarding this XML file:

- **Well-Formedness** - If the file is not a Well-formed XML document (on page 1021) (or fragments are not well-formed), the transformation will fail.

  A common use case is if you want to include several script or link elements. In this case, the XML fragment has multiple root elements and to make it well-formed, you can wrap it in an html element. This element tag will be filtered out and only its children will be copied to the output documents. Similarly, you can wrap your content in head, body, html/head, or html/body elements.

- **Referencing Resources in the XML File** - You can include references to local resources (such as JavaScript or CSS files) by using the built-in \${oxygen-webhelp-output-dir} macro to specify their paths relative to the output directory:

```html
<html>
  <script type=text/javascript src=\${oxygen-webhelp-output-dir}/js/test.js/>
  <link rel=stylesheet type=text/css

  href=\${oxygen-webhelp-output-dir}/css/test.css />
</html>
```
If you want that the path of your resource to be relative to the templates directory (on page 1508), you can use the \${oxygen-webhelp-template-dir} macro.

To copy the referenced resources to the output directory, follow the procedure in: How to Copy Additional Resources to Output Directory (on page 1577).

- **Inline JavaScript or CSS Content:**

  **JavaScript:**

  ```
  <script type="text/javascript">
  /* Include JavaScript code here. */

  function myFunction() {
    return true;
  }
  </script>
  ```

  **CSS:**

  ```
  <style>
  /* Include CSS style rules here. */

  *{
    color:red
  }
  </style>
  ```

  **Note:** If you have special characters (for example, &, <) that break the well-formedness of the XML fragment, it is important to place this content inside an XML comment:

  ```
  <script type="text/javascript">
  <!--
  /* Include JavaScript code here. */

  function myFunction() {
    return true;
  }
  //-->
  </script>
  ```
Using WebHelp Macros Inside an HTML Fragment File

The XML file can use WebHelp macros, which are variables that will be expanded when the content of the HTML fragment file will be copied in the final output.

There are two possibilities for using macros:

- **Directly in attribute values** - For example, if you want to reference a JavaScript file from the Publishing Template directory, you can use the following construct:

  ```xml
  <script type="text/javascript" src="$\{path(oxygen-webhelp-template-dir)\}/"></script>
  ```

- **In text content** - Using the `<whc:macro/>` template component:

  ```xml
  <script type="text/javascript" xmlns:whc="http://www.oxygenxml.com/webhelp/components">
    var outDirPath = '
    <whc:macro value="$\{path(oxygen-webhelp-output-dir)\}"/>
    console.log("The output directory path is:", outDirPath);
  </script>
  ```

The following *macros* are supported:

- **i18n**
  For localizing a string.

  ```xml
  $\{i18n(string.id)\}
  ```

- **param**
  Returns the value of a transformation parameter.

  ```xml
  $\{param(webhelp.show.main.page.tiles)\}
  ```

- **env**
  Returns the value of an environment variable.

  ```xml
  $\{env(JAVA_HOME)\}
  ```

- **system-property**
  Returns the value of a system property.

  ```xml
  $\{system-property(os.name)\}
  ```

- **timestamp**
Can be used to format the current date and time. Accepts a string (as a parameter) that
determines how the date and time will be formatted (format string or picture string as it
is known in the XSLT specification). The format string must comply with the rules of the
XSLT format-dateTime function specification.

```{timestamp([h1]:[m01] [P] [M01]/[D01]/[Y0001])}
```

path

Returns the path associated with the specified path ID. The following paths IDs are supported:

- **oxygen-webhelp-output-dir** - The path to the output directory. The path is relative
to the current HTML file.
- **oxygen-webhelp-assets-dir** - The path to the oxygen-webhelp subdirectory
  from the output directory. The path is relative to the current HTML file.
- **oxygen-webhelp-template-dir** - The path to the template directory. The path is
  relative to the current HTML file.

```{path(oxygen-webhelp-template-dir)}
```

Note: New paths IDs can be added by overriding the `wh-macro-custom-path`
template from `com.oxygenxml.webhelp.responsive\xsl\template\macroExpander.xsl`

```xml
<!-- Extension template for expanding a custom path macro. -->
<xsl:template name="wh-macro-custom-path">
  <xsl:param name="pathId"/>
  <xsl:value-of select="$pathId"/>
</xsl:template>
```

map-xpath

Can be used to execute an XPath expression over the DITA map file from the temporary
directory.

Tip: Available in all template layout HTML pages.

```{map-xpath(/map/title)}
```

topic-xpath

Can be used to execute an XPath expression over the current topic.

Tip: Available only in the topic HTML page template `wt_topic.html`. 
Referencing the HTML fragment using a Publishing Template

1. If you have not already created a Publishing Template, see Working with Publishing Templates (on page 1551).
2. Insert the HTML content in a well-formed XML file (for example, custom-html.html).
3. Using the Project view, copy your custom HTML fragment in a folder inside publishing the template root folder (for example, in the custom_footer_template/html-fragments folder).
4. Open the template descriptor file (on page 1511) associated with your publishing template and add a reference to the custom HTML fragment in the html-fragments section.

```
<publishing-template>
  ...
  <webhelp>
    ...
    <html-fragments>
      ...
      <fragment
        file="html-fragments/custom-html.html"
        placeholder="webhelp.fragment.head"/>
    </html-fragments>
  </webhelp>
  ...
</publishing-template>
```

**Note:** If you want to insert the content in another location within the output document, you can reference the XML file from any other HTML Fragment extension points (on page 1518).
5. Open the DITA Map WebHelp Responsive transformation scenario.
6. Click the Choose Custom Publishing Template link and select your template.
7. Click OK to save the changes to the transformation scenario.
8. Run the transformation scenario.

**Results:** Your additional content will be included at the end of the head element of your output document.

Referencing the HTML Fragment using a Transformation Parameter

1. Insert the HTML content in a well-formed XML file.
2. Edit the DITA Map WebHelp Responsive transformation scenario and open the Parameters tab.
3. Edit the value of the `webhelp.fragment.head` parameter and set it to the absolute path of your XML file.

**Note:** If you want to insert the content in another location within the output document, you can reference the XML file from any other HTML Fragment extension points (on page 1518).

4. Click **OK** to save the changes to the transformation scenario.

5. Run the transformation scenario.

**Results:** Your additional content will be included at the end of the `head` element of your output document.

---

**How to Insert JavaScript AMD Modules in WebHelp Responsive Output**

In the WebHelp Responsive output, you may want to include a JavaScript module that uses the Asynchronous Module Definition (AMD) format. Unlike the traditional JavaScript resources that are loaded using `<script>` tags, these modules are loaded using the *RequireJS* library. For the traditional JavaScript libraries, the standard procedure to contribute your script to the output would be to use an HTML fragment file as described here (on page 1560).

Although following the procedure that uses HTML fragments (on page 1560) would result in having your JS file included in the output, loading the JS code in the browser will result in an error. Since your JS module uses the AMD API, it cannot be loaded using a `<script>` element. For example, because many jQuery plugins use the AMD format, it will be difficult for you to use those libraries in your custom WebHelp output.

Normally, a JavaScript AMD module can be loaded in one of the following ways:

- **As a top-level script**, using the `data-main` attribute of the `<script>` element used to load the *RequireJS* library.

  ```html
  <script data-main="js/template-main.js" src="js/require.js"></script>
  ```

However, since WebHelp already loads its internal JS modules using *RequireJS*, a top level script is already specified and you cannot specify another top level script in the same page. Therefore,
this approach can not be used to load your custom JS module in Oxygen XML WebHelp, leaving you with only the following option.

- **As a dependency module**, using a `require()` call from the top level (main) script or from one of its dependency modules. This means that you would have to alter one of the WebHelp core JS libraries and inject a `require()` call to load your custom module:

  ```javascript
  require(['js/template-main.js']);
  ```

  **Note:** Altering the WebHelp core libraries is not recommended because when you will upgrade the WebHelp plugin to a newer version, those modifications will be lost.

### Contributing JavaScript AMD Modules Using a Publishing Template

**Oxygen XML WebHelp** provides the ability to contribute a custom JavaScript Asynchronous Module Definition (AMD) resource in the output by referencing it in the Publishing Template descriptor file (on page 1511). This module is automatically copied to the output directory and it is automatically loaded in the output HTML pages using a `require()` call. Thus, you can include your scripts in the output without altering WebHelp's core JavaScript libraries.

This module may contain all of your custom functionality or can be used to load other AMD JavaScript modules. The additional sub-modules can be stored either locally in your custom Publishing Template or on a remote web server.

**Important:** To enable loading of a JS module you should set the `webhelp.enable.template.js.module.loading` parameter to yes (the default value is no) in the Publishing Template descriptor file or in the transformation scenario.

### The JavaScript Modules

**The JS Modules sample template** contains a main JavaScript module (`template-main.js`) that loads other modules stored in the template package or in a remote location on the Internet.

```javascript
define(['require'], function (require) {
    require(['./red', './italic', './tables']);
});
```

Besides the main JavaScript example, the template contains 3 other sub-modules:

- **red.js** - Changes the font color of the publication title.

```javascript
define(['jquery'], function ($) {
    $(document).ready(function () {
        // Make the title red
    });
});
```
• **italic.js** - Changes the font style of your publication title.

```javascript
define(['jquery'], function ($) {
  $(document).ready(function () {
    // Make the title italic
    $('.wh_publication_title a').wrapInner('<i></i>');</
  });
});
```

• **tables.js** - Loads the DataTables jQuery plugin from a CDN.

```javascript
define(['jquery',
  'https://cdn.datatables.net/1.10.16/js/jquery.dataTables.min.js'], function ($) {

  $(document).ready(function () {
    $('.table').DataTable();
  };
});
```

The JavaScript modules are stored in the Publishing Template package as follows:

```
[template-dir]
[js]
  template-main.js
  italic.js
  red.js
  tables.js
```

---

**Note:**

• The main module should be referenced in the Publishing Template descriptor file (on page 1511) by specifying its path relative to the base directory of the template.

```xml
<js-amd-module file="js/template-main.js"/>
```

• The main JS module is copied automatically to the output directory, but the sub-modules are not. To instruct the Publishing Template engine to copy those modules to the output directory you should include a `<fileset>` section in the Publishing Template descriptor file (on page 1511).

```xml
<fileset>
```

```xml
</fileset>
```
The main module can reference other modules bundled in the publishing template package as follows:

- **Relative to template directory** - Prefix their paths with the ID of the template directory:
  `template-base-dir` (for example: `template-base-dir/js/italic`).

- **Relative to the name of the current JS module** - Use `./` to prefix the paths of the referenced modules.

- The `.js` extension **should be omitted** for local modules, because the RequireJS library will add it automatically.

- [How to Insert HTML Content in WebHelp Responsive Output](on page 1560)

How to Change Numbering Styles for Ordered Lists

Ordered lists (`ol`) are usually numbered in XHTML output using numerals. If you want to change the numbering to alphabetical, follow these steps:

1. Define a custom `outputclass` value and set it as an attribute of the ordered list, as in the following example:

   ```xml
   <ol outputclass="number-alpha">
     <li>A</li>
     <li>B</li>
     <li>C</li>
   </ol>
   ```

2. Add the following code snippet in a custom CSS file:

   ```css
   ol.number-alpha{
     list-style-type:lower-alpha;
   }
   ```

3. Reference the CSS file in a WebHelp Responsive transformation using an Oxygen Publishing Template (on page 1569) or the `args.css` parameter (on page 1569).
Referencing the Custom CSS from a Publishing Template

1. If you haven’t already created a Publishing Template, see Working with Publishing Templates (on page 1551).
2. Using the Project view, copy your custom CSS in a folder inside the publishing template root folder (for example, in the custom_footer_template/resources folder).
3. Open the template descriptor file (on page 1511) associated with your publishing template and add your custom CSS in the resources section.

```
<publishing-template>
  ...
  <webhelp>
  ...
  <resources>
  ...
  <css file="resources/MyCustom.css"/>
```

4. Open the DITA Map WebHelp Responsive transformation scenario.
5. Click the Choose Custom Publishing Template link and select your template.
6. Click OK to save the changes to the transformation scenario.
7. Run the transformation scenario.

Result: Your custom CSS will be applied as a final layer on top of any existing CSS rules and the output will reflect the changes you made.

Referencing the CSS Using the args.css Parameter

1. Edit the DITA Map WebHelp Responsive transformation scenario and open the Parameters tab.
2. Set the args.css parameter to the path of your custom CSS file.
3. Set the args.copycss parameter to yes to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
4. Click OK to save the changes to the transformation scenario.
5. Run the transformation scenario.

Result: Your custom CSS will be applied as a final layer on top of any existing CSS rules and the output will reflect the changes you made.

How to Show or Hide Navigation Links in Topic Pages

The topic pages (on page 1478) in WebHelp Responsive output can contain navigation links (← Previous / → Next arrows) that can be used to navigate to the previous or next topic.
How to Control Which Topic Pages Include Navigation Links

The navigation links are controlled by the `collection-type` attribute. For example, if you set `collection-type="sequence"` on a parent topic reference in your DITA map, navigation links will be generated in the output for all of its child topics (from children to parent, and from child to previous sibling and next sibling).

```
<map id="example_map" title="Example Map">
  <topicref href="../topics/ParentTopic.dita" collection-type="sequence">
    <topicref href="../topics/Childtopic.dita"/>
  </topicref>
</map>
```

How to Generate Navigation Links for All Topics (Ignoring the Collection Type Attribute)

You can use the `webhelp.default.collection.type.sequence` parameter in the transformation and set its value to `yes` to generate navigation links for all topics, regardless of whether or not the `collection-type` attribute is present.

How to Hide All Navigation Links

To hide all navigation links, use the `webhelp.show.navigation.links` parameter in the transformation and set its value to `no`.

How to Change the Main Page Layout

This section contains topics that explain how to customize the layout of the main page in the WebHelp Responsive output.

How to Customize the Menu

By default, the menu component is displayed in all WebHelp Responsive pages. However, you might want to hide it completely, or only display some of its menu entries.

How to Hide Some of the Menu Entries

There are two methods for doing this. One of them involves editing the DITA map (on page 2793) and marking the topics that do not need to be included in the menu, and another one that uses a small CSS customization.

Editing the DITA Map
To edit the metadata in the DITA map to control which topics will not be displayed in the menu, follow these steps:

1. Open the DITA map in the Text editing mode of Oxygen XML Author.
2. Add the following metadata information in the topicref element (or any of its specializations) for each topic you do not want to be displayed in the menu:

   ```xml
   <topicmeta>
     <data name="wh-menu">
       <data name="hide" value="yes"/>
     </data>
   </topicmeta>
   ```

Customizing the CSS

To customize the CSS to control which topics will not be displayed in the menu, follow these steps:

1. Make sure you set an ID on the topic that you do not want to include in the menu.
2. Create a new CSS file that contains a rule that hides the menu entry generated for the topic (identified by the topic ID growing-flowers in the following example). The CSS file should have content that is similar to this:

   ```css
   .wh_top_menu *[data-id='growing-flowers'] { display:none; }
   ```

3. Reference the CSS file in a WebHelp Responsive transformation using an Oxygen Publishing Template (on page 1559) or the args.css parameter (on page 1560).

How to Hide the Entire Menu

If you do not want to include a main menu in the pages of the WebHelp Responsive output, you can instruct the transformation scenario to skip the menu generation completely.

**Using a Publishing Template**

To hide the menu using an Oxygen Publishing Template (on page 1508), follow this procedure:

1. If you haven't already created a Publishing Template, see Working with Publishing Templates (on page 1551).
2. Open the template descriptor file (on page 1511) associated with your publishing template and add the webhelp.show.top.menu parameter in the parameters section with its value set to no.

   ```xml
   <publishing-template>
     ...
   </publishing-template>
   ```
3. Open the **DITA Map WebHelp Responsive** transformation scenario.

4. Click the **Choose Custom Publishing Template** link and select your template.

5. Click **OK** to save the changes to the transformation scenario.

6. Run the transformation scenario.

**Using a Transformation Scenario in Oxygen XML Editor/Author**

To hide the menu using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Edit the **DITA Map WebHelp Responsive** transformation scenario and choose a *template*.

2. Open the **Parameters** tab and set the `webhelp.show.top.menu` parameter to no.

3. Click **OK** to save the changes to the transformation scenario.

4. Run the transformation scenario.

**How to Add a Welcome Message in the WebHelp Responsive Main Page**

The main page of the WebHelp Responsive output contains a set of empty placeholders (on page 1518) that can be used to display customized text fragments. These placeholders are available to you through WebHelp Responsive transformation scenario parameters. For example, the placeholder identified through the `webhelp.fragment.welcome` parameter displays text content above the search box in the main page.

**Using a Publishing Template**

To add a customized welcome message in the main page of the WebHelp Responsive output using an **Oxygen Publishing Template** (on page 1508), follow this procedure:

1. If you haven't already created a Publishing Template, see Working with Publishing Templates (on page 1551).

2. Open the **template descriptor file** (on page 1511) associated with your publishing template and add the `webhelp.fragment.welcome` parameter in the **parameters** section with its value set to one of the following:

   - A small well-formed XHTML fragment (such as: `<i>Welcome to the User Guide</i>`).
   - A path to a file that contains well-formed XHTML content.
3. Open the DITA Map WebHelp Responsive transformation scenario.
4. Click the Choose Custom Publishing Template link and select your template.
5. Click OK to save the changes to the transformation scenario.
6. Run the transformation scenario.

Result: In the WebHelp output, your custom message will be displayed above the search box in the main page.

Using a Transformation Scenario in Oxygen XML Editor/Author

⚠️ Important: Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin (https://www.oxygenxml.com/buy_webhelp.html).
- The Oxygen XML WebHelp Plugin must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To add a customized welcome message in the main page of the WebHelp Responsive output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Edit the DITA Map WebHelp Responsive transformation scenario and choose a template.
2. Open the Parameters tab and set the webhelp.fragment.welcome parameter with its value set to one of the following:
   - A small well-formed XHTML fragment (such as: <i>Welcome to the User Guide</i>).
   - A path to a file that contains well-formed XHTML content.
3. Click OK to save the changes to the transformation scenario.
4. Run the transformation scenario.

Result: In the WebHelp output, your custom message will be displayed above the search box in the main page.
How to Create a Custom Footer

The main page of the WebHelp Responsive output contains a set of empty placeholders (on page 1518) that can be used to display customized text fragments. These placeholders are available to you through WebHelp Responsive transformation scenario parameters. For example, the placeholder identified through the webhelp.fragment.footer parameter displays the custom content at the bottom of the page.

Using a Publishing Template

To create a custom footer in the WebHelp Responsive output using an Oxygen Publishing Template (on page 1508), follow this procedure:

1. If you haven't already created a Publishing Template, see Working with Publishing Templates (on page 1551).
2. Open the template descriptor file (on page 1511) associated with your publishing template and add the webhelp.fragment.footer parameter in the parameters section with its value set to one of the following:
   - A small well-formed XHTML fragment.
   - A path to a file that contains well-formed XHTML content.

   ```xml
   <publishing-template>
   ...
   <webhelp>
   ...
   <parameters>
   <parameter name="webhelp.fragment.footer" value="c:\myFooter.xhtml"/>
   </parameters>
   </webhelp>
   </publishing-template>
   ```
3. Open the DITA Map WebHelp Responsive transformation scenario.
4. Click the Choose Custom Publishing Template link and select your template.
5. Click OK to save the changes to the transformation scenario.
6. Run the transformation scenario.

   Result: In the WebHelp output, your custom footer will be displayed at the bottom of the page.

Using a Transformation Scenario in Oxygen XML Editor/Author

⚠️ Important: Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:
• You must have a valid license for the **Oxygen XML WebHelp Plugin** ([https://www.oxygenxml.com/buy_webhelp.html](https://www.oxygenxml.com/buy_webhelp.html)).

• The **Oxygen XML WebHelp Plugin** must be installed and integrated for the **DITA Open Toolkit** or a **DocBook XSL Distribution**.

To create a custom footer in the WebHelp Responsive output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Edit the **DITA Map WebHelp Responsive** transformation scenario and choose a **template**.
2. Open the **Parameters** tab and set the **webhelp.fragment.footer** parameter with its value set to one of the following:
   - A small well-formed XHTML fragment.
   - A path to a file that contains well-formed XHTML content.
3. Click **OK** to save the changes to the transformation scenario.
4. Run the transformation scenario.

   **Result:** In the WebHelp output, your custom footer will be displayed at the bottom of the page.

### How to Configure the Tiles on the WebHelp Responsive Main Page

The **tiles** version of the main page of the WebHelp Responsive output displays a tile for each topic found on the first level of the **DITA map (on page 2793)**. However, you might want to customize the way they look or even to hide some of them.

Depending on your particular setup, you can choose to customize the tiles either by setting metadata information in the **DITA map** or by customizing the CSS that is associated with the **DITA map**.

### How to Hide Some of the Tiles

If your documentation is very large or there is a large number of topics on the first level, you might want to hide some of the tiles. Also, this might be useful if you only want to display the topics in the first page that are most relevant to your intended audience.

There are two methods for doing this. One of them involves editing the **DITA map** and marking the topics that do not need to be displayed as tiles, and another one that uses a small CSS customization level to hide some tiles identified by the ID of the topic.

#### Editing the DITA Map

To edit the metadata in the **DITA map** to control which topics on the first level of the **DITA map** will not be displayed as a tile, follow these steps:

1. Open the **DITA map** in the **Text** editing mode of Oxygen XML Author.
2. Add the following metadata information in the `topicref` element (or any of its specializations) for each first-level topic that you do not want to be displayed as a tile:

```xml
<topicmeta>
  <data name="wh-tile">
    <data name="hide" value="yes"/>
  </data>
</topicmeta>
```

Customizing the CSS

To customize the CSS to control which topics on the first level of the DITA map will not be displayed as a tile, follow these steps:

1. Make sure you set an ID on the topic you want to hide.
2. Create a new CSS file that contains a rule that hides the tile generated for the topic (identified in the following example by the topic ID `growing-flowers`). The CSS file should have content that is similar to this:

   ```css
   .wh_tile [data-id='growing-flowers'] { display: none; }
   }
   ```

3. Reference the CSS file in a WebHelp Responsive transformation using an Oxygen Publishing Template (on page 1559) or the `args.css` parameter (on page 1560).

How to Add an Image to the Tiles

There are two methods that you can use to add an image to a tile. One of them involves editing the DITA map, and the other uses a CSS customization.

Editing the DITA Map

To edit the metadata in the DITA map to set an image to be displayed in a tile, follow these steps:

1. Open the DITA map in the Text editing mode of Oxygen XML Author.
2. Add the following metadata information in the `topicref` element (or any of its specializations) for each first-level topic that will have an image displayed in the corresponding tile:

   ```xml
   <topicmeta>
     <data name="wh-tile">
       <data name="image" href="img/tile-image.png" format="png">
         <data name="attr-width" value="64"/>
         <data name="attr-height" value="64"/>
       </data>
     </data>
   </topicmeta>
   ```
Customizing the CSS

To customize the CSS to set an image to be displayed in a tile, follow these steps:

1. Make sure you set an ID on the topic that you want the tile include an image.
2. Create a new CSS file that contains a rule that associates an image with a specific tile. The CSS file should have content that is similar to this:

```css
.wh_tile[data-id='growing-flowers'] > div {
  background-image: url('resources/flower.png');
}
```

3. Reference the CSS file in a WebHelp Responsive transformation using an Oxygen Publishing Template (on page 1559) or the args.css parameter (on page 1560).

Adding Graphics and Media Resources

This section contains topics that explain how to add media resources to the published output or the output directory.

How to Copy Additional Resources to Output Directory

You can copy additional resources (such as JavaScript, CSS, or other resources) to the output directory either by using an Oxygen Publishing Template (on page 2797) or the webhelp.custom.resources parameter.

Copying Additional Resources to the Output Directory using a Publishing Template

1. If you haven't already created a Publishing Template, see Working with Publishing Templates (on page 1551).
2. Add a new `<fileset>` element in the resources section of the template descriptor file (on page 1515).
3. Open the DITA Map WebHelp Responsive transformation scenario.
4. Click the Choose Custom Publishing Template link and select your template.
5. Click OK to save the changes to the transformation scenario.
6. Run the transformation scenario.

Results: All files from the custom resources directory will be copied to the WebHelp Output Directory/oxygen-webhelp/template folder.

Copying Additional Resources to the Output Directory using a Transformation Parameter

1. Place all your resources in the same directory.
2. Edit the DITA Map WebHelp Responsive transformation scenario and open the Parameters tab.
3. Edit the value of the webhelp.custom.resources parameter and set it to the absolute path of the directory in step 1.
4. Click OK to save the changes to the transformation scenario.
5. Run the transformation scenario.

Results: All files from the new directory will be copied to the root of the WebHelp output directory.

How to Add a Logo Image in the Title Area

You can customize WebHelp Responsive output to include a logo in the title area. It will be displayed before the publication title. You can also specify a URL that can be used to send users to a specific website when they click the logo image.

This customization can be done using an Oxygen Publishing Template or using a transformation scenario from within Oxygen XML Editor/Author.

Using a Publishing Template

To add a logo in the title area of your WebHelp output using an Oxygen Publishing Template (on page 1508), follow this procedure:
1. If you haven't already created a Publishing Template, see Working with Publishing Templates (on page 1551).

2. Open the template descriptor file (on page 1511) associated with your publishing template and add the `webhelp.logo.image` parameter in the `parameters` section with its value set to path of your logo.

3. If you also want to add a link to your website when you click the logo image, set its URL in the `webhelp.logo.image.target.url` parameter.

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <parameters>
      <parameter name="webhelp.logo.image" value="c:\myLogo.jpg"/>
      <parameter name="webhelp.logo.image.target.url" value="http://sample.com"/>
    </parameters>
  </webhelp>
</publishing-template>
```

4. Open the DITA Map WebHelp Responsive transformation scenario.

5. Click the Choose Custom Publishing Template link and select your template.

6. Click OK to save the changes to the transformation scenario.

7. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To add a logo in the title area of your WebHelp output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Edit the DITA Map WebHelp Responsive transformation scenario and choose a template.
2. Open the Parameters tab and set the `webhelp.logo.image` parameter to the path of your logo.
3. If you also want to add a link to your website when you click the logo image, set its URL in the `webhelp.logo.image.target.url` parameter.
4. Click OK to save the changes to the transformation scenario.
5. Run the transformation scenario.

How to Add a Favicon in WebHelp Systems

You can add a custom favicon to your WebHelp output by simply using a parameter in the transformation scenario to point to your favicon image.
This customization can be done using an Oxygen Publishing Template or using a transformation scenario from within Oxygen XML Editor/Author.

**Using a Publishing Template**

To add a favicon to your WebHelp output using an Oxygen Publishing Template (on page 1508), follow this procedure:

1. If you haven't already created a Publishing Template, see Working with Publishing Templates (on page 1551).
2. Open the template descriptor file (on page 1511) associated with your publishing template and add the webhelp.favicon parameter in the parameters section with its value set to path of your image.

   ```xml
   <publishing-template>
     ...
     <webhelp>
       ...
       <parameters>
         <parameter name="webhelp.favicon" value="c:\myFavicon.jpg"/>
       </parameters>
     </webhelp>
   </publishing-template>
   ```

3. Open the DITA Map WebHelp Responsive transformation scenario.
4. Click the Choose Custom Publishing Template link and select your template.
5. Click OK to save the changes to the transformation scenario.
6. Run the transformation scenario.

   **Result:** Browsers that provide favicon support will display the favicon (typically in the browser’s address bar, in the list of bookmarks, and in the history).

**Using a Transformation Scenario in Oxygen XML Editor/Author**

To add a favicon to your WebHelp output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Edit the DITA Map WebHelp Responsive transformation scenario and choose a template.
2. Open the Parameters tab and set the webhelp.favicon parameter to the path of your image.
3. Click OK to save the changes to the transformation scenario.
4. Run the transformation scenario.
How to Add Video and Audio Objects in DITA WebHelp Output

You can insert references to video and audio media resources (such as videos, audio clips, or embedded HTML frames) in your DITA topics and then publish them to WebHelp output. The media objects can be played directly in all HTML5-based outputs, including WebHelp systems.

To add media objects in the WebHelp output generated from DITA documents, follow the procedures below.

Adding Videos to DITA WebHelp Output

1. Edit the DITA topic and insert a reference to the video through one of the following methods:
   - Use the Insert Media Object toolbar action (on page 2578).
   - Drag (or copy) the video file from your system explorer or the Project view (on page 320) and drop (or paste) it into your document.
   - Manually add an object element, as in one of the following examples:

```
<object outputclass="video" type="video/mp4" data="MyVideo.mp4"/>
```

or, instead of the data attribute, you can specify the video using a parameter like this:

```
<object outputclass="video">
  <param name="src" value="videos/MyVideo.mp4"/>
</object>
```

2. Apply a DITA to WebHelp transformation to obtain the output.

Result: The transformation converts the object element to an HTML5 video element.

```
<video controls="controls"> <source type="video/mp4" src="MyVideo.mp4"></source> </video>
```

Adding Audio Clips to DITA WebHelp Output

1. Edit the DITA topic and insert a reference to the audio clip through one of the following methods:
   - Use the Insert Media Object toolbar action (on page 2578).
   - Drag (or copy) the audio file from your system explorer or the Project view (on page 320) and drop (or paste) it into your document.
   - Manually add an object element, as in one of the following examples:

```
<object outputclass="audio" type="audio/mpeg" data="MyClip.mp3"/>
```

or, instead of the data attribute, you can specify the video using a parameter like this:
Adding Embedded HTML Frames (such as YouTube videos) to DITA WebHelp Output

1. Edit the DITA topic and insert a reference to the embedded object by using the Insert Media Object toolbar action (on page 2578) or by manually adding an object element, as in one of the following examples:

   `<object outputclass="iframe" data="https://www.youtube.com/embed/m_vv2s5Trn4"/>`

   or, instead of the data attribute, you can specify the object using a parameter like this:

   `<object outputclass="iframe">`
   `<param name="src" value="http://www.youtube.com/embed/m_vv2s5Trn4"/>`
   `</object>`

2. If you want the video to be allowed to play in full screen mode once the document is converted to XHTML output, also add an allowfullscreen parameter and set its value to true:

   `<object outputclass="iframe" data="https://www.youtube.com/embed/m_vv2s5Trn4"/>
   `<param name="allowfullscreen" value="true"/>
   `</object>`

   Tip: If you copy the embed code from the source and paste it into the Insert Media dialog box (see the specific instructions: here (on page 2580)), the allowfullscreen parameter will automatically be added and all you have to do is set the value to true.

3. Apply a DITA to WebHelp transformation to obtain the output.

   Result: The transformation converts the object element to an HTML5 iframe element.

   `<iframe controls="controls" src="https://www.youtube.com/embed/m_vv2s5Trn4">`
   `</iframe>`

For more information, see the following video demonstration:
https://www.youtube.com/embed/llX11gS4WaU

How to Publish MathML Formulas when Generating WebHelp from a Command Line

The DITA-OT distribution that comes bundled with Oxygen includes some additional pre-installed DITA-OT plugins that add support for properly displaying MathML formulas in the WebHelp output. However, if you are generating your WebHelp output from a command line, MathML formulas will not be displayed properly unless you install these plugins manually.

These plugins can be downloaded and installed from DITA 1.3 Support for Open Toolkit (https://github.com/dita-community/dita13-dita-ot-1.x-support). This plugin package adds DITA 1.3 support, including MathML.

How to Add Support for MathML when Generating WebHelp from a Command Line

1. Download and unzip the DITA 1.3 Support for Open Toolkit 1.x distribution package. It includes 4 DITA-OT plugins.
2. Copy the four plugin directories to your DITA-OT-DIR/plugins directory.
3. In the home directory of your DITA-OT installation, run the ant -f integrator.xml command.

Searching the Output

This section contains topics that explain how to use some of the search features in WebHelp Responsive output.

How to Change Element Scoring in Search Results

The WebHelp Search feature is enhanced with a rating mechanism that computes scores for every page that matches the search criteria. HTML tag elements are assigned a scoring value and these values are evaluated for the search results. The WebHelp directory includes a properties file that defines the scoring values for tag elements and this file can be edited to customize the values according to your needs.

To edit the scoring values of HTML tag element for enhancing WebHelp search results, follow these steps:
1. Edit the scoring properties file for DITA. The properties file includes instructions and examples to help you with your customization. The file is located in: `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\indexer\scoring.properties`. The values that can be edited in the `scoring.properties` file:

```
h1 = 10
h2 = 9
h3 = 8
h4 = 7
h5 = 6
h6 = 5
b = 5
strong = 5
em = 3
i = 3
u = 3
div.toc = -10
title = 20
div.ignore = ignored
meta_keywords = 20
meta_indexterms = 20
meta_description = 25
shortdesc = 25
```

2. Save your changes to the file.

3. Re-run your WebHelp transformation.

How to Exclude Certain DITA Topics from Search Results

There are several ways to exclude certain DITA resources from your WebHelp system's search results. This is useful if you have topics in your DITA map (on page 2793) structure that you do not want to be included in search results for your WebHelp system. The first method involves setting a parameter in the WebHelp transformation scenario and the second involves setting an attribute for each DITA topic reference that you want to exclude.

**Transformation Parameter Method**

To exclude DITA topics from WebHelp search results using a transformation parameter, follow these steps:
1. Create a simple text file that will contain your excluded file patterns. Each pattern must be on a new line. The patterns are considered to be relative to the output directory and they accept wildcards such as ‘*’ (matches zero or more characters) or ‘?’ (matches one character). For more information about the patterns, see https://ant.apache.org/manual/dirtasks.html#patterns.

Example: Suppose that in your project, you want to exclude all files located in the resources directory and all files located in the topics directory that have a .bak file extension. You could create a simple text file (for example, named exclude.properties), and add the following lines:

```
resources/*
topics/*.bak
```

2. Set the `webhelp.search.custom.excludes.file` parameter to specify the path to the file that contains the excluded file patterns (for example, exclude.properties in step 1). The parameter can be specified in the `parameters` section of the template descriptor file (on page 1517) associated with your publishing template or in the Parameters tab of the transformation scenario dialog box in Oxygen XML Editor/Author.

3. Run the transformation.

**Search Attribute Method**

The WebHelp Search engine does not index DITA topics that have the `@search` attribute set to `no`.

To exclude DITA topics from WebHelp search results using this attribute, follow these steps:

1. Edit the DITA map and for any `topicref` that you want to exclude from search results, set the `search` attribute to `no`. For example:

```
<topicref href="../topics/internal-topic1.dita" search="no"/>
```

2. Save your changes to the DITA map.

3. Run your WebHelp system transformation.

**How to Optimize Search Results**

A DITA Map WebHelp transformation scenario can be configured to produce a sitemap.xml file that is used by search engines to aid crawling and indexing mechanisms. A sitemap lists all pages of a WebHelp system and allows webmasters to provide additional information about each page, such as the date it was last updated, change frequency, and importance of each page in relation to other pages in your WebHelp deployment.

The structure of the sitemap.xml file looks like this:

```
<urlset xmlns="http://www.sitemaps.org/schemas/sitemap/0.9">
```
Each page has a `<url>` element structure containing additional information, such as:

- **loc** - The URL of the page. This URL must begin with the protocol (such as `http`), if required by your web server. It is constructed from the value of the `webhelp.sitemap.base.url` parameter from the transformation scenario and the relative path to the page (collected from the `href` attribute of a `topicref` element in the DITA map).

  **Note:** The value must have fewer than 2,048 characters.

- **lastmod** (optional) - The date when the page was last modified. The date format is `YYYY-MM-DD`.

- **changefreq** (optional) - Indicates how frequently the page is likely to change. This value provides general information to assist search engines, but may not correlate exactly to how often they crawl the page. Valid values are: `always`, `hourly`, `daily`, `weekly`, `monthly`, `yearly`, and `never`. The first time the `sitemap.xml` file is generated, the value is set based upon the value of the `webhelp.sitemap.change.frequency` parameter in the DITA WebHelp transformation scenario. You can change the value in each `url` element by editing the `sitemap.xml` file.

  **Note:** The value `always` should be used to describe documents that change each time they are accessed. The value `never` should be used to describe archived URLs.

- **priority** (optional) - The priority of this page relative to other pages on your site. Valid values range from 0.0 to 1.0. This value does not affect how your pages are compared to pages on other sites. It only lets the search engines know which pages you deem most important for the crawlers.

The first time the `sitemap.xml` file is generated, the value is set based upon the value of the `webhelp.sitemap.priority` parameter in the DITA WebHelp transformation scenario. You can change the value in each `url` element by editing the `sitemap.xml` file.
Creating and Editing the `sitemap.xml` File

Follow these steps to produce a `sitemap.xml` file for your WebHelp system, which can then be edited to fine-tune search engine optimization:

1. Edit the transformation scenario you currently use for obtaining your WebHelp output. This opens the Edit DITA Scenario dialog box.
2. Open the Parameters tab and set a value for the following parameters:
   - `webhelp.sitemap.base.url` - The URL of the location where your WebHelp system is deployed.  
     *Note:* This parameter is required for Oxygen XML Author to generate the `sitemap.xml` file.
   - `webhelp.sitemap.change.frequency` - How frequently the WebHelp pages are likely to change (accepted values are: always, hourly, daily, weekly, monthly, yearly, and never).
   - `webhelp.sitemap.priority` - The priority of each page (value ranging from 0.0 to 1.0).
3. Run the transformation scenario.
4. Look for the `sitemap.xml` file in the transformation's output folder. Edit the file to fine-tune the parameters of each page, according to your needs.

How to Index Japanese Content

To optimize the indexing of Japanese content in WebHelp pages, the Lucene Kuromoji Japanese analyzer can be used. This analyzer is included in the Oxygen XML Editor/Author installation kit.

Using a Publishing Template

To add a logo in the title area of your WebHelp output using an Oxygen Publishing Template (on page 1508), follow this procedure:

1. If you haven’t already created a Publishing Template, see Working with Publishing Templates (on page 1551).
2. Open the template descriptor file (on page 1511) associated with your publishing template and add the `default.language` parameter in the parameters section with its value set to `ja-jp`.

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <parameters>
      <parameter name="default.language" value="ja-jp"/>
    </parameters>
  </webhelp>
  ...
</publishing-template>
```
3. Open the DITA Map WebHelp Responsive transformation scenario.
4. Click the Choose Custom Publishing Template link and select your template.
5. Click OK to save the changes to the transformation scenario.
6. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To activate the Japanese indexing in your WebHelp output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Edit a DITA to WebHelp transformation scenario and in the Parameters tab, set the value of the default.language parameter to ja-jp.

    Note: Alternatively, you could set the xml:lang attribute on the root of the DITA map (on page 2793) and the referenced topics to ja-jp. Another alternative for DITA output is to use the webhelp.search.japanese.dictionary parameter to specify a path to a Japanese dictionary that will be used by the Kuromoji morphological engine (note that the encoding for the dictionary must be UTF8).

2. Run the WebHelp transformation scenario to generate the output.

Localization

This section contains topics that explain how to use the localization support in WebHelp Responsive output.

How to Localize Email Notifications of Feedback System

The feedback-enabled WebHelp Responsive systems use emails to notify users when comments are posted. These emails are based on templates stored in the WebHelp directory. The default messages are in English, French, German, and Japanese. These messages are copied into the WebHelp system deployment directory during the execution of the corresponding transformation scenario.

Using a Publishing Template

To change the language of the emails for DITA Map WebHelp Responsive with Feedback output using an Oxygen Publishing Template (on page 1508), follow this procedure:

1. Create the following directory:
2. Copy all English template files from `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\oxygen-webhelp\resources\php\templates\en` and paste them into the directory you just created.

3. Edit the HTML files from the `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\oxygen-webhelp\resources\php\templates\nl` directory and translate the content into your language.

4. Open the template descriptor file *(on page 1511)* associated with your publishing template and add the `default.language` parameter in the `parameters` section with its value set to the appropriate language code (for example, `nl` for Dutch).

   ![Note](image)

   **Note:** If you set the parameter to a value such as `LanguageCode-CountryCode` (for example, `en-us`), the transformation scenario will only use the language code.

   ```xml
   <publishing-template>
     ...
     <webhelp>
       ...
       <parameters>
         <parameter name="default.language" value="nl"/>
       </parameters>
     </webhelp>
   </publishing-template>
   ```

5. Open the *DITA Map WebHelp Responsive* transformation scenario.
6. Click the Choose Custom Publishing Template link and select your template.
7. Click **OK** to save the changes to the transformation scenario.
8. Run the transformation scenario.

### Using a Transformation Scenario in Oxygen XML Editor/Author

To change the language of the emails for DITA Map WebHelp Responsive with Feedback output using a transformation scenario from within *Oxygen XML Editor/Author*, follow this procedure:

1. Create the following directory:

   ```plaintext
   DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\oxygen-webhelp\resources\php\templates\nl
   ```

2. Copy all English template files from `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\oxygen-webhelp\resources\php\templates\en` and paste them into the directory you just created.
3. Edit the HTML files from the DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\oxygen-webhelp\resources\php\templates\nl directory and translate the content into your language.

4. Edit a DITA Map WebHelp Responsive transformation scenario and open the Parameters tab.

5. In the Parameters tab, look for the default.language parameter and set its value to the appropriate language code (for example, nl for Dutch).

   **Note:** If you set the parameter to a value such as LanguageCode-CountryCode (for example, en-us), the transformation scenario will only use the language code.

6. Run the transformation scenario.

**How to Localize the Interface of WebHelp Responsive Output**

Static labels used in the WebHelp output are stored in translation files that have the strings-lang1-lang2.xml name format, where lang1 and lang2 are ISO language codes. For example, the US English labels are kept in the strings-en-us.xml file.

These translation files are collected from two locations:

- **DITA-OT-DIR/xsl/common** folder - DITA-OT's default translations (generated text for note, fig, and table elements).
- **DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/resources/localization** folder - These translations are contributed by the WebHelp plugin and extend the default ones provided by DITA-OT. The labels defined in this folder take precedence over the DITA-OT defaults.

There are two major reasons you may want to use modify the translation files: to modify the existing strings or to translate to a new language.

---

**Related Information:**

- How to Index Japanese Content *(on page 1587)*

- Customizing Generated Text
Modifying the Existing Strings

To modify the generated text for WebHelp transformations, you need to create a DITA-OT extension plugin that uses the dita.xsl.messages extension point. The following procedure is for changing English labels, but you can adapt it for any language:

1. Create a com.oxygenxml.webhelp.localization plugin directory inside the DITA-OT-DIR/plugins/ location.
2. Create a plugin.xml file inside that com.oxygenxml.webhelp.localization directory with the following content:

```xml
<plugin id="com.oxygenxml.webhelp.localization">
  <require plugin="com.oxygenxml.webhelp.classic"/>
  <require plugin="com.oxygenxml.webhelp.responsive"/>
  <feature extension="dita.xsl.strings" file="webhelp-extension-strings.xml"/>
</plugin>
```

3. Create a webhelp-extension-strings.xml file with the following content:

```xml
<langlist>
  <lang xml:lang="en" filename="strings-en-us.xml"/>
  <lang xml:lang="en-us" filename="strings-en-us.xml"/>
</langlist>
```

4. Copy the strings you want to change from the translation files (on page 1590) to the strings-en-us.xml file. Make sure you leave the name attribute unchanged because this is the key used to look up the string. A sample content might be:

```xml
<strings xml:lang="en-US">
  <str name="Figure">Fig</str>
  <str name="Draft comment">ADDRESS THIS DRAFT COMMENT</str>
</strings>
```

5. Use the Run DITA-OT Integrator transformation scenario (on page 1283) found in the DITA Map section in the Configure Transformation Scenario(s) dialog box (on page 1378).

Adding a New Language

To add a new language for WebHelp transformations, you need to create a DITA-OT extension plugin that uses the dita.xsl.messages extension point. The following sample procedure is for adding translation files for the Polish language, but you can adapt it for any language:
1. Create a `com.oxygenxml.webhelp.localization` plugin directory inside the `DITA-OT-DIR/plugins/` location.

2. Create a `plugin.xml` file inside that `com.oxygenxml.webhelp.localization` directory with the following content:

   ```xml
   <plugin id="com.oxygenxml.webhelp.localization">
     <require plugin="com.oxygenxml.webhelp.classic"/>
     <require plugin="com.oxygenxml.webhelp.responsive"/>
     <feature extension="dita.xsl.strings" file="webhelp-extension-strings.xml"/>
   </plugin>
   ```

3. Create a `webhelp-extension-strings.xml` file with the following content:

   ```xml
   <langlist>
     <lang xml:lang="pl" filename="strings-pl-pl.xml"/>
     <lang xml:lang="pl-PL" filename="strings-pl-pl.xml"/>
   </langlist>
   ```

5. In the `strings-pl-pl.xml` file, change the `@xml:lang` attribute on the root element that conforms with the new language.

   ```xml
   <strings xml:lang="pl-PL">
     ...
   </strings>
   ```

6. Translate the content of each `<str>` element (make sure to leave the `name` attribute unchanged).

   ```xml
   <strings xml:lang="pl-PL">
     ...
     <str name="webhelp.content" js="true" php="false">Polish translation for "Content".</str>
     <str name="webhelp.search" js="true" php="false">Polish translation for "Search"</str>
     ...
   </strings>
   ```

7. Copy the common DITA-OT strings defined in the `DITA-OT-DIR/xsl/common/strings-en-us.xml` file. It defines a set generated text available for HTML-based transformations (such as `note`, `fig`, and `table` elements). Translate the content of each `<str>` element.

   ```xml
   <strings xml:lang="pl-PL">
     ...
   </strings>
   ```
8. Use the Run DITA-OT Integrator transformation scenario (on page 1283) found in the DITA Map section in the Configure Transformation Scenario(s) dialog box (on page 1378).

How to Activate Support for Right-to-Left (RTL) Languages

To activate support for RTL (right-to-left) languages in WebHelp output, edit the DITA map (on page 2793) and set the xml:lang attribute on its root element (`map`). The corresponding attribute value can be set for following RTL languages:

- ar-eg - Arabic
- he-il - Hebrew
- ur-pk - Urdu

Integrating Social Media and Google Tools in the WebHelp Output

This section contains topics that explain how to integrate some of the most popular social media sites in WebHelp output.

How to Add a Facebook Like Button in WebHelp Responsive Output

It is possible to integrate Facebook into your WebHelp Responsive output and you can specify where you want the widget to appear in your WebHelp page.

Using a Publishing Template

To add a Facebook Like widget to your WebHelp output using an Oxygen Publishing Template (on page 1508), follow this procedure:

1. Go to the Facebook Developers website.
2. Fill in the displayed form, then click the Get Code button.
3. Copy the two code snippets and paste them into a `<div>` element inside an XML file called `facebook-widget.xml`. Make sure you follow these rules:

- The file must be well-formed.
- The code for each `<script>` element must be included in an XML comment.
- The start and end tags for the XML comment must be on a separate line.

The content of the XML file should look like this:

```xml
<div id="facebook">
  <div id="fb-root"/>
  <script>
    <!--
    (function(d, s, id) {
      var js, fjs = d.getElementsByTagName(s)[0];
      if (d.getElementById(id)) return;
      js = d.createElement(s); js.id = id;
      js.src = '//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0';
      fjs.parentNode.insertBefore(js, fjs);
    })(document, 'script', 'facebook-jssdk');
    -->
    <div class="fb-like" data-layout="standard" data-action="like"
     data-show-faces="true" data-share="true"/>
  </script>
</div>
```

4. Open the template descriptor file (on page 1511) associated with your publishing template.
5. Use one of the parameters that begin with `webhelp.fragment` (on page 1518) in the `html-fragments` section of the descriptor file. Set the value of that parameter to reference the `facebook-widget.xml` file that you created earlier.

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <html-fragments>
      <fragment
        file="HTML-fragments/facebook-widget.xml"
        placeholder="webhelp.fragment.after.toc_or_tiles"/>
    </html-fragments>
  </webhelp>
</publishing-template>
```

6. Open the DITA Map WebHelp Responsive transformation scenario.
7. Click the Choose Custom Publishing Template link and select your template.
8. Click **OK** to save the changes to the transformation scenario.
9. Run the transformation scenario.

**Using a Transformation Scenario in Oxygen XML Editor/Author**

To add a Facebook *Like* widget to your WebHelp output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Go to the Facebook Developers website.
2. Fill in the displayed form, then click the **Get Code** button.
3. Copy the two code snippets and paste them into a `<div>` element inside an XML file called `facebook-widget.xml`. Make sure you follow these rules:
   - The file must be well-formed.
   - The code for each `<script>` element must be included in an XML comment.
   - The start and end tags for the XML comment must be on a separate line.

   The content of the XML file should look like this:

   ```xml
   <div id="facebook">
     <div id="fb-root"/>
     <script>
       <!--
       (function(d, s, id) {
           var js, fjs = d.getElementsByTagName(s)[0];
           if (d.getElementById(id)) return;
           js = d.createElement(s); js.id = id;
           js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
           fjs.parentNode.insertBefore(js, fjs);
       }(document, 'script', 'facebook-jssdk'));
     //-->
     <div class="fb-like" data-layout="standard" data-action="like"
         data-show-faces="true" data-share="true"/>
   </div>
   
   <div id="facebook">
   
   </div>
   ```

4. Edit the **DITA Map WebHelp Responsive** transformation scenario and choose a template.
5. Switch to the **Parameters** tab. Depending on where you want to display the button, edit one of the parameters that begin with `webhelp.fragment` *(on page 1518)*. Set that parameter to reference the `facebook-widget.xml` file that you created earlier.
6. Click **Ok** and run the transformation scenario.
How to Add a Google+ Button in WebHelp Responsive Output

It is possible to integrate Google into your WebHelp Responsive output and you can specify where you want the widget to appear in your WebHelp page.

Using a Publishing Template

To add a Google+ widget to your WebHelp Responsive output using an Oxygen Publishing Template (on page 1508), follow this procedure:

1. Go to the Google Developers website.
2. Fill in the displayed form. The preview area on the right side displays the code and a preview of the widget.
3. Copy the code snippet displayed in the preview area and paste it into a div element inside an XML file called google-plus-button.xml. Make sure that the content of the file is well-formed. The content of the XML file should look like this:

   ```xml
   <div id="google-plus">
     <!-- Place this tag in your head or just before your close body tag. -->
     <script src="https://apis.google.com/js/platform.js" defer></script>

     <!-- Place this tag where you want the +1 button to render. -->
     <div class="g-plusone" data-annotation="inline" data-width="300"></div>
   </div>
   ```

4. Open the template descriptor file (on page 1511) associated with your publishing template.
5. Use one of the parameters that begin with webhelp.fragment (on page 1518) in the html-fragments section of the descriptor file. Set the value of that parameter to reference the google-plus-button.xml file that you created earlier.

   ```xml
   <publishing-template>
     ...
     <webhelp>
       ...
       <html-fragments>
         <fragment
           file="HTML-fragments/google-plus-button.xml"
           placeholder="webhelp.fragment.after.toc_or_tiles"/>
         </html-fragments>
       </webhelp>
   </publishing-template>
   ```

6. Open the DITA Map WebHelp Responsive transformation scenario.
7. Click the Choose Custom Publishing Template link and select your template.
8. Click OK to save the changes to the transformation scenario.
Using a Transformation Scenario in Oxygen XML Editor/Author

To add a Google+ widget to your WebHelp Responsive output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Go to the Google Developers website.
2. Fill in the displayed form. The preview area on the right side displays the code and a preview of the widget.
3. Copy the code snippet displayed in the preview area and paste it into a div element inside an XML file called google-plus-button.xml. Make sure that the content of the file is well-formed. The content of the XML file should look like this:

```xml
<div id="google-plus">
  <!-- Place this tag in your head or just before your close body tag. -->
  <script src="https://apis.google.com/js/platform.js" async defer></script>
  <!-- Place this tag where you want the +1 button to render. -->
  <div class="g-plusone" data-annotation="inline" data-width="300"></div>
</div>
```
4. Edit the DITA Map WebHelp Responsive transformation scenario and choose a template.
5. Switch to the Parameters tab. Depending on where you want to display the button, edit one of the parameters that begin with webhelp.fragment (on page 1518). Set that parameter to reference the google-plus-button.xml file that you created earlier.
6. Click Ok and run the transformation scenario.

How to Add Tweet Button in WebHelp Responsive Output

It is possible to integrate Twitter into your WebHelp Responsive output and you can specify where you want the widget to appear in your WebHelp page.

Using a Publishing Template

To add a Twitter Tweet widget to your WebHelp Responsive output using an Oxygen Publishing Template (on page 1508), follow this procedure:

1. Go to the Tweet button generator page.
2. Fill in the displayed form. The Preview and code area displays the code that you will need.
3. Copy the code snippet displayed in the Preview and code area and paste it into a div element inside an XML file called tweet-button.xml. Make sure you follow these rules:
• The file must be well-formed.
• The code for each `script` element must be included in an XML comment.
• The start and end tags for the XML comment must be on a separate line.

The content of the XML file should look like this:

```xml
<div id="twitter">
  <a href="https://twitter.com/share" class="twitter-share-button">Tweet</a>
  <script>
    <!--
    !function (d, s, id) {
      var js, fjs = d.getElementsByTagName(s)[0], p = /^http:/.test(d.location) ? 'http': 'https';
      if (! d.getElementById(id)) {
        js = d.createElement(s);
        js.id = id;
        js.src = p + '://platform.twitter.com/widgets.js';
        fjs.parentNode.insertBefore(js, fjs);
      }
    }
    (document, 'script', 'twitter-wjs');
    -->
  </script>
</div>
```

4. Open the template descriptor file (on page 1511) associated with your publishing template.
5. Use one of the parameters that begin with `webhelp.fragment` (on page 1518) in the `html-fragments` section of the descriptor file. Set the value of that parameter to reference the `tweet-button.xml` file that you created earlier.

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <html-fragments>
      <fragment file="HTML-fragments/tweet-button.xml" placeholder="webhelp.fragment.after.toc_or_tiles"/>
    </html-fragments>
  </webhelp>
</publishing-template>
```

6. Open the DITA Map WebHelp Responsive transformation scenario.
7. Click the **Choose Custom Publishing Template** link and select your template.
8. Click **OK** to save the changes to the transformation scenario.
9. Run the transformation scenario.

**Using a Transformation Scenario in Oxygen XML Editor/Author**

To add a Twitter *Tweet* widget to your WebHelp Responsive output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Go to the **Tweet button generator** page.
2. Fill in the displayed form. The **Preview and code** area displays the code that you will need.
3. Copy the code snippet displayed in the **Preview and code** area and paste it into a `div` element inside an XML file called `tweet-button.xml`. Make sure you follow these rules:
   - The file must be well-formed.
   - The code for each `script` element must be included in an XML comment.
   - The start and end tags for the XML comment must be on a separate line.

The content of the XML file should look like this:

```xml
<div id="twitter">
    <a href="https://twitter.com/share" class="twitter-share-button">Tweet</a>
    <script>
        !function (d, s, id) {
            var js, fjs = d.getElementsByTagName(s)[0], p = /^http:/.test(d.location) ? 'http' : 'https';
            if (!d.getElementById(id)) {
                js = d.createElement(s);
                js.id = id;
                js.src = p + '//platform.twitter.com/widgets.js';
                fjs.parentNode.insertBefore(js, fjs);
            }
        }
        (document, 'script', 'twitter-wjs');
    </script>
</div>
```

4. Edit the **DITA Map WebHelp Responsive** transformation scenario and choose a **template**.
5. Switch to the **Parameters** tab. Depending on where you want to display the button, edit **one of the parameters that begin with `webhelp.fragment`**. Set that parameter to reference the `tweet-button.xml` file that you created earlier.

6. Click **Ok** and run the transformation scenario.

---

**How to Integrate Google Analytics in WebHelp Responsive Output**

You can use **Google Analytics** to track and report site data for your **WebHelp Responsive** output.

**Using a Publishing Template**

To integrate **Google Analytics** into your WebHelp Responsive output using an **Oxygen Publishing Template** (on page 1508), follow this procedure:

1. Create a new **Google Analytics account** (if you do not already have one) and log on.
2. Choose the Analytics solution that best fits the needs of your website.
3. Follow the on-screen instructions to obtain a **Tracking Code** that contains your **Tracking ID**. A **Tracking Code** looks like this:

   ```html
   <script>
   (function(i,s,o,g,r,a,m){i['GoogleAnalyticsObject']=r;i[r]=i[r]||function(){
   (i[r].q=i[r].q||[]).push(arguments)},i[r].l=1*new Date();a=s.createElement(o),
m=s.getElementsByTagName(o)[0];a.async=1;a.src=g;m.parentNode.insertBefore(a,m)
   })(window,document,'script','//www.google-analytics.com/analytics.js','ga');

ga('create', 'UA-XXXXXXXX-X', 'auto');
ga('send', 'pageview');
</script>
   ```

4. Save the Tracking Code (obtained in the previous step) in a new XML file called `googleAnalytics.xml`. Note that the file should only contain the tracking code.

5. Open the **template descriptor file** (on page 1511) associated with your publishing template.

6. Use the **webhelp.fragment.after.body** parameter (on page 1621) in the **html-fragments** section of the descriptor file. Set the value of that parameter to reference the `googleAnalytics.xml` file that you created earlier. The content of this file will be copied at the end of all generated output pages, right before the ending `<body>` element. This ensures that the page is loaded before the Google Analytics servers are contacted, thus reducing page loading time.
7. Open the **DITA Map WebHelp Responsive** transformation scenario.
8. Click the **Choose Custom Publishing Template** link and select your template.
9. Click **OK** to save the changes to the transformation scenario.
10. Run the transformation scenario.

**Using a Transformation Scenario in Oxygen XML Editor/Author**

To integrate **Google Analytics** into your WebHelp Responsive output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Create a new **Google Analytics account** (if you do not already have one) and log on.
2. Choose the Analytics solution that best fits the needs of your website.
3. Follow the on-screen instructions to obtain a **Tracking Code** that contains your **Tracking ID**. A **Tracking Code** looks like this:

   ```html
   <script>
   (function(i,s,o,g,r,a,m){i['GoogleAnalyticsObject']=r;i[r]=i[r]||function(){
   (i[r].q=i[r].q||[]).push(arguments)},i[r].l=1*new Date();a=s.createElement(o),m=s.getElementsByTagName(o)[0];a.async=1;a.src=g;m.parentNode.insertBefore(a,m)
   })(window,document,'script','//www.google-analytics.com/analytics.js','ga');

   ga('create', 'UA-XXXXXXXX-X', 'auto');
   ga('send', 'pageview');
   </script>
   ```

4. Save the Tracking Code (obtained in the previous step) in a new XML file called **googleAnalytics.xml**. Note that the file should only contain the tracking code.
5. Edit the **DITA Map WebHelp Responsive** transformation scenario and choose a **template**.
6. Switch to the **Parameters** tab. Edit the **webhelp.fragment.after.body** parameter (on page 1621) and set it to reference the **googleAnalytics.xml** file that you created earlier. The content of this file will be copied at the end of all generated output pages, right before the ending `<body>` element. This ensures that the page is loaded before the Google Analytics servers are contacted, thus reducing page loading time.
7. Click **Ok** and run the transformation scenario.
How to Integrate Google Search in WebHelp Responsive Output

It is possible to integrate the Google Search Engine into your WebHelp Responsive output and you can specify where you want the results to appear in your WebHelp page.

Using a Publishing Template

To integrate the Google Search Engine into your WebHelp Responsive output using an Oxygen Publishing Template (on page 1508), follow this procedure:

1. Go to the Google Custom Search Engine page using your Google account.
2. Select the Create a custom search engine button.
3. Follow the on-screen instructions to create a search engine for your site. At the end of this process you should obtain a code snippet that looks like this:

   ```html
   <script>
   (function() {
     var cx = '00088821088975888983:8mn4x_mf-yg';
     var gcse = document.createElement('script');
     gcse.type = 'text/javascript';
     gcse.async = true;
     var s = document.getElementsByTagName('script')[0];
     s.parentNode.insertBefore(gcse, s);
   })();
   </script>
   ```

4. Save the script into a well-formed HTML file called googlecse.html.
5. Open the template descriptor file (on page 1511) associated with your publishing template and add the webhelp.google.search.script parameter in the parameters section with its value set to reference the googlecse.html file that you created earlier.

   ```xml
   <publishing-template>
     ...
   <webhelp>
     ...
   <parameters>
     <parameter name="webhelp.google.search.script" value="resources/googlecse.html"/>
   </parameters>
   </publishing-template>
   ```
6. You can also use the webhelp.google.search.results parameter to choose where to display the search results.
   a. Create an HTML file with the following content:
      ```html
      <div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>
      ```
      (you must use the HTML5 version for the GCSE). For more information about other supported attributes, see Google Custom Search: Supported Attributes.
   b. Set the value of the webhelp.google.search.results parameter to the file path of the file you just created. If this parameter is not specified, the following code is used:
      ```html
      <div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>
      ```

7. Open the DITA Map WebHelp Responsive transformation scenario.
8. Click the Choose Custom Publishing Template link and select your template.
9. Click OK to save the changes to the transformation scenario.
10. Run the transformation scenario.

### Using a Transformation Scenario in Oxygen XML Editor/Author

To integrate the Google Search Engine into your WebHelp Responsive output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Go to the Google Custom Search Engine page using your Google account.
2. Select the Create a custom search engine button.
3. Follow the on-screen instructions to create a search engine for your site. At the end of this process you should obtain a code snippet that looks like this:

```html
<script>
(function() {
  var cx = '000888210889775888983:8mn4x_mf-yg';
  var gcse = document.createElement('script');
  gcse.type = 'text/javascript';
  gcse.async = true;
  var s = document.getElementsByTagName('script')[0];
  s.parentNode.insertBefore(gcse, s);
})();
</script>
```
4. Save the script into a well-formed HTML file called `googlecse.html`.

5. Edit the DITA Map WebHelp Responsive transformation scenario and choose a template.

6. Switch to the Parameters tab and edit the `webhelp.google.search.script` parameter to reference the `googlecse.html` file that you created earlier.

7. You can also use the `webhelp.google.search.results` parameter to choose where to display the search results.
   a. Create an HTML file with the following content:
      ```html
      <div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>
      ```
      (you must use the HTML5 version for the GCSE). For more information about other supported attributes, see Google Custom Search: Supported Attributes.
   b. Set the value of the `webhelp.google.search.results` parameter to the file path of the file you just created. If this parameter is not specified, the following code is used:
      ```html
      <div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>
      ```

8. Click Ok and run the transformation scenario.

### XSLT Extensions for WebHelp Responsive Transformations

Since WebHelp Responsive output is primarily obtained by running XSLT transformations over the DITA input files, one customization method would be to override the default XSLT templates that are used by the WebHelp Responsive transformations.

There are two methods available to override the XSLT stylesheets implied by the WebHelp Responsive transformation.

- Use XSLT-import extension points from an Oxygen Publishing Template.(on page 2797).

  **Note:** Use this method if you want to affect only the transformations that use this publishing template.

- Use XSLT-import extension points from a DITA-OT extension plugin.

  **Note:** This method will affect all the outputs generated with the WebHelp system.

**Related Information:**

- WebHelp Responsive XSLT-Import and XSLT-Parameter Extension Points (on page 1626)

**How to Use XSLT Extension Points from a Publishing Template**

This example demonstrates how to use WebHelp XSLT-import Extension Points from an Oxygen Publishing Template (on page 1637).
Use Case 1: Add Copyright Information Extracted from a DITA Bookmap

Suppose you want to customize the WebHelp Responsive main page by adding information about the legal rights associated with the book in the footer (for example, copyright dates and owner). This information is specified in the bookmap:

```xml
<bookrights>
  <copyrfirst>
    <year>2002</year>
  </copyrfirst>
  <copyrlast>
    <year>2017</year>
  </copyrlast>
  <bookowner>
    <organization>SyncRO Soft SRL</organization>
  </bookowner>
</bookrights>
```

Figure 421. Example: Copyright information added in the WebHelp footer

The XSLT stylesheet that generates the main page is located in: `DITA-OT-DIR.plugins\com.oxygenxml.webhelp.responsive\xsl\mainFiles\createMainPage.xsl`. This XSLT stylesheet declares the `copy_template` mode that processes the main page template (on page 1526) to expand its components. The main page template declares a component for the footer section that looks like this:

```html
<div class="footer-container text-center">
  <whc:include_html href="${webhelp.fragment.footer}"/>
</div>
```

In the following example, the extension stylesheet will add a template that matches this component. It applies the default processing and adds the copyright information at the end.

```xml
<xsl:template match="*:div[contains(@class, 'footer-container')]" mode="copy_template">
  <!-- Apply the default processing -->
```
To add this functionality using a Oxygen Publishing Template, follow these steps:

1. If you haven't already created a Publishing Template, see Working with Publishing Templates (on page 1551).
2. Link the folder associated with the publishing template to your current project in the **Project** view. You should have the `custom_footer_template` folder linked in your project.

3. Using the **Project** view, create an `xslt` folder inside the project root folder. You should have the `custom_footer_template/xsl` folder in your project.

4. Create your customization stylesheet (for example, `custom_mainpage.xsl`) in the `custom_footer_template/xsl` folder. Edit it to override the template that produces the footer section:

```xml
<xsl:template match="*:div[contains(@class, 'footer-container')]" mode="copy_template">
    <!-- Apply the default processing -->
    <xsl:next-match/>

    <!-- Add a div containing the copyright information -->
    <div class="copyright_info">
        <xsl:choose>
            <!-- Adds the start-end years if they are defined -->
            <xsl:when test="exists($toc/*/topicmeta/*:bookrights/*:copyrfirst) and exists($toc/*/topicmeta/*:bookrights/*:copyrlast)">
                <span class="copyright_years">
                    ©<xsl:value-of select="$toc/*/topicmeta/*/bookrights/*:copyrfirst"/>
                    -<xsl:value-of select="$toc/*/topicmeta/*/bookrights/*:copyrlast"/>
                </span>
            </xsl:when>
            <!-- Adds only the first year if last is not defined. -->
            <xsl:when test="exists($toc/*/topicmeta/*/bookrights/*/copyrfirst)">
                <span class="copyright_years">
                    ©<xsl:value-of select="$toc/*/topicmeta/*/bookrights/*/copyrfirst"/>
                </span>
            </xsl:when>
        </xsl:choose>
        <xsl:if test="exists($toc/*/topicmeta/*/bookowner/*:organization)">
            <span class="organization">
            </span>
        </xsl:if>
    </div>
</xsl:template>
```
5. Open the template descriptor file (on page 1511) associated with your publishing template and set the XSLT stylesheet created in previous step with the com.oxygenxml.webhelp.xsl.createMainPage XSLT extension point.

6. Open the DITA Map WebHelp Responsive transformation scenario.

7. Click the Choose Custom Publishing Template link and select your template.

8. Click OK to save the changes to the transformation scenario.

9. Run the transformation scenario.

Use Case 2: Add generation time in the output footer

Another possible customization for the main page is to add the generation time in its footer. A transformation parameter is used to control whether or not this customization is active.

Figure 422. Generation time added in the WebHelp footer

To add this functionality, follow these steps:
1. In the customization stylesheet that you just created (for example, `custom_mainpage.xsl`), modify the template by adding the following XSLT code at the end.

```xml
<xsl:if test="oxyf:getParameter('webhelp.footer.add.generation.time') = 'yes'">
  <div class="generation_time">
    Generation date: <xsl:value-of select="format-dateTime(" current-dateTime(), 
      '[h1]:[m01] [P] on [M01]/[D01]/[Y0001].'="/">
  </div>
</xsl:if>
```

**Note:** You can read the value of a WebHelp transformation parameter from your XSLT extension stylesheets by using the `getParameter(param.name)` function from the `http://www.oxygenxml.com/functions` namespace.

2. Open the template descriptor file (on page 1511) associated with your publishing template and set the `webhelp.footer.add.generation.time` parameter to the default value.

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <parameters>
      <parameter
        name="webhelp.footer.add.generation.time"
        value="yes"/>
    </parameters>
  </webhelp>
  ...
</publishing-template>
```

3. Open the DITA Map WebHelp Responsive transformation scenario.

4. In the Parameters tab, you can change the value of the `webhelp.footer.add.generation.time` parameter.

5. Click OK to save the changes to the transformation scenario.

6. Run the transformation scenario.

**How to Use XSLT Extension Points from a DITA-OT Plugin**

In this example, the main page footer is modified by adding copyright information extracted from the DITA bookmap or by adding the output generation time. The first use-case uses an XSLT-Import extension point while the second uses an XSLT-Parameter extension point.
Note: This customization is available as a GitHub project at: https://github.com/oxygenxml/com.oxygenxml.webhelp.responsive.custom.footer.

Use Case 1: WebHelp XSLT-Import extension point to add copyright information extracted from a DITA Bookmap

Suppose you want to customize the WebHelp Responsive main page by adding information about the legal rights associated with the book in the footer (for example, copyright dates and owner). This information is specified in the bookmap:

```xml
<bookrights>
    <copyrfirst>
        <year>2002</year>
    </copyrfirst>
    <copyrlast>
        <year>2017</year>
    </copyrlast>
    <bookowner>
        <organization>SyncRO Soft SRL</organization>
    </bookowner>
</bookrights>
```

Figure 423. Example: Copyright information added in the WebHelp footer

The XSLT stylesheet that generates the main page is located in: DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\mainFiles\createMainPage.xsl. This XSLT stylesheet declares the `copy_template` mode that processes the main page template to expand its components. The main page template (on page 1526) declares a component for the footer section that looks like this:

```xml
<div class="footer-container text-center">
    <whc:include_html href="${webhelp.fragment.footer}"/>
</div>
```
In the following example, the extension stylesheet will add a template that matches this component. It applies the default processing and adds the copyright information at the end.

```xml
<xsl:template match="*:div[contains(@class, 'footer-container')]
 mode="copy_template">
  <!-- Apply the default processing -->
  <xsl:next-match/>

  <!-- Add a div containing the copyright information -->
  <div class="copyright_info">
    <xsl:choose>
      <!-- Adds the start-end years if they are defined -->
      <xsl:when test="exists($toc/*:topicmeta/*:bookrights/*:copyrfirst) and exists($toc/*:topicmeta/*:bookrights/*:copyrlast)">
        <span class="copyright_years">
          ©<xsl:value-of select="$toc/*:topicmeta/*:bookrights/*/copyrfirst"/>
          -<xsl:value-of select="$toc/*:topicmeta/*:bookrights/*/copyrlast"/>
        </span>
      </xsl:when>

      <!-- Adds only the first year if last is not defined. -->
      <xsl:when test="exists($toc/*:topicmeta/*:bookrights/*:copyrfirst)">
        <span class="copyright_years">
          ©<xsl:value-of select="$toc/*:topicmeta/*:bookrights/*/copyrfirst"/>
        </span>
      </xsl:when>
    </xsl:choose>

    <!-- Adds the book owner -->
    <xsl:if test="exists($toc/*:topicmeta/*:bookrights/*:bookowner/*:organization)">
      <span class="organization">
        <xsl:text>©</xsl:text>
        <xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:bookowner/*:organization"/>
        . All rights reserved.</xsl:value-of>
      </span>
    </xsl:if>
  </div>
</xsl:template>
```
You can implement this functionality with a WebHelp extension plugin that uses the com.oxygenxml.webhelp.xsl.createMainPage extension point (on page 1628). This extension point allows you to specify a customization stylesheet that will override the template described above.

To add this functionality as a DITA-OT plugin, follow these steps:

1. In the DITA-OT-DIR\plugins\ folder, create a folder for this plugin (for example, com.oxygenxml.webhelp.responsive.custom.footer).

2. Create a plugin.xml file (in the folder you created in step 1) that specifies the extension point and your customization stylesheet. For example:

   ```xml
   <plugin id="com.oxygenxml.webhelp.responsive.custom.footer">
     <feature extension="com.oxygenxml.webhelp.xsl.createMainPage">
       file="custom_mainpage.xsl"/>
   </plugin>
   ```

3. Create your customization stylesheet (for example, custom_mainpage.xsl), and edit it to override the template that produces the footer section:

   ```xml
   <xsl:template match="*:div[contains(@class, 'footer-container')]" mode="copy_template">
     <!-- Apply the default processing -->
     <xsl:next-match/>
   </xsl:template>

   <!-- Add a div containing the copyright information -->
   <div class="copyright_info">
     <xsl:choose>
       <!-- Adds the start-end years if they are defined -->
       <xsl:when test="exists($toc/*:topicmeta/*:bookrights/*:copyrfirst) and exists($toc/*:topicmeta/*:bookrights/*:copyrlast)">
         <span class="copyright_years">
           ©<xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrfirst"/>
           -<xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrlast"/>
         </span>
       </xsl:when>
       <!-- Adds only the first year if last is not defined. -->
       <xsl:when test="exists($toc/*:topicmeta/*:bookrights/*:copyrfirst)">
         <span class="copyright_years">
           ©<xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrfirst"/>
         </span>
       </xsl:when>
     </xsl:choose>
   </div>
   ```
4. Use the Run DITA-OT Integrator transformation scenario (on page 1283) found in the DITA Map section in the Configure Transformation Scenario(s) dialog box (on page 1378).

5. Run a DITA Map WebHelp Responsive transformation scenario to obtain the customized side TOC.

**Use-Case 2: WebHelp XSLT-Parameter extension point to control if generation time is displayed in the output**

Another possible customization for the main page is to add the generation time in its footer. You can use an XSLT-Parameter extension point to control whether or not this customization is active. In this case, you can use the `com.oxygenxml.webhelp.xsl.createMainPage.param` extension point (on page 1628).

Figure 424. Generation time added in the WebHelp footer

To add this functionality, follow these steps:

1. Create a DITA-OT plugin structure by following the first 3 steps in the procedure above (on page 1609).
2. In the customization stylesheet that you just created (for example, `custom_mainpage.xsl`), declare `webhelp.footer.add.generation.time` as a global parameter and modify the template by adding the following XSLT code at the end.
3. Edit the `plugin.xml` file to specify the `com.oxygenxml.webhelp.xsl.createMainPage.param` extension point and a custom parameter file by adding the following line:

```xml
<feature extension="com.oxygenxml.webhelp.xsl.createMainPage.param" file="params.xml"/>
```

4. Create a custom parameter file (for example, `params.xml`). It should look like this:

```xml
<dummy>
  <param name="webhelp.footer.add.generation.time" expression="${webhelp.footer.add.generation.time}" if="webhelp.footer.add.generation.time">
</dummy>
```

5. Use the Run DITA-OT Integrator transformation scenario (on page 1283) found in the DITA Map section in the Configure Transformation Scenario(s) dialog box (on page 1378).

6. Edit a DITA Map WebHelp Responsive transformation scenario and in the Parameters tab (on page 2717), specify the desired value (yes or no) for your custom parameter (`webhelp.footer.add.generation.time`).

7. Run the transformation scenario.

Miscellaneous Customization Topics

This section contains miscellaneous topics about how to customize the WebHelp Responsive output.
How to Add an Edit Link to Launch Oxygen XML Web Author

You can embed *Edit* links in the DITA WebHelp Responsive output that will automatically launch a particular document in *Oxygen XML Web Author*. A reviewer can then simply click the link and they will be redirected to the Oxygen XML Web Author editing page with that particular file open and editable.

**Using a Publishing Template**

To embed an *Edit* link in the DITA Map WebHelp Responsive output using an *Oxygen Publishing Template (on page 1508)*, follow this procedure:

1. If you haven't already created a Publishing Template, see Working with Publishing Templates (on page 1551).
2. Open the template descriptor file (on page 1511) associated with your publishing template and add the following parameters with their values set to the URLs:
   - `editlink.remote.ditamap.url` - The URL of the DITA Map suitable for opening in Oxygen XML Web Author.
   - `editlink.web.author.url` - The URL of the Oxygen XML Web Author installation.

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <parameters>
      <parameter name="editlink.remote.ditamap.url" value="webdav-https://dav.box.com/dav/my.ditamap"/>
      <parameter name="editlink.web.author.url" value="https://www.oxygenxml.com/webauthor.html"/>
    </parameters>
  </webhelp>
</publishing-template>
```

3. Open the *DITA Map WebHelp Responsive* transformation scenario.
4. Click the Choose Custom Publishing Template link and select your template.
5. Click OK to save the changes to the transformation scenario.
6. Run the transformation scenario.

**Result:** In the WebHelp output, all topics will have an *Edit* link to the right side of the title and clicking the link will launch that particular document in Oxygen XML Web Author.

For example:

- **Windows:**
Using a Transformation Scenario in Oxygen XML Editor/Author

To embed an *Edit* link in the DITA Map WebHelp Responsive output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Edit a DITA Map WebHelp Responsive transformation scenario and open the Parameters tab.
2. Set values for the following parameters:
   - `editlink.remote.ditamap.url` - The URL of the DITA Map suitable for opening in Oxygen XML Web Author.
   - `editlink.web.author.url` - The URL of the Oxygen XML Web Author installation.
3. Run the transformation scenario.

**Result:** In the WebHelp output, all topics will have an *Edit* link to the right side of the title and clicking the link will launch that particular document in Oxygen XML Web Author.

- Web Author Customization Guide: Embedding an Edit Link that will Launch Web Author

How to Flag DITA Content in WebHelp Output

Flagging content in WebHelp output involves defining a set of images that will be used for marking content across your information set.

To flag DITA content, you need to create a filter file that defines properties that will be applied on elements to be flagged. Generally, flagging is supported for *block elements (on page 2792)* (such as paragraphs), but not for phrase-level elements within a paragraph. This ensures that the images that will flag the content are easily scanned by the reader, instead of being buried in the text.
Using a Publishing Template

To flag content in DITA Map to WebHelp output using an *Oxygen Publishing Template* (on page 1508), follow this procedure:

1. Create a DITA filter file (DITAVAL) and add it in a directory of your choice (for example, named `myFile.ditaval`).
2. Define the property for the elements you want to be flagged. For example, if you want to flag any element that has the `audience` attribute set to `programmer`, the content of the DITAVAL file should look like this:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<val>
  <prop att="audience" val="programmer" action="flag"
  img="D:\resource\delta.gif" alt="sample alt text"/>
</val>
```

Note that for an element to be flagged, at least one attribute-value pair needs to have a property declared in the DITAVAL file.

3. Open the template descriptor file (on page 1511) associated with your publishing template and add the `args.filter` parameter in the `parameters` section with its value set to the path of the DITAVAL file you created.

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <parameters>
      <parameter name="args.filter" value="resources/myFile.ditaval"/>
    </parameters>
  </webhelp>
</publishing-template>
```

4. Open the **DITA Map WebHelp Responsive** transformation scenario.
5. Click the **Choose Custom Publishing Template** link and select your template.
6. Click **OK** to save the changes to the transformation scenario.
7. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To flag content in the DITA Map to WebHelp output using a transformation scenario from within *Oxygen XML Editor/Author*, follow this procedure:
1. Create a DITA filter file (DITAVAL) and add it in a directory of your choice (for example, named myFile.ditaval.

2. Define the property for the elements you want to be flagged. For example, if you want to flag any element that has the audience attribute set to programmer, the content of the DITAVAL file should look like this:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<val>
  <prop att="audience" val="programmer" action="flag" img="D:\resource\delta.gif" alt="sample alt text"/>
</val>
```

Note that for an element to be flagged, at least one attribute-value pair needs to have a property declared in the DITAVAL file.

3. Edit a DITA Map to WebHelp transformation scenario.

4. Specify the DITAVAL file in the Filters tab (with the Use DITAVAL File option).

5. Run the transformation scenario.

Related Information:

- Filtering Profiling Values with a DITAVAL File (on page 2760)

How to Deploy the Output on a SharePoint Site

Since WebHelp output must be published locally, on the same machine where the WebHelp process is running, to publish your files directly to a SharePoint library you need to map a network drive to connect to SharePoint and change your file extensions to .aspx, as described in the steps below.

Using a Script Outside of Oxygen XML Editor/Author

To publish WebHelp Responsive output on a SharePoint site using an Oxygen Publishing Template (on page 1508), follow this procedure:

1. Map a network drive to connect to your SharePoint library. For more information, see: https://support.microsoft.com/en-us/kb/2616712.

2. To allow browsers to open your published files (rather than downloading them), you need to change the file extensions from .html to .aspx.

3. Open the template descriptor file (on page 1511) associated with your publishing template and add the args.outext parameter in the parameters section with its value set to .aspx.
4. Open the DITA Map WebHelp Responsive transformation scenario.
5. Click the Choose Custom Publishing Template link and select your template.
6. Click OK to save the changes to the transformation scenario.
7. Run the transformation scenario.

### Using a Transformation Scenario in Oxygen XML Editor/Author

To publish WebHelp Responsive output on a SharePoint site using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Map a network drive to connect to your SharePoint library. For more information, see: [https://support.microsoft.com/en-us/kb/2616712](https://support.microsoft.com/en-us/kb/2616712).
2. To allow browsers to open your published files (rather than downloading them), you need to change the file extensions from .html to .aspx. Fortunately, this can be done in the transformation.
   a. Edit the WebHelp transformation scenario and open the Parameters tab.
   b. Set the args.outext parameter to .aspx.
   c. Run the transformation scenario.

### WebHelp Responsive Transformation Parameters

In addition to the common DITA-OT transformation parameters and the HTML-based Output Parameters, there are numerous other supported parameters that are specific to the WebHelp Responsive output.

#### Publishing Template Parameters

*webhelp.publishing.template*

Specifies the path to the ZIP archive (or root folder) that contains your custom WebHelp Responsive template.

Note: The built-in templates are stored in the `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/templates` folder.
Note: Relative paths are resolved based on the current working directory.

webhelp.publishing.template.descriptor

Specifies the name of the descriptor to be loaded from the WebHelp Responsive template package. If it is not specified, the first encountered descriptor will be automatically loaded.

Custom Resource Parameters

webhelp.custom.resources

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

webhelp.favicon

The file path that points to an image to be used as a favicon in the WebHelp output.

webhelp.logo.image.target.url

Specifies a target URL that is set on the logo image. When you click the logo image, you will be redirected to this address.

webhelp.logo.image

Specifies a path to an image displayed as a logo in the left side of the output header.

webhelp.logo.image.alt

Specifies a value that will be set in the alt attribute of the logo image. If the parameter is not specified, the alt attribute will contain the publication title. Note that this parameter makes sense only in conjunction with the webhelp.logo.image parameter.

Feedback-Enabled Parameters

webhelp.product.id (available only for Feedback-enabled systems)

This parameter specifies a short name for the documentation target, or product (for example, mobile-phone-user-guide, hvac-installation-guide).

Note: You can deploy documentation for multiple products on the same server.

Restriction: The following characters are not allowed in the value of this parameter: < > / \ ' { } = ; * % + &.

webhelp.product.version (available only for Feedback-enabled systems)
Specifies the documentation version number (for example, 1.0, 2.5, etc.). New user
comments are bound to this version.

Note: Multiple documentation versions can be deployed on the same server.

Restriction: The following characters are not allowed in the value of this parameter:
< > / \ ' ( ) { } = ; * % + & .

HTML Fragment Extension Parameters

webhelp.fragment.after.body
In the generated output it displays a given XHTML fragment after the page body. The
value of the parameter can be either a well-formed XHTML fragment or a path to a file
that contains a well-formed XHTML fragment.

webhelp.fragment.after.logo_and_title
In the generated output it displays a given XHTML fragment after the logo and title. The
value of the parameter can be either a well-formed XHTML fragment or a path to a file
that contains a well-formed XHTML fragment.

webhelp.fragment.after.main.page.search
In the generated output it displays a given XHTML fragment after the search field. The
value of the parameter can be either a well-formed XHTML fragment or a path to a file
that contains a well-formed XHTML fragment.

webhelp.fragment.after.toc_or_tiles
In the generated output it displays a given XHTML fragment after the table of contents
or tiles in the main page. The value of the parameter can be either a well-formed XHTML
fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.top_menu
In the generated output it displays a given XHTML fragment after the top menu. The
value of the parameter can be either a well-formed XHTML fragment or a path to a file
that contains a well-formed XHTML fragment.

webhelp.fragment.before.body
In the generated output it displays a given XHTML fragment before the page body. The
value of the parameter can be either a well-formed XHTML fragment or a path to a file
that contains a well-formed XHTML fragment.

webhelp.fragment.before.logo_and_title
In the generated output it displays a given XHTML fragment before the logo and title. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.before.main.page.search**

In the generated output it displays a given XHTML fragment before the search field. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.before.toc_or_tiles**

In the generated output it displays a given XHTML fragment before the table of contents or tiles in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.before.top_menu**

In the generated output it displays a given XHTML fragment before the top menu. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.footer**

In the generated output it displays a given XHTML fragment as the page footer. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.head**

In the generated output it inserts a given XHTML fragment in the `<head>` element. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.welcome**

In the generated output it displays a given XHTML fragment as a welcome message (or title). The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**Output Component Parameters**

**webhelp.default.collection.type.sequence**

Specifies if the **sequence** value will be used by default when the `collection-type` attribute is not specified. This option is helpful if you want to have *Next* and *Previous* navigational buttons generated for all HTML pages. Allowed values are **no** (default) and **yes**.

**webhelp.merge.nested.topics.related.links**
Specifies if the related links from nested topics will be merged with the links in the parent topic. Thus the links will be moved from the topic content to the related links component and all of the links from the same group (for example, Related Tasks, Related References, Related Information) are merged into a single group. The default value is yes.

webhelp.show.breadcrumb

Specifies if the breadcrumb component will be presented in the output. The default value is yes.

webhelp.show.changes.and.comments

When set to yes, user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is no.

webhelp.show.child.links

Specifies if child links will be generated in the output for all topics that have subtopics. The default value is no.

webhelp.show.full.size.image

Specifies if responsive images that are displayed with a smaller dimension than their original size can be clicked to see an enlarged version of the image. The default value is yes.

webhelp.show.indexterms.link

Specifies if an icon that links to the index will be presented in the output. The default value is yes.

webhelp.show.main.page.tiles

Specifies if the tiles component will be presented in the main page of the output. For a tree style layout, this parameter should be set to no.

webhelp.show.main.page.toc

Specifies if the table of contents will be presented in the main page of the output. The default value is yes.

webhelp.show.navigation.links

Specifies if navigation links will be presented in the output. The default value is yes.

webhelp.show.print.link

Specifies if a print link or icon will be presented within each topic in the output. The default value is yes.

webhelp.show.publication.toc
Specifies if a table of contents will be presented on the left side of each topic in the output. The default value is **yes**.

**webhelp.show.topic.toc**

Specifies if a topic table of contents will be presented on the right side of each topic in the output. This table of contents contains links to each `<section>` within the current topic that contains an `@id` attribute and the section corresponding to the current scroll position is highlighted. The default value is **yes**.

**webhelp.show.top.menu**

Specifies if a menu will be presented at the topic of the main page in the output. The default value is **yes**.

**webhelp.publication.toc.hide.chunked.topics**

Specifies if the table of contents will contain links for chunked topics. The default value is **yes**.

**webhelp.publication.toc.links**

Specifies which links will be included in the table of contents. The possible values are:

- **chapter** (default) - The TOC will include links for the current topic, its children, its siblings, and its direct ancestor (including the direct ancestor's siblings), and the parent chapter.
- **topic** - The TOC will only include links for the current topic and its direct children.
- **all** - The TOC will include all links.

**webhelp.publication.toc.tooltip.position**

By default, if a topic contains a `shortdesc` element, its content is displayed in a tooltip when the user hovers over its link in the table of contents. This parameter controls whether or not this tooltip is displayed and its position relative to the link. The possible values are:

- **left** (default)
- **right**
- **top**
- **bottom**
- **hidden** - The tooltip will not be displayed.

**webhelp.top.menu.depth**

Specifies the maximum depth level of the topics that will be included in the top menu. The default value is **3**. A value of **0** means that the menu has unlimited depth.

**webhelp.topic.collapsible.elements.initial.state**
Specifies the initial state of collapsible elements (tables with titles, nested topics with titles, sections with titles, index term groups). The possible values are collapsed or expanded (default value).

Search-Related Parameters

webhelp.search.japanese.dictionary
The file path of the dictionary that will be used by the Kuromoji morphological engine for indexing Japanese content in the WebHelp pages. The encoding for the dictionary must be UTF8.

webhelp.search.ranking
If this parameter is set to false then the 5-star rating mechanism is no longer included in the search results that are displayed on the Search tab (default setting is true).

webhelp.search.stop.words.exclude
Specifies a list of words that will be excluded from the default list of stop words that are filtered out before the search processing. Use comma separators to specify more than one word (for example: if,for,is).

webhelp.sitemap.base.url
Base URL for all the loc elements in the generated sitemap.xml file. The value of a loc element is computed as the relative file path from the href attribute of a topicref element from the DITA map, appended to this base URL value. The loc element is mandatory in sitemap.xml. If you leave this parameter set to its default empty value, then the sitemap.xml file is not generated.

webhelp.enable.search.autocomplete
Specifies if the Autocomplete feature is enabled in the WebHelp search text field. The default value is yes.

webhelp.search.enable.pagination
Specifies whether or not search results will be displayed on multiple pages. Allowed values are yes or no.

webhelp.search.page.numberOfItems
Specifies the number of search results items displayed on each page. This parameter is only used when the webhelp.search.enable.pagination parameter is enabled.

webhelp.sitemap.change.frequency
The value of the changefreq element in the generated sitemap.xml file. The changefreq element is optional in sitemap.xml. If you leave this parameter set to its default empty value, then the changefreq element is not added in sitemap.xml.
Allowed values: <empty string> (default), always, hourly, daily, weekly, monthly, yearly, never.

webhelp.sitemap.priority

The value of the priority element in the generated sitemap.xml file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The priority element is optional in sitemap.xml. If you leave this parameter set to its default empty value, then the priority element is not added in sitemap.xml.

webhelp.google.search.results

A file path that specifies the location of a well-formed XHTML file containing the Google Custom Search Engine element gcse:searchresults-only. You can use all supported attributes for this element. It is recommend to set the $linkTarget$ attribute to frm for frameless (iframe) version of WebHelp or to contentWin for the frameset version of WebHelp. The default value for this attribute is _blank and the search results will be loaded in a new window. If this parameter is not specified, the following code will be used: <gcse:searchresults-only linkTarget="frm"></gcse:searchresults-only>

webhelp.google.search.script

A file path that specifies the location of a well-formed XHTML file containing the Custom Search Engine script from Google.

Note: The fix.external.refs.com.oxygenxml parameter is not supported when running the transformation from a command line. This parameter is normally used to specify whether or not the application tries to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references.

• Generating WebHelp Responsive Output (on page 1544)

• Setting DITA-OT Parameters

WebHelp Responsive XSLT-Import and XSLT-Parameter Extension Points

XSLT extension points can be used from either from an Oxygen Publishing Template or from a DITA-OT extension plug-in.
Extension Points from an Oxygen Publishing Template

The publishing template allows you to specify one or more XSLT extension points. These extension points will affect only the transformations that use the particular template.

For an example of how to use these extension in a publishing template, see: How to Use a XSLT Extension Point from a Publishing Template (on page 1604) topic.

Example:

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <xslt>
      <extension
        id="com.oxygenxml.webhelp.xsl.createMainPage"
        file="xsl/customMainPage.xsl"/>
    </xslt>
  </webhelp>
</publishing-template>
```

Extension Points from a DITA-OT Extension Plug-in

The DITA-OT plug-in installer adds an XSLT import statement in the default WebHelp XSLT so that the XSLT stylesheet referenced by the extension point becomes part of the normal build. You can use these extension points to override XSLT processing steps.

Example:

```xml
<plugin id="com.oxygenxml.webhelp.responsive.extension">
  <feature extension="com.oxygenxml.webhelp.responsive.xsl.dita2webhelp"
    file="xsl/fixup.xsl"/>
</plugin>
```

XSLT-Import Extension Points

The following extension points are available:

- `com.oxygenxml.webhelp.xsl.dita2webhelp`
  Extension point to override the XSLT stylesheet (`dita2webhelp.xsl`) that produces an HTML file for each DITA topic. The location of this file is `DITA-OT_DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\dita2webhelp\dita2webhelp.xsl`
**com.oxygenxml.webhelp.xsl.createMainPage**

Extension point to override the XSLT stylesheet (createMainPage.xsl) that produces the WebHelp Responsive main HTML page (index.html). The location of this file is `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\mainFiles\createMainPage.xsl`.

**com.oxygenxml.webhelp.xsl.createNavLinks**

Extension point to override the XSLT stylesheets that are used to generate navigation links in the WebHelp Responsive pages. These stylesheets can be found in the navLinks folder: `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\navLinks`.

**com.oxygenxml.webhelp.xsl.createSearchPage**

Extension point to override the XSLT stylesheet (createSearchPage.xsl) that produces the WebHelp Responsive search HTML page (search.html). The location of this file is `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\mainFiles\createSearchPage.xsl`.

**com.oxygenxml.webhelp.xsl.createIndexTermsPage**

Extension point to override the XSLT stylesheet (createIndexTermsPage.xsl) that produces the WebHelp Responsive index terms HTML page (indexterms.html). The location of this file is `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\mainFiles\createIndexTermsPage.xsl`.

**com.oxygenxml.webhelp.xsl.createTocXML**

Extension point to override the XSLT stylesheet (tocDita.xsl) that produces the toc.xml file. This file contains information extracted from the DITA map (on page 2793) and it is mainly used to construct the WebHelp Table of Contents and navigational links. The path to this stylesheet is: `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\toc\tocDita.xsl`.

**XSLT-Parameter Extension Points**

If your customization stylesheet declares one or more XSLT parameters and you want to control their values from the transformation scenario, you can use one of the following XSLT parameter extension points:

**com.oxygenxml.webhelp.xsl.dita2webhelp.param**

Use this extension point to pass parameters to the stylesheet specified using the `com.oxygenxml.webhelp.xsl.dita2webhelp` extension point (on page 1627).

**com.oxygenxml.webhelp.xsl.createMainPage.param**
Use this extension point to pass parameters to the stylesheet specified using the
com.oxygenxml.webhelp.xsl.createMainPage extension point (on page 1628).

com.oxygenxml.webhelp.xsl.createNavLinks.param
Use this extension point to pass parameters to the stylesheet specified using the
com.oxygenxml.webhelp.xsl.createNavLinks extension point (on page 1628).

com.oxygenxml.webhelp.xsl.createSearchPage.param
Use this extension point to pass parameters to the stylesheet specified using the
com.oxygenxml.webhelp.xsl.createSearchPage extension point (on page 1628).

com.oxygenxml.webhelp.xsl.createIndextermsPage.param
Use this extension point to pass parameters to the stylesheet specified using the
com.oxygenxml.webhelp.xsl.createIndexTermsPage extension point (on page 1628).

com.oxygenxml.webhelp.xsl.createTocXML.param
Use this extension point to pass parameters to the stylesheet specified using the
com.oxygenxml.webhelp.xsl.createTocXML extension point (on page 1628).

• [DITA-OT] XSLT-Parameter Extension Points

DITA to PDF Output Customization

Oxygen XML Author provides support for generating PDF output using transformation scenarios for
certain types of documents (for example, DITA, DocBook, TEI, and JATS) and Oxygen XML Author
supports several different types of processors. There are numerous ways to customize the published
output to fit your specific needs.

CSS-based DITA to PDF Customization

Oxygen XML Author comes bundled with a DITA-OT CSS-based PDF Publishing Plugin that combines
all the topics from a map or bookmark and styles the resulting document using CSS. It is the base of
the DITA Map PDF - based on HTML5 & CSS transformation scenario.
DITA Map to PDF - based on HTML5 and CSS Transformation Type

This transformation type uses a CSS-based processing engine and HTML5 as an intermediate format. For this transformation, the `pdf-css-html5` transtype is used. Because the structure of the HTML5 intermediate format resembles the one used in WebHelp output, it is possible to reuse parts of your CSS file you developed for a WebHelp customization.

DITA Map PDF - based on DITA and CSS (WYSIWYG) Transformation Type (Deprecated)

This transformation type converts DITA maps to PDF using a CSS-based processing engine and a merged DITA map (one with all topics expanded inline) as an intermediate format. For this transformation, the `pdf-css` transtype is used. This transformation scenario was deprecated starting with version 21.0. It is recommended to use the DITA Map PDF - based on HTML5 & CSS transformation scenario (on page 1275) instead.

Related Information:

- DITA Map to PDF - based on HTML5 and CSS Transformation (on page 1275)

Overview

This section contains topics that provide a basic overview of the DITA-OT CSS-based PDF Publishing Plugin, technical details, and some additional resources to help you with your customizations.

Resources

Customizing the PDF output requires knowledge of CSS, Paged Media, and DITA. The following list provides some resources to help you:

- **CSS** - You can find a good tutorial here: https://developer.mozilla.org/en-US/docs/Learn/CSS/Introduction_to_CSS. Also, the specification is available on the W3C website: https://www.w3.org/Style/CSS/Overview.en.html.
- **CSS Paged Media** - This is a part of the CSS specification that shows how to organize your publication in pages, how to use headers/footers, page breaks, and other page-related issues. The specification is available here: https://www.w3.org/TR/CSS2/page.html. Also, there is a set of hands-on examples in the Oxygen PDF Chemistry user guide: https://www.oxygenxml.com/doc/ug-chemistry/.

• **HTML5** - For the DITA Map PDF - based on HTML5 & CSS transformation type, you will need a good knowledge of HTML5. You can find resources here: https://developer.mozilla.org/en-US/docs/Web/Guide/HTML/HTML5

**Related Information:**

- **DITA-OT DAY 2017: Using CSS to Style PDF Output**

**Supported Processors**

The **DITA-OT CSS-based PDF Publishing Plugin** supports the following CSS processors:

- **Oxygen PDF Chemistry** - This is recommended processor because the built-in CSS files were fine-tuned for this processor. For example, metadata extraction (on page 1686) only functions with this processor. If the plugin is started from an Oxygen XML Editor/Author distribution, a Chemistry installation is not needed.

**Technical Details**

It has two transformation types:

- **pdf-css-html5** (*DITA Map PDF - based on HTML5 & CSS transformation*) - CSS styling applied over a merged HTML5 document (the merged DITA converted to HTML5).

- **pdf-css** (*DITA Map PDF - based on DITA & CSS - WYSIWYG transformation*) - CSS styling applied directly over a merged DITA document. This transformation type was deprecated started with version 21.

This is how it works:
1. It expands all the topic references into a temporary clone of the map, resolving keys and reused content. This is the standard DITA-OT pre-processing procedure.

2. It generates a structure for the table of contents and index. The result is a merged map with all the references resolved. This is a standard DITA-OT processing procedure, based on the PDF2 plugin.

3. Then it post-processes the merged map. It fixes some of the structure in the TOC and index, moves the frontmatter and backmatter to the correct places, transforms any change tracking and review processing instructions to elements that can be styled later, etc. The result is another merged map.

4. When using the DITA Map PDF - based on HTML5 & CSS transformation type, the merged DITA map is transformed to a single HTML5 file. The generated HTML elements copy the class attributes from the original DITA elements. In this way you can either use selectors that were designed for DITA structure, or ones for the HTML structure - see: Reusing the Styling for
WebHelp and PDF Output (on page 1760). This step can apply customization XSLT extension points (on page 1649) that change the default processing.

5. In the last phase, it uses a collection of CSS files to style the merged map (or for the DITA Map PDF - based on HTML5 & CSS transformation type, the merged map in the HTML5 format with the help of the CSS processor).

**Note:** For the DITA Map PDF - based on DITA & CSS (WYSIWYG) transformation type, the used CSS files are those selected in the Styles drop-down menu from the toolbar in Oxygen XML Editor/Author, and they are processed along with the CSS files specified with the args.css parameter set in the transformation scenario.

**Note:** For the DITA Map PDF - based on HTML5 & CSS transformation type, references to the CSS files are collected from the publishing template (on page 1639).

Increasing Memory Allocation for Java

If you are working with a large project with extensive metadata or key references, you may need to increase the amount of memory that is allocated to the Java process that performs the publishing.

When the Transformation is Started from Oxygen

It is possible to alter the memory allocation setting from the transformation scenario:

1. Open the Configure Transformation Scenario(s) dialog box.
2. Select your transformation scenario, then click **Edit**.
3. Go to the **Advanced** tab.
4. Locate the JVM Arguments, and increase the default value. For instance, to set 1GB as maximum of memory, you can specify: \(-Xmx1024m\).
When the Transformation is Started from the Command Line

You can change the value of the `ANT_OPTS` environment variable from a command line for a specific session.

**Example:** To increase the JVM memory allocation to 1024 MB for a specific session, issue the following command from a command prompt (depending on your operating system):

- **Windows**
  
  ```
  set ANT_OPTS=%ANT_OPTS% -Xmx1024M
  ```

- **Linux/Mac OS X**
  
  ```
  export ANT_OPTS=$ANT_OPTS -Xmx1024M
  ```

**Tip:** To persistently change the memory allocation, change the value allocated to the `ANT_OPTS` environment variable on your system.

Transformation Parameters

This list includes the most common customization parameters that are available in the DITA Map PDF - based on HTML5 & CSS transformation scenario. Other standard DITA-OT parameters were omitted for clarity, but they are still supported.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>args.css</td>
<td>You can use this to specify a list of CSS URLs to be used in addition to those specified in the <code>dita.css.list</code> parameter or publishing template. The files must have URL syntax and be separated using semicolons.</td>
</tr>
<tr>
<td>args.css.param.*</td>
<td>You can use this parameter pattern to set attributes on the root of the merged map. This means you can activate specific CSS rules from your custom CSS using custom attributes. For examples, see: Styling Through Custom Parameters (on page 1779).</td>
</tr>
<tr>
<td>args.css.param.numbering</td>
<td>You can use this parameter to change the numbering of the chapters and sections. Allowed values:</td>
</tr>
</tbody>
</table>

- **shallow** - Only the topics from the first level will be numbered (chapters).
- **deep** - All the topics from the map will be numbered (chapters and sections).
- **deep-chapter-scope** - Similar to deep, but in addition, the page numbers, figures, and table numbers are reset at the start of each chapter. The table and figure titles (and the links to
them) are prefixed with the chapter numbers. The generic cross reference links contain both the chapter numbers and the page numbers to avoid ambiguity. This parameter value is only available for the DITA Map PDF - based on HTML5 & CSS transformation scenario.

- **deep-chapter-scope-no-page-reset**: Similar to `deep-chapter-scope`, but the page numbers do not reset at the start of each chapter. The generic cross reference links contain only the page number. This parameter value is only available for the DITA Map PDF - based on HTML5 & CSS transformation scenario.

For more details, see Numbering Types *(on page 1708).*

<table>
<thead>
<tr>
<th><strong>args.draft</strong></th>
<th>Specifies whether or not the content of <code>&lt;draft-comment&gt;</code> and <code>&lt;required-cleanup&gt;</code> elements is included in the output.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Allowed values:</strong></td>
<td></td>
</tr>
<tr>
<td>- <strong>no</strong>: No draft information is shown in the output. This is the default.</td>
<td></td>
</tr>
<tr>
<td>- <strong>yes</strong>: The draft information is shown in the output.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>args.figurelink.style</strong></th>
<th>Specifies how cross references to figures are styled in output.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Allowed values:</strong></td>
<td></td>
</tr>
<tr>
<td>- <strong>NUMBER</strong>: Only the number of the figures will be shown in links.</td>
<td></td>
</tr>
<tr>
<td>- <strong>TITLE</strong>: Only the title of the figures will be shown in links.</td>
<td></td>
</tr>
<tr>
<td>- <strong>NUMTITLE</strong> (default): Both the title and number of the figures will be shown in links.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>args.chapter.layout</strong></th>
<th>Specifies whether chapter level TOCs are generated for bookmaps. When set to MINITOC, a small section with links is added at the beginning of each chapter. The default is BASIC. For details, see: Table of Contents for Chapters (Mini TOC) <em>(on page 1718).</em></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Allowed values:</strong></td>
<td></td>
</tr>
<tr>
<td>- <strong>BASIC</strong>: No chapter TOC is created.</td>
<td></td>
</tr>
<tr>
<td>- <strong>MINITOC</strong>: A chapter level TOC will be generated.</td>
<td></td>
</tr>
</tbody>
</table>

| **args.gen.task.lbl** | Specifies whether or not to generate headings for sections within task topics. Allowed values: YES or NO (default). When set to yes, headings like "About this task", "Procedure", or "What to do next", are shown in the task contents. |

<p>| <strong>args.input</strong> | Specifies the master DITA map file for your documentation project. |</p>
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>args.output.base</td>
<td>Specifies the name of the output file without a file extension. By default, the name of the PDF file is derived from the name of the DITA map file. This parameter allows you to override it.</td>
</tr>
</tbody>
</table>
| args.tablelink.style      | Specifies how cross references to tables are styled in output. Allowed values:                                                                                           *
|                           | • NUMBER - Only the number of the tables will be shown in links.                                                                                                           |
|                           | • TITLE - Only the title of the tables will be shown in links.                                                                                                              |
|                           | • NUMTITLE (default) - Both the title and number of the tables will be shown in links.                                                                                                                                  |
| clean.temp               | Specifies whether the DITA-OT deletes the files in the temporary directory after it finishes a build. Allowed values: yes (default) / no                                                                                                         |
| css.processor.path.antenna-house | Path to the Antenna House executable file that needs to be run to generate the PDF (for example, C:\path\to\AHFCmd.exe on Windows).                                                                                                                                                          |
| css.processor.path.chemistry | Path to the Oxygen PDF Chemistry executable file that needs to be run to generate the PDF (for example, C:\path\to\chemistry.bat on Windows). If this parameter is not set, the plugin will use the system's PATH environment variable to locate and start Oxygen PDF Chemistry. |
| css.processor.path.prince | Path to the Prince executable file that needs to be run to generate the PDF (for example, C:\path\to\prince.exe on Windows).                                                                                                             |
| css.processor.type        | Specifies the processor to use for the transformation. Allowed values: chemistry (default) / antenna-house / prince.                                                                                                           |
| default.language          | Specifies the default language for source documents. Examples: fr, de, zh, etc. Depending on the transformation type, the actual number of supported languages can vary, see: Localization (on page 1748).                                                                                     |
| editlink.remote.ditamap.url | Use this parameter in conjunction with editlink.web.author.url to add an Edit link next to the topic title in the PDF output. When a user clicks the link, the topic is opened in Oxygen XML Web Author where they can make changes that can be saved to a file server. The value should be set as the custom URL of the main DITA map. For example, a GitHub custom URL might look like this: https://getFileContent/oxyengxml/userguide/master/UserGuide.ditamap. |
| editlink.web.author.url   | This parameter needs to be used in conjunction with editlink.remote.ditamap.url to add an Edit link next to the topic title in the PDF output. When a user clicks the link, the topic is opened in Oxygen XML Web Author where they can make changes that can be saved to a file server. The value should be set as |
the URL of the Web Author installation. For example: https://www.oxygenxml.com/oxygen-xml-web-author/.

<table>
<thead>
<tr>
<th>parameter</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>figure.title.placement</td>
<td>Controls the title placement of the figures, relative to the image. Possible values include top (default) and bottom.</td>
</tr>
<tr>
<td>generate.named.destinations</td>
<td>When set to yes (default), the @id attributes from the DITA content are used as PDF named destinations.</td>
</tr>
<tr>
<td>hide.frontpage.toc.index.glossary</td>
<td>When set to yes, the generated structures (table of contents, index list, front page, etc.) are removed from the output. The default is no.</td>
</tr>
<tr>
<td>show.changes.and.comments</td>
<td>When set to yes, the user comments, colored highlights and track-changes are shown in the output.</td>
</tr>
<tr>
<td>show.changes.and.comments.as.pdf.sticky.notes</td>
<td>When set to yes (default) and the show.changes.and.comments parameter is also set to yes, the user comments and tracked changes are shown in the PDF output as stick note annotations. When set to no, the comments and tracked changes are left in the document model and are styled by the default CSS rules as footnotes. You can override this from your customization CSS (on page 1657).</td>
</tr>
</tbody>
</table>

The following parameters can be used to specify a publishing template:

<table>
<thead>
<tr>
<th>parameter</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pdf.publishing.template</td>
<td>Specifies the path to the folder containing the custom PDF template.</td>
</tr>
<tr>
<td>pdf.publishing.template.descriptor</td>
<td>Specifies the name of the descriptor to be loaded from the PDF template folder or package. If it is not specified, the first encountered descriptor will be loaded.</td>
</tr>
</tbody>
</table>

**Publishing Templates**

An Oxygen Publishing Template defines all aspects of the layout and styles for output obtained from the following transformation scenarios:

- WebHelp Responsive
- WebHelp Responsive with Feedback
- DITA Map PDF - based on HTML5 & CSS

It is a self-contained customization package stored as a ZIP archive or folder that can easily be shared with others. It provides the primary method for customizing the output.

Some possible customization methods include:

- Add additional template resources to customize the output (such as logos, Favicon, or CSS files).
- Extend the default processing by specifying one or more XSLT extension points.
- Specify one or more transformation parameters to customize the output.
• Customize various aspects of the output through simple CSS styling.
• For **WebHelp Responsive** output, change the layout of the main page or topic pages by customizing which components will be displayed and where they will be positioned in the page.

The following graphics are possible sample structure for **Oxygen Publishing Template** packages:

**Figure 425. Oxygen Publishing Template Package (WebHelp Responsive)**

```

• How to Add a Publishing Template to the Publishing Templates Gallery (on page 1554)
Publishing Template Package Contents for PDF Customizations

An Oxygen Publishing Template for PDF output must contain a template descriptor file and at least one CSS file, and may contain other resources (such as graphics, XSLT files, etc.). All the template resources can be stored in either a ZIP archive or in a folder. It is recommended to use a ZIP archive because it is easier to share with others.

Template Descriptor File

Each publishing template includes a descriptor file that defines the meta-data associated with template. It is an XML file with certain elements that defines all the resources included in a template (such as CSS files, images, and transformation parameters).

The template descriptor file must have the .opt file extension and must be located in the templates' root folder.

A PDF template descriptor might look like this:

```xml
<publishing-template>
  <name>Flowers</name>

  <pdf>
    <tags>
      <tag>purple</tag>
      <tag>light</tag>
    </tags>
    <preview-image file="flowers-preview.png"/>

    <resources>
      <css file="flowers.css"/>
    </resources>

    <parameters>
      <parameter name="figure.title.placement" value="top"/>
    </parameters>
  </pdf>
</publishing-template>
```
**Tip:** It is recommended to edit the template descriptor in Oxygen XML Editor/Author because it provides content completion and validation support.

### Template Name and Description

Each template descriptor file requires a `name` element. This information is displayed as the name of the template in the transformation scenario dialog box.

Optionally, you can include a `description` and it displayed when the user hovers over the template in the transformation scenario dialog box.

```xml
<publishing-template>
  <name>Flowers</name>
  <description>Flowers themed light colored template</description>
  ...
</publishing-template>
```

### Template Author

Optionally, you can include author information in the descriptor file and it displayed when the user hovers over the template in the transformation scenario dialog box. This information might be useful if users run into an issue or have questions about a certain template.

If you include the `author` element, a `name` is required and optionally you can include `email`, `organization`, and `organizationUrl` information.

```xml
<publishing-template>
  ...
  <author>
    <name>John Doe</name>
    <email>jdoe@example.com</email>
    <organization>ACME</organization>
    <organizationUrl>http://www.example.com/jdoe</organizationUrl>
  </author>
  ...
</publishing-template>
```

### PDF Element

The `pdf` element contains various details about the template and its resources that define the PDF output. It is a required element if you intend on using a DITA Map to PDF transformation scenario. The elements that are allowed in this `pdf` section specify the template tags *(on page 1641)*, template
Template Tags

The tags section provides meta information about the template (such as color theme). Each tag is displayed at the top of the Templates tab window in the transformation scenario dialog box and they help the user filter and find particular templates.

Template Preview Image

The preview-image element is used to specify an image that will be displayed in the transformation scenario dialog box. It provides a visual representation of the template to help the user select the right template. The image dimensions should be 200 x 115 pixels and the supported image formats are: JPEG, PNG, or GIF.

You can also include an online-preview-url element to specify the URL of a published sample of your template. This will display an Online preview icon in the bottom-right corner of the image in the
transformation scenario dialog box and if the user clicks that icon, it will open the specified URL in
their default browser.

```xml
<publishing-template>
  ...
  <pdf>
    ...
    <preview-image file="ashes/ashes-tree.png"/>
    <online-preview-url=https://www.example.com/samples/tiles/ashes</online-preview-url>
  </pdf>
</publishing-template>
```

**Template Resources**

The **resources** section of the descriptor file specifies a set of resources (CSS files) that are used to
customize various components in generated output. These resources will be copied to the output
folder during the transformation process. At least one CSS file must be included, while the other types
of resources are optional.

```xml
<publishing-template>
  ...
  <pdf>
    ...
    <resources>
      <css file="css/custom_styles.css"/>
      <css file="css/custom_fonts.css"/>
    </resources>
  </pdf>
</publishing-template>
```

⚠️ **Note:**  All relative paths specified in the descriptor file are relative to the template root folder.

**Transformation Parameters**

You can also set one or more transformation parameters in the descriptor file.

```xml
<publishing-template>
  ...
  <pdf>
    ...
    <parameters>
      <parameter name="show.changes.and.comments" value="yes"/>
    </parameters>
  </pdf>
</publishing-template>
```
The following information can be specified in the `parameter` element:

**Parameter name**

The name of the parameter. It may be one of the transformation parameters listed in the Parameters tab of the DITA Map to PDF - based on HTML5 & CSS transformation scenario or a DITA-OT PDF-based output parameter.

![Note](image)

Note: It is not recommended to specify an input/output parameter in the descriptor file (such as the input Map, DITAVAL file, or temporary directory).

![Attention](image)

Attention: JVM arguments like `-Xmx` cannot be specified as a transformation parameter.

**Parameter Value**

The value of the parameter. It should be a relative path to the template root folder for file paths parameters.

**Parameter Type**

The type of the parameter: `string` or `filepath`. The `string` value is default.

After creating a publishing template *(on page 1645)* and adding it to the templates gallery *(on page 1648)*, when you select the template in the transformation scenario dialog box, the Parameters tab will automatically be updated to include the parameters defined in the descriptor file. These parameters are displayed in italics.

**XSLT Extension Points**

The publishing templates support one or more XSLT extension points. They can be specified in the descriptor file using the following structure:

```xml
<publishing-template>
  ...
  <pdf>
    ...
    <xslt>
      <extension
        id="com.oxygenxml.pdf.css.xsl.merged2html5"
        file="xslt/merged2html5Extension.xsl"/>
      <extension
        id="com.oxygenxml.pdf.css.xsl.merged2merged"
        file="xslt/merged2mergedExtension.xsl"/>
    </xslt>
  </pdf>
  ...
</publishing-template>
```
For more information about the available extension points, see: XSLT Extensions for PDF Transformations (on page 1649).

Combining PDF and WebHelp Responsive Customizations in a Template Package

An Oxygen Publishing Template package can contain both a PDF and WebHelp Responsive customization in the same template package and you can use that same template in both types of transformations. The template descriptor file can define the customization for both types by including both a webhelp and pdf element and some of the resources can be reused. Resources referenced in elements in the webhelp element will only be used for WebHelp transformations, and resources referenced in the elements in the pdf element will only be used in PDF transformations.

```xml
<publishing-template>
   <name>Flowers</name>
   <description>Flowers themed light-colored template</description>

   <webhelp>
      <tags>
         <tag>purple</tag>
         <tag>light</tag>
      </tags>
      <preview-image file="flowers-preview.png"/>
      <resources>
         <css file="flowers-wh.css"/>
         <css file="flowers-page-styling.css"/>
      </resources>
      <parameters>
         <parameter name="webhelp.show.main.page.tiles" value="no"/>
         <parameter name="webhelp.show.main.page.toc" value="yes"/>
      </parameters>
   </webhelp>

   <pdf>
      <tags>
         <tag>purple</tag>
         <tag>light</tag>
      </tags>
      <preview-image file="flowers-preview.png"/>
      <resources>
         <css file="flowers-pdf.css"/>
         <css file="flowers-page-styling.css"/>
      </resources>
   </pdf>
</publishing-template>
```
<parameters>
  <parameter name="show.changes.and.comments" value="yes"/>
</parameters>
<pdf>
</publishing-template>

How to Create a Publishing Template

To create a customization, you can start from scratch or from an existing template, and then adapt it according to your needs.

Creating a Template Starting from Scratch

To create a new Oxygen Publishing Template, follow these steps:

1. Create a folder that will contain all the template files.
2. In Oxygen XML Editor/Author, open the new document wizard (use File > New or the New toolbar button), then choose the Publishing Template Descriptor template.

Figure 427. Choosing the Publishing Template Descriptor Document Template
3. Save the .opt file into your customization directory.

4. Open the .opt file in the editor and customize it to suit your needs.

Creating a Template Starting from an Existing Template

If you are using a WebHelp Responsive or DITA Map PDF - based on HTML5 & CSS transformation, the easiest way to create a new Oxygen Publishing Template (on page 2797) is to select an existing template in the transformation scenario dialog box and use the Save template as button to save that template into a new template package that can be used as a starting point.

To create a new Oxygen Publishing Template, follow these steps:

1. Open the transformation scenario dialog box and select the publishing template you want to export and use as a starting point.

2. Optional: You can set one or more transformation parameters from the Parameters tab and the edited parameters will be exported along with the selected template. You will see which parameters will be exported in the dia
go box that is displayed after the next step.

3. Click the Save template as button.

   Step Result: This opens a template package configuration dialog box that contains some options and displays the parameters that will be exported to your template package.

4. Specify a name for the new template.

5. Optional: Specify a template description.

6. Optional: The same publishing template package can contain both a WebHelp Responsive and PDF customization and you can use the same template in both types of transformations (DITA Map WebHelp Responsive or DITA Map to PDF - based on HTML5 & CSS). You can use the
Include WebHelp customization and Include PDF customization options to specify whether your custom template will include both types of customizations.

7. **Optional:** For WebHelp Responsive customizations, you can select the Include HTML Page Layout Files option if you want to copy the default HTML Page Layout Files (on page 1525) in your template package. They are helpful if you want to change the structure of the generated HTML pages.

8. In the Save as field, specify the name and path of the ZIP file where the template will be saved.

   **Step Result:** A new ZIP archive will be created on disk in the specified location with the specified name.

9. Open the .opt file in the editor and customize it to suit your needs.

How to Edit a Packed Publishing Template

To edit an existing Oxygen Publishing Template (on page 2797) package, follow these steps:

1. Unzip the ZIP archive associated with the Oxygen Publishing Template in a separate folder.
2. Link the folder associated with the template in the Project view.
3. Using the Project view, you can modify the resources (CSS, JS, fonts) within the Oxygen Publishing Template folder to fit your needs.
4. Open the publishing template descriptor file (.opt extension) in the editor and modify to suit your needs.
5. **Optional:** Once you finish your customization, you can archive the folder as a ZIP file.

**Related Information:**

How to Use a Publishing Template in a PDF Transformation

From Oxygen XML Editor/Author

A publishing template can be used for PDF output from the DITA Map PDF - based on HTML5 & CSS transformation scenario.

The Templates tab in the DITA Map PDF - based on HTML5 & CSS transformation scenario dialog displays all the templates that are available in your template gallery. To use a particular template in the transformation scenario, simply select it from this tab and then continue configuring the transformation using the other tabs to suit your needs.

To add the publishing template to your templates gallery, follow these steps:

1. Open the transformation scenario dialog box by editing a DITA Map PDF - based on HTML5 & CSS transformation.
2. In the Templates tab, click the Configure Publishing Templates Gallery link to.
   
   **Step Result:** This will open the preferences page.
3. Click the Add button and specify the location of your template directory.
   
   **Step Result:** Your template directory is now added to the Additional Publishing Templates Galleries list.
4. Click OK to return to the transformation scenario dialog box.
   
   **Step Result:** All the templates contained in your template directory will be displayed in the preview pane along with all the built-in templates.

From Command Line

You can use the simpler form, in which you use only the pdf.publishing.template parameter to point to the *.opt (publishing template) file:

```bash
dita.bat
   --input=map\test.ditamap"
   "-Dpdf.publishing.template=full_path_to_template_dir/my_template.opt"
   --format=pdf-css-html5
   ...
```
Or use the two parameters to indicate the folder containing the publishing templates and the name of the publishing template file relative to that folder:

```bash
dita.bat
--input=map\test.ditamap"
"-Dpdf.publishing.template=full_path_to_template_dir"
"-Dpdf.publishing.template.descriptor=my_template.opt"
--format=pdf-css-html5
...
```

Related Information:

- Transformation Parameters (on page 1634)

How to Share a Publishing Template

To share a publishing template with others, following these steps:

1. Copy your template in a new folder in your project.
2. Go to Options > Preferences > DITA > Publishing and add that new folder to the list.
3. Switch the option as the bottom of that preferences page to Project Options.
4. Share your project file (.xpr).

XSLT Extensions for PDF Transformations

Since PDF output is primarily obtained by running XSLT transformations over the DITA input files, one customization method would be to override the default XSLT templates that are used by the PDF transformation.

The pdf-css-html5 transformation type uses two stages to transform the merged DITA map (the one that aggregates all the topics) to HTML5:

1. **Stage 1**: Makes some changes on the merged map (on page 1658) and the result is a modified merged map. This stage can be altered by implementing the com.oxygenxml.pdf.css.xsl.merged2merged XSLT extension point. This extension overrides the stylesheets found in the following folder: DITA-OT-DIR\plugins\com.oxygenxml.pdf.css\xsl\merged2merged.

   ![Note:](image) Use this when you need to filter DITA content.
2. **Stage 2**: Transforms the *merged map (on page 1658)* to HTML5 and the result is a single HTML document. This stage can be altered by implementing the `com.oxygenxml.pdf.css.xsl.merged2html5` XSLT extension point. This extension overrides the stylesheets found in the following folder: `DITA-OT-DIR\plugins\com.oxygenxml.pdf.css\xsl\merged2html5`.

**Note**: Use this when you need to change the HTML structures generated for a specific DITA element.

These extension points can be used either from a *Publishing Template* or a DITA-OT extension plugin.

**How to Use XSLT Extension Points for PDF Output from a Publishing Template**

These examples demonstrate how to use XSLT extension points from an *Oxygen Publishing Template*.

**Use Case 1: Styling Codeblocks with a Zebra Effect**

Suppose you want your *codeblocks* to have a particular background color for one line, and another color for the next line. One advantage of this coloring technique is that you can clearly see when text from the *codeblock* is wrapped.

This effect can be done by altering the HTML5 output, creating a `<div>` for each line from the code block, then styling them.

To add this functionality using an *Oxygen Publishing Template*, follow these steps:

1. If you haven't already created a Publishing Template, see *How to Create a Publishing Template (on page 1645)*.
2. Link the folder associated with the publishing template to your current project in the *Project* view.
3. Using the *Project* view, create an *xslt* folder inside the project root folder.
4. In this folder, create an XSL file (for example, named `merged2html5Extension.xsl`) with the following content:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    exclude-result-prefixes="xs"
    version="2.0">

    <xsl:template match="*[contains(@class, ' pr-d/codeblock ')]">
        <div class='zebra'>
            <xsl:analyze-string regex="\n" select="."/>
            <xsl:matching-substring/>
        </div>
    </xsl:template>
</xsl:stylesheet>
```
5. Open the template descriptor file (on page 1639) associated with your publishing template (the .opt file) and set the XSLT stylesheet created in previous step with the com.oxygenxml.pdf.css.xsl.merged2html5 XSLT extension point:

```xml
<publishing-template>
  ...
  <pdf>
    ...
    <xslt>
      <extension
        id="com.oxygenxml.pdf.css.xsl.merged2html5"
        file="xslt/merged2html5Extension.xsl"/>
    </xslt>
  </pdf>
</publishing-template>
```

6. Create a css folder in the publishing template directory. In this directory, save a custom CSS file with rules that style the codeblock structure. For example:

```css
div.zebra {
  font-family: courier, fixed, monospace;
  white-space: pre-wrap;
}
div.zebra > *:nth-of-type(odd){
  background-color: silver;
}
```

7. Open the template descriptor file (on page 1639) associated with your publishing template (the .opt file) and reference your custom CSS file in the resources element:

```xml
<publishing-template>
  ...
  <pdf>
    ...
    <resources>
      <css file="css/custom.css"/>
    </resources>
  </pdf>
</publishing-template>
```
8. Edit the DITA Map PDF - based on HTML5 & CSS transformation scenario.
9. In the Templates tab, click the Choose Custom Publishing Template link and select your template.
10. Click OK to save the changes to the transformation scenario.
11. Run the transformation scenario.

Use Case 2: Removing the Related Links Section

Suppose you want the related links sections to be removed from the PDF output.

To add this functionality using an Oxygen Publishing Template, follow these steps:

1. If you haven't already created a Publishing Template, see How to Create a Publishing Template (on page 1645).
2. Link the folder associated with the publishing template to your current project in the Project view.
3. Using the Project view, create an xslt folder inside the project root folder.
4. In this folder, create an XSL file (for example, named merged2mergedExtension.xsl) with the following content:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
                xmlns:xs="http://www.w3.org/2001/XMLSchema"
                exclude-result-prefixes="xs"
                version="2.0">

  <xsl:template match="*[contains(@class, ' topic/related-links ')]">
    <!-- Remove. -->
  </xsl:template>
</xsl:stylesheet>
```

5. Open the template descriptor file (on page 1639) associated with your publishing template (the .opt file) and set the XSLT stylesheet created in previous step with the com.oxygenxml.pdf.css.xsl.merged2merged XSLT extension point:

```xml
<publishing-template>
  ...
  <pdf>
    ...
    <xslt>
      <extension
        id="com.oxygenxml.pdf.css.xsl.merged2merged"
        file="xslt/merged2mergedExtension.xsl"/>
    </xslt>
  </pdf>
  ...
</publishing-template>
```
6. Edit the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.
7. In the **Templates** tab, click the **Choose Custom Publishing Template** link and select your template.
8. Click **OK** to save the changes to the transformation scenario.
9. Run the transformation scenario.

**How to Use XSLT Extension Points for PDF Output from a DITA-OT Plugin**

These examples demonstrate how to use XSLT extension points from a **DITA-OT plugin**.

**Use-Case 1: Styling Codeblocks with a Zebra Effect**

Suppose you want your **codeblocks** to have a particular background color for one line, and another color for the next line. One advantage of this coloring technique is that you can clearly see when text from the **codeblock** is wrapped.

This effect can be done by altering the HTML5 output, creating a **div** for each line from the code block, then styling them.

To add this functionality using a DITA-OT plugin, follow these steps:

1. In the **DITA-OT-DIR\plugins\** folder, create a folder for this plugin (for example, `com.oxygenxml.pdf.custom.codeblocks`).
2. Create a **plugin.xml** file (in the folder you created in step 1) that specifies the extension point and your customization stylesheet. For example:

   ```xml
   <plugin id="com.oxygenxml.pdf.custom.codeblocks">
     <feature extension="com.oxygenxml.pdf.css.xsl.merged2html5"
      file="custom_codeblocks.xsl"/>
   </plugin>
   ```

3. Create your customization stylesheet (for example, **custom_codeblocks.xsl**) with the following content:

   ```xml
   <?xml version="1.0" encoding="UTF-8"?>
   <xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    exclude-result-prefixes="xs"
    version="2.0">

   <xsl:template match="*[contains(@class, ' pr-d/codeblock ')]">
     <div class='zebra'>
       <xsl:analyze-string regex="\n" select="."/>
     </div>
   </xsl:template>
   ```
4. Use the Run DITA-OT Integrator transformation scenario (on page 1283) found in the DITA Map section in the Configure Transformation Scenario(s) dialog box.

5. Create a custom CSS file with rules that style the codeblock structure. For example:

```
div.zebra {
    font-family: courier, fixed, monospace;
    white-space: pre-wrap;
}
div.zebra > *:nth-of-type(odd){
    background-color: silver;
}
```

6. Edit a DITA Map PDF - based on HTML5 & CSS transformation scenario and reference your custom CSS file (using the args.css parameter).

7. Run the transformation scenario.

Use-Case 2: Removing the Related Links Section

Suppose you want the related links sections to be removed from the PDF output.

To add this functionality using a DITA-OT plugin, follow these steps:

1. In the DITA-OT-DIR\plugins\ folder, create a folder for this plugin (for example, com.oxygenxml.pdf.custom.codeblocks).

2. Create a plugin.xml file (in the folder you created in step 1) that specifies the extension point and your customization stylesheet. For example:

```
<plugin id="com.oxygenxml.pdf.custom.related.links">
    <feature extension="com.oxygenxml.pdf.css.xsl.merged2merged">
        file="custom_related_links.xsl"/>
</plugin>
```

3. Create your customization stylesheet (for example, custom_related_links.xsl) with the following content:
4. Use the Run DITA-OT Integrator transformation scenario *(on page 1283)* found in the DITA Map section in the Configure Transformation Scenario(s) dialog box.

5. Run the DITA Map PDF - based on HTML5 & CSS transformation scenario.

Sample Use-cases: Using XSLT and CSS for PDF Transformations

In this section, you will find a series of use-cases that can be used as starting points for other customizations.

How to Use a Bullet Instead of Numbers for Tasks Containing a Single Step

If a DITA Task only contains one step (*<step>* element), you probably want it to be rendered like an unordered list (displayed with a bullet instead of a number).

```xml
...<steps>
  <step>
    <cmd>The step</cmd>
  </step>
</steps>
...
```

Should be rendered as:

- The step

Instead of:

1. The step
To achieve this, you need to create an XSLT template that adds a special `@outputclass` attribute (with its value set to `single`) for the single step, then you need to match this attribute from the CSS and change its aspect.

1. In the customization XSL, add:

```xml
<xsl:template match="*[contains(@class, ' task/step ')][count(../*[contains(@class, ' task/step '))] = 1]">
    <xsl:copy>
        <xsl:copy-of select="@*"/>
        <xsl:attribute name="outputclass" select="concat(@outputclass, ' single')"/>
        <xsl:apply-templates/>
    </xsl:copy>
</xsl:template>
```

2. In your customization CSS (on page 1657), add:

```css
*[outputclass =~ "single"] {  
    list-style-type:circle !important;  
    margin-left:2em;  
}
```

- How to Use XSLT Extension Points for PDF Output from a Publishing Template (on page 1650)

DITA-OT Extension Points

The DITA-OT CSS-based PDF Publishing Plugin supports DITA-OT extension points that can be used to expand the functionality of the transformation. The extension points are defined in the plugin.xml file. For more information, see DITA Open Toolkit Extension Points.

Related Information:
- XSLT Extensions for PDF Transformations (on page 1649)
How to Contribute a Custom CSS to the Transformation from a DITA-OT Plugin

This topic is intended for publishing architects/developers that need to deploy a customized DITA-OT.

Usually, the CSS styles can be passed to the transformation by referencing the CSS files using the \texttt{args.css} parameter. However, there are cases where you want to add some sort of "built-in" CSS that is applied in conjunction with the publishing template or CSS files referenced in the transformation.

For this, you need to use the \texttt{com.oxygenxml.pdf.css.init} extension point and set the value of the \texttt{extension.css} ANT property to the path of the custom CSS file:

1. In your \texttt{plugin.xml} file, add:

```
<feature extension="com.oxygenxml.pdf.css.init" file="init.xml"/>
```

2. Create a file named \texttt{init.xml} with the following ANT content:

```
<root>
  <property name="extension.css" value="${dita.plugin.[com.my.plugin.id].dir}/css/my-custom.css"/>
  <!-- add here more init stuff if needed -->
</root>
```

\textbf{Note:} The name of the root element does not matter. The content of this element will be copied in an initialization template.

\textbf{Important:} Make sure all file references begin with the ANT variable that is expanded to the base directory of your plugin.

### Related Information:

- How to Use XSLT Extension Points for PDF Output from a DITA-OT Plugin (on page 1653)

Customization CSS

The publishing process is driven by a customization CSS.

To change the styling of the output for the \textbf{DITA Map PDF - based on HTML5 & CSS} transformation scenario:

1. Create the CSS file that will contain all your customizations. It is recommended to create this file in your project directory so you can edit it easily.
2. Add the custom CSS rules. See the various topics in this section for assistance with specific types of customizations.

3. For linking the CSS file, you have two options:
   a. Create a publishing template, create the customization CSS file inside the template folder and link it into the publishing template descriptor. See Publishing Templates (on page 1508).
   b. Choose an existing publishing template, then edit the scenario and set the full path to the custom CSS file as the value of the args.css parameter. The rules from custom CSS will override the rules from the template CSS files.

4. Run the transformation scenario.

Debugging the CSS

If you notice that some of the CSS properties were not applied as expected, some of the tips offered in this topic might help you with the debugging process.

Merged Map File

Depending on the type of transformation, one or more merged map files are created at some point during the transformation stages. These files could be used to help debug unexpected results.

1. The first thing you should try is to check the file structure of the merged map file. This can be found in the out/pdf-css directory and it has the .merged.xml file extension. For the DITA Map PDF - based on HTML5 & CSS transformation type, you will also find a .merged.html file. You can open these files in Oxygen XML Editor/Author to examine the structure. Optionally, you can use the pretty print feature (Format and Indent) to make the structure easier to read.

2. Check that the CSS selectors are written correctly against the document structure.

3. If you still cannot identify the problem, then inspect how the styles are applied (you can try any of the methods listed below).

Inspecting the Applied Styles Using the Chrome Browser

To inspect the applied CSS styles using Chrome:

1. In Chrome, open the file ending in .merged.xml or .merged.html (for the DITA Map PDF - based on HTML5 & CSS transformation type).

2. Click on the element you want to inspect.

3. Activate the Chrome Developer Tools by using ▼ ▸ More Tools ▸ Developer Tools, or press CTRL +SHIFT+I.

4. Activate the Rendering pane by using ▼ ▸ More Tools ▸ Rendering:
5. In the Rendering pane, select print from the Emulate CSS media section. This will activate the CSS selectors enclosed in `@media print { .. }`.

**Note:** This allows you to debug the styling of elements, table of contents, and index, but not the styles of the page margin boxes (headers, footers) or page breaks.

**Tip:** In the left pane of the Developer Tools interface, you can inspect elements and their styles in the Elements tab. You can click on any of the links to display the applied CSS files in the Styles tab in the right pane. Editing the styles in that pane results in a live preview of how the change will affect the output.

**CAUTION:** Do not modify the built-in rules directly in the CSS files from the Oxygen XML Editor/Author installation. Instead, copy the rules to your own customization CSS.
Inspecting the Applied Styles Using Oxygen XML Editor/Author

To inspect styles:

1. In Oxygen XML Editor/Author, open the file ending in `.merged.xml` or `.merged.html` (for the DITA Map PDF - based on HTML5 & CSS transformation type).
2. [Optional] From the Styles toolbar, choose the + Print Ready entry. This will activate certain CSS selectors enclosed in `@media print {}`.
3. Click on the element you want to style. Use the Inspect Styles action from the Contextual Menu. A specialized CSS Inspector view will show the built-in CSS rules.

Tip: With this file opened in Author mode, it might be helpful to switch the Tags Display Mode to Full Tags with Attributes. You might be able to identify the selector you need to style without using the CSS Inspector view.

Note: This allows you to debug styling of elements, but not of the page margin boxes (headers, footers) or page breaks.

CAUTION: Do not modify the built-in rules directly in the CSS files from the Oxygen XML Editor/Author installation. Instead, copy the rules to your own customization CSS.

Other techniques

These are some other techniques you may find useful:

- Add background and borders properties to the specific CSS rule. If they do not appear in the output then there is a problem with the rule selector.
- Try to use the `!important` notation to the property that is not applied, or make the selector more specific (you can add more parent selectors).
- To figure out how the elements are mapped into PDF, you can use this fragment in the customization CSS:

```css
* {
  border: 1pt solid blue !important;
}

*:before(1000) {
  content: oxy_name() !important;
  color: orange;
}

*:before(999) {
```
content: *[ class~="front-page/front-page-title"]*:before {
  text-align: left;
  content: oxy_xpath("//*[contains(@class, 'topic/prodname')]/text()"[1]);
  display:block;
}

This will show the element name, its class attribute, and will paint a blue border around each of the elements in the output. It will not show the page margin boxes or some content elements that were hidden.

How to Speed up CSS Development and Debugging

You can speed up your CSS development considerably by not invoking the entire pipeline of transforming your DITA maps to PDF. Instead, you can use the merged map (on page 1658) and transform it directly to PDF.

1. Transform your DITA Map to PDF using the DITA Map PDF - based on HTML5 & CSS or DITA Map PDF - based on DITA & CSS transformation scenario.
2. Open the merged file (on page 1658) (*.merged.html or *.merged.xml) that is located in the output directory in the editor.
3. Configure an XML to PDF transformation with CSS scenario. Do not set CSS files here since the merged file already contains pointers to the stylesheets. This scenario uses the Chemistry CSS processor.
4. Optional: Enable the output of the CSS processor using the following preferences page: Options > Preferences > XML > PDF Processors > CSS Processor.

Now you can make incremental changes to the CSS stylesheet and quickly see the results by transforming the merged file directly.

Fastpath: If your changes involve only element styling, with no specific paged media CSS rules and properties, you can simply open the merged file in a browser (such as Chrome or Firefox) and refresh at each CSS change, as shown in: Debugging the CSS (on page 1658).

How to Write XPath Expressions

This topic contains some guidelines for writing XPath expressions. They are used to extract the content from the merged DITA map document.

This is an example where the product name meta-information is placed before the front page title:
Notes:

• Do not use the DITA element names directly. You must use the DITA `@class` attribute instead, as these attributes are propagated to the merged elements (including HTML `<div>` elements) while the element names can be lost. By using the class selectors, you also cover DITA specializations.
• Use the `[1]` XPath predicate to select the first value from the document. For example,
  
  ```xml
  oxy_xpath('//*[contains(@class, 'topic/prodname')]/text()')[1]
  ```
  
  The meta-information might be copied multiple times in the output, inherited by the `<topicref>` elements, so you can get many more values than expected.
• Do not use strings as values for the pseudo elements content, as the string values are not supported for pseudo elements. Instead, use the XPath directly.
• Use the Oxygen XPath Builder view to test the XPath expressions.

Related Information:

• How to Debug XPath Expressions (on page 1662)

How to Debug XPath Expressions

You can use the content extracted from the document using the `oxy_xpath` function in your pseudo elements (`:before`, `:after`) or in `string-set` variables.

For example, the following XPath finds the publication author, set in the DITA map:

```xml
<map>
  <title>The Art of Bike Repair</title>
  <topicmeta>
    <author>John Doe</author>
  </topicmeta>
  ...
</map>

:root {
  string-set: author oxy_xpath('//*[contains(@class, "front-page/front-page")]/
  *[contains(@class, "map/topicmeta")]/*[contains(@class, "topic/author")]/text()');
}
```

To debug an XPath expression:

1. Read the XPath Expressions Guidelines (on page 1661).
2. Begin by transforming your document using your customization CSS.
3. In the output folder, you will find a [MAP_NAME].merged.xml file (or if you are using the DITA Map PDF - based on HTML5 & CSS transformation, a [MAP_NAME].merged.html file).
4. Open the merged file in the Oxygen XML Editor/Author.
5. Activate the XPath Builder view (Window > Show View > XPath/XQuery Builder).
6. Paste your XPath expression and press the Execute XPath button. Check if it returns the expected results.

The XPath builder has a function that allows it to display the document path of the current element from the editor (Settings drop-down menu > Update on cursor move). Alternatively, you can right-click the element in the merged document and select the Copy XPath action, then paste it in the XPath builder.

- XPath Builder Documentation
- XPath Examples (w3schools.com)

Default Page Definitions

All page definitions are found in: [PLUGIN_DIR]css/print/p-pages-and-headers.css.

⚠️ Note: This is listed solely for illustration purposes, as the plugin might use something different.

There are pages for the default page, chapter page, front matter page, back matter page, blank pages, index page, and large tables page.

**Default Page**

The default page imposes a header that contains the publication title, chapter, and section title. They alternate on the left or right side of the page:

```xml
@page :left {
    @top-left {
        content: string(maptitle) string(parttitle) string(chaptertitle)
        string(sectiontitle) " | " counter(page);
        font-size:8pt;
    }
}
```
Tip: To override the default rules defined for named pages (such as chapter or table of contents), you need to use more specific page rules that contain the page name:

```xml
@page :right {  
    @top-right {  
        content: string(maptitle) string(parttitle) string(chaptertitle)  
        string(sectiontitle) " | " counter(page);  
        font-size:8pt;  
    }  
}  
```

Chapter Page

This is inherited from the default page. The chapter page is associated to the topics marked as chapters, usually direct children of the map. It clears the header from the first page of each chapter.

```xml
@page chapter{  
    /* Currently inherit from the default page.*/  
}  
/* No headers on the chapter first page. */  
@page chapter:first: left{  
    @top-left {  
        content: none;  
    }  
}  
@page chapter:first: right{  
    @top-right {  
        content: none;  
    }  
}  
```
Front Matter and Back Matter page

The bookmap front matter and back matter page. It clears the headers.

```xml
@page matter-page {
    @top-left-corner    { content:none }
    @top-left           { content:none }
    @top-center         { content:none }
    @top-right          { content:none }
    @top-right-corner   { content:none }
    @bottom-left-corner { content:none }
    @bottom-left        { content:none }
    @bottom-center      { content:none }
    @bottom-right       { content:none }
    @bottom-right-corner{ content:none }
}
```

Blank Pages

The following example clears the header for the blank pages that may be created by a page-break-before, page-break-after, or by using double side pagination (on page 1725):

```xml
@page :blank{
    @top-left { content: none; }
    @top-right { content: none; }
}
```

Index Page

The page that contains the index terms (appears only if there are such items in your topics). It uses a lower roman page number in the footer:

```xml
@page index {
    @top-left-corner    { content:none }
}
```
When transformed, the page layout is spread on two columns.

### Large Tables Page

The big tables are placed on a rotated page, with orientation landscape:

```xml
@page landscape-page :right {
  size: landscape;

  @top-left {
    content: none
  }

  @top-center {
    content: none
  }

  @top-right {
    content: none
  }

  @right-bottom {
    content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " | " counter(page);
    font-size: 8pt;
    transform: rotate(90);
  }

  @top-left-corner {
    content: none
  }

  @top-center-corner {
    content: none
  }

  @top-right-corner {
    content: none
  }

  @bottom-left-corner {
    content: none
  }

  @bottom-left {
    content: none
  }

  @bottom-center {
    content: counter(page, lower-alpha)
  }

  @bottom-right {
    content: none
  }

  @bottom-right-corner {
    content: none
  }
}
```
Page Size

This is where you can find information on how the page sizes are defined.

Page Size - Built-in CSS rules

The {PLUGIN_DIR}/css/print/p-page-size.css file contains the default page rules. It uses the US-LETTER size (8.5 X 11 inches). The content of this file is:

```css
@page {
    padding-top: 0.2em;
    padding-bottom: 0.2em;
    size: us-letter;
}
```
How to Change the Page Size

Suppose you want to publish using the standard A4 page size, with a margin of 2cm.

In your customization CSS (on page 1657), use:

```css
@page {
    size: A4;
    margin: 2cm;
}
```

If you need different margins depending on the page side:

```css
@page {
    size: A4;
    margin: 2cm;
}

@page :left{
    margin-right: 4cm;
}

@page :right{
    margin-left: 4cm;
}
```

This would only increase the gutter margins or the inside margins needed for binding of the final book. The other margins would remain 2cm.

How to Change the Page Orientation

Suppose you want to publish on a landscape page. The default is portrait, so you need to change it by using the size property. This will contain both the physical measurements and the orientation. In your customization CSS (on page 1657), use:

```css
@page {
    size: us-letter landscape;
}
```
How to Change the Page Settings for a Specific Element

Suppose your publication is mainly using a portrait page orientation, but there are some topics that have wide images. To avoid having the images bleeding outside of the page, you could use a wider page setting (landscape).

1. Mark the topic with an @outputclass attribute and give it a distinct value (for example, wide).
   You can set the attribute on the root element of the topic, or on the <topicref> element from the map.

   Note: The outputclass values from the topicref automatically propagate to the root of the topic from the merged map (on page 1658).

2. In your customization CSS (on page 1657), match the output class and associate it with a named page. This page has landscape orientation and small margins. This technique works for any element (consider a table or a list) not necessarily a topic.

   ```css
   *[outputclass = 'wide'] { 
       page: wide-page; 
   }
   
   @page wide-page { 
       size: letter landscape; 
       margin: 0.5in; 
   }
   ```

Page Headers and Footers

The page headers and footers use the string sets defined for publication, chapter, and section titles. These string-sets are defined in the numbering CSS (on page 1704):

- `parttitle`  
  Set to the title of the current part (only for DITA bookmaps that use parts).

- `chaptertitle`  
  Set to the title of the current chapter (Shallow and Deep numbering).

- `sectiontitle`  
  Set to the title of each section (Deep numbering only).

Although you may define string sets in your customization CSS, you need to take into account the fact that the string-set CSS property is not additive, and matching the same elements will end up breaking the current definitions. A very common use-case is to match the title element that is also used in the default CSS. The best approach in this case is to take a look at the rules from the numbering CSS.
(on page 1704), copy the ones dealing with string sets to your customization, then alter the property definition by adding your definition to the existing ones (and not removing the existing ones).

**Related Information:**

- Numbering (on page 1704)

---

Page Headers and Footers - Built-in CSS

The headers and footers are part of the page definitions. To see how the default page layouts are defined, see: Default Page Definitions (on page 1663).

**How to Position Text in the Headers and Footers**

By default, the name of the publication and chapter titles are placed in the top-left or top-right page margin boxes:

```css
@page :left {
  @top-left {
    content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " | " counter(page);
  }
}

@page :right {
  @top-right {
    content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " | " counter(page);
  }
}
```

If you want to change this, you should use the `content` CSS properties of other page margin boxes, and inhibit the ones in the above content. For example, to set the chapter title in the page top left corner, you can use:

```css
@page :left {
  @top-left {
    content:none;
  }

  @top-left-corner {
    content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " | " counter(page);
  }
```

Note: The corner page margin boxes are fixed and limited as the available space. Above, the `text-align` and `white-space` properties are used to make the text bleed out of these boxes towards the center of the page. If you plan to add an image or artwork background, you should consider using the technique described in: How to Decorate the Header by Using a Background Image on the Entire Page (on page 1676).

How to Change the Size of Headers and Footers

This is directly related to the page margins and size.

The headers and footers are placed in the so called page margin boxes, a series of rectangular areas residing in the page margins.

To affect the margins of all page definitions, you may use the following rule:

```css
@page {
  margin-top: 3cm !important;
  margin-bottom: 3cm !important;
  margin-left: 2cm !important;
  margin-right: 2cm !important;
}
```
If you want to affect only a specific page, like the first page from chapters for instance, you must use more specific page selectors. See the Default Page Definitions (on page 1663) for details.

Note that the page margin boxes fill the entire page margin. This means the margin-top, for example, dictates the height of the @top-left-corner, @top-left, @top-center, @top-right, @top-right-corner margin boxes. These cannot have margins on themselves, so to change the position of the content inside them, you must use padding properties:

```css
@page {
  @top-left {
    content: "...
    padding: 1cm;
  }
  ..
}
```

How to Change the Font of the Headers and Footers

To change the font for all the headers and footers, in your customization CSS (on page 1657), add a CSS rule similar to this:

```css
@page {
  font-size: 12pt;
  font-family: "Arial";
}
```

⚠️ Important: These settings apply to all page margin boxes, but not to the text inside the page.

If you want to change the settings only for a specific page type (for example, the table of contents), use the name of the page:

```css
@page table-of-contents {
  font-size: 12pt;
  font-family: "Arial";
}
```

Related Information:

- How to Change the Header of the Table of Contents (on page 1715)
How to Add a Multi-line Copyright Notice to the Footer

Suppose you want to add a footer with the following two lines of text at the end of each page that is shown on the right side:

© 2017 - My Company Ltd
All rights reserved

For this, you need to specify a rule that matches all the right pages and adds that content in the `bottom-center`. In your *customization CSS (on page 1657)*, add the following CSS rule:

```css
@page :right {
  @bottom-center {
    content: "© 2017 - My Company Ltd \A All rights reserved";
    font-size: 0.5em;
    color: silver;
  }
}
```

**Note:** Other page rules (such as the `table-of-contents`) override the contents of the `@bottom-center` because they are more specific. If you need to also print the copyright in the TOC pages, then use this as the selector:

```css
@page :right, table-of-contents:right {
  ...
}
```

**Note:** To use new lines (`\n` characters) in your headers or footers, use the `\A` notation, as in the example above.

How to Add a Group of Topics to the Footer

To create a footer that contains the content of several topic files, but only on the last page, there are two possible approaches:

**Method 1: Using the position:fixed CSS Property**

1. Group all the footer topics under a single parent topic, under the last topic from your DITA map.

   For example, you can have the following map structure:

   ```xml
   ...
   End topic
   Footer container topic
   ```
2. Add an `<outputclass>=footer` on the `<topic>` root element of the footer container topic, or on its `<topicref>` in the map.

3. Use the CSS `position: fixed` property to position this topic to the bottom of the page:

   ```css
   *[outputclass =~ "footer"] {
     position: fixed;

     bottom: 0.5in;
     left: 0.5in;

     width: 5in;
     height: 200pt;
   }
   ```

   **Note:** Make sure the width and height are enough for the content of the footer to fit. Be careful because the content might bleed out of the page. Use bottom and left values to position the block in the page.

**Method 2: Using the float:footnote CSS Property**

The second approach would be to declare the footer block as a footnote. Assuming the same DITA Map structure as above, you can use the following CSS fragment:

   ```css
   *[outputclass =~ "footer"] {
     float: footnote;
   }

   *[outputclass =~ "footer"]:footnote-call{
     color: transparent;
     font-size: 0;
   }

   *[outputclass =~ "footer"]:footnote-marker{
     color: transparent;
     font-size: 0;
   }
   ```

   **Note:** Use transparent colors and/or zero size font to avoid the display of the footnote counters.
How to Add a Background Image to the Header

A common use-case is to add a background image to one of the page corners.

```xml
@page :left {
    @bottom-left-corner{
        content: " ";
        background-image: url('https://www.oxygenxml.com/resellers/resources/OxygenXMLEditor_icon.svg');
        background-repeat:no-repeat;
        background-position:50% 50%;
    }
}
```

⚠️ **Important:** Always specify a `content` property. If not, the page margin box will not be generated.

Another use-case is to use one of the `@top-left` or `@top-right` page margin boxes. These boxes have an automatic layout and they can be very small if they have no content. If there is no text to be placed over the image, use a series of non-breaking spaces ( \A0 ) to increase the box width as in the following example (alternatively, you can use the technique described in How to Decorate the Header by Using a Background Image on the Entire Page (on page 1676)):

```xml
@page :left {
    @top-left{
        content: '\A0\A0\A0\A0\A0\A0\A0\A0\A0\A0\A0\A0\A0\A0\A0\A0\A0\A0\A0';
        background-image: url('https://www.oxygenxml.com/resellers/resources/OxygenXMLEditor_icon.svg');
        background-repeat:no-repeat;
        background-position:50% 50%;
    }
}
```

⚠️ **Note:** You can use raster image formats (such as PNG or JPEG), but it is best to use vector images (such as SVG or PDF). They scale very well and produce better results when printed. In addition the text from these images is searchable and can be selected (if the glyphs have not been converted to shapes) in the PDF viewer.

**Related Information:**

- Images and Figures (on page 1766)
How to Decorate the Header by Using a Background Image on the Entire Page

If you want to precisely position artwork and the page margin boxes are not sufficient, it is possible to use a background image for the entire page.

This technique consists of creating an image (SVG is the best since it is a vector image) as wide as the page that would contain the logo and placing other decorations at the desired locations. This offers the best results and the position of the artwork does not depend on the page margin contents.

Example:

```css
@page :left, chapter: left, chapter: first: left {
    background-image: url('img/page_background_image_with_logos_and_artwork_for_left_page.svg');
    background-repeat: no-repeat;
    background-position: 50% 50%;
}
```

For a list of all the possible page names, see: Default Page Definitions (on page 1663).

Related Information:

- How to Add a Background Image for the Cover (on page 1694)

How to Style a Part of the Text from the Header

If you need to style a fragment of text (for example, a company slogan) with certain colors or font styles, you have several options:

- Use an SVG image as background for a page margin box or for the entire page. See: How to Add a Background Image to the Header (on page 1674).
- Use the `oxy_label` constructor. This is a function that creates a text label with a set of styles.

```css
@page {
    @top-right {
        content: oxy_label(text, "My Company", styles, "color:red; font-size: larger;")
    }
}
```
You can combine the `oxy_label` with `oxy_xpath`, to extract and style a piece of text from the document:

```xml
content: oxy_label(text, oxy_xpath("/some/xpath"), styles, "color:blue; ");
```

**Note:** These functions work only with the Chemistry CSS processor.

**Note:** You cannot use `string()` inside an `oxy_label()`. As a workaround, to apply styling on the dynamic text retrieved by a `string()` function you can define some overall styles for the entire page margin box and then use the `oxy_label` to style differently the static text.

```xml
@page {
  @top-right {
    color: red;
    content: oxy_label(text, "My Company", styles, "color:black")
    ' ' 
    string(chaptertitle); /* This inherits the styling from @top-right*/
  }
}
```

• Use two adjacent page margin boxes, and style them differently:

```xml
@page {
  @top-center {
    content: "First part";
    color: red;
    text-align:right;
  }
  @top-left {
    content: "- Second part";
    color: blue;
    text-align:left;
  }
}
```
How to Simplify the Header (Keep Only the Chapter Title)

The headers display information such as map title, part title, chapter title, and section title, ending in the page number.

content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " \n| " counter(page);

This might be too much if you have long titles. The solution is to override the default header content.

In your customization CSS (on page 1657), add the following CSS rule:

```css
@page :left {
  @top-left {
    content: string(chaptertitle) " | " counter(page);
  }
}

@page :right{
  @top-right {
    content: string(chaptertitle) " | " counter(page);
  }
}
```

⚠️ **Important:** Some of the CSS default page rules are more important. If you see that the content does not change:

- Try to also specify the name of the page, to increase the specificity of the rules:

```css
@page :left, table-of-contents:left, chapter:left{
  ...
}

@page :right, table-of-contents:right, chapter:right{
  ...
}
```

- Add an `!important` classifier just before the semi-colon.

```css
@top-right {
  content: string(chaptertitle) " | " counter(page) !important;
}
```
How to Change the Header Separators (Between Sections and Chapter Titles)

There are some strings defined for part, chapter, and sections. Each of these strings start with the " | " character as a separator. For example, in the header of a page, you may find a sequence of strings:

| My Publication | Introduction | Getting Started |

1. "My Publication" is the value of the maptitle string.
2. "Introduction" is the value of the chaptertitle string.
3. "Getting Started" is the value of the sectiontitle string.

There might be cases where you want to change this separator. You will need to recompose the header content using the above string sets. Suppose you want to use " - " as a separator. In your customization CSS (on page 1657), add the following CSS rule:

```css
*[class ~="topic/topic"] [is-part] > *[class ~="topic/title"] {
  string-set: parttitle " - " counter(part, upper-roman) " - " content(),
  chaptertitle ""; /* Avoid propagating a past chapter title on a new part */
}
*[class ~="topic/topic"] [is-chapter]:not([is-part]) > *[class ~="topic/title"] {
  string-set: chaptertitle " - " counter(chapter) " - " content();
}
```

If you enabled the deep numbering for chapters and subsections (on page 1708), then use:

```css
/*
* Alter the string sets that are shown in the header of the page.
*/
*class ~="map/map"] [p|numbering^="deep"] *[class ~="topic/topic"] [is-part] > *[class ~="topic/title"] {
  string-set: parttitle " - " counter(part, upper-roman) " - " content(),
  chaptertitle ""; /* Avoid propagating a past chapter title on a new part */
}
*class ~="map/map"] [p|numbering^="deep"] *[class ~="topic/topic"] [is-chapter]:not([is-part]) > *[class ~="topic/title"] {
  string-set: chaptertitle " - " counter(chapter) " - " content(), sectiontitle "";
}
*class ~="map/map"] [p|numbering^="deep"] *[class ~="topic/topic"] [is-chapter]:not([is-part]) > *[class ~="topic/title"] > *[class ~="topic/title"] {
  string-set: sectiontitle " - " counter(chapter) "." counter(section1) " - " content();
}
```
How to Change the Header Styling Depending on Page Side

To modify the styling of the default page headers, add the following CSS rule in your customization CSS (on page 1657):

```css
@page :left {
  @top-left {
    color: navy;
    font-style: italic;
  }
  @top-right {
    color: red;
  }
}
```

If you intend to modify just the headers of the table of contents, use the `table-of-contents` page rule selector:

```css
@page table-of-contents: left {
  @top-left {
    color: navy;
    font-style: italic;
  }
  @top-right {
    color: red;
  }
}
```

How to Use XPath Computed Data or Images in the Header or Footer

A very simple approach is to use the `oxy_xpath` directly in the `content` property:

```css
@page front-page {
  @top-center {
    content: "Created: " oxy_xpath('//*[contains(@class, " topic/created ")[1]'));
  }
}
```

Example 1: Compute the Number of Words

The following example computes the number of words from the publication. It counts all the words, including the ones from the TOC, but does not take the static labels into account:

```css
@page front-page {
```
```
Tip: XPath 2.0 is supported (not schema aware).

Example 2: Retrieve Image from a Document and Insert it in the Header

Another example is to use an image from the document in the publication header:

```xml
<bookmeta>
  <metadata>...
    <data name="cover">
      <image href="product-cover.png" outputclass="cover-image"/>
    </data>
  ...
</metadata>
</bookmeta>
```

```css
@page {
  @top-center {
    content: url("oxy_xpath('//*[contains(@outputclass, "cover-image")]/@href]");
  }
}
```

If the URL returned by oxy_xpath is not absolute, it is considered to be relative to the CSS file. To obtain an absolute URL from one relative to the XML document, you can use in the XPath expression functions like resolve-uri and document-uri:

```css
@page {
  @top-center {
    content: url(oxy_xpath("resolve-uri(@href)[contains(outputclass, "cover-image")]"));
  }
}
```
Example 3: Insert the Current Date in the Footer

Another example is to use the `oxy_xpath` function to compute the current date and insert it in the publication footer:

```xml
@page {
    @bottom-left {
        content: oxy_xpath('current-date()');
    }
}
```

- Oxygen User Guide: `oxy_xpath()` Function

How to Change Header Images for Each Chapter

It is possible to dynamically change an image in the header depending on the chapter. For this, you need to define an image reference in the metadata section of each chapter. One way is to specify it in the DITA map by using the `<topicmeta>` element for the `<chapter>` topic reference:

```xml
<chapter href="topics/installing.dita">
    <topicmeta>
        <data name="header-image" value="img/installing.png"/>
    </topicmeta>
    ...
</chapter>
```

In the above example, there is a set of key value pairs with the name `header-image`. The `img/installing.png` is an image reference relative to the DITA map URI. This information is automatically copied into the content in the merged map file (on page 1658), like this:

```xml
<topic is-chapter="true" ...>
    <title class="- topic/title ">Installing</title>
```
You install components to make them available for your solution.

This information can be picked up from CSS:

```css
/* Define the string set variable that contains an URL */
*[class =~ "topic/topic"] *[class =~ "topic/data"] [name="header-image"] {
    string-set: imgst oxy_url(oxy_xpath('/@xtrf'), attr(value));
}

/* Using the value='none' stops applying the image. */
*[class =~ "topic/topic"] *[class =~ "topic/data"] [name="header-image"] [value="none"] {
    string-set: imgst "";
}

/* Use the string set variable in one of the page margin boxes. */
$page chapter {
    @top-left-corner {
        content: string(imgst);
        font-size: 0; /* remove the font ascent and descent */
    }
}
```

**Details:** The `@value` attribute is used to build a URL relative to the URI of the DITA map. To determine the base URI of the DITA map, the `@xtrf` attribute was used from the root element of the merged map document, extracted using the `oxy_xpath` function.

**Notes:**

- The image is always aligned vertically to the middle of available space from the page margin box.
- Make sure you use an image of the correct size. For example, if you want to place the image in the top-left corner of the page, assuming the top and left page margins are 1 in, then make sure the image is a square having a size of 1 in.
- The image is applied to all pages that follow the data element, until another data element changes it:
To clear the image, use the `none` value:

```xml
...<data name="header-image" value="none"/>
...```

How to Add a Line Under the Header

There are two ways to add a horizontal line under the header.

**Method 1: Add a Border in the Page Margin Boxes**

To add a horizontal line that would stretch across the width of the page, add a bottom border to each of the 5 margin boxes in the top side of the page (top-left-corner, top-left, top-center, top-right, top-right-corner).

If you consider that the space between the header and the bottom border is too large, you could also change the alignment by adding a `vertical-align: bottom;` declaration in the page margin boxes.

For example, if you need to set some text as a header in the top-left margin box and insert a horizontal line under it, the customization CSS would look something like this:

```css
@page chapter, chapter:first: left: right, front-page{
...```
Note: The `padding-top: 1em;` is used to avoid the border at the bottom of the header that joins with the page content.

Method 2: Use a Background Image

An alternative method is to add a horizontal line/border under an existing header (or in any other part of the page) using an SVG image, as described in How to Add a Background Image to the Header (on page 1674).
Metadata

DITA has a solid vocabulary for specifying metadata. There are `<prolog>` elements in the topics, and `<topicmeta>`, `<bookmeta>` elements in the bookmaps. They can be used to define authors, dates, audiences, organizations, etc. See: https://www.oxygenxml.com/dita/1.3/specs/archSpec/base/metadata-in-maps-and-topics.html

It is up to you to decide where this information should be presented, in the PDF content or in the PDF document properties.

Metadata - XML Fragment

In the merged map file (on page 1658), the metadata section is placed inside the `<oxy:front-page>` element. This is different from the original placement in the map or bookmap - after the title, but allows usage of information from it in the title page.

Bookmaps

This is an example of a section taken from a merged bookmap. It only contains some of the possible metadata elements. The `<bookmeta>` metadata section is inherited from `<topicmeta>`:

```xml
         xmlns:opentopic-index="http://www.idiominc.com/opentopic/index"
         cascade="merge"
         ditaarch:DITAArchVersion="1.3">
    <bookmeta xmlns:dita-ot="http://dita-ot.sourceforge.net/ns/201007/dita-ot"
              class="- map/topicmeta bookmap/bookmeta">
      <author class="- topic/author">Howe Tuduit</author>
      <bookid class="- topic/data bookmap/bookid">
        <isbn class="- topic/data bookmap/isbn">071271271X</isbn>
        <booknumber class="- topic/data bookmap/booknumber">SG99-9999-00</booknumber>
        <maintainer class="- topic/data bookmap/maintainer">
          <organization class="- topic/data bookmap/organization">ACME Tools</organization>
        </maintainer>
        <person class="- topic/data bookmap/person"/>
      </bookid>
    </bookmeta>

    ...
For the DITA Map PDF - based on HTML5 & CSS transformation type, the merged map is further processed resulting in a collection of HTML5 `<div>` elements. These elements preserve the original DITA `@class` attribute values and add a new value derived from the DITA element name.
Maps

The maps have a more simple structure, they use the `<topicmeta>` element for metadata sections. This is also a simplified example, as there may be many more elements in the metadata section:

```xml
<map xmlns:ditaarch="http://dita.oasis-open.org/architecture/2005/"
     xmlns:opentopic-index="http://www.idiominc.com/opentopic/index"
     cascade="merge" class="- map/map"
     ditaarch:DITAArchVersion="1.3">

... 
</map>

  <topicmeta class="- map/topicmeta">
    <author class="- topic/author">Dan C</author>
    <metadata class="- topic/metadata">
      <prodinfo class="- topic/prodinfo">
        <prodname class="- topic/prodname">oXygen PDF CSS DITA Plugin</prodname>
      </prodinfo>
    </metadata>
    <audience/>
  </topicmeta>

... 
</oxy:front-page>
```

For the DITA Map PDF - based on HTML5 & CSS transformation type, the merged map is further processed resulting in a collection of HTML5 `<div>` elements:

```xml
    xmlns:opentopic-index="http://www.idiominc.com/opentopic/index"
    cascade="merge" class="- map/map"
    ditaarch:DITAArchVersion="1.3">

... 
</div>

<div class=" front-page/front-page front-page">

  ...

</div>

<div class="- map/topicmeta topicmeta">

  <div class="- topic/author author">
    Dan C
  </div>

</div>
```
Metadata - Built-in CSS rules

The [PLUGIN_DIR]/css/print/p-meta.css file contains the rules that extract metadata.

How to Add the Publication Audience to the Custom PDF Metadata

The audience element indicates the users the publication is addressing. This can be placed inside a <topicmeta> element in a <map> as in the following example:

```xml
<map>
    ...
    <topicmeta>
        ...
        <audience type="programmer" job="programming" experiencelevel="expert"/>
    </topicmeta>
</map>
```

To collect the @type attribute, add the following in your customization CSS (on page 1657):

```css
*[class =~ "map/map"] > *[class =~ "map/topicmeta"] > *[class =~ "topic/audience"] {
    -oxy-pdf-meta-custom: "Audience" attr(type);
}
```

**Note:** It is best to use the class selector (such as *[class =~ "map/topicmeta"]) instead of topicmeta to cover cases where the elements are specialized (for instance, in a bookmap the bookmeta is a topicmeta, so your selector will also function for bookmaps, not only simple maps.

**Note:** The selector begins with map > to choose the <topicmeta> that is a direct child of the map, not other <topicmeta> elements from other <topicref> elements.

The metadata is displayed in the Custom tab of the Document Properties dialog box from Acrobat Reader:
How to Show Metadata in the Cover Page

Suppose you need to present the author and the ISBN just under the publication title. Your bookmap contains:

```xml
<bookmap id="taskbook">
  <booktitle>
    <booklibrary>Retro Tools</booklibrary>
    <mainbooktitle>Product tasks</mainbooktitle>
    <booktitlealt>Tasks and what they can do</booktitlealt>
  </booktitle>
  <bookmeta>
    <author>Howe Tuduit</author>
    <critdates>
      <created date="1/1/2015"/>
      <revised modified="3/4/2016"/>
      <revised modified="3/5/2016"/>
    </critdates>
    <bookid>
      <isbn>071271271X</isbn>
      <booknumber>SG99-9999-00</booknumber>
    </bookid>
  </bookmeta>
</bookmap>
```
The entire `<booktitle>` element content is displayed on the first page of the PDF, so suppose you need to add the information after it.

In your customization CSS (on page 1657), add the following CSS rules:

```css
*[class ~="bookmap/booktitle"]:after {
  display: block;
  content: "by " oxy_xpath("//*[contains(@class, " bookmap/bookmeta ")]/*[contains(@class, " topic/author ")]//text()";
  margin-top: 4em;
  text-align: center;
  color: gray;
}
*[class ~="bookmap/booktitle"]:after(2) {
  display: block;
  content: "ISBN " oxy_xpath("//*[contains(@class, " bookmap/isbn ")]//text()";
  text-align: center;
  color: gray;
}
```

The following CSS extensions were used in this example:

- **oxy_xpath** - Executes an XPath expression and returns a string content. Use this whenever you need to extract data from elements other than the one matched by the CSS rule selector.
- **:after(N)** - Creates more than one `after` pseudo element. The argument value represents how far the generated content is from the real content. In the example above, the content of the `:after` is closer to the title (upper) than the content of the `:after(2)`.

Note: The `attr()` CSS function can also be used but is limited to extracting attribute values from the matched element.

Generating Synthetic Pages for Metadata.

Suppose you need to show this information on a page that follows the title page, instead of on the title page. In this case, you need to prepare a named page and place the content on it. In your customization CSS (on page 1657), add the following CSS rules:

```css
@page page-for-meta {
  background-color: yellow; /* Just to see it better*/
  @top-left-corner {
    content: ""; /* Remove the default header */
  }
```
How to Show Metadata in the Header or Footer

The header and footer are composed of page margin boxes that can be populated with static text by using string-sets. If you need to add some of the map metadata to the header of the front page (for example, the creation date), add the following CSS rules in your customization CSS (on page 1657):

```css
*[class ~= "bookmap/booktitle"]:after { 
    page: page-for-meta;
}
*[class ~= "bookmap/booktitle"]:after(2) { 
    page: page-for-meta;
}
```

```css
@page front-page { 
    @top-center { 
        content: "Created: " string(mapcreated);
    }
}
```

**Note:** The front-page is the name of a page that used to present the element with the class “front-page/front-page”. The above page rule is combined with the default styles.

Cover (Title) Page

Customizing the cover page is one of the most requested customization requests.
Cover Page - XML Fragment

The merged map file (on page 1658) contains the `<oxy:front-page>` element, as a child of the root element. This contains the metadata and an `<oxy:front-page-title>` element with the title structure.

```xml
<bookmap xmlns:ditaarch="http://dita.oasis-open.org/architecture/2005/" ...>
    <bookmeta xmlns:dita-ot="http://dita-ot.sourceforge.net/ns/201007/dita-ot" ...
    </bookmeta>
    <oxy:front-page-title>
      <booktitle xmlns:dita-ot="http://dita-ot.sourceforge.net/ns/201007/dita-ot" class="- topic/title bookmap/booktitle">
        <booklibrary class="- topic/ph bookmap/booklibrary">Retro Tools</booklibrary>
        <mainbooktitle class="- topic/ph bookmap/mainbooktitle">Tasks</mainbooktitle>
        <booktitlealt class="- topic/ph bookmap/booktitlealt">Product tasks</booktitlealt>
      </booktitle>
    </oxy:front-page-title>
  </oxy:front-page>
</bookmap>
```

For the DITA Map PDF - based on HTML5 & CSS transformation type, the merged map is further processed resulting in a collection of HTML5 `<div>` elements. These elements preserve the original DITA `@class` attribute values and add a new value derived from the DITA element name.

```html
<div class="- map/map bookmap/bookmap bookmap" ...>
  <div class="- front-page/front-page front-page front-page">
    <div class="- map/topicmeta bookmap/bookmeta boometa">
      ...
    </div>
  </div>
  <div class="- front-page/front-page-title front-page-title">
    <div class="- topic/title bookmap/booktitle booktitle">
      <booklibrary class="- topic/ph bookmap/booklibrary booklibrary">Retro Tools</booklibrary>
      <mainbooktitle class="- topic/ph bookmap/mainbooktitle mainbooktitle">Tasks</mainbooktitle>
      <booktitlealt class="- topic/ph bookmap/booktitlealt booktitlealt">Product tasks</booktitlealt>
    </div>
  </div>
</div>
```
Cover Page - Built-in CSS rules

The element with the class `frontpage/frontpage` is associated with a page named `front-page` with no headers or footers. The front page title is styled with a bigger font. The built-in CSS rules are in `[PLUGIN_DIR]/css/print/p-front-page.css`.

```css
@media print {
  *[class~="front-page/front-page"] {
    page: front-page;
  }

  *[class~="front-page/front-page-title"] {
    display:block;
    text-align:center;
    margin-top:3in;
    font-size:2em;
    font-family:arial, helvetica, sans-serif;
    font-weight:bold;
  }

  @page front-page {
    @top-left-corner { content:none }
    @top-left { content:none }
    @top-center { content:none }
    @top-right { content:none }
    @top-right-corner { content:none }
    @bottom-left-corner { content:none }
    @bottom-left { content:none }
    @bottom-center { content:none }
    @bottom-right { content:none }
    @bottom-right-corner{ content:none }
  }
}
```

**Note:** This is listed solely for illustration purposes, as the plugin might use something different.

How to Add a Background Image for the Cover

The simplest way is to create an SVG image as large as the entire physical page and set it as the background for the `front-page`. This makes it very easy to accomplish a good positioning of the
graphical elements or artwork. In the foreground, you can place text fragments using a series of :after pseudo elements bound to the front page title.

To set the size to an SVG image, you should specify the @width and @height attributes on the <svg> root element using specified unit values (in, cm, etc.) This should be enough only if all the coordinates from your drawing have unit identifiers.

If you are using unit-less coordinates in your drawing like the following:

```xml
<svg xmlns="http://www.w3.org/2000/svg" width="8.5in" height="11in"
viewBox="0 0 600 850">
  <desc>A gradient as big as a page.</desc>
  <defs>
    <linearGradient id="lc"
      x1="0%" y1="0%"
      x2="0%" y2="100%"
      spreadMethod="pad">
      <stop offset="0%" stop-color="#00DD00" stop-opacity="1"/>
      <stop offset="100%" stop-color="#00AA00" stop-opacity="1"/>
    </linearGradient>
  </defs>
  <rect x="5" y="5" width="100" height="100" rx="10" ry="10"
    style="fill:url(#lc);
    stroke: #005000;
    stroke-width: 3;"
  >
  <text x="33%" y="50%" color="#FFFFAA"> Sample </text>
</svg>
```

then make sure you also specify a @viewBox attribute on the <svg> root element that defines the abstract rectangle that contains the drawing:

```xml
<svg xmlns="http://www.w3.org/2000/svg" width="8.5in" height="11in"
viewBox="0 0 110 110">
  <desc>A gradient as big as a page.</desc>
  <defs>
    <linearGradient id="lc"
      x1="0%" y1="0%"
      x2="0%" y2="100%"
      spreadMethod="pad">
      <stop offset="0%" stop-color="#00DD00" stop-opacity="1"/>
      <stop offset="100%" stop-color="#00AA00" stop-opacity="1"/>
    </linearGradient>
  </defs>
  <rect x="5" y="5" width="100" height="100" rx="10" ry="10"
    style="fill:url(#lc);
    stroke: #005000;
    stroke-width: 3;"
  >
  <text x="33%" y="50%" color="#FFFFAA"> Sample </text>
</svg>
```

The following SVG document has the @width, @height, and @viewBox attributes. The width and height have physical units (in inches), while the view box and rectangle coordinates are unit-less.
This example shows a gradient. It is the size of a US-LETTER page and can be used in a publication using this page size.

**Note:** You can use raster image formats (such as PNG or JPEG), but it is best to use vector images (such as SVG or PDF). They scale very well and produce better results when printed. In addition the text from these images is searchable and can be selected (if the glyphs have not been converted to shapes) in the PDF viewer.

In your **customization CSS (on page 1657)**, add the following:

```css
@page front-page {
  background-image: url("us-letter.svg");
  background-position: center;
}
```

For smaller artworks, you can use `background-position` with percentage values to position and center the artwork (for example, a company logo):

```css
@page front-page {
  background-image: url("company-logo.svg");
  background-position: 50% 5%; /* The first is the alignment on the X axis, the second on the Y axis.*/
  background-repeat: no-repeat;
}
```

**Note:** The text from the SVG or PDF background images are searchable in the PDF reader.

**How to Change Styling of the Cover Page Title**

Match the front page title element in your **customization CSS (on page 1657)** based on its class attribute:

```css
*[class ~="front-page/front-page-title"] {
  margin-top: 1in;
  font-size: 3em;
}
```
How to Add Text to the Cover Page

If you need to add arbitrary text to the cover page, you can use the front page title element as an anchor and add as many blocks of text as you need after it, and style them differently.

In your customization CSS (on page 1657), add the following:

```css
*[class =~ "front-page/front-page-title"]:after(1) {
  display: block;
  content: "DRAFT VERSION";
  font-size: large;
  color: red;
  text-align: center;
}

*[class =~ "front-page/front-page-title"]:after(2) {
  display: block;
  content: "DO NOT DISTRIBUTE WITHOUT PERMISSION";
  font-size: large;
  color: red;
  text-align: center;
  font-style: italic;
}
```

The result is:

![Result Image]

To use content from the document, you can use the `oxy_xpath` function in the `content` property. For a more complex example, including the generation of a new page for the synthetic :after elements, see: How to Show Metadata in the Cover Page (on page 1690).

Related Information:
• How to Show Metadata in the Cover Page (on page 1690)

How to Place Cover on the Right or Left Side

In your customization CSS (on page 1657), add the following CSS rules:

```css
*[^~="front-page/front-page"]{  
  page-break-before: left;  
}
```

**Note:** This will create an empty page at the beginning of the publication, moving the cover content on the needed side.

For more information, see: Oxygen PDF Chemistry: Controlling Page Breaks.

Related Information:

• Double Side Pagination (on page 1725)

How to Add a Specific Number of Empty Pages After the Cover Page

In your customization CSS (on page 1657), add the following CSS rules:

```css
@page my-blank-page {  
  /* Hide the page numbers */  
  @top-left {content: none;};  
  @top-right {content: none;};  
}

*[^~="front-page/front-page"]:after(1){  
  page:my-blank-page;  
  display:block;  
  content: '\'2002';  
  color:transparent;  
  page-break-after:always;  
}

*[^~="front-page/front-page"]:after(2){  
  page:my-blank-page;  
  display:block;  
```
content: '\2002';
page-break-after:always;
}

* [class ~='front-page/front-page']:after{3{
    page:my-blank-page;
    display:block;
    content: '\2002';
    page-break-after:always;
}

**Note:** The \2002 character is a space that is not shown on the pages, but gives a value for the content property.

---

### How to Add a Copyright Page after the Map Cover (Not for Bookmaps)

Regular DITA maps do not have the concept of a copyright notice. This is available only in the DITA bookmap structure.

If you are constrained to using a regular map and you need to add a copyright page between the front cover and the TOC, use the following technique:

In your customization CSS ([on page 1657](#)), declare a new page layout:

```css
@page copyright-notice-page {
  @top-left {
    content:none; /* Clear the headers for the copyright page */
  }
  @top-right {
    content:none;
  }
}
```

The oxy:front-page element contains the title of the publication and generates the cover page. A synthetic :after element is created that follows this element and it is placed on a different page.

```css
front-page:after{
```
display:block;

page: copyright-notice-page; /* Moves the synthetic element on a new page. */

margin-top:90%; /* use margins to position the text in the page */
margin-left: 5em;
margin-right: 5em;

color:blue;

}  

If you need to add more content as blocks, use the :after(2), :after(3) pseudo elements:

front-page:after(2){

display:block;

page: copyright-notice-page; /* Continue on the same page as the first ':after'. */

color:blue;
}

If you want to extract information from the document, use the oxy_xpath() function. For example, if the copyright info is stored in the map like this:

<map ...>
  <topicmeta>
    <copyright>
      <copyryear year="2018"/>
      <copyrholder>MyCorp Inc.</copyrholder>
    </copyright>
  </topicmeta>
...

Use:

front-page:after(3){

display:block;

page: copyright-notice-page;

content: "Year: " oxy_xpath('//*:front-page/topicmeta/copyright/copyryear/@year')
How to Remove the Cover Page and TOC

If you need to hide or remove the cover page, the table of contents or other structures, match the elements with a "front-page/front-page" and "toc/toc" classes in your customization CSS (on page 1657):

```
* [class ~='map/map'] > * [class ~= 'toc/toc'] {
    display: none !important;
}
* [class ~='map/map'] > * [class ~= 'front-page/front-page']{
    display: none !important;
}
* [class~='topic/topic'][is-chapter] {
    -oxy-page-group : auto;
}
```

Front Matter and Back Matter

The front matter is a series of topics that are usually placed after the cover page and before the TOC or the content.

The back matter is a series of topics that are usually placed after the content of the book.

Front Matter and Back Matter - XML Fragment

In the merged map file (on page 1658), the frontmatter topics are wrapped in an <oxy:front-matter> element that has the class bookmap/frontmatter (it is a clone of the original <frontmatter> element from the map):

```
<bookmap xmlns:ditaarch="http://dita.oasis-open.org/architecture/2005/" ...>
    class=" front-page/front-page ">
        ...
    </oxy:front-page>

    class="- map/topicref bookmap/frontmatter ">
        <concept xmlns:dita-ot="http://dita-ot.sourceforge.net/ns/201007/dita-ot"
        class="- topic/topic concept/concept ">
```

```
```
For the **DITA Map PDF - based on HTML5 & CSS** transformation type, the merged map is further processed resulting in a collection of HTML5 `<div>` elements. These elements preserve the original DITA `@class` attribute values and add a new value derived from the DITA element name.

```
<oxy:front-matter>

Front Matter and Back Matter - Built-in CSS

The built-in CSS rules are in [PLUGIN_DIR]/css/print/p-bookmap-frontmatter-backmatter.css. By default, it associates the top-level topics that do not represent chapters to a `matter-page` style of page layout. Each child topic starts on a new page.

Related Information:

- Page Headers and Footers *on page 1669*

How to Remove Page Breaks Between Front Matter Child Topics

If you do not like the fact that all the topics that enter a bookmap frontmatter start on a new page, you can disable this by using the following rules in your customization CSS *on page 1657*:

```
*[class ~="map/map"] > *[class ~="topic/topic"]:not([is-chapter]){
    page-break-before: auto;
}
```
How to Style the Front Matter and Back Matter Topics

Style all the Topics with the Same Aspect

All the topics referenced from the `<frontmatter>` and `<backmatter>` bookmap elements are formatted using the `matter-page` as defined in Default Page Definitions (on page 1663). In the merged file, the `<backmatter>` and `<frontmatter>` elements are omitted, and their child topic content is matched using a CSS rule like the one below:

```
*[class =~ "map/map"] > *[class =~ "topic/topic"]:not([is-chapter]){
    page: matter-page;
    ...
}
```

Style the Topics Depending on Their Role

There might be cases when you need to distinguish between different topics having different roles in your publication:

- Preface
- Notice
- Abstract
- Copyright

These are referenced from the DITA map by specialized `<topicref>` elements, with different class attribute values.

The class attribute values are then passed by the transformation process onto the corresponding topic elements from the merged map content. For example, a topic that was referenced by a `<preface>` map element now has a "bookmap/preface" value in its `@topicrefclass` attribute:

```
<topic
    class="- topic/topic"
    id="unique_1"
    topicrefclass="- map/topicref bookmap/preface " .. >
  ...
</topic>
```

This can be used to match and apply different styling, or even a different page layout:

```
@page preface-page {
  background-color:silver;
  @top-center{
    ...
  }
```

Numbering

The topics in this section contain some technical details in case you need to fine-tune the way the numbering works.

Numbering - Built-in CSS

The built-in CSS rules are in:

- [PLUGIN_DIR]/css/print/p-numbering-shallow.css
- [PLUGIN_DIR]/css/print/p-numbering-deep.css
- [PLUGIN_DIR]/css/print/p-numbering-deep-chapter-scope.css
- [PLUGIN_DIR]/css/print/p-numbering-deep-chapter-scope-no-page-reset.css

The first CSS (shallow) contains rules that add a "Chapter NN" before the first-level topics from the publication, the second one (deep) contains rules that add a deep structure of counters on all topics referenced from the map (at any level), the third one (chapter-scope) creates a chapter scope-oriented numbering (meaning that the numbering for pages, tables, figures, and links to them are reset for each chapter), and the last one is similar to the third except that page numbers do not reset. For more details, see Numbering Types (on page 1708).

Numbering - Input XML Fragments

The numbering affects multiple logical parts of your publication, the table of contents, headers/footers, chapter titles, figures and tables titles:

The Table of Contents

The table of contents is a tree of <topicref> elements.
Note: The `<opentopic:map>` element contains the effective table of contents structure.

Note: The TOC items are the elements with the class: `- map/topicref`.

Note: The ones identified as chapters have the `@is-chapter` attribute set.

For the DITA Map PDF - based on HTML5 & CSS transformation type, the merged map is further processed resulting in a collection of HTML5 `<div>` elements. These elements preserve the original DITA `@class` attribute values and add a new value derived from the DITA element name.

```
<opentopic:map xmlns:opentopic="http://www.idiominc.com/opentopic" class=" toc/toc ">
  <title class="- topic/title ">Publication Title</title>

  <topicref is-chapter="true" class="- map/topicref ">
    <topicmeta class="- map/topicmeta ">
      <navtitle href="#unique_1" class="- topic/navtitle ">Overview</navtitle>
    </topicmeta>
  </topicref>

  <topicref class="- map/topicref ">
    <topicmeta class="- map/topicmeta " data-topic-id="dcpp_resources">
      <navtitle href="#unique_2" class="- topic/navtitle ">Resources</navtitle>
    </topicmeta>
  </topicref>

</opentopic:map>
```

```
Note: The <opentopic:map> element contains the effective table of contents structure.

Note: The TOC items are the elements with the class: `- map/topicref`.

Note: The ones identified as chapters have the `@is-chapter` attribute set.

For the DITA Map PDF - based on HTML5 & CSS transformation type, the merged map is further processed resulting in a collection of HTML5 `<div>` elements. These elements preserve the original DITA `@class` attribute values and add a new value derived from the DITA element name.

```
<div class="- map/map map" />
  <div class=" front-page/front-page front-page">
    ...
  </div>

<div class=" toc/toc toc">
  <div class="- topic/title title">Publication Title</div>

  <div is-chapter="true" class="- map/topicref topicref">
    <div class="- map/topicmeta topicmeta">
      <div href="#unique_1" class="- topic/navtitle navtitle">Overview</div>
    </div>
  </div>

</div>
```
The Header and Footers

These are based on string sets generated for the titles. The complete set of strings is defined in: [INSTALLATION_DIR]/css/print/p-pages-and-headers.css.

The CSS rules that build the string sets are matching the map title from the front page and the titles from the content.

For the DITA Map PDF - based on HTML5 & CSS transformations:

The main content is organized as follows:
For the DITA Map PDF - based on HTML5 & CSS transformations:

```
<opentopic:map>
  ...
</opentopic:map>
```

**Note:** The topic content comes after the `<opentopic:map>` element.

**Note:** The child topics are the elements that have the class `- topic/topic` included in the parents.
Note: The ones identified as chapters have the `@is-chapter` attribute set.

The Titles of Chapters

The titles from the content are children of the topics:

```xml
<topic class="- topic/topic" id="unique_2" oid="dcpp_parameters">
  <title class="- topic/title">Parameters</title>
  ...
</topic>
```

For the DITA Map PDF - based on HTML5 & CSS transformations:

```xml
<div class="- topic/topic topic" id="unique_2" oid="dcpp_parameters">
  <div class="- topic/title title">Parameters</div>
  ...
</div>
```

Note: The title elements have the class: `- topic/title`. The actual element name can be different.

Numbering Types

The type of numbering is controlled by the parameter `args.css.param.numbering`.

This parameter activates various sets of CSS rules from the built-in CSS. By default, only the first-level topics (the chapters) are numbered (shallow numbering). The following values are accepted:

<table>
<thead>
<tr>
<th>Value</th>
<th>Chapters</th>
<th>Sections</th>
<th>Figures &amp; Tables</th>
<th>Pages</th>
</tr>
</thead>
<tbody>
<tr>
<td>shallow</td>
<td>numberedno</td>
<td>counted from the start of the publication</td>
<td>from the start of the publication</td>
<td></td>
</tr>
<tr>
<td>deep</td>
<td>numberednumbered</td>
<td>counted from the start of the publication</td>
<td>from the start of the publication</td>
<td></td>
</tr>
<tr>
<td>deep-chapter-scope</td>
<td>numberednumbered</td>
<td>numbering is restarted at the beginning of each chapter, adds the chapter number in their titles (and in the links to them), and in the list of tables and list of figures sections</td>
<td>restarted at the beginning of each chapter</td>
<td></td>
</tr>
<tr>
<td>deep-chapter-scope-no-page-reset</td>
<td>numberednumbered</td>
<td>numbering is restarted at the beginning of each chapter, adds the chapter number in their titles</td>
<td>from the start of the publication</td>
<td></td>
</tr>
<tr>
<td>Value</td>
<td>Chapters</td>
<td>Sections</td>
<td>Figures &amp; Tables</td>
<td>Pages</td>
</tr>
<tr>
<td>---------------------------</td>
<td>----------</td>
<td>----------</td>
<td>------------------</td>
<td>-------</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>(and in the links to them), and in the list of tables and list of figures sections</td>
<td></td>
</tr>
</tbody>
</table>

**Note:** The deep-chapter-scope and deep-chapter-scope-no-page-reset values are only available for the DITA Map PDF - based on HTML5 & CSS transformation scenario.

**Examples**

**Shallow**

Each chapter is numbered, but sections are not numbered. Figures, tables, and pages are numbered sequentially from the start of the publication and they do not reset.

1. First Chapter
   - Page 1
     - Section
     - Table 1
     - Table 2
   - Section
     - Page 2
     - Table 3
2. Second Chapter
   - Page 3
     - Section
     - Table 4
     - Table 5
     - Section
     - Page 4

**Deep**

Each chapter and section is numbered (sections are prefixed with the chapter number). Figures, tables, and pages are numbered sequentially from the start of the publication and they do not reset.

1. First Chapter
   - Page 1
     - Section 1.1
     - Table 1
     - Section 1.2
     - Table 2
     - Page 2
## Deep Chapter Scope

Each chapter is independent (so it can be read separately, as a separate part of your publication). The section, page, figure, and table counters (and links to them) restart at each chapter. The general cross reference links also display the chapter number before the page number to clearly specify the target.

<table>
<thead>
<tr>
<th>Table 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>2. Second Chapter</td>
</tr>
<tr>
<td>Page 3</td>
</tr>
<tr>
<td>Section 2.1</td>
</tr>
<tr>
<td>Table 4</td>
</tr>
<tr>
<td>Table 5</td>
</tr>
<tr>
<td>Section 2.2</td>
</tr>
<tr>
<td>Page 4</td>
</tr>
</tbody>
</table>

### Deep Chapter Scope No Page Reset

Each chapter is independent (so it can be read separately, as a separate part of your publication). The section, figure, and table counters (and links to them) restart at each chapter, but the page numbers do not reset. The generic cross reference links contain only the page number.

<table>
<thead>
<tr>
<th>Link to page 2.2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. First Chapter</td>
</tr>
<tr>
<td>Page 1</td>
</tr>
<tr>
<td>Section 1.1</td>
</tr>
<tr>
<td>Table 1.1</td>
</tr>
<tr>
<td>Link to page 2.2</td>
</tr>
<tr>
<td>Section 1.2</td>
</tr>
<tr>
<td>Page 1.2</td>
</tr>
<tr>
<td>Table 1.2</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>2. Second Chapter</th>
</tr>
</thead>
<tbody>
<tr>
<td>Page 2.1</td>
</tr>
<tr>
<td>Section 2.1</td>
</tr>
<tr>
<td>Table 2.1</td>
</tr>
<tr>
<td>Table 2.2</td>
</tr>
<tr>
<td>Table 2.3</td>
</tr>
<tr>
<td>Section 2.2</td>
</tr>
<tr>
<td>Table 2.4</td>
</tr>
<tr>
<td>Page 2.2</td>
</tr>
<tr>
<td>Link to page 1.1</td>
</tr>
</tbody>
</table>
How to Remove the 'Chapter NN' Prefix from Table of Contents and Content.

If you are using the shallow numbering CSS (this is the default), and you want to hide the "Chapter" prefix, use the following rules in your customization CSS (on page 1657):

For the TOC:

```css
*[^class ~ "map/topicmeta"] > *[^class ~ "topic/navtitle"]::before {
    display: none !important;
}
```

For the titles in the content, change the content of the title :before (this example just uses the chapter number):

```css
[^class ~ "topic/topic"][^is-chapter]:not([is-part]) > *[^class ~ "topic/title"]::before {
    content: counter(chapter) ". " !important;
}
```

Table of Contents

The table of contents is a hierarchy of topic titles with links to the topic content.

For plain maps, the TOC is automatically generated. For DITA bookmaps, you will need to add a `<toc>` element in the `<booklists>` element (inside the `<frontmatter>`):
Related Information:

- Table of Contents for Chapters (Mini TOC) *(on page 1718)*
- List of Tables/Figures *(on page 1722)*
- Index *(on page 1730)*

Table of Contents - XML Fragment

In the merged map file *(on page 1658)*, the `<opentopic:map>` contains a hierarchy of `<topicref>` elements, or other elements (such as `<chapter>` or `<part>`) that are specializations of `<topicref>`.

Each of the `<topicref>` elements include a *metadata* section that includes the topic title.
For the **DITA Map PDF - based on HTML5 & CSS** transformation type, the merged map is further processed resulting in a collection of HTML5 `<div>` elements. These elements preserve the original DITA `@class` attribute values and add a new value derived from the DITA element name.
The <oxy:toc-title> element is used as a placeholder for the name of the TOC. For instance, you can use the string "Contents", specified on a pseudo element, in the CSS.

Table of Contents - Built-in CSS

The built-in CSS rules are in: [PLUGIN_DIR]/css/print/p-toc.css.

Related Information:

- Page Headers and Footers (on page 1669)

How to Style the Table of Contents Entries

Note: Each of the items from the table of contents is an element that has the map/topicref class.

The following example uses the italic font for the label and changes the color and style of the connecting line between the title and the page number.

In your customization CSS (on page 1657), add the following two selectors:
And if you need to alter the indent of the nested table of content items, use the following selector:

```html
*[class ~="map/topicref"]*[class ~="map/topicref"] { 
    margin-left: 1em;
}
```

The numbers can be styled like this:

```html
*[class ~="map/topicref"] > *[class ~="map/topicmeta"]:before,
*[class ~="map/topicref"]
    > *[class ~="map/topicmeta"] > *[class ~="topic/navtitle"]:before{
        color:blue;
}
```

The following is an example of customizing the font size for the items representing chapters. The chapters are level one topics and are marked in the merged DITA document TOC with the attribute @is-chapter.

```html
*[class ~="map/topicref"]@is-chapter = "true"] > *[class ~="map/topicmeta"] > *[class ~="topic/navtitle"]{
    font-size:2em;
}
```

How to Change the Header of the Table of Contents

In the built-in CSS, there is a page named table-of-contents. The default is to have the word 'Contents' in its header (this is localized, using the toc-header string defined in the p-18n.css) alternating in the left or right side of the header:

```html
@page table-of-contents:left 
{
    @top-left {
```
If you need to change this string, or change the color, you should use the following `@page` selectors as a starting point in your customization CSS (on page 1657):

```css
@page table-of-contents: left {
    @top-left {
        content: "My publication table of contents | " counter(page, lower-roman);
        color:red;
    }
}

@page table-of-contents: right {
    @top-right {
        content: "My publication table of contents | " counter(page, lower-roman);
        color:red;
    }
}
```

**Related Information:**

- Localization (on page 1748)

**How to Make the Table of Contents Start on an Odd Page**

In your customization CSS (on page 1657), add the following snippet for the `table-of-contents` page:

```css
@page table-of-contents{
    -oxy-initial-page-number: auto-odd;
}
```

**Related Information:**
How to Display a Topic Before the Table of Contents

To display a topic before the *table-of-contents* page, follow these steps:

1. Make sure the topic is referenced on the first level in the DITA map.
2. Set the *@outputclass* to *before-toc* on the `<topicref>`.

```xml
<topicref href="pathToMyTopic" outputclass="before-toc">
```

**Result:** When the PDF is processed, the topic will automatically appear before the table of contents.

**Related Information:**

- *Controlling the Publication Content (on page 1780)*

---

How to Display Short Descriptions in the TOC

To display the short descriptions from the topics in the table of contents, you need to make the `<shortdesc>` element visible.

The following example only makes the short descriptions associated with the chapters visible. The chapters are level one topics and are marked in the merged DITA document TOC with the attribute *@is-chapter*.

In your *customization CSS (on page 1657)*, add the following CSS selector:

```css
*[class ~="map/topicref"] [is-chapter = "true"] > *[class ~="map/topicmeta"] > *[class ~="map/shortdesc"] {
    display:block; /* The default is none - the shortdesc is hidden. */
    color:gray;
}
```

**Note:** If you need all the TOC item short descriptions to be visible, remove the [*is-chapter*] condition.
How to Remove Entries from the TOC

To remove entries from the table of contents, set the @toc="no" attribute on the topicrefs from the map that need to be removed. This is sometimes desirable for the topics listed in the frontmatter or backmatter when using a bookmap.

How to Hide the TOC

To hide the TOC, you have multiple options:

- Use a DITA bookmap instead of a DITA map, and omit the <toc> element from the <booklists>. An example bookmap can be found in the DITA 1.3 Spec. This is the best approach.
- Use the transformation parameter: hide.frontpage.toc.index.glossary (on page 1637).
- Use a display:none property to hide the element that contains the TOC structure, and also remove it from the PDF bookmarks tree:

```xml
*[class =~ "map/map"] > *[class =~ "toc/toc"] {
  display:none;
}

*[class =~ "map/map"] > *[class =~ "toc/toc"] > *[class =~ "toc/title"]{
  bookmark-label: none;
  -ah-bookmark-label: none;
}
```

Related Information:

- Transformation Parameters (on page 1634)

Table of Contents for Chapters (Mini TOC)

To add a mini table of contents for each chapter, you need to:

- Use DITA bookmaps instead of regular maps.
- Set the args.chapter.layout transformation parameter to the value: MINITOC.

This table of contents is positioned between the chapter title and the chapter child topics. It consists of a list of links pointing to the child topics, positioned in the left side of the page, and a description in the right side. This content is collected from the topic file referenced by the chapter <topicref> in the map.
Chapter 1. Introduction

About this framework.
The framework is DITA.

Description
The framework is composed by a large set of modules.

The above chapter example has the following DITA map fragment:

```xml
<chapter href="topics/chapter-introduction.dita">
  <topicref href="topics/introduction-about.dita" />
  <topicref href="topics/introduction-description.dita" />
</chapter>
```

The `chapter-introduction.dita` file provides the description content that is in the right side of the page. The children `<topicref>` elements generate the mini TOC links.

Table of Contents for Chapters (Mini TOC) - XML Fragment

In the merged XML file, the mini TOC is built from a related links section and some `<div>` elements that wrap the entire mini TOC and the description area.

- `<chapter/minitoc>`
  Wraps the entire structure, including the content of the chapter `<topicref>`.

- `<chapter/minitoc-links>`
  Wraps the `<related-links>` element. Note that the label of the related links list is internationalized.

- `<chapter/minitoc-desc>`
  Contains the entire content of the topic file referenced by the chapter `<topicref>` element in the map.
When using the pdf-css-html5 transformation, this structure is converted to a set of HTML elements, preserving the class values:
About this framework.

Description

DITA Open Toolkit, or DITA-OT for short, is a set of Java-based, open-source tools that provide processing for content authored in the Darwin Information Typing Architecture.

The DITA Open Toolkit documentation provides information about installing, running, configuring and extending the toolkit.

Table of Contents for Chapters (Mini TOC) - Built-in CSS

The built-in CSS rules are in: [PLUGIN_DIR]/css/print/p-chapters-minitoc.css.

How to Style the Table of Contents for Chapters (Mini TOC)

Suppose that you do not want the links and the chapter description to be side by side, but instead place the links above the description. Also, you may choose to remove the label above the links, and put all the links in a colored rectangle, with decimal numbers before them.
In your customization CSS (on page 1657), add the following selectors:

```css
/* Change from inline to blocks to stack them one over the other. */
*{class~="chapter/minitoc-desc"},
*{class~="chapter/minitoc-links"} {
  display: block;
  width: 100%;
}
/* No need for the 'Topics:' label. */
*{class~="chapter/minitoc-links"} *[class~="topic/desc"] {
  display:none;
}

/* Add background for the links list. */
*{class~="chapter/minitoc-links"} {
  background-color:silver;
  padding:0.5em;
}
/* Remove the border and the padding from the description. We do not need that separator. */
*{class~="chapter/minitoc-desc"} {
  border-left:none;
  padding-left:0;
}
/* Add a number before each of the links. */
*{class~="chapter/minitoc-links"} *[class~="topic/link"] {
  display:list-item;
  list-style-type:decimal;
  margin-left:1em;
}
```

Related Information:

- How to Speed up CSS Development and Debugging (on page 1661)
List of Tables/Figures

To activate these:

1. The map must be a DITA bookmap.
2. There must be a `<figurelist>` or `<tablelist>` in the frontmatter or backmatter. In the following example, both of the lists are added just after the table of contents (the `<toc>` element is the placeholder where the table of contents will be created):

```xml
<frontmatter>
  <booklists>
    <toc/>
    <figurelist/>
    <tablelist/>
  </booklists>
</frontmatter>
```

How to Set a Header for a List of Tables/Figures

Suppose you want to set the headline “Figure List” on the second and subsequent pages associated to a list of figures and something similar for a list of tables.

Start by associating pages to the list of figures and tables from the merged file:

```xml
*[class~="placeholder/tablelist"] { 
  page:tablelist;
  color:green;
}
*[class~="placeholder/figurelist"]{
  page:figurelist;
  color:green;
}
```

⚠️ **Note:** The "placeholder/tablelist" is the class name of the output generated from the `<tablelist>` bookmap element.

Then define the pages:

```xml
@page figurelist {
  @top-left { content: none; }
  @top-center { content: "Figure List"; }
  @top-right { content: none; }
```
How to Remove the Numbers Before a List of Tables or Figures

Suppose you need to remove the "Figure NN" prefix before each entry of a list of figures.

An entry in the generated list of figures from the merged map looks like this:

```xml
<entry class="listentry/entry" href="#unique_6_Connect_42_fig_rjy_spn_xgb">
  <prefix class="listentry/prefix">Figure</prefix>
  <number class="listentry/number">4</number>
  <title class="topic/title">This is another figure</title>
</entry>
```

For the HTML merged map, the element names are all `div` elements but they have the same class.

So, to hide the label and the number, use:

```css
* [class="listentry/prefix"],
  *[class="listentry/number"] {
    display:none;
  }
```

This works for both a list of tables and list of figures since the structure of each entry is the same.
To make it more specific (for example, to apply it only for the list of figures), you can add the selector:

```css
*[class~="placeholder/figurelist"] *{[class~="listentry/prefix"],
  *[class~="placeholder/figurelist"] *{[class~="listentry/number"] {
  display:none;
}}
```

**Double Side Pagination**

By default, the processor generates pages that are mirror images (the right page has the header on the right side, the left pages have the header on the left side). The chapters follow one another with no constraint on the page side.

**Note:** For a plain DITA map, the chapters are the `<topicref>` elements that are placed on the first level. For bookmaps, the chapters are the topics referenced by a `<chapter>` element.

This section contains information about how to position the start of the chapters on an odd folio number. Some of the CSS rules given here as examples are already listed in:

```
[INSTALLATION_DIRECTORY]/css/print/p-optional-double-side-pagination.css
```

You may choose to import this file from your customization CSS (on page 1657).

**How to Start Chapters on Odd Pages**

A common use case is to arrange the chapters of the publication to start on an odd page number.

In your customization CSS (on page 1657), add the following:

```css
@page chapter {
  -oxy-initial-page-number: auto-odd;
}
@page table-of-contents {
  -oxy-initial-page-number: auto-odd;
}
```

Supported values for `-oxy-initial-page-number` include: auto, auto-even, auto-odd, or a number.

**How to Style the Empty (Blank) Pages**

By making the chapters start on an odd page, the CSS processor might add blank pages to the previous page sequence as padding.

To style those blank pages add the following code in your customization CSS (on page 1657):

```css
@page chapter:blank, table-of-contents:blank {
  @top-left    { content: none; }
}
Note: This just removes the headers and footers, but you can use a background image or a header with "Intentionally left blank" text.

Related Information:

- How to Add a Background Image for the Cover (on page 1694)

How to Force an Odd or Even Number of Pages in a Chapter

Another use case is to specify a number of pages for a section. Suppose that you have a table of contents that follows the cover page and you need to have an even number of pages. Hence, the next chapter would start on an even page.

In your customization CSS (on page 1657), use the -oxy-force-page-count property with an even value:

```css
@page table-of-contents {
  -oxy-force-page-count: even;
}
```

Supported values for -oxy-force-page-count include: even, odd, end-on-even, end-on-odd, auto, no-force.

How to Style the First page of a Chapter

You can use the :first page rule selector to control how the first page of a chapter looks. Suppose that you have defined the following layout for your default page and you want to put the publication title (the maptile string) on the header of the first page (instead of the chapter name that is displayed on this page):

In your customization CSS (on page 1657), add the following:

```css
@page chapter:first {
  @top-right-corner { content: string(maptile); }
  @top-left { content: none; }
```
Multiple Column Pages

This section contains information about how to deal with pages that have multiple columns.

How to Use a Two Column Layout

Change Layout for Predefined Pages.

First you need to identify which of the pages need to be changed. Pages are already defined for the cover page, table of contents, chapter content, and others. The complete list is here: Default Page Definitions (on page 1663).

Next, add the `column-count` and `column-gap` properties to that page. For example:

```xml
@page chapter{
    column-count:2;
    column-gap:1in;
}
```

If you need some of the elements to expand on all the columns, use the `column-span:all` CSS property. The next snippet makes the chapter titles span both columns:

```xml
*[class ~="topic/topic"][is-chapter] > *[class ~="topic/title"] {
    column-span:all;
}
```

⚠️ Limitation: You cannot use multiple column configurations on the same page. Oxygen XML Author only takes the `column-count` and `column-gap` properties into account if they are set on `@page` rules, not on elements from the content.

Change Layout for a Specific Topic.

If you need to have a different column layout just for one topic, you can use the following technique:

1. Define an `outputclass` on the topic root element.

   ```xml
   <topic outputclass="two_columns" ...>
   ```

2. Define a CSS rule that changes the `page` property for the matching element.

   ```xml
   *[class ~= "two_columns"],
   *[outputclass ~= "two_columns"]{
   ```
Tip: In the selector, use the `class` attribute for the HTML transformation, or `outputclass` for the direct transformation, or leave them both if you are not sure.

Note: The topics from the first level use the `chapter` page. You must use `!important` because the built-in rules are more specific and you need to override the `page` property.

3. Define a page layout.

```xml
@page two_column_page {
    column-count: 2;
}
```

Note that the topic will be separated from other sibling topics with different page layouts by page breaks.

Related Information:

- Page Formatting in oXygen PDF Chemistry

PDF Bookmarks

The PDF Bookmarks are used to generate a hierarchical structure similar to a table of contents in a specialized view of your PDF Reader.

By default, the titles defined in the topics are used as bookmark labels.

PDF Bookmarks - Built-in CSS

The PDF bookmarks are generated by matching the titles from the topics in the content. The built-in CSS rules are in: `[PLUGIN_DIR]/css/print/p-bookmarks.css`.

How to Change the Bookmark Labels using the Navigation Title

To change the bookmark labels, you can specify a navigation title in a DITA map or topic.

This will be used as the bookmark label instead of the topic title in the table of contents and the bookmark views. There are two possibilities to do specify it:

1. Place a `<navtitle>` element in the topic reference in the DITA map:

```xml
..."
**Note:** As a best practice, a `@locktitle` attribute with the value 'yes' is needed to activate the navigation title. The plugin applies the navigation title even if the attribute is missing.

2. Place a `<navtitle>` element in the topic, as a title alternative.

```xml
<topic id="other_topic" xml:lang="en-us">
  <title>Normal Title</title>
  <titlealts>
    <navtitle>Navigation Title</navtitle>
  </titlealts>
  <body>
    ...
  </body>
</topic>
```

**How to Control the Depth of the Sections From the PDF Bookmarks.**

By default, the PDF bookmarks are generated for up to 7 levels. If you need to limit them (for example to 2 levels), you can use the following CSS rules in your customization CSS *(on page 1657)*:

```css
/*[class~="topic/topic"] */[class~="topic/topic"] /*[class~="topic/topic"] */[class~="topic:title"] {
  bookmark-label:none;
}
```

These rules clear the labels generated by the titles starting with the depth 3 (the topic nesting level is given by the selectors `*[class~="topic/topic"]`)
How to Specify the Open/Closed PDF Bookmark State

If you want to specify the initial state for the bookmarks (opened/expanded or closed/collapsed), you can use the `bookmark-state` property in your customization CSS (on page 1657).

For example, to specify that all bookmarks for the first three levels are opened (expanded) in the initial state, use:

```css
*[class~="topic/topic"] > *[class="topic/title"],
*[^class~="topic/topic"] *[^class~="topic/topic"] > *[^class~="topic/title"],
[^class~="topic/topic"] *[^class~="topic/topic"] *[^class~="topic/topic"] >
[^class~="topic/title"] {
  bookmark-state:open;
}
```

How to Remove the Numbering From the PDF Bookmarks

By default, the PDF bookmark labels are generated while taking the text set before the chapters titles into account. Since this usually contains the part, chapter, or section numbers, the PDF Bookmarks will make use of them.

The solution is to remove the `content(before)` from the `bookmark-label`, leaving just the `content(text)`.

In your customization CSS (on page 1657), add the following CSS rules:

```css
[^class~="topic/topic"] > *[class="topic/title"] {
  bookmark-label: content(text);
  -ah-bookmark-label: content();
}
```

⚠️ Important: This is a simple example that does not use the possible navigation titles, just the content of the `<title>` element. Copy and modify the built-in CSS for the full CSS rule that matches the `<title>` and `<titlealts>` elements:

```css
[^class~="topic/topic"]:has([class~="topic/titlealts"]) > *[class~="topic/title"]
(...)
```

Related Information:

- Numbering (on page 1704)
Index

The content of an `<indexterm>` element is used to produce an index entry in the generated index. You can nest `<indexterm>` elements to create multi-level indexes. The content is not output as part of the topic content, only as part of the index tree.

To add an index to your publication, you just need to add `<indexterm>` elements inside the `<prolog>` section (inside a `<metadata>` element):

```xml
<title>The topic title.</title>

<prolog>
  <metadata>
    <keywords>
      <indexterm>Installing <indexterm>Water Pump</indexterm></indexterm>
    </keywords>
  </metadata>
</prolog>

<body>
  ..... 
```

or in the content itself:

```xml
... 
<p>Open the lid then turn the body pump to the right. 
<indexterm>Installing <indexterm>Water Pump</indexterm></indexterm> </p> 
... 
```

If you are using a bookmap, you need to specify where the index list should be presented (for instance in the backmatter of the book. Technically, it is possible to also add it to the frontmatter, but this is unusual). This is done using an `<indexlist>` element in the `<booklists>` element (inside the `<backmatter>`):

```xml
<bookmap>
  ... 
  <chapter href="tasks/troubleshooting.dita">
  ... 
  </chapter>
  <backmatter>
    <booklists>
      <indexlist/>
    </booklists>
  </backmatter>
```

```xml
```
For plain maps, the index list is automatically added at the end of the publication, with no need to modify the map.

Index - XML Fragment

In the merged map file (on page 1658), the structure that holds the index tree is the  element.

Each of the groups contain:

- A label, the starting letter ("T" in the following example).
- A tree of  elements.
Each of the entries contain:

- The formatted value (<opentopic-index:formatted-value>).
- A link to the publication content (<opentopic-index:refID> / <oxy:index-link> ).
- Possibly other child entries.

For the DITA Map PDF - based on HTML5 & CSS transformation type, the merged map is further processed resulting in a collection of HTML5 <div> elements. These elements preserve the original DITA @class attribute values and add a new value derived from the DITA element name.
The index group content becomes:

```html
<div class="index/group group">
  <div class="index/label label">T</div>
  <div class="index/entry entry">
    <div class="index/formatted-value formatted-value">table of contents</div>
    <div class="index/refid refid">
      <div class="index/link link" href="#d16e3988">[d16e3988]</div>
    </div>
  </div>
  <div class="index/entry entry">
    <div class="index/formatted-value formatted-value">change header</div>
    <div class="index/refid refid">
      <div class="index/link link" href="#d16e4176">[d16e4176]</div>
    </div>
  </div>
  <div class="index/entry entry">
    <div class="index/formatted-value formatted-value">style</div>
    <div class="index/refid refid">
      <div class="index/link link" href="#d16e4120">[d16e4120]</div>
    </div>
  </div>
</div>
```

Index - Built-in CSS

All index styling is found in: [PLUGIN_DIR]css/print/p-index.css.
How to Style the Index Page Title and the Grouping Letters

In your customization CSS (on page 1657), add the following CSS rules:

```
*[,class ~="index/groups"]*[,class ~="index/group"]*[,class ~="index/label"] {  
  font-size:1.5em;  
  color:navy;  
}

*[,class ~="index/groups"]:before {  
  content:"- Index -";  
  color:navy;  
  font-size:4em;  
}
```

The result is:

```
- Index -
```

How to Style the Index Terms Labels

In your customization CSS (on page 1657), add the following CSS rule:

```
*[,class ~='index/groups']*[,class ~='index/formatted-value'] {  
  font-style:oblique;  
  color:gray;  
}
```

The result is:
How to Add Filling Dots Between the Index Labels and the Page Numbers

Suppose you want the leader CSS content to generate a row of dots. It is necessary that the parent entry has the text justified.

In your customization CSS (on page 1657), add the following CSS rule:

```css
*[class~="index/formatted-value"],
*[class="index/refid"] {
    display:inline;
}

/* Hide the sequences of links that actually do not contain links. */
*[class="index/group"] *[class = "index/entry"] > *[class="index/refid"]{
    display:none;
}
*[class="index/group"] *[class = "index/entry"] > *[class="index/refid"]:has(*[class="index/link"]){
    display:inline;
}

*[class="index/group"] *[class="index/entry"] {
    text-align:justify;
}
*[class="index/group"] *[class = "index/entry"] > *[class="index/refid"]:before{
    content:leader('.',");
}
```

The output now contains the dots:
How to Change the Index Page Number Format and Reset its Value

The page number is reset at the beginning of the index page by the built-in CSS rule:

```css
*{class ~="index/groups"]
   counter-reset: page 1;
}
```

If you want to start the page counter from a different initial number, just change the value of this counter. For example, to continue the normal page counting, use:

```css
*{class ~="index/groups"]
   counter-reset: none;
}
```

If you need to style the page number differently (for example, using decimals), add the following CSS rule in your customization CSS (on page 1657):

```css
@page index {
   @bottom-center { content: counter(page, decimal) } }
}
```

How to Impose a Table-like Index Layout

In case you need to place the index labels and links on the same line but with some extra alignment constraints, you can use inline blocks to give the index a table-like appearance:
You need to place the elements that have the following class on the same line:

```
index/formatted-value
```

This is the text of the index term.

```
index/refid
```

This element contains a list of links.

A fixed width is used for the formatted value and the links container (almost half of the available width). To achieve the index hierarchical layout, set progressive padding to the formatted value text.

In your customization CSS (on page 1657), add the following CSS rule:

```css
*[^~="index/formatted-value"],
*[^~="index/refid"]{
  display:inline-block;
}

*[^~="index/formatted-value"]{
  width:45%;
}

*[^~="index/refid"] {
  width:45%;
}

/* Hide the sequences of links that actually do not contain links. */
```
To avoid bleeding of the index term label, you may need to mark it as being hyphenated:

```html
*{display:none;}

*has{display:inline-block;}

/* Move the nesting of indexterms from margin to padding */

margin-left:0;

padding-left:0.2em;

padding-left:0.4em;

padding-left:0.6em;

/* Some styling */

padding:0.2em;

background-color:#EEEEEE;
```
To activate hyphenation, see: How to Enable Hyphenation for Entire Map (on page 1744).

Footnotes

Footnotes are pieces of information placed at the bottom of the page. A footnote has a number that is left in the content (the footnote call) and the same value placed before the footnote text (the footnote marker).

Footnotes - Built-in CSS

Footnote properties are defined in [PLUGIN_DIR]css/print/p-foot-notes.css.

How to Change Style of the Footnote Markers and Footnote Calls

To bold the footnotes numbers and use some colors, add the following rules to your customization CSS (on page 1657):

```css
*[class ~= "topic/fn"]:footnote-call {
  font-weight: bold;
  color:red;
}

*[class ~= "topic/fn"]:footnote-marker {
  font-weight: bold;
  color:red;
}
```

Related Information:

How to Add a Separator Above the Footnotes

The @footnote part of a @page declaration controls the style of the separator between the page content and the footnotes. For the content, you should set a leader. The leader uses a letter or a line style to fill the entire width of the page.

```xml
@page {
  margin:0.5in;
  ....
}
```
To create a dotted line, you can use the dot character: `leader('..')`. Other commonly used characters are: "-" (dash) and "_" (underscore).

### How to Reset the Footnotes Counter

There are cases where you want to reset the footnote counter.

For example, if you need to reset it at the beginning of each chapter, add the following rules to your customization CSS (on page 1657):

```css
*[class =~ "bookmap/chapter"],
*[class =~ "topic/topic"]{is-chapter} {
  counter-reset: footnote 1;
}
```

Or you can mark any element with an `@outputclass` value, match that value, and reset the counter at any point in your counter:

```html
<p outputclass="reset-footnotes"/>
```

```css
*[outputclass =~ "reset-footnotes"] {
  counter-reset: footnote 1;
}
```

### Page Breaks

The page breaks can be controlled in multiple ways:

1. **By creating an `@page` and assigning it to an element will create a page break between this element and the sibling elements that have a different page.**
2. **Using the CSS properties:** `page-break-before`, `page-break-after`, or `page-break-avoid`.
3. **In your DITA topic, set the `@outputclass` attribute on the topic root (or any element) to contain one of the `page-break-before`, `page-break-after`, or `page-break-avoid` values.** If you want to control the page breaking from the DITA map, use the `@outputclass` attribute on the `<topicref>`, with any of the values mentioned above.
Related Information:

- Double Side Pagination *(on page 1725)*
- Oxygen PDF Chemistry: Controlling Page Breaks

Page Breaks - Built-in CSS

Page break properties are used in: `[PLUGIN_DIR]css/print/p-page-breaks.css`.

How to Avoid Page Breaks in Lists and Tables

To avoid splitting elements over two pages, you can use the `page-break-inside` CSS property. For example, if you want to impose this on tables and lists, then add the following rules to your customization CSS *(on page 1657)*:

```css
*[class =~ "topic/table"] {  
  page-break-inside:avoid;
}
*[class =~ "topic/ol"] {  
  page-break-inside:avoid;
}
*[class =~ "topic/ul"] {  
  page-break-inside:avoid;
}
```

**Note:** Since the task steps are inherited from `topic/ol`, they will also not be split over two separate pages. However, if you want to allow this, add the following CSS rule:

```css
*[class =~ "task/steps"] {  
  page-break-inside:auto;
}
```

**Note:** Another way to do this is to mark the element with an `@outputclass` set to `page-break-avoid`.

How to Force a Page Break Before or After a Topic or Another Element

If you want to force a page break, mark the topic (or any other element you need to control page breaking for) with an `@outputclass` set to one of these values:
**page-break-before**

Use this for a page break before the marked element.

**page-break-after**

Use this for a page break after the marked element.

**page-break-avoid**

Use this to avoid page breaks inside the marked element.

For example, to force a page break before a certain topic, you should use:

```xml
<topic outputclass="page-break-before" ... >
```

**Note:** You can set the output class on the `<topicref>` element from the DITA map instead of the `<topic>` element. In this way you can reuse the topic in another context where the page breaking is not necessary.

You can also control page breaking for lists, paragraphs, or any other block type elements. The following example avoids page breaks inside an ordered list:

```xml
<ol outputclass="page-break-avoid" ... >
```

### How to Add a Blank Page After a Topic

If you want to add a new blank page after a topic, add the following rules to your customization CSS *(on page 1657).*

Style the separating blank page:

```css
@page topic-separating-page{
    @top-left {
        content: "";
    }
    @top-right {
        content: "";
    }
    @top-center {
        content: "This page is blank";
    }
}
```

Associate this page to the :after pseudo element of the topic:

```css
*[class~="topic/topic"]*[outputclass~="add-separator-page"]:after {
```
In the XML content, on the `<topic>` element, set the `@outputclass` to the `add-separator-page` value.

```xml
<topic outputclass="add-separator-page"> ... </topic>
```

The `:after` pseudo element will be created next to the topic content and will be placed on the `topic-separating-page`.

Use the page margin box selectors to override the default content from the headers/footers.

**Note:** You can set the output class on the `<topicref>` element from the DITA map instead of the `<topic>` element. This allows you to reuse the topic in another context where the page breaking is not necessary.

**How to Enforce a Number of Lines from Paragraphs that Continue in Next Page**

In typography, an **orphan** is the first line of a paragraph that appears alone at the bottom of a page (the paragraph continues on a following page), while a **widow** is the last line of a paragraph that appears alone at the top of a page. The default is 2 for each of them. You can control this number by adding the following to your customization CSS *(on page 1657)*:

```css
:root {
    widows:4;
    orphans:4;
}
```

**Hyphenation**

Hyphenation specifies how words should be hyphenated when text wraps across multiple lines.

**How to Enable Hyphenation for Entire Map**

To enable hyphenation for your entire map:

1. Make sure you set an `@xml:lang` attribute on the root of your map, or set the `default.language` parameter in the transformation.
2. In your customization CSS *(on page 1657)*, add:

```css
:root {
    hyphens: auto;
}
```
3. To except certain elements from being hyphenated, use `hyphens:none`. The following example excludes the `<keyword>` elements from being hyphenated:

```
*[class =~ "topic/keyword"] {
    hyphens: none;
}
```

How to Enable/Disable Hyphenation for Tables

To enable hyphenation for your entire map:

1. Make sure you set an `@xml:lang` attribute on the root of your map or your table elements.
2. In your customization CSS (on page 1657), add:

```
*[class =~ "topic/table"] {
    hyphens: auto;
}
```

3. To except certain elements from being hyphenated, use `hyphens:none`. The following example excludes the `<keyword>` elements from being hyphenated:

```
*[class =~ "topic/keyword"] {
    hyphens: none;
}
```

Accessibility

By default, the PDF documents produced using this plugin are partially accessible in the sense that most of the paragraphs, tables, lists, headers, and footers are tagged automatically so a PDF reader can use this information to present the content.

Related Information:

- Oxygen PDF Chemistry: Accessibility

Accessibility - Built-in CSS

Accessibility properties are defined in `[PLUGIN_DIR]css/print/p-accessibility.css.`
How to Create Fully Accessible Documents

To make your documents fully accessible (PDF/UA1), do the following:

1. In your customization CSS (on page 1657), specify fonts for all elements and for all page margin boxes. There should be no text that falls back to the basic provided fonts (Times, Courier, etc.). For instance, you can use:

   ```css
   :root { font-family: Arial }
   @page {
     @top-left {font-family: Arial }
     ...
   }
   ```

2. Specify an @alt attribute with a description on any image, or better, use the <alt> DITA element.

3. Change the Chemistry invocation from the build.xml file, adding the argument -pdf-ua. There are two targets to change: chemistry and chemistry.embedded.

Fonts

Fonts are an important part of the publication. Your font selection should take into consideration both design and the targeted ranges of characters.

To use them in the customization CSS (on page 1657):

- You can place the font files in the same folder as your CSS and use a @font-face definition to reference them.
- You can use web fonts (for example, Google Fonts), and import the CSS snippet into your CSS.
- You can use system fonts.

All these techniques are explained in: Oxygen PDF Chemistry User Manual: Fonts.

How to Avoid Characters Being Rendered as #

When the processor renders text with a font that does not include certain characters, those characters are replaced with the # symbol.

To prevent this, make sure you use the proper font.

As an example, suppose the right arrow character is used in a definition list like this:

```xml
<dlentry>
  <dt>&#8594;</dt>
  <dd><ph>This is the right arrow.</ph></dd>
</dlentry>
```
If the font does not include this character, the output will look something like this:

```plaintext
#
This is the right arrow.
```

To fix this, use a fallback font. For example, if you use *Times New Roman* for the entire publication, you could add *Symbol* as the fallback font. In your customization CSS (on page 1657), add:

```css
*{font-family: "Times New Roman", Symbol;}
```

Tip: On Windows, one simple way to determine the font needed to display the text is to copy the text fragment that has rendering problems from the DITA source document and paste it into Microsoft WordPad or Word. It will automatically select a font capable of rendering the text. Simply click on the text to see the name of the font from the "Font" ribbon toolbar. Then you can use it as a fallback font in the CSS. Make sure there are no licensing restrictions on that particular font.

### How to Set Fonts in Titles and Content

Suppose that in your customization CSS (on page 1657), you have defined your font (for example, *Roboto*) using a Google web font:

```css
@import url('https://fonts.googleapis.com/css?family=Roboto');
```

You can force a font on all elements, then style the ones that need to be different. The advantage of this method is that you do not need to trace all elements that have a font family defined in the built-in CSS files, you just reset them all.

In your customization CSS (on page 1657), add an `!important` rule that associates a font to all the elements from the document:

```css
*{
  font-family:"Roboto" !important;
}
```

Note: If you want to use the `:root` selector instead of the `*` selector, without the `!important` qualifier, the elements that have a predefined font specified in the built-in CSS will keep that font. If your content uses non-Latin glyphs, it is possible that the built-in fonts do not render them.

Next, identify the selectors for the elements that need to be styled with a different font than the one associated above. For information on how to do this, see: Debugging the CSS (on page 1658).
For example, if you want the titles or the pre-formatted text to have a different font from the rest, matched by the above * selector, you need to use more specific CSS selectors:

```css
*[class~="front-page/front-page-title"],
*[class~="topic/title"] {
  font-family: Arial !important;
}

*[class~="pr-d/codeph"],
*[class~="topic/pre"] {
  font-family: monospace !important;
}
```

Related Information:

- How to Change the Font of the Headers and Footers (on page 1672)

How to Use Fonts for Asian Languages

For Asian languages, you must use a font or a sequence of fonts that cover the needed character ranges. If the characters are not found, the # symbol is used.

When you specify a sequence of fonts, if the glyphs are not found in the first font, the next font is selected until one that includes all the glyphs is found. A common font sequence for Asian languages is as follows:

```css
font-family: Calibri, SimSun, "Malgun Gothic", "Microsoft JhengHei";
```

To apply this font sequence, see: How to Set Fonts in Titles and Content (on page 1747).

Some of the Asian fonts do not have italic, bold, or bold-italic variants. In this case, you may use the regular font file with multiple font face definitions to simulate (synthesize) the missing variants. You need to use the -oxy-simulate-style:yes CSS property in the font face definition as explained in: Using Simulated/Synthetic Styles in Oxygen Chemistry

Localization

Depending on the transformation type, based on HTML5 or using a direct DITA transformation, there are different localization capabilities. If you are just starting your customization, we strongly recommend using the pdf-cshtml5 transformation, since it supports out of the box a large number of languages.
Localization - Transformation Based on HTML5 and CSS

This section applies to the **DITA Map PDF - based on HTML5 & CSS** transformation type.

In this type of transformation, the intermediary merged DITA map is transformed to HTML5 using the DITA-OT built-in support, so the customization of the internationalization (the labels for chapters, parts, figures, tables, notes, etc.) can be achieved by following the DITA-OT recommendations: [Customizing Generated Text](https://www.dita-ot.org/3.2/topics/globalization-languages.html).

It is recommended that you do this customization on a DITA-OT distribution deployed outside of the **Oxygen** installation. Otherwise, you will lose the customization when upgrading **Oxygen**. You can contact the **Oxygen support team** to ask for the **Oxygen Publishing Engine** package.

Supported Languages (HTML5 and CSS)

There are supported over 20 languages. For the full list of supported languages (and their codes), see the list: [https://www.dita-ot.org/3.2/topics/globalization-languages.html](https://www.dita-ot.org/3.2/topics/globalization-languages.html).

How to Select a Language (HTML5 and CSS)

There are two ways to switch the labels to a specific language:

- Alter the DITA maps and/or topics to have the `@xml:lang` attribute set to the root element, to one of a supported value (i.e. "fr", "de", "zh", "ru").
- If changing the files is not an option, you can alter the value of the transformation parameter `default.language` to the desired language code.

How to Add Support for a New Language (HTML5 and CSS)

If the list of supported languages does include the language you need, you can create a custom dictionary for this transformation.

The DITA-OT documentation offers a good insight on how to do it: [https://www.dita-ot.org/3.2/topics/plugin-addgeneratedtext.html](https://www.dita-ot.org/3.2/topics/plugin-addgeneratedtext.html)

In addition to that, you need to alter your CSS. Some of the labels come from CSS files located in: `[/PLUGIN_DIR]/css/print/i18n/`

You should use one of the files as a template and copy its rules to your customization CSS ([on page 1657](#)) and translate the labels. Make sure you change also the `:lang` selector to match your language code.
Localization - Transformation Based on DITA and CSS

The DITA Map PDF - based on DITA & CSS - WYSIWYG transformation type supports fewer languages than the one based on HTML5 (on page 1748).

Supported Languages (DITA and CSS)

The list of supported languages for the DITA Map PDF - based on DITA & CSS - WYSIWYG transformation type includes: English, German, French (en, de, fr).

How to Select a Language (DITA and CSS)

There are two ways to switch the labels to a specific language for the DITA Map PDF - based on DITA & CSS - WYSIWYG transformation type:

• Alter the DITA maps and/or topics to have the @xml:lang attribute set to the root element, to one of a supported value (i.e. "fr", "en", "de").
• If changing the files is not an option, you can alter the value of the transformation parameter default.language to the desired language code.

How to Add Support for a New Language (DITA and CSS)

For the DITA Map PDF - based on DITA & CSS - WYSIWYG transformation type, the built-in CSS rules are in two directories. For example, the French translation is in:

```plaintext
[PLUGIN_DIR]/css/core/-i18n-fr.css
[PLUGIN_DIR]/css/print/i18n/p-i18n-fr.css
```

1. Copy and then rename the English translation files next to your customization CSS (on page 1657).

```plaintext
-il8n-en.css -> -il8n-nl.css
p-il8n-en.css -> p-il8n-nl.css
```

2. Reference these two files from your customization CSS (on page 1657).

3. Change the rules to match your language code and translate each of the strings. For example, for Dutch, the rules should contain the :lang(nl) selector:

```plaintext
/* Title in the Index page */
*[class ~= "index/groups"]:lang(nl):before {
  content: "Trefwoordenregister";
}
```
Comments and Tracked Changes

The comments and tracked changes can be made visible in the PDF output by setting the `show.changes.and.comments` transformation parameter to `yes`.

Figure 428. Chemistry Annotations in Acrobat Reader

By default, they are shown as PDF text annotations (sticky notes). These are graphical markers in the document content and are also listed in the Comments section when opening the output file in Acrobat Reader.

**Note:** Comments with the Mark as Done flag selected appear with a checkmark in the Comments section and with a Completed label (✓ John Doe Completed).

To avoid rendering the elements as PDF annotations and show them as footnotes instead, you can use the `show.changes.and.comments.as.pdf.sticky.notes` transformation parameter set to `no`.

The comments and changes are included in the merged map file (on page 1658) either as XML elements (<oxy-insert>, <oxy-delete>, <oxy-comment>, <oxy-attributes>) in the case of the XML merged map, or as HTML elements with similar classes (oxy-insert, oxy-delete, oxy-comment, oxy-attributes) in the case of the HTML merged map. Sub-elements contain meta-information about each change.

**Tip:** These elements are automatically recognized and transformed in PDF annotations when using Chemistry as PDF processor.

**Note:** The inserted text, deleted text, and deleted markup are included in the sticky notes.

Related Information:

- Transformation Parameters (on page 1634)
Comments and Tracked Changes - XML Fragment

This section contains information about how each type of tracked change is structured in the merged map XML file (on page 1658).

Insertions

For an insertion type of tracked change, the structure that defines the insertion details is inside the range (<oxy-range-start> to <oxy-range-end>), the inserted text is highlighted by an <oxy-insert-hl> element, and the details are stored in the <oxy-insert> element.

```xml
<oxy:oxy-range-start id="sc_1" hr_id="1"/>

<oxy:oxy-insert href="#sc_1" hr_id="1">
    <oxy:oxy-author>dan</oxy:oxy-author>
    <oxy:oxy-content>insert</oxy:oxy-content>
    <oxy:oxy-date>2018/03/15</oxy:oxy-date>
    <oxy:oxy-hour>09:38:29</oxy:oxy-hour>
    <oxy:oxy-tz>+02:00</oxy:oxy-tz>
</oxy:oxy-insert>

<oxy:oxy-insert-hl>This is an insert!!</oxy:oxy-insert-hl>

<oxy:oxy-range-end hr_id="1"/>
```

Comments

Similar to insertions, comments are defined in a range (<oxy-range-start> to <oxy-range-end>), the comment details is in the <oxy-comment> element, and the highlighted content is wrapped in the <oxy-comment-hl> element.

```xml
<oxy:oxy-range-start id="sc_1" hr_id="1"/>

<oxy:oxy-comment href="#sc_1" hr_id="1">
    <oxy:oxy-author>dan</oxy:oxy-author>
    <oxy:oxy-comment-text>This is a comment.</oxy:oxy-comment-text>
    <oxy:oxy-date>2018/03/15</oxy:oxy-date>
    <oxy:oxy-hour>09:56:59</oxy:oxy-hour>
</oxy:oxy-comment>
```
Note: Comments that are marked as done have a `flag="done"` attribute:

```
<oxy:oxy-comment href="#sc_6" hr_id="6" flag="done">
```

### Attribute changes

The attribute changes are more complex. The `range` is empty, and is directly above the affected element (the one that has modified attributes). The `<oxy-attributes>` element contains details about multiple attribute changes, each stored in the `<oxy-attributed-change>` element.

```
<element>
  <oxy:oxy-range-start id="sc_3" hr_id="3"/>
  <oxy:oxy-range-end hr_id="3"/>
  <oxy:oxy-attributes href="#sc_3" hr_id="3">
    <oxy:oxy-attribute-change type="inserted" name="platform">
      <oxy:oxy-author>dan</oxy:oxy-author>
      <oxy:oxy-current-value>windows</oxy:oxy-current-value>
      <oxy:oxy-date>2018/03/15</oxy:oxy-date>
      <oxy:oxy-hour>10:05:04</oxy:oxy-hour>
      <oxy:oxy-tz>+02:00</oxy:oxy-tz>
    </oxy:oxy-attribute-change>
    ....
    <oxy:oxy-attribute-change type="removed" name="audience">
      ....
    </oxy:oxy-attribute-change>
  </oxy:oxy-attributes>
  ...
</element>
```
Deletions

For a deletion, there are some elements that define the start and end of the deletion, and the highlighted text is wrapped in the `<oxy-delete-hl>` element.

```xml
<oxy:oxy-range-start id="sc_2" hr_id="2"/>
<oxy:oxy-delete-hl>This is a deleted text. </oxy:oxy-delete-hl>
<oxy:oxy-range-end hr_id="2"/>
```

There is a structure that offers details about the deletion change, using the `<oxy-delete>` element. This is linked to the above deletion range by the same ID value:

```xml
<oxy:oxy-delete href="#sc_2" hr_id="2">
  <oxy:oxy-author>dan</oxy:oxy-author>
  <oxy:oxy-content><image href="../img/ex.gif"></oxy:oxy-content>
  <oxy:oxy-date>2018/03/14</oxy:oxy-date>
  <oxy:oxy-hour>11:38:06</oxy:oxy-hour>
  <oxy:oxy-tz>+02:00</oxy:oxy-tz>
</oxy:oxy-delete>
```

Colored Highlights

To show some text as highlighted with a background color:

```xml
<oxy:oxy-color-hl color="rgba(140,255,140,50)">Some colored text.</oxy:oxy-color-hl>
```

Comments and Tracked Changes - HTML Fragment

This section contains information about how each type of tracked change is structured in the merged map HTML file (on page 1658).

Insertions

For an insertion type of tracked change, the structure that defines the insertion details is inside a `range` (oxy-range-start to oxy-range-end), the inserted text is highlighted by a `<span>` element with the class `oxy-insert-hl`, and the details are stored in a `<span>` element with the `oxy-insert` class.

```xml
<span class="oxy-range-start" id="sc_1" hr_id="1"/>

<span class="oxy-insert" href="#sc_1" hr_id="1">
  <span class="oxy-author">dan</span>
</span>
```
Comments

Similar to insertions, comments are defined in a range (oxy-range-start to oxy-range-end), the comment details in an element with the class oxy-comment, and the highlighted content is wrapped in the oxy-comment-hl element.

Note: Comments that are marked as done have a flag="done" attribute:

Attribute changes

The attribute changes are more complex. The range is empty, and is directly above the affected element (the one that has modified attributes). The element with the class oxy-attributes contains details about multiple attribute changes, each stored in an element with the class oxy-attribute-change.
Deletions

For a deletion, there are some elements that define the start and end of the deletion, and the highlighted text is wrapped in an element with the class `oxy-delete-hl`.

```xml
<span class="oxy-range-start" id="sc_2" hr_id="2"/>
<span class="oxy-delete-hl">This is a deleted text. </span>
<span class="oxy-range-end" hr_id="2"/>
```

There is a structure that offers details about the deletion change, using the element with the class `oxy-delete`. This is linked to the above deletion range by the same ID value:

```xml
<span class="oxy-delete" href="#sc_2" hr_id="2">
  <span class="oxy-author">dan</span>
  <span class="oxy-content"><image href="../img/ex.gif"></image></span>
  <span class="oxy-date">2018/03/14</span>
  <span class="oxy-hour">11:38:06</span>
  <span class="oxy-tz">+02:00</span>
</span>
```
Colored Highlights

To show some text as highlighted with a background color:

```html
<span class="oxy-color-hl" color="rgba(140,255,140,50)">Some colored text.</span>
```

Comments and Tracked Changes - Built-in CSS

The built-in CSS that controls the way tracked changes and comments are displayed is found in:

```
[PLUGIN_DIR]css/print/p-side-notes.css
```

How to Style Changed or Commented Text

To style the highlighted text from the document content, use the `<oxy-comment-hl>` element (or `<oxy-delete-hl>`, `<oxy-insert-hl>`, respectively, by local name or class name):

```css
oxy-comment-hl,
.oxy-comment-hl {
  color:magenta;
}
```

**Note:** The class name selector is useful when using the DITA Map PDF - based on HTML5 & CSS transformation scenario.

If you want to change the small labels that define the affected start and end ranges (they are a number formatted like: "[n] .. [/n]" where n is the number of the change), you can use the following selectors:

```css
oxy-range-start:before,
.oxy-range-start:before {  
display:inline;
  content:'[' attr(hr_id) ']';
  color:red;
}
oxy-range-end:before,
.oxy-range-end:before { 
  display:inline;
  content:'[/' attr(hr_id) ']' ;
  color:red;
}
```

Use `display:none` if you want to hide them.
If you want to change the background color of the comment footnote (assuming you set the `show.changes.and.comments.as.pdf.sticky.notes` transformation to `no`), add the following snippet in your customization CSS (on page 1657):

```css
oxy-comment,
.oxy-comment {
  background-color: inherit;
  border: 2pt solid yellow;
}
```

Similarly, you can style the other footnotes for `<oxy-attributes>`, `<oxy-delete>`, and `<oxy-insert>` elements.

**How to Hide Tracked Change Footnotes**

This topic is relevant if you have set the `show.changes.and.comments.as.pdf.sticky.notes` transformation parameter to `no`, and therefore the changes are shown as footnotes instead of PDF annotations.

In some cases, when your document contains a lot of tracked changes, you may need to hide the footnotes associated with the insertions, deletions, or attribute changes. Using the following example, the deletions and insertions are hidden, but the comments remain visible. In your customization CSS (on page 1657), add:

```css
oxy-attributes,
oxy-delete,
oxy-insert{
  float:none;
  display:none;
}
```

**Draft Watermarks**

A *watermark* is an image displayed as the background of a printed document and it is faded enough to keep the publication text readable. *Draft watermarks* are used to indicate that a document is under construction or has not yet been approved.

**How to Add a Draft Watermark on All Pages**

To add a draft watermark to all of your publication pages, you can use the following page selector in your customization CSS (on page 1657):

```css
@page {
```
If you have already set a background image for other pages (for example, the front-page or table-of-contents), the above selector won’t change them, as they are more specific.

The best practice is to use a different draft.css CSS file that imports the customization CSS where the rest of the style changes reside. If you need to publish as draft, use the draft.css in your transformation scenario, otherwise directly reference the customization CSS (on page 1657).

Related Information:

- Images and Figures (on page 1766)

How to Add a Draft Watermark Depending on Metadata

Suppose you want to apply a Draft watermark until your DITA bookmap is approved and the map is approved when an <approved> element has been added to the metadata section (for example, in the bookmeta/bookchangehistory element).

```xml
<bookmeta>
    <author>John</author>
    <critdates>
        <created date="1/1/2015"/>
        <revised modified="3/4/2016"/>
        <revised modified="3/5/2016"/>
    </critdates>
    <bookchangehistory>
        <approved/>
    </bookchangehistory>
...</```

Use oxy_xpath every time you need to probe the value from an element other than the one matched by the CSS selector, and test the expression on the merged HTML file using the Oxygen XPath Builder view.

You can either use a page selector that imposes the draft watermark on the entire page surface (recommended):
Styling the Content

If you need to change the styles of the elements from the topic contents, you should create a customization CSS (on page 1657) and then add CSS rules. To create the CSS rules, you can use the development tools described in Debugging the CSS (on page 1658).

Reusing the Styling for WebHelp and PDF Output

If you are using the pdf-css-html5 transformation type, then the generated HTML5 document that is later converted to PDF is very similar to the generated HTML5 pages from the WebHelp Responsive output.

This is an output example from the WebHelp transformation:

```html
<h1 class="title topic-title1" id="ariaid-title2">Care and Preparation</h1>
```
And the same example from the PDF transformation (note the additional emphasized class values):

It makes sense to reuse the same CSS rules you developed for one transformation type to the other. The main rule is to use the short class names instead of the long ones. For example, to style the short descriptions with italic font, use:

```
.shortdesc {
  font-style: italic;
}
```

The rule of thumb is that if you have a CSS rule that successfully styles an element in WebHelp, it should apply without any modification in the PDF output.

**Equations**

This processor supports MathML equations.

**How to Change the Font of MathML Equations**

Suppose that you need to change the font of MathML equations from the documentation, and also add some padding. The MathML fragments are wrapped in elements that have the class `equation-d/equation-block` or `equation-d/equation-inline`, so you can match them with:

```
*[class ~="equation-d/equation-block"],
*[class ~="equation-d/equation-inline"]{
  font-family: "courier new";
  font-size:1.5em;
  padding:1em;
}
```

**Note:** Some of the fonts may not be supported. In that case, a default serif font is used.
Lists

You can style the list item markers, or other properties.

How to Style the List Markers

For the media print, the default CSS rules for the list items use the :marker pseudo-class.

```css
@media print {
  *[class~="topic/li"]::marker {
    text-align: center;
    font-weight: bold;
  }
  *[class~="topic/li"] {
    margin-left: 0.25in;
  }
}
```

To eliminate the bold font weight for the items form ordered lists then add the following rules to your customization CSS (on page 1657):

```css
*[class~="topic/ol"] > *[class~="topic/li"]:marker {
  font-weight: normal;
}
```

For the unordered lists:

```css
*[class~="topic/ul"] > *[class~="topic/li"]:marker {
  font-weight: normal;
}
```

How to Change the Numbering System of Ordered Lists

It is possible to change all lists to have a different numbering system and there are several methods that can be used to achieve this.

Use the list-style-type CSS Property.

The Chemistry engine supports the following types: decimal, decimal-leading-zero, lower-roman, upper-roman, lower-latin, upper-latin, lower-alpha, upper-alpha.

```css
*[class ~="topic/ol"] {
  list-style-type: lower-roman;
}
```
Change the Content of the `:marker` CSS Pseudo Element.

The following example emulate the Cyrillic numbering for the list items for an ordered list that has the `@outputclass` attribute set to `cyrillic`:

⚠ **Important**: This example will work only for lists up to 28 items. You will have to extend it for longer lists!

```css
*[class ~= "topic/ol"] [outputclass ~= "cyrillic"] > *[class ~= "topic/li"] :marker {
  width: 3em;
}

*[class ~= "topic/ol"] [outputclass ~= "cyrillic"] > *[class ~= "topic/li"] :nth-of-type(1) :marker {
  content: "а";
}

*[class ~= "topic/ol"] [outputclass ~= "cyrillic"] > *[class ~= "topic/li"] :nth-of-type(2) :marker {
  content: "'b";
}

*[class ~= "topic/ol"] [outputclass ~= "cyrillic"] > *[class ~= "topic/li"] :nth-of-type(3) :marker {
  content: "#";
}

*[class ~= "topic/ol"] [outputclass ~= "cyrillic"] > *[class ~= "topic/li"] :nth-of-type(4) :marker {
  content: "#";
}

*[class ~= "topic/ol"] [outputclass ~= "cyrillic"] > *[class ~= "topic/li"] :nth-of-type(5) :marker {
  content: "#";
}

*[class ~= "topic/ol"] [outputclass ~= "cyrillic"] > *[class ~= "topic/li"] :nth-of-type(6) :marker {
  content: "#";
}

*[class ~= "topic/ol"] [outputclass ~= "cyrillic"] > *[class ~= "topic/li"] :nth-of-type(7) :marker {
  content: "#";
}

*[class ~= "topic/ol"] [outputclass ~= "cyrillic"] > *[class ~= "topic/li"] :nth-of-type(8) :marker {
  content: "#";
}

*[class ~= "topic/ol"] [outputclass ~= "cyrillic"] > *[class ~= "topic/li"] :nth-of-type(9) :marker {
  content: "#";
}

*[class ~= "topic/ol"] [outputclass ~= "cyrillic"] > *[class ~= "topic/li"] :nth-of-type(10) :marker {
  content: "#";
}

*[class ~= "topic/ol"] [outputclass ~= "cyrillic"] > *[class ~= "topic/li"] :nth-of-type(11) :marker {
  content: "#";
}

*[class ~= "topic/ol"] [outputclass ~= "cyrillic"] > *[class ~= "topic/li"] :nth-of-type(12) :marker {
  content: "#";
}

*[class ~= "topic/ol"] [outputclass ~= "cyrillic"] > *[class ~= "topic/li"] :nth-of-type(13) :marker {
  content: "#";
}
```

- Oxygen PDF Chemistry User Guide: Lists

Links

Links allow the users to navigate through the documentation.
How to Remove 'on page NNN' Link Label

For printed material, it is usually desirable for the links to display a label after the text content (such as "on page 54"). This makes it easier the user to identify the target page. However, if the produced PDF is not printed and is intended only for electronic use, this label may create clutter and make the document harder to read. To eliminate this label, add the following in your customization CSS (on page 1657):

```css
*[class ~="topic/xref"] [href]:after,
*[class ~="topic/link"] [href]:after {
  content: none !important;
}
```

Another use-case is to remove the labels only from links shown in tables cells, and leave the others as they are. For this, you could use a more specific selector:

```css
*[class ~="topic/entry"] *[class ~="topic/xref"] [href]:after{
  content: none !important;
}
```

How to Change Link Styles

Suppose you want the links to be bold and with an underline. In your customization CSS (on page 1657), add this snippet:

```css
*[class ~="topic/xref"] [href]:after,
*[class ~="topic/link"] [href]:after {
  font-weight: bold;
  text-decoration: underline;
}
```

How to Hide Descriptions in Related Links Sections

The link descriptions that come from DITA relationship tables or related link elements within topics, are structured in the merged map (on page 1658) like this:

```xml
<related-links class="- topic/related-links ">
  <linkpool class="- topic/linkpool ">
    <link class="- topic/link "
      ... 
      role="friend" scope="local" type="topic">
      <linktext class="- topic/linktext ">Salvia</linktext>
      <desc class="- topic/desc ">The salvia plant</desc>
    </link>
  </linkpool>
</related-links>
```
Images and Figures

Images are an important part of a publication.

**Note:** You can use raster image formats (such as PNG or JPEG), but it is best to use vector images (such as SVG or PDF). They scale very well and produce better results when printed. In addition, the text from these images is searchable and can be selected (if the glyphs have not been converted to shapes) in the PDF viewer.

Images - Built-in CSS

Image properties are defined in [PLUGIN_DIR]css/print/p-images.css.

```css
*{class =~ "topic/image"} {
    prince-image-resolution: 120dpi;
    -ah-image-resolution: 120dpi;
    image-resolution: 120dpi;
    /* The US-letter page size minus page margins. See p-page-size.css for the current page size. */
    max-width: 6.5in;
}
```

How to Fix Image Bleeding - Control Image Size

Sometimes the images may be too big for the page. The built-in CSS rules specify a maximum size for images, limiting to the width of the parent block. But if the parent block is itself too wide and bleeds out of page, you might consider specifying a length.

In your customization CSS *(on page 1657)*, add the following snippet:

```css
*{class =~ "topic/image"} {
```

/* The US-letter page size minus page margins. See p-page-size.css for the current page size. */
max-width: 6.5in;
}

How to Change Image Resolution

This is a good technique to change the size of all raster images from your documentation. This will not work for vector images, such as PDF or SVG. If the images (PNG, for example) contain the image resolution in their metadata, this will be taken into account. For all other images, the default resolution is 120dpi.

If the default resolution is not good (suppose you need a higher pixel density of 300dpi), you can change it by adding the following in your customization CSS (on page 1657):

 '*.class ~="topic/image"' {  
   prince-image-resolution: 300dpi;  
   -ah-image-resolution: 300dpi;  
   image-resolution: 300dpi;  
   }

How to Place Big Images on Rotated Pages

Very wide images may bleed out of the page. One solution for this is to use landscape pages for these wide images.

In your customization CSS (on page 1657), add:

 '*.class~="topic/image"'[outputclass='land'] {  
   page: landscape-page;  
   }

Setting the attribute @outputclass = 'land' on the table element will force the table on a new landscape page.

Another solution is to set an @outputclass attribute on the image, then create a rule that matches it, and associate a landscape page for it.

How to Place a Text and Image Side by Side

If you need to align text and an image side by side, you can use the following technique:

1. Organize your text and image under a <div> element like this:
<div outputclass="side-by-side">
  <p>This will be in the left side, the next figure in the right. </p>
  <fig>
    <image href="cactus.jpeg"/>
  </fig>
</div>

Note: You can use the @outputclass attribute to mark the <div> elements that have this special layout.

2. In your customization CSS (on page 1657), add:

/*[outputclass =~ "side-by-side"] > *[class =~ "topic/p"] {
   display:inline-block;
   width: 45%;
}

/*[outputclass =~ "side-by-side"] > *[class =~ "topic/fig"] {
   display:inline-block;
   width: 45%;
}

The image should fill the entire width of the parent <fig> element:

/*[outputclass =~ "side-by-side"] > *[class =~ "topic/fig"] > *[class =~ "topic/image"] {
   width:100%;
}

By default, the bottom of the image is on the same line as the text baseline. If you want the text and the image to be aligned at the top, add these lines:

/*[outputclass =~ "side-by-side"] > *[class =~ "topic/p"] {
   vertical-align:top;
}

/*[outputclass =~ "side-by-side"] > *[class =~ "topic/fig"] {
   vertical-align:top;
   font-size:0pt;
}
Note: The font-size:0pt is needed to remove the font ascent and descent around the image rectangle.

How to Control the Image Size in Complex Static Content

It is common to have text and images mixed together in a :before or :after pseudo element. For example, for notes you may have both artwork and text:

```
*[class ~= "topic/note"]:before {
  content: url('note.png') "Some text";
}
```

If you want to change the size of the image, you have two options:

- **Use the image-resolution CSS property:**

```
*[class ~= "topic/note"] {
  image-resolution:300dpi;
}
```

- **Separate the image from the text and apply the width and height CSS properties only on the image, using the width and height properties. You could use multiple :before pseudo-elements for that, considering that the farthest content presented before the actual content of an element is matched by the :before with the highest number in the brackets:**

```
*[class ~= "topic/note"]:before(2) {
  content: url('note.png');
  width:0.5in;
}

*[class ~= "topic/note"]:before(1) {
  content: "Some text";
}
```

How to Center Images

DITA defines a @placement attribute for the <image> elements. The implicit value is inline. Suppose that you need to center the images that have the placement set to break (for example, they are not on the same line with other content and the images from the <fig> element).

In your customization CSS (on page 1657), add:
How to Change/Reset the Figure Numbering

**Note:** This topic is applicable for the *DITA Map PDF - based on HTML5 & CSS* transformation type.

There are cases when you need to change the aspect of the figure counter that is shown before the figure titles. By default, the figure titles are formatted like this:

```
Figure NN. Lore Ipsum Title
```

**NN** is the number of the figure that starts being counted from the beginning of the publication.

One use-case is to have the NN counter be incremented only within one chapter (for example, the first chapter contains "Figure 1" and "Figure 2", and second chapter starts over with "Figure 1" instead of incrementing to "Figure 3").

You should reset the figure counter on each topic marked as chapter, then hide the label from the figure `<figcaption>` (this is an HTML element generated by the XSL transformation), and create another label using a `:before` selector on the `<figcaption>`.

```
*[class ~= "topic/topic"]{is-chapter} { 
    counter-reset: figcount;
}
```
Tables are widely used in technical documentation. This section contains information about the CSS rules that are used to style them and how to fix some problems.

### Tables - Built-in CSS

There is a combination of CSS files that address tables:

- [PLUGIN_DIR]/css/core/-table-html-cals.css
- [PLUGIN_DIR]/css/print/p-tables.css

### How to Deal With Wide Tables - Page Rotation

Some of the tables can have a large number of columns. In this case, the table may bleed out of the page. One solution is to use landscape pages for these tables.

Setting the attribute `@orient = 'land'` on the table element will force the table on a new landscape page.

Another solution is to use automatic detection of wide tables (5 or more columns):

```css
*[class="topic/table"] > *[class="topic/tgroup"]{cols='5'},
*[class="topic/table"] > *[class="topic/tgroup"]{cols='6'},
*[class="topic/table"] > *[class="topic/tgroup"]{cols='7'},
*[class="topic/table"] > *[class="topic/tgroup"]{cols='8'} {
    page: landscape-page;
    max-width: 100%;
    page-break-before: avoid;
}
```
Note: The landscape-page page layout is defined in the `PLUGIN_DIR/css/print/p-pages-and-headers.css`.

If you want to rotate the entire topic that contains the big table, use:

```html
*\[class~="topic/table"] > *\[class~="topic/tgroup"]\[cols='5'] { max-width: 100%;
    table-layout: auto;
}
```

```html
*\[class~="topic/topic"]\[cols='5'] { *\[class~="topic/table"] > *\[class~="topic/tgroup"]{ max-width: 100%;
    table-layout: auto;
}
```
How to Fix Text Bleeding From Table Cells

Slim tables or tables that have many columns make the text from the cells to be confined to a small horizontal space. Long words would bleed outside the cell boundaries. To fix this, you should enable hyphenation in your tables, thus making the words spread on multiple lines. In your customization CSS (on page 1657), add:

```
*[^class~="topic/table"] { 
  hyphens: auto;
}
```

Related Information:

- Hyphenation (on page 1744)

How to Enable the Automatic Table Layout

The DITA specification indicates that tables should have a fixed layout. However, you can get a more optimal arrangement of the cells using the automatic layout. In your customization CSS (on page 1657), add:

```
*[class="^topic/tgroup"] { 
  table-layout:auto !important;
}
```

If you want to control which table you want this layout, you can set the @outputclass attribute on the `<table>` element:

```
<table outputclass='auto_tbl'> ... </table>
```

Then, in the CSS, use a rule that matches the @outputclass:

```
*[class="^topic/table"][outputclass='auto_tbl'] > *[^class="^topic/tgroup"] { 
  table-layout:auto !important;
}
```

⚠️ **Important:** Make sure the tables have no column width specified.
How to Rotate Content from a Table Cell

There are cases where you want to style the first column as a kind of table header, with vertical text.

There is an important thing to remember: you can rotate an element from a table cell, but not the cell itself. So, your DITA table cell should contain a `<div>` or a `<p>` element that will be rotated. The cell has to be marked somehow so that it can be matched from the CSS. One way is to set an `@outputclass` attribute on it, another will be to mark the table and then match the first entries from it.

```xml
<row>
  ...
  <entry outputclass="rotated">
    <p>Rotated</p>
  </entry>
  ...
</row>
```

In your customization CSS (on page 1657), use the following rule that matches the child of the entry:

```css
*[outputclass ~~ "rotated"] > * {
  display: block;
  transform: rotate(-90deg) !important;
  text-align: left !important;
  padding: 0;
  margin: 0;
  white-space: nowrap;
  width: 150px;
  height: 80px;
}
```

The padding and margins are set to zero to clear any space that may come from other rules. The width is required - it will become the height of the cell. If this is not specified, the vertical rotated text will bleed out of the cell. The height is optional.

How to Add Horizontal Lines to a Choice Table

To add horizontal lines that separate the options within a `<choicetable>`, you can use borders set on each of the rows. The following CSS styles the top header and the first column with some background colors. In a choice table, the first column represents the choice labels.
Note: Using the frame attribute on the choice table will make these selectors apply partially. Please make sure you are designing your customization CSS taking into account all possible values for the frame attribute.

Code Blocks

Code blocks are used to render section of programming code.

How to Enable Code Syntax Highlighting

This topic refers only to the DITA Map PDF - based on HTML5 & CSS transformation type.

You can use syntax highlighting to make it easier to read your code snippets by displaying each type of code in different colors and fonts. In the DITA topics, set the @outputclass attribute on the <codeblock> elements to one of these values:

- language-bourne
- language-c
- language-cpp
• language-csharp
• language-css
• language-ini
• language-java
• language-javascript
• language-json
• language-lua
• language-perl
• language-php
• language-python
• language-ruby
• language-sql
• language-xml

For example, for a java snippet:

```csharp
<codeblock outputclass="language-java">
    for (int i=0; i <100; i++) {
        // do something
    }
</codeblock>
```

The resulting HTML fragment in the merged HTML5 document is:

```html
<pre class="+ topic/pre pr-d/codeblock pre codeblock language-java" xml:space="preserve">
    <strong class="hl-keyword" style="color:#7f0055">for</strong>(int i=0; i &lt;100; i++) {
        <em class="hl-comment" style="color:#006400">// do something</em>
    }
</pre>
```

And in the output, it will be rendered as:

```csharp
for (int i=0; i <100; i++) {
    // do something
}
```
Changing the Colors for the Syntax Highlighting

As you can see in the above example, the HTML elements `<span>` and `<strong>` are used to color the content. Since they have a `@style` attribute set, the overriding properties need to be marked with `!important`.

Suppose you want to color the keywords in red and the comments in blue. To do so, add the following to your customization CSS (on page 1657):

```css
.hl-keyword {
    color: red !important;
}
.hl-comment {
    color: blue !important;
}
```

How to Disable Line Wrapping in Code Blocks

By default, code blocks have the content wrapped to avoid the bleeding of long lines out of the page. To avoid wrapping, add the following in your customization CSS (on page 1657):

```css
*[class~="pr-d/codeblock"] {
    white-space: pre;
}
```

For the DITA Map PDF - based on HTML5 & CSS transformation type, the best solution to distinguish between lines is to leave them wrapped, but color each line with a different background (zebra coloring). An example is provided here: XSLT Extensions for PDF Transformations (on page 1649).

How to Deal with Unwanted Returns in Code Blocks

There are cases where the source file contains long lines of code that need to continue onto the next line in the rendered PDF (to wrap visually).

When the user copies the block from the PDF reader, they get two separated lines. This means that the command fails when users copy it from the PDF to the command-line terminal (because it comes in as two commands).

For example, the command:

```
$gist = ls -l * | count -n | some more
```

May be rendered in the PDF on two lines:
$gist = ls -l * | count -n
| some more

And this is invalid when used in the terminal.

There is no CSS workaround for this, but to manually format the command line, add a line continuation character like this:

```bash
$gist = ls -l * | count -n |
| some more
```

**Note:** For Linux/Mac OSX, the continuation character is the backslash `\`. For Windows, this is the shift character `^`. The command-line processor will now recognize that the first line is continuing on to the next one.

**Notes**

Notes contain an additional piece of information that calls attention to particular content. They may have various types (tip, caution, danger, restriction, important, warning).

For information on how to add and manage mixed content before the note icons and labels, see [How to Control the Image Size in Complex Static Content (on page 1769)](#).

**How to Change Note Icons**

The recommended icon format is SVG.

To change the default icons for notes that do not have a `type` attribute, add the following rule to your customization CSS (on page 1657):

```css
div.note > span.note__title{
    background-image:url("../img/note.svg") !important;
}
```

For a note with a `type` attribute set to `warning`, `caution`, or `trouble`, add the following corresponding CSS rule:

```css
div.warning > span.note__title{
    background-image:url("../img/warning.svg") !important;
}
div.caution > span.note__title{
    background-image:url("../img/caution.svg") !important;
}
```
Abbreviated Forms

When using the `<abbreviated-form>` element in your content, it is possible to style the subsequent occurrences differently than the first occurrence. To achieve this, add something similar to the following rule in your customization CSS (on page 1657):

```css
a:has(dfn[@class =~ "abbreviated-form"]) {
    color: oxy_xpath("let $cdf:= dfn return if (preceding::dfn[@keyref = $cdf/@keyref]) then 'black' else 'red'");
    text-decoration: oxy_xpath("let $cdf:= dfn return if (preceding::dfn[@keyref = $cdf/@keyref]) then 'none' else 'underline'");
}
```

This example would render the first occurrence with a red color and an underline, while the subsequent occurrences would be rendered with a black color and no underline.

Styling Through Custom Parameters

You can activate parts of your CSS by using custom transformation parameters that start with the `args.css.param` prefix.

These parameters are recognized by the publishing pipeline and are forwarded as synthetic attributes on the root element of the merged map. The last part of the parameter name will become the attribute name, while the value of the parameter will become the attribute value. The namespace of these synthetic attributes is: `http://www.oxygenxml.com/extensions/publishing/dita/css/params`.

**Notes:**

- Use only Latin alphanumeric characters for parameter names.
- You can set multiple styling parameters at the same time.

How to Limit the Depth of the TOC Using a Parameter

In the following example, a custom parameter is used to switch from a full depth table of contents to a flat one that shows only the titles of the first-level topics (such as chapters, preface, notices).

The custom parameter is:
The CSS that hides the topicrefs at level 2 or more:

```css
@namespace a "http://www.oxygenxml.com/extensions/publishing/dita/css/params";

:root[a|only-chapters-in-toc='yes'] *[class =~ "toc/toc"]
    > *[class =~ "map/topicref"]> *[class =~ "map/topicref"] {
        display: none;
    }
```

The selector `:root[a|only-chapters-in-toc='yes']` makes the rule activate only when the attribute is set.

### How to Change the Page Size Using a Parameter

In the next example, a custom parameter is used to modify the page size. The parameter is defined in the transformation scenario:

```xml
args.css.param.page-size="A4"
```

Then in the CSS, the attribute value is extracted and used:

```css
@page {
    size: oxy_xpath(`/[@local-name()="page-size"]`);
}
```

### Controlling the Publication Content

Using a plain DITA map, the transformation will produce a publication with a front page, a table of contents, chapters with content, and an index at the end. This is appropriate for most cases, but there are use cases where some adjustments are necessary. For example, if you want to do one of the following:

- Remove the TOC or index.
- Add a glossary.
- Change the position of the TOC or the index relative to the sibling topics.
- Add a preface, frontmatter, or backmatter with copyright notices, abstracts, list of tables, list of figures, etc.

All of these can be achieved using a DITA **bookmap**.
A bookmap has a more elaborate structure than a regular map. You should start by defining the title structure, with a main title and alternative title:

```xml
<!DOCTYPE bookmap PUBLIC "-//OASIS//DTD DITA BookMap//EN" "bookmap.dtd">
<bookmap id="taskbook">
  <booktitle>
    <mainbooktitle>Publication Title</mainbooktitle>
    <booktitlealt>A very short description of the publication</booktitlealt>
  </booktitle>
</bookmap>
```

Then you may define a front matter. In this, you may link the topics that need to appear before the main content. You may also define the location where the table of contents will be placed. In the example below, it appears between the "abstract" and "foreword" topics:

```xml
<frontmatter>
  <topicref href="topics/abstract.dita"/>
  <booklists>
    <toc/>
  </booklists>
  <topicref href="topics/foreword.dita"/>
</frontmatter>
```

Note: To remove the TOC from the publication, just omit the `<toc>` element from the `<booklists>`.

Next, the topics are grouped into chapters:

```xml
...<chapter href="topics/installation.dita" />
...```

At the end, you could define the structure of the backmatter. Just like for the frontmatter, you can include some topics and some generated content, such as the index. In the example below, it is defined that the glossary should come after the index, followed by a list of figures and list of tables. At the very end, there is a topic with some thank you notes.

```xml
<backmatter>
  <topicref href="topics/conclusion.dita"/>
  <booklists>
    <indexlist/>
    <glossarylist>
      <topicref href="topics/xp.dita" keys="xp" print="yes"/>
    </glossarylist>
  </booklists>
</backmatter>
```
As you can see, the bookmap offers a much better control over the final content of the publication. It also offers more options in controlling the metadata that will go into the PDF (see the Metadata (on page 1686) topic).

How to Omit the Front Page, TOC, Glossary, Index for a Plain DITA Map

For a plain DITA map, there are no elements that allow you to control if and where to place the generated content such as the title page, table of contents, list of tables, glossary, or index. For the most common use-case, when you want to hide them all and just keep the content, you can use the transformation parameter hide.frontpage.toc.index.glossary. See: Transformation Parameters (on page 1634).

Related Information:

- How to Remove Entries from the TOC (on page 1717)
- How to Hide the TOC (on page 1718)

How to Make Chapters Look Like Individual Publications

Note: This topic is only applicable for the DITA Map PDF - based on HTML5 & CSS transformation scenario.

Sometimes you want to make each chapter independent (i.e. it can be read separately, as a separate part of your publication). For this, you need the page counter, figure, and table counters to restart at each chapter. You can control this by using the args.css.param.numbering (on page 1704) command line parameter.

In addition to numbering, you can force the creation of a chapter TOC (on page 1718).
Troubleshooting

This section contains information about fixing various publishing problems.

Error Parsing CSS File - Caused by a Networking Problem

Problem

My custom styles are not applied and in the transformation results console, I get an error containing one of the following: I/O exception, Unknown host, Error parsing.

Cause

One of the CSS files contains references to resources from another website that is currently inaccessible. These resources may include:

- Fonts
- Images
- Other CSS files

Note: If you exported one of the built-in publishing templates from the transformation scenario dialog, it is possible that the associated CSS files use an imported Google Font.

Remedy

1. Check your proxy settings (ask the system administrator for help).

2. If the server is still inaccessible from the transformation process, download the remote resources using a web browser, save them in the customization CSS file folder, and refer them directly from your CSS.

Note: If the problem is caused by a remote font, see Using Local Fonts.

XSL FO-based DITA to PDF Customization

Oxygen XML Author comes bundled with the DITA Open Toolkit that provides a mechanism for converting DITA maps (on page 2793) to PDF output. Oxygen XML Author includes a built-in DITA Map PDF - based on XSL-FO (on page 1280) transformation scenario that converts DITA maps to PDF using an xsl:fo processor.

There are several methods that can be used to customize DITA to PDF output:
Create a customization directory that contains your customized files and reference that directory in the PDF transformation scenario (using the `customization.dir` parameter).

Creating a DITA Open Toolkit plugin that adds extensions to the PDF output. More details can be found in the DITA Open Toolkit Documentation.

**Tip:** Some sample plugins are available on GitHub that could help you to get started with creating a plugin:

- Sample Plugin: DITA-OT PDF Customization Plugin for Oxygen User Manual
- Sample Plugin: DITA-OT PDF2 - Generate Numbers Before Topic's Title

Using a Customization Directory

One way to customize the PDF output generated by the DITA Map to PDF - based on XSL-FO (on page 1280) transformation scenario is to create a dedicated folder to store customized files. With this approach, you will copy the contents of the built-in customization directory to a new directory where you can customize the files according to your needs and reference the new directory using the `customization.dir` parameter in the transformation scenario. The biggest advantage of this method is that the contents of your customization directory will remain unaffected when the DITA-OT is upgraded.

**How to Create a Customization Directory**

Follow this procedure to create a customization directory:

1. Copy all the entire `DITA-OT-DIR\plugins\org.dita.pdf2\Customization` directory to another location where you have write access.
2. Modify any of the files in whatever way necessary to achieve your specific goal. For inspiration, see Embedding a Company Logo (on page 1785) for a specific example of how you can modify contents of the directory to embed a logo in the output.

**Tip:** For other specific examples, see DITA-OT Documentation - PDF Customization Plugin.

3. Edit the DITA Map to PDF - based on XSL-FO (on page 1280) transformation scenario, go to the Parameters tab, and set the `customization.dir` parameter to point to the location of your customization directory.

**Related Information:**

- Automatic PDF plugin customization generator by Jarno Elovirta.
Embedding a Company Logo

The following procedure explains how to embed a company logo image in the front matter of the book.

1. Create a customization directory (on page 1784) (if you haven't already done so).
2. Create a \cfg\common\artwork directory structure in your customization directory and copy your logo to that directory (for example, \C:\Customization\cfg\common\artwork \logo.png).

⚠️ Important: Make sure that your logo image is named: logo.png.
3. Rename Customization\catalog.xml.orig to: Customization\catalog.xml.
4. Open the catalog.xml in Oxygen XML Author and uncomment this line:
   
   <!--uri name="cfg:fo/xsl/custom.xsl" uri="fo/xsl/custom.xsl"-->

   It now looks like this:

   <uri name="cfg:fo/xsl/custom.xsl" uri="fo/xsl/custom.xsl"/>

5. Rename the file Customization\fo\xsl\custom.xsl.orig to: C:\Customization\fo xsl\custom.xsl
6. Open the custom.xsl file in Oxygen XML Author and create the template called createFrontCoverContents for DITA-OT 3.3.1.

   Tip: You can copy the same template from DITA-OT-DIR\plugins \org.dita.pdf2\xsl\fo\front-matter.xsl and modify it in whatever way necessary to achieve your specific goal. This new template in the custom.xsl file will override the same template from DITA-OT-DIR\plugins\org.dita.pdf2\xsl\fo\front-matter.xsl.

   Example:

For example, the custom.xsl could look like this:

```xml
<?xml version='1.0'?>
<xsl:stylesheet xmlns:xsl='http://www.w3.org/1999/XSL/Transform'
    xmlns:fo='http://www.w3.org/1999/XSL/Format'
    version='2.0'>

    <xsl:template name="createFrontCoverContents">
        <!-- set the title -->
```
7. Edit the **DITA Map to PDF - based on XSL-FO** *(on page 1280)* transformation scenario, go to the **Parameters** tab, and set the **customization.dir** parameter to point to the location of your customization directory.
Customizing the Header and Footer in PDF Output

The XSLT stylesheet `DITA-OT-DIR/plugins/org.dita.pdf2/xsl/fo/static-content.xsl` contains templates that output the static header and footers for various parts of the PDF such as the prolog, table of contents, front matter, or body.

The templates for generating a footer for pages in the body are called `insertBodyOddFooter` or `insertBodyEvenFooter`.

These templates get the static content from resource files that depend on the language used for generating the PDF. The default resource file is `DITA-OT-DIR/plugins/org.dita.pdf2/cfg/common-vars/en.xml`. These resource files contain variables (such as `Body odd footer`) that can be set to specific user values.

Instead of modifying these resource files directly, they can be overwritten with modified versions of the resources in a PDF customization directory.

1. Create a customization directory (on page 1784) (if you haven’t already done so).
2. Locate the stylesheets and templates listed above in your customization directory and modify them in whatever way necessary to achieve your specific goal.

Tip: For more information and examples, see the Oxygen PDF Customization Plugin project on GitHub.
3. Edit the DITA Map to PDF - based on XSL-FO (on page 1280) transformation scenario, go to the Parameters tab, and set the customization.dir parameter to point to the location of your customization directory.

Related Information:

- Using a Customization Directory (on page 1784)
Adding a Watermark to PDF Output

To add a watermark to the PDF output of a DITA Map PDF - based on XSL-FO (on page 1280) transformation scenario, follow this procedure:

1. Create a customization directory (on page 1784) (if you haven’t already done so).
2. Create a \cfg\common\artwork directory structure in your customization directory and copy your watermark image to that directory (for example, C:\Customization\cfg\common\artwork\watermark.png).
3. Rename the Customization\catalog.xml.orig file to Customization\catalog.xml.
4. Open the catalog.xml in Oxygen XML Author and uncomment this line:

   <!--uri name="cfg:fo/xsl/custom.xsl" uri="fo/xsl/custom.xsl"/>

   The uncommented line should look like this:

   <uri name="cfg:fo/xsl/custom.xsl" uri="fo/xsl/custom.xsl"/>

5. Rename the file: Customization\fo\xsl\custom.xsl.orig to: Customization\fo\xsl\custom.xsl.
6. Open the Customization\fo\xsl\custom.xsl file in Oxygen XML Author to overwrite two XSLT templates:

   • The first template is located in the XSLT stylesheet DITA-OT-DIR\plugins\org.dita.pdf2\xsl\fo\static-content.xsl. Override by copying the original template content in the custom.xsl and specifying a watermark image for every page in the PDF content, using a block-container element that references the watermark image file:

     ```xml
     <fo:static-content flow-name="odd-body-header">
       <fo:block-container absolute-position="absolute" top="-2cm" left="-3cm" width="21cm" height="29.7cm"
         background-image="{concat($artworkPrefix,'Configuration/OpenTopic/cfg/common/artwork/watermark.png')}"
       >
         <fo:block/>
       </fo:block-container>
       <fo:block xsl:use-attribute-sets="__body_odd__header">
         <xsl:call-template name="insertVariable">
           <xsl:with-param name="theVariableID" select="'Body odd header'"/>
           <xsl:with-param name="theParameters">
             <prodname>
               <xsl:value-of select="$productName"/>
             </prodname>
           </xsl:with-param>
         </xsl:call-template>
         <heading>
       </fo:block>
     </fo:static-content>
     ```
The second template to override is located in the XSLT stylesheet \DITA-OT-DIR\plugins\org.dita.pdf2\xsl\fo\commons.xsl and is used for styling the first page of the output. Override it by copying the original template content in the custom.xsl and adding the block-container element that references the watermark image file:

```xml
<xsl:template name="createFrontMatter_1.0">
  <fo:page-sequence master-reference="front-matter" xsl:use-attribute-sets="__force__page__count">
    <xsl:call-template name="insertFrontMatterStaticContents"/>
    <fo:flow flow-name="xsl-region-body">
      <fo:block-container absolute-position="absolute"
        top="-2cm" left="-3cm" width="21cm" height="29.7cm"
        background-image="{concat($artworkPrefix, 'Configuration/OpenTopic/cfg/common/artwork/watermark.png')}">
        <fo:block/>
      </fo:block-container>
      <fo:block xsl:use-attribute-sets="__frontmatter">
        <!-- set the title -->
      </fo:block>
    </fo:flow>
  </fo:page-sequence>
</xsl:template>
```
7. Edit the DITA Map to PDF - XSL-FO (on page 1280) transformation scenario, go to the Parameters tab, and set the customization.dir parameter to point to the location of your customization directory.
Adding an Edit Link in PDF Output to Launch Oxygen XML Web Author

You can embed *Edit* links in the DITA Map PDF output that will automatically launch a particular document in *Oxygen XML Web Author*. A reviewer can then simply click the link and they will be redirected to the Oxygen XML Web Author editing page with that particular file open and editable.

To embed an *Edit* link in the DITA Map PDF output, follow these steps:

1. Edit a [DITA Map to PDF - based on XSL-FO (on page 1280)](on page 2727) transformation scenario and open the Parameters tab.
2. Set values for the following parameters:
   - `editlink.remote.ditamap.url` - The URL of the DITA Map suitable for opening in Oxygen XML Web Author.
   - `editlink.web.author.url` - The URL of the *Oxygen XML Web Author* installation, for example `https://www.oxygenxml.com/oxygen-xml-web-author/`
3. Run the transformation scenario.

**Result:** In the PDF output, all topics will have an *Edit* link to the right side of the title and clicking the link will launch that particular document in Oxygen XML Web Author.

Force Page Breaks Between Two Block Elements in PDF Output

Suppose that in your DITA content you have two *block elements (on page 2792)*, such as two paragraphs:

```html
<p>First para</p>
<p>Second para</p>
```

and you want to force a page break between them in the PDF output.

Here is how you can implement a DITA Open Toolkit plugin (on page 2797) that would achieve this:

1. Define your custom processing instruction that marks the place where a page break should be inserted in the PDF, for example:

```html
<p>First para</p>
<?pagebreak?>
<p>Second para</p>
```

2. Locate the DITA Open Toolkit distribution and in the plugins directory create a new plugin folder (for example, `DITA-OT-DIR/plugins/pdf-page-break`).
3. In this new folder, create a new plugin.xml file with the following content:

```xml
<plugin id="com.yourpackage.pagebreak">
    <feature extension="package.support.name" value="Force Page Break Plugin"/>
    <feature extension="package.support.email" value="support@youremail.com"/>
    <feature extension="package.version" value="1.0.0"/>
    <feature extension="dita.xsl.xslfo" value="pageBreak.xsl" type="file"/>
</plugin>
```

The most important feature in the plugin is that it will add a new XSLT stylesheet to the XSL processing that produces the PDF content.

4. In the same folder, create an XSLT stylesheet named pageBreak.xsl with the following content:

```xml
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:fo="http://www.w3.org/1999/XSL/Format" version="1.0">
    <xsl:template match="processing-instruction('pagebreak')">
        <fo:block break-after="page"/>
    </xsl:template>
</xsl:stylesheet>
```

5. Install your plugin in the DITA Open Toolkit. (on page 2768)

The source code for the plugin can be found on GitHub here: https://github.com/dita-community/org.dita-community.pdf-page-break.

Customizing Note Images in PDF

To customize the images that appear next to each type of note in the PDF output, use a PDF customization folder (on page 1784) with the following procedure:

1. Create a customization directory (on page 1784) (if you haven't already done so).
2. Create a cfg\common\vars directory structure in your customization directory and copy the contents of DITA-OT-DIR\plugins\org.dita.pdf2\cfg\common\vars into that created directory.
3. Locate the DITA-OT-DIR\plugins\org.dita.pdf2\cfg\common\vars\en.xml file in your customization directory (for example, custom_org.dita.pdf2\cfg\common\vars \en.xml).
4. Create a cfg\common\artwork directory structure in your customization directory and add your custom notice image (for example, Customization\cfg\common\artwork\notice.gif).
5. Locate and edit the Customization\cfg\common\vars\en.xml file and modify the appropriate note element. For example, modify the path to the image for <note> element with the type attribute set to notice from:
6. Edit the DITA Map to PDF - based on XSL-FO (on page 1280) transformation scenario, go to the Parameters tab, and set the path for the customization.dir property to point to the customization folder. Also, set the com.oxygenxml.use.custom.note.images parameter to no.

Show Comments and Tracked Changes in PDF Output

To include comments and tracked changes (stored within your DITA topics) in the PDF output, follow these steps:

1. Edit a DITA Map to PDF transformation scenario.
2. In the Parameters tab, set the value of the show.changes.and.comments parameter to yes.
3. Optionally, you can configure any of these other parameters to adjust the colors of the comments and tracked changes:
   - ct.insert.color - Specifies the color for insertion type tracked changes, as a plain color (e.g. red, yellow, blue), or with a hexadecimal equivalent (e.g. #FFFFFF). The default value is 'blue'.
   - ct.delete.color - Specifies the color for deletion type tracked changes, as a plain color (e.g. red, yellow, blue), or with a hexadecimal equivalent (e.g. #FFFFFF). The default value is 'red'.
   - ct.comment.bg.color - Specifies the background color for comment type tracked changes, as a plain color (e.g. red, yellow, blue), or with a hexadecimal equivalent (e.g. #FFFFFF). The default value is 'yellow'.
4. Click OK and then the Apply Associated button to run the transformation scenario.

Result: Comment threads and tracked changes will now appear in the PDF output. Details about each comment or change will be available in the footer section for each page.

Set a Font for PDF Output Generated with FO Processor

When a DITA map (on page 2793) is transformed to PDF using an FO processor and it contains some Unicode characters that cannot be rendered by the default PDF fonts, a font that is capable of rendering these characters must be configured and embedded in the PDF result.

The settings that must be modified for configuring a font for the built-in FO processor are detailed in Add a Font to the Built-in FO Processor - Advanced Version (on page 1356).
DITA OT PDF Font Mapping

The DITA OT contains a file `DITA-OT-DIR/plugins/org.dita.pdf2/cfg/fo/font-mappings.xml` that maps logical fonts used in the XSLT stylesheets to physical fonts that will be used by the FO processor to generate the PDF output.

The XSLT stylesheets used to generate the XSL-FO output contain code like this:

```xml
<xsl:attribute name="font-family">monospace</xsl:attribute>
```

The font-family is defined to be `monospace`, but `monospace` is just an alias. It is not a physical font name. Therefore, another stage in the PDF generation takes this `monospace` alias and looks in the `font-mappings.xml`.

If it finds a mapping like this:

```xml
<aliases>
  <alias name="monospace">Monospaced</alias>
</aliases>
```

then it looks to see if the `monospace` has a `logical-font` definition and if so, it will use the `physical-font` specified there:

```xml
<logical-font name="Monospaced">
  <physical-font char-set="default">
    <font-face>Courier New, Courier</font-face>
  </physical-font>
  .........
</logical-font>
```

⚠️ Important:

If no alias mapping is found for a font-family specified in the XSLT stylesheets, the processing defaults to `Helvetica`.

Related Information:

Adding Libraries to the Built-in FO Processor (DITA-OT)

Starting with Oxygen XML Author version 20.0, both hyphenation and PDF image support are enabled by default in the built-in DITA-OT FO processor. For older version of Oxygen XML Author, use the following procedures to enable such support.

Adding Hyphenation Support for DITA-OT Transformation Scenarios

1. Download the pre-compiled JAR (on page 2795) from OFFO.
2. Edit the DITA-OT transformation scenario and switch to the Advanced tab.
3. Click the Libraries button and add the path to the fop-hyph.jar library.

Adding Support for PDF Images

1. Download the fop-pdf-images JAR libraries.
2. Edit the DITA-OT transformation scenario and switch to the Advanced tab.
3. Click the Libraries button and add the path to the libraries.

Adding Support for CGM Images

1. Go to the JCGM page and download the jcgm-image-0.1.1.jar and jcgm-core-0.2.0.jar libraries.
2. Edit the DITA-OT transformation scenario and switch to the Advanced tab.
3. Click the Libraries button and add the path to the libraries.

Debugging DITA PDF Transformations

To debug a DITA PDF transformation scenario using the XSLT Debugger follow these steps:

1. Open the Preferences dialog box (Options > Preferences) (on page 79), go to XML > XML Catalog, click Add, and select the file located at DITA-OT-DIR\plugins \org.dita.pdf2\cfg\catalog.xml.

2. Open the map in the DITA Maps Manager (on page 2503) and create a DITA Map PDF - XSL-FO transformation scenario.

3. Edit the scenario, go to the Parameters tab and change the value of the clean.temp parameter to no.

4. Run the transformation scenario.
5. Open the `stage1.xml` file located in the temporary directory and format and indent (on page 805) it.

6. Create a transformation scenario for this XML file by associating the `topic2fo_shell_fop.xsl` stylesheet located at `DITA-OT-DIR\plugins\org.dita.pdf2\xsl\fo\topic2fo_shell_fop.xsl`. If you are specifically using the RenderX XEP or Antenna House FO processors to build the PDF output, you should use the XSL stylesheets `topic2fo_shell_xep.xsl` or `topic2fo_shell_axf.xsl` located in the same folder.

   **Note:** For validation purposes, you need to add the main debugged stylesheet (usually `topic2fo_shell_fop.xsl`) to the Master Files folder (on page 671) in the Project view.

7. In the transformation scenario edit the XSLT Processor combo box choose the Saxon EE XSLT processor (the same processor used when the DITA OT transformation is executed).

8. In the transformation scenario, edit the Parameters list and set the parameter `locale` with the value `en_GB` and the parameter `customizationDir.url` to point either to your customization directory or to the default DITA OT customization directory. Its value should have a URL syntax like this: `file://c:/path/to/DITA-OT-DIR/plugins/org.dita.pdf2/cfg`.

9. Debug the transformation scenario.

**Related Information:**

- How to Enable Debugging for FO Processor Transformations (on page 1358)

**DocBook to PDF Output Customization**

When the default layout and output of the DocBook to PDF transformation needs to be customized, follow these steps:

   You should start from a copy of the file `[DocBook XSL directory]/fo/titlepage.templates.xml` and customize it. The instructions for the spec file can be found here.

   An example of spec file:

   ```xml
   <t:titlepage-content t:side="recto">
   <mediaobject/>
   ```
2. Generate a new XSLT stylesheet from the title spec file from the previous step. Apply [DocBook XSL directory]/template/titlepage.xsl to the title spec file. The result is an XSLT stylesheet (for example, mytitlepages.xsl).

3. Import mytitlepages.xsl in a DocBook customization layer. The customization layer is the stylesheet that will be applied to the XML document. The mytitlepages.xsl should be imported with an element like this:

   `<xsl:import href="dir-name/mytitlepages.xsl"/>

5. Apply the customization layer to the XML document. A quick way is to duplicate the transformation scenario DocBook PDF that is included with Oxygen XML Author and set the customization layer in the XSL URL property of the scenario (on page 1293).

Related Information:

• customizing the PDF output.

• Video demonstration for creating a DocBook customization layer in Oxygen XML Author.
11. Working with XPath Expressions

XPath is a language for addressing specific parts of a document. XPath models an XML document as a tree of nodes. An XPath expression is a mechanism for navigating through and selecting nodes from the document. An XPath expression is, in a way, analogous to an SQL query used to select records from a database.

**Note:** If an XPath expression is run over a JSON document, it is converted to XML and the XPath is executed over the converted XML document.

There are various types of nodes, including element nodes, attribute nodes, and text nodes. XPath defines a way to compute a string-value for each type of node.

XPath defines a library of standard functions for working with strings, numbers and boolean expressions.

**Examples:**

- `child::*` - Selects all children of the root node.
- `./name` - Selects all elements having the name "name", descendants of the current node.
- `catalog/cd[price>10.80]` - Selects all the `cd` elements that have a price element with a value larger than 10.80.

To find out more about XPath, see [http://www.w3.org/TR/xpath](http://www.w3.org/TR/xpath).

**Related Information:**

- Find/Replace in Multiple Files *(on page 687)*
- Find/Replace Dialog Box *(on page 683)*

**XPath Toolbar**

XPath is a query language for selecting nodes from an XML document. To use XPath expressions effectively, you need a good understanding of the XPath Core Function Library.
XPath Toolbar

Oxygen XML Author provides an XPath toolbar to let you query XML documents fast and easy using XPath expressions.

Figure 429. XPath Toolbar

The XPath toolbar includes the following features:

**XPath version chooser drop-down menu**

You can choose the XPath version from the drop-down menu available in the left side of the toolbar. Available options include XPath 1.0, XPath 2.0, XPath 2.0 SA, XPath 3.1, XPath 3.1 SA.

**Note:** The XPath 2.0 SA and XPath 3.1 SA options have some limitations. These options only offer information about the beginning part of the matching result. For example, if you search for an element, it will only highlight the start tag.

**Warning:** Oxygen XML Author uses Saxon to execute XPath 3.1 expressions, but implements a part of the 3.1 functions. When using a function that is not implemented, Oxygen XML Author can return a compilation error.

**XPath scope menu**

Oxygen XML Author allows you to define a scope for which the XPath operation will be executed. You can choose where the XPath expression will be executed:

- Current file - Current selected file only.
- Project - All the files in the project.
- Selected project resources - The files selected in the project.
- All opened files - All files opened in the application.
- Current DITA Map hierarchy - All resources referenced in the currently selected DITA map, opened in the DITA Maps Manager view (on page 2503).
- Opened archive - Files open in the Archive Browser view (on page 1807).
- Working sets - The selected working sets (on page 2800).

At the bottom of the scope menu the following scope configuration actions are available:
• Configure XPath working sets - Allows you to configure and manage collections of files and folders, encapsulated in logical containers called working sets (on page 2800).

• XPath file filter - You can filter the files from the selected scope for which the XPath expression will be executed. By default, the XPath expression will be executed only on XML or JSON files, but you can also define a set of patterns that will filter out files from the current scope. If you select the include archive option, the XPath expression will be also executed on the files in any archive (including EPUB and DocX) found at the current scope.

History drop-down list

The XPath combo box keeps a history of the last 15 expressions that were used so that you can easily choose them again.

Settings menu

The following actions are available in this drop-down menu:

• XPath update on cursor move

When selected and you navigate through a document, the XPath expression corresponding to the XML node at the current cursor position is displayed. For JSON documents, it displays the XPath expression for the current property.

• Evaluate XPath as you type

When you select this option, the XPath expression you are composing is evaluated in real time.

Note: This option and the automatic validation are disabled when you edit huge documents (on page 723) or when the scope is other than Current file.

• XPath Options

Opens the Preferences page of the currently selected processing engine.

 Switch to XPath Builder View

Opens the XPath Builder view (on page 1801).

Note: During the execution of an XPath expression, the XPath toolbar displays a ■ Stop button. Press this button to stop the XPath execution.

When you type expressions longer than 60 characters, a dialog box opens that offers you the possibility to switch to the XPath Builder view (on page 1801).
XPath Builder View

The **XPath/XQuery Builder** view allows you to compose complex XPath expressions and execute them over the currently edited XML document. For XPath 2.0 / 3.1, you can use the `doc()` function to specify the source file for which the expressions are executed. When you connect to a database, the expressions are executed over that database. If you are using the **XPath/XQuery Builder** view and the current file is an XSLT document, Oxygen XML Author executes the expressions over the XML document in the associated scenario.

**Note:** If an XPath expression is run over a JSON document, it is converted to XML and the XPath is executed over the converted XML document.

If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu. You can also open it simply by pressing the **Switch to XPath Builder View** button that is located on the **XPath toolbar** (on page 1798).

The upper part of the view contains the following actions:

**XPath version chooser drop-down menu**

A drop-down menu that allows you to select the type of the expression you want to execute. You can choose between:

- XPath 1.0 (Xerces-driven)
- XPath 2.0, XPath 2.0 SA, XPath 3.1, XPath 3.1 SA, Saxon-HE XQuery, Saxon-PE XQuery, or Saxon-EE XQuery (all of them are Saxon-driven)
- Custom connection to XML databases that can execute XQuery expressions

**Note:** The results returned by XPath 2.0 SA and XPath 3.1 SA have a location limited to the line number of the start element (there are no column information and no end specified).

**Note:** Oxygen XML Author uses Saxon to execute XPath 3.1 expressions. Since Saxon implements a part of the 3.1 functions, when using a function that is not implemented, Oxygen XML Author returns a compilation error.
Use this button to start the execution of the XPath or XQuery expression you are editing. The result of the execution is displayed in the Results view (on page 343).

 Favorites button

Allows you to save certain expressions that you can later reuse. To add an expression as a favorite, press the star button and enter a name for it. The star turns yellow to confirm that the expression was saved. Expand the drop-down menu next to the star button to see all your favorites. Oxygen XML Author automatically groups favorites in folders named after the method of execution.

 History drop-down menu

Keeps a list of the last 15 executed XPath expressions. Use the ✶ Clear history action from the bottom of the list to remove them.

 Settings drop-down menu

Contains the following three options:

-update on cursor move

When selected and you navigate through a document, the XPath expression corresponding to the XML node at the current cursor position is displayed. For JSON documents, it displays the XPath expression for the current property.

Evaluate as you type

When you select this option, the XPath expression you are composing is evaluated in real time.

Note: This option and the automatic validation are disabled when you edit huge documents (on page 723) or when the scope is other than Current file.

 Options

Opens the Preferences page of the currently selected processing engine.

XPath scope menu

Oxygen XML Author allows you to define a scope for which the XPath operation will be executed. You can choose where the XPath expression will be executed:

- Current file - Current selected file only.
- Project - All the files in the project.
- Selected project resources - The files selected in the project.
- All opened files - All files opened in the application.
Current DITA Map hierarchy - All resources referenced in the currently selected DITA map, opened in the DITA Maps Manager view (on page 2503).

Opened archive - Files open in the Archive Browser view (on page 1807).

Working sets - The selected working sets (on page 2800).

At the bottom of the scope menu the following scope configuration actions are available:

Configure XPath working sets - Allows you to configure and manage collections of files and folders, encapsulated in logical containers called working sets (on page 2800).

XPath file filter - You can filter the files from the selected scope for which the XPath expression will be executed. By default, the XPath expression will be executed only on XML or JSON files, but you can also define a set of patterns that will filter out files from the current scope. If you select the Include archive option, the XPath expression will be also executed on the files in any archive (including EPUB and DocX) found at the current scope.

Figure 430. XPath/XQuery Builder View
While you edit an XPath or XQuery expression, Oxygen XML Author assists you with the following features:

- **Content Completion Assistant (on page 2792)** - It offers context-dependent proposals and takes into account the cursor position in the document you are editing. The set of functions proposed by the Content Completion Assistant also depends on the engine version. Select the engine version from the drop-down menu available in the toolbar.

- **Syntax Highlighting** - Allows you to identify the components of an expression. To customize the colors of the components of the expression, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Syntax Highlight (on page 173).

- Automatic validation of the expression as you type.

**Note:** When you type invalid syntax, a red serrated line underlines the invalid fragments.

The usual edit actions (Cut, Copy, Paste, Select All, Undo, Redo) are available in the contextual menu of the top editable part of the view.

**Related Information:**

- XPath Expression Results View (on page 1804)

**XPath Expression Results View**

When you run an XPath expression, Oxygen XML Author displays the results of its execution in the Results view (on page 343).

This view contains the following columns:

- **Description** - The result that Oxygen XML Author displays when you run an XPath expression.
- **XPath location** - The path to the matched node.
- **Resource** - The name of the document that you run the XPath expression on.
- **System ID** - The path to the document itself.
- **Location** - The location of the result in the document.

To arrange the results depending on a column, click its header. To group the results by their resource, or by their system ID, right-click the header of any column in the Results view and select Group by "Resource" or Group by "System ID". If no information regarding location is available, Oxygen XML Author displays Not available in the Location column. Oxygen XML Author displays results in a valid XPath expression format.
The **Results** view also includes various toolbar and contextual menu actions. For more information, see [Results View (on page 343)](#).

**Example:**

The following snippets are taken from a DocBook book based on the DocBook XML DTD. The book contains a number of chapters. To return all the chapter nodes of the book, enter `//chapter` in the XPath expression field and press **(Enter)**. This action returns all the `chapter` nodes of the DocBook book in the **Results View**. Click a record in the **Results View** to locate and highlight its corresponding chapter element and all its children nodes in the document you are editing.

To find all `example` nodes contained in the `sect2` nodes of a DocBook XML document, use the following XPath expression: `//chapter/sect1/sect2/example`. Oxygen XML Author adds a result in the **Results View** for each `example` node found in any `sect2` node.

For example, if the result of the above XPath expression is:

```
- /chapter[1]/sect1[3]/sect2[7]/example[1]
```

it means that in the edited file, the `example` node is located in the first chapter, third section level one, seventh section level 2.

**Figure 431. XPath Results Highlighted in Editor Panel with Character Precision**
XPath and XML Catalogs

The evaluation of the XPath expression tries to resolve the locations of documents referenced in the expression through XML Catalogs (on page 2800). These catalogs are configured in the XML Catalog preferences (on page 183) pages and the XML Parser preferences (on page 185).

Example:

As an example, consider the evaluation of the \texttt{collection()} function (XPath 2.0). To resolve the references from the files returned by the \texttt{collection()} function with an XML catalog, specify the class name of the catalog-enabled parser for parsing these collection files. The class name is \texttt{ro.sync.xml.parser.CatalogEnabledXMLReader}. Specify it as it follows:

\begin{verbatim}
let $docs := collection(iri-to-uri("file:///D:/temp/test/XQuery-catalog/mydocsdir?recurse=yes;select=*.xml;parser=ro.sync.xml.parser.CatalogEnabledXMLReader"))
\end{verbatim}

XPath Prefix Mapping

To define default mappings between prefixes (that you can use in the XPath toolbar (on page 1798)) and namespace URIs go to the XPath preferences page (on page 203) and enter the mappings in the Default prefix-namespace mappings table. The same preferences panel allows you to configure the default namespace used in XPath 2.0 expressions.

⚠️ Important: If you define a default namespace, Oxygen XML Author binds this namespace to the first free prefix from the list: \texttt{default}, \texttt{default1}, \texttt{default2}, and so on. For example, if you define the default namespace \texttt{xmlns="something"} and the prefix \texttt{default} is not associated with another namespace, you can match tags without prefix in an XPath expression typed in the XPath toolbar by using the prefix \texttt{default}. To find all the \texttt{level} elements when you define a default namespace in the root element, use this expression: \texttt{//default:level} in the XPath toolbar.
Oxygen XML Author includes a useful Archive Browser view (on page 1807) that offers the means to work with files directly from various types of archives (for example, opening and saving files directly in archives, or browsing and modifying archive structures). The archive support is available for all ZIP-type archives, including:

- ZIP archives
- EPUB books
- JAR archives (on page 2795)
- Office Open XML (OOXML) files
- Open Document Format (ODF) files
- IDML files (on page 2795)

You can transform, validate, and perform many other operations on files directly from an archive. For instance, you can transform, or validate files directly from OOXML or ODF packages, and the structure and content of the ZIP archives can be opened, edited, and saved, similar to any other ZIP archive browsing tool. Also, when browsing for a URL in various dialog boxes, you can use the Browse for archived file action to browse and select files from a particular archive.

For more information about working with an EPUB archive in Oxygen XML Author, watch our video demonstration:

https://www.youtube.com/embed/OIGTNQw0CI8

Browsing Archives

Oxygen XML Author includes a helper view called the Archive Browser that allows you to view the contents and structure of an archive, and it offers a variety of toolbar and contextual menu actions. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

To open an archive in the Archive Browser view, use one of the following methods:

- Open an archive from the Project view (on page 320).
- Select an archive in one of the file chooser dialog boxes in Oxygen XML Author (such as the Open dialog box).
- Drag an archive from a system file explorer and drop it in the Archives Browser view.
When displaying an archive, the Archive Browser view locks the archive file. It is then automatically unlocked when the Archive Browser view is closed.

Tip: If a file is not recognized by Oxygen XML Author as a supported archive type, you can add it from the Archive preferences page (on page 234).

Figure 432. Archive Browser

Archive Browser Toolbar Actions

The following actions are available on the Archive Browser toolbar:

Open Archive menu

Provides access to the Open Archive action that opens a new archive in the browser. If the extension is not known as an archive extension, you will be directed to the Archive preferences page (on page 234) to add a new extension. The sub-menu keeps a list of recently open archive files and a Clear history action that allows you to delete the list.

Close

Closes the browsed archive and unlocks the archive file.

Validate (available for EPUB archives only)

Checks the EPUB archive to see if its content and structure is valid.

New folder

Creates a folder as child of the selected folder in the browsed archive.

New file

Creates a file as child of the selected folder in the browsed archive.
Add files

Adds existing files as children of the selected folder in the browsed archive.

Note: You can also add files in the archive by dragging them from the file browser or the Project view (on page 320) and dropping them in the Archive Browser view.

Delete

Deletes the selected resource in the browsed archive.

Open in System Application

Opens the selected resource in the default system application that is associated with that type of file.

Archive Options

Opens the Archive preferences page (on page 234).

Archive Browser Contextual Menu Actions

The following additional actions are available from the contextual menu for resources in the Archive Browser view:

Open

Opens a resource from the archive in the editor.

Extract

Extracts a resource from the archive in a specified folder.

New folder

Creates a folder as child of the selected folder in the browsed archive.

New file

Creates a file as child of the selected folder in the browsed archive.

Add files

Adds existing files as children of the selected folder in the browsed archive.

Note: On OS X, the Add file action is also available and it allows you to add one file at a time.

Rename

 Renames a resource in the archive.

Find/Replace in Files
Opens the **Find/Replace in Files** dialog box (on page 687) that allows you to search for and replace specific pieces of text inside the archive.

- **Cut**
  Cuts the selected archive resource.

- **Copy**
  Copies the selected archive resource.

- **Paste**
  Pastes a file or folder into the archive.

- **Delete**
  Removes a file or folder from archive.

- **Preview**
  Previews an image contained in the archive. See the Image Preview (on page 664) topic for more details.

- **Copy location**
  Copies the URL location of the selected resource.

- **Refresh**
  Refreshes the selected resource.

- **Properties**
  Shows the properties of the selected resource.

For more information, watch our video demonstration about working with an EPUB in the Archive Browser view:

https://www.youtube.com/embed/OIGTNQw0CI8

### Working with Archive Files

Oxygen XML Author includes support for working with various types of archives, including the following:

- **EPUB** - An e-book file format that can be used on many types of devices, such as smart phones, tablets, e-readers, or computers.

- **OOXML** - An XML-based file format for representing spreadsheets, charts, presentations, and word processing documents.

- **ODF** - An free and open-source XML-based file format for electronic office documents, such as spreadsheets, charts, presentations, and word processing documents.
When these types of files are opened in the Archive Browser view (on page 1807), their internal components are expanded:

- Document content (XHTML and image files).
- Packaging files.
- Container files.

Figure 433. EPUB File Displayed in the Archive Browser View

When an archive is expanded in the Archive Browser view (on page 1807), you can add or delete files that compose the archive structure. All changes made to the structure of an archive are saved immediately. You can open files from within the archive to edit them in the main editing pane and save changes (on page 1812) back to the archive. You can also use the Open in System Application action to open the archive in the default system application that is associated with that type of file.

**EPUB-Specific Validation**

When working with EPUB archives, the Archive Browser (on page 1807) includes a Validate action on the toolbar that checks the EPUB archive to make sure the structure and content are valid. Oxygen XML Author uses the open-source EpubCheck validator to perform the validation. This validator detects many types of errors, including OCF container structure, OPF and OPS mark-up, as well as internal reference consistency.
For more information about working with an EPUB archive in Oxygen XML Author, watch our video demonstration:

https://www.youtube.com/embed/OIGTNQwOCi8

Related Information:

- The Archive Browser View (on page 1807)
- EPUB Document Type (Framework) (on page 1254)

Creating an Archive

To create an archive from scratch, follow these steps:

1. Go to File > New or click New on the main toolbar.
2. Choose your particular type of archive template. For example, select one of the ODF, OOXML, or EPUB templates.
3. Click Create and choose the name and location of the file.
4. Click Save.
   - A skeleton archive is saved on disk and opened in the Archive Browser view (on page 1807).
   - Tip: Use toolbar and contextual menu actions to edit, add, and remove resources from the archive. For EPUB archives, you can use the Validate action to verify the integrity of the EPUB archive.

Editing and Saving Files Inside an Archive

You can open files directly from an archive in the Archive Browser view (on page 1807) and then edit them in the main editor pane. To open a file, simply double-click it or select Open from the contextual menu.

When saving the file back to the archive, you are prompted to choose if you want the application to make a backup copy of the archive before saving the new content. If you choose Never ask me again, you will not be asked again to make backup copies. You can re-enable the pop-up message from the Messages preferences page (on page 250).
Migrating Archives to DITA or TEI

Certain types of archives can be converted to DITA or TEI. For example, OOXML (Office Open XML) archive files with the DOCX file extension can be migrated to DITA or TEI.

To migrate DOCX files to DITA or TEI, follow these steps:

1. Open and expand the archive in the Archive Browser (on page 1807).
2. Open the document.xml file contained in the archive.
3. Run one of the following built-in transformation scenarios:
   a. DOCX DITA to migrate to DITA.
   b. DOCX TEI P5 to migrate to TEI.
4. You may need to do some manual reconfiguring to map DOCX styles to DITA or TEI content.

Tip: Oxygen XML Author also includes a built-in transformation scenario called ODT TEI P5 for converting ODF archive files with the ODT file extension to TEI and a similar process can be used to migrate ODT files to TEI.
Oxygen XML Author provides support for connecting and integrating with various databases and Microsoft SharePoint. This section includes information about the database-related features in Oxygen XML Author. It explains how to connect with the supported databases, presents the actions that are available for each type, and includes information about SharePoint integration.

Working with Databases

XML is a storage and interchange format for structured data and is supported by all major database systems. Oxygen XML Author offers the means for managing the interaction with some of the most commonly used databases (both Relational and Native XML databases). Through this interaction, Oxygen XML Author helps users with browsing, content editing, importing from databases, using XQuery with databases, SQL execution, and generating XML Schema from a database structure.

The types of connections that are supported in Oxygen XML Author include:

- IBM DB2 (on page 1820)
- Microsoft SQL Server (on page 1825)
- Oracle Database (on page 1829)
- PostgreSQL (on page 1834)
- Berkeley DB XML (on page 1838)
- eXist (on page 1845)
- MarkLogic (on page 1850)
- MySQL (on page 1855)
- Generic JDBC (on page 1857)
- JDBC-ODBC (on page 1859)
- BaseX (on page 1860)
- WebDAV (on page 1865)
- Microsoft SharePoint (on page 1871)

Related Information:

- Integration with Microsoft SharePoint (on page 1871)
Data Source Explorer View

The **Data Source Explorer** view displays your database connections. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

You can connect to a database simply by expanding the connection node (click the connection) . The database structure can be expanded to resource level, or even all the way to column level for tables inside relational databases. Oxygen XML Author supports multiple simultaneous database connections and the connection tree in the **Data Source Explorer** view provides an easy method for browsing them.

Figure 434. Data Source Explorer View

The objects (nodes) that are displayed in the **Data Source Explorer** view depend on the connection type and structure of the database. Various contextual menu actions are available for each hierarchical level and for some connections you can add or move resources in a container by simply dragging them from the **Project view (on page 320)**, a file browsing application, or another database.

**Toolbar Actions**

The following actions are available in the toolbar of this view:

- **Filters**
  
  Opens the **Data Sources / Table Filters preferences page (on page 223)**, allowing you to decide which table types are displayed in the **Data Source Explorer** view.

- **Configure Database Sources**
  
  Opens the **Data Sources preferences page (on page 218)** where you can configure both data sources and connections.
Database-Specific Contextual Menu Actions

Each specific type of database will also include its own specific contextual menu actions in the Data Source Explorer view. The actions depend on the type of database, the type of node, or the hierarchical level of the node in which the contextual menu is invoked.

For more information on the specific actions that are available, see the topics in this section for each specific type of database.

Related Information:
- Data Sources Preferences (on page 218)

Table Explorer View

Relational databases tables in the Data Source Explorer view (on page 1814) can be displayed and edited in the Table Explorer view by selecting the Edit action from the contextual menu of a Table node or by double-clicking one of its fields. To modify the content of a cell, double-click it and start typing. When editing is complete, Oxygen XML Author attempts to update the database with the new cell content.

Figure 435. Table Explorer View

You can sort the content of a table by one of its columns by clicking its column header.

Note the following:

- The first column is an index (not part of the table structure).
- Every column header contains the field name and its data type.
- The primary key columns are marked with this symbol: 了一口气。
• Multiple tables are presented in a tabbed manner.

For performance issues, you can set the maximum number of cells that are displayed in the **Table Explorer** view (using the Limit the number of cells option in the Data Sources Preferences page (on page 223)). If a table that has more cells than the value set in the options is displayed in the **Table Explorer** view, a warning dialog box informs you that the table is only partially shown.

You are notified if the value you have entered in a cell is not valid (and thus cannot be updated).

• If the content of the edited cell does not belong to the data type of the column, the cell is marked by a red square and remains in an editing state until a correct value is inserted. For example, in the following figure propID contains LONG values. If a character or string is inserted, the cell will look like this:

Figure 436. Cell Containing an Invalid Value

![Table Explorer](image)

• If the constraints of the database are not met (for instance, primary key constraints), an information dialog box will appear, notifying you of the reason the database has not been updated. For example, in the table below, trying to set the second record in the primary key propID column to 8, results in a duplicate entry error since that value has already been used in the first record:

Figure 437. Duplicate Entry for Primary Key

![Table with Duplicate Entry](image)
Table Explorer Contextual Menu Actions

Common editing actions (Cut, Copy, Paste, Select All, Undo, Redo) are available in the contextual menu of an edited cell.

The contextual menu, available on every cell in the Table Explorer view, also includes the following actions:

Set NULL
Sets the content of the cell to null. This action is not available for columns that cannot have a value of null.

Insert row
Inserts an empty row in the table.

Duplicate row
Makes a copy of the selected row and adds it in the Table Explorer view. Note that the new row will not be inserted in the database table until all conflicts are resolved.

Commit row
Commits the selected row.

Delete row
Deletes the selected row.

Copy
Copies the content of the cell.

Paste
Pastes copied content into the selected cell.
Table Explorer Toolbar Actions

The toolbar of the Table Explorer view also includes the following actions:

- **Export to XML**
  
  Opens the Export Criteria dialog box.

- **Refresh**
  
  Performs a refresh for the sub-tree of the selected node.

- **Insert row**
  
  Inserts an empty row in the table.

- **Duplicate row**
  
  Makes a copy of the selected row and adds it in the Table Explorer view. Note that the new row will not be inserted in the database table until all conflicts are resolved.

- **Commit row**
  
  Commits the selected row.

- **Delete row**
  
  Deletes the selected row.

Related Information:

- Data Source Explorer View (on page 1814)

Database Connection Support

Oxygen XML Author offers support for a variety of Relational and Native XML database connections. The database drivers and connections for various types of database are configured in the Data Sources preferences page (on page 218) and once configured, the database connections can be viewed and managed in the Data Source Explorer view (on page 1814). Oxygen XML Author also includes a Database perspective (on page 287) that helps you to manage databases.

The database support in Oxygen XML Author offers a variety of capabilities, including:

- Browsing the structure of databases in the Data Source Explorer view (on page 1814).
- Viewing relational tables in the Table Explorer view (on page 1816).
- Executing SQL queries against databases.
-Calling stored procedures with input and output parameters.
• XQuery execution with databases.
• Exporting data from databases to XML.

Relational Database Support

Relational databases use a relational model and are based on tables linked by a common key. Oxygen XML Author offers support for the most commonly used relational databases, including:

• IBM DB2
• Oracle 11g
• Microsoft SQL Server
• PostgreSQL
• MySQL

Oxygen XML Author also offers generic support (table browsing and execution of SQL queries) for any JDBC-compliant database (for example, MariaDB).

Native XML Database Support

Native XML databases have an XML-based internal model and their fundamental unit of storage is XML. They use XML as an interface to specify documents as tree structured data that may contain unstructured text, but on disk the data is stored as optimized binary files. This makes query and retrieval processes faster. Oxygen XML Author offers support for the most commonly used native XML databases, including:

• Berkeley DB XML
• eXist
• MarkLogic
• Oracle XML DB
• Base X

Related Information:

• WebDAV Connections (on page 1865)
• Integration with Microsoft SharePoint (on page 1871)
IBM DB2 Database Connections

Oxygen XML Author includes support for IBM DB2 database connections. Oxygen XML Author allows you to browse the structure of an IBM DB2 database in the Data Source Explorer view (on page 1814), open tables in the Table Explorer view (on page 1816), and perform various operations on the resources in the repository.

Figure 438. IBM DB2 Database Connection

Configuring an IBM DB2 Database Connection

To configure the support for the IBM DB2 database, follow this procedure:

1. Go to the IBM website and in the DB2 Clients and Development Tools category select the DB2 Driver for JDBC and SQLJ download link. Fill out the download form and download the zip file. Unzip the zip file and use the db2jcc.jar and db2jcc_license_cu.jar files in Oxygen XML Author for configuring a DB2 data source (on page 1821).
2. Configure IBM DB2 Data Source drivers (on page 1821).
3. Configure an IBM DB2 Server Connection (on page 1823).
4. To view your connection, go to the Data Source Explorer view (on page 1814) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2797).

How to Configure IBM DB2 Data Source Drivers

Available in the Enterprise edition only.
To configure a data source for connecting to an IBM DB2 server, follow these steps:

1. Go to the IBM website and in the DB2 Clients and Development Tools category select the DB2 Driver for JDBC and SQLJ download link. Fill out the download form and download the zip file.

2. Unzip the downloaded archive.

3. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Data Sources.

4. Click the + New button in the Data Sources panel.

   The dialog box for configuring a data source is opened.

   Figure 439. Data Source Drivers Configuration Dialog Box

5. Enter a unique name for the data source.

6. Select DB2 in the driver Type drop-down menu.

7. Click the Add Files button and select the IBM DB2 driver files from the archive that you downloaded and unzipped.

   The IBM DB2 driver files are:
   
   • db2jcc.jar
   • db2jcc_license_cisuz.jar
8. Select the most appropriate **Driver class**.

9. Click the **OK** button to finish the data source configuration.

10. Continue on to configure your IBM DB2 connection (on page 1823).

**How to Configure an IBM DB2 Connection**

The support to create an IBM DB2 connection is available in the Enterprise edition only.

To configure a connection to an IBM DB2 server, follow these steps:

1. Open the **Preferences** dialog box (Options > Preferences) (on page 79) and go to **Data Sources**.

2. Click the **New** button in the **Connections** panel.

   The dialog box for configuring a database connection is displayed.

   **Figure 440. Connection Configuration Dialog Box**

3. Enter a unique name for the connection.

4. Select an **IBM DB2** data source in the **Data Source** drop-down menu.

5. Enter the connection details.
   a. Enter the URL to the installed IBM DB2 engine.
   b. Enter the user name to access the IBM DB2 engine.
   c. Enter the password to access the IBM DB2 engine.
6. Click the OK button to finish the connection configuration.

7. To view your connection, go to the Data Source Explorer view (on page 1814) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2797).

IBM DB2 Contextual Menu Actions

General Contextual Menu Actions

For relational databases, the following general actions are available in the contextual menu of the Data Source Explorer view (on page 1814), depending on the node in which it is invoked:

- **Refresh**
  Performs a refresh on the selected node.

- **Disconnect (available on Connection nodes)**
  Closes the current database connection. If a table is already open, you are warned to close it before proceeding.

- **Configure Database Sources (available on Connection nodes)**
  Opens the Data Sources preferences page (on page 218) where you can configure both data sources and connections.

- **Edit (available on Table nodes)**
  Opens the selected table in the Table Explorer view (on page 1816).

- **Export to XML (available on Table nodes)**
  Opens the Export Criteria dialog box.

Database-Specific Contextual Menu Actions

In addition to the general contextual menu actions in the Data Source Explorer view (on page 1814), the various nodes in IBM DB2 connections include the following additional contextual menu actions:

- **XML Schema Repository Level Nodes**
  - **Register**
    Opens a dialog box for adding a new schema file in the DB XML repository. In this dialog box, you enter a collection name and the necessary schema files. Schema dependencies management can be done by using the Add and Remove buttons.
Schema Level Nodes

Unregister
Removes the selected schema from the XML Schema Repository.

View
Opens the selected schema in Oxygen XML Author.

Microsoft SQL Server Database Connections

Oxygen XML Author includes support for Microsoft SQL Server database connections. Oxygen XML Author allows you to browse the structure of a SQL Server database in the Data Source Explorer view (on page 1814), open tables in the Table Explorer view (on page 1816), and perform various operations on the resources in the repository.

Configuring a Microsoft SQL Server Connection

To configure the support for a Microsoft SQL Server database, follow this procedure:

2. Configure MS SQL Server Data Source drivers (on page 1825).
3. Configure a MS SQL Server Connection (on page 1826).
4. To view your connection, go to the Data Source Explorer view (on page 1814) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2797).

How to Configure Microsoft SQL Server Data Source Drivers

Available in the Enterprise edition only.

To configure a data source for connecting to a Microsoft SQL server, follow these steps:

2. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Data Sources.
3. Click the ✦ New button in the Data Sources panel.

The dialog box for configuring a data source is opened.
4. Enter a unique name for the data source.

5. Select **SQL Server** in the driver **Type** drop-down menu.

6. Click the **Add Files** button and select the Microsoft SQL Server driver file that you downloaded. The SQL Server driver file is called `sqljdbc.jar`.

7. Select the most appropriate **Driver class**.

8. Click the **OK** button to finish the data source configuration.

9. Continue on to configure your Microsoft SQL Server connection *(on page 1826)*.

**How to Configure a Microsoft SQL Server Connection**

The support to configure a Microsoft SQL Server connection is available in the Enterprise edition only.

To configure a connection to a Microsoft SQL Server, follow these steps:

1. Open the **Preferences** dialog box (**Options > Preferences**) *(on page 79)* and go to **Data Sources**.

2. Click the **+ New** button in the **Connections** panel.
The dialog box for configuring a database connection is displayed.

Figure 442. Connection Configuration Dialog Box

3. Enter a unique name for the connection.

4. Select the SQL Server data source in the Data Source drop-down menu.

5. Enter the connection details.

   a. Enter the URL of the SQL Server server. If you want to connect to the server using Windows integrated authentication, you must add ;integratedSecurity=true to the end of the URL. The URL will look like this:

   \[jdbc:sqlserver://localhost;instanceName=SQLEXPRESS;integratedSecurity=true;\]

   **Note**: For integrated authentication, leave the User and Password fields empty.

   b. Enter the user name for the connection to the SQL Server.

   c. Enter the password for the connection to the SQL Server.

6. Click the OK button to finish the connection configuration.

7. To view your connection, go to the Data Source Explorer view (on page 1814) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2797).
Microsoft SQL Server Contextual Menu Actions

General Contextual Menu Actions

For relational databases, the following general actions are available in the contextual menu of the Data Source Explorer view (on page 1814), depending on the node in which it is invoked:

- **Refresh**
  Performs a refresh on the selected node.

- **Disconnect (available on Connection nodes)**
  Closes the current database connection. If a table is already open, you are warned to close it before proceeding.

- **Configure Database Sources (available on Connection nodes)**
  Opens the Data Sources preferences page (on page 218) where you can configure both data sources and connections.

- **Edit (available on Table nodes)**
  Opens the selected table in the Table Explorer view (on page 1816).

- **Export to XML (available on Table nodes)**
  Opens the Export Criteria dialog box.

Database-Specific Contextual Menu Actions

In addition to the general contextual menu actions in the Data Source Explorer view (on page 1814), the resource level nodes in Microsoft SQL Server connections include the following additional contextual menu action:

- **XML Schema Repository Level Nodes**
  
  - **Register**
    Opens a dialog box for adding a new schema file in the DB XML repository. In this dialog box, you enter a collection name and the necessary schema files. Schema dependencies management can be done by using the Add and Remove buttons.

- **Schema Level Nodes**
  
  - **Add**
    Adds a new schema to the XML Schema files.

  - **Unregister**
Removes the selected schema from the XML Schema Repository.

View

Opens the selected schema in Oxygen XML Author.

Oracle Database Connections

The Oracle database is a common relational type of database system. Oxygen XML Author comes with built-in support for the 11g version of the database system. The Oracle database also includes a Oracle XML DB component that adds native XML support. Oxygen XML Author allows you to browse Oracle repositories in the Data Source Explorer view (on page 1814), open tables in the Table Explorer view (on page 1816), and perform various operations on the resources in the repository.

- Using XQuery with Oracle XML DB

Configuring an Oracle 11g Database Connection

To configure the support for a Oracle 11g database, follow this procedure:

2. Configure Oracle 11g Data Source drivers (on page 1830).
3. Configure an Oracle 11g Connection (on page 1831).
4. To view your connection, go to the **Data Source Explorer view** (on page 1814) (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database perspective** (on page 2797).

**How to Configure Oracle 11g Data Source Drivers**

Available in the Enterprise edition only.

To configure a data source for connecting to an Oracle 11g server, follow these steps:

2. Open the **Preferences** dialog box (**Options > Preferences**) (on page 79) and go to **Data Sources**.

3. Click the **New** button in the **Data Sources** panel.

   The dialog box for configuring a data source is opened.

   **Figure 444. Data Source Drivers Configuration Dialog Box**

   ![Data Source Drivers Configuration Dialog Box](image)

4. Enter a unique name for the data source.

5. Select **Oracle** in the driver **Type** drop-down menu.
6. Click the Add Files button and select the Oracle driver file that you downloaded. The Oracle driver file is called ojdbc5.jar.

7. Select the most appropriate Driver class.

8. Click the OK button to finish the data source configuration.

9. Continue on to configure your Oracle connection (on page 1831).

How to Configure an Oracle 11g Connection

Available in the Enterprise edition only.

To configure a connection to an Oracle 11g server, follow these steps:

1. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Data Sources.

2. Click the + New button in the Connections panel.

The dialog box for configuring a database connection is displayed.

Figure 445. Connection Configuration Dialog Box

3. Enter a unique name for the connection.

4. Select the Oracle 11g data source in the Data Source drop-down menu.

5. Enter the connection details.
   a. Enter the URL of the Oracle server.
   b. Enter the user name for the connection to the Oracle server.
c. Enter the password for the connection to the Oracle server.

6. Click the OK button to finish the connection configuration.

7. To view your connection, go to the Data Source Explorer view (on page 1814) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2797).

Oracle Database Contextual Menu Actions

General Contextual Menu Actions

For relational databases, the following general actions are available in the contextual menu of the Data Source Explorer view (on page 1814), depending on the node in which it is invoked:

- **Refresh**
  Performs a refresh on the selected node.

- **Disconnect (available on Connection nodes)**
  Closes the current database connection. If a table is already open, you are warned to close it before proceeding.

- **Configure Database Sources (available on Connection nodes)**
  Opens the Data Sources preferences page (on page 218) where you can configure both data sources and connections.

- **Edit (available on Table nodes)**
  Opens the selected table in the Table Explorer view (on page 1816).

- **Export to XML (available on Table nodes)**
  Opens the Export Criteria dialog box.

Database-Specific Contextual Menu Actions

In addition to the general contextual menu actions in the Data Source Explorer view (on page 1814), the various nodes in Oracle database connections include the following additional contextual menu actions:

- **XML Schema Repository Level Nodes**
  Register
Opens a dialog box for adding a new schema file in the XML repository. To add an XML Schema, enter the schema URI and location on your file system. *Local* scope means that the schema is visible only to the user who registers it. *Global* scope means that the schema is public.

**Note:** Registering a schema may involve dropping/creating types. Hence you need type-related privileges such as DROP TYPE, CREATE TYPE, and ALTER TYPE. You need privileges to delete and register the XML schemas involved in the registering process. You need all privileges on XMLType tables that conform to the registered schemas. For XMLType columns, the ALTER TABLE privilege is needed on corresponding tables. If there are schema-based XMLType tables or columns in other database schemas, you need privileges such as the following:

- CREATE ANY TABLE
- CREATE ANY INDEX
- SELECT ANY TABLE
- UPDATE ANY TABLE
- INSERT ANY TABLE
- DELETE ANY TABLE
- DROP ANY TABLE
- ALTER ANY TABLE
- DROP ANY INDEX

To avoid having to grant all these privileges to the schema owner, Oracle recommends that the registration be performed by a DBA if there are XML schema-based XMLType table or columns in other user database schemas.

**XML Repository Level Nodes**

- **Add container**
  - Adds a new child container to the current one.

- **Add resource**
  - Adds a new resource to the folder.

**Container Level Nodes**

- **Add container**
  - Adds a new child container to the current one.

- **Add resource**
**Resource Level Nodes**

- **Open**
  Opens the selected resource in the editor.

- **Open in System Application**
  When you use this action, Oxygen XML Author downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the **Data Source Explorer** view, Oxygen XML Author will detect that there was a change and will ask if you want to upload the edited resource to the server.

- **Rename**
  Renames the current resource

- **Move**
  Moves the current resource to a new container (also available through drag and drop).

- **Delete**
  Deletes the current container.

- **Copy location**
  Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

- **Properties**
  Shows various properties of the current container.

- **Compare**
  Compares two selected resources using the **Compare Files tool** (on page 2284).
PostgreSQL Database Connections

Oxygen XML Author includes support for PostgreSQL database connections. Oxygen XML Author allows you to browse the structure of a PostgreSQL database in the Data Source Explorer view (on page 1814), open tables in the Table Explorer view (on page 1816), and perform various operations on the resources in the repository.

Figure 446. PostgreSQL Database Connection

Configuring a PostgreSQL Database Connection

To configure the support for a PostgreSQL database, follow this procedure:

1. Go to http://jdbc.postgresql.org/download.html and download the PostgreSQL 8.3 JDBC3 driver.
2. Configure PostgreSQL Data Source drivers (on page 1835).
3. Configure a PostgreSQL Connection (on page 1836).
4. To view your connection, go to the Data Source Explorer view (on page 1814) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2797).

How to Configure PostgreSQL 8.3 Data Source Drivers

To configure a data source for connecting to a PostgreSQL server, follow these steps:

1. Go to http://jdbc.postgresql.org/download.html and download the PostgreSQL 8.3 JDBC3 driver.
2. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Data Sources.
3. Click the **New** button in the **Data Sources** panel.

   The dialog box for configuring a data source is opened.

4. Enter a unique name for the data source.

5. Select *PostgreSQL* in the driver **Type** drop-down list.

6. Click the **Add Files** button and select the PostgreSQL driver file that you downloaded.
   
   The PostgreSQL driver file is called *postgresql-8.3-603.jdbc3.jar*.

7. Select the most appropriate **Driver class**.

8. Click the **OK** button to finish the data source configuration.

9. Continue on to configure your PostgreSQL connection *(on page 1836)*.

**How to Configure a PostgreSQL 8.3 Connection**

To configure a connection to a PostgreSQL 8.3 server, follow these steps:

1. **Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Data Sources.**

2. Click the **New** button in the **Connections** panel.

   The dialog box for configuring a database connection is displayed.

**Figure 447. Connection Configuration Dialog Box**
3. Enter a unique name for the connection.

4. Select the PostgreSQL 8.3 data source in the Data Source drop-down menu.

5. Enter the connection details.
   a. Enter the URL of the PostgreSQL 8.3 server.
   b. Enter the user name for the connection to the PostgreSQL 8.3 server.
   c. Enter the password for the connection to the PostgreSQL 8.3 server.

6. Click the OK button to finish the connection configuration.

7. To view your connection, go to the Data Source Explorer view (on page 1814) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2797).

PostgreSQL Contextual Menu Actions

General Contextual Menu Actions

For relational databases, the following general actions are available in the contextual menu of the Data Source Explorer view (on page 1814), depending on the node in which it is invoked:

- Refresh
  Performs a refresh on the selected node.

Disconnect (available on Connection nodes)
  Closes the current database connection. If a table is already open, you are warned to close it before proceeding.

Configure Database Sources (available on Connection nodes)
  Opens the Data Sources preferences page (on page 218) where you can configure both data sources and connections.

Edit (available on Table nodes)
  Opens the selected table in the Table Explorer view (on page 1816).

Export to XML (available on Table nodes)
  Opens the Export Criteria dialog box.
Database-Specific Contextual Menu Actions

In addition to the general contextual menu actions in the Data Source Explorer view (on page 1814), the resource level nodes in PostgreSQL connections include the following additional contextual menu action:

- **Resource Level Nodes**
  
  **Compare**
  
  Compares two selected resources using the Compare Files tool (on page 2284).

Berkeley DB XML Database Connections

Oxygen XML Author includes support for Berkeley DB XML database connections. Oxygen XML Author allows you to browse the structure of a Berkeley DB XML database in the Data Source Explorer view (on page 1814) and perform various operations on the resources in the repository.

Oracle Berkeley DB XML is an open source, embeddable XML database with XQuery-based access to documents stored in containers and indexed based on their content. It is built on top of the Oracle Berkeley DB and inherits its features and attributes, along with native XML support. A detailed description can be found at: [http://www.oracle.com/us/products/database/berkeley-db/xml/overview/index.html](http://www.oracle.com/us/products/database/berkeley-db/xml/overview/index.html).

**Figure 448. Berkeley DB XML Connection**

![Berkeley DB XML Connection](image)

Configuring a Berkeley DB XML Database Connection

Follow this procedure to configure the support for a Berkeley DB XML database:
1. **Configure Berkeley DB XML Data Source drivers (on page 1839).**
2. **Configure a Berkeley DB XML Connection (on page 1839).**
3. To view your connection, go to the Data Source Explorer view (on page 1814) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2797).

**How to Configure Berkeley DB XML Data Source Drivers**

For this procedure, you need to already have a Berkeley DB XML database installed on your system.

Oxygen XML Author supports Berkeley DB XML versions 2.3.10, 2.4.13, 2.4.16 & 2.5.16. To configure a data source for a Berkeley DB XML database, follow these steps:

1. **Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Data Sources.**
2. Click the **+ New** button in the Data Sources panel.
3. Enter a unique name for the data source.
4. Select *Berkeley DBXML* from the driver *Type* drop-down menu.
5. Click the **Add Files** button to add the Berkeley DB driver files.
   
   The driver files for the Berkeley DB database (and their locations) are as follows:
   
   - `db.jar` (check for it in `[DBXML_DIR]/lib` or `[DBXML_DIR]/jar`)
   - `dbxml.jar` (check for it in `[DBXML_DIR]/lib` or `[DBXML_DIR]/jar`)

   Where `[DBXML_DIR]` is the Berkeley DB XML database root directory. For example, in Windows it is: `C:\Program Files\Oracle\Berkeley DB XML <version>`.
6. Click the **OK** button to finish the data source configuration.
7. Continue on to configure your Berkeley DB XML connection (on page 1839).

**How to Configure a Berkeley DB XML Connection**

Oxygen XML Author supports Berkeley DB XML versions 2.3.10, 2.4.13, 2.4.16 & 2.5.16. To configure a connection to a Berkeley DB XML database, follow these steps:

1. **Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Data Sources.**
2. Click the **+ New** button in the Connections panel.
3. Enter a unique name for the connection.
4. Select a previously configured Berkeley data source from the Data Source drop-down menu.
5. Enter the connection details.
a. Set the path to the Berkeley DB XML database directory in the Environment home directory field. Use a directory with write access. DO NOT use the installation directory where Berkeley DB XML is installed if you do not have write access to that directory.

b. Select the Verbosity level: DEBUG, INFO, WARNING, or ERROR.

c. Optionally, you can select the Join existing environment checkbox. If selected, an attempt is made to join an existing environment in the specified home directory and all the original environment settings are preserved. If that fails, try reconfiguring the connection with this option unchecked.

6. Click the OK button to finish the connection configuration.

7. To view your connection, go to the Data Source Explorer view (on page 1814) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2797).

Berkeley DB XML Contextual Menu Actions

While browsing Berkeley DB XML connections in the Data Source Explorer view (on page 1814), the various nodes include the following contextual menu actions:

Connection Level Nodes

- Configure Database Sources
  
  Opens the Data Sources preferences page (on page 218) where you can configure both data sources and connections.

Disconnect

  Stops the connection.

New Collection

  Opens a Container configuration dialog box that allows you to adds a new container in the repository.

Figure 449. Container Configuration Dialog Box
This dialog box allows you to configure the following:

- **Name** - The name of the new container.
- **Container type** - At creation time, every container must have a type defined for it. This container type identifies how XML documents are stored in the container. As such, the container type can only be determined at container creation time. You cannot change it when subsequent container opens. You can select one of the following types:
  - **Node container** - XML documents are stored as individual nodes in the container. Each record in the underlying database contains a single leaf node, its attributes and attribute values (if any), and its text nodes (if any). Berkeley DB XML also keeps the information it requires to reassemble the document from the individual nodes stored in the underlying databases. This is the default selection and is the preferred container type.
  - **Whole document container** - The container contains entire documents. The documents are stored without any manipulation of line breaks or whitespace.
- **Allow validation** - If selected, documents will be validated when they are loaded into the container. The default behavior is to not validate documents.
- **Index nodes** - If selected, indices for the container will return nodes rather than documents. The default is to index at the document level. This property has no meaning if the container type is **Whole document container**.

**Refresh**

Performs a refresh on the selected node.

**Properties**
Shows various properties of the current container.

Find/Replace in Files

Opens the Find/Replace in Files dialog box (on page 687) that allows you to find and replace text in multiple files from the connection.

Container Level Nodes

Import Files

Allows you to add a new file on the connection, in the current folder.

Export

Allows you to export the folder on the remote connection to a local folder.

Cut

Removes the current selection and places it in the clipboard.

Paste

Pastes the copied selection.

Rename

Renames the current resource

Delete

Deletes the current container.

Edit indices

Opens a Container Indices dialog box that allows you to configure indices properties for the selected Berkeley container.

Figure 450. Container Indices Dialog Box
This dialog box allows you to configure the following properties:

- **Granularity** - A measure of the level of details of your data in the database. You can select one of the following:
  - **Document level** - Good option for retrieving large documents.
  - **Node level** - Good option for retrieving nodes from within documents.

- **Node** - The name of the node.

- **Namespace** - The index namespace.

- **Index type**:
  - **Uniqueness** - Indicates whether or not the indexed value must be unique within the container.
  - **Path type** - Drop-down menu that allows you to select from the following:
    - node - Indicates that you want to index a single node in the path.
    - edge - Indicates that you want to index the portion of the path where two nodes meet.
  - **Node type** - Drop-down menu that allows you to select from the following:
    - element - An element node in the document content.
    - attribute - An attribute node in the document content.
metadata - A node found only in the metadata content of a document.

- **Key type** - Drop-down menu that allows you to select from the following:
  - **equality** - Improves the performances of tests that look for nodes with a specific value.
  - **presence** - Improves the performances of tests that look for the existence of a node regardless of its value.
  - **substring** - Improves the performance of tests that look for a node whose value contains a given substring.

- **Syntax** - The syntax describes the type of data the index contains and is mostly used to determine how indexed values are compared. The default value is string.

**Refresh**

Performs a refresh on the selected node.

**Properties**

Shows various properties of the current container.

**Find/Replace in Files**

Opens the Find/Replace in Files dialog box (on page 687) that allows you to find and replace text in multiple files from the connection.

**Resource Level Nodes**

**Open**

Opens the selected resource in the editor.

**Open in System Application**

When you use this action, Oxygen XML Author downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the Data Source Explorer view, Oxygen XML Author will detect that there was a change and will ask if you want to upload the edited resource to the server.

**Cut**

Removes the current selection and places it in the clipboard.

**Copy location**
Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

**Rename**

Renames the current resource

**Delete**

Deletes the current container.

**Refresh**

Performs a refresh on the selected node.

**Properties**

Shows various properties of the current container.

**Find/Replace in Files**

Opens the **Find/Replace in Files** dialog box (on page 687) that allows you to find and replace text in multiple files from the connection.

**Compare**

Compares two selected resources using the **Compare Files** tool (on page 2284).

eXist Database Connections

Oxygen XML Author includes support for eXist database connections. Oxygen XML Author allows you to browse the structure of a eXist database in the **Data Source Explorer** view (on page 1814) and perform various operations on the resources in the repository.

Figure 451. eXist Database Connection
Configuring an eXist Database Connection

There are two ways to configure the support for an eXist database:

- Use the dedicated Create eXist-db XML connection wizard.
- Use the Data Sources preferences page to manually configure your connection.

How to Configure an eXist Connection Using the Built-in Wizard

To configure a connection for an eXist database using the dedicated Create eXist-db XML connection wizard, follow these steps:

1. Open the Preferences dialog box (Options > Preferences) (on page 79), go to Data Sources and click the Create eXist-db XML connection link.
2. Enter your connection details in the connection wizard and click OK.

⚠️ Important: To create an eXist connection using this wizard, Oxygen XML Author expects the exist/webstart/exist.jnlp path to be accessible at the provided Host and Port.
3. To view your connection, go to the Data Source Explorer view (on page 1814) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2797).

How to Configure an eXist Connection Manually

⚠️ Attention: For this manual procedure, you need to already have an eXist database server installed.
Tip: There is an easier way to configure an eXist database connection using a built-in wizard. For more information, see How to Configure an eXist Connection Using the Built-in Wizard (on page 1846).

**Step 1: Configure eXist Data Source Drivers**

Oxygen XML Author supports eXist database server versions up to and including version 4.5. To configure a data source for an eXist database, follow these steps:

1. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Data Sources.
2. Click the + New button in the Data Sources panel.
3. Enter a unique name for the data source.
4. Select eXist from the driver Type drop-down menu.
5. Click the Add Files button to add the eXist driver files. The following driver files should be added and they are found in the installation directory of the eXist database server. Make sure you copy the files from the installation of the eXist server where you want to connect from Oxygen XML Author.
   - The exist.jar file located in the base directory.
   - All JAR files in the lib/core/ directory.
6. Click the OK button to finish the data source configuration.

**Step 2: Configure an eXist Connection**

To configure a connection to an eXist database, follow these steps:

1. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Data Sources.
2. Click the + New button in the Connections panel.
3. Enter a unique name for the connection.
4. Select a previously configured eXist data source from the Data Source drop-down menu.
5. Enter the connection details:
   a. Set the URI to the installed eXist engine in the XML DB URI field.
   b. Set the user name in the User field.
   c. Set the password in the Password field.
   d. Enter the start collection in the Collection field.

   eXist organizes all documents in hierarchical collections. Collections are like directories. They are used to group related documents together. This text field allows the user to set the default collection name.
6. Click the OK button to finish the connection configuration.
7. To view your connection, go to the Data Source Explorer view (on page 1814) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2797).

For more information about running XQuery against an eXist XML database, watch our video demonstration:

https://www.youtube.com/embed/Yoc5h1zSddA

eXist Contextual Menu Actions

While browsing eXist database connections in the Data Source Explorer view (on page 1814), the various nodes include the following contextual menu actions:

Connection Level Nodes

- **Configure Database Sources**
  
  Opens the Data Sources preferences page (on page 218) where you can configure both data sources and connections.

- **Disconnect**
  
  Stops the connection.

- **Refresh**
  
  Performs a refresh on the selected node.

- **Find/Replace in Files**
  
  Opens the Find/Replace in Files dialog box (on page 687) that allows you to find and replace text in multiple files from the connection.

Container Level Nodes

- **New File**
  
  Creates a new file on the connection, in the current folder.

- **New Collection**
  
  Creates a new collection on the connection.

- **Import Folders**
  
  Imports folders on the server.

- **Import Files**
  
  Allows you to add a new file on the connection, in the current folder.

Export
Allows you to export the folder on the remote connection to a local folder.

Cut
- Removes the current selection and places it in the clipboard.

Paste
- Pastes the copied selection.

Refresh
- Performs a refresh on the selected node.

Properties
- Shows various properties of the current container.

Find/Replace in Files
- Opens the Find/Replace in Files dialog box that allows you to find and replace text in multiple files from the connection.

Resource Level Nodes

Open
- Opens the selected resource in the editor.

Open in System Application
- When you use this action, Oxygen XML Author downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the Data Source Explorer view, Oxygen XML Author will detect that there was a change and will ask if you want to upload the edited resource to the server.

Save As
- Allows you to save the selected resource as a file on disk.

Cut
- Removes the current selection and places it in the clipboard.

Copy
- Copies the current selection into the clipboard.
Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

**Rename**

Renames the current resource

**Delete**

Deletes the current container.

**Refresh**

Performs a refresh on the selected node.

**Properties**

Shows various properties of the current container.

**Find/Replace in Files**

Opens the Find/Replace in Files dialog box (on page 687) that allows you to find and replace text in multiple files from the connection.

**Compare**

Compares two selected resources using the Compare Files tool (on page 2284).

MarkLogic Database Connections

Oxygen XML Author Enterprise edition includes support for MarkLogic database connections. Once you configure a MarkLogic connection (on page 1851), you can use the Data Source Explorer view (on page 1814) to display all the application servers that are configured on the MarkLogic server. You can expand each application server and view all of its configured modules, and the Data Source Explorer view (on page 1814) allows you to open and edit these modules.

**Note:** To browse modules located in a database, directory properties must be associated with them. These directory properties are generated automatically if the directory creation property of the database is set to automatic. If this property is set to manual or manual-enforced, add the directory properties of the modules manually, using the XQuery function xdmp:directory-create(). For example, for two documents with the /code/modules/main.xqy and /code/modules/imports/import.xqy IDs, run the following query:

```xquery
{xdmp:directory-create('/code/modules/'), xdmp:directory-create('/code/modules/imports/')} 
```

For more information about directory properties, go to: http://blakeley.com/blogofile/2012/03/19/directory-assistance/.
MarkLogic and XQuery

MarkLogic connections can be used in conjunction with XQuery scripts to debug and solve problems with XQuery transformations. XQuery modules can also be validated using a MarkLogic server to allow you to spot possible issues without the need of actually executing the XQuery script.

Modules Container

For each Application server (for example: Bill (HTTP port:8060)), you have access to the XQuery modules that are visible to that server. When editing, executing, or debugging XQuery it is recommended to open the XQuery files from this Modules container.

Note: You can also manage resources for a MarkLogic database through a WebDAV connection, although it is not recommended if you work with XQuery files since imported modules may not be resolved correctly.

Requests Container

Each MarkLogic application server includes a Requests container. In this container, Oxygen XML Author displays both queries that are stopped for debugging purposes and queries that are still running. To clean up the entire Requests container at the end of your session, right-click it and use the Cancel all requests action (on page 1854).

Figure 452. MarkLogic Connection in Data Source Explorer

Configuring a MarkLogic Database Connection

Note that this feature is available in Oxygen XML Author Enterprise edition only.

Follow this procedure to configure the support for a MarkLogic database connection:
1. Download the MarkLogic driver from MarkLogic Community site.
2. Configure MarkLogic Data Source drivers (on page 1852).
3. Configure a MarkLogic Connection (on page 1852).
4. To view your connection, go to the Data Source Explorer view (on page 1814) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2797).

Related Information:

How to Configure MarkLogic Data Source Drivers

Available in the Enterprise edition only.

Note: Oxygen XML Author supports MarkLogic version 4.0 or later.

To configure a data source for MarkLogic, follow this procedure:

2. Unzip the downloaded archive.
3. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Data Sources.
4. Click the + New button in the Data Sources panel.
5. Enter a unique name for the data source.
6. Select MarkLogic from the driver Type drop-down list.
7. Click the Add Files button and select the MarkLogic driver file from the lib folder of the archive that you downloaded and unzipped. The driver file name is marklogic-xcc-{server_version}.jar, where {server_version} is the MarkLogic server version.
8. Click the OK button to finish the data source configuration.
9. Continue on to configure your MarkLogic Connection (on page 1852).

How to Configure a MarkLogic Connection

Available in the Enterprise edition only.

Note: Oxygen XML Author supports MarkLogic version 4.0 or later.

To configure a connection to a MarkLogic database, follow these steps:

1. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Data Sources.
2. Click the + New button in the Connections panel.
3. Enter a unique name for the connection.
4. Select a previously configured MarkLogic data source from the Data Source drop-down menu.
5. Enter the connection details.
   
a. The host name or IP address of the installed MarkLogic engine in the **XDBC Host** field. Oxygen XML Author uses XCC connector to interact with MarkLogic XDBC server and requires the basic authentication schema to be set. Starting with version MarkLogic 4.0 the default authentication method when you create an HTTP or WebDAV Server is **digest**, so make sure to change it to **basic**.

b. Set the port number of the MarkLogic engine in the **Port** field. A MarkLogic XDBC application server must be configured on the server on this port. This XDBC server will be used to process XQuery expressions against the server. Later, if you want to change the XDBC server, instead of editing the configuration just use the **Use it to execute queries** action (on page 1854) from Data Source Explorer.

c. Set the user name to access the MarkLogic engine in the **User** field.

d. Set the password to access the MarkLogic engine in the **Password** field.

e. Optionally, in the **WebDAV URL** field, set the URL used for browsing the MarkLogic database in the **Data Source Explorer** view (on page 1814). The **Database** field specifies the database for which the XQuery expressions are executed. If you set this option to default, the database associated to the application server of the configured port is used.

6. Click the **OK** button to finish the connection configuration.

7. To view your connection, go to the **Data Source Explorer** view (on page 1814) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the **Database perspective** (on page 2797).

**MarkLogic Contextual Menu Actions**

While browsing MarkLogic connections in the **Data Source Explorer** view (on page 1814), the various nodes include the following contextual menu actions:

**Connection Level Nodes**

- **Configure Database Sources**
  
  Opens the **Data Sources preferences page** (on page 218) where you can configure both data sources and connections.

- **Disconnect**

  Stops the connection.

- **Refresh**

  Performs a refresh on the selected node.
Find/Replace in Files

Opens the Find/Replace in Files dialog box (on page 687) that allows you to find and replace text in multiple files from the connection.

Container Level Nodes

Enable Debug Mode

Switches the server to a debugging mode.

Use it to Execute Queries

The server will be used to process XQuery expressions against it.

Refresh

Performs a refresh on the selected node.

Module or Folder Level Nodes

Export

Allows you to export the folder on the remote connection to a local folder.

Refresh

Performs a refresh on the selected node.

Requests Level Nodes

Refresh

Performs a refresh on the selected node.

Cancel all requests

Cancels all queries that are either running or stopped on the application server. You can use this action to clean up the entire Requests container at the end of your sessions.

Resource Level Nodes

Open

Opens the selected resource in the editor.

Open in System Application

When you use this action, Oxygen XML Author downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the Data Source Explorer view,
Oxygen XML Author will detect that there was a change and will ask if you want to upload the edited resource to the server.

**Copy location**

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

**Refresh**

Performs a refresh on the selected node.

**Compare**

Compares two selected resources using the Compare Files tool (on page 2284).

- Configuring a MarkLogic Database Connection (on page 1851)

---

**MySQL Database Connections**

Oxygen XML Author includes support for MySQL database connections. Oxygen XML Author allows you to browse the structure of a SQL Server database in the Data Source Explorer view (on page 1814), open tables in the Table Explorer view (on page 1816), and perform various operations on the resources in the repository.

**Configuring a MySQL Database Connection**

To configure the support for a MySQL database, follow this procedure:

1. Configure MySQL Data Source drivers (on page 1855).
2. Configure a MySQL Connection. (on page 1857)
3. To view your connection, go to the Data Source Explorer view (on page 1814) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2797).

**How to Configure MySQL Data Source Drivers**

To connect to a MySQL server, you need to create a generic JDBC type data source based on the MySQL JDBC driver available on the MySQL website.

To configure this data source, follow these steps:
1. Go to https://www.oxygenxml.com/database_drivers.html and download the appropriate MySQL driver.

2. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Data Sources.

3. Click the + New button in the Data Sources panel.

   The dialog box for configuring a data source is opened.

   Figure 453. Data Source Drivers Configuration Dialog Box

4. Enter a unique name for the data source.

5. Select Generic JDBC in the driver Type drop-down list.

6. Click the Add Files button and select the MySQL driver file that you downloaded.
   
   The driver file for the MySQL server is called mysql-com.jar.

7. Select the most appropriate Driver class.

8. Click the OK button to finish the data source configuration.

9. Continue on to configure your MySQL connection (on page 1857).
How to Configure a MySQL Connection

To configure a connection to a MySQL server, follow these steps:

1. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Data Sources.

2. Click the + New button in the Connections panel.

   The dialog box for configuring a database connection is displayed.

   Figure 454. Connection Configuration Dialog Box

3. Enter a unique name for the connection.

4. Select the MySQL data source in the Data Source drop-down list.

5. Enter the connection details.
   a. Enter the URL of the MySQL server.
   b. Enter the user name for the connection to the MySQL server.
   c. Enter the password for the connection to the MySQL server.

6. Click the OK button to finish the connection configuration.

7. To view your connection, go to the Data Source Explorer view (on page 1814) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2797).
Generic JDBC Database Connections

Oxygen XML Author includes support for Generic JDBC database connections.

Configuring a Generic JDBC Database Connection

To configure the support for a generic JDBC database, follow this procedure:

1. Configure Generic JDBC Data Source drivers (on page 1858).
2. Configure a Generic JDBC Connection (on page 1858).
3. To view your connection, go to the Data Source Explorer view (on page 1814) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2797).

How to Configure Generic JDBC Data Source Drivers

Starting with version 17, Oxygen XML Author comes bundled with Java 8, which does not provide built-in access to JDBC-ODBC data sources. To access such sources, you need to find an alternative JDBC-ODBC bridge or use a platform-independent distribution of Oxygen XML Author along with a Java VM version 7 or 6.

To configure a generic JDBC data source, follow these steps:

1. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Data Sources.
2. Click the + New button in the Data Sources panel.
3. Enter a unique name for the data source.
4. Select Generic JDBC in the driver Type drop-down list.
5. Add the driver file(s) using the Add Files button.
6. Select the most appropriate Driver class.
7. Click the OK button to finish the data source configuration.
8. Continue on to configure a generic JDBC connection (on page 1858).

How to Configure a Generic JDBC Connection

To configure a connection to a generic JDBC database, follow these steps:

1. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Data Sources.
2. Click the + New button in the Connections panel.
3. Enter a unique name for the connection.
4. Select the Generic JDBC data source in the Data Source drop-down menu.
5. Enter the connection details.
a. Enter the URL of the generic JDBC database, with the following format: jdbc:
   <subprotocol>: <subname>.

b. Enter the user name for the connection to the generic JDBC database.

c. Enter the password for the connection to the generic JDBC database.

6. Click the OK button to finish the connection configuration.

7. To view your connection, go to the Data Source Explorer view (on page 1814) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2797).

JDBC-ODBC Database Connections

Oxygen XML Author includes support for JDBC-ODBC database connections.

How to Configure a JDBC-ODBC Connection

Starting with version 17, Oxygen XML Author comes bundled with Java 8, which does not provide built-in access to JDBC-ODBC data sources. To access such sources, you need to find an alternative JDBC-ODBC bridge or use a platform-independent distribution of Oxygen XML Author along with a Java VM version 7 or 6.

To configure a connection to an ODBC data source, follow these steps:

1. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Data Sources.

2. Click the + New button in the Connections panel.

   The dialog box for configuring a database connection is displayed.

   Figure 455. Connection Configuration Dialog Box
3. Enter a unique name for the connection.

4. Select JDBC-ODBC Bridge in the Data Source drop-down list.

5. Enter the connection details.
   a. Enter the URL of the ODBC source.
   b. Enter the user name of the ODBC source.
   c. Enter the password of the ODBC source.

6. Click the OK button to finish the connection configuration.

7. To view your connection, go to the Data Source Explorer view (on page 1814) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2797).

BaseX Database Connections

Oxygen XML Author includes support for BaseX database connections using a WebDAV connection. BaseX is a light-weight XML database engine and XQuery processor. Oxygen XML Author allows you to browse the structure of a BaseX database in the Data Source Explorer view (on page 1814) and perform XQuery executions.

How to Configure a BaseX Connection

To configure a BaseX connection, follow these steps:
1. First of all, make sure the BaseX HTTP Server is started. For details about starting the BaseX HTTP server, go to http://docs.basex.org/wiki/Startup#BaseX_HTTP_Server. The configuration file for the HTTP server is named .basex and is located in the BaseX installation directory. This file helps you to find out which port the HTTP server using. The default port for BaseX WebDAV is 8984.

2. To ensure that everything is functioning, open a WebDAV URL inside a browser and check to see if it works. For example, the following URL retrieves a document from a database named TEST:

   http://localhost:8984/webdav/TEST/etc/factbook.xml

3. Once you are sure that the BaseX WebDAV service is working, you can configure the WebDAV connection in Oxygen XML Author as described in How to Configure a WebDAV Connection (on page 1866). The WebDAV URL should resemble this: http://{hostname}:{port}/webdav/. If the BaseX server is running on your own machine and it has the default configuration, the data required by the WebDAV connection is:

   • WebDAV URL: http://localhost:8984/webdav
   • User: admin
   • Password: admin

4. Once the WebDAV connection is created, to view your connection, go to the Data Source Explorer view (on page 1814) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2797).

**BaseX Contextual Menu Actions**

While browsing BaseX connections in the Data Source Explorer view (on page 1814), the various nodes include the following contextual menu actions:

#### Connection Level Nodes

- **Configure Database Sources**
  
  Opens the Data Sources preferences page (on page 218) where you can configure both data sources and connections.

- **Disconnect**
  
  Stops the connection.

- **New Folder**
  
  Creates a new folder on the connection.

- **Import Files**
  
  Allows you to add a new file on the connection, in the current folder.

- **Refresh**
  
  Performs a refresh on the selected node.
Find/Replace in Files

Opens the Find/Replace in Files dialog box (on page 687) that allows you to find and replace text in multiple files from the connection.

Folder Level Nodes

New File

Creates a new file on the connection, in the current folder.

New Folder

Creates a new folder on the connection.

Import Folders

Imports folders on the server.

Import Files

Allows you to add a new file on the connection, in the current folder.

Export

Allows you to export the folder on the remote connection to a local folder.

Cut

Removes the current selection and places it in the clipboard.

Copy

Copies the current selection into the clipboard.

Paste

Pastes the copied selection.

Rename

Renames the current resource.

Delete

Deletes the current container.

Refresh

Performs a refresh on the selected node.

Find/Replace in Files

Opens the Find/Replace in Files dialog box (on page 687) that allows you to find and replace text in multiple files from the connection.

Resource Level Nodes
Open

Opens the selected resource in the editor.

Open in System Application

When you use this action, Oxygen XML Author downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the Data Source Explorer view, Oxygen XML Author will detect that there was a change and will ask if you want to upload the edited resource to the server.

Cut

Removes the current selection and places it in the clipboard.

Copy

Copies the current selection into the clipboard.

Copy location

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

Rename

Renames the current resource

Delete

Deletes the current container.

Refresh

Performs a refresh on the selected node.

Properties

Shows various properties of the current container.

Find/Replace in Files

Opens the Find/Replace in Files dialog box (on page 687) that allows you to find and replace text in multiple files from the connection.

Compare

Compared two selected resources using the Compare Files tool (on page 2284).
Base X XQJ Connection

XQuery execution is possible in a BaseX connection through an XQJ connection.

⚠️ **Important:** The XQJ connector is only capable of running XQuery 1.0 scripts, therefore XQuery 3.0 and 3.1 scripts are not supported.

BaseX XQJ Data Source

First of all, create an XQJ data source as described in How to Configure an XQJ Data Source (on page 1864). The BaseX XQJ API-specific files that must be added in the configuration dialog box are `xqj-api-1.0.jar`, `xqj2-0.1.0.jar` and `basex-xqj-1.2.3.jar` (the version names of the JAR file may differ). These libraries can be downloaded from `xqj.net/basex/basex-xqj-1.2.3.zip`. As an alternative, you can also find the libraries in the BaseX installation directory, in the `lib` sub-directory.

BaseX XQJ Connection

The next step is to create an XQJ connection (on page 1865).

For a default BaseX configuration, the following connection details apply (you can modify them when necessary):

- **Port**: 1984
- **serverName**: localhost
- **user**: admin
- **password**: admin

XQuery Execution

Now that the XQJ connection is configured, open the XQuery file you want to execute in Oxygen XML Author and create an XQuery Transformation (on page 1365). In the Transformer drop-down menu, select the name of the XQJ connection you created. Apply the transformation scenario and the XQuery will be executed.

How to Configure an XQJ Data Source

Any transformer that offers an XQJ API implementation can be used when validating XQuery or transforming XML documents. An example of an XQuery engine that implements the XQJ API is Zorba.

1. If your XQJ Implementation is native, make sure the directory containing the native libraries of the engine is added to your system environment variables: to **PATH** - on Windows, to
LD_LIBRARY_PATH - on Linux, or to DYLD_LIBRARY_PATH - on OS X. Restart Oxygen XML Author after configuring the environment variables.

2. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Data Sources.

3. Click the + New button in the Data Sources panel.

4. Enter a unique name for the data source.

5. Select XQuery API for Java (XQJ) in the Type combo box.

6. Press the Add button to add XQJ API-specific files.
   You can manage the driver files using the Add, Remove, Detect, and Stop buttons.
   Oxygen XML Author detects any implementation of javax.xml.xquery.XQDataSource and presents it in Driver class field.

7. Select the most suited driver in the Driver class combo box.

8. Click the OK button to finish the data source configuration.

9. Continue on to configure the XQJ connection (on page 1865).

How to Configure an XQJ Connection

The steps for configuring an XQJ connection are the following:

1. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Data Sources.

2. Click the + New button in the Connections panel.

3. Enter a unique name for the connection.

4. Select one of the previously configured XQJ data sources (on page 1864) in the Data Source combo box.

5. Fill-in the connection details.
   The properties presented in the connection details table are automatically detected depending on the selected data source.

6. Click the OK button to finish the connection configuration.
WebDAV Connections

Oxygen XML Author includes support for WebDAV server connections. Oxygen XML Author allows you to browse the structure of a WebDAV connection in the Data Source Explorer view (on page 1814) and perform various operations on the resources in the repository.

How to Configure a WebDAV Connection

By default, Oxygen XML Author contains built-in data source drivers for WebDAV connections. Based on this data source, you can create a WebDAV connection for browsing and editing data from a database that provides a WebDAV interface. The connection is available in the Data Source Explorer view (on page 1814).

To configure a WebDAV connection, follow these steps:

1. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Data Sources.

2. Click the + New button in the Connections panel.

3. Enter a unique name for the connection.

4. Select one of the WebDAV data sources in the Data Source drop-down menu.

5. Enter the connection details:
   a. Set the URL to the WebDAV repository in the field WebDAV URL.
   b. Set the user name that is used to access the WebDAV repository in the User field.
   c. Set the password that is used to access the WebDAV repository in the Password field.

6. Click the OK button to finish the connection configuration.

7. To view your connection, go to the Data Source Explorer view (on page 1814) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2797).

   For more information about the WebDAV support in Oxygen XML Author, watch our video demonstration:

   https://www.youtube.com/embed/vDXO36CqbvM

WebDAV Contextual Menu Actions

While browsing WebDAV connections in the Data Source Explorer view (on page 1814), the various nodes include the following contextual menu actions:

Connection Level Nodes
Configure Database Sources

Opens the Data Sources preferences page (on page 218) where you can configure both data sources and connections.

Disconnect

Stops the connection.

New Folder

Creates a new folder on the connection.

Import Files

Allows you to add a new file on the connection, in the current folder.

Refresh

Performs a refresh on the selected node.

Find/Replace in Files

Opens the Find/Replace in Files dialog box (on page 687) that allows you to find and replace text in multiple files from the connection.

Folder Level Nodes

New File

Creates a new file on the connection, in the current folder.

New Folder

Creates a new folder on the connection.

Import Folders

Imports folders on the server.

Import Files

Allows you to add a new file on the connection, in the current folder.

Export

Allows you to export the folder on the remote connection to a local folder.

Cut

Removes the current selection and places it in the clipboard.

Copy

Copies the current selection into the clipboard.

Paste

Pastes the copied selection.
Renaming Resources

Renaming Resources allows you to rename the current resource.

Delete Container

Deleting a container removes it from the connection.

Refresh Container

Refreshing a container updates its contents with the latest data.

Find/Replace in Files

Finding and replacing text in files is facilitated through the Find/Replace in Files dialog box.

Open Resource

Opening a resource allows you to edit it in the editor.

Open in System Application

This action opens a resource in the system application associated with that type of resource.

Cut Selection

Cutting a selection removes it from the current context and places it in the clipboard.

Copy Selection

Copying a selection duplicates it and places it in the clipboard.

Copy Location

Copying a location allows you to save the URL for future use.

Rename Resource

Renaming a resource changes its name within the connection.

Delete Container

Deleting a container removes it from the connection.
**Refresh**

Performs a refresh on the selected node.

**Properties**

Shows various properties of the current container.

**Find/Replace in Files**

Opens the Find/Replace in Files dialog box (on page 687) that allows you to find and replace text in multiple files from the connection.

**Compare**

Compares two selected resources using the Compare Files tool (on page 2284).

---

**SQL Execution Support**

The database support in Oxygen XML Author includes support for writing SQL statements, syntax highlighting, folding (on page 2794), and dragging and dropping from the Data Source Explorer view (on page 1814). It also includes transformation scenarios for executing the statements, and the results are displayed in the Table Explorer view (on page 1816).

**Drag and Drop from Data Source Explorer View**

Dragging operations from the Data Source Explorer view (on page 1814) and dropping them in the SQL Editor allows you to create SQL statements quickly by inserting the names of tables and columns in the SQL statements.

1. Configure a database connection (see the specific procedure for your database server in the Database Connection Support (on page 1819) section).

2. Browse to the table you will use in your statement.

3. Drag the table or a column of the table into the editor where a SQL file is open.

   Drag and drop actions are available both on the table and on its fields. A pop-up menu is displayed in the SQL editor.

4. Select the type of statement from the pop-up menu.

   Depending on your choice, dragging a table results in one of the following statements being inserted into the document:
• SELECT `field1`, `field2`, .... FROM `catalog`.`table` (for example: SELECT 'DEPT', 'DEPTNAME', 'LOCATION' FROM 'camera'.'cameraDesc')

• UPDATE `catalog`.`table` SET `field1` =, `field2` =, .... (for example: UPDATE 'camera'.'cameraDesc' SET 'DEPT' =, 'DEPTNAME' =, 'LOCATION' =)

• INSERT INTO `catalog`.`table` (`field1`, `field2`, ....) VALUES (, , ) (for example: INSERT INTO 'camera'.'cameraDesc' (DEPT, DEPTNAME, LOCATION) VALUES (, , ))

• DELETE FROM `catalog`.`table` (for example: DELETE FROM 'camera'.'cameraDesc')

Depending on your choice, dragging a column results in one of the following statements being inserted into the document:

• SELECT `field` FROM `catalog`.`table` (for example: SELECT 'DEPT' FROM 'camera'.'cameraDesc')

• UPDATE `catalog`.`table` SET `field` = (for example: UPDATE 'camera'.'cameraDesc' SET 'DEPT' =)

• INSERT INTO `catalog`.`table` (`field1`) VALUES () (for example: INSERT INTO 'camera'.'cameraDesc' (DEPT) VALUES (1))

• DELETE FROM `catalog`.`table` (for example: DELETE FROM 'camera'.'cameraDesc' WHERE 'DEPT' =)

SQL Validation

SQL validation support is offered for IBM DB2. Note that if you choose a connection that does not support SQL validation, you will receive a warning when trying to validate. The SQL document is validated using the connection from the associated transformation scenario.

Executing SQL Statements

The steps for executing an SQL statement on a relational database are as follows:

1. Configure a transformation scenario (on page 1258) using the Configure Transformation Scenario(s) action from the toolbar or the Document > Transformation menu.

   A SQL transformation scenario needs a database connection. You can configure a connection using the Preferences button from the SQL transformation dialog box.

   The dialog box contains the list of existing scenarios that apply to SQL documents.

2. Set parameter values for SQL placeholders using the Parameters button from the SQL transformation dialog box.

   For example, in SELECT * FROM `test`.'department' where DEPT = ? or DEPTNAME = ? the two parameters can be configured for the place holders (?) in the transformation scenario.
When the SQL statement is executed, the first placeholder is replaced with the value set for the first parameter in the scenario, the second placeholder is replaced by the second parameter value, and so on.

⚠️ **Restriction:** When a stored procedure is called in an SQL statement executed on an SQL Server database, mixing inline parameter values with values specified using the **Parameters** button of the scenario dialog box is not recommended. This is due to a limitation of the SQL Server driver for Java applications. An example of stored procedure that is not recommended: `call dbo.Test(22, ?)`.

3. Execute the SQL scenario by clicking the **OK** or **Apply associated** button.

The result of a SQL transformation is displayed in a view *(on page 343)* at the bottom of the Oxygen XML Author window.

4. View more complex return values of the SQL transformation in a separate editor panel.

A more complex value returned by the SQL query (for example, an *XMLTYPE* or *CLOB* value) cannot be displayed entirely in the result table.

   a. Right-click the cell containing the complex value.

   b. Select the action **Copy cell** from the contextual menu.

      The action copies the value in the clipboard.

   c. Paste the value into an appropriate editor.

      For example, you can paste the value in an opened XQuery editor panel of Oxygen XML Author.

### Integration with Microsoft SharePoint

Oxygen XML Author provides support for browsing and managing SharePoint connections in the **Data Source Explorer view** *(on page 1814)*. You can easily create new resources on the repository, copy and move them using contextual actions or the drag and drop support, or edit and transform the documents in the editor.

⚠️ **Note:** You can access documents stored on SharePoint Online for Office 365 sites that use either *Cloud identity (default)* or *Federated identity (ADFS)* as the authentication method.

⚠️ **Restriction:** The SharePoint connection is only available in the Enterprise edition of Oxygen XML Author.
By default, Oxygen XML Author contains built-in data source drivers for SharePoint. Use this data source to create a connection to a SharePoint server that will be available in the Data Source Explorer view (on page 1814).

To configure a SharePoint connection, follow these steps:

1. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Data Sources.

2. In the Connections panel click the + New button.

3. Enter a unique name for the connection.

4. Select SharePoint in the Data Source combo box.

5. Fill-in the connection details:
   a. Set the URL to the SharePoint repository in the field SharePoint URL.
b. Set the server domain in the **Domain** field. If you are using a SharePoint 365 account, leave this field empty.

c. Set the user name to access the SharePoint repository in the **User** field.

d. Set the password to access the SharePoint repository in the **Password** field.

6. To view your connection, go to the **SharePoint Browser view (on page 1873)** (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu).

For more information about connecting to repository located on a SharePoint server, watch our video demonstration:

https://www.youtube.com/embed/1u2xBlQp1mQ

**SharePoint Browser View**

The **SharePoint Browser** view allows you to connect to a SharePoint repository and perform SharePoint-specific actions on the available resources. To display this view, go to **Window > Show View > SharePoint Browser**.

**Figure 457. SharePoint Browser View**

The view is split in several functional areas:
Connection Area

The following controls are available:

- The Site combo box allows you to select and connect to an already defined SharePoint connection (on page 1872).
- The Disconnect action terminates the current connection.
- The Settings drop-down menu contains actions that help you to quickly define a new connection or manage the existing ones from the Data Source options page: New SharePoint Connection and Configure Database Sources. Also, here you can choose one of the predefined view layouts.

SharePoint Site Navigation Area

If there is no connection selected in the Site combo box, this area is left blank and promotes the actions that allow you to quickly add SharePoint connections. Otherwise, the navigation area presents the SharePoint site structure in a tree-like fashion with various node types (such as sites, libraries, and folders).

Depending on the type of node, a contextual menu offers customized actions that can be performed on that node. The contextual menu of a folder allows you to create new folders and documents, import folders and files, and to rename and delete the folder.

Note: The rename and delete actions are not available for library root folders (folders located at first level in a SharePoint library).

Each library node displays a drop-down menu next to its name where you can select what you want to display for the current library node. This functionality is also available on the contextual menu of the node.

Figure 458. Drop-Down Menu to Select Which Items to Display

Folder Content Area

The content of a folder is displayed in a tabular form, where each row represents the properties of a folder or document. The list of columns and the way the documents and folders are organized depends on the currently selected view of the parent library.
### Table 19. Contextual Menu Actions for the Folder Area

| Action       | Description                                                                 | Available for |  |
|--------------|-----------------------------------------------------------------------------|---------------|
| Open         | Displays the content of the currently selected folder.                      | ✓             | ✓ |
|              |Opens the current document for editing.                                      |               |   |
| Rename       | Renames the current node on server.                                         | ✓             | ✓ |
| Import       | Import files or folders into the currently selected folder.                 | ✓             | ✓ |
| Delete       | Deletes the current node from the server.                                   | ✓             | ✓ |
| Copy Location| Copies to clipboard the URL of the current node.                             | ✓             | ✓ |
| Check Out    | Reserves the current document for your use so that other users cannot change it while you are editing it. |               |   |
| Check In     | Commits on the server the changes you made to the document, so that other users can see them. It also makes the document available for editing to other users. | ✓             |   |
| Discard Check Out | Discards the previous checkout operation, making the file available for editing to other users. |               |   |
| Refresh      | Queries the server to refresh the available properties of the current node. | ✓             | ✓ |
| Drag and Drop| You can drag documents from the SharePoint Browser view and drop them in the main editor area to open them with ease. |               |   |

You can filter and sort the displayed items. To display the available filters of a column, click the filter widget located on the column header. You can apply multiple filters at the same time.

**Note:** A column can be filtered or sorted only if it was configured this way on the server side.

![Column Filter](image)

**Figure 459. Column Filter**

**Related Information:**

- [How to Configure a SharePoint Connection](on page 1872)
SharePoint Contextual Menu Actions

While browsing SharePoint connections in the Data Source Explorer view (on page 1814), the various nodes include the following contextual menu actions:

Connection Level Nodes

- **Configure Database Sources**
  
  Opens the Data Sources preferences page (on page 218) where you can configure both data sources and connections.

- **Disconnect**
  
  Stops the connection.

- **New Folder**
  
  Creates a new folder on the connection.

Folder Level Nodes

- **New File**
  
  Creates a new file on the connection, in the current folder.

- **New Folder**
  
  Creates a new folder on the connection.

- **Import Folders**
  
  Imports folders on the server.

- **Import Files**
  
  Allows you to add a new file on the connection, in the current folder.

- **Export**
  
  Allows you to export the folder on the remote connection to a local folder.

- **Cut**
Removes the current selection and places it in the clipboard.

Copy
Copies the current selection into the clipboard.

Paste
Pastes the copied selection.

Rename
Renames the current resource

Delete
Deletes the current container.

Refresh
Performs a refresh on the selected node.

Find/Replace in Files
Opens the Find/Replace in Files dialog box (on page 687) that allows you to find and replace text in multiple files from the connection.

Resource Level Nodes

Open
Opens the selected resource in the editor.

Open in System Application
When you use this action, Oxygen XML Author downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the Data Source Explorer view, Oxygen XML Author will detect that there was a change and will ask if you want to upload the edited resource to the server.

Cut
Removes the current selection and places it in the clipboard.

Copy
Copies the current selection into the clipboard.
Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

**Check Out**
Checks out the selected document on the server.

**Check In**
Checks in the selected document on the server. This action opens the **Check In** dialog box. In this dialog box, the following options are available:

- **Minor Version** - Increments the minor version of the file on the server.
- **Major Version** - Increments the major version of the file on the server.
- **Overwrite** - Overwrites the latest version of the file on the server.
- **Comment** - Allows you to comment on a file that you check in.

**Discard Check Out**
Discards the previous checkout operation, making the file available for editing to other users.

**Rename**
Renames the current resource

**Delete**
Deletes the current container.

**Refresh**
Performs a refresh on the selected node.

**Properties**
Shows various properties of the current container.

**Find/Replace in Files**
Opens the **Find/Replace in Files** dialog box (on page 687) that allows you to find and replace text in multiple files from the connection.

**Compare**
Compares two selected resources using the **Compare Files** tool (on page 2284).
14.

Importing Data

Computer systems and databases contain data in incompatible formats and exchanging data between these systems can be very time consuming. Converting the data to XML can greatly reduce the complexity and create data that can be read by various types of applications.

Oxygen XML Author offers support for importing text files, MS Excel files, Database Data, and HTML files into XML documents. The XML documents can be further converted into other formats using the Transform features (on page 1258).

Import from Text Files

Oxygen XML Author includes the possibility of importing text files (txt or csv file extensions) as XML documents.

To import a text file into an XML file, follow these steps:

1. Go to File > Import > Text File.
   A Select text file dialog box is displayed.

2. Select the URL of the text file (txt or csv file extensions).

3. Select the encoding of the text file.

4. Click the Next button.
   The Import Criteria dialog box is displayed.

Figure 460. Import Criteria Dialog Box
5. Configure the settings for the conversion.
   a. Select the Field delimiter for the import settings. You can choose between the following: Comma, Semicolon, Tab, Space, Of Pipe.
   b. The Import settings section presents the input data in a tabular form. By default, all data items are converted to element content ( element), but this can be overridden by clicking the individual column headers. Clicking a column header once causes the data from this column to be converted to attribute values ( attribute) symbol). Clicking a second time causes the column data to be ignored ( ignored symbol) when generating the XML file. You can cycle through these three options by continuing to click the column header.
   c. First row contains field names - If this option is selected, the default column headers are replaced (where such information is available) by the content of the first row. In other words, the first row is interpreted as containing the field names. The changes are also visible in the preview panel.
   d. Customize - This button opens a Presentation Names dialog box that allows you to edit the name, XML name, and conversion criterion for the root and row elements. The XML names can be edited by double-clicking the desired item and entering the label. The conversion
criteria can also be modified by selecting one of the following options in the drop-down menu: ELEMENT, ATTRIBUTE, or SKIPPED.

e.  
  **Import Settings** - Clicking this button opens the Import preferences page (on page 211) that allows you to configure more import options.

f.  
  The XML Import Preview panel contains an example of what the generated XML document looks like.

g.  
  **Open in editor** - If selected, the new XML document created from the imported text file is opened in the editor.

h.  
  **Save in file** - If selected, the new XML document is saved in the specified path.

6. Click **Import** to generate the XML document.

---

Import from MS Excel Files

Oxygen XML Author provides several methods for importing MS Excel files into an XML file. The first method is to use the Oxygen XML Author Smart Paste mechanism (on page 860) by simply copying data from Excel and pasting it into a document in Author mode (note that this is only supported in DITA, DocBook, TEI, JATS, and XHTML documents). You can also copy data from Excel and paste it into inserted cells in Grid mode, but this is a more manual process. If you want to import an entire Excel file, Oxygen XML Author also offers a configurable import wizard that works with any type of XML document.

**Smart Paste Method in Author Mode**

If you are importing data into DITA, DocBook, TEI, JATS, or XHTML documents, you can open the Excel spreadsheet in your office application, copy its content, and simply paste it into your document in Author mode.

The Oxygen XML Author Smart Paste mechanism (on page 860) will convert the pasted content to the equivalent XML markup and considers various pasting solutions to keep the resulting document valid, while preserving the original text styling (such as bold, italics, underline) and formatting (such as lists, tables, paragraphs).

**Grid Mode Method**

The Grid mode in Oxygen XML Author displays all content in an XML document as a structured grid of nested tables and you can work with the cells in those tables much like you would with any spreadsheet application. When importing Excel data into Grid mode, you first need to insert new cells in the particular nested table and then you can paste data from Excel the same as you would in any table or spreadsheet.
1. Copy the particular cells from your Excel spreadsheet that you want to import into an XML file.
2. Switch to Grid mode in Oxygen XML Author.
3. Expand the particular nodes and locate the nested table where you want to insert the copied cells.
4. Right-click a particular row or column where you want to insert the data and select Insert row or Insert column, depending on the structure of the copied cells.
5. Paste the copied cells from the clipboard into the newly inserted cells in Grid mode.
6. You may need to make some manual adjustments. For example, if the selection of copied cells contained an empty cell, Oxygen XML Author might ignore that cell.

**Import Wizard Method**

By default, this method supports importing Excel 97/2000/XP/2003 formats out-of-the-box. To import spreadsheet data from Excel 2007 or newer, additional libraries are needed before using this procedure. See Import Data from MS Excel 2007 or Newer (on page 1884) for instructions on adding more libraries.

To use the Import wizard to import an Excel file into an XML file, follow these steps:

1. Go to File > Import > MS Excel file.
2. Select the URL of the Excel file. The sheets of the document you are importing are presented in the Available Sheets section of this dialog box.
3. Click the Next button to proceed to the next stage of the wizard.

Figure 461. Import Wizard
4. Configure the settings for the conversion. This stage of the wizard offers the following options:

**Import settings section**

Presents the input data in a tabular form. By default, all data items are converted to element content (symbol), but this can be overridden by clicking the individual column headers. Clicking a column header once causes the data from this column to be converted to attribute values (symbol). Clicking a second time causes the column data to be ignored (symbol) when generating the XML file. You can cycle through these three options by continuing to click the column header.

**First row contains field names**

If this option is selected, the default column headers are replaced (where such information is available) by the content of the first row. In other words, the first row is interpreted as containing the field names. The changes are also visible in the preview panel.

**Customize**
This button opens a Presentation Names dialog box that allows you to edit the name, XML name, and conversion criterion for the root and row elements. The XML names can be edited by double-clicking the desired item and entering the label. The conversion criteria can also be modified by selecting one of the following option in the drop-down menu: ELEMENT, ATTRIBUTE, or SKIPPED.

**Import Settings**

Clicking this button opens the Import preferences page (on page 211) that allows you to configure more import options.

**Import formatted data (as displayed in Excel)**

If this option is selected, the imported data retains the Excel data formatting (such as the representation of numeric values or dates). If deselected, the data formatting is not imported.

**XML Import Preview panel**

Contains an example of what the generated XML document will look like.

**Open in editor**

If selected, the new XML document created from the imported file is opened in the editor.

**Save in file**

If selected, the new XML document is saved in the specified path.

5. Click Import to generate the XML document.

For more information about exchanging data between Oxygen XML Author and spreadsheet applications, watch our video demonstration:

https://www.youtube.com/embed/8VwsF58zLkU

**Related Information:**

- Exporting XML Content to Excel (on page 834)

**Import Data from MS Excel 2007 or Newer**

To import spreadsheet data from Excel 2007 or newer (.xlsx), Oxygen XML Author needs additional libraries from the release 3.10 of the Apache POI project.

To add this support, follow this procedure:
1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field or select it from the drop-down menu.
3. Select Excel XLSX libraries plugin and click Next.
4. Restart the application.

**Result:** You can now use the Import wizard (on page 1882) to import data from Excel 2007 or newer.

**Alternate Method to Manually Add the Libraries**

To manually add the libraries, follow these steps:

3. Copy the following .jar files into the lib directory of the installation folder of Oxygen XML Author:
   - dom4j-1.6.1.jar
   - poi-ooxml-3.10-FINAL-20140208.jar
   - poi-ooxml-schemas-3.10-FINAL-20140208.jar
   - xmlbeans-2.3.0.jar

   **Note:** The .jar files can be found in either the root folder where you unpacked the archive, or in the ooxml-lib subfolder.

**Result:** You can now use the Import wizard (on page 1882) to import data from Excel 2007 or newer.

**Related Information:**

- Exporting XML Content to Excel (on page 834)

**Import Database Data as an XML Document**

To import the data from a relational database table as an XML document, follow these steps:

1. Go to File > Import > Database Data to start the Import wizard.

   This opens a Select database table dialog box that lists all the defined database connections:

   Figure 462. Select Database Table Dialog Box
2. Select the connection to the database that contains the appropriate data. Only connections configured in relational data sources can be used to import data.

3. If you want to edit, delete, or add a data source or connection, click the **Configure Database Sources** button. The **Preferences/Data Sources** option page is opened.

4. Click **Connect**.

5. In the list of sources, expand a schema and choose the required table.

6. Click the **Next** button.

   The **Import Criteria** dialog box is opened with a default query string in the **SQL Query** pane.

   Figure 463. Import from Database Criteria Dialog Box
7. Configure the settings for the conversion.
   a. **SQL Preview** - If this button is pressed, the **Settings** pane displays the labels that are used in the XML document and the first five lines from the database. By default, all data items are converted to element content ( symbol), but this can be overridden by clicking the individual column headers. Clicking a column header once causes the data from this column to be converted to attribute values ( symbol). Clicking a second time causes the column data to be ignored ( symbol) when generating the XML file. You can cycle through these three options by continuing to click the column header.
   b. **Customize** - This button opens a **Presentation Names** dialog box that allows you to edit the name, XML name, and conversion criterion for the root and row elements. The XML names can be edited by double-clicking the desired item and entering the label. The conversion criteria can also be modified by selecting one of the following option in the drop-down menu: **ELEMENT**, **ATTRIBUTE**, or **SKIPPED**.
   c. **Import Settings** - Clicking this button opens the **Import preferences page** (on page 211) that allows you to configure more import options.
   d. The **XML Import Preview** panel contains an example of what the generated XML document looks like.
e. **Open in editor** - If selected, the new XML document created from the imported file is opened in the editor.

f. **Save in file** - If selected, the new XML document is saved in the specified path.

g. **Generate XML Schema** - Allows you to specify the path of the generated XML Schema file.

8. Click **Import** to generate the XML document.

### Import from HTML Files

Oxygen XML Author offers two methods for importing HTML files into an XML document. The first method is to simply copy data from an HTML document and paste it into a document in **Author** mode, but this is only supported in DITA, DocBook, TEI, JATS, and XHTML documents. Oxygen XML Author also offers a configurable import wizard that works with any type of XML document.

#### Smart Paste Method

If you are importing data into DITA, DocBook, TEI, JATS, or XHTML documents, you can open the HTML document in your web browser, copy its content, and paste it into your document in **Author** mode.

The Oxygen XML Author **Smart Paste mechanism (on page 860)** will convert the pasted content to the equivalent XML markup and considers various pasting solutions to keep the resulting document valid, while preserving the original text styling (such as bold, italics, underline) and formatting (such as lists, tables, paragraphs).

#### Import Wizard Method

To use the **Import** wizard to import from HTML files, follow these steps:

1. Go to **File > Import > HTML File**. The **Import HTML** wizard is displayed.

2. Enter the URL of the HTML document.

3. Select the type of the resulting XHTML document:
   - XHTML5
   - XHTML 1.0 Transitional
   - XHTML 1.0 Strict

4. Click the **OK** button.

**Result:** The resulting document is an XHTML file containing a DOCTYPE declaration that references the XHTML DTD definition on the Web. The parsed content of the imported file is transformed to XHTML5, XHTML Transitional, or XHTML Strict depending on the option you chose.
Import Content Dynamically

Along with the built-in support for various useful URL protocols (such as HTTP or FTP), Oxygen XML Author also provides special support for a convert protocol that can be used to chain predefined processors to dynamically import content from various sources.

A dynamic conversion URL chains various processors that can be applied, in sequence, on a target resource and has the following general syntax:

```
convert:/processor=xslt;ss=urn:processors:excel2d.xsl/processor=excel!/urn:files:my.xls
```

The previous example first applies a processor (excel) on a target identified by the identifier (urn:files:sample.xls) and converts the Excel™ resource to XML. The second applied processor (xslt) applies an XSLT stylesheet identified using the identifier (urn:processors:excel2d.xsl) over the resulting content from the first applied processor. These identifiers are all mapped to real resources on disk via an XML catalog that is configured in the application, as in the following example:

```
<catalog xmlns="urn:oasis:names:tc:entity:xmlns:xml:catalog">
  <rewriteURI uriStartString="urn:files:" rewritePrefix="./resources/"/>
  <rewriteURI uriStartString="urn:processors:" rewritePrefix="./processors/"/>
</catalog>
```

The target resource part of the conversion URL must always follow the !/ pattern. It can be any of the following:

- An absolute URL that points to a resource.
- An identifier that will be resolved to an actual resource via the XML Catalog (on page 2800) support in the application. In the example above, the urn:files:sample.xls target resource is resolved via the XML catalog.
- A relative location. This location can only be resolved to an actual resource URL when the application has enough information about the location where the URL is referenced.

For example, for a DITA map (on page 2793) with a topicref such as:

```
<styleref href="convert:/.../processor=xcel!/resources/sample.xls"/>
```

the resources/sample.xls path will be resolved relative to the DITA map location.

This type of URL can be opened in the application by using the Open URL action from the File menu. It can also be referenced from existing XML resources via xi:include or as a topic reference from a DITA map.

A GitHub project that contains various dynamic conversion samples for producing DITA content from various sources (and then publishing it) can be found here: https://github.com/oxygenxml/dita-glass.
Conversion Processors

A set of predefined conversion processors is provided in Oxygen XML Author. Each processor has its own parameters that can be set to control the behavior of the conversion process. All parameters that are resolved to resources are passed through the XML catalog mapping.

The following predefined conversion processors are included:

- **xslt Processor** - Converts an XML input using the Saxon EE XSLT processor. The `ss` parameter indicates the stylesheet resource to be loaded. All other specified parameters will be set as parameters to the XSLT transformation.

  convert:/processor=xslt;ss=urn:processors:convert.xsl;p1=v1!/urn:files:sample.xml

- **xquery Processor** - Converts an XML input using the Saxon EE XQuery processor. The `ss` parameter indicates the XQuery script to be loaded. All other specified parameters will be set as parameters to the XSLT transformation.

  convert:/processor=xquery;ss=urn:processors:convert.xquery;p1=v1!/urn:files:sample.xml

- **excel Processor** - Converts an Excel™ input to an XML format that can later be converted by other piped processors. It has a single parameter `sn`, which indicates the name of the sheet that needs to be converted. If this parameter is missing, the XML will contain the combined content of all sheets included in the Excel™ document.

  convert:/processor=excel;sn=test!/urn:files:sample.xls

- **java Processor** - Converts an input to another format by applying a specific Java method. The `jars` parameter is a comma-separated list of JAR (on page 2795) libraries, or folders that libraries will be loaded from. The `ccn` parameter is the fully qualified name of the conversion class that will be instantiated. The conversion class needs to have a method with the following signature:

  ```java
  public void convert(String systemID, String originalSourceSystemID, InputStream is, OutputStream os, LinkedHashMap<String, String> properties)
  throws IOException
  ```

  convert:/processor=java;jars=libs;ccn=test.JavaToXML!/urn:files:java/WSEditorBase.java

- **js Processor** - Converts an input to another format by applying a JavaScript method. The `js` parameter indicates the script that will be used. The `fn` parameter is the name of the method that will be called from the script. The method must take a string as an argument and return a string. If any of the parameters are missing, an error is thrown and the conversion stops.
import:/processor=js;js=urn:processors:md.js;fn=convertExternal!/urn:files:sample.md

- **json Processor** - Converts a JSON input to XML. It has no parameters.
  import:/processor=json!/urn:files:personal.json

- **xhtml Processor** - Converts HTML content to well-formed XHTML. It has no parameters.
  import:/processor=xhtml!/urn:files:test.html

- **wrap Processor** - Wraps content in a tag name making it well-formed XML. The `rn` parameter indicates the name of the root tag to use. By default, it is `wrapper`. The `encoding` parameter specifies the encoding that should be used to read the content. By default, it is `UTF8`. As an example, this processor can be used if you want to process a comma-separated values file with an XSLT stylesheet to produce XML content. The CSV file is first wrapped as well-formed XML, which is then processed with an `xslt` processor.
  import:/processor=wrap!/urn:files:test.csv

- **cache Processor** - Caches the converted content obtained from the original document to a temporary file. The cache will be used on subsequent uses of the same URL, thus increasing the speed for the application returning the converted content. If the original URL points to the local disk, the cache will be automatically invalidated when the original file content gets modified. Otherwise, if the original URL points to a remote resource, the cache will need to be invalidated by reloading (File > C Reload (F5)) the URL content that is opened in the editor.
  import:/processor=cache/processor=xslt;...!/urn:files:test.csv

### Reverse Conversion Processors

All processors defined above can also be used for saving content back to the target resource if they are defined in the URL as reverse processors. Reverse processors are evaluated right to left. These reverse processors allow *round-tripping* content to and from the target resource.

As an example, the following URL converts HTML to DITA when the URL is opened using the `h2d.xsl` stylesheet and converts DITA to HTML when the content is saved in the application using the `d2h.xsl` stylesheet.

import:/processor=xslt;ss=h2d.xsl/rprocessor=xslt;ss=d2h.xsl!/urn:files:sample.html

⚠️ **Important:** If you are publishing a *DITA map* that has such conversion URL references inside, you need to edit the transformation scenario and set the value of the parameter `fix.external.refs.com.oxygenxml` to `true`. This will instruct Oxygen XML Author to resolve such references during a special pre-processing stage. Depending on the conversion, you may also require
additional libraries to be added using the Libraries button in the Advanced tab of the transformation scenario.

15. Framework and Author Mode Customization

This section contains information and tutorials about customizing the authoring experience through custom frameworks and customizing the Author editing mode through CSS styling or API extensions.

Creating and Configuring Custom Frameworks

Oxygen XML Author includes built-in, configured frameworks for DocBook, DITA, TEI, XHTML, and JATS, but you can also create your own customization to handle other types of documents. A common use case is wanting to customize the interface to accommodate the needs of your authoring team.

Fully configuring a framework usually involves customizing CSS stylesheets, XML schemas, GUI components (menu actions, toolbars, inline components, content completion proposals, and more), configuring other more general settings, then bundling the framework to share with your team. The CSS and GUI components are used to customize the interface, while other general settings can be configured to accommodate custom document templates, XML catalogs, transformation scenarios, and more.

Advanced Framework Customization

Oxygen XML Author supports individual document types and classes of document types through frameworks. A framework associates a document type or a class of documents with CSS stylesheets, validation schemas, catalog files, new files templates, transformation scenarios, content completion proposals, custom actions, and more.

This section includes information about numerous possibilities for creating and customizing a framework, and how to share your customization with others.

Tip: A sample framework customization package is available that you can dabble with and use to help you get started. It can be downloaded from: https://www.oxygenxml.com/php/get_oxygen_sample_framework.php. The package includes a sample CSS file, XSL file, schema files, document templates, an XML catalog file, custom icons, and other resources.
Creating/Extending a Custom Framework

The easiest way to create a custom framework (on page 2794) (document type) is by extending an existing built-in framework, such as DITA or DocBook, and then making modifications to it. You can then easily share the custom framework (on page 1942) with your team.

To create a custom framework by extending an existing one, follow these steps:

1. In a location where you have full write access, create a folder structure similar to this:
   
   custom_frameworks/dita-extension.

2. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Document Type Association > Locations (on page 93). Add the path to your custom_frameworks folder in the Additional frameworks directories list and click OK or Apply to save your changes.

3. Go to the Document Type Association preferences page (on page 92) and select an existing framework configuration (for example, DITA) and use the Extend button to create an extension for it.

   **Step Result:** This opens the Document Type Configuration dialog box (on page 94) where you can define the set of rules and settings for your custom framework.

4. Give the extension an appropriate name, select External for the Storage option, click the browsing button ( ) to specify the location of the custom directory you created in step 1.

5. Continue to configure the extension using the tabs on the bottom half of the dialog box. For details about each of those tabs, see the child topics in the Document Type Configuration dialog box (on page 94) section. For even more information about customizing the extended framework, see the various topics and tutorials in the Creating and Configuring Custom Frameworks (on page 1893) section. Make sure that you save any resources you reference in your framework configuration (CSS files, new document templates, schemas used for validation, catalogs, etc.) in your custom framework directory you created in step 1.

6. Click OK to close the configuration dialog box and then OK or Apply to save your changes.

   **Results:** You now have a fully functional framework that can be shared with others (on page 1942).

Related Information:

- Sharing a Custom Framework (on page 1942)

Configuring Actions, Menus, Toolbars, Content Completion for a Framework

You can configure actions, menus, toolbars, icons, and content completion proposals specifically for a particular framework (on page 2794) (document type) to customize your editing experience in Author.
mode by using the Document Type configuration dialog box (on page 94). Advanced users who are familiar with API development can also create custom Author mode operations for a particular framework.

Configuring Actions for a Framework

To add or configure actions for a framework (on page 2794) (document type), follow this procedure:

1. Open the Preferences dialog box (Options > Preferences) (on page 79), go to Document Types Association, and select the framework for which you want to create an action.
2. Click Edit and in the Document Type configuration dialog box (on page 94) go to the Author tab, then go to the Actions subtab.
3. To create a new action, click the New button. To edit an existing action, select the action and click the Edit button.

Result: In either case, this opens the Action configuration dialog box (on page 102) where you can configure numerous aspects of the action.

Example: Configure the Insert Section Action for a Framework

This topic describes the procedure for defining the Insert Section action for a custom framework (on page 2794). It is assumed that the icon files, (Section16.gif) for the menu item and (Section20.gif) for the toolbar, are already available. Although you could use the same icon size for both the menu and toolbar, usually the icons from the toolbars are larger than the ones found in the menus. These files should be placed in your custom framework directory (\OXYGEN_INSTALL_DIR\frameworks\{CUSTOM_FRAMEWORK_DIR\}).

Figure 464. Action Dialog Box
1. Set the **ID** field to `insert_section`. This is a unique action identifier.

2. Set the **Name** field to **Insert Section**. This will be the action's name, displayed as a tooltip when the action is placed in the toolbar, or as the menu item name.

3. Set the **Menu access key** to `i`. On Windows, the menu items can be accessed using **Alt+** keys combination, when the menu is visible. The **letter** is visually represented by underlining the first letter from the menu item name having the same value.

4. Add a **Description**.

5. Set the **Large icon (20x20)** field to `.${frameworks}/sdf/Section20.gif`. A good practice is to store the image files inside the **framework directory** and use **editor variable** *(on page 266)* `.${framework}` to make the image relative to the **framework** location.

   If the images are bundled in a **JAR** *(on page 2795)* archive together with some Java operations implementation, for instance, it might be convenient for you to reference the images not by the file name, but by their relative path location in the class-path.

   If the image file `Section20.gif` is located in the **images** directory inside the **JAR** archive, you can reference it by using `/images/Section20.gif`. The **JAR** file must be added into the **Classpath** list.

6. Set the **Small icon (16x16)** field to `.${frameworks}/sdf/Section16.gif`.

7. Click the text field next to **Shortcut key** and set it to **Ctrl+Shift+S** (**Meta+Shift+S** on Mac OS). This will be the key combination to trigger the action using the keyboard only.
The shortcut is enabled only by adding the action to the main menu of Author mode (on page 1898), which contains all the actions that the author will have in a menu for the current document type.

8. At this time the action has no functionality added to it. Next you must define how this action operates. An action can have multiple operation modes. The first action mode enabled by the evaluation of its associated XPath expression will be executed when the action is triggered by the user. The XPath expression needs to be version 2.0 and its scope must be only element and attribute nodes of the edited document. Otherwise, the expression will not return a match and will not trigger the action. If the expression is left empty, the action will be enabled anywhere in the scope of the root element. For this example, suppose you want the action to add a section only if the current element is either a book, article, or another section.

   a. Set the XPath expression field to:

   ```
   local-name()='section' or local-name()='book' or local-name()='article'
   ```

   b. Set the invoke operation field to InsertFragmentOperation built-in operation, designed to insert an XML fragment at cursor position. This belongs to a set of built-in operations, a complete list of which can be found in the Author Default Operations (on page 2022) section. This set can be expanded with your own Java operation implementations.

   c. Configure the arguments section as follows:

   ```
   <section xmlns="http://www.oxygenxml.com/sample/documentation">
   <title/>
   </section>
   ```

   - insertLocation - leave it empty. This means the location will be at the cursor position.
   - insertPosition - select "Inside".

Example: Configure the Insert Table Action for a Framework

This topic describes the procedure for defining the Insert Table action for a custom framework (on page 2794). Suppose that you want to create an action that inserts a table with three rows and three columns into a document and the first row is the table header. As with the insert section action (on page 1895), you will use the InsertFragmentOperation built-in operation.

Place the icon files for the menu item, and for the toolbar, in your custom framework directory (`{OXYGEN_INSTALL_DIR}\frameworks\{CUSTOM_FRAMEWORK_DIR}\`).
1. Set ID field to `insert_table`.
2. Set Name field to `Insert table`.
3. Set Menu access key field to `t`.
4. Set Description field to `Adds a table element`.
5. Set Toolbar icon to `${framework}/toolbaricon.png`.
6. Set Menu icon to `${framework}/menuicon.png`.
7. Set Shortcut key to `Ctrl + Shift + T (Command + Shift + T on OS X)`.
8. Set up the action's functionality:
   a. Set XPath expression field to `true()`.
      `true()` is equivalent with leaving this field empty.
   b. Set Invoke operation to use `InsertFragmentOperation` built-in operation that inserts an XML fragment to the cursor position.
   c. Configure operation's arguments as follows:
      - **fragment** - set it to:
        ```xml
        <table xmlns="http://www.oxygenxml.com/sample/documentation">
        <header>
        <td/><td/><td/></header>
        <tr><td/><td/><td/></tr>
        <tr><td/><td/><td/></tr>
        </table>
        ```
      - **insertLocation** - to add tables at the end of the section use the following code:
        ```xml
        ancestor::section/*[last()]
        ```
      - **insertPosition** - Select After.

**Configure the Main Menu for a Framework**

Defined actions can be grouped into customized menus in the Oxygen XML Author menu bar.

1. Open the Document Type configuration dialog box ([on page 94](#)), select your custom framework ([on page 2794](#)), and go to the Author tab.
2. Go to the Menu subtab. In the left side you have the list of actions and some special entries:
   - **Submenu** - Creates a submenu. You can nest an unlimited number of menus.
   - **Separator** - Creates a separator into a menu. This way you can logically separate the menu entries.
3. The right side of the panel displays the current actions for that menu tree. To change its name, click this label to select it, then press the Edit button.

4. Select the Submenu label in the left panel section and the appropriate label in the right panel section, then press the Add as child button. Change the submenu name to Table, using the Edit button.

5. Select the Insert section action in the left panel section and the Table label in the right panel section, then press the Add as sibling button.

6. Now select the Insert table action in the left panel section and the Table in the right panel section. Press the Add as child button.

Figure 465. Configuring the Menu

When opening a test document for a custom framework in Author mode, the menu you created is displayed in the editor menu bar, between the Tools and the Document menus. The upper part of the menu contains generic Author mode actions (common to all document types) and the two actions created previously (with Insert table under the Table submenu).

Figure 466. Author Mode Menu
Configure the Contextual Menu for a Framework

The contextual menu is displayed when you right-click in the **Author** editing area. You can only configure the bottom part of the menu, since the top part is reserved for a list of generic actions (such as Copy, Paste, Undo, etc.)

1. Open the **Document Type** configuration dialog box ([on page 94](#)) for the particular **framework** ([on page 2794](#)) and go to the **Author** tab. Next, go to the **Contextual Menu** subtab.

2. Follow the same steps as explained in the **Configuring the Main Menu** ([on page 1898](#)), except changing the menu name because the contextual menu does not have a name.

   **Note:** You can choose to reuse a submenu that contains general authoring actions. In this case, all actions (both general and **framework**-specific ones) are grouped together under the same submenu.

Figure 467. Configuring the Contextual Menu
To test it, open the test file, and open the contextual menu. In the lower part there is shown the **Table** sub-menu and the **Insert section** action.

**Configure the Toolbars for a Framework**

This procedure describes how to add defined actions to a toolbar for a custom *framework (on page 2794)*. You can also create additional custom toolbars with existing or custom actions.

1. Open the **Document Type** configuration dialog box (on page 94) for your custom *framework* and select the **Author** tab.
2. Next, go to the **Toolbar** subtab.

![Figure 468. Configuring the Toolbar](image)

The panel is divided in two sections. The left side contains a list of actions, while the right side contains an action tree, displaying the list of actions added in the toolbar. The special entry called **Separator** allows you to visually separate the actions in the toolbar.

3. To add an action, select it in the left panel and select the particular toolbar label where you want it added in the right panel section, then click the **Add as child** or **Add as sibling** button.

**Result:** When opening a document for the particular *framework* in **Author** mode, the toolbar with the new buttons will be displayed in the toolbar area.

**Tip:** If you have many custom toolbar actions, or want to group actions according to their category, add more toolbars with custom names and split the actions to better suit your purpose. If your toolbar is not displayed when switching to the **Author** mode, right-click the main toolbar, select **Configure Toolbars**, and make sure the appropriate toolbar (such as the **Author Custom Actions** toolbar) is selected.
Note: A maximum of 16 toolbars can be added. If you add more, all extra toolbars will be automatically converted to sub-toolbars for the last added toolbar.

Configure Content Completion for a Framework

You can customize the content of the following Author controls, adding items (which, when invoked, perform custom actions) or filtering the default contributed ones:

- Content Completion Assistant (on page 2792) window
- Elements view (on page 418)
- Insert Element menus (from the Outline view (on page 334) or breadcrumb (on page 849) contextual menus)

You can use the content completion customization support in a custom framework (on page 2794) by following this procedure:

1. Open the Document type configuration dialog box (on page 94) for your custom framework and select the Author tab. Next, go to the Content Completion tab.

The top side of the Content Completion section contains the list with all the actions defined within the custom framework and the list of actions that you decided to include in the Content Completion Assistant list of proposals. The bottom side contains the list with all the items that you decided to remove from the Content Completion Assistant list of proposals.
2. If you want to add a custom action to the list of current Content Completion proposals, select the action item from the Available actions list and press the Add as child or Add as sibling button to include it in the Current actions list. An Insert Action dialog box appears, giving you the possibility to select where to provide the selected action.

Figure 470. Insert Action Dialog Box

![Insert Action Dialog Box](image)

3. If you want to exclude a certain item from the Content Completion proposals, you can use the Add button from the Filter - Remove content completion items list. The Remove item dialog box is displayed, allowing you to input the item name and to choose the controls that filter it. The Item name combo box accepts wildcards.

Figure 471. Remove Item Dialog Box

![Remove Item Dialog Box](image)

**Adding Retina/HiDPI Icons in a Framework**

Higher resolution icons can also be included in customized frameworks (on page 2794) for rendering them in a Retina or HiDPI display. The icons can be referenced directly from the Document Type Configuration dialog box (on page 94) (from the Action dialog box (on page 102)) or from an API (ro.sync.exml.workspace.api.node.customizer.XMLNodeRendererCustomizer (on page 2002)).

As with any image, the higher resolution icons are stored in the same images folder as the normal resolution images and they are identified by a scaling factor that is included in the name of the image
files. For instance, icons with a Retina scaling factor of 2 will include @2x in the name (for example, myIcon@2x.png).

Developers should not specify the path of the alternate icons (@2x or @3x) in the Action dialog box (on page 102) or the XMLNodeRendererCustomizer API (on page 2002). When using a Retina or HiDPI display, Oxygen XML Author automatically searches the folder of the normal icon for a corresponding image file with a Retina scaling factor in the name. If the higher resolution icon file does not exist, the normal icon is scaled and used instead.

Related Information:

- Retina/HiDPI Images in Author Mode (on page 970)

Localizing Frameworks

Oxygen XML Author supports framework (on page 2794) localization (translating framework actions, buttons, and menu entries to various languages). This lets you develop and distribute a framework to users that speak other languages without changing the distributed framework. Changing the language used in Oxygen XML Author in the Global preferences page is enough to set the right language for each framework.

To localize the content of a framework, create a translation.xml file that contains all the translation (key, value) mappings. The translation.xml has the following format:

```xml
<translation>
  <languageList>
    <language description="English" lang="en_US"/>
    <language description="German" lang="de_DE"/>
    <language description="French" lang="fr_FR"/>
  </languageList>
  <key value="list">
    <comment>List menu item name.</comment>
    <val lang="en_US">List</val>
    <val lang="de_DE">Liste</val>
    <val lang="fr_FR">Liste</val>
  </key>
</translation>
```
Oxygen XML Author matches the GUI language with the language set in the translation.xml file. If this language is not found, the first available language declared in the languagelist tag for the corresponding framework is used.

Add the directory where this file is located to the Classpath list corresponding to the edited document type.

After you create this file, you can use the keys defined in it to customize the name and description of the following:

- Actions
- Menu entries
- Contextual menus
- Toolbars
- Static CSS content

For example, if you want to localize the bold action, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Document Type Association. Use the New or Edit button to open the Document type configuration dialog box (on page 94), go to Author > Actions, and rename the bold action to `${i18n(translation_key)}`. Actions with a name format other than `${i18n(translation_key)}` are not localized. Translation_key corresponds to the key from the translation.xml file.

Now open the translation.xml file and edit the translation entry if it exists or create one if it does not exist. This example presents an entry in the translation.xml file:

```xml
<key value="translation_key">
    <comment>Bold action name.</comment>
    <val lang="en_US">Bold</val>
    <val lang="de_DE">Bold</val>
    <val lang="fr_FR">Bold</val>
</key>
```

To use a description from the translation.xml file in the Java code used by your custom framework, use the new ro.sync.ecss.extensions.api.AuthorAccess.getAuthorResourceBundle() API method to request the associated value for a certain key. This allows all the dialog boxes that you present from your custom operations to have labels translated in multiple languages.

You can also reference a key directly in the CSS content:

```css
title:before{
    content: "${i18n(title.key)} : ";
}
```
**Note:** You can enter any language you want in the `langagelist` tag and any number of keys.

The `translation.xml` file for the DocBook framework is located here: `OXYGEN_INSTALL_DIR/frameworks/docbook/i18n/translation.xml`. In the Classpath list corresponding to the DocBook document type the following entry was added: `$(framework)/i18n/`.

To see how the DocBook actions are defined to use these keys for their name and description, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Document Type Association > Author > Actions. If you look in the Java class `ro.sync.ecss.extensions.docbook.table.SADocbookTableCustomizerDialog` available in the `oxygen-sample-framework` module of the Oxygen SDK Maven archetype, you can see how the new `ro.sync.ecss.extensions.api.AuthorResourceBundle` API is used to retrieve localized descriptions for various keys.

Creating New Document Templates for a Custom Framework

You can create your own custom document templates and attach them to a custom framework (on page 2794). You can then share the custom framework (on page 1942) so that all users will have access to the templates in the New document wizard (on page 619).

To create your own custom document template and have it appear in the new document wizard, follow these steps:

1. Create a new file and customize it to become a starting point for creating new files of this type.

   **Tip:** You can use editor variables (on page 266) in the template file content and they will be expanded when the files are opened. Also, see Customizing Document Templates (on page 627) for other template customization tips (for example, you could add placeholders or hints (on page 630) to assist authors).

2. Save the new template in a directory (for example, called `templates`) within your custom framework directory.

   **Attention:** The name that you use to save the template will be the name that appears in the new document wizard, including capitalization, space, and characters (for example, `My Custom Template1.xml` will appear in the new file wizard as `My Custom Template1`). You can also configure the displayed name in a properties file by following the procedure found in the Configure the Displayed Names for Document Templates (on page 629) section.

3. Open the Document Type configuration dialog box (on page 94) for that specific framework, go to the Templates tab (on page 117), and click the ** button in the bottom-right corner to add your new directory to the list. It is recommended that the reference be made relative to the framework directory (for example, `$(frameworkDir)/templates`). Binding to an absolute file (e.g., `C:\some_dir\templates`) makes the association difficult to share between users.

4. Click OK for all of the dialog boxes to save your changes.
5. To test the template, open the new document wizard (New toolbar button or File > New) and you should see your custom template in the folder for your custom framework (in the Framework templates section).

Related Information:

- Customizing Document Templates (on page 627)

Configuring XML Catalogs

For cases where you need to reference the location of a schema file from a remote web location and an Internet connection may not be available, an XML Catalog (on page 2800) may be used to map the web location to a local file system entry. The following procedure presents an example of using an XML catalog in a custom framework (on page 2794) by modifying an XML Schema file.

1. Create a catalog file that will help the parser locate the schema for validating the XML document. The file must map the location of the schema to a local version of the schema.

   Example:

   Create a new XML file called catalog.xml and save it in your custom framework directory ([OXYGEN_INSTALL_DIR]\frameworks\[CUSTOM_FRAMEWORK_DIR]). The content of the file should look like this:

   ```xml
   <?xml version="1.0"?>
   <catalog xmlns="urn:oasis:names:tc:entity:xmlns:xml:catalog">
     <uri name="http://www.oxygenxml.com/SDF/abs.xsd" uri="schema/abs.xsd"/>
   </catalog>
   ```

2. Add catalog files to your custom framework using the Catalogs tab (on page 118) from the Document Type configuration dialog box (on page 94).

To test the catalog settings, restart Oxygen XML Author and try to validate a new sample document for your custom framework. There should be no errors.

Example:

The schema that validates the document refers the other file abs.xsd through an import element:
The `schemaLocation` attribute references the `abs.xsd` file:

```xml
<xsi:schemaLocation="http://www.oxygenxml.com/sample/documentation/abstracts"
   http://www.oxygenxml.com/SDF/abs.xsd"/>
```

The catalog mapping is:

```
http://www.oxygenxml.com/SDF/abs.xsd -> schema/abs.xsd
```

This means that all the references to `http://www.oxygenxml.com/SDF/abs.xsd` must be resolved to the `abs.xsd` file located in the `schema` directory (note that the `schema` directory needs to be in the same folder as the XML Catalog). The URI element is used by URI resolvers (for example, to resolve a URI reference used in an XSLT stylesheet).

Configuring Transformation Scenarios for a Framework

When distributing a framework (on page 2794) to users, it is a good idea to have the transformation scenarios already configured. This helps the content authors publish their work in various formats. By being contained in the framework configuration, the scenarios can be distributed along with the actions, menus, toolbars, and catalogs.

These are the steps that allow you to create a transformation scenario for your framework.

1. Create an `xsl` folder inside your custom framework directory

   ```
   \OXYGEN_INSTALL_DIR\frameworks\[CUSTOM_FRAMEWORK_DIR]\xsl
   ```

   The folder structure for the documentation framework should be:

   ```
   oxygen
   frameworks
   [CUSTOM_FRAMEWORK_DIR]
   schema
   css
   templates
   xsl
   ```

2. Create an `xsl` file and save it in the `xsl` folder. To help you get started, you can use the sample `sdf.xsl` file found in the sample framework customization package.

3. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Document Type Associations. Select the particular framework, click the Edit button to open Document Type
Configuration dialog box (on page 94), and choose the Transformation tab. Click the **New** button and choose the appropriate type of transformation (for example, **XML transformation with XSLT**).

In the **New scenario** dialog box, fill in the following fields:

- Fill in the **Name** field with the name of your transformation scenario.
- Set the **XSL URL** field to path of your custom stylesheet (for example, `${framework}/xsl/mycustom.xsl`).

Figure 472. Configuring a New XSLT Transformation Scenario

4. Change to the **Output** tab. Configure the fields as follows:

- Set the **Save as** field to `${cfd}/${cfn}.html`. This means the transformation output file will have the name of the XML file and the *html* extension and will be stored in the same folder.
- Select the **Open in Browser/System Application** option.

  **Note:** To set the browser or system application that will be used, open the **Preferences** dialog box (Options > Preferences) (on page 79), go to **Global**, and set it in the **Default Internet browser** field. This will take precedence over the default system application settings.
- Select the **Saved file** option.

5. Click the **OK** button to save the new scenario.

Now the scenario is listed in the **Transformation** tab:

Figure 473. Transformation Tab
To test the transformation scenario that you just created, you can use the sample sdf.xml file found in the sample framework customization package. Click the Apply Transformation Scenario(s) button to display the Transform with dialog box. The scenario list contains the scenario you defined earlier. Select the SDF to HTML scenario that you just defined and click the Apply associated button. The HTML file is saved in the same folder as the XML file and displayed in the browser.

Configuring Validation Scenarios for a Framework

You can distribute a framework (on page 2794) with a series of already configured validation scenarios. Also, this provides enhanced validation support that allows you to use multiple grammars to check the document. For example, you can use Schematron rules to impose guidelines that are otherwise impossible to enforce using conventional validation.

Note: If a master file is associated with the current file, the validation scenarios defined in the master file, along with any Schematron schema defined in the default scenarios for that particular framework, are used for the validation. These take precedence over other types of validation units defined in the default scenarios for the particular framework. For more information on master files, see Master Files Support (on page 669) or Working with Modular XML Files in the Master Files Context (on page 1068).

To associate a validation scenario with a specific framework, follow these steps:

1. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Document Type Association.

2. Select the document type and click the Edit button to open the Document Type Configuration dialog box (on page 94), then choose the Validation tab. This tab displays a list of document types in which you can define validation scenarios. To set one or more of the validation scenarios listed in this tab to be used as the default validation scenario (when another one is not specified in the validation process) for a specific document type, check the Default box for that specific document type.

3. To edit an existing scenario, select the scenario and click the Edit button. To add a new scenario, click the New button. In either case, a scenario configuration dialog box is displayed. It lists all the validation units for the scenario.
This scenario configuration dialog box allows you to configure the following information and options:

**Name**

The name of the validation scenario.

**Storage**

You can choose between storing the scenario in the Project Options (on page 2798) or Global Options (on page 2795).

**URL of the file to validate**

The URL of the main module that includes the current module. It is also the entry module of the validation process when the current one is validated. To edit the URL, double-click its cell and specify the URL of the main module by doing one of the following:

- Enter the URL in the text field or select it from the drop-down list.
- Use the Browse drop-down button to browse for a local, remote, or archived file.
- Use the Insert Editor Variable button to insert an editor variable (on page 266) or a custom editor variable (on page 274).

Figure 475. Insert an Editor Variable
File type

The type of the document that is validated in the current validation unit. Oxygen XML Author automatically selects the file type depending on the value of the **URL of the file to validate** field.

Validation engine

You can select one of the engines available in Oxygen XML Author for validation of the particular document type.

**Default engine** means that the default engine is used to run the validation for the current document type, as specified in the preferences page for that type of document (for example, XSLT preferences page (on page 192), XML Schema preferences page (on page 186)).

The **DITA Validation** engine performs DITA-specific checks in the context of the specifications (it is similar to the checks done with the **DITA Maps Manager Validate and Check for Completeness** action (on page 2549), but for a local file rather than an entire DITA map (on page 2793)).

The **Table Layout Validation** engine looks for table layout problems (for more information, see **Report table layout problems** (on page 2553)).

Automatic validation

If this option is selected, the validation operation defined by this row is also applied by the **automatic validation feature** (on page 1024). If the **Automatic validation** feature is disabled in the Document Checking preferences page (on page 174), then this option is ignored, as the preference setting has a higher priority.

Schema

This option becomes active when you set the **File type** to **XML Document** and allows you to specify the schema used for the validation unit.
**Specify Schema**

Opens the Specify Schema dialog box that allows you to set a schema to be used for validating XML documents.

Figure 476. Specify Schema Dialog Box

The Specify Schema dialog box contains the following options:

**Use detected schema**

Uses the schema detected for the particular document (on page 1055).

**Use custom schema**

Allows you to specify the schema using the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S). You can specify the URL by using the text field, the history drop-down, the Insert Editor Variables (on page 266) button, or the browsing actions in the Browse drop-down list.

- **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the URL field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.

- **Embedded Schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, select this option.
- **Extensions** - Opens a dialog box that allows you to specify Java extension JARs (on page 2795) to be used during the validation.
- **Public ID** - Allows you to specify a public ID if you have selected a DTD.
- **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.

**Move Up**

Moves the selected scenario up one spot in the list.

**Move Down**

Moves the selected scenario down one spot in the list.

**Add**

Adds a new validation unit to the list.

**Remove**

Removes an existing validation unit from the list.

4. Configure any of the existing validation units according to the information above, and you can use the buttons at the bottom of the table to add, remove, or move validation units. Note that if you add a Schematron validation unit, you can also select the validation phase.

5. Press Ok.

The newly created validation scenario is now included in the list of scenarios in the Validation tab (on page 120). You can use the Default checkbox to specify that the new scenario be used as the default validation scenario when another specific scenario is not specified in the validation process.

**Customizing Smart Paste Support**

The Smart Paste feature (on page 860) preserves certain style and structure information when copying content from some of the most common applications and pasting into frameworks (document types) that support Smart Paste (on page 861) in Oxygen XML Author. For other document types, the default behavior of the paste operation is to keep only the text content without the styling.

The style of the pasted content can be customized by editing an XSLT stylesheet for a particular document type (framework (on page 2794)). The XSLT stylesheet must accept an XHTML flavor of the copied content as input, and transform it to the equivalent XML markup that is appropriate for the target document type of the paste operation.
How to Customize the Smart Paste Mapping

To customize the mapping between the markup of the copied content and the markup of the pasted content for a particular document type, follow these steps:

1. Make sure the particular framework contains a folder named resources in the following path structure:

   `/frameworks/[Document Type]/resources`

2. Create an XSLT file named `xhtml2content.xsl` and save it in the resources folder for the particular framework.

   For example: `/frameworks/[Document Type]/resources/xhtml2content.xsl`

3. Add your customized styling in the XSLT file. A list of supported parameters can be found in the Supported Parameters for the Custom Smart Paste XSLT (on page 1916) section below.

   **Tip:** The built-in DITA framework includes an `xhtml2ditaDriver.xsl` file (in `[OXYGEN_INSTALL_DIR]/frameworks/dita/resources`) that imports various other stylesheets that apply cleanup and handle the conversion from the pasted HTML content to DITA. If you are using a custom extension of the DITA framework, you can copy the entire contents of the built-in `dita/resources` folder and customize the stylesheets according to your needs.

4. You can test modifications done in the stylesheet by pasting content without having to restart Oxygen XML Author.

**Result:** When you paste content from external applications (such as a web browser or and Office document) to a document that is opened in Author mode, and that matches the particular framework, the styling from the `xhtml2content.xsl` stylesheet will be applied on the clipboard contents.

**Customized Smart Paste Stylesheet Sample:**

```xml
<xsl:stylesheet version="1.0"
 xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
 xmlns:xhtml="http://www.w3.org/1999/xhtml"
 xmlns="urn:hl7-org:v3"
 exclude-result-prefixes="xsl xhtml">

 <xsl:output method="xml" indent="no" omit-xml-declaration="yes"/>

 <xsl:template match="xhtml:b | xhtml:strong">
   <content styleCode="bold">
     <xsl:apply-templates select="@* | node"/>
   </content>

 </xsl:template>

</xsl:stylesheet>
```
Supported Parameters for the Custom Smart Paste XSLT

The following parameters can be used in your XSLT stylesheet for customizing the Smart Paste mechanism:

**inTableContext**

The custom XSLT stylesheet receives this parameter with a value of true if the end user is pasting content inside a table.

**folderOfPasteTargetXml**

A URL pointing to the folder where the current edited XML document is located. This is used to save images relative to the current XML document.

**context.path.names**

A sequence of element names showing the current context in the XML document where the paste occurred.

**context.path.uris**

A sequence of namespaces, one for each context path name.

**context.path.separator**

The separator between the path names. Its value can be used to split the context path names to a sequence.

By default, there is an extra check in place to ensure that the applied XSLT does not remove the original text from the pasted content. If there is a file called externalPasteOptions.xml in the resources folder, you can use it to specify the default behavior for checking if the XSLT stylesheet loses content during conversion:
Customizing Author Mode Using CSS Files Associated with a Framework

The easiest way to customize the main (on page 2796) CSS stylesheet of a framework (on page 2794) is to create a new stylesheet, save it as an alternate (on page 2791) CSS file that will be applied as an additional layer to the main CSS, and then select it from the Styles drop-down menu in Author mode.

For example, suppose that you want to customize the main CSS for DITA documents. To do this, follow these steps:

1. First, create a new CSS stylesheet and save it in the /frameworks/dita/css/edit folder (where the default main stylesheet named style-basic.css is located).

2. Edit the DITA framework and go to the CSS subtab (on page 100):
   a. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Document Type Association.
   b. Select the DITA document type and press the Edit button.

   **Tip:** If you do not have write permissions to modify the document type, use the Extend button to create an extension of the framework.

   a. Go to the CSS subtab of the Author tab.

Figure 477. CSS Subtab of the Document Type Association Author Tab
3. Add the new stylesheet as an alternate CSS stylesheet:
   a. Click the Add button to open a dialog box that allows you to specify the URI and Title for your newly created stylesheet.
   b. Select the Alternate option to define it as an alternate stylesheet that will be applied as an additional layer to the main CSS.

   ![Figure 478. Add CSS Dialog Box](image)

4. Press OK in all the dialog boxes to validate the changes.

5. Select your newly created CSS stylesheet from the Styles drop-down menu on the toolbar in Author mode.

   You can now edit DITA documents based on the new CSS stylesheet. You can also edit the new CSS stylesheet itself and see its effects on rendering DITA documents in the Author mode by using the Refresh action that is available on the Author toolbar and in the DITA menu.

Related Information:

- Configuring and Managing Multiple CSS Styles for a Framework (on page 1919)
Configuring and Managing Multiple CSS Styles for a Framework

Oxygen XML Author provides a Styles drop-down menu on the toolbar that allows you to select one main (non-alternate) CSS style (on page 2796) and multiple alternate CSS styles (on page 2791). This makes it easy to change the look of the document as it appears in Author mode and the output without having to continually edit the CSS stylesheets.

An example of a common use case is when content authors want to use custom styling within a document. You can select a main CSS stylesheet that styles the whole document and then apply alternate styles, as layers, to specific parts of the document.

Managing the CSS Styles

The main (on page 2796) and alternate (on page 2791) styles that are listed in the Styles drop-down menu can be controlled in the Document Type configuration dialog box (on page 94). To access it, follow these steps:

1. Open the Preferences dialog box (on page 79).
2. Go to Document Type Association.
3. Select the appropriate document type and press the Edit button.

⚠️ Important: If you do not have access rights to the folder where the framework (on page 2794) files are stored, you can either elevate read/write permissions on that framework folder or you can extend the framework and customize the CSS stylesheets in the extension. If you want to share the customized extension with the rest of your team, see Sharing the Extended Framework (on page 1942).

The CSS styles (CSS files) associated with the particular document type are listed in the CSS subtab (on page 100) of the Author tab.

Figure 479. Main and Alternate CSS Styles in the Document Type Configuration Dialog Box
You can Add, Edit, or Delete styles from this dialog box to manage the main (on page 2796) and alternate (on page 2791) styles associated to the particular document type. You can also change the order of the styles by using the Move Up and Move Down buttons. This will also change the order that they appear in the Styles drop-down menu. The alternate styles are combined with the main CSS sequentially, in the order that they appear in this list. Therefore, if the same style rules are included in multiple CSS files, the rules that are defined in the last alternate style in this list will take precedence, since it is the last one to be combined (applied as a layer).

The URI column shows the path of each CSS file. The names listed in the Styles drop-down menu match the values in the Title column. The value in the Alternate column determines whether it is a main or alternate CSS. If the value is no it is a main CSS. If the value is yes it is an alternate CSS and the style can be combined with a main CSS or other alternate styles when using the Styles drop-down menu.

Note: To group alternate styles into categories (submenus), use a vertical bar character (|) in the Title column. You can use multiple vertical bars for multiple submenus. The text before each vertical bar will be rendered as the name of a submenu entry in the Styles drop-down menu, while the text after the final vertical bar will be rendered as the name of the style inside the submenu.
Example: Suppose that you want to add two alternate stylesheets in separate submenus, with the Title column set to My Styles|User Assistance|Hints and My Styles|User Actions|Inline Actions, respectively.

Oxygen XML Author will add a My Styles submenu with two submenus (User Assistance that contains the Hints style, and User Actions that contains the Inline Actions style) in the Styles drop-down menu.

The Enable multiple selection of alternate CSSs checkbox (on page 101) at the bottom of the pane must be selected for the alternate CSS styles (on page 2791) to be combined. They are applied like layers and you can activate any number of them. If this option is not selected, the alternate styles are treated like main CSS styles (on page 2796) and you can only select one at a time. By default, this option is selected. There are also a few options that allow you to specify how to handle the CSS if there are CSS styles specified in the document. You can choose to ignore or merge them.

The following rules apply for merging CSS styles:

- CSS files with the same title will be merged.
- CSS files without a title will contribute to all others.
- They are merged sequentially, in the order that they appear in the list.

Using the Styles Drop-down Menu

You can use the Styles drop-down menu to select a main css style (on page 2796) that applies to the whole document and then select one or more alternate css styles (on page 2791) that behave like layers and are merged sequentially with the main style. Each of the styles that are listed in this drop-down menu have a corresponding CSS file that defines how your documents are rendered in Author mode and in the output. Also, the selections from this drop-down menu are persistent, meaning that Oxygen XML Author will remember them when subsequent documents are opened.

Main CSS Style

The main styles are listed in the top section and each of their corresponding CSS files are primarily used to render basic things such as the font and background of the document. You can only select one main style at a time.

Alternate CSS Styles
The *alternate styles* are listed in the bottom section and their corresponding CSS files are used to render numerous different types of things in the document as they are merged with the selected *main styles*. You can select as many alternate styles as you wish. If you are unsure about how each of the styles will change the look of your documents based solely upon their name, there is no harm in selecting them to see the difference. You can simply deselect them to revert to the previous look.

**Note:** If you deselect the **Enable multiple selection of alternate CSSs** option (on page 101) in the **CSS** subtab of the **Document Type configuration dialog box** (on page 94), the *alternate styles* are treated like *main CSS styles* and you can only select one at a time.

**EXAMPLE: CSS Styles in DITA**

Oxygen XML Author comes with a set of built-in CSS layer stylesheets for DITA documents (as well as some that are specifically for *DITA maps* (on page 2793)). In the subsequent figure, a DITA document has the *Century* style selected for the *main CSS style* and the *alternate styles Full width*, *Show table column specification*, *Hints*, and *Inline actions* are combined for additive styling to specific parts of the document.

**Tip:** The *Hints* style displays tooltips throughout DITA documents that offer additional information to help you with the DITA structure. The *Inline actions* style displays possible elements that are allowed to be inserted at various locations throughout DITA documents.

Figure 480. Styles Drop-down Menu in a DITA Document
Customizing the Content Completion Assistant

Oxygen XML Author gathers information from the associated schemas (DTDs, XML Schema, RelaxNG) to determine the proposals that appear in the Content Completion Assistant (on page 2792). Oxygen XML Author also includes support that allows you to customize the Content Completion Assistant to suit your specific needs.

There are two ways to customize the Content Completion Assistant in Oxygen XML Author:

- You can add, modify, or remove actions that are proposed for each particular document type (framework) by using the Content Completion subtab in the Document Type Association configuration dialog box (on page 116). To access this subtab, open the Preferences dialog box (Options > Preferences) (on page 79), go to Document Type Association, use the New, Edit, Duplicate, or Extend button (on page 92), click on the Author tab, and then the Content Completion subtab.
- You can use a cc_config.xml configuration file that is specific to each document type (framework) to configure the values that are proposed in certain contexts, to customize the attributes or elements that are proposed, or to customize how certain aspects of the proposals are rendered in the interface. The rest of the topics in this section explain how you can use this configuration file to customize the content completion.

Configuring the Proposals for Elements and Attributes

There are many cases where elements have a relaxed content model and can accept a large number of child elements. For example, the DITA list item element (li) accepts more than 60 child elements. Oxygen XML Author includes support to allow the content architect to put some constraints on the possible elements or attributes, or to impose some best practices in the way content is edited.

For an example of a specific use-case, suppose that you want to restrict DITA list item elements (li) to only accept paragraph elements (p). In this case, the Content Completion Assistant (on page 2792) should not offer any element other than a paragraph (p) when a list item (li) is inserted into a document. It would also be helpful if the required child element (p) was automatically inserted whenever a list item (li) is inserted.
One method of changing the content model is to alter the element definition in the associated schema (XML Schema, DTD, RelaxNG), but this may be quite complicated in some cases. Fortunately, Oxygen XML Author offers a simple, alternative method of using a configuration file to customize the content completion proposals for each element.

**Setting up the Content Completion Configuration File**

To customize the configuration file for the *Content Completion Assistant* (on page 2792), follow these steps:

1. Create a new `resources` folder (if it does not already exist) in the `frameworks` directory for the particular document type (for example, `OXYGEN_INSTALL_DIR/frameworks/dita/resources`).

2. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Document Type Association. Select the particular document type, click the Edit button, and in the Classpath tab (on page 98) add a link to that `resources` folder (if it does not already exist).

3. Create a new configuration file or edit an existing one.
   a. To easily create a new configuration file, you can use the Content Completion Configuration document template that is included in Oxygen XML Author (File > New > Framework templates > Oxygen Extensions > Content Completion Configuration). The document template includes details about how each element and attribute is used in the configuration file.
   b. If a configuration file (`cc_config.xml`) already exists for the particular document type (in the `resources` folder), you can modify this existing file.

4. Make the appropriate changes to your custom configuration file.

5. Save the file in the `resources` folder for the particular document type, using the fixed name: `cc_config.xml` (for example, `OXYGEN_INSTALL_DIR/frameworks/dita/resources/cc_config.xml`).

6. Restart the application and open an XML document. In the Content Completion Assistant you should see your customizations.

   **Tip:** In some cases, you can simply use the **Refresh (F5)** action to test your customizations, without having to restart the application.

**Configuring Elements or Attributes that are Proposed for Each Element**

For the purposes of customizing the elements or attributes that are proposed for each individual element, the configuration file (`cc_config.xml`) uses `elementProposals` elements. This element allows you to customize or filter the child elements and attributes for an element.
**Warning:** Note that you can only choose elements or attributes that are already allowed by the schema in a particular context. For example, you cannot specify an element that is not allowed by the schema as a child of a particular node.

**Elements:**

To control the elements that are proposed for an element, you can use the following attributes for the `elementProposals` element:

- **path** - A path within the document that matches the element that will have its content completion proposals changed. For example, "title" matches all the `title` elements in the document, while "chapter/title" matches only the `title` elements that are direct children of the `chapter` element. You can use simplified forms of XPath in this attribute.

The XPath expressions can accept multiple attribute conditions and inside each condition you can use `AND/OR` boolean operators and parentheses to override the priority.

You can use one or more of the following attribute conditions (default attribute values are not taken into account):

- `element[@attr]` - Matches all instances of the specified element that include the specified attribute.
- `element[not(@attr)]` - Matches all instances of the specified element that do not include the specified attribute.
- `element[@attr = "value"]` - Matches all instances of the specified element that include the specified attribute with the given value.
- `element[@attr != "value"]` - Matches all instances of the specified element that include the specified attribute and its value is different than the one given.

**Example:** The following are examples of how you could use multiple boolean operators and parentheses inside an attribute condition:

```
*[@a and @b or @c and @d]
*[@a and (@b or @c) and @d]
```

The following are just examples of how simplified XPath expressions might look like:

- `elementName`
- `//elementName`
- `/elementName1/elementName2/elementName3`
- `//xs:localName`

**Note:** Using a namespace prefix requires that you declare it in the configuration file. For example:

```xml
<elementProposals xmlns:db5="http://docbook.org/ns/docbook"
                   path="db5:listitem" insertElements="db5:para" />
```
- `//xs:documentation[@lang="en"]`
Note: If the *path* attribute is missing, the customization will apply to the proposals for all elements. You can intentionally omit this attribute and use *possibleElements* (on page 1926) or *rejectElements* (on page 1926) to specify or restrict particular elements for a *framework* (on page 2794).

For example, suppose that in your DITA documents, you want to restrict your users from using `image` and `fig` elements because you do not want images to be included in your output. The configuration file should look like this:

```
<elementProposals rejectElements="image fig" />
```

Since the *path* attribute is missing, the specified element will be filtered out from the proposals for the entire *framework*.

- **insertElements** - A space-separated sequence of child element names. Each time the element specified in the *path* attribute is inserted into the document, these child elements will also be inserted in the order that they are listed. For example, `insertElements="b i"` will insert exactly one `b` element, followed by an `i` element. An empty value ("" ) means that no child elements should be inserted.

  Note: If this attribute is missing, the default required child elements will be inserted, as specified in the associated schema for the document.

- **possibleElements** - A space-separated list of element names that will be shown in the content completion list when invoked inside an element that is specified in the *path* attribute. For example, "b i codeph ph" means that the *Content Completion Assistant* will contain these four elements when invoked on the element specified in the *path* attribute. The following other possible values are also supported:
  - **NONE** - There will be no proposals in the content completion list.
  - **ALL** - All the possible elements specified in the associated schema will be presented in the content completion list. This is also the default behavior if this attribute is missing.
  - **INSERTED** - The proposals will be the same list of elements that are defined in the `insertElements` attribute.

When using this attribute to specify multiple elements, only use one entry with the element names separated by a space:

```
<elementProposals possibleElements="b i codeph ph" />
```

- **rejectElements** - A space-separated list of element names that will be filtered out from the list of proposals that are presented in the content completion list. Each time the element specified in the *path* attribute is inserted into the document, the list of proposals in the *Content Completion Assistant* will include the entries that are defined in the associated schema, minus the elements specified in this attribute.
This setting also influences copy/paste and insertion behaviors. For example, if you reject the insertions of images in paragraphs and you try to paste an image inside a paragraph, by default the application will take your choice into account and try to insert the image in a place where it is allowed.

When using this attribute to specify multiple elements, only use one entry with the element names separated by a space:

```xml
<elementProposals rejectElements="image fig imemap foreign"/>
```

Attributes:

To control the attributes that are proposed for an element, you can use the following attributes for the `elementProposals` element:

- **path** - A path within the document that matches the element that will have its attribute proposals changed. For example, "title" matches all the `title` elements in the document, while "chapter/title" matches only the `title` elements that are direct children of the `chapter` element. You can use simplified forms of XPath in this attribute. For examples of such forms of XPath expressions, see the note in XML Preferences (on page 159).

  **Note:** If this attribute is missing, the customization will apply to the proposals for all elements. You can intentionally omit this attribute and use `possibleAttributes` (on page 1928) or `rejectAttributes` (on page 1928) to specify or restrict attributes for an entire framework.

For example, suppose that you only want to allow a limited set of attributes in a customized framework. The configuration file should look like this:

```xml
<elementProposals possibleAttributes="id domains href scope format type conref props keyref class"/>
```

Since the `path` attribute is missing, this applies to the entire framework and only the specified attributes will be proposed.

- **insertAttributes** - A space-separated sequence of attribute names that will be inserted along with the element.

```xml
<elementProposals path="ol/li" insertAttributes="product platform"/>
```

- **insertAttribute** - This is similar to the preceding attribute, but this one also allows you to specify a value for the attribute that will be inserted. This attribute should be used like this:

```xml
<elementProposals path="ol/li">
  <insertAttribute name="platform" value="test"/>
</elementProposals>
```
• **possibleAttributes** - A space-separated list of attribute names that will be shown in the content completion list when invoked inside an element that is specified in the `path` attribute. When using this attribute to specify multiple attributes, only use one entry with the attribute names separated by a space:

```xml
<elementProposals possibleAttributes="scope format type" />
```

• **rejectAttributes** - A space-separated list of attribute names that will be filtered out from the list of proposals that are presented in the content completion list. Each time the element specified in the `path` attribute is inserted into the document, the list of proposals in the Content Completion Assistant will include the entries that are defined in the associated schema, minus the attributes specified in this attribute. When using this attribute to specify multiple attributes, only use one entry with the attribute names separated by a space:

```xml
<elementProposals rejectAttributes="importance platform product" />
```

### Other Important Notes About the Configuration File

**Important:**

- By default, the element names that do not have a namespace prefix are considered from `no-namespace`. Consider declaring the namespace mapping on the root of the configuration file and prefixing the element names from the `elementPath` and `model` attributes.
- This configuration file only affects the content completion assistance. It has no effect on validation or operations invoked from other areas in the interface (such as the toolbar or menus).
- To test the effects of your changes, you should restart the application, although in some cases, you can simply use the **Refresh (F5)** action to test your customizations.
- When an XML element from the document is matched against a list of configured `elementProposals`, the first one in sequence takes precedence. Therefore, make sure you place the more specific `elementProposals` (those with a longer path) first in your configuration file.
- Regular expression patterns can be used in the following attributes: `possibleElements`, `rejectElements`, `possibleAttributes`, and `rejectAttributes`. For example, `code*`, `*block`, `con*ref`, `_*`.
- Only simple recursion cases are detected and avoided by the editor, and logged to the console. Therefore, if `complex elementProposals` patterns are defined, you should avoid *infinite recursions.*
Examples: Configuring the Element Proposals

- **Example 1: Automatically Insert Elements**

  Suppose that you want to automatically insert a paragraph element (p) whenever a DITA ordered list item element (ol/li) is inserted, and also to not allow any other element besides a paragraph inside the ordered list items.

  To achieve this, the configuration file should include the following:

  ```xml
  <elementProposals path="ol/li" insertElements="p"
                  possibleElements="_INSERTED_"/>
  ```

  **Tip:** This particular example modifies an action that inserts a list in a DITA document. There are several ways to invoke this action in the interface. For example, there is a toolbar button and an action in the DITA menu that inserts a list. However, since the configuration file only affects the Content Completion Assistant, this modification will have no effect on the behavior of the toolbar or menu action. Those actions would need to be configured separately if you want the result to be the same as the content completion proposal. For more information, see Configuring Actions, Menus, Toolbars, Content Completion for a Framework (on page 1894).

- **Example 2: Insert Complex Element Structure**

  For a more complex example, suppose that you want to insert a complex structure whenever a DITA prolog element is inserted.

  For instance, if you need to insert the following structure inside prolog elements:

  ```xml
  <prolog>
    <author/>
    <metadata>
    <keywords>
      <keyword/>
      <keyword/>
    </keywords>
    </metadata>
  </prolog>
  ```

  The configuration file should include the following:

  ```xml
  <elementProposals path="prolog" insertElements="author metadata"/>
  <elementProposals path="prolog/metadata" insertElements="keywords"/>
  <elementProposals path="prolog/metadata/keywords"
                    insertElements="keyword, keyword"/>
  ```
Example 3: Limit Possible Elements

Suppose that you also want to limit the proposals for the keywords element to only allow the user to insert audience or keyword elements. The configuration file should include the following:

```xml
<elementProposals path="prolog/metadata" insertElements="keywords"
    possibleElements="audience keywords"/>
```

Suppose that you want to simply restrict your users from inserting image elements inside DITA list item elements (li), but still propose all the other elements that are defined in the associated schema. The configuration file should look like this:

```xml
<elementProposals path="li" rejectElements="image"/>
```

Examples: Configuring the Attributes Proposals

Example 1: Automatically Insert Attributes

Suppose that you want to insert an id attribute (with an empty value) whenever a DITA list item element (li) is inserted. The configuration file should include the following:

```xml
<elementProposals path="li" insertAttributes="id"/>
```

Example 2: Limit Possible Attributes

Suppose that you also want to limit the number of choices for attributes that are presented to the user whenever a DITA list item element (li) is inserted. The configuration file should look like this:

```xml
<elementProposals path="li" insertAttributes="id"
    possibleAttributes="id product platform audience"/>
```

Suppose that you want to simply restrict your users from inserting conref attributes inside DITA topics (topic element), but still propose all the other attributes that are defined in the associated schema. The configuration file should look like this:

```xml
<elementProposals path="topic" rejectAttributes="conref"/>
```

Related Information:

- Configuring the Proposals for Attribute and Element Values (on page 1931)
Configuring the Proposals for Attribute and Element Values

Oxygen XML Author includes support for configuring the proposed values that appear in the Content Completion Assistant (on page 2792). To do so, a configuration file is used, along with the associated schema, to add or replace possible values for attributes or elements that are proposed in the Content Completion Assistant.

For an example of a specific use-case, suppose that you want the Content Completion Assistant to propose several possible values for the language code when you use an xml:lang attribute.

Setting up the Content Completion Configuration File

To customize the configuration file for the Content Completion Assistant (on page 2792), follow these steps:

1. Create a new resources folder (if it does not already exist) in the frameworks directory for the particular document type (for example, OXYGEN_INSTALL_DIR/frameworks/dita/resources).
2. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Document Type Association. Select the particular document type, click the Edit button, and in the Classpath tab (on page 98) add a link to that resources folder (if it does not already exist).
3. Create a new configuration file or edit an existing one.
   a. To easily create a new configuration file, you can use the Content Completion Configuration document template that is included in Oxygen XML Author (File > New > Framework templates > Oxygen Extensions > Content Completion Configuration). The document template includes details about how each element and attribute is used in the configuration file.
   b. If a configuration file (cc_config.xml) already exists for the particular document type (in the resources folder), you can modify this existing file.
4. Make the appropriate changes to your custom configuration file.
5. Save the file in the resources folder for the particular document type, using the fixed name: cc_config.xml (for example, OXYGEN_INSTALL_DIR/frameworks/dita/resources/cc_config.xml).
6. Restart the application and open an XML document. In the Content Completion Assistant you should see your customizations.

Tip: In some cases, you can simply use the Refresh (F5) action to test your customizations, without having to restart the application.
### Configuring Proposed Values

For the purposes of adding or replacing the values that are proposed, the configuration file (cc_config.xml) includes a series of match instructions that will match an element or attribute name. You also have the possibility of using an attribute called editable on the match element to specify the editable state of the attribute values, as reflected in the Attributes view (on page 412) and the In-place Attributes Editor (on page 415). The possible values for the editable attribute are:

- **true** - The attribute values can be edited by choosing from a combo box or manually providing a value.
- **false** - The attribute values cannot be edited.
- **onlyAllowedItems** - The attribute values can be edited, but only by choosing from a list of proposed values, in a non-editable combo box.

A new value is specified inside one or more item elements, which are grouped inside an items element. The behavior of the items element is specified with the help of the action attribute, which can have any of the following values:

- **append** - Adds new values to appear in the proposals list (default value).
- **addIfEmpty** - Adds new values to the proposals list only if no other values are contributed by the schema.
- **replace** - Replaces the values contributed by the schema with new values to appear in the proposals list.

The values in the configuration file can be specified either directly or by calling an external XSLT file that will extract data from an external source.

### Other Important Notes About the Configuration File

**Important:**

- This configuration file only affects the content completion assistance, not validation.
- To test the effects of your changes, you should restart the application.

### Example: Specifying Values Directly

If you want to specify the values directly, the configuration file should look like this:

```xml
<match elementName="lg" elementNS="http://www.oxygenxml.com/ns/samples">
  <!-- Replaces the values for an element with the local name "lg", from the given namespace -->
</match>
```
Example: Calling an External XSLT Script

If you want to collect values from an external XSLT script, the configuration file should include something like this:

```xml
<xslt href="../xsl/get_values_from_db.xsl" useCache="false" action="replace"/>
```

In this example, the `get_values_from_db.xsl` is executed to extract values from a database.

Tip: You can use `xsl:message` as a debugging mechanism. These messages are presented in the results area at the bottom of the application whenever the Content Completion Assistant is invoked.

Note: A comprehensive XSLT sample is included in the Content Completion Configuration document template (in the Framework Templates > Oxygen Extensions section of the New document wizard (on page 619)).

Configuring Proposed Values in the Context Where the Content Completion was Invoked

Web Author Customization Note: This particular scenario is not supported for an Oxygen XML Web Author customization.

A more complex scenario is if you want to choose the possible values to propose, depending on the context of the element in which the content completion was invoked.
Suppose that you want to propose certain possible values for one property (for example, *color*) and other values for another property (for example, *shape*). If the property represents a color, then the values should represent applicable colors, while if the property represents a shape, then the values should represent applicable shapes. See the following code snippets:

**Your main document:**

```xml
<sampleArticle>
  <!-- The possible values for @value should be "red" and "blue" -->
  <property name="color" value=""/>
  <!-- The possible values for @value should be "square" and "rectangle" -->
  <property name="shape" value=""/>
</sampleArticle>
```

**The content completion configuration file:**

```xml
<config xmlns="http://www.oxygenxml.com/ns/ccfilter/config">
  <match elementName="property" attributeName="value">
    <xslt href="get_values.xsl" useCache="false" action="replace"/>
  </match>
</config>
```

**The stylesheet that defines the possible values based on the context of the property on which the content completion was invoked:**

```xml
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
                 xmlns:xs="http://www.w3.org/2001/XMLSchema"
                 xmlns:saxon="http://saxon.sf.net/"
                 exclude-result-prefixes="xs"
                 version="2.0">

  <xsl:param name="documentSystemID" as="xs:string"/>
  <xsl:param name="contextElementXPathExpression" as="xs:string"/>

  <xsl:template name="start">
    <xsl:apply-templates select="doc($documentSystemID)"/>
  </xsl:template>

  <xsl:template match="/">
    <xsl:variable name="propertyElement">
      <xsl:variable name="propertyElement" select="saxon:eval(saxon:expression($contextElementXPathExpression, ./*))"/>
    </xsl:variable>
  </xsl:template>

</xsl:stylesheet>
```
The `contextElementXPathExpression` parameter will be bound to an XPath expression that identifies the element in the context for which the content completion was invoked.

### Related Information:

- Configuring the Proposals for Elements and Attributes (on page 1923)
- Customizing the Rendering of Elements (on page 1935)

### Customizing the Rendering of Elements

In addition to the support for configuring the proposals that appear in the Content Completion Assistant (on page 2792), Oxygen XML Author also includes support for customizing how the elements are rendered. You can do this by using the `XMLNodeRendererCustomizer` API extension (on page 2002), but you can also use the same configuration file that is used to configure the content completion proposals.

For an example of a specific use-case, suppose that in DITA you want the names of paragraph elements (\texttt{p}) to be rendered as "Paragraph" instead of "p" in the various components in Author mode (such as in the Outline view (on page 334), Elements view (on page 418), Attributes view (on page 412), and the breadcrumb navigation bar). To achieve this, you can use the `elementRenderings` element in the configuration file.

### Setting up the Content Completion Configuration File

To customize the configuration file for the Content Completion Assistant (on page 2792), follow these steps:
1. Create a new `resources` folder (if it does not already exist) in the `frameworks` directory for the particular document type (for example, `OXYGEN_INSTALL_DIR/frameworks/dita/resources`).

2. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Document Type Association. Select the particular document type, click the Edit button, and in the Classpath tab (on page 98) add a link to that `resources` folder (if it does not already exist).

3. Create a new configuration file or edit an existing one.
   a. To easily create a new configuration file, you can use the Content Completion Configuration document template that is included in Oxygen XML Author (File > New > Framework templates > Oxygen Extensions > Content Completion Configuration). The document template includes details about how each element and attribute is used in the configuration file.
   b. If a configuration file (`cc_config.xml`) already exists for the particular document type (in the `resources` folder), you can modify this existing file.

4. Make the appropriate changes to your custom configuration file.

5. Save the file in the `resources` folder for the particular document type, using the fixed name: `cc_config.xml` (for example, `OXYGEN_INSTALL_DIR/frameworks/dita/resources/cc_config.xml`).

6. Restart the application and open an XML document. In the Content Completion Assistant you should see your customizations.

   **Tip:** In some cases, you can simply use the Ctrl Refresh (F5) action to test your customizations, without having to restart the application.

### Changing the Rendering of Elements (Their Names, Annotations, and Icons)

For the purposes of customizing how the content completion elements are rendered, you can use the `render` element inside a `elementRenderings` element to specify how element names, their annotations, and their icons are rendered.

The `elementRenderings` element supports the `platform` attribute, which can have one of the following values:

- `webapp`
  
  The element renderings are only applied to Oxygen XML Web Author.

- `standalone`
  
  The element renderings are only applied to standalone distributions of Oxygen.

- `eclipse`
  
  The element renderings are only applied to Eclipse plugin distributions of Oxygen.
**Note:** If the `platform` attribute is missing, the element renderings are applied to all types of distributions.

You can use the following attributes for the `render` element:

- **element**
  Identifies the element to be customized, in the form of a qualified name. If it does not have a prefix, it is considered to be from `noNamespace`.

- **as**
  Provides the name (label) that will be displayed for the element in various components in Author mode (the Content Completion Assistant, the breadcrumb navigation bar, the Full Tags display mode (on page 427), and the Outline (on page 334), Elements (on page 418), and Attributes (on page 412) views). This attribute is optional. If it is missing, the name of the element is used.

If you want to translate this label into another language, use the `${i18n(key_name)}` editor variable (on page 272). The following code snippet shows how the DITA paragraph elements (`p`) can be translated:

```xml
<elementRenderings>
  <render element="p" as="${i18n(cc_p)}"/>
</elementRenderings>
```

**Note:** The `cc_p` id is a key that identifies the translations available for the paragraph element.

- **iconPath**
  Optional attribute that specifies the icon for the element. This is shown in the Content Completion Assistant and the Outline view (on page 334) in Author mode. If it is a relative path, the full path of the icon image file will be computed starting from the directory of the configuration file (for example, a value of "myImg.png" will cause Oxygen XML Author to load "frameworks/${framework}/resources/myImg.png"). If you want to access a built-in resource, the value can begin with a forward slash "/", and the image file will be searched for in the Oxygen XML Author classpath resources (for example, "/images/OrderedList16.png" will load an icon from the built-in Oxygen XML Author JAR file resources.

- **xml:lang** (Deprecated)
  It is recommended to use the `${i18n(key_name)}` editor variable (on page 272) instead. Optional attribute that could be used to render the same element differently, depending on the language. If there are multiple `render` elements for the same element attribute (element name) and the `xml:lang` attribute is missing on one of them, that one will
be considered the default fallback value to be used if none of the others match the language specified in the interface.

**Note:** The default entry should be listed first, since the application tries to match them in sequence and the last match found is the one that is used.

For example, suppose that you want the name of DITA paragraph elements (p) to be rendered as "Paragraphe" if the language is French, "Absatz" if the language is German, and "Paragraph" if the language is English (or any other language). Your configuration file should look something like this:

```xml
<elementRenderings>
  <render element="p" as="Paragraph"/>
  <render element="p" as="Paragraphe" xml:lang="fr"/>
  <render element="p" as="Absatz" xml:lang="de"/>
</elementRenderings>
```

You can also use the configuration file to customize the annotations for elements. For this purpose, the render element also accepts the following element to change the tooltip annotations for an element (in both Author mode and Text mode):

```xml
annotation
  This element can be used within the render element to customize the tooltip annotations that are displayed for the element in various components in Author mode (such as tooltips shown in the Content Completion Assistant documentation window, the breadcrumb navigation bar, the Full Tags display mode (on page 427), and the Outline (on page 334), Elements (on page 418), Attributes (on page 412) views), as well as the tooltips that are displayed when you hover over elements in Text mode. You can use HTML content to style the annotations (see the example below (on page 1939)).

**Note:** If this element is missing, the styling for the annotations for that element is collected from the associated schema (on page 867).

**Tip:** The annotations can also be translated in the configuration file. For example:
Other Important Notes About the Configuration File for Rendering Elements

⚠️ Important:

• This configuration file only affects the content completion assistance, not validation.
• To test the effects of your changes, you should restart the application, although in some cases, you can simply use the ⊛ Refresh (F5) action to test your customizations.
• If the framework (on page 2794) has an associated style guide, then the annotations defined in the configuration file will take precedence over those defined in the style guide. To check to see if your framework uses a style guide, look for the following folder: ${oXygenInstallDir}frameworks/${framework}/styleguide/. If that folder exists, it is recommended that you make your annotation changes directly in the style guide, rather than in the configuration file.
• If an XMLNodeRendererCustomizer API extension (on page 2002) has been implemented for the framework and a configuration file is also used, the rendering customization for an element will be the result of merging the two. For example, if the XMLNodeRendererCustomizer implementation customizes the element name, while the configuration file specifies an icon for the element, the properties of both customizations will be rendered. However, if both implementations define the same property (for example, both specify the rendering of an element name), the customizations defined in the configuration file take precedence.
• The rendering customizations defined in the configuration file also apply to aspects of the Oxygen XML Web Author interface.

Example: Changing the Rendering of an Element

Suppose that you want to render the name of the DITA title element to begin with a capital letter, use a custom icon for it, and provide specific documentation for that element in the various components in Author mode. The configuration file should look like this:

```xml
<elementRenderings>
  <render element="title" as="Title" iconPath="cimg/AcceptAll16.png">
    <annotation>
      <html xmlns="http://www.w3.org/1999/xhtml">
        <head>
          <title>Documentation for the Title Element</title>
        </head>
        <body>
          <p>A <i>heading</i> or <b>label</b> for the main parts of a topic</p>
        </body>
      </html>
    </annotation>
  </render>
</elementRenderings>
```
Customizing Annotations in the Content Completion Assistant

Oxygen XML Author gathers documentation from the associated schemas (DTD, XML Schema, RelaxNG) and presents it for each element or attribute. For example, if you open the Content Completion Assistant (on page 2792) for a recognized XML vocabulary, documentation is displayed for each element provided by the associated schema. Similar information is displayed when you hover over tag names presented in the Elements view (on page 418). If you hover over attributes in the Attributes view (on page 412) you also see information about each attribute, gathered from the same schema.

If you have a framework configuration (on page 94) set up for your XML vocabulary, there is a special XML configuration file that can be added to provide additional documentation information or links to additional information for certain elements and attributes.

To provide this additional information in the Content Completion Assistant, follow these steps:

1. Create a new folder in the configuration directory for the document type.

   Example: OXYGEN_INSTALL_DIR/frameworks/dita/styleguide

2. Use the New document wizard to create a file using the Content Completion Styleguide document template (in the Framework Templates > Oxygen Extensions section).

3. Save the file in the folder created in step 1, using the fixed name:
   contentCompletionElementsMap.xml.
4. Open the **Preferences** dialog box (**Options > Preferences**) (on page 79), go to **Document Type Association**, and edit the document type configuration for your XML vocabulary. Now you need to indicate where Oxygen XML Author will locate your mapping file by doing one of the following:
   - In the **Classpath** tab add a link to the newly created folder.
   - In the **Catalogs** tab add a new catalog file (on page 1064). The selected file needs to contain the following:

   ```xml
   <?xml version="1.0" encoding="UTF-8"?>
   <!DOCTYPE catalog PUBLIC "-//OASIS//DTD XML Catalogs V1.1//EN" "http://www.oasis-open.org/committees/entity/release/1.1/catalog.dtd">
   <catalog xmlns="urn:oasis:names:tc:entity:xmlns:xml:catalog">
     <uri name="http://www.oxygenxml.com/{processed_dt_name}/styleguide/contentCompletionElementsMap.xml" uri="contentCompletionElementsMap.xml"/>
   </catalog>
   ``

   where `{processed_dt_name}` is the name of the document type in lower case and with spaces replaced by underscores.

   **Note:** If Oxygen XML Author finds a mapping file in both locations, the one in the **Catalogs** tab takes precedence.

5. Make the appropriate changes to your custom mapping file.

   **Example:** You can look at how the DITA mapping file is configured: `OXYGEN_INSTALL_DIR/frameworks/dita/styleguide/contentCompletionElementsMap.xml`

   The associated XML Schema contains additional details about how each element and attribute is used in the mapping file.

6. Re-open the application and open an XML document.

   In the **Content Completion Assistant (on page 2792)**, you should see the additional annotations for each element.

**Translating Annotations**

Annotations in the Content Completion Assistant can be displayed in various languages. Based on the language set for the interface, Oxygen XML Author looks for several filename formats to determine the information to load for the content completion annotations. These files, that begin with the name `contentCompletionElementsMap`, are located in the `styleguide` folder for each built-in framework (for example, `OXYGEN_INSTALL_DIR/frameworks/dita/styleguide`).

For example, for English, the files are loaded in the following order (from specific to more general):
• `contentCompletionElementsMap_en_US.xml` or `contentCompletionElementMap_en_UK.xml`, and so on
• `contentCompletionElementsMap_en.xml`
• `contentCompletionElementsMap.xml`

If you want the annotations to be displayed in another language, you need to create similar files for the particular language. For example, to show annotations in German, create a file with one of the following names (and store it in the styleguide folder for your framework):

• `contentCompletionElementsMap_de_DE.xml`
• `contentCompletionElementsMap_de.xml`

Related Information:

• Customizing the Rendering of Elements (on page 1935)

Sharing a Custom Framework

You can create a custom framework by extending a built-in document type (on page 1893) (such as DITA or DocBook) using the Document Type Association preferences page (on page 92), make modifications to it, and then share the extension with your team.

**Sharing the Extended Framework**

There are several ways that you can share the extended custom framework (on page 1893) with others:

• Distribute the extended framework along with a project by following these steps:
  1. In a location where you have full write access, create a folder for your project.
  2. Go to the Project view (on page 320) and create a project. Save it in the folder you created in step 1.
  3. Create a custom framework by extending an existing one (on page 1893), if you haven't already done so, and copy the custom framework directory to the folder you created in step 1. Make sure your custom framework directory includes any resources that are referenced in your framework (CSS files, new document templates, schemas used for validation, catalogs, etc.).
  4. Go to Options > Preferences > Document Type Association > Locations (on page 93) and select Project Options (on page 2798) at the bottom of the page.
5. In the **Additional frameworks directories** list, add an entry using the `$(pd)` editor variable (on page 272) like this: `$(pd)/custom_frameworks`.

6. You can then share the new project directory with other users. For example, you can commit it to your version control system and have them update their working copy. When they open the customized project file in their Project view (on page 320), the new framework becomes available in the list of document types.

- Pack and deploy the extended framework as an add-on (on page 1943).
- Distribute the directory of the extended framework (on page 1893) to the other members of your team. They will simply copy that directory to their `/frameworks` directory. The new framework will be available in their list of document types when Oxygen XML Author starts.

To test the extended framework, the other members of your team can check the list of document types in the Document Type Association preferences page (on page 92) to see if the framework is present and if it appears before the built-in frameworks (meaning that it has higher priority).

**Packing and Deploying Frameworks as Add-ons**

**Packing a Framework as an Add-on**

This procedure is suitable for developers who want a better control over the add-on (on page 2797) package or those who want to automate some of the steps:

1. Pack the full custom framework (on page 1893) (or an extension of a framework) as a **ZIP** file or a **Java Archive** (on page 2795). Note that you should pack the entire root directory not just its contents.

2. Digitally sign the package. Note that you can perform this step only if you have created a Java Archive at the previous step. You will need a certificate signed by a trusted authority. To sign the JAR you can either use the `jarsigner` command-line tool inside Oracle's Java Development Kit. ([JDK_DIR]/bin/jarsigner.exe) or, if you are working with Apache Ant (on page 2791), you can use the `signjar` task (a front for the `jarsigner` command-line tool).

   **Note:** The benefit of having a signed add-on is that you can verify the integrity of the add-on issuer. If you do not have such a certificate you can generate one yourself using the `keytool` command-line tool. This approach is mostly recommended for tests since anyone can create a self signed certificate.

3. Create a descriptor file. You can use a template that Oxygen XML Author provides. To use this template, go to File > New and select the Oxygen add-ons update site template. Once deployed, this descriptor file is referenced as update site.

   Alternatively, you can use the Add-ons Packager plugin by following this procedure:
1. Install the **Add-ons Packager** plugin following the procedure described in Installing Add-ons *(on page 75)*.

2. Restart Oxygen XML Author. If the add-on is correctly installed, the **Add-ons packager** toolbar action is available.

3. Invoke the **Add-ons packager** toolbar action and input the required information in the displayed dialog box.

4. Press **OK** to complete the packaging process.

**Deploying an Add-on**

To deploy an add-on, copy the **ZIP** or **Java Archive (on page 2795)** file and the descriptor file to an HTTP server. The URL to this location serves as the **Update Site URL**.

**Framework Customization Tutorial**

This section contains topics meant to provide a general tutorial for customizing a **framework (on page 2794)**. It includes information about creating a basic document type association, some basic customizations, testing the configuration, packaging and deploying the custom framework, and more.

**Tip:** A sample framework customization package is available that you can dabble with and use to help you get started. It can be downloaded from: https://www.oxygenxml.com/php/get_oxygen_sample_framework.php. The package includes a sample CSS file, XSL file, schema files, document templates, an XML catalog file, custom icons, and other resources.

**Framework Customization Overview**

The most important elements of a document type customization are represented by an XML Schema to define the XML structure, the CSS to render the information and the XML instance template that links the first two together.

**XML Grammar**

To provide as-you-type validation and to compute valid insertion proposals, Oxygen XML Author needs an XML grammar (XML Schema, DTD, or Relax NG) associated to the XML. The grammar specifies how the internal structure of the XML is defined. For information about associating a schema and how Oxygen XML Author detects the schema, see Associating a Schema to XML Documents *(on page 1054)*.

Consider a use-case in which several users are testing a system and must send report results to a content management system. The customization should provide a visual editor for this type of document. The following XML Schema, `test_report.xsd` defines a report with results of a testing
session. The report consists of a title, few lines describing the test suite that was run, and a list of test results (each with a name and a boolean value indicating if the test passed or failed).

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema">
  <xs:element name="report">
    <xs:complexType>
      <xs:sequence>
        <xs:element ref="title"/>
        <xs:element ref="description"/>
        <xs:element ref="results"/>
      </xs:sequence>
    </xs:complexType>
  </xs:element>
  <xs:element name="title" type="xs:string"/>
  <xs:element name="description">
    <xs:complexType>
      <xs:sequence maxOccurs="unbounded">
        <xs:element name="line">
          <xs:complexType mixed="true">
            <xs:sequence minOccurs="0" maxOccurs="unbounded">
              <xs:element name="important" type="xs:string"/>
            </xs:sequence>
          </xs:complexType>
        </xs:element>
      </xs:sequence>
    </xs:complexType>
  </xs:element>
  <xs:element>
    <xs:sequence>
    </xs:complexType>
  </xs:element>
  <xs:element name="results">
    <xs:complexType>
      <xs:sequence maxOccurs="unbounded">
        <xs:element name="entry">
          <xs:complexType>
            <xs:sequence>
              <xs:element name="test_name" type="xs:string"/>
              <xs:element name="passed"/>
            </xs:sequence>
          </xs:complexType>
        </xs:element>
      </xs:sequence>
    </xs:complexType>
  </xs:element>
</xs:schema>
```
CSS Stylesheet

A set of rules must be defined for describing how the XML document is to be rendered in Author mode. This is done using Cascading Style Sheets (CSS). CSS is a language used to describe how an HTML or XML document should be formatted by a browser. CSS is widely used in the majority of websites.

The elements from an XML document are displayed in the layout as a series of boxes. Some of the boxes contain text and may flow one after the other, from left to right. These are called inline boxes. There are also other types of boxes that flow one below the other (such as paragraphs). These are called block boxes.

For example, consider the way a traditional text editor arranges the text. A paragraph is a block, because it contains a vertical list of lines. The lines are also blocks. However, blocks that contain inline boxes arrange its children in a horizontal flow. That is why the paragraph lines are also blocks, while the traditional "bold" and "italic" sections are represented as inline boxes.

The CSS allows us to specify that some elements are displayed as tables. In CSS, a table is a complex structure and consists of rows and cells. The table element must have children that have a table-row style. Similarly, the row elements must contain elements with a table-cell style.

To make it easy to understand, the following section describes how each element from a schema is formatted using a CSS file. Note that this is just one of infinite possibilities for formatting the content.

```css
report{
  display:block;
  margin:1em;
}
```

This element is the root element of a report document. It should be rendered as a box that contains all other elements. To achieve this the display type is set to block. Additionally, some margins are set for it. The CSS rule that matches this element is:
title

The title of the report. Usually titles have a large font. The block display is used so that the subsequent elements will be placed below it, and its font is changed to double the size of the normal text.

```html
title {
    display:block;
    font-size:2em;
}
```

description

This element contains several lines of text describing the report. The lines of text are displayed one below the other, so the description has the block display. Also, the background color is changed to make it standout.

```html
description {
    display:block;
    background-color:#EEEEFF;
    color:black;
}
```

line

A line of text in the description. A specific aspect is not defined and it just indicates that the display should be block style.

```html
line {
    display:block;
}
```

important

The `important` element defines important text from the description. Since it can be mixed with text, its display property must be set to inline. Also, the text is emphasized with bold to make it easier to spot.

```html
important {
    display:inline;
    font-weight:bold;
}
```
The `results` element displays the list of `test_names` and the results for each one. To make it easier to read, it is displayed as a `table`, with a green border and margins.

```css
results{
    display:table;
    margin:2em;
    border:1px solid green;
}
```

element

An item in the results element. The results are displayed as a table so the entry is a row in the table. Thus, the display is `table-row`.

```css
entry {
    display:table-row;
}
```

test_name, passed

The name of the individual test, and its result. They are cells in the results table with the display set to `table-cell`. Padding and a border are added to emphasize the table grid.

```css
test_name, passed{
    display:table-cell;
    border:1px solid green;
    padding:20px;
}
passed{
    font-weight:bold;
}
```

The full content of the CSS file `test_report.css` is:

```css
report {
    display:block;
    margin:1em;
}
description {
    display:block;
```
Figure 481. Report Rendered in **Author Mode**
XML Instance Template

Based on the XML Schema and CSS file Oxygen XML Author can help the content author in loading, editing, and validating the test reports. An XML document template must be created as a kind of skeleton that the users can use as a starting point for creating new test reports. The template must be generic enough and reference the XML Schema file and the CSS stylesheet.

This is an example:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<?xml-stylesheet type="text/css" href="test_report.css"?>
<report xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
   xsi:noNamespaceSchemaLocation="test_report.xsd">
  <title>Automated test report</title>
  <description>
    <line>This is the report of the test automatically ran. Each test suite is ran at 20:00h each day. Please <important>check</important> the failed ones!</line>
  </description>
  <results>
    <entry>
      <test_name>Database connection test</test_name>
      <passed>true</passed>
    </entry>
  </results>
</report>
```
The processing instruction `xml-stylesheet` associates the CSS stylesheet to the XML file. The `href` pseudo attribute contains the URI reference to the stylesheet file. In the example, the CSS is in the same directory as the XML file.

The next step is to place the XSD file and the CSS file on a web server and modify the template to use the HTTP URLs, like this:

```xml
<?xml version="1.0" encoding="UTF-8"?>
  <title>Test report title</title>
  <description>
      .......
  </description>
</report>
```

If you want to share the files with other team members, you could create an archive containing the `test_report.xml`, `test_report.css`, and `test_report.xsd` and send it to the other users.

Basic Tutorial: Creating and Configuring a Custom Framework

This basic tutorial is meant to provide an example of creating and configuring a custom document type (framework (on page 2794)). This basic tutorial offers examples for creating a custom schema, adjusting the authoring experience through custom CSS styling, and creating a custom action. For more advanced and other types of customizations, see the Advanced Framework Customization (on page 1893) section.
Step 1: Organize Framework Files

First, create a new folder for your customized framework. This folder will be used to store all files related to the documentation framework. The folder structure will look something like this:

```
oxygen
  frameworks
    sdf
      schema
      css
```

The frameworks directory is the container where all the Oxygen XML Author framework customizations are located. Each subdirectory contains files related to a specific type of XML documents (schemas, catalogs, stylesheets, CSS stylesheets, etc.) Distributing a framework means delivering a framework directory.

It is assumed that you have the right to create files and folders inside the Oxygen XML Author installation directory. If you do not have this right, you will have to install another copy of the program in a folder you have access to, the home directory for instance, or your desktop.

To test your framework distribution, copy it in the frameworks directory of the newly installed application and start Oxygen XML Author by running the provided start-up script files.

You should copy the created schema files abs.xsd and sdf.xsd, sdf.xsd being the master schema, to the schema directory and the CSS file sdf.css to the css directory.

Step 2: Extend an Existing Framework

The easiest way to create a custom framework (document type) is by extending an existing built-in framework, such as DITA or DocBook, and then making modifications to it.

1. Open the Preferences dialog box (Options > Preferences) and go to Document Type Association > Locations. Add the path to your custom framework directory in the Additional frameworks directories list and click OK or Apply to save your changes.
2. Go to the Document Type Association preferences page and select an existing framework configuration (for example, DocBook) and use the Extend button to create an extension for it.

   **Step Result:** This opens the Document Type Configuration dialog box where you can define the set of rules and settings for your custom framework.
3. Give the extension an appropriate name, select External for the Storage option, click the browsing button to specify the location of your custom framework directory.
4. Click OK to close the configuration dialog box and then OK or Apply to save your changes.

**Results:** You now have a fully functional framework that you can continue to customize.

**Step 3: Create a Custom XML Schema**

To illustrate an example of creating an XML Schema for a custom DocBook framework (on page 2794), suppose the documents are either articles or books, both composed of sections. The sections may contain titles, paragraphs, figures, tables, and other sections. To complete the picture, each section includes a def element from another namespace.

The first schema file:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xs:schema xmlns:xm="http://www.w3.org/2001/XMLSchema"
    targetNamespace="http://www.oxygenxml.com/sample/documentation"
    xmlns:doc="http://www.oxygenxml.com/sample/documentation"
    xmlns:abs="http://www.oxygenxml.com/sample/documentation/abstracts"
    elementFormDefault="qualified">
    <xs:import namespace="http://www.oxygenxml.com/sample/documentation/abstracts"
        schemaLocation="abs.xsd"/>
</xs:schema>
```

Next, the structure of the sections is defined. They all start with a title, then have the optional def element then either a sequence of other sections, or a mixture of paragraphs, images and tables.

```xml
<xs:element name="book" type="doc:sectionType"/>
<xs:element name="article" type="doc:sectionType"/>
<xs:element name="section" type="doc:sectionType"/>

<xs:complexType name="sectionType">
    <xs:sequence>
        <xs:element name="title" type="xs:string"/>
        <xs:element ref="abs:def" minOccurs="0"/>
        <xs:choice>
            <xs:sequence>
```

```xml
```
The paragraph contains text and other styling markup, such as bold (\textbf{}) and italic (\textit{}) elements.

```xml
<xs:element name="para" type="doc:paragraphType"/>
<xs:complexType name="paragraphType" mixed="true">
  <xs:choice minOccurs="0" maxOccurs="unbounded">
    <xs:element name="b"/>
    <xs:element name="i"/>
  </xs:choice>
</xs:complexType>
```

The image element has an attribute with a reference to the file containing image data.

```xml
<xs:element name="image">
  <xs:complexType>
    <xs:attribute name="href" type="xs:anyURI" use="required"/>
  </xs:complexType>
</xs:element>
```

The table contains a header row and then a sequence of rows (\textit{tr} elements) each of them containing the cells. Each cell has the same content as the paragraphs.

```xml
<xs:element name="table">
  <xs:complexType>
    <xs:sequence>
      <xs:element name="header">
        <xs:complexType>
          <xs:sequence>
            <xs:element name="td" maxOccurs="unbounded" type="doc:paragraphType"/>
          </xs:sequence>
        </xs:complexType>
      </xs:element>
    </xs:sequence>
  </xs:complexType>
</xs:element>
```
The `def` element is defined as a text only element in the imported schema `abs.xsd`:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema"
    targetNamespace="http://www.oxygenxml.com/sample/documentation/abstracts">
    <xs:element name="def" type="xs:string"/>
</xs:schema>
```

Now the XML data structure will be styled.

**Step 4: Associate the Schema to the Framework**

In the bottom section of the Document Type configuration dialog box (on page 94), there are a series of tabs. The Schema tab refers to the schema that is used for validation of the documents that match the defined association rules.
Important: If the document references a schema directly (for example, using a `DOCTYPE` declaration, `xsi:schemaLocation` attribute, or a Relax NG `xml-model` processing instruction), the schema defined in this Schema tab will not be used for validation or content completion.

**Schema Type**

Select from the combo box the value XML Schema.

**Schema URI**

Enter the value of the schema location (for example, `$\{frameworks\}/sdf/schema/sdf.xsd`). Use the `$\{frameworks\}` editor variable (on page 272) in the schema URI path instead of a full path to be valid for multiple Oxygen XML Author installations.

Important: The `$\{frameworks\}` variable is expanded at the time of validation into the absolute location of the directory containing the framework (on page 2794).

**Step 5: Create a Custom CSS**

If you read the Framework Customization Overview (on page 1944) then you already have some basic knowledge about creating simple styles. The example document contains elements from various namespaces, so you need to use CSS Level 3 extensions (supported by the Author mode layout engine) to associate specific properties with that element.

**Defining the General Layout**

Now the basic layout of the rendered documents is created.

Elements that are stacked one on top of the other are: book, article, section, title, figure, table, image. These elements are marked as having block style for display. Elements that are placed one after the other in a flowing sequence are: b, i. These will have inline display.

```css
// Vertical flow
book,
section,
para,
title,
image,
ref {
    display:block;
}

// Horizontal flow
b,i {
```
Important: Having block display children in an inline display parent results in Oxygen XML Author changing the style of the parent to block display.

Styling an Element

The title of any section must be bold and smaller than the title of the parent section. To create this effect, a sequence of CSS rules must be created. The * operator matches any element, it can be used to match titles having progressive depths in the document.

```css
title{
    font-size: 2.4em;
    font-weight: bold;
}
* * title{
    font-size: 2.0em;
}
* * * title{
    font-size: 1.6em;
}
* * * * title{
    font-size: 1.2em;
}
```

It is useful to have before the title a constant text, indicating that it refers to a section. This text can include also the current section number. The :before and :after pseudo elements will be used, plus the CSS counters.

First declare a counter named sect for each book or article. The counter is set to zero at the beginning of each such element:

```css
book,
article{
    counter-reset: sect;
}
```

The sect counter is incremented with each section, that is a direct child of a book or an article element.
The "static" text that will prefix the section title is composed of the constant "Section ", followed by the decimal value of the sect counter and a dot.

To make the documents easy to read, you add a margin to the sections. In this way the higher nesting level, the larger the left side indent. The margin is expressed relatively to the parent bounds:

Figure 482. A sample of nested sections and their titles.

In the above screenshot you can see a sample XML document rendered by the CSS stylesheet. The selection "avoids" the text that is generated by the CSS "content" property. This happens because the CSS generated text is not present in the XML document and is just a visual aid.
Styling Inline Elements

The "bold" style is obtained by using the `font-weight` CSS property with the value `bold`, while the "italic" style is specified by the `font-style` property:

```css
b {
    font-weight: bold;
}

i {
    font-style: italic;
}
```

Styling Images

The CSS 2.1 does not specify how an element can be rendered as an image. To overpass this limitation, Oxygen XML Author supports a CSS Level 3 extension allowing to load image data from a URL. The URL of the image must be specified by one of the element attributes and it is resolved through the catalogs specified in Oxygen XML Author.

```css
image{
    display: block;
    content: attr(href, url);
    margin-left: 2em;
}
```

The `image` element has the required attribute `href` of type `xs:anyURI`. The `href` attribute contains an image location so the rendered content is obtained by using the function:

```css
attr(href, url)
```

The first argument is the name of the attribute pointing to the image file. The second argument of the `attr` function specifies the type of the content. If the type has the `url` value, then Oxygen XML Author identifies the content as being an image. If the type is missing, then the content will be the text representing the attribute value.

Oxygen XML Author handles both absolute and relative specified URLs. If the image has an `absolute` URL location (for example: "http://www.oasis-open.org/images/standards/oasis_standard.jpg") then it is loaded directly from this location. If the image URL is `relative` specified to the XML document (for example: "images/my_screenshot.jpg") then the location is obtained by adding this value to the location of the edited XML document.
An image can also be referenced by the name of a DTD entity that specifies the location of the image file. For example, if the document declares an entity `graphic` that points to a JPEG image file:

```
<!ENTITY graphic SYSTEM "depo/keyboard_shortcut.jpg" NDATA JPEG>
```

and the image is referenced in the XML document by specifying the name of the entity as the value of an attribute:

```
<mediaobject>
  <imageobject>
    <imagedata entityref="graphic" scale="50"/>
  </imageobject>
</mediaobject>
```

The CSS should use the functions `url`, `attr` and `unparsed-entity-uri` for displaying the image in the `Author` mode:

```
imagedata[entityref]{
  content: url(unparsed-entity-uri(attr(entityref)));
}
```

To take into account the value of the `width` attribute of the `imagedata` and use it for resizing the image, the CSS can define the following rule:

```
imagedata[width]{
  width:attr(width, length);
}
```

Figure 483. Samples of images in Author
Step 6: Associate the Custom CSS to the Framework

Once you have customized your framework through CSS styling rules, you then need to associate the custom CSS file.

Step 7: Testing the Framework Customization

To test the new framework (on page 2794) customization, create an XML instance that conforms with the association rules that you specified in your framework customization. You will not specify an XML Schema location directly in the document, using an xsi:schemaLocation attribute. Instead, Oxygen XML Author will detect its associated document type and use the specified schema.

```xml
<book xmlns="http://www.oxygenxml.com/sample/documentation"
      xmlns:abs="http://www.oxygenxml.com/sample/documentation/abstracts">

  <title>My Technical Book</title>
  <section>
    <title>XML</title>
    <abs:def>Extensible Markup Language</abs:def>
    <para>In this section of the book I will explain different XML applications.</para>
  </section>
</book>
```

When trying to validate the document there should be no errors. Now modify the title to title2. Validate again. This time there should be as error.

Invalid content was found starting with element 'title2'. One of '{"http://www.oxygenxml.com/sample/documentation":title}'} is expected.

Undo the tag name change, go to Author mode, and Oxygen XML Author should load the CSS from the document type association (on page 2793) and create a layout similar to this:

Figure 484. Example: Testing a Framework Customization
Customizing Frameworks and Author Mode Using Extensions, Plugins, SDK

Advanced users can extend the functionality of custom frameworks and Author mode by using plugins (on page 2797), extensions, or the Oxygen SDK.

There is also an API Frequently Asked Questions section (on page 2203) that contains answers to common questions regarding API customizations.

Related Information:

- Extending Oxygen XML Author with Plugins (on page 2151)
- Oxygen XML Author Component (on page 2189)
- SDK Common Use Cases (on page 2203)

Configuring Frameworks and Author Mode through Extensions

You can add extensions (on page 2797) to your custom framework (on page 2794) (document type) by using the Extensions tab from the Document Type configuration dialog box (on page 94).

Note: It is possible for a plugin to share the same classes with a framework. For further details, go to How to Share the Classloader Between a Framework and a Plugin (on page 2182).

Configuring an Extensions Bundle

All extensions (on page 2797) that are provided by Oxygen XML Author are included in a single bundle.
Note: The individual extensions can still be set (open the Preferences dialog box (Options > Preferences) (on page 79), go to Document Type Association, double-click a document type, and go to the extension tab), and if present, they take precedence over the single provider. However, this practice is discouraged and the single provider should be used instead.

The extensions bundle is represented by the ro.sync.ecss.extensions.api.ExtensionsBundle class. The provided implementation of the ExtensionsBundle is instantiated when the Document Type Association (on page 2793) rules defined for the custom framework (on page 2794) matches a document opened in the editor. Therefore, references to objects that need to be persistent throughout the application running session must not be kept in the bundle because the next detection event can result in creating another ExtensionsBundle instance.

To configure an extensions bundle, follow this procedure:

1. Create a new Java project in your IDE. Create a lib folder in the Java project folder and copy in it the oxygen.jar file from the \{OXYGEN_INSTALL_DIR\}/lib folder.

2. Create the class (for example, simple.documentation.framework.SDFExtensionsBundle) to extend the abstract class ro.sync.ecss.extensions.api.ExtensionsBundle.
   
   For example:
   ```java
   public class SDFExtensionsBundle extends ExtensionsBundle {
   }
   ```

3. A Document Type ID and a short description should be defined first by implementing the methods getDocumentTypeID and getDescription. The Document Type ID is used to uniquely identify the current framework. Such an ID must be provided especially if options related to the framework need to be persistently stored and retrieved between sessions.
   
   For example:
   ```java
   public String getDocumentTypeID() {
   }

   public String getDescription() {
       return "A custom extensions bundle used for the Simple Document" + 
       "Framework document type";
   }
   ```

4. To be notified about the activation of the custom Author Extension in relation with an opened document, ro.sync.ecss.extensions.api.AuthorExtensionStateListener should be implemented. The activation and deactivation events received by this listener should be used to perform custom initializations and to register or remove listeners such as
ro.sync.ecss.extensions.api.AuthorListener, ro.sync.ecss.extensions.api.AuthorMouseListener, or ro.sync.ecss.extensions.api.AuthorCaretListener. The custom Author Extension state listener should be provided by implementing the `createAuthorExtensionStateListener` method. For example:

```java
public AuthorExtensionStateListener createAuthorExtensionStateListener() {
    return new SDFAuthorExtensionStateListener();
}
```

The `AuthorExtensionStateListener` is instantiated and notified about the activation of the framework when the rules of the Document Type Association match a document opened in the Author editing mode. The listener is notified about the deactivation when another framework is activated for the same document, the user switches to another mode or the editor is closed. A complete description and implementation of `ro.sync.ecss.extensions.api.AuthorExtensionStateListener` can be found in Implementing an Author Extension State Listener (on page 1977).

If Schema Aware mode (on page 135) is active in Oxygen XML Author, all actions that can generate invalid content will be redirected toward the `ro.sync.ecss.extensions.api.AuthorSchemaAwareEditingHandler`. The handler can resolve a specific case, let the default implementation take place, or reject the edit entirely by throwing an `ro.sync.ecss.extensions.api.InvalidEditException`. The actions that are forwarded to this handler include typing, delete, or paste.

See Handling Schema-Aware Editing Events (on page 2005) for more details about this handler.

5. Customizations of the content completion proposals are permitted by creating a schema manager filter extension. The interface that declares the methods used for content completion proposals filtering is `ro.sync.contentcompletion.xml.SchemaManagerFilter`. The filter can be applied on elements, attributes, or on their values. The `createSchemaManagerFilter` method is responsible for creating the content completion filter. A new `SchemaManagerFilter` will be created each time a document matches the rules defined by the Document Type Association that contains the filter declaration. For example:

```java
public SchemaManagerFilter createSchemaManagerFilter() {
    return new SDFSchemaManagerFilter();
}
```

A detailed presentation of the schema manager filter can be found in the Configuring a Content Completion Handler (on page 1970) section.
6. The **Author** mode supports link-based navigation between documents and document sections. Therefore, if the document contains elements defined as links to other elements (for example, links based on the `id` attributes), the extension should provide the means to find the referenced content. To do this, an implementation of the `ro.sync.ecss.extensions.api.link.ElementLocatorProvider` interface should be returned by the `createElementLocatorProvider` method. Each time an element pointed by a link needs to be located, the method is invoked.

For example:

```java
public ElementLocatorProvider createElementLocatorProvider() {
    return new DefaultElementLocatorProvider();
}
```

For more information on how to implement an element locator provider, see the Configuring a Link Target Element Finder (on page 1996) section.

7. The drag and drop functionality can be extended by implementing the `ro.sync.exml.editor.xmleditor.pageauthor.AuthorDnDListener` interface. Relevant methods from the listener are invoked when the mouse is dragged, moved over, or exits the **Author** editing mode, when the drop action changes, and when the drop occurs. Each method receives the `DropTargetEvent` containing information about the drag and drop operation. The drag and drop extensions are available in **Author** mode for both Oxygen XML Author Eclipse plugin and standalone application. The **Text** mode corresponding listener is available only for Oxygen XML Author Eclipse plugin. The methods corresponding to each implementation are: `createAuthorAWTDndListener`, `createTextSWTDndListener`, and `createAuthorSWTDndListener`.

```java
public AuthorDnDListener createAuthorAWTDndListener() {
    return new SDFAuthorDndListener();
}
```

For more details about the **Author** mode drag and drop listeners, see the Configuring a custom Drag and Drop Listener (on page 1972) section.

8. Another extension that can be included in the bundle is the reference resolver. For example, the references represented by the `ref` element and the attribute indicating the referenced resource is `location`. To be able to obtain the content of the referenced resources you will have to implement a Java extension class that implements `ro.sync.ecss.extensions.api.AuthorReferenceResolver`. The method responsible for creating the custom references resolver is `createAuthorReferenceResolver`. The method is called each time a document opened in an **Author** editing mode matches the **Document Type Association** where the extensions bundle is defined. The instantiated references resolver object is kept and used until
another extensions bundle corresponding to another document type is activated as result of the detection process. For example:

```java
public AuthorReferenceResolver createAuthorReferenceResolver() {
    return new ReferencesResolver();
}
```

A more detailed description of the references resolver can be found in the Configuring a References Resolver (on page 1973) section.

9. To be able to dynamically customize the default CSS styles for a certain `ro.sync.ecss.extensions.api.node.AuthorNode`, an implementation of `ro.sync.ecss.extensions.api.StylesFilter` can be provided. The extensions bundle method responsible for creating the `StylesFilter` is `createAuthorStylesFilter`. The method is called each time a document opened in an Author editing mode matches the Document Type Association where the extensions bundle is defined. The instantiated filter object is kept and used until another extensions bundle corresponding to another document type is activated as a result of the detection process. For example:

```java
public StylesFilter createAuthorStylesFilter() {
    return new SDFStylesFilter();
}
```

See the Configuring CSS Styles Filter (on page 1995) section for more details about the styles filter extension.

10. To edit data in custom tabular format, implementations of the `ro.sync.ecss.extensions.api.AuthorTableCellSpanProvider` and the `ro.sync.ecss.extensions.api.AuthorTableColumnWidthProvider` interfaces should be provided. The two methods from the ExtensionsBundle specifying these two extension points are `createAuthorTableCellSpanProvider` and `createAuthorTableColumnWidthProvider`. For example:

```java
public AuthorTableCellSpanProvider createAuthorTableCellSpanProvider() {
    return new TableCellSpanProvider();
}

public AuthorTableColumnWidthProvider createAuthorTableColumnWidthProvider() {
    return new TableColumnWidthProvider();
}
```
The two table information providers are not reused for different tables. The methods are called for each table in the document so new instances should be provided every time. Read more about the cell span and column width information providers in Configuring a Table Cell Span Provider (on page 1987) and Configuring a Table Column Width Provider (on page 1981) sections.

If the functionality related to one of the previous extension point does not need to be modified, then the developed ro.sync.ecss.extensions.api.ExtensionsBundle should not override the corresponding method and leave the default base implementation to return null.

11. An XML vocabulary can contain links to various areas of a document. If the document contains elements defined as links, you can choose to present a more relevant text description for each link. To do this, an implementation of the ro.sync.ecss.extensions.api.link.LinkTextResolver interface should be returned by the createLinkTextResolver method. This implementation is used each time the oxy_link-text() function (on page 2103) is encountered in the CSS styles associated with an element.

For example:

```java
public LinkTextResolver createLinkTextResolver() {
    return new DitaLinkTextResolver();
}
```

12. Pack the compiled class into a JAR (on page 2795) file.

13. Copy the JAR file into your custom framework directory (for example, frameworks/sdf).

14. Add the JAR file to the class path. To do this, open the Preferences dialog box (Options > Preferences) (on page 79), go to Document Type Association, select the document type (for example, SDF), press the Edit button, select the Classpath tab, and press the + Add button. In the displayed dialog box, enter the location of the JAR file relative to the Oxygen XML Author frameworks folder.

15. Register the Java class by going to the Extensions tab. Press the Choose button and select the name of the class (for example, SDFExtensionsBundle).

Note: The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Author website.
Adding a Custom Image Decorator for Author Mode

The AuthorImageDecorator extension point allows you to add a custom decorator over images in Author mode. For example, you could use it to add a message over an image informing the user that they can double-click the image to edit it.

How to Implement an AuthorImageDecorator

To implement your own AuthorImageDecorator, follow this procedure:

1. Implement the ro.sync.ecss.extensions.api.AuthorImageDecorator interface.
2. To instruct Oxygen XML Author to use this newly created implementation, use either of the following methods:
   a. If you have configured an extensions bundle (on page 1962), you can return the AuthorImageDecorator implementation using the ro.sync.ecss.extensions.api.ExtensionsBundle.getAuthorImageDecorator() method.
   b. Specify the AuthorImageDecorator in the Author image decorator individual extension in the Extensions tab (on page 121) of the Document Type configuration dialog box (on page 94) for your particular document type.

Example

The following example illustrates an implementation for presenting a simple message over an image that informs the user that they can double-click the image to edit it:

```java
/**
 * Custom Author image decorator for drawing string over images.
 */
public class CustomAuthorImageDecorator extends AuthorImageDecorator {

    /**
     * @see ro.sync.ecss.extensions.api.AuthorImageDecorator#paint
     * (ro.sync.exml.view.graphics.Graphics, int, int, int, int,
     * ro.sync.exml.view.graphics.Rectangle,
     * ro.sync.ecss.extensions.api.node.AuthorNode,
     * ro.sync.ecss.extensions.api.AuthorImageDecorator) Location
     */
```
Example result: In the top-left corner of the image, the following message will be displayed: [Double-click to edit image].

Adding Custom Persistent Highlights

The Author API includes a class that allows you to create or remove custom persistent highlights, set new properties for the highlights, and customize their appearance. An example of a possible use case would be if you want to implement your own way of editing review comments. The custom persistent highlights get serialized in the XML document as processing instructions, with the following format:

```xml
<?oxy_custom_start prop1="val1"....?> xml content <?oxy_custom_end?>
```

This functionality is available through the AuthorPersistentHighlighter class that is accessible through the AuthorEditorAccess#getPersistentHighlighter() method.

For more information, see the JavaDoc details for this class at https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/ecss/extensions/api/highlights/AuthorPersistentHighlighter.html.

Configuring the Automatic ID Generation and Unique Attributes Recognizer

The ro.sync.ecss.extensions.api.UniqueAttributesRecognizer interface can be implemented if you want to provide for your framework (on page 2794) the following features:

- **Automatic ID generation** - You can automatically generate unique IDs for newly inserted elements. Implementations are already available for the DITA and DocBook frameworks (on page 2794). The following methods can be implemented to accomplish this: assignUniqueIDs(int startOffset, int endOffset), isAutoIDGenerationActive()
• **Avoiding copying unique attributes when "Split" is called inside an element** - You can split the current block element (on page 2792) by pressing the "Enter" key and then choosing "Split". This is a very useful way to create new paragraphs, for example. All attributes are by default copied on the new element but if those attributes are IDs you sometimes want to avoid creating validation errors in the editor. Implementing the following method, you can decide whether or not an attribute should be copied during the split: `boolean copyAttributeOnSplit(String attrQName, AuthorElement element)`

**Tip:** The `ro.sync.ecss.extensions.commons.id.DefaultUniqueAttributesRecognizer` class is an implementation of the interface that can be extended by your customization to provide easy assignment of IDs in your framework (on page 2794). You can also check out the DITA and DocBook implementations of `ro.sync.ecss.extensions.api.UniqueAttributesRecognizer` to see how they were implemented and connected to the extensions bundle.

**Note:** The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Author website.

### Configuring Content Completion Proposals

You can filter or contribute to proposals offered for content completion by implementing the `ro.sync.contentcompletion.xml.SchemaManagerFilter` interface.

```java
import java.util.List;

import ro.sync.contentcompletion.xml.CIAxis;
import ro.sync.contentcompletion.xml.CIAttribute;
import ro.sync.contentcompletion.xml.CIElement;
import ro.sync.contentcompletion.xml.CIValue;
import ro.sync.contentcompletion.xml.Context;
import ro.sync.contentcompletion.xml.SchemaManagerFilter;
import ro.sync.contentcompletion.xml.WhatAttributesCanGoHereContext;
import ro.sync.contentcompletion.xml.WhatElementsCanGoHereContext;
import ro.sync.contentcompletion.xml.WhatPossibleValuesHasAttributeContext;

public class SDFSchemasManagerFilter implements SchemaManagerFilter {

You can implement the various callbacks of the interface either by returning the default values given by Oxygen XML Author or by contributing to the list of proposals. The filter can be applied on elements, attributes or on their values. Attributes filtering can be implemented using the `filterAttributes` method and changing the default content completion list of `ro.sync.contentcompletion.xml.CIAxis` for the element provided by the current `ro.sync.contentcompletion.xml.WhatAttributesCanGoHereContext` context. For example, the
SDFSchemaManagerFilter checks if the element from the current context is the table element and adds the frame attribute to the table list of attributes.

```java
/**
 * Filter attributes of the "table" element.
 */
public List<CIAttribute> filterAttributes(List<CIAttribute> attributes, WhatAttributesCanGoHereContext context) {
    // If the element from the current context is the 'table' element add the 'frame' attribute
    if (context != null) {
        ContextElement contextElement = context.getParentElement();
        if ("table".equals(contextElement.getQName())) {
            CIAttribute frameAttribute = new CIAttribute();
            frameAttribute.setName("frame");
            frameAttribute.setRequired(false);
            frameAttribute.setFixed(false);
            frameAttribute.setDefaultValue("void");
            if (attributes == null) {
                attributes = new ArrayList<CIAttribute>();
            }
            attributes.add(frameAttribute);
        }
    }
    return attributes;
}
```

The elements that can be inserted in a specific context can be filtered using the filterElements method. The SDFSchemaManagerFilter uses this method to replace the td child element with the th element when header is the current context element.

```java
public List<CIElement> filterElements(List<CIElement> elements, WhatElementsCanGoHereContext context) {
    // If the element from the current context is the 'header' element remove the 'td' element and add the 'th' element.
    if (context != null) {
        Stack<ContextElement> elementStack = context.getElementStack();
        if (elementStack != null) {
            ContextElement contextElement = context.getElementStack().peek();
            if ("header".equals(contextElement.getQName())) {
```

```java
```
```java
if (elements != null) {
    for (Iterator<CIElement> iterator = elements.iterator(); iterator.hasNext();) {
        CIElement element = iterator.next();
        // Remove the 'td' element
        if ("td".equals(element.getQName())) {
            elements.remove(element);
            break;
        }
    } else {
        elements = new ArrayList<CIElement>();
    }
    // Insert the 'th' element in the list of content completion proposals
    CIElement thElement = new SDPElement();
    thElement.setName("th");
    elements.add(thElement);
}
else {
    // If the given context is null then the given list of content completion
    // elements contains global elements.
    return elements;
}
```

The elements or attributes values can be filtered using the `filterElementValues` or `filterAttributeValues` methods.

**Note:** The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Author website.

### Configuring a Custom Drag and Drop Listener

Sometimes it is useful to perform various operations when certain objects are dropped from outside sources in the editing area. You can choose from three interfaces to implement depending on whether you are using the Eclipse plugin or the standalone version of the application, or if you want to add the handler for the Text or Author modes.

**Interfaces for the Drag and Drop Listener**
ro.sync.exml.editor.xmleditor.pageauthor.AuthorDnDListener

Receives callbacks from the standalone application for Drag And Drop in Author mode.

com.oxygenxml.editor.editors.author.AuthorDnDListener

Receives callbacks from the Eclipse plugin for Drag And Drop in Author mode.

com.oxygenxml.editor.editors.TextDnDListener

Receives callbacks from the Eclipse plugin for Drag And Drop in Text mode.

Note: The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Author website.

To configure how dropped URLs or XHTML fragments are handled in documents, see Handling When URLs or XHTML Fragments are Dropped or Pasted in Author Mode (on page 2008).

Configuring a Reference Resolver

This information is helpful if you need to provide a handler for resolving references and obtain the content they reference. For example, suppose the element that has references is ref and the attribute indicating the referenced resource is location. You need to implement a Java extension class for obtaining the referenced resources.

1. Create the class simple.documentation.framework.ReferencesResolver. This class must implement the ro.sync.ecss.extensions.api.AuthorReferenceResolver interface.

```java
import ro.sync.ecss.extensions.api.AuthorReferenceResolver;
import ro.sync.ecss.extensions.api.AuthorAccess;
import ro.sync.ecss.extensions.api.node.AttrValue;
import ro.sync.ecss.extensions.api.node.AuthorElement;
import ro.sync.ecss.extensions.api.node.AuthorNode;

public class ReferencesResolver
    implements AuthorReferenceResolver {
```

2. The hasReferences method verifies if the handler considers the node to have references. It takes AuthorNode as an argument that represents the node that will be verified. The method will return
true if the node is considered to have references. In the following example, to be a reference, the node must be an element with the name `ref` and it must have an attribute named `location`.

```java
public boolean hasReferences(AuthorNode node) {
    boolean hasReferences = false;
    if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
        AuthorElement element = (AuthorElement) node;
        if ("ref".equals(element.getLocalName())) {
            AttrValue attrValue = element.getAttribute("location");
            hasReferences = attrValue != null;
        }
    }
    return hasReferences;
}
```

3. The method `getDisplayName` returns the display name of the node that contains the expanded referenced content. It takes `AuthorNode` as an argument that represents the node for which the display name is needed. The referenced content engine will ask this `AuthorReferenceResolver` implementation for the display name for each node that is considered a reference. In the following example, the display name is the value of the `location` attribute from the `ref` element.

```java
public String getDisplayName(AuthorNode node) {
    String displayName = "ref-fragment";
    if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
        AuthorElement element = (AuthorElement) node;
        if ("ref".equals(element.getLocalName())) {
            AttrValue attrValue = element.getAttribute("location");
            if (attrValue != null) {
                displayName = attrValue.getValue();
            }
        }
    }
    return displayName;
}
```

4. The method `resolveReference` resolves the reference of the node and returns a `SAXSource` with the parser and its input source. It takes `AuthorNode` as an argument that represents the node for which the reference needs resolving, the `systemID` of the node, the `AuthorAccess` with access methods to the `Author` mode data model and a `SAX EntityResolver` that resolves resources that are already opened in another editor or resolve resources through the `XML Catalog` (on page 2800). In the implementation, you need to resolve the reference relative to the `systemID`, and create a parser and an input source over the resolved reference.
public SAXSource resolveReference(
    AuthorNode node,
    String systemID,
    AuthorAccess authorAccess,
    EntityResolver entityResolver) {
SAXSource saxSource = null;

if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
    AuthorElement element = (AuthorElement) node;
    if ("ref".equals(element.getLocalName())) {
        AttrValue attrValue = element.getAttribute("location");
        if (attrValue != null) {
            String attrStringVal = attrValue.getValue();

            try {
                URL absoluteUrl = new URL(new URL(systemID),
                authorAccess.getUtilAccess().correctURL(attrStringVal));

                InputSource inputSource = entityResolver.resolveEntity(null,
                absoluteUrl.toString());
                if (inputSource == null) {
                    inputSource = new InputSource(absoluteUrl.toString());
                }

                XMLReader xmlReader = authorAccess.newNonValidatingXMLReader();
                xmlReader.setEntityResolver(entityResolver);

                saxSource = new SAXSource(xmlReader, inputSource);
            } catch (MalformedURLException e) {
                logger.error(e, e);
            } catch (SAXException e) {
                logger.error(e, e);
            } catch (IOException e) {
                logger.error(e, e);
            }
        }
    }
}

return saxSource;
5. The method `getReferenceUniqueID` should return a unique identifier for the node reference. The unique identifier is used to avoid resolving the references recursively. The method takes `AuthorNode` as an argument that represents the node with the reference. In the following example, the unique identifier is the value of the `location` attribute from the `ref` element.

```java
public String getReferenceUniqueID(AuthorNode node) {
    String id = null;
    if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
        AuthorElement element = (AuthorElement) node;
        if ("ref".equals(element.getLocalName())) {
            AttrValue attrValue = element.getAttribute("location");
            if (attrValue != null) {
                id = attrValue.getValue();
            }
        }
    }
    return id;
}
```

6. The method `getReferenceSystemID` should return the `systemID` of the referenced content. It takes `AuthorNode` as an argument that represents the node with the reference and the `AuthorAccess` with access methods to the `Author` mode data model. For example, the value of the `location` attribute is used from the `ref` element and resolved relatively to the XML base URL of the node.

```java
public String getReferenceSystemID(AuthorNode node, AuthorAccess authorAccess) {
    String systemID = null;
    if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
        AuthorElement element = (AuthorElement) node;
        if ("ref".equals(element.getLocalName())) {
            AttrValue attrValue = element.getAttribute("location");
            if (attrValue != null) {
                String attrStringVal = attrValue.getValue();
                try {
                    URL absoluteUrl = new URL(node.getXMLBaseURL(),
                        authorAccess.getUtilAccess().correctURL(attrStringVal));
                    systemID = absoluteUrl.toString();
                } catch (MalformedURLException e) {
                    logger.error(e, e);
                }
            }
        }
    }
    return systemID;
}
```
In the listing below, the XML document contains the `ref` element:

```xml
<ref location="referenced.xml">Reference</ref>
```

When no reference resolver is specified, the reference has the following layout:

Figure 485. Reference with no specified reference resolver

![Reference without a reference resolver](Image)

When the above implementation is configured, the reference has the expected layout:

Figure 486. Reference with reference resolver

![Reference with a reference resolver](Image)

**Note:** The complete source code for framework customization examples can be found in the `oxygen-sample-framework` module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Author website.

Configuring a State Listener for Author Mode

The `ro.sync.ecss.extensions.api.AuthorExtensionStateListener` implementation is notified when the Author mode extension (where the listener is defined) is activated or deactivated in the document type detection process.

```java
import ro.sync.ecss.extensions.api.AuthorAccess;
import ro.sync.ecss.extensions.api.AuthorExtensionStateListener;

public class SDFAuthorExtensionStateListener implements AuthorExtensionStateListener {
    private AuthorListener sdfAuthorDocumentListener;
    private AuthorMouseListener sdfMouseListener;
    private AuthorCaretListener sdfCaretListener;
```
When the association rules of the framework (on page 2794) (document type) configuration match that of a document opened in the Author editing mode, the activation event received by this listener should be used to perform custom initializations and to register listeners such as ro.sync.ecss.extensions.api.AuthorListener, ro.sync.ecss.extensions.api.AuthorMouseListener, or ro.sync.ecss.extensions.api.AuthorCaretListener.

```java
private OptionListener sdfOptionListener;

public void activated(AuthorAccess authorAccess) {
    // Get the value of the option.
    String option = authorAccess.getOptionsStorage().getOption(
        "sdf.custom.option.key", "");
    // Use the option for some initializations...

    // Add an OptionListener.
    authorAccess.getOptionsStorage().addOptionListener(sdfOptionListener);

    // Add author DocumentListeners.
    sdfAuthorDocumentListener = new SDFAuthorListener();
    authorAccess.getDocumentController().addAuthorListener(
        sdfAuthorDocumentListener);

    // Add MouseListener.
    sdfMouseListener = new SDFAuthorMouseListener();
    authorAccess.getEditorAccess().addAuthorMouseListener(sdfMouseListener);

    // Add CaretListener.
    sdfCaretListener = new SDFAuthorCaretListener();
    authorAccess.getEditorAccess().addAuthorCaretListener(sdfCaretListener);

    // Other custom initializations...
}
```

The authorAccess parameter received by the activated method can be used to gain access to specific Author mode actions and informations related to components such as the editor, document, workspace, tables, or the change tracking manager.

If options specific to the custom developed Author Extension need to be stored or retrieved, a reference to the ro.sync.ecss.extensions.api.OptionsStorage can be obtained by calling the getOptionsStorage method from the authorAccess. The same object can be used to register
ro.sync.ecss.extensions.api.OptionListener listeners. An option listener is registered in relation with an option key and will be notified about the value changes of that option.

An AuthorListener can be used if events related to the Author mode document modifications are of interest. The listener can be added to the ro.sync.ecss.extensions.api.AuthorDocumentController. A reference to the document controller is returned by the getDocumentController method from the authorAccess. The document controller can also be used to perform operations involving document modifications.

To provide access to the Author mode component-related functionality and information, the authorAccess has a reference to the ro.sync.ecss.extensions.api.access.AuthorEditorAccess that can be obtained when calling the getEditorAccess method. At this level, AuthorMouseListener and AuthorCaretListener can be added to provide notification of mouse and cursor events that occur in the Author editor mode.

The deactivation event is received when another framework is activated for the same document, the user switches to another editor mode or the editor is closed. The deactivate method is typically used to unregister the listeners previously added on the activate method and to perform other actions. For example, options related to the deactivated Author Extension can be saved at this point.

```java
public void deactivated(AuthorAccess authorAccess) {
    // Store the option.
    authorAccess.getOptionsStorage().setOption("sdf.custom.option.key", optionValue);

    // Remove the OptionListener.
    authorAccess.getOptionsStorage().removeOptionListener(sdfOptionListener);

    // Remove DocumentListeners.
    authorAccess.getDocumentController().removeAuthorListener(sdfAuthorDocumentListener);

    // Remove Mouselistener.
    authorAccess.getEditorAccess().removeAuthorMouseListener(sdfMouseListener);

    // Remove CaretListener.
    authorAccess.getEditorAccess().removeAuthorCaretListener(sdfCaretListener);

    // Other actions...
}
```
Note: The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Author website.

Configuring Tables

There are standard CSS properties used to indicate what elements are tables, table rows and table cells. What CSS is missing is the possibility to indicate the cell spanning, row separators or the column widths. Oxygen XML Author offers support for adding extensions to solve these problems.

The table in this example is a simple one. The header must be formatted in a different way than the ordinary rows, so it will have a background color.

```css
table {
    display: table;
    border: 1px solid navy;
    margin: 1em;
    max-width: 1000px;
    min-width: 150px;
}

table[width] {
    width: attr(width, length);
}

tr, header {
    display: table-row;
}

header {
    background-color: silver;
    color: inherit
}

td {
    display: table-cell;
    border: 1px solid navy;
    padding: 1em;
}
```
Suppose that in the schema, the `td` tag has the attributes `row_span` and `column_span` that are not automatically recognized by Oxygen XML Author, a Java extension will be implemented that will provide information about the cell spanning. See the section Configuring a Table Cell Span Provider (on page 1987).

Suppose the column widths are specified by the `width` attribute of the `customcol` elements that are not automatically recognized by Oxygen XML Author. It is necessary to implement a Java extension that will provide information about the column widths. For more information, see Configuring a Table Column Width Provider (on page 1981).

The table from the example does not make use of the attributes `colsep` and `rowsep` (which are automatically recognized) but if you want the rows to be separated by horizontal lines, it is necessary to implement a Java extension that will provide information about the row and column separators. For more information, see Configuring a Table Cell Row and Column Separator Provider (on page 1990).

### Configuring a Table Column Width Provider

In a custom framework (on page 2794), the `table` element as well as the table columns can have specified widths. For these widths to be considered by Author mode, you need to provide the means for determining them. As explained in Configuring Tables (on page 1980), if you use the table element attribute `width` Oxygen XML Author can determine the table width automatically. In this example the table has `col` elements with `width` attributes that are not recognized by default. You will need to implement a Java extension class to determine the column widths.

1. Create the class `simple.documentation.framework.TableColumnWidthProvider`. This class must implement the `ro.sync.ecss.extensions.api.AuthorTableColumnWidthProvider` interface.

```java
import ro.sync.ecss.extensions.api.AuthorAccess;
import ro.sync.ecss.extensions.api.AuthorOperationException;
import ro.sync.ecss.extensions.api.AuthorTableColumnWidthProvider;
import ro.sync.ecss.extensions.api.WidthRepresentation;
import ro.sync.ecss.extensions.api.node.AuthorElement;

public class TableColumnWidthProvider implements AuthorTableColumnWidthProvider {
    public void init(AuthorElement tableElement) {
        this.tableElement = tableElement;
    }
}
```

2. Method `init` is taking as argument an `ro.sync.ecss.extensions.api.node.AuthorElement` that represents the XML `table` element. In our case the column widths are specified in `col` elements from the `table` element. In such cases you must collect the span information by analyzing the `table` element.

```java
import ro.sync.ecss.extensions.api.AuthorAccess;
import ro.sync.ecss.extensions.api.AuthorOperationException;
import ro.sync.ecss.extensions.api.AuthorTableColumnWidthProvider;
import ro.sync.ecss.extensions.api.WidthRepresentation;
import ro.sync.ecss.extensions.api.node.AuthorElement;

public class TableColumnWidthProvider implements AuthorTableColumnWidthProvider {
    public void init(AuthorElement tableElement) {
        this.tableElement = tableElement;
    }
}
```
AuthorElement[] colChildren = tableElement.getElementsByLocalName("customcol");
    if (colChildren != null && colChildren.length > 0) {
        for (int i = 0; i < colChildren.length; i++) {
            AuthorElement colChild = colChildren[i];
            if (i == 0) {
                colsStartOffset = colChild.getStartOffset();
            }
            if (i == colChildren.length - 1) {
                colsEndOffset = colChild.getEndOffset();
            }
            // Determine the 'width' for this col.
            AttrValue colWidthAttribute = colChild.getAttribute("width");
            String colWidth = null;
            if (colWidthAttribute != null) {
                colWidth = colWidthAttribute.getValue();
                // Add WidthRepresentation objects for the columns this 'customcol'
                // specification spans over.
                colWidthSpecs.add(new WidthRepresentation(colWidth, true));
            }
        }
    }

3. The method isTableAcceptingWidth should check if the table cells are td.

    public boolean isTableAcceptingWidth(String tableCellsTagName) {
        return "td".equals(tableCellsTagName);
    }

4. The method isTableAndColumnsResizable should check if the table cells are td. This method
determines if the table and its columns can be resized by dragging the edge of a column.

    public boolean isTableAndColumnsResizable(String tableCellsTagName) {
        return "td".equals(tableCellsTagName);
    }

5. Methods getTableWidth and getCellWidth are used to determine the table and column width. The
   table layout engine will ask this ro.sync.ecss.extensions.api.AuthorTableColumnWidthProvider
   implementation what is the table width for each table element and the cell width for each cell
   element from the table that was marked as cell in the CSS using the property display:table-
   cell. The implementation is simple and just parses the value of the width attribute. The methods
   must return null for the tables / cells that do not have a specified width.
public WidthRepresentation getTableWidth(String tableCellsTagName) {
    WidthRepresentation toReturn = null;
    if (tableElement != null && "td".equals(tableCellsTagName)) {
        AttrValue widthAttr = tableElement.getAttribute("width");
        if (widthAttr != null) {
            String width = widthAttr.getValue();
            if (width != null) {
                toReturn = new WidthRepresentation(width, true);
            }
        }
    }
    return toReturn;
}

public List<WidthRepresentation>
getCellWidth(AuthorElement cellElement, int colNumberStart,
            int colSpan) {
    List<WidthRepresentation> toReturn = null;
    int size = colWidthSpecs.size();
    if (size >= colNumberStart && size >= colNumberStart + colSpan) {
        toReturn = new ArrayList<WidthRepresentation>(colSpan);
        for (int i = colNumberStart; i < colNumberStart + colSpan; i++) {
            // Add the column widths
            toReturn.add(colWidthSpecs.get(i));
        }
    }
    return toReturn;
}

6. Methods commitTableWidthModification and commitColumnWidthModifications are used to commit changes made to the width of the table or its columns when using the mouse drag gestures.

public void commitTableWidthModification
(AuthorDocumentController authorDocumentController,
 int newTableWidth, String tableCellsTagName) throws AuthorOperationException {
 if ("td".equals(tableCellsTagName)) {
    if (newTableWidth > 0) {
        if (tableElement != null) {
            String newWidth = String.valueOf(newTableWidth);
            // Add the column widths
            toReturn.add(colWidthSpecs.get(i));
        }
    }
}
authorDocumentController.setAttribute("width",
    new AttrValue(newWidth),
    tableElement);
} else {
    throw new AuthorOperationException("Cannot find the table element.");
}
}
}

public void commitColumnWidthModifications
(AuthorDocumentController authorDocumentController,
    WidthRepresentation[] colWidths, String tableCellsTagName)
throws AuthorOperationException {
    if ("td".equals(tableCellsTagName)) {
        if (colWidths != null && tableElement != null) {
            if (colsStartOffset >= 0 && colsEndOffset >= 0 && colsStartOffset < colsEndOffset) {
                authorDocumentController.delete(colsStartOffset, colsEndOffset);
            }
            String xmlFragment = createXMLFragment(colWidths);
            int offset = -1;
            AuthorElement[] header = tableElement.getElementsByTagName("header");
            if (header != null && header.length > 0) {
                // Insert the cols elements before the 'header' element
                offset = header[0].getStartOffset();
            }
            if (offset == -1) {
                throw new AuthorOperationException("No valid offset to insert column width");
            }
            authorDocumentController.insertXMLFragment(xmlFragment, offset);
        }
    }
}

private String createXMLFragment(WidthRepresentation[] widthRepresentations) {
    StringBuffer fragment = new StringBuffer();
    String ns = tableElement.getNamespace();
    for (int i = 0; i < widthRepresentations.length; i++) {
WidthRepresentation width = widthRepresentations[i];
fragment.append("</customcol");
String strRepresentation = width.getWidthRepresentation();
if (strRepresentation != null) {
    fragment.append(" width=" + width.getWidthRepresentation() + "\n");
}
if (ns != null && ns.length() > 0) {
    fragment.append(" xmlns=" + ns + "\n");
}
fragment.append("/>");
return fragment.toString();
}

7. The following three methods are used to determine what type of column width specifications the table column width provider support. In our case all types of specifications are allowed:

    public boolean isAcceptingFixedColumnWidths(String tableCellsTagName) {
        return true;
    }

    public boolean isAcceptingPercentageColumnWidths(String tableCellsTagName) {
        return true;
    }

    public boolean isAcceptingProportionalColumnWidths(String tableCellsTagName) {
        return true;
    }

Note: The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Author website.

In the listing below, the XML document contains the table element:

    <table width="300">
        <customcol width="50.0px"/>
        <customcol width="1*"/>
        <customcol width="2*"/>
        <customcol width="20%"/>
        <header>
When no table column width provider is specified, the table has the following layout:

Figure 487. Table layout when no column width provider is specified

<p>| | | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>C1</td>
<td>C2</td>
<td>C3</td>
<td>C4</td>
</tr>
<tr>
<td>cs=1, rs=1</td>
<td>cs=1, rs=1</td>
<td>cs=1, rs=2</td>
<td>cs=1, rs=3</td>
</tr>
<tr>
<td>cs=1, rs=1</td>
<td>cs=1, rs=1</td>
<td></td>
<td></td>
</tr>
<tr>
<td>cs=3, rs=1</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

When the above implementation is configured, the table has the correct layout:

Figure 488. Columns with custom widths
Configuring a Table Cell Span Provider

In a custom framework (on page 2794), the table element can have cells that span over multiple columns and rows. As explained in Configuring Tables (on page 1980), you need to indicate Oxygen XML Author a method to determine the cell spanning. If you use the cell element attributes rowspan and colspan or rows and cols, Oxygen XML Author can determine the cell spanning automatically. In the following example, the td element uses the attributes row_span and column_span that are not recognized by default. You will need to implement a Java extension class for defining the cell spanning.

1. Create the class simple.documentation.framework.TableCellSpanProvider. This class must implement the ro.sync.ecss.extensions.api.AuthorTableCellSpanProvider interface.

   ```java
   import ro.sync.ecss.extensions.api.AuthorTableCellSpanProvider;
   import ro.sync.ecss.extensions.api.node.AttrValue;
   import ro.sync.ecss.extensions.api.node.AuthorElement;

   public class TableCellSpanProvider implements AuthorTableCellSpanProvider {
     
   }
   ```

2. The init method takes ro.sync.ecss.extensions.api.node.AuthorElement that represents the XML table element as its argument. In this example, the cell span is specified for each of the cells so you leave this method empty. However, there are cases (such as the CALS table model) when the cell spanning is specified in the table element. In such cases, you must collect the span information by analyzing the table element.

   ```java
   public void init(AuthorElement table) {
     
   }
   ```
3. The `getColSpan` method is taking as argument the table cell. The table layout engine will ask this `AuthorTableSpanSupport` implementation what is the column span and the row span for each XML element from the table that was marked as cell in the CSS using the `display:table-cell` property. The implementation is simple and just parses the value of `column_span` attribute. The method must return `null` for all the cells that do not change the span specification.

```java
public Integer getColSpan(AuthorElement cell) {
    Integer colSpan = null;

    AttrValue attrValue = cell.getAttribute("column_span");
    if(attrValue != null) {
        // The attribute was found.
        String cs = attrValue.getValue();
        if(cs != null) {
            try {
                colSpan = new Integer(cs);
            } catch (NumberFormatException ex) {
                // The attribute value was not a number.
            }
        }
    }
    return colSpan;
}
```

4. The row span is determined in a similar manner:

```java
public Integer getRowSpan(AuthorElement cell) {
    Integer rowSpan = null;

    AttrValue attrValue = cell.getAttribute("row_span");
    if(attrValue != null) {
        // The attribute was found.
        String rs = attrValue.getValue();
        if(rs != null) {
            try {
                rowSpan = new Integer(rs);
            } catch (NumberFormatException ex) {
                // The attribute value was not a number.
            }
        }
    }
    return rowSpan;
}
```
5. The method `hasColumnSpecifications` always returns `true` considering column specifications always available.

```java
public boolean hasColumnSpecifications(AuthorElement tableElement) {
    return true;
}
```

**Note:** The complete source code for framework customization examples can be found in the `oxygen-sample-framework` module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Author website.

6. In the listing below, the XML document contains the table element:

```xml
<table>
    <header>
        <td>C1</td>
        <td>C2</td>
        <td>C3</td>
        <td>C4</td>
    </header>
    <tr>
        <td>cs=1, rs=1</td>
        <td column_span="2" row_span="2">cs=2, rs=2</td>
        <td row_span="3">cs=1, rs=3</td>
    </tr>
    <tr>
        <td>cs=1, rs=1</td>
    </tr>
    <tr>
        <td column_span="3">cs=3, rs=1</td>
    </tr>
</table>
```

When no table cell span provider is specified, the table has the following layout:

Figure 489. Table layout when no cell span provider is specified
When the above implementation is configured, the table has the correct layout:

Figure 490. Cells spanning multiple rows and columns.

Note: The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Author website.

Configuring a Table Cell Row and Column Separator Provider

In a custom framework (on page 2794), the table element has separators between rows. As explained in Configuring Tables (on page 1980), you need to indicate a method to determine the way
rows and columns are separated. If you use the `rowsep` and `colsep` cell element attributes, or your table is conforming to the CALS table model, Oxygen XML Author can determine the cell separators. Even if there are no attributes that define the separators, you can still force a separator between rows by implementing a Java extension.

1. Create the class `simple.documentation.framework.TableCellSepProvider`. This class must implement the `ro.sync.ecss.extensions.api.AuthorTableCellSepProvider` interface.

```java
import ro.sync.ecss.extensions.api.AuthorTableCellSepProvider;
import ro.sync.ecss.extensions.api.node.AuthorElement;

public class TableCellSepProvider implements AuthorTableCellSepProvider {

2. The `init` method takes the `ro.sync.ecss.extensions.api.node.AuthorElement` interface that represents the XML `table` element as its argument. If the separator information is implicit, it does not depend on the current table, so you leave this method empty. However, there are cases (such as the CALS table model) when the cell separators are specified in the `table` element. In such cases, you should initialize your provider based on the given argument.

```java
public void init(AuthorElement table) { }
```

3. The `getColSep` method takes the table cell as its argument. The table layout engine will ask this `AuthorTableCellSepProvider` implementation if there is a column separator for each XML element from the table that was marked as cell in the CSS using the property `display:table-cell`. The following example returns `false`, meaning there will not be column separators.

```java
/**
 * @return false - No column separator at the right of the cell.
 */
@Override
public boolean getColSep(AuthorElement cellElement, int columnIndex) {
    return false;
}
```

4. The row separators are determined in a similar manner. This time the example returns `true`, forcing a separator between the rows.

```java
/**
 * @return true - A row separator below each cell.
 */
@Override
public boolean getRowSep(AuthorElement cellElement, int columnIndex) {
```
Note: The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Author website.

5. In the example below, the XML document contains the table element:

```xml
<table>
  <header>
    <td>H1</td>
    <td>H2</td>
    <td>H3</td>
    <td>H4</td>
  </header>
  <tr>
    <td>C11</td>
    <td>C12</td>
    <td>C13</td>
    <td>C14</td>
  </tr>
  <tr>
    <td>C21</td>
    <td>C22</td>
    <td>C23</td>
    <td>C24</td>
  </tr>
  <tr>
    <td>C31</td>
    <td>C32</td>
    <td>C33</td>
    <td>C34</td>
  </tr>
</table>
```

When the borders for the td element are removed from the CSS, the row separators become visible:

Figure 491. Row separators provided by the Java implementation.
Customizing Attribute Value Editors

The `CustomAttributeValueEditor` extension point allows you to customize the attribute value editing mechanisms in Oxygen XML Author. It changes the `Browse` button found in the attribute editors to an `Edit` button. When a user clicks that `Edit` button, your custom attribute value editor will be presented.

The `Edit` button can be accessed in the following attribute editors:

- The Attributes view in Author mode (on page 412) (when the `Expand` button is used to reveal an expanded panel).
- The Attributes view in Text mode (on page 337) (when the `Expand` button is used to reveal an expanded panel).
- The In-place Attributes Editor (on page 415) when invoked in Author mode.
- The In-place Attributes Editor invoked in the Outline view (on page 334).

How to Implement a `CustomAttributeValueEditor`

To implement your own `CustomAttributeValueEditor`, follow this procedure:

1. Extend the `ro.sync.ecss.extensions.api.CustomAttributeValueEditor` abstract class.
2. To instruct Oxygen XML Author to use this newly created implementation, use either of the following methods:
   a. If you have configured an extensions bundle (on page 1962), you can return the `CustomAttributeValueEditor` implementation using the `ro.sync.ecss.extensions.api.ExtensionsBundle.createCustomAttributeValueEditor()` method.
b. Specify the CustomAttributeValueEditor in the Author custom attribute value editor individual extension in the Extensions tab (on page 121) of the Document Type configuration dialog box (on page 94) for your particular document type.

Example

The following example creates a very simple custom attribute value editor:

```java
/**
 * A custom attribute value editor.
 */
public class MyCustomAttributeValueEditor extends CustomAttributeValueEditor {

    /**
    * @see ro.sync.ecss.extensions.api.Extension#getDescription()
    */
    @Override
    public String getDescription() {
        return "My custom attribute value editor";
    }

    /**
    * @see ro.sync.ecss.extensions.api.CustomAttributeValueEditor#getAttributeValue(EditedAttribute, java.lang.Object)
    */
    @Override
    public String getAttributeValue(EditedAttribute attribute, Object parentComponent)
        throws CancelledByUserException {
        // Show an input dialog for collecting the new value
        return JOptionPane.showInputDialog("Set a new value for " + attribute.getAttributeQName() + ":");
    }

    /**
    * @see ro.sync.ecss.extensions.api.CustomAttributeValueEditor#shouldHandleAttribute(EditedAttribute)
    */
    @Override
    public boolean shouldHandleAttribute(EditedAttribute attribute) {
        // Handle all attributes
        return true;
    }
```
Example result: If a user were to click the Edit button in any of the attribute editors, the following dialog box would be displayed that allows the user to insert a value for the particular attribute:

Customizing the CSS Styles Filter

You can modify the CSS styles for each ro.sync.ecss.extensions.api.node.AuthorNode rendered in the Author mode using an implementation of ro.sync.ecss.extensions.api.StylesFilter. You can implement the various callbacks of the interface either by returning the default value given by Oxygen XML Author or by contributing to the value. The received styles ro.sync.ecss.css.Styles can be processed and values can be overwritten with your own. For example, you can override the KEY_BACKGROUND_COLOR style to return your own implementation of ro.sync.exml.view.graphics.Color or override the KEY_FONT style to return your own implementation of ro.sync.exml.view.graphics.Font.

For instance, in this simple document example, the filter can change the value of the KEY_FONT property for the table element:

```java
package simple.documentation.framework;

import ro.sync.ecss.css.Styles;
import ro.sync.ecss.extensions.api.StylesFilter;
import ro.sync.ecss.extensions.api.node.AuthorNode;
import ro.sync.exml.view.graphics.Font;

public class SDFStylesFilter implements StylesFilter {

    public Styles filter(Styles styles, AuthorNode authorNode) {
        if (AuthorNode.NODE_TYPE_ELEMENT == authorNode.getType() && "table".equals(authorNode.getName())) {
            styles.setProperty(Styles.KEY_FONT, new Font(null, Font.BOLD, 12));
        }
        return styles;
    }
}
```
Customizing Elements that Wrap Profiled Content

For each framework (on page 2794) (document type), you can configure the phrase-type elements that wrap the profiled content by setting a custom
ro.sync.ecss.extensions.api.ProfilingConditionalTextProvider. This configuration is set by default for DITA and DocBook frameworks.

Customizing the Link Target Reference Finder

The link target reference finder represents the support for finding references from links that indicate specific elements inside an XML document. This support will only be available if a schema is associated with the document type.

If you do not define a custom link target reference finder, the DefaultElementLocatorProvider implementation (on page 1997) will be used by default. The interface that should be implemented for a custom link target reference finder is ro.sync.ecss.extensions.api.link.ElementLocatorProvider. As an alternative, the ro.sync.ecss.extensions.commons.DefaultElementLocatorProvider implementation can also be extended.

The used ElementLocatorProvider will be queried for an ElementLocator when a link location must be determined (when a link is clicked). Then, to find the corresponding (linked) element, the obtained ElementLocator will be queried for each element from the document.

Note: The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Author website.

Creating a Custom Link Target Reference Finder

If you need to create a custom link target reference finder you can do so by creating the class that will implement the ro.sync.ecss.extensions.api.link.ElementLocatorProvider interface. As an alternative, your class could extend ro.sync.ecss.extensions.commons.DefaultElementLocatorProvider, the default implementation.

Note: The complete source code of the ro.sync.ecss.extensions.commons.DefaultElementLocatorProvider, ro.sync.ecss.extensions.commons.IDElementLocator or
ro.sync.ecss.extensions.commons.XPointerElementLocator can be found in the oxygen-sample-framework project.

Default Link Target Reference Finder

The DefaultElementLocatorProvider implementation is used by default to find link target references. It offers support for the most common types of links:

- Links based on ID attribute values (on page 1997).
- XPointer element() scheme (on page 1998).

The method getElementLocator determines what ElementLocator should be used. In the default implementation, it checks if the link is an XPointer element() scheme. Otherwise, it assumes it is an ID. A non-null IDTypeVerifier will always be provided if a schema is associated with the document type.

The link string argument is the anchor (on page 2791) part of the of the URL that is composed from the value of the link property specified for the link element in the CSS.

```java
public ElementLocator getElementLocator(IDTypeVerifier idVerifier, String link) {
    ElementLocator elementLocator = null;
    try {
        if(link.startsWith("element(")){
            // xpointer element() scheme
            elementLocator = new XPointerElementLocator(idVerifier, link);
        } else {
            // Locate link element by ID
            elementLocator = new IDElementLocator(idVerifier, link);
        }
    } catch (ElementLocatorException e) {
        logger.warn("Exception when create element locator for link: " + link + ". Cause: " + e, e);
    }
    return elementLocator;
}
```

ID Element Locator

The IDEElementLocator is an implementation of the abstract class ro.sync.ecss.extensions.api.link.ElementLocator for links that use an ID.
The constructor only assigns field values and the method `endElement` is empty for this implementation.

The method `startElement` checks each of the element's attribute values and when one matches the link, it considers the element found if one of the following conditions is satisfied:

- The qualified name of the attribute is `xml:id`.
- The attribute type is ID.

The attribute type is checked with the help of the method `IDTypeVerifier.hasIDType`.

```java
public boolean startElement(String uri, String localName,
                           String name, Attr[] atts) {
    boolean elementFound = false;
    for (int i = 0; i < atts.length; i++) {
        if (link.equals(atts[i].getValue())) {
            if ("xml:id".equals(atts[i].getQName())) {
                // xml:id attribute
                elementFound = true;
            } else {
                // check if attribute has ID type
                String attrLocalName =
                    ExtensionUtil.getLocalName(atts[i].getQName());
                String attrUri = atts[i].getNamespace();
                if (idVerifier.hasIDType(localName, uri, attrLocalName, attrUri)) {
                    elementFound = true;
                }
            }
        }
    }
    return elementFound;
}
```

**XPointer Element Locator**

`XPointerElementLocator` is an implementation of the abstract class `ro.sync.ecss.extensions.api.link.ElementLocator` for links that have one of the following XPointer `element()` scheme patterns:

- `element (elementID)`
  
  Locate the element with the specified ID.
A child sequence appearing alone identifies an element by means of stepwise navigation, which is directed by a sequence of integers separated by slashes (/). Each integer n locates the nth child element of the previously located element.

A child sequence appearing after a NCName identifies an element by means of stepwise navigation, starting from the element located by the given name.

The constructor separates the ID/integers, which are delimited by slashes(/) into a sequence of identifiers (an XPointer path). It will also check that the link has one of the supported patterns of the XPointer element() scheme.

```java
public XPointerElementLocator(IDTypeVerifier idVerifier, String link) throws ElementLocatorException {
    super(link);
    this.idVerifier = idVerifier;

    link = link.substring("element(".length(), link.length() - 1);

    StringTokenizer stringTokenizer = new StringTokenizer(link, "/", false);
    xpointerPath = new String[stringTokenizer.countTokens()];
    int i = 0;
    while (stringTokenizer.hasMoreTokens()) {
        xpointerPath[i] = stringTokenizer.nextToken();
        boolean invalidFormat = false;
    
        // Empty xpointer component is not supported
        if(xpointerPath[i].length() == 0){
            invalidFormat = true;
        }
    
        if(i > 0){
            try {
                Integer.parseInt(xpointerPath[i]);
            } catch (NumberFormatException e) {
                invalidFormat = true;
            }
        }
    }

    if(invalidFormat){
```
```java
throw new ElementLocatorException(
    "Only the element() scheme is supported when locating XPointer links."
    + "Supported formats: element(elementID), element(/1/2/3),
    element(elemID/2/3/4)."
);
}
i++;
}

if (Character.isDigit(xpointerPath[0].charAt(0))) {  
    // This is the case when xpointer have the following pattern /1/5/7
    xpointerPathDepth = xpointerPath.length;
} else {  
    // This is the case when xpointer starts with an element ID
    xpointerPathDepth = -1;
    startActivityWithElementID = true;
}
}
```

The method `startElement` will be invoked at the beginning of every element in the XML document (even when the element is empty). The arguments it takes are:

- `uri` The namespace URI, or the empty string if the element has no namespace URI or if namespace processing is disabled.

- `localName` Local name of the element.

- `qName` Qualified name of the element.

- `atts` Attributes attached to the element. If there are no attributes, this argument will be empty.

The method returns `true` if the processed element is found to be the one indicated by the link.

The `XPointerElementLocator` implementation of the `startElement` will update the depth of the current element and keep the index of the element in its parent. If the `xpointerPath` starts with an element ID then the current element ID is verified to match the specified ID. If this is the case the depth of the XPointer is updated taking into account the depth of the current element.
If the XPointer path depth is the same as the current element depth then the kept indices of the current element path are compared to the indices in the XPointer path. If all of them match then the element has been found.

```java
public boolean startElement(String uri, String localName,
                          String name, Attr[] atts) {
    boolean linkLocated = false;
    // Increase current element document depth
    startElementDepth ++;

    if (endElementDepth != startElementDepth) {
        // The current element is the first child of the parent
        currentElementIndexStack.push(new Integer(1));
    } else {
        // Another element in the parent element
        currentElementIndexStack.push(new Integer(lastIndexInParent + 1));
    }

    if (startWithElementID) {
        // This the case when xpointer path starts with an element ID.
        String xpointerElement = xpointerPath[0];
        for (int i = 0; i < atts.length; i++) {
            if (xpointerElement.equals(atts[i].getValue())){
                if (idVerifier.hasIDType(
                        localName, uri, atts[i].getQName(), atts[i].getNamespace())){
                    xpointerPathDepth = startElementDepth + xpointerPath.length - 1;
                    break;
                }
            }
        }
    }

    if (xpointerPathDepth == startElementDepth){
        // check if xpointer path matches with the current element path
        linkLocated = true;
        try {
            int xpointerIdx = xpointerPath.length - 1;
            int stackIdx = currentElementIndexStack.size() - 1;
            int stopIdx = startWithElementID ? 1 : 0;
            while (xpointerIdx >= stopIdx && stackIdx >= 0) {
                int xpointerIndex = Integer.parseInt(xpointerPath[xpointerIdx]);
            }
        } catch (Exception e) {
            linkLocated = false;
        }
    }

    return linkLocated;
}
```
```java
int currentElementIndex =
    ((Integer)currentElementIndexStack.get(stackIdx)).intValue();
if (xpointerIndex != currentElementIndex) {
    linkLocated = false;
    break;
}
xpointerIdx--;
stackIdx--;
}

} catch (NumberFormatException e) {
    logger.warn(e,e);
}
}
return linkLocated;
}
```

The method `endElement` will be invoked at the end of every element in the XML document (even when the element is empty).

The `XPointerElementLocator` implementation of the `endElement` updates the depth of the current element path and the index of the element in its parent.

```java
public void endElement(String uri, String localName, String name) {
    endElementDepth = startElementDepth;
    startElementDepth --;
    lastIndexInParent = ((Integer)currentElementIndexStack.pop()).intValue();
}
```

Customizing XML Node Rendering

You can use this API extension to customize the way an XML node is rendered in the Outline view (on page 334) in Author mode, breadcrumb navigation bar (on page 849) in Author mode, Outline view (on page 334) in Text mode, Content Completion Assistant (on page 2792) window, or DITA Maps Manager view (on page 2503).

⚠️ **Note:** Oxygen XML Author uses `XMLNodeRendererCustomizer` implementations for the following frameworks (on page 2794): DITA, DITA Map, DocBook 4, DocBook 5, TEI, XHTML, XSLT, and XML Schema.
There are two methods to provide an implementation of
ro.sync.exml.workspace.api.node.customizer.XMLNodeRendererCustomizer:

- As a part of a bundle, returning it from the createXMLNodeCustomizer() method of the
  ExtensionsBundle associated with your document type in the Document type configuration dialog box (on page 94) (Extensions bundle field in the Extensions tab).
- As an individual extension, associated with your document type in the Document type configuration dialog box (on page 94) (XML node renderer customizer field in the Individual extensions section of the Extensions tab).

Support for Retina/HiDPI Displays

To support Retina or HiDPI displays, the icons provided by the XMLNodeRendererCustomizer should be backed up by a copy of larger size using the proper Retina/HiDPI naming convention (on page 971).

For example, for the title element, if the XMLNodeRendererCustomizer returns the path
${framework}/images/myImg.png, then to support Retina images with a scaling factor of 2, an extra file (myImg@2x.png) should be added to the same images directory (${framework}/images/myImg@2x.png). If the higher resolution icon (the @2x file) does not exist, the normal icon is scaled and used instead.

For more information about using Retina/HiDPI images, refer to the Using Retina/HiDPI Images in Author Mode (on page 970) section.

Note: The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Author website.

Related Information:

- Customizing the Rendering of Elements (on page 1935)

Handling Author Mode Action Events

The AuthorActionEventHandler extension point allows you to handle certain Author mode actions in a special way. For example, a specific use-case would be if you want to insert new lines when you press Enter instead of it opening the Content Completion Assistant (on page 2792).
How to Implement an **AuthorActionEventHandler**

To implement your own **AuthorActionEventHandler**, follow this procedure:

1. Implement the `ro.sync.ecss.extensions.api.AuthorActionEventHandler` interface.
2. To instruct Oxygen XML Author to use this newly created implementation, use either of the following methods:
   a. If you have configured an extensions bundle (on page 1962), you can return the **AuthorActionEventHandler** implementation using the `ro.sync.ecss.extensions.api.ExtensionsBundle.getAuthorActionEventHandler()` method.
   b. Specify the **AuthorActionEventHandler** in the **Author action event handler** individual extension in the Extensions tab (on page 121) of the Document Type configuration dialog box (on page 94) for your particular document type.

Example

The following example illustrates the use-case mentioned in the introduction, that is an implementation for inserting a new line when the user presses **Enter** in **Author** mode. It uses the **canHandleEvent** method to make sure the insertion will be performed in an element that will preserve the new-line character. Then the **handleEvent** method inserts the new line at the current cursor position.

```java
public class CustomAuthorActionEventHandler implements AuthorActionEventHandler {

    /**
     * @see ro.sync.ecss.extensions.api.AuthorActionEventHandler#canHandleEvent
     * (AuthorAccess, AuthorActionEventType)
     */
    @Override
    public boolean canHandleEvent(AuthorAccess authorAccess, AuthorActionEventType type) {
        boolean canHandle = false;

        if (type == AuthorActionEventType.ENTER) {
            AuthorDocumentController documentController = authorAccess.getDocumentController();
            int caretOffset = authorAccess.getEditorAccess().getCaretOffset();
            try {
                AuthorNode nodeAtOffset = documentController.getNodeAtOffset(caretOffset);
                if (nodeAtOffset instanceof AuthorElement) {
```

```
AuthorElement elementAtOffset = (AuthorElement) nodeAtOffset;
AttrValue xmlSpace = elementAtOffset.getAttribute("xml:space");
if (xmlSpace != null && xmlSpace.getValue().equals("preserve")) {
    canHandle = true;
}
}
} catch (BadLocationException ex) {
    if (logger.isDebugEnabled()) {
        logger.error(ex.getMessage(), ex);
    }
}

return canHandle;
}/**
 * @see ro.sync.ecss.extensions.api.AuthorActionEventHandler#handleEvent(ro.sync.ecss.extensions.api.AuthorAccess,
 * ro.sync.ecss.extensions.api.AuthorActionEventHandler.AuthorActionEventType)
 */
@Override
public boolean handleEvent(AuthorAccess authorAccess,
AuthorActionEventType eventType) {
    int caretOffset = authorAccess.getEditorAccess().getCaretOffset();
    // Insert a new line
    authorAccess.getDocumentController().insertText(caretOffset, 
"
    return true;
}
}/**
 * @see ro.sync.ecss.extensions.api.Extension#getDescription()
 */
@Override
public String getDescription() {
    return "Insert a new line";
}
Handling Schema-Aware Editing Events

The `AuthorSchemaAwareEditingHandlerAdapter` extension point allows you to handle certain `Author` mode actions in various ways. For example, implementing the `AuthorSchemaAwareEditingHandlerAdapter` makes it possible to handle events such as typing, the keyboard delete event at a given offset (using Delete or Backspace keys), delete element tags, delete selection, join elements, or paste fragment. It also makes it possible to improve solutions that are proposed by the paste mechanism in Oxygen XML Author when pasting content (through the use of some specific methods (on page 2007)).

How to Implement an `AuthorSchemaAwareEditingHandlerAdapter`

For this handler to be called, the `Schema Aware Editing` option (on page 135) must be set to `On` or `Custom` in the `Schema-Aware` preferences page (on page 135). The handler can either resolve a specific case, let the default implementation take place, or reject the edit entirely by throwing an `InvalidEditException`.

To implement your own `AuthorSchemaAwareEditingHandlerAdapter`, follow this procedure:

1. Implement the `ro.sync.ecss.extensions.api.AuthorSchemaAwareEditingHandlerAdapter` extension.
2. To instruct Oxygen XML Author to use this newly created implementation, configure an extensions bundle (on page 1962) and return the `AuthorSchemaAwareEditingHandlerAdapter` implementation using the `ro.sync.ecss.extensions.api.ExtensionsBundle.getAuthorSchemaAwareEditingHandlerAdapter()` method.

**Example**

Typing events can be handled using the `handleTyping` method. For example, the `AuthorSchemaAwareEditingHandler` checks if the schema is not a learned one, was loaded successfully, and if the `Smart paste and drag and drop` option (on page 136) is selected. If these conditions are met, the event will be handled.

```java
public class AuthorSchemaAwareEditingHandlerAdapter extends AuthorSchemaAwareEditingHandler {

    /**
     * @see AuthorSchemaAwareEditingHandler#handleTyping
     * (int, char, ro.sync.ecss.extensions.api.AuthorAccess)
     */
    public boolean handleTyping(int offset, char ch, AuthorAccess authorAccess)
```
```java
throws InvalidEditException {
    boolean handleTyping = false;
    AuthorSchemaManager authorSchemaManager =
        authorAccess.getDocumentController().getAuthorSchemaManager();
    if (!authorSchemaManager.isLearnSchema() &&
        !authorSchemaManager.hasLoadingErrors() &&
        authorSchemaManager.getAuthorSchemaAwareOptions().isEnableSmartTyping()) {
        try {
            AuthorDocumentFragment characterFragment =
                authorAccess.getDocumentController().createNewDocumentTextFragment
                (String.valueOf(ch));
            handleTyping = handleInsertionEvent
                (offset, new AuthorDocumentFragment[] {characterFragment}, authorAccess);
        } catch (AuthorOperationException e) {
            throw new InvalidEditException
                (e.getMessage(), "Invalid typing event: " + e.getMessage(), e, false);
        }
    }
    return handleTyping;
}
```

**Note:** The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Author website.

**Methods for Improving the Paste Mechanism**

*getAncestorDetectionOptions*

When pasting content in **Author** mode, if the result causes the document to become invalid, Oxygen XML Author will propose solutions to make it valid. As a possible solution, Oxygen XML Author might surround the pasted content in a sequence of ancestor elements. This `getAncestorDetectionOptions` method allows you to choose which parent elements might be a possible solution.

*canBeReplaced*

Allows you to improve solutions that might be proposed by the paste mechanism when pasting content in Oxygen XML Author. For example, when pasting an element inside an empty element with the same name, this `canBeReplaced` method allows Oxygen XML Author to replace the empty node rather than pasting it after or before the empty node. The callback could also reject this behavior if, for instance, the replacement node contains attributes.
Handling When URLs or XHTML Fragments are Dropped or Pasted in Author Mode

The `AuthorExternalObjectInsertionHandler` extension can be used to configure how URLs or XHTML fragments from external applications are handled when they are dropped or pasted in Author mode.

How to Implement an `AuthorExternalObjectInsertionHandler`

To implement your own `AuthorExternalObjectInsertionHandler`, follow this procedure:

1. Implement the `ro.sync.ecss.extensions.api.AuthorExternalObjectInsertionHandler` interface.
2. To instruct Oxygen XML Author to use this newly created implementation, use either of the following methods:
   a. If your framework is an extension of DITA, DocBook, TEI, or XHTML, you can specify the `AuthorExternalObjectInsertionHandler` in the Author extern object Insertion handler individual extension in the Extensions tab (on page 121) of the Document Type configuration dialog box (on page 94) for your particular document type.
   b. Otherwise, you can configure an extensions bundle (on page 1962), then return the `AuthorExternalObjectInsertionHandler` implementation using the `ro.sync.ecss.extensions.api.ExtensionsBundle.createAuthorExternalObjectInsertionHandler()` method.
3. You can use a stylesheet to convert the pasted XHTML to your own XML vocabulary by overwriting the following method:

   `ro.sync.ecss.extensions.api.AuthorExternalObjectInsertionHandler.getImporterStylesheetFileName(AuthorAccess)`

   and return the file name of the stylesheet that will be applied. The path to the importer stylesheet must also be added in the Classpath tab (on page 98) in the Document Type configuration dialog box (on page 94) for your particular document type.

Example

The following example illustrates an implementation for the DITA framework:

```csharp
/**
 * @see ro.sync.ecss.extensions.api.ExtensionsBundle#
```
Tip: For XHTML fragments, there is another method that you could use to configure how they are handled when they are pasted in Author mode. For more information, see Customizing Smart Paste Support (on page 1914).

Presenting an Edit Properties Dialog Box for Actions in Author Mode

The EditPropertiesHandler extension point allows you to present a specialized dialog box when the action of double-clicking an element tag is intercepted in Author mode. For example, you could use it to present a dialog box that allows the user to editing the properties of an image.

How to Implement an EditPropertiesHandler

To implement your own EditPropertiesHandler, follow this procedure:

1. Implement the ro.sync.ecss.extensions.api.EditPropertiesHandler interface.
2. To instruct Oxygen XML Author to use this newly created implementation, use either of the following methods:
   a. If you have configured an extensions bundle (on page 1962), you can return the EditPropertiesHandler implementation using the ro.sync.ecss.extensions.api.ExtensionsBundle.createEditPropertiesHandler() method.
   b. Specify the EditPropertiesHandler in the Author edit properties handler individual extension in the Extensions tab (on page 121) of the Document Type configuration dialog box (on page 94) for your particular document type.
Example

The following example illustrates an implementation for presenting a simple properties editing dialog box when a user double-clicks an image tag in Author mode (with tags displayed from the Tags display mode drop-down menu):

```java
public class CustomEditPropertiesHandler implements EditPropertiesHandler {

    /**
     * @see ro.sync.ecss.extensions.api.Extension#getDescription()
     */
    @Override
    public String getDescription() {
        return "Sample implementation that handles properties for a table element.";
    }

    /**
     * @see ro.sync.ecss.extensions.api.EditPropertiesHandler#canEditProperties(ro.sync.ecss.extensions.api.node.AuthorNode)
     */
    @Override
    public boolean canEditProperties(AuthorNode authorNode) {
        // If this node is an image element we can edit its properties.
        return "image".equals(authorNode.getDisplayName());
    }

    /**
     * @see ro.sync.ecss.extensions.api.EditPropertiesHandler#editProperties(ro.sync.ecss.extensions.api.node.AuthorNode,
     * ro.sync.ecss.extensions.api.AuthorAccess)
     */
    @Override
    public void editProperties(AuthorNode authorNode, AuthorAccess authorAccess) {
        // If we receive this call then it surely an image.
        AuthorElement imageElement = (AuthorElement) authorNode;
        String currentValue = "";
        AttrValue altValue = imageElement.getAttribute("alt");
        if (altValue != null) {
            currentValue = altValue.getValue();
        }
    }
}
```
```java
String newValue = JOptionPane.showInputDialog(
    (Component) authorAccess.getWorkspaceAccess().getParentFrame(),
    "Alternate text",
    currentValue);

if (newValue != null) {
    authorAccess.getDocumentController().setAttribute
    ("alt", new AttrValue(newValue), imageElement);
}
}
```

**Example result**: If a user were to double-click an `image` tag icon in **Author** mode, the following dialog box would be displayed that allows the user to edit the *alternate text* property for the image:

![Dialog box](image)

**Java API - Extending Author Functionality through Java**

Oxygen XML Author **Author** mode has a built-in set of operations covering the insertion of text and XML fragments (see the Author Default Operations *(on page 2022)*) and the execution of XPath expressions on the current document edited in **Author** mode. However, there are situations in which you need to extend this set. The following examples are just a few of the possible situations:

- You need to enter an element whose attributes will be edited by the user through a graphical user interface.
- The user must send selected element content (or the whole document) to a server for some kind of processing.
- Content authors need to extract pieces of information from a server and insert it directly into the edited XML document.
- You need to apply an XPath expression on the current document and process the nodes of the resulting node set.

To extend the Oxygen XML Author **Author** mode functionality through Java, you will need the Oxygen SDK available on the Oxygen XML Author website. It includes the source code of the **Author** mode
operations in the built-in document types and the full documentation (in Javadoc format) of the public API available for Author mode custom actions.

The subsequent Java examples make use of AWT classes. If you are developing extensions for the Oxygen XML Author XML Editor plugin for Eclipse, you will have to use their SWT counterparts.

⚠️ **Attention:** Make sure the Java classes of your custom Author mode operations are compiled with the same Java version used by Oxygen XML Author. Otherwise, the classes may not be loaded by the Java virtual machine. For example, if you run Oxygen XML Author with a Java 1.8 virtual machine but the Java classes of your custom Author mode operations are compiled with a Java 9 or later virtual machine then the custom operations cannot be loaded and used by the Java 1.8 virtual machine.

**Related Information:**

- [https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/ecss/extensions/api/AuthorOperation.html](https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/ecss/extensions/api/AuthorOperation.html)
- AuthorOperation.html

**Example 1 - Simple Use of a Dialog Box from an Author Mode Operation**

In this example, functionality is added for inserting images in a custom [framework](on page 2794). The images are represented by the `image` element. The location of the image file is represented by the value of the `href` attribute. In the Java implementation, a dialog box will be displayed with a text field, in which the user can enter a full URL or browse for a local file.

1. Set up a sample project following this set of instructions. The framework project is `oxygen-sample-framework`.

2. Modify the `simple.documentation.framework.InsertImageOperation` class that implements the `ro.sync.ecss.extensions.api.AuthorOperation` interface. This interface defines three methods: `doOperation`, `getArguments` and `getDescription`.

A short description of these methods follows:

- The `doOperation` method is invoked when the action is performed either by pressing the toolbar button, by selecting the menu item or by pressing the shortcut key. The arguments taken by this method can be one of the following combinations:
  - An object of type `ro.sync.ecss.extensions.api.AuthorAccess` and a map.
  - Argument names and values.
- The `getArguments` method is used by Oxygen XML Author when the action is configured. It returns the list of arguments (name and type) that are accepted by the operation.
• The `getDescription` method is used by Oxygen XML Author when the operation is configured. It returns a description of the operation.

**Example:**

Here is the implementation of these three methods:

```java
/**
 * Performs the operation.
 */
public void doOperation(
    AuthorAccess authorAccess,
    ArgumentsMap arguments)
    throws IllegalArgumentException,
             AuthorOperationException {

    JFrame oxygenFrame = (JFrame) authorAccess.getWorkspaceAccess().getParentFrame();
    String href = displayURLDialog(oxygenFrame);
    if (href.length() != 0) {
        // Creates the image XML fragment.
        String imageFragment =
            "<image xmlns='http://www.oxygenxml.com/sample/documentation' href='" + href + "'/>";
        // Inserts this fragment at the cursor position.
        int caretPosition = authorAccess.getEditorAccess().getCare Offset();
        authorAccess.getDocumentController().insertXMLFragment(imageFragment, caretPosition);
    }
}

/**
 * Has no arguments.
 */
public ArgumentDescriptor[] getArguments() {
    return null;
}

/**
 * ...
* @return A description of the operation.
*/

public String getDescription() {
    return "Inserts an image element. Asks the user for a URL reference."
}

**Note:** The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Author website.

**Important:**

Make sure you always specify the namespace of the inserted fragments.

```xml
<image xmlns="http://www.oxygenxml.com/sample/documentation"
       href='path/to/image.png'/>
```

3. Package the compiled class into a JAR (on page 2795) file. An example of an Ant script that packages the classes folder content into a JAR archive named sdf.jar is listed below:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<project name="project" default="dist">
  <target name="dist">
    <jar destfile="sdf.jar" basedir="classes">
      <fileset dir="classes">
        <include name="**/*"/>
      </fileset>
    </jar>
  </target>
</project>
```

4. Copy the sdf.jar file into your custom framework directory
   ([OXYGEN_INSTALL_DIR]\frameworks\[CUSTOM_FRAMEWORK_DIR]).

5. Add the sdf.jar to the class path. To do this, open the Preferences dialog box (Options > Preferences) (on page 79), go to Document Type Association, select SDF, and press the Edit button.

6. Select the Classpath tab in the lower part of the Document Type configuration dialog box (on page 94) and press the + Add button. In the displayed dialog box, enter the location of the JAR file, relative to the Oxygen XML Author frameworks folder.
7. Next, create the action that will use the defined operation. Go to the **Actions** subtab. Copy the icon files for the menu item and for the toolbar in your custom framework directory (`{OXYGEN_INSTALL_DIR}/frameworks/{CUSTOM_FRAMEWORK_DIR}`).

8. Define the action's properties:
   - Set **ID** to **insert_image**.
   - Set **Name** to **Insert image**.
   - Set **Menu access key** to letter **i**.
   - Set **Toolbar action** to `$({framework})/toolbarImage.png`.
   - Set **Menu icon** to `$({framework})/menuImage.png`.
   - Set **Shortcut key** to **Ctrl (Meta on Mac OS)+Shift+i**.

9. Next, set up the operation. You want to add images only if the current element is a **section**, **book** or **article**.
   - Set the value of **XPath expression** to
     ```xml
     local-name()='section' or local-name()='book' or local-name()='article'
     ```
   - Set the **Invoke operation** field to `simple.documentation.framework.InsertImageOperation`.

Figure 492. Selecting the Operation

10. Add the action to the toolbar, using the **Toolbar** panel.
To test the action, open or create an XML file and place the cursor at a valid location. Then press the button associated with the action from the toolbar. In the dialog box, select an image URL and press OK. The image is inserted into the document.

Example 2- Operations with Arguments. Report from Database Operation

In this example you will create an operation that connects to a relational database and executes an SQL statement. The result should be inserted in the edited XML document as a table. To make the operation fully configurable, it will have arguments for the database connection string, the user name, the password and the SQL expression.

1. Set up a sample project following this set of instructions. The framework project is oxygen-sample-framework.

2. Create the class simple.documentation.framework.QueryDatabaseOperation. This class must implement the ro.sync.ecss.extensions.api.AuthorOperation interface.

```java
import ro.sync.ecss.extensions.api.AuthorOperation;
import ro.sync.ecss.extensions.api.AuthorAccess;
import ro.sync.ecss.extensions.api.AuthorOperationException;
import ro.sync.ecss.extensions.api.ArgumentsMap;
import ro.sync.ecss.extensions.api.ArgumentDescriptor;

public class QueryDatabaseOperation implements AuthorOperation{

    // ... (remaining code)
}
```

3. Now define the operation's arguments. For each of them you will use a String constant representing the argument name:

```java
private static final String ARG_JDBC_DRIVER = "jdbc_driver";
private static final String ARG_USER = "user";
private static final String ARG_PASSWORD = "password";
private static final String ARG_SQL = "sql";
private static final String ARG_CONNECTION = "connection";
```

4. You must describe each of the argument name and type. To do this, implement the getArguments method that will return an array of argument descriptors:

```java
public ArgumentDescriptor[] getArguments() {
    ArgumentDescriptor args[] = new ArgumentDescriptor[] {
        new ArgumentDescriptor("ARG_JDBC_DRIVER",
```
```java
```
ArgumentDescriptor.TYPE_STRING,
   "The name of the Java class that is the JDBC driver."),
new ArgumentDescriptor(
   ARG_CONNECTION,
   ArgumentDescriptor.TYPE_STRING,
   "The database URL connection string."),
new ArgumentDescriptor(
   ARG_USER,
   ArgumentDescriptor.TYPE_STRING,
   "The name of the database user."),
new ArgumentDescriptor(
   ARG_PASSWORD,
   ArgumentDescriptor.TYPE_STRING,
   "The database password."),
new ArgumentDescriptor(
   ARG_SQL,
   ArgumentDescriptor.TYPE_STRING,
   "The SQL statement to be executed.")
};
return args;

These names, types and descriptions will be listed in the Arguments table when the operation is configured.

5. When the operation is invoked, the implementation of the doOperation method extracts the arguments, forwards them to the method that connects to the database and generates the XML fragment. The XML fragment is then inserted at the cursor position.

```java
public void doOperation(AuthorAccess authorAccess, ArgumentsMap map)
    throws IllegalArgumentException, AuthorOperationException {

    // Collects the arguments.
    String jdbcDriver =
        (String)map.getArgumentValue(ARG_JDBC_DRIVER);
    String connection =
        (String)map.getArgumentValue(ARG_CONNECTION);
    String user =
        (String)map.getArgumentValue(ARG_USER);
    String password =
        (String)map.getArgumentValue(ARG_PASSWORD);
```
String sql = 
(String)map.getArgumentValue(ARG_SQL);

int caretPosition = authorAccess.getCaretOffset();
try {
    authorAccess.getDocumentController().insertXMLFragment(
        getFragment(jdbcDriver, connection, user, password, sql),
        caretPosition);
} catch (SQLException e) {
    throw new AuthorOperationException(
        "The operation failed due to the following database error: 
        + e.getMessage(), e);
} catch (ClassNotFoundException e) {
    throw new AuthorOperationException(
        "The JDBC database driver was not found. Tried to load 
        + jdbcDriver + ", e);
    }
}

6. The getFragment method loads the JDBC driver, connects to the database and extracts the data. The result is a table element from the http://www.oxygenxml.com/sample/documentation namespace. The header element contains the names of the SQL columns. All the text from the XML fragment is escaped. This means that the ‘<’ and ‘&’ characters are replaced with the ‘&lt,’ and ‘&amp;’ character entities to ensure the fragment is well-formed.

private String getFragment(
    String jdbcDriver,
    String connectionURL,
    String user,
    String password,
    String sql) throws
    SQLException,
    ClassNotFoundException {
        Properties pr = new Properties();
        pr.put("characterEncoding", "UTF8");
        pr.put("useUnicode", "TRUE");
        pr.put("user", user);
        pr.put("password", password);

        // Loads the database driver.
Class.forName(jdbcDriver);
// Opens the connection
Connection connection =
    DriverManager.getConnection(connectionURL, pr);
java.sql.Statement statement =
    connection.createStatement();
ResultSet resultSet =
    statement.executeQuery(sql);

StringBuffer fragmentBuffer = new StringBuffer();
fragmentBuffer.append(
    "<table xmlns="
    "'http://www.oxygenxml.com/sample/documentation'>"]");

//
// Creates the table header.
//
fragmentBuffer.append("<header>");
ResultSetMetaData metaData = resultSet.getMetaData();
int columnCount = metaData.getColumnCount();
for (int i = 1; i <= columnCount; i++) {
    fragmentBuffer.append("<td>");
    fragmentBuffer.append(xmlEscape(metaData.getColumnName(i)));
    fragmentBuffer.append("</td>");
}
fragmentBuffer.append("</header>");

//
// Creates the table content.
//
while (resultSet.next()) {
    fragmentBuffer.append("<tr>");
    for (int i = 1; i <= columnCount; i++) {
        fragmentBuffer.append("<td>");
        fragmentBuffer.append(xmlEscape(resultSet.getObject(i)));
        fragmentBuffer.append("</td>");
    }
    fragmentBuffer.append("</tr>");
}
Note: The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Author website.

7. Package the compiled class into a JAR (on page 2795) file.

8. Copy the JAR file and the JDBC driver files into your custom framework directory
   ([OXYGEN_INSTALL_DIR]\frameworks\[CUSTOM_FRAMEWORK_DIR]).

9. Add the JARS to the class path. To do this, open the Document Type Association preferences page (on page 92), select SDF and press the Edit button. Select the Classpath tab in the lower part of the Document Type configuration dialog box (on page 94) and press the Add button. In the displayed dialog box, enter the location of the JAR file, relative to the Oxygen XML Author frameworks folder.

10. Go to the Actions subtab. The action properties are:
    - Set ID to clients_report.
    - Set Name to Clients Report.
    - Set Menu access key to letter r.
    - Set Description to Connects to the database and collects the list of clients.
    - Set Toolbar icon to ${framework}/TableDB20.png (image TableDB20.png is already stored in the frameworks / sdf folder).
    - Leave empty the Menu icon.
    - Set shortcut key to Ctrl + Shift + C (Command + Shift + C on OS X).

11. The action will work only if the current element is a section. Set up the operation as follows:
    - Set XPath expression to:
      
      ```
      local-name()='section'
      ```
    - Use the Java operation defined earlier to set the Invoke operation field. Press the Choose button, then select simple.documentation.framework.QueryDatabaseOperation. Once
selected, the list of arguments is displayed. In the figure below the first argument, `jdbc_driver`, represents the class name of the MySQL JDBC driver. The connection string has the URL syntax: `jdbc://<database_host>:<database_port>/<database_name>`.

The SQL expression used in the example follows, but it can be any valid SELECT expression that can be applied to the database:

```java
SELECT userID, email FROM users
```

12. Add the action to the toolbar, using the **Toolbar** panel.

**Figure 493. Java Operation Arguments Setup**

To test the action, open or create an *xml* file and place the cursor at a valid location. Then press the **Create Report** button from the toolbar. You can see below the toolbar with the action button and sample table inserted by the **Clients Report** action.

**Figure 494. Table Content Extracted from the Database**
Author Mode Operations

This topic lists the default operations for the Author mode.

ChangeAttributeOperation

This operation allows you to add/modify/remove an attribute. You can use this operation in your own custom Author mode action to modify the value for a certain attribute on a specific XML element. The arguments of the operation are:

name
The attribute local name.

namespace
The attribute namespace.

elementLocation
The XPath location that identifies the element.

value
The new value for the attribute. If empty or null the attribute will be removed.

editAttribute
If an in-place editor exists for this attribute, it will automatically activate the in-place editor and start editing.

removeIfEmpty
The possible values are `true` and `false`. True means that the attribute should be removed if an empty value is provided. The default behavior is to remove it.

**ChangeAttributesOperation**

This operation allows you to add/modify/remove multiple attributes. You can use this operation in your own custom Author mode action to modify the value for one or more attributes for one or more XML elements. The arguments of the operation are:

- **elementLocations**
  The XPath location that identifies the elements whose attributes will be affected. If not defined, the element at the cursor location will be used.

- **attributeNames**
  The names of the attributes to add, modify, or remove. The values can be local names or Clark notations.

- **values**
  The new attributes values, each on a new line. An empty value will remove the attribute if `removeIfEmpty` is set to `true`.

- **removeIfEmpty**
  The possible values are `true` (default) and `false`. True means that the attribute will be removed if an empty value is provided.

**ChangePseudoClassesOperation**

Operation that sets a list of pseudo-class values to nodes identified by an XPath expression. It can also remove a list of values from nodes identified by an XPath expression. The operation accepts the following parameters:

- **setLocations**
  An XPath expression indicating a list of nodes for which the specified list of pseudo-classes will be set. If it is not defined, then the element at the cursor position will be used.

- **setPseudoClassNames**
  A space-separated list of pseudo-class names that will be set on the matched nodes.

- **removeLocations**
  An XPath expression indicating a list of nodes from which the specified list of pseudo-classes will be removed. If it is not defined, then the element at the cursor position will be used.
removePseudoclassNames
A space-separated list of pseudo-class names that will be removed from the matched nodes.

includeAllNodes
The possible values are yes and no. If set to yes, comments, CDATA, and text nodes are included when evaluating XPath expressions. If set to no, they are ignored.

DeleteElementOperation
Deletes the node indicated by the elementLocation parameter XPath expression. If missing, the operation will delete the node at the cursor location.

DeleteElementsOperation
Deletes the nodes indicated by the elementLocations parameter XPath expression. If missing, the operation will delete the node at the cursor location.

ExecuteCommandLineOperation
This operation allows you to start a process executing a given command line. It has the following arguments:

name
The name of the operation (or name of the console panel that corresponds to the process run by an action built over this operation).

workingDirectory
The path to the directory where the command line is executed. The default value is "." (current directory).

cmdLine
The command line to be executed (accepts editor variables (on page 2039)).

showConsole
If set to true, the console panel will be displayed in Oxygen XML Author. The default value is false.
ExecuteMultipleActionsOperation

This operation allows the execution of a sequence of actions, defined as a list of action IDs. The actions must be defined by the corresponding framework, or one of the common actions for all frameworks supplied by Oxygen XML Author.

**actionIDs**

The action IDs list that will be executed in sequence, the list must be a string sequence containing the IDs separated by commas or new lines.

ExecuteMultipleWebappCompatibleActionsOperation

An implementation of an operation that runs a sequence of Oxygen XML Web Author-compatible actions, defined as a list of IDs.

ExecuteTransformationScenariosOperation

This operation allows running one or more transformation scenarios defined in the current document type association (on page 2793). It is useful to add to the toolbar buttons that trigger publishing to various output formats. The argument of the operation is:

**scenarioNames**

The list of scenario names that will be executed, separated by new lines.

InsertEquationOperation

Inserts a fragment containing a MathML equation at the cursor offset. The argument of this operation is:

**fragment**

The XML fragment containing the MathML content that should be inserted.

InsertFragmentOperation

Inserts an XML fragment at the current cursor position. The selection, if there is one, remains unchanged. The fragment will be inserted in the current context of the cursor position meaning that if the current XML document uses some namespace declarations then the inserted fragment must use the same declarations. The namespace declarations of the inserted fragment will be adapted to the existing namespace declarations of the XML document. For more details about its list of parameters, see Arguments of InsertFragmentOperation Operation (on page 2043).
**InsertOrReplaceFragmentOperation**

Similar to **InsertFragmentOperation (on page 2025)**, except it removes the selected content before inserting the fragment. Also, the `insertPosition` parameter has another possible value: `Replace`. If this value is used, the operation deletes the node selected by the XPath expression denoted by the `insertLocation` parameter. For more details about its list of parameters, see **Arguments of InsertFragmentOperation Operation (on page 2043)**.

**InsertOrReplaceTextOperation**

Inserts a text at current position removing the selected content, if any. The argument of this operation is:

```
text
```

The text section to insert.

**InsertXIncludeOperation**

Insert an `XInclude` element at the cursor offset. Opens a dialog box that allows you to browse and select content to be included in your document and automatically generates the corresponding XInclude instruction.

**JSOperation**

Allows you to call the Java API from custom JavaScript content. For some sample **JSOperation** implementations, see [https://github.com/oxygenxml/javascript-sample-operations](https://github.com/oxygenxml/javascript-sample-operations).

**Note:** For the Oxygen XML Web Author, this operation cannot be invoked using the JavaScript API.

This operation accepts the following parameter:

```
script
```

The JavaScript content to execute. It must have a function called `doOperation()`, which can use the predefined `authorAccess` variable. The `authorAccess` variable has access to the entire `ro.sync.ecss.extensions.api.AuthorAccess` Java API.

The following example is a script that retrieves the current value of the `type` attribute on the current element, allows the end user to edit its new value and sets the new value in the document:

```javascript
function doOperation(){
    // Retrieve the current value of the type attribute
    let currentValue = authorAccess.type;
    // Prompt the user to edit the value
    let newValue = prompt("Enter new value for type: ", currentValue);
    // Set the new value in the document
    authorAccess.type = newValue;
}
```
//The current node is either entirely selected...
currentNode = authorAccess.getEditorAccess().getFullySelectedNode();
if(currentNode == null){
    //or the cursor is placed in it
caretOffset = authorAccess.getEditorAccess().getCaretOffset();
currentNode = authorAccess.getDocumentController().getNodeAtOffset(caretOffset);
}

//Get current value of the @type attribute
currentTypeValue = "";
currentTypeValueAttr = currentNode.getAttribute("type");
if(currentTypeValueAttr != null){
    currentTypeValue = currentTypeValueAttr.getValue();
}

//Ask user for new value for attribute.
newTypeValue = javax.swing.JOptionPane.showInputDialog("Input @type value", currentTypeValue);
if(newTypeValue != null){
    //Create and set the new attribute value for the @type attribute.
    attrValue = new Packages.ro.sync.ecss.extensions.api.node.AttrValue(newTypeValue);
    authorAccess.getDocumentController().setAttribute("type", attrValue, currentNode);
}
}

Tip: You can call functions defined inside a script called commons.js from your custom script content so that you can use that external script file as a library of functions. Note that this commons.js file must be placed in the root of the framework directory (for example, \[OXYGEN_INSTALL_DIR\]/frameworks/dita/commons.js) because that is the only location where Oxygen XML Author will look for it.

MoveCaretOperation

Flexible operation for moving the cursor within a document and it is also capable of performing a selection. The operation accepts the following arguments:

xpathLocation

An XPath expression that identifies the node relative to where the cursor will be moved. If the expression identifies more than one node, only the first one will be taken into account.
position

The position relative to the node obtained from the XPath expression where the cursor will be moved. When also choosing to perform a selection, you can use the following possible values:

- **Before** - Places the cursor at the beginning of the selection.
- **Inside, at the beginning** - Places the cursor at the beginning of the selection.
- **After** - Places the cursor at the end of the selection.
- **Inside, at the end** - Places the cursor at the end of the selection.

selection

Specifies if the operation should select the element obtained from the XPath expression, its content, or nothing at all. The possible values of the argument are: \texttt{None}, \texttt{Element}, and \texttt{Content}.

**MoveElementOperation**

Flexible operation for moving an XML element to another location from the same document. XPath expressions are used to identify the source element and the target location. The operation takes the following parameters:

- **sourceLocation**
  XPath expression that identifies the content to be moved.

- **deleteLocation**
  XPath expression that identifies the node to be removed. This parameter is optional. If missing, the \texttt{sourceLocation} parameter will also identify the node to be deleted.

- **surroundFragment**
  A string representation of an XML fragment. The moved node will be wrapped in this string before moving it in the destination.

- **targetLocation**
  XPath expression that identifies the location where the node must be moved to.

- **insertPosition**
  Argument that indicates the insert position.

- **moveOnlySourceContentNodes**
  When \texttt{true}, only the content of the source element is moved.

- **processTrackedChangesForXPathLocations**
When nodes are located via an XPath expression and the nodes are deleted with Change Tracking (on page 2800) enabled, they are considered as being present by default (thus, the change tracking is ignored). If you set this argument to true and change tracking is enabled, deleted nodes will be ignored when the XPath locations are computed (thus, the change tracking is NOT ignored).

**OpenInSystemAppOperation**

Opens a resource in the system application that is associated with the resource in the operating system. The arguments of this operation are:

- **resourcePath**
  
  An XPath expression that, when executed, returns the path of the resource to be opened. Editor variables (on page 266) are expanded in the value of this parameter, before the expression is executed.

- **isUnparsedEntity**
  
  Possible values are true or false. If the value is true, the value of the resourcePath argument is treated as the name of an unparsed entity.

**ReloadContentOperation**

Reloads the content of the editor by re-reading the information from the URL used to open it. It accepts the following argument:

- **markAsNotModified**
  
  The possible values are true and false. After reloading the editor, the content may appear as modified and in some cases where the content is already present on the file server, you would not want the user to save it again. You can set this flag to true to prevent the editor from showing the content as modified.

**RemovePseudoClassOperation**

An operation that removes a pseudo-class from an element. Accepts the following parameters:

- **name**
  
  Name of the pseudo-class to be removed.

- **includeAllNodes**
  
  The possible values are yes and no. If set to yes, comments, CDATA, and text nodes are included when evaluating XPath expressions. If set to no, they are ignored.

- **elementLocation**
The XPath location that identifies the element. Leave it empty for the current element. It can also identify multiple elements, in which case the pseudo class will be removed from all of them.

Example:

Suppose that there is a pseudo-class called `myClass` on the element `paragraph` and there are CSS styles matching the pseudo-class.

```xml
paragraph:myClass{
    font-size:2em;
    color:red;
}
paragraph{
    color:blue;
}
```

In the previous example, by removing the pseudo-class, the layout of the `paragraph` is rebuilt by matching the other rules (in this case, the foreground color of the `paragraph` element will become blue.

**RenameElementOperation**

This operation allows you to rename all occurrences of the elements identified by an XPath expression. The operation requires two parameters:

- `elementName`
  The new element name.

- `elementLocation`
  The XPath expression that identifies the element occurrences to be renamed. If this parameter is missing, the operation renames the element at current cursor position.

**SetPseudoClassOperation**

An operation that sets a pseudo-class to an element. The operation accepts the following parameters:

- `elementLocation`
  An XPath expression indicating the element for which the pseudo-class will be set. If it is not defined, then the element at cursor position will be used.

- `name`
  The pseudo-class local name.
**includeAllNodes**

The possible values are *yes* and *no*. If set to *yes*, comments, CDATA, and text nodes are included when evaluating XPath expressions. If set to *no*, they are ignored.

**ShowElementDocumentationOperation**

Opens the associated specification HTML page for the current element. The operation accepts as parameter a URL pattern that points to the HTML page containing the documentation.

**SurroundWithFragmentOperation**

Surrounds the selected content with a text fragment. Since the fragment can have multiple nodes, the surrounded content will be always placed in the first leaf element. If there is no selection, the operation will simply insert the fragment at the cursor position. For more details about the list of parameters go to: Arguments of SurroundWithFragmentOperation *(on page 2046)*.

**SurroundWithTextOperation**

This operation has two arguments (two text values) that will be inserted before and after the selected content. If there is no selected content, the two sections will be inserted at the cursor position. The arguments of the operation are:

- **header**
  - The text that is placed before the selection.

- **footer**
  - The text that is placed after the selection.

**TogglePseudoClassOperation**

An implementation of an operation to toggle on/off the pseudo-class of an element. Accepts the following parameters:

- **name**
  - Name of the pseudo-class to be toggled on/off.

- **includeAllNodes**
  - The possible values are *yes* and *no*. If set to *yes*, comments, CDATA, and text nodes are included when evaluating XPath expressions. If set to *no*, they are ignored.

- **elementLocation**
The XPath location that identifies one or more elements for which the pseudo class will be toggled. Leave it empty for the current element.

**Example:**

```
paragraph:myClass{
  color:red;
}
paragraph{
  color:blue;
}
```

By default, the paragraph content is rendered in blue. Suppose that you have a `TogglePseudoClassOperation` configured for the `myClass` pseudo-class. Invoking it the first time will set the `myClass` pseudo-class and the paragraph will be rendered in red. Invoking the operation again, will remove the pseudo-class and the visible result will be a blue rendered paragraph element.

**ToggleSurroundWithElementOperation**

This operation allows wrapping and unwrapping content in a specific wrapper element that can have certain attributes specified on it. It is useful to implement toggle actions such as highlighting text as bold, italic, or underline. The operation supports processing multiple selection intervals, such as multiple cells within a table column selection. The arguments of the operation are:

- `element`:
  The element to wrap or unwrap content.

- `schemaAware`:
  This argument applies only on the surround with element operation and controls whether or not the insertion is valid, based upon the schema. If the insertion is not valid, then wrapping action will be broken up into smaller intervals until the wrapping action is valid. For example, if you try to wrap a `paragraph` element with a `bold` element, it would not be valid, so the operation will wrap the text inside the paragraph instead, since it would be valid at that position.

**UnwrapTagsOperation**

This operation allows removing the element tags either from the current element or for an element identified with an XPath location. The argument of the operation is:

- `unwrapElementLocation`
An XPath expression indicating the element to unwrap. If it is not defined, the element at the cursor position is unwrapped.

**XQueryUpdateOperation**

Allows you to execute an XQuery Update script directly over content in Author mode.

**Note:** This operation is not applicable to the Oxygen XML Author Component or the Oxygen XML Web Author.

It supports the following arguments:

- **script**
  
The XQuery Update script to be executed. The value can either be an XQuery script or a URL that points to the XQuery Update script. You can use the `${framework}` (on page 272) or `${frameworkDir}` (on page 272) editor variables to refer the scripts from the framework directory.

  The script will be executed in the context of the node at the cursor position. If the script declares the following variable, it will also receive the selected nodes (assuming that entire nodes are selected):
  
  ```xml
  declare variable $oxyxq:selection external;
  ```

  In the example below (on page 2034), you can see how this argument is used.

- **externalParams**
  
  A string that can assign multiple key-value pairs separated by a comma or a new line character.

  For example, if an XQuery script declares two external parameters like this:
  
  ```xml
  declare variable $param1 external;
  declare variable $param2 external;
  ```

  You can pass custom values for each parameter by setting the `externalParams` to `param1=value1,param2=value2`.

- **expandXincludeReferences**
  
  Makes all XInclude elements transparent to the XQuery transformer. When the XInclude references are transparent, the XQueryUpdateOperation can use the referenced elements for further processing in the current document, but it cannot change their values in the original document. The default value is `false`, which means the XInclude elements are not transparent.
An example of an XQuery Update Script that converts paragraphs to list items:

```xquery
declare namespace oxyxq = "http://www.oxygenxml.com/ns/xqu";

(: This variable will be linked to the selected nodes assuming that there are
  actually fully selected nodes. For example this selection will return null:
  <p>{SEL_START}text{SEL_END} in para</p>
  but this will give two "p" elements:
  {SEL_END}<p>text</p><p>text2</p>{SEL_END}

  If a multiple selection exists it will also be processed and forwarded.
  Again, only fully selected nodes will be passed.
:)

declare variable $oxyxq:selection external;

(: We will process either the selection or the context node :)
let $toProcess :=
  if (empty($oxyxq:selection)) then
    (.)
  else
    ($oxyxq:selection)

return if (not(empty($toProcess))) then

  (;
   (: Create the list :)\n   let $ul :=
     <ul>
     {\n       for $sel in $toProcess
       return
       <li>{$sel}</li>
     }
   </ul>

  )

return

  (;
   (: Delete the processed nodes :)\n   for $sel in $toProcess
   return
   delete node $sel,
   (: Inserts the constructed list :)\n   insert node $ul
   before $toProcess[1]
)```

XSLTOperation and XQueryOperation

Applies an XSLT or XQuery script on a source element and then replaces or inserts the result in a specified target element.

**Note:** For the Oxygen XML Web Author, these operations cannot be invoked using the JavaScript API.

These operations accept the following parameters:

**sourceLocation**

An XPath expression indicating the element that the script will be applied on. If it is not defined, then the element at the cursor position will be used.

There may be situations in which you want to look at an ancestor of the current element and take decisions in the script based on this. To do this, you can set the **sourceLocation** to point to an ancestor node then use the **oxy:current-element()** function to access the current element, as in the following example:

```xml
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform" version="2.0"
    xpath-default-namespace="http://docbook.org/ns/docbook"
    xmlns:oxygen="http://www.oxygenxml.com/ns/author/xpath-extension-functions"
    exclude-result-prefixes="oxy">
    <xsl:template match="/">
        <xsl:apply-templates select="oxy:current-element()"/>
    </xsl:template>

    <xsl:template match="para">
        <!-- And the context is again inside the current element, but we can use information from the entire XML -->
        <xsl:variable name="keyImage" select="/imagedata[@fileref='images/lake.jpeg']/ancestor::inlinemediaobject/@xml:id/string()">
            <xref linkend="{$keyImage}" role="key_include" xmlns="http://docbook.org/ns/docbook"/>
        </xsl:variable>
    </xsl:template>
</xsl:stylesheet>
```
targetLocation

An XPath expression indicating the insert location for the result of the transformation. If it is not defined then the insert location will be at the cursor location.

script

The script content (XSLT or XQuery). The base system ID for this will be the framework file, so any include/import reference will be resolved relative to the .framework file that contains this action definition.

For example, for the following script, the imported xslt_operation.xsl needs to be located in the current framework directory.

```xml
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    version="1.0">  
    <xsl:import href="xslt_operation.xsl"/>
</xsl:stylesheet>
```

You can also use a path for an included or imported reference. When using a path, the following apply:

- A relative path is resolved to the framework directory.
- The $[framework] editor variable (on page 272) can also be used to reference resources from the framework directory.
- The path is passed through the catalog mappings. It helps to use an absolute URL (for instance, http://www.oxygenxml.com/fr/testy.xsl) and map it in the catalog.xml file from the framework directory to a resource from the framework.

action

The insert action relative to the node determined by the target XPath expression. It can be: Replace, At cursor position, Before, After, Inside as first child or Inside as last child.

caretPosition

The position of the cursor after the action is executed. It can be: Preserve, Before, Start, First editable position, End, or After. If this parameter is not set, you can still indicate the position of the cursor by using the $[caret] editor variable (on page 270) in the inserted content.
expandEditorVariables

Parameter controlling the expansion of editor variables (on page 266) returned by the script processing. Expansion is enabled by default.

suspendTrackChanges

It has 2 possible values (true and false). The default value is false. When set to true, the Track Changes (on page 2800) feature is deactivated. When using this argument, after the action is finished, the state of the Track Changes feature is restored to its initial value.

externalParams

A string that can assign multiple key-value pairs separated by a comma or a new line character.

For example, if an XQuery script declares two external parameters like this:

```
declare variable $param1 external;
declare variable $param2 external;
```

You can pass custom values for each parameter by setting the externalParams to param1=value1,param2=value2.

XSLTOperation Example: Sort a list with respect to the language declared on the root element:

Suppose you want an action that will sort a list with respect to the language declared on the root element and you have an XML file like this:

```
<article xml:lang="en">
  <ul>
    <li>B</li>
    <li>C</li>
    <li>A</li>
  </ul>
</article>
```

The XSLTOperation needs to be configured as follows:

- sourceLocation is set to /* so that the script has access to the root element and its children.
- targetLocation is left untouched (assuming that the action is active only when the cursor is inside the list).

The XSLT script would look like this:

```
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
```
<xsl:stylesheet version="2.0"
xmlns:oxy="http://www.oxygenxml.com/ns/author/xpath-extension-functions"
xmlns:xs="http://www.w3.org/2001/XMLSchema"
exclude-result-prefixes="xs oxy">

<xsl:template match="/">

<!--
sourceLocation parameter was set to /* to have a larger context.
We can pinpoint the element that contained the caret
using the oxy:current-element() function.
-->
<xsl:apply-templates select="oxy:current-element()"/>
</xsl:template>

<xsl:template match="ul">

<!-- Because the sourceLocation parameter was set to /* we now have access to
the root element and its attributes. -->
<xsl:variable name="lang" select="//*/@xml:lang"/>
<xsl:variable name="collationURI">
  <xsl:value-of select="concat('http://www.w3.org/2013/collation/UCA?lang=',
$lang)"/>
</xsl:variable>

<xsl:copy>
  <xsl:copy-of select="@*"/>

  <!-- Copy the list items, but sorted. -->
  <xsl:apply-templates select="li">
    <xsl:sort collation="{$collationURI}" select="text()"/>
  </xsl:apply-templates>
</xsl:copy>
</xsl:template>

<!-- This copy template will handle the contents of the list items. -->
<xsl:template match="@* | node()">
  <xsl:copy>
    <xsl:apply-templates select="@* | node()"/>
  </xsl:copy>
</xsl:template>
</xsl:stylesheet>
Using Entities and Xincludes with the XSLTOperation

- **Entities** will be resolved in the result.
- **Xincludes** are also resolved in the result, and you can alter the XML obtained after the resolving using the XSLT/XQuery script of the operation, but you cannot alter the included document itself.

Editor Variables in Author Mode Operations

**Author** mode operations can include parameters that contain the following editor variables (on page 266):

- **${caret}** - The position where the cursor is located. This variable can be used in a code template, in **Author** mode operations, or in a **selection plugin**.

  **Note:** The **${caret}** editor variable is available only for parameters that take XML content as values. It is replaced with the **${UNIQUE_CARET_MARKER_FOR_AUTHOR}** macro. The default Author operations process this macro and position the cursor at the designated offset.

- **${selection}** - The current selected text content in the current edited document. This variable can be used in a code template, in **Author** mode operations, or in a **selection plugin**.

- **${ask('message', type, ('real_value1':'rendered_value1'; 'real_value2':'rendered_value2'; ...), 'default_value', @id)}** - To prompt for values at runtime, use the **ask('message', type, ('real_value1':'rendered_value1'; 'real_value2':'rendered_value2'; ...), 'default_value')** editor variable. You can set the following parameters:
  - 'message' - The displayed message. Note the quotes that enclose the message.
  - 'default-value' - Optional parameter. Provides a default value.
  - '@id' - Optional parameter. Used for identifying the variable to reuse the answer using the **${answer(@id)}** editor variable.
  - 'type' - Optional parameter, with one of the following values:

  **Note:** The title of the dialog box will be determined by the type of parameter and as follows:
  - For **url** and **relative_url** parameters, the title will be the name of the parameter and the value of the 'message'.
  - For the other parameters listed below, the title will be the name of that respective parameter.
  - If no parameter is used, the title will be "Input".

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Format: ${ask('message', url, 'default_value')}</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>url</strong></td>
<td><strong>Description:</strong> Input is considered a URL. Oxygen XML Author checks that the provided URL is valid.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>password</td>
<td>Format: ${ask('message', password, 'default')}</td>
</tr>
<tr>
<td></td>
<td>Description: The input is hidden with bullet characters.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
</tr>
<tr>
<td></td>
<td>■ ${ask('Input password', password)} - The displayed dialog box</td>
</tr>
<tr>
<td></td>
<td>has the name 'Input password' and the input is hidden with bullet</td>
</tr>
<tr>
<td></td>
<td>symbols.</td>
</tr>
<tr>
<td></td>
<td>■ ${ask('Input password', password, 'abcd')} - The displayed dialog box</td>
</tr>
<tr>
<td></td>
<td>has the name 'Input password' and the input hidden with bullet</td>
</tr>
<tr>
<td></td>
<td>symbols. The input field already contains the default abcd value.</td>
</tr>
<tr>
<td>generic</td>
<td>Format: ${ask('message', generic, 'default')}</td>
</tr>
<tr>
<td></td>
<td>Description: The input is considered to be generic text that requires no</td>
</tr>
<tr>
<td></td>
<td>special handling.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
</tr>
<tr>
<td></td>
<td>■ ${ask('Hello world!')} - The dialog box has a Hello world! message</td>
</tr>
<tr>
<td></td>
<td>displayed.</td>
</tr>
<tr>
<td></td>
<td>■ ${ask('Hello world!', generic, 'Hello again!')} - The dialog box has a</td>
</tr>
<tr>
<td></td>
<td>Hello world! message displayed and the value displayed in the input box is</td>
</tr>
<tr>
<td></td>
<td>'Hello again!'.</td>
</tr>
<tr>
<td>relative_url</td>
<td>Format: ${ask('message', relative_url, 'default')}</td>
</tr>
<tr>
<td></td>
<td>Description: Input is considered a URL. Oxygen XML Author tries to make</td>
</tr>
<tr>
<td></td>
<td>the URL relative to that of the document you are editing.</td>
</tr>
<tr>
<td></td>
<td>Note: If the $ask editor variable is expanded in content that is not</td>
</tr>
<tr>
<td></td>
<td>yet saved (such as an untitled file, whose path cannot be determined),</td>
</tr>
<tr>
<td></td>
<td>then Oxygen XML Author will transform it into an absolute URL.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
</tr>
<tr>
<td></td>
<td>${ask('File location', relative_url, 'C:/example.txt')} - The dialog box</td>
</tr>
<tr>
<td></td>
<td>has the name 'File location'. The URL inserted in the input box is made</td>
</tr>
<tr>
<td></td>
<td>relative to the current edited document location.</td>
</tr>
<tr>
<td>combobox</td>
<td>Format: ${ask('message', combobox, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'), 'default'})</td>
</tr>
</tbody>
</table>
| Parameter | Description: Displays a dialog box that offers a drop-down menu. The drop-down menu is populated with the given `rendered_value` values. Choosing such a value will return its associated value (`real_value`).

**Note:** The `default` parameter specifies the default selected value and can match either a key or a value.

**Example:**

- \${ask('Operating System', combobox, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'osx')} - The dialog box has the name 'Operating System'. The drop-down menu displays the three given operating systems. The associated value will be returned based upon your selection.

**Note:** In this example, the default value is indicated by the `osx` key. However, the same result could be obtained if the default value is indicated by `Mac OS X`, as in the following example: \${ask('Operating System', combobox, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'Mac OS X')}

- \${ask('Mobile OS', combobox, ('win':'Windows Mobile';'ios':'iOS';'and':'Android'), 'Android')}  

**editable_comboboxFormat:** \${ask('message', editable_combobox, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'), 'default')}

**Description:** Displays a dialog box that offers a drop-down menu with editable elements. The drop-down menu is populated with the given `rendered_value` values. Choosing such a value will return its associated `real_value` or the value inserted when you edit a list entry.

**Note:** The `default` parameter specifies the default selected value and can match either a key or a value.

**Example:**

\${ask('Operating System', editable_combobox, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'osx')} - The dialog box has the name 'Operating System'. The drop-down menu displays the three given operating systems and also allows you to edit the entry. The associated value will be returned based upon your selection or the text you input.
Parameter | Format: \${ask('message', radio, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'), 'default'))
--- | ---
radio | Description: Displays a dialog box that offers a series of radio buttons. Each radio button displays a 'rendered_value' and will return an associated real_value.

⚠️ Note: The 'default' parameter specifies the default selected value and can match either a key or a value.

Example:

\${ask('Operating System', radio, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'osx'}) - The dialog box has the name 'Operating System'. The radio button group allows you to choose between the three operating systems.

⚠️ Note: In this example, Mac OS X is the default selected value and if selected, it would return osx for the output.

- \${timeStamp} - Time stamp, that is the current time in Unix format. For example, it can be used to save transformation results in multiple output files on each transformation.
- \${uuid} - Universally unique identifier, a unique sequence of 32 hexadecimal digits generated by the Java UUID class.
- \${id} - Application-level unique identifier. It is a short sequence of 10-12 letters and digits that is not guaranteed to be universally unique.
- \${cfm} - Current file name without extension and without parent folder. The current file is the one currently opened and selected.
- \${cfne} - Current file name with extension. The current file is the one currently opened and selected.
- \${cf} - Current file as file path, that is the absolute file path of the current edited document.
- \${cfd} - Current file folder as file path, that is the path of the current edited document up to the name of the parent folder.
- \${frameworksDir} - The path (as file path) of the frameworks directory.
- \${pd} - The file path to the folder that contains the current project file (.xpr).
- \${oxygenInstallDir} - Oxygen XML Author installation folder as file path.
- \${homeDir} - The path (as file path) of the user home folder.
- \${pn} - Current project name.
- \${env(VAR_NAME)} - Value of the VAR_NAME environment variable. The environment variables are managed by the operating system. If you are looking for Java System Properties, use the \${system(var.name)} editor variable.
- `{system(var.name)}` - Value of the `var.name` Java System Property. The Java system properties can be specified in the command-line arguments of the Java runtime as `-Dvar.name=var.value`. If you are looking for operating system environment variables, use the `{env(VAR_NAME)}` editor variable instead.

- `{date(pattern)}` - Current date. The allowed patterns are equivalent to the ones in the Java `SimpleDateFormat` class. Example: `yyyy-MM-dd`.

**Note:** This editor variable supports both the `xs:date` and `xs:datetime` parameters. For details about `xs:date`, go to: [http://www.w3.org/TR/xmlschema-2/#date](http://www.w3.org/TR/xmlschema-2/#date). For details about `xs:datetime`, go to: [http://www.w3.org/TR/xmlschema-2/#dateTime](http://www.w3.org/TR/xmlschema-2/#dateTime).

### How to Find More Information About the Arguments of an Operation

If you need to find more information about the arguments of an operation, there are several places where this information is available:

- In the [API documentation](#) for the particular operation.
- By invoking the `getArguments()` method on the operation.
- In the source code of the operation.
- In Oxygen XML Author:
  1. Go to **Options > Preferences > Document Type Association**, select a document type and click the **New, Edit, Duplicate, or Extend** button (on page 92).
  2. Go to the **Author** tab and then the **Actions** subtab. At the bottom of this subtab, click **New** to open the **Action** dialog box (on page 102).
  3. Locate the **Operation** field and click the **Choose** button on the right side. This will open a dialog box that displays the default operations.
  4. Double-click the operation (or select it and click **OK**).

    The arguments for the operation will now be displayed in the **Action** dialog box (on page 102).

### Arguments of InsertFragmentOperation Operation

**fragment**

This argument has a textual value. This value is parsed by Oxygen XML Author as it was already in the document at the cursor position. You can use entity references declared in the document and it is namespace aware. The fragment may have multiple roots.

You can even use namespace prefixes that are not declared in the inserted fragment, if they are declared in the document where the insertion is done. For the sake of clarity, you should always prefix and declare namespaces in the inserted fragment!
If the fragment contains namespace declarations that are identical to those found in the document, the namespace declaration attributes will be removed from elements contained by the inserted fragment.

There are two possible scenarios:

1. **Prefixes that are not bound explicitly**

   For instance, the fragment:

   ```xml
   <x:item id="dty2"/>
   &ent;
   <x:item id="dty3"/>
   ```

   Can be correctly inserted in the document: ('|' marks the insertion point):

   ```xml
   <?xml version="1.0" encoding="UTF-8"?>
   <!DOCTYPE x:root [  
     <!ENTITY ent "entity">
   ]>
   <x:root xmlns:x="nsp">
     |
   </x:root>
   
   Result:
   ```

   ```xml
   <?xml version="1.0" encoding="UTF-8"?>
   <!DOCTYPE x:root [  
     <!ENTITY ent "entity">
   ]>
   <x:root xmlns:x="nsp">
     <x:item id="dty2"/>
     &ent;
     <x:item id="dty3"/>
   </x:root>
   ```

2. **Default namespaces**

   If there is a default namespace declared in the document and the document fragment (on page 2793) does not declare a namespace, the elements from the fragment are considered to be in **no namespace**.

   For instance, the fragment:
Inserted in the document:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<root xmlns="nsp">
|  
</root>
```

Gives the result document:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<root xmlns="nsp">
  <item xmlns="" id="dty2"/>
  <item xmlns="" id="dty3"/>
</root>
```

**insertLocation**

An XPath expression that is relative to the current node. It selects the reference node for the fragment insertion. When missing, the fragment will be inserted at the cursor position.

**insertPosition**

Specifies where the insertion is made relative to the reference node selected by the `insertLocation`. It can be one of the following constants:

- **Inside as first child** (default value) - The fragment is inserted as first child of the reference node.
- **Inside as last child** - The fragment is inserted as the last child of the reference node.
- **After** - The fragment is inserted after the reference node.
- **Before** - The fragment is inserted before the reference node.

**goToNextEditablePosition**

After inserting the fragment, the first editable position is detected and the cursor is placed at that location. It handles any in-place editors used to edit attributes. It will be ignored if the fragment specifies a cursor position using the `$({caret})` editor variable (on page 270). The possible values of this action are true and false.

**schemaAware**

This argument applies only on the surround with element operation and controls whether or not the insertion is valid, based upon the schema. If the insertion is not valid,
then wrapping action will be broken up into smaller intervals until the wrapping action is valid. For example, if you try to wrap a *paragraph* element with a *bold* element, it would not be valid, so the operation will wrap the text inside the paragraph instead, since it would be valid at that position.

### Arguments of SurroundWithFragmentOperation

**fragment**

The XML fragment that will surround the selection. For example, consider the fragment:

```xml
<F>
  <A>
  </A>
  <B>
    <C></C>
  </B>
</F>
```

and the document:

```xml
<doc>
  <X></X>
  <Y></Y>
  <Z></Z>
</doc>
```

Considering the selected content to be surrounded is the sequence of elements $X$ and $Y$, then the result is:

```xml
<doc>
  <F>
    <A>
      <X></X>
      <Y></Y>
    </A>
    <B>
      <C></C>
    </B>
  </F>
  <Z></Z>
</doc>
```
Since the element \( \lambda \) was the first leaf in the fragment, it received the selected content. The fragment was then inserted in the place of the selection.

**schemaAware**

This argument applies only on the surround with element operation and controls whether or not the insertion is valid, based upon the schema. If the insertion is not valid, then wrapping action will be broken up into smaller intervals until the wrapping action is valid. For example, if you try to wrap a *paragraph* element with a *bold* element, it would not be valid, so the operation will wrap the text inside the paragraph instead, since it would be valid at that position.

Adding a Custom Operation to an Existing Framework

This task explains how to add a custom Author mode operation to an existing framework (on page 2794) (document type).

1. Setup a sample project by following the instructions for installing the SDK.
   
   **Tip:** The SDK contains a sample framework project called oxygen-sample-framework.

2. A variety of classes in the `simple.documentation.framework.operations` package implement the `ro.sync.ecss.extensions.api.AuthorOperation` interface. Depending on your use-case, modify one of these classes.

3. Pack the operation class inside a Java JAR library.

4. Copy the JAR library to your framework directory (for example, `{OXYGEN_INSTALL_DIR}/frameworks/{FRAMEWORK_DIR}`).

5. Open the Preferences dialog box (Options > Preferences) (on page 79), go to Document Type Association, and edit the document type (you need write access to the `{OXYGEN_INSTALL_DIR}` to open the Document Type configuration dialog box (on page 94).
   
   a. In the Classpath tab, add a reference to your JAR library (for example, `${framework}/customAction.jar`).
   b. Go to the Author tab, then go to the Actions subtab.
   c. Click the + New button and use the Action dialog box (on page 102) to create a new action that uses your custom operation.
   d. Mount the action to the toolbars or menus. You can also define a shortcut key.

6. Share the modifications (on page 1942) with your colleagues. The files that should be shared are your customAction.jar library and the .framework configuration file from the `{OXYGEN_INSTALL_DIR}/frameworks/{FRAMEWORK_DIR}` directory.
Customizing Author Mode Through CSS

The visual Author editing mode can be customized by creating CSS files to define styles for the XML elements and other components. The Author editing mode supports most CSS 2.1 selectors, numerous CSS 2.1 properties, and some CSS 3 selectors. Oxygen XML Author also supports stylesheets coded with the LESS dynamic stylesheet language. Also, Oxygen XML Author has added some custom functions and properties that extend the W3C CSS specification and are useful for a wide range of use-cases for developers who customize Author mode through custom frameworks (on page 1893).

Associating a CSS with an XML Document

**Associating a Stylesheet with an XML Document**

The rendering of an XML document in the Author mode is driven by a CSS stylesheet that conforms to the version 2.1 of the CSS specification from the W3C consortium. Some CSS 3 features, such as namespaces and custom extensions, of the CSS specification are also supported. Oxygen XML Author also supports stylesheets coded with the LESS dynamic stylesheet language.

There are several methods for associating a stylesheet (CSS or LESS) with an XML document:

1. Insert the `xml-stylesheet` processing instruction with the `type` attribute at the beginning of the XML document. If you do not want to alter your XML documents, you should create a new document type (framework) (on page 1893).

   **CSS example:**

   ```xml
   <?xml-stylesheet type="text/css" href="test.css"?>
   ```

   **LESS example:**

   ```xml
   <?xml-stylesheet type="text/css" href="test.less"?>
   ```

   **Note:** XHTML documents need a `link` element, with the `href` and `type` attributes in the `head` child element, as specified in the W3C stylesheet specification. XHTML example:
Tip: You can also insert the `xml-stylesheet` processing instruction by using the Associate XSLT/CSS Stylesheet action that is available on the toolbar or in the Document > XML Document menu.

2. Add a new CSS or LESS file to a framework (on page 2794) (document type). To do so, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Document Type Association. Edit the appropriate framework, open the Author tab, then the CSS subtab. Press the + New button to add a new CSS or LESS file.

Note: The built-in frameworks are read-only, so you need to Extend (on page 93) or Duplicate (on page 92) them to configure them as custom frameworks.

If a document has no CSS association or the referenced stylesheet files cannot be loaded, a default one is used. A warning message is also displayed at the beginning of the document, presenting the reason why the CSS cannot be loaded.

Figure 495. Document with no CSS association default rendering

For information about associating a CSS to a framework (document type), see Customizing Author Mode Using CSS Files Associated with a Framework (on page 1917).

Handling CSS Imports

When a CSS document contains imports to other CSS documents, the references are also passed through the XML Catalog (on page 2800) URI mappings to determine an indirect CSS referenced location.
Example: CSS Import

For example, if you can have a CSS import, such as:

```html
@import "http://host/path/to/location/custom.css";
```

and then add your own XML Catalog (on page 2800) file that maps the location to a custom CSS in the XML Catalog preferences page (on page 183):

```xml
<uri name="http://host/path/to/location/custom.css" uri="path/to/custom.css"/>
```

Adding a Custom Default CSS for Every XML Document

To add a custom CSS that is applied to every XML document, add a mapping in your XML Catalog (on page 2800) file that looks like this:

```xml
<uri name="http://www.oxygenxml.com/extensions/author/css/userCustom.css" uri="path/to/custom.css"/>
```

This extra mapped CSS location will be parsed every time the application processes the CSS stylesheets used to render the opened XML document in the visual Author editing mode. This allows your custom CSS to be used without the need to modify all other CSS stylesheets contributed in the document type configuration.

Editor Variables in CSS Imports

You can use various editor variables (on page 266) in CSS imports. When editing an XML document with an associated CSS in Author mode, the editor variables will be expanded and resolved.

Example: Editor Variable in a CSS Import

For example, the following editor variable:

```html
@import "${framework(DITA)}/custom.css";
```

is resolved in the DITA framework (on page 2794) folder where the custom.css is placed. In the Document Type Association preferences page (on page 92), you can see a list of document type. The name for your particular document type needs to be passed as a parameter to the framework() function.

Note: If you use editor variables like $(cfdu) (Current File Directory URL), it will be expanded to the URL of the current CSS document that contains the imports rather than the XML document that references the CSS.
Displaying Processing Instructions from Other XML Editors

By default, external processing instructions are hidden (for example, processing instructions used to store metadata in other XML editors). If you want them to be displayed (for example, to edit them), they must be associated with the current document using a CSS (on page 2048) like this:

```css
@namespace oxy "http://www.oxygenxml.com/extensions/author";
 oxy|processing-instruction[Pub],
 oxy|processing-instruction[PubTbl],
 oxy|processing-instruction[xm-replace_text],
 oxy|processing-instruction[xm-deletion_mark],
 oxy|processing-instruction[xm-insertion_mark_start],
 oxy|processing-instruction[xm-insertion_mark_end]
{
    display:block !important;
}
```

Specifying Media Types in the CSS

The CSS style sheets can specify how a document is presented on different types of media (on the screen, paper, etc.) You can specify that some of the selectors from your CSS should be taken into account only in the Oxygen XML Author Author mode and ignored in other media types. This can be accomplished by using the oxygen media type.

**Example: oxygen Media Type**

```css
b{
    font-weight:bold;
    display:inline;
}
@media oxygen{
    b{
        text-decoration:underline;
    }
}
```

This example results in the text being bold if the document is opened in a web browser that does not recognize `@media oxygen`, while the text is bold and underlined when opened in Oxygen XML Author Author mode.
You can also use the `oxygen` media type to specify CSS selectors to be applied in certain operating systems or platforms by using the `os` and `platform` properties. For example, you can specify one set of style rules for displaying Oxygen XML Author in Windows, and another set of style rules for Mac OS. The supported properties are as follows:

- **os** - The possible values are: `win`, `linux`, or `mac`.
- **platform** - The possible values are: `standalone`, `eclipse`, or `webapp`.

**Example: os and platform Properties**

```css
@media oxygen AND (os:"win") AND (platform:"standalone") { 
  p{ 
    content:"PPP"; 
  }
}
```

**Related Information:**

- [@media Rule (on page 2052)]

**CSS At-Rules**

Oxygen XML Author supports some of the standard at-rules specified by CSS Level 2.1 and 3. The `@media` rule also include support for some style rules that are specific to Oxygen XML Author.

**@font-face At-Rule**

Oxygen XML Author allows you to use custom fonts in the Author mode by specifying them in the CSS using the `@font-face` media type. Only the `src` and `font-family` CSS properties can be used for this media type.

**Example: @font-face Rule**

```css
@font-face{
  font-family:"Baroque Script";
  /*The location of the loaded TTF font must be relative to the CSS*/
  src:url("BaroqueScript.ttf");
}
```
@media Rule

The @media rule allows you to set different style rules for multiple types of media in the same stylesheet. For example, you can set the font size to be different on the screen than on paper. Oxygen XML Author supports several media types, allowing you to set the style rules for presenting a document on various media (on screen, paper, etc.)

Supported Media Types

- **screen** - The styles marked with this media type are used only for rendering a document on screen.
- **print** - The styles marked with this media type are used only for printing a document.
- **all** - The styles marked with this media type are used for rendering a document in all supported types of media.
- **oxygen** - The styles marked with this media type are used only for rendering a document in the Oxygen XML Author Author mode. For more information, see Specifying Media Types in the CSS (on page 2051).
- **oxygen-dark-theme** - The styles marked with this media type are used only for rendering a document in the Oxygen XML Author Author mode when a dark theme is used (for example, Graphite).
- **oxygen-high-contrast-black** - The styles marked with this media type are used only for rendering a document in the Oxygen XML Author Author mode on a Windows High Contrast Theme with a black background.
- **oxygen-high-contrast-white** - The styles marked with this media type are used only for rendering a document in the Oxygen XML Author Author mode on a Windows High Contrast Theme with a white background.

Example: @media Rule

```css
@media oxygen{
  b{
    text-decoration:underline;
  }
}
@media oxygen-high-contrast-white{
  b{
    font-weight:bold;
  }
}
```
Supported Properties

Oxygen XML Author also supports a few properties to set specific style rules that depend upon the size of the visible area in Author mode. These supported properties are as follows:

- **min-width** - The styles selected in this property are applied if the visible area in Author mode is equal to or greater than the specified value.
- **max-width** - The styles selected in this property are applied if the visible area in Author mode is less than or equal to the specified value.

**Example: min-width and max-width Properties**

```
@media (min-width:500px){
  p{
    content:'XXX';
  }
}

@media (max-width:700px){
  p:after{
    content:'yyy';
  }
}
```

**Related Information:**

- Specifying Media Types in the CSS *(on page 2051)*

Standard W3C CSS Supported Features

Oxygen XML Author supports most of the CSS Level 3 selectors and most of the CSS Level 2.1 properties

**Supported CSS Selectors**

The following table lists the CSS selectors that are supported in Oxygen XML Author:

<table>
<thead>
<tr>
<th>Expression</th>
<th>Name</th>
<th>CSS Level</th>
<th>Description / Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>*</td>
<td>Universal selector</td>
<td>CSS Level 2</td>
<td>Matches any element</td>
</tr>
<tr>
<td>ε</td>
<td>Type selector</td>
<td>CSS Level 2</td>
<td>Matches any ε element (i.e. an element with the local name ε)</td>
</tr>
<tr>
<td>Expression</td>
<td>Name</td>
<td>CSS Level</td>
<td>Description / Example</td>
</tr>
<tr>
<td>------------</td>
<td>-------------------------</td>
<td>-----------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>E F</td>
<td>Descendant selector</td>
<td>CSS Level 2</td>
<td>Matches any F element that is a descendant of an E element.</td>
</tr>
<tr>
<td>E &gt; F</td>
<td>Child selectors</td>
<td>CSS Level 2</td>
<td>Matches any F element that is a child of an element E.</td>
</tr>
<tr>
<td>E:lang(c)</td>
<td>Language pseudo-class</td>
<td>CSS Level 2</td>
<td>Matches element of type E if it is in (human) language c (the document language specifies how language is determined).</td>
</tr>
<tr>
<td>E + F</td>
<td>Adjacent selector</td>
<td>CSS Level 2</td>
<td>Matches any F element immediately preceded by a sibling element E.</td>
</tr>
<tr>
<td>E ~ F</td>
<td>General sibling selector</td>
<td>CSS Level 3</td>
<td>Matches any F element preceded by a sibling element E.</td>
</tr>
<tr>
<td>E[foo]</td>
<td>Attribute selector</td>
<td>CSS Level 2</td>
<td>Matches any E element with the &quot;foo&quot; attribute set (whatever the value).</td>
</tr>
<tr>
<td>E[foo=&quot;warning&quot;]</td>
<td>Attribute selector with</td>
<td>CSS Level 2</td>
<td>Matches any E element whose &quot;foo&quot; attribute value is exactly equal to &quot;warning&quot;.</td>
</tr>
<tr>
<td>E[foo~=&quot;warning&quot;]</td>
<td>Attribute selector</td>
<td>CSS Level 2</td>
<td>Matches any E element whose &quot;foo&quot; attribute value is a list of space-separated values, one of which is exactly equal to &quot;warning&quot;.</td>
</tr>
<tr>
<td>E[lang</td>
<td>=&quot;en&quot;]</td>
<td>Attribute selector</td>
<td>CSS Level 2</td>
</tr>
<tr>
<td>E:before and E:after</td>
<td>Pseudo elements</td>
<td>CSS Level 2</td>
<td>The ':before' and ':after' pseudo-elements can be used to insert generated content before or after an element's content.</td>
</tr>
<tr>
<td>E:before(n) and E:after(n)</td>
<td>Pseudo elements</td>

<tr>
<td>E!&gt;F</td>
<td>The subject selector</td>
<td>CSS Level 4 (experimental)</td>
<td>An element that has the local name E and has a child F. See Subject Selector (on page 2059).</td>
</tr>
</tbody>
</table>

### Namespace Selector

In the CSS 2.1 standard, the element selectors ignore the namespaces of the elements they are matching. Only the local name of the elements are considered in the selector matching process.

Oxygen XML Author uses a different approach that is similar to the CSS Level 3 specification. If the element name from the CSS selector is not preceded by a namespace prefix it is considered to match an element with the same local name as the selector value and ANY namespace. Otherwise, the element must match both the local name and the namespace.

In CSS up to version 2.1, the name tokens from selectors match all elements from ANY namespace that have the same local name. Example:

```html
<x:b xmlns:x="ns_x"/>
<y:b xmlns:y="ns_y"/>
```

Are both matched by the rule:

```css
b {font-weight:bold}
```

Starting with CSS Level 3, you can create selectors that are namespace aware.

**Example: Defining prefixed and default namespaces**

Given the namespace declarations:

```xml
@namespace sync "http://sync.example.org";
@namespace "http://example.com/foo";
```

Then:

```
sync|A
```

Represents the name A in the http://sync.example.org namespace.

```
*|B
```
Represents the name B in ANY namespace, including NO NAMESPACE.

Represented by C

Represents the name C in ANY namespace, including NO NAMESPACE.

**Example: Defining prefixed namespaces combined with pseudo-elements**

To match the `def` element its namespace declares, bind it to the `abs` prefix and then write a CSS rule:

```css
@namespace abs "http://www.oxygenxml.com/sample/documentation/abstracts";
```

Then:

```css
.abs|def
```

Represents the name "def" in the `http://www.oxygenxml.com/sample/documentation/abstracts` namespace.

```css
.abs|def:before
```

Represents the :before pseudo-element of the "def" element from the `http://www.oxygenxml.com/sample/documentation/abstracts` namespace.

**Subject Selector**

Oxygen XML Author supports the subject selector described in CSS Level 4 (currently a working draft at W3C [http://www.w3.org/TR/selectors4/]). This selector matches a structure of the document, but unlike a compound selector, the styling properties are applied to the subject element (the one marked with '!') instead of the last element from the path.

*The subject of the selector can be explicitly identified by appending an exclamation mark (!) to one of the compound selectors in a selector. Although the element structure that the selector represents is the same with or without the exclamation mark, indicating the subject in this way can change which compound selector represents the subject in that structure.*

**Example:**

```css
table! > caption {
   border: 1px solid red;
}
```

A border will be drawn to the table elements that contain a caption, as direct child.

This is different from:

```css
table > caption {
   border: 1px solid red;
}
```
This draws a border around the caption.

**Taking Processing Instructions into Account in CSS Subject Selectors**

You can test for the existence of specific processing instructions (PI) in the child hierarchy of a subject selector.

For example:

```css
@namespace oxy "http://www.oxygenxml.com/extensions/author";

chapter! > oxy|processing-instruction[important][level="high"]{
  color:red;
}
```

This would change the color of a DocBook chapter to red if it contains the `important` processing instruction:

```xml
<chapter>
  <title>A title</title>
  <?important level='high'?>
</chapter>
```

**Descendant Selectors Limitation**

⚠️ **Important:** The current implementation has a known limitation. The general descendant selectors are taken into account as direct child selectors. For example, the following two CSS selectors are considered equivalent:

```css
a:has(b c)
```

and:

```css
a:has(b>c)
```

**Related Information:**

- :has Relational Pseudo-Class *(on page 2060)*
Oxygen XML Author supports the CSS Level 4 subject selector (currently a working draft at W3C [http://www.w3.org/TR/selectors4/]), as described in Subject Selector (on page 2059). Oxygen XML Author also supports the :has relational pseudo-class that has similar functionality and it can match an element by taking its child elements into account. For more information, see https://drafts.csswg.org/selectors-4/#relational.

You can create conditions that take into account the structure of the matching element.

**Example: **has Pseudo Class

```
table:has( tbody > thead){
  border: 1px solid red;
}
```

This example will result in a border being drawn for the table elements that contain at least a `thead` element in the `tbody` element.

**Taking Processing Instructions into Account in CSS Subject Selectors**

You can test for the existence of specific processing instructions (PI) in the child hierarchy of a subject selector.

For example:

```
@namespace oxy "http://www.oxygenxml.com/extensions/author";

chapter! > oxy|processing-instruction[important][level="high"]{
  color:red;
}
```

This would change the color of a DocBook chapter to red if it contains the important processing instruction:

```
<chapter>
  <title>A title</title>
  <?important level='high'/>
</chapter>
```
Descendant Selectors Limitation

⚠️ **Important:** The current implementation has a known limitation. The general descendant selectors are taken into account as direct child selectors. For example, the following two CSS selectors are considered equivalent:

```css
a:has(b c)
```

and:

```css
a:has(b>c)
```

**Supported CSS Properties**

Oxygen XML Author validates all CSS 2.1 properties, but does not render *aural* and *paged* categories properties in *Author* mode, as well as some of the values of the *visual* category that are listed below under the *Ignored Values* column. For the Oxygen XML Author-specific (extension) CSS properties, see Oxygen CSS Extensions (*on page* 2072).

**<length>** - Refers to distance measurements and is expressed in units such as mm, cm, in, em, rem, ex, pc, pt, px. For more information, see the W3 CSS Level 3 length type specifications.

**Related Information:**
Transparent Colors

CSS3 supports RGBA colors. The RGBA declaration allows you to set opacity (via the Alpha channel) as part of the color value. A value of 0 corresponds to a completely transparent color, while a value of 1 corresponds to a completely opaque color. To specify a value, you can use either a real number between 0 and 1, or a percent.

Example: RGBA Color

```css
personnel:before {
    display: block;
    padding: 1em;
    font-size: 1.8em;
    content: "Employees";
    font-weight: bold;
    color: #EEEEEE;
    background-color: rgba(50, 50, 50, 0.6);
}
```

attr() Function: Properties Values Collected from the Edited Document

In CSS Level 2.1 you may collect attribute values and use them as content only for the pseudo-elements. For instance, the :before pseudo-element can be used to insert some content before an element. This is valid in CSS 2.1:

```css
title:before{
    content: "[Audience Level: " attr(audience) "]";
}
```

If the `title` element from the XML document is:

```html
<title audience="Expert">Changing the Timing Belt</title>
```

Then the title will be displayed as:

```
[Audience Level: Expert] Changing the Timing Belt
```

In Oxygen XML Author, the use of `attr()` function is available not only for the `content` property, but also for any other property. This is similar to the CSS Level 3 working draft: [http://www.w3.org/TR/2006/WD-css3-values-20060919/#functional](http://www.w3.org/TR/2006/WD-css3-values-20060919/#functional). The arguments of the function are:
attr ( attribute_name , attribute_type , default_value )

attribute_name

The attribute name. This argument is required.

attribute_type

The attribute type. This argument is optional. If it is missing, argument's type is considered string. This argument indicates what is the meaning of the attribute value and helps to perform conversions of this value. Oxygen XML Author accepts one of the following types:

color

The value represents a color. The attribute may specify a color in various formats. Oxygen XML Author supports colors specified either by name (red, blue, green, etc.) or as an RGB hexadecimal value #FFEEFF.

url

The value is a URL pointing to a media object. Oxygen XML Author supports only images. The attribute value can be a complete URL, or a relative one to the XML document. Note that this URL is also resolved through the catalog resolver.

integer

The value must be interpreted as an integer.

number

The value must be interpreted as a float number.

length

The value must be interpreted as an integer.

percentage

The value must be interpreted relative to another value (length, size) expressed in percents.

em

The value must be interpreted as a size. 1 em is equal to the font-size of the relevant font.

ex
The value must be interpreted as a size. 1 ex is equal to the *height* of the `x` character of the relevant font.

**px**

The value must be interpreted as a size expressed in pixels relative to the viewing device.

**mm**

The value must be interpreted as a size expressed in millimeters.

**cm**

The value must be interpreted as a size expressed in centimeters.

**in**

The value must be interpreted as a size expressed in inches. 1 inch is equal to 2.54 centimeters.

**pt**

The value must be interpreted as a size expressed in points. The points used by CSS2 are equal to 1/72th of an inch.

**pc**

The value must be interpreted as a size expressed in picas. 1 pica is equal to 12 points.

**default_value**

This argument specifies a value that is used by default if the attribute value is missing. This argument is optional.

**Example: attr Function**

Consider the following XML instance:

```xml
<sample>
  <para bg_color="#AAAAFF">Blue paragraph.</para>
  <para bg_color="red">Red paragraph.</para>
  <para bg_color="red" font_size="2">Red paragraph with large font.</para>
  <para bg_color="#00AA00" font_size="0.8" space="4">Green paragraph with small font and margin.</para>
</sample>
```
The `<para>` elements have `bg_color` attributes with RGB color values (such as `#AAAAFF`). You can use the `attr()` function to change the elements appearance in the editor based on the value of this attribute:

```css
background-color: attr(bg_color, color);
```

The attribute `font_size` represents the font size in `em` units. You can use this value to change the style of the element:

```css
font-size: attr(font_size, em);
```

The complete CSS rule is:

```css
para{
    display: block;
    background-color: attr(bg_color, color);
    font-size: attr(font_size, em);
    margin: attr(space, em);
}
```

The document is rendered as:

```html
<doc>
  <para>Blue paragraph.</para>
  <para style="background-color: #FF0000;">Red paragraph.</para>
  <p style="background-color: #FF0000; font-size: 1.5em;">Red paragraph with large font.</p>
</doc>
```

**CSS Level 3 target-counter() and target-counters() Functions**

The CSS Level 3 functions `target-counter` and `target-counters` can be used as values for the `content` property to retrieve counter values and display information obtained from a target at the end of a link.
target-counter Function

This function retrieves the value of the innermost counter with a given name.

\( \text{target-counter (} \langle \text{url} \rangle, \langle \text{custom-ident} \rangle [, \langle \text{counter-style} \rangle ] ? \) \)

\( \text{url} \)

The URL of the target. This argument is required.

\( \text{custom-ident} \)

The name of the counter. This argument is required.

\( \text{counter-style} \)

This argument can be used to format the result. This argument is optional.

Example:

HTML:

```html
<nav>
  <ol>
    <li class="frontmatter"><a href="#pref_01">Preface</a></li>
    <li class="frontmatter"><a href="#intr_01">Introduction</a></li>
    <li class="bodymatter"><a href="#chap_01">Chapter One</a></li>
  </ol>
</nav>
```

CSS:

```
.frontmatter a::after { content: leader('.') target-counter(attr(href url), page, lower-roman) }
.bodymatter a::after { content: leader('.') target-counter(attr(href url), page, decimal) }
```

Result:

```
Preface...........v11
Introduction........xi
Chapter One...........1
```
**target-counters Function**

This function fetches the value of all counters of a given name from the end of a link, and formats them by inserting a given string between the value of each nested counter.

```xml
target-counter ( <url> , <custom-ident> , <string> [ , <counter-style> ] ? )
```

- **url**
  - The URL of the target. This argument is required.

- **custom-ident**
  - The name of the counter. This argument is required.

- **string**
  - The string to be inserted between the value of each nested counter. This argument is required.

- **counter-style**
  - This argument can be used to format the result. This argument is optional.

**Related Information:**

**Oxygen CSS Extensions**

CSS stylesheets provide support for displaying documents. When editing non-standard documents, Oxygen XML Author CSS extensions are useful.

Examples of how they can be used:

- Property for marking foldable elements (on page 2794) in large files.
- Enforcing a display mode for the XML tags, regardless of the current mode selected by the user.
- Constructing a URL from a relative path location.
- String processing functions.
Built-in CSS Selectors

When Oxygen XML Author renders content in the **Author** mode, it adds built-in CSS selectors (in addition to the CSS stylesheets linked in the XML or specified in the document type associated to the XML document). These built-in CSS selectors are processed before all other CSS content, but they can be overwritten if the CSS developer wants to modify a default behavior.

**List of CSS Selector Contributed by Oxygen XML Author**

```css
@namespace oxy "http://www.oxygenxml.com/extensions/author";
@namespace xi "http://www.w3.org/2001/XInclude";
@namespace xlink "http://www.w3.org/1999/xlink";
@namespace svg "http://www.w3.org/2000/svg";
@namespace mml "http://www.w3.org/1998/Math/MathML";

oxy|document {
  display:block !important;
}

oxy|cdata {
  display:oxy-morph !important;
  white-space:pre-wrap !important;
  border-width:0px !important;
  margin:0px !important;
  padding:0px !important;
}

oxy|processing-instruction {
  display:oxy-morph !important;
  color:rgb(139, 38, 201) !important;
  white-space:pre-wrap !important;
  border-width:0px !important;
  margin:0px !important;
  padding:0px !important;
}

/*EXM-33415 Avoid showing other editor PIs in content, not useful when editing in Oxygen*/
oxy|processing-instruction[Pub],
oxy|processing-instruction[PubTbl],
oxy|processing-instruction[xm-replace_text],
oxy|processing-instruction[xm-deletion_mark],
oxy|processing-instruction[xm-insertion_mark_start],
oxy|processing-instruction[xm-insertion_mark_end],

  }
}

/*
* EXM-40349
*
* In DIFF these place holder PIs are not handled so we treat them as normal PIs with a bit of styling.
*
Example:

To show all entities in the **Author** mode as transparent, without a gray background, first define in your CSS after all imports the namespace:
and then add the following selector:

```css
oxy|entity {
    background-color: inherit !important;
}
```

### Additional CSS Selectors

Oxygen XML Author provides support for selecting additional types of nodes. These custom selectors apply to: `document`, `doctype`, `processing-instruction`, `comment`, `CDATA sections`, `entities`, and `reference sections`. `Processing-instructions` are not displayed by default. To display them, open the Preferences dialog box (Options > Preferences) (on page 79), go to Editor > Author, and select Show processing instructions.

**Note:** The custom selectors are presented in the default CSS for Author mode and all of their properties are marked with an `!important` flag. For this reason, you have to set the `!important` flag on each property of the custom selectors from your CSS to be applicable.

For the custom selectors to work in your CSS stylesheets, declare the Author mode extensions namespace at the beginning of the stylesheet documents:

```css
@namespace oxy "http://www.oxygenxml.com/extensions/author";
```

- **oxy|document** - The `oxy|document` selector matches the entire document:

```css
oxy|document {
    display:block !important;
}
```

- **oxy|doctype** - The following example changes the rendering of doctype sections:

```css
oxy|doctype {
    display:block !important;
    color:blue !important;
    background-color:transparent !important;
}
```

- **oxy|processing-instruction** - To match the processing instructions, you can use the `oxy|processing-instruction` selector:

```css
oxy|processing-instruction {
    display:block !important;
    color:purple !important;
```
A processing instruction usually has a target and one or more pseudo attributes:

```xml
<?target_name data="b"?>
```

You can match a processing instruction with a particular target from the CSS using the construct:

```css
oxy|processing-instruction[target_name]
```

You can also match the processing instructions having a certain target and pseudo attribute value, such as:

```css
oxy|processing-instruction[target_name][data="b"]
```

- **oxy|comment** - The XML comments display in Author mode can be changed using the `oxy|comment` selector:

  ```css
  oxy|comment {
    display:block !important;
    color:green !important;
    background-color:transparent !important;
  }
  ```

- **oxy|cdata** - The `oxy|cdata` selector matches CDATA sections:

  ```css
  oxy|cdata {
    display:block !important;
    color:gray !important;
    background-color:transparent !important;
  }
  ```

- **oxy|entity** - The `oxy|entity` selector matches the entities content:

  ```css
  oxy|entity {
    display:morph !important;
    editable:false !important;
    color:orange !important;
    background-color:transparent !important;
  }
  ```

To match particular entities, use the `oxy|entity` selector in expressions such as:

```css
oxy|entity[name='amp'],
oxy|entity[name='lt'],
oxy|entity[name='gt'],
oxy|entity[name='quot'],
```
The references to entities, XInclude, and DITA conrefs and conkeyrefs are expanded by default in Author mode and the referenced content is displayed. The referenced resources are displayed inside the element or entity that refers to them.

You can use the reference property to customize the way these references are rendered in Author mode:

```
oxy|reference {
  border:1px solid gray !important;
}
```

In the Author mode, content is highlighted when text contains comments (on page 883) and changes (if Track Changes (on page 883) was active when the content was modified).

If this content is referenced, the Author mode does not display the highlighted areas in the new context. If you want to mark the existence of this comments and changes you can use the `oxy|reference[comments]`, `oxy|reference[changeTracking]`, and `oxy|reference[changeTracking][comments]` selectors.

**Note:** Two artificial attributes (comments and changeTracking) are set on the reference node, containing information about the number of comments and tracked changes in the content.

- The following example represents the customization of the reference fragments that contain comments:

```
oxy|reference[comments]:before {
  content: "Comments: " attr(comments) !important;
}
```

- To match reference fragments based on the fact that they contain tracked changes inside, use the `oxy|reference[changeTracking]` selector.

```
oxy|reference[changeTracking]:before {
  content: "Change tracking: " attr(changeTracking) !important;
}
```

- Here is an example of how you can set a custom color to the reference containing both tracked changes and comments:

```
oxy|reference[changeTracking][comments]:before {
  content: "Change tracking: " attr(changeTracking)
```
Additional CSS Properties

Oxygen XML Author provides various additional CSS properties to extend the standard CSS properties.

Append Content Properties: -oxy-append-content / -oxy-prepend-content

Used to append specified content.

-oxy-append-content Property

This property appends the specified content to the content generated by other matching CSS rules of lesser specificity. Unlike the content property, where only the value from the rule with the greatest specificity is taken into account, the -oxy-append-content property adds content to that generated by the lesser specificity rules into a new compound content.

Example:
The content shown before the `element` will be `Hello World!`.

**-oxy-prepend-content Property**

Prepends the specified content to the content generated by other matching CSS rules of lesser specificity. Unlike the `content` property, where only the value from the rule with the greatest specificity is taken into account, the `-oxy-prepend-content` prepends content to that generated by the lesser specificity rules into a new compound content.

**Example:**

```css
element:before{
    content: "Hello!";
}
element:before{
    -oxy-prepend-content: "said: ";
}
element:before{
    -oxy-prepend-content: "I ";
}
```

The content shown before the `element` will be `I said: Hello!`.

**Collapse Text: -oxy-collapse-text Property Value**

Used to collapse the content of an element.

Oxygen XML Author allows you to set the value of the `visibility` property to `-oxy-collapse-text`, meaning that the content of that element is not rendered. If an element is marked as `-oxy-collapse-text` you are not able to position the cursor inside it and edit it. The purpose of `-oxy-collapse-text` is to make the text value of an element editable only through a form control.

**Example: visibility Property**

The text value of an XML element will be edited using a text field form control. In this case, the text content is not directly present in the Author visual editing mode:
Cyrillic Counters: -oxy-lower-cyrillic Property Values

Used to style lists with Cyrillic counters.

Oxygen XML Author allows you to set the value of the `list-style-type` property to Cyrillic counters. For example, `-oxy-lower-cyrillic-ru`, `-oxy-lower-cyrillic-uk`, `-oxy-upper-cyrillic-ru` or `-oxy-upper-cyrillic-uk`, meaning that you can have Russian and Ukrainian counters.

Example: Cyrillic Counters

Counting list items with Cyrillic symbols:

```xml
li{
  display: list-item;
  list-style-type: -oxy-lower-cyrillic-ru;
}
```

Display Tag Markers: -oxy-display-tags Property

Used to specify whether or not tag markers are displayed.

Oxygen XML Author allows you to choose whether tag markers of an element should never be presented or the current display mode should be respected. This is especially useful when working with :before and :after pseudo-elements, in which case the element range is already visually defined so the tag markers are redundant.

The property is named `-oxy-display-tags`, with the following possible values:

- `none` - Tags markers will not be presented regardless of the current display mode. (on page 427).
- `default` - The tag markers will be created depending on the current display mode. (on page 427).
- `inherit` - The value of the property is inherited from an ancestor element.
Example: -oxy-display-tags Property

In this example, the para element from DocBook uses a :before and :after element and its tag markers will not be visible.

```css
para:before{
  content: "{";
}
para:after{
  content: "}";
}
para{
  -oxy-display-tags: none;
  display:block;
  margin: 0.5em 0;
}
```

Editable: -oxy-editable Property

Used to inhibit the content of a particular element.

If you want to inhibit editing a certain element's content, you can set the -oxy-editable CSS property (deprecated property editable is also supported) to false.

Folding Elements: -oxy-foldable Property

Used to configure whether or not the content of an element can be expanded or collapsed.

Oxygen XML Author allows you to declare some elements to be foldable (on page 2794). This is especially useful when working with large documents organized in logical blocks, editing a large DocBook article or book, for instance. Oxygen XML Author marks the foldable content with a small blue triangle. When you hover with your mouse pointer over this marker, a dotted line borders the collapsible content. The following actions are available in the Folding submenu of the contextual menu:

- **Toggle Fold**
  Toggles the state of the current fold.

- **Collapse Other Folds (Ctrl + NumPad/ (Command + NumPad/ on OS X))**
  Folds all the elements except the current element.

- **Collapse Child Folds (Ctrl + NumPad. (Command + NumPad. on OS X))**
Folds the elements indented with one level inside the current element.

**Expand Child Folds**

Unfolds all child elements of the currently selected element.

**Expand All (Ctrl + NumPad* (Command + NumPad* on OS X))**

Unfolds all elements in the current document.

To define the element whose content can be folded by the user, you must use the property: `-oxy-foldable:true;`. To define the elements that are folded by default, use the `-oxy-folded:true` property.

**Note:** The `-oxy-folded` property works in conjunction with the `-oxy-foldable` property. Thus, the `folded` property is ignored if the `-oxy-foldable` property is not set on the same element.

When collapsing an element, it is useful to keep some of its content visible (for example, a short description of the collapsed region). The property `-oxy-not-foldable-child` is used to identify the child element that is kept visible. It accepts as value an element name or a list of comma-separated element names. The first child element from the XML document that appears in the list of element names will be identified as the not foldable child and displayed. If the element is marked as foldable (`-oxy-foldable:true;`) but it doesn't have the property `-oxy-not-foldable-child` or none of the specified non-foldable children exists, then the element is still foldable. In this case the element kept visible when folded will be the `before` pseudo-element.

**Note:** Deprecated properties `foldable`, `not-foldable-child`, and `folded` are also supported.

**Example: Folding DocBook Elements**

All the elements below can have a title child element and are considered to be logical sections. You mark them as being foldable leaving the title element visible.

```xml
set,
book,
part,
reference,
chapter,
preface,
article,
sect1,
sect2,
sect3,
sect4,
section,
appendix,
```
Links: -oxy-link Property

Used to specify that a particular element should be considered a link.

Oxygen XML Author allows you to declare some elements to be links. This is especially useful when working with many documents that reference each other. The links allow for an easy way to get from one document to another. Clicking the link marker will open the referenced resource in an editor.

To define the element that should be considered a link, you must use the link property on the before or after pseudo element. The value of the property indicates the location of the linked resource. Since links are usually indicated by the value of an attribute in most cases it will have a value similar to attr(href)

**Example: DocBook Link Elements**

The following elements are defined to be links on the before pseudo element and their values are defined by the value of an attribute.

```
*[href]:before{
    -oxy-link:attr(href);
    content: "Click " attr(href) " for opening" ;
}

ulink[url]:before{
    -oxy-link:attr(url);
    content: "Click to open: " attr(url);
}

olink[targetdoc]:before{
    -oxy-link: attr(targetdoc);
    content: "Click to open: " attr(targetdoc);
}
```

Morph Elements: -oxy-morph Property Value

Used to specify that an element should be displayed inline.
Oxygen XML Author allows you to specify that an element has an `-oxy-morph` display type (deprecated `morph` property is also supported), meaning that the element is *inline*(on page 2795) if all its children are *inline*.

**Example: `-oxy-morph` Property Value**

Suppose you have a `wrapper` XML element that allows users to set a number of attributes on all sub-elements. This element should have an *inline* (on page 2795) or *block* (on page 2792) behavior, depending on the behavior of its child elements:

```xml
wrapper{
    display:-oxy-morph;
}
```

**Placeholders for Empty Elements: `-oxy-placeholder-content` Property**

Used to configure placeholders for empty elements.

Oxygen XML Author displays the element name as pseudo-content for empty elements if the `Show placeholders for empty elements` option (on page 130) is selected in the `Author` preferences page and there is no `before` or `after` content set in the CSS for this type of element. There are two CSS properties that can be used to control the placeholders (`-oxy-placeholder-content` and `-oxy-show-placeholder`).

**-oxy-placeholder-content CSS Property**

To control the displayed pseudo-content for empty elements, you can use the `-oxy-placeholder-content` CSS property.

The following example would change the `keyword` element to be displayed as `key`:

```css
keyword{
    -oxy-placeholder-content:"key";
}
```

**Note:** This CSS property accepts the `$i18n(key)` (on page 272) localization editor variable, as in the following example:

```css
-oxy-placeholder-content: "$i18n(id)";
```

**-oxy-show-placeholder CSS Property**

The `-oxy-show-placeholder` property allows you to decide whether or not the placeholder will be shown. The possible values are:
• always - Always display placeholders.
• default - Always display placeholders if before or after content is not set in the CSS.
• inherit - The placeholders are displayed according to the Show placeholders for empty elements option (on page 130) (if before and after content is not declared).
• no - Never display placeholders.

Note: Deprecated properties show-placeholder and placeholder-content are also supported.

Related Information:

• Using Placeholders in Document Templates (on page 627)

Style Elements: -oxy-style Property

Used to configure the style of particular elements.

Oxygen XML Author allows you to specify the style for an XML element. This is helpful if you want to embed CSS styling to XML elements directly in the XML file you are editing without having to edit the CSS files that are normally attached to the XML files. The property should have an XPath function for the value.

Example: -oxy-style Property

The following code snippet should be added in the CSS file that renders the files for your framework customization:

```css
* {
    -oxy-style: attr(style);
}
```

Suppose you want to display the title elements in your XML document in the color red. You could add the following snippet directly in the XML document:

```xml
<title style="color:red;">My Memoirs</title>
```

Tip: The style attribute is supported by default in HTML5 documents.

Tags Color: -oxy-tags-color Property

Used to configure the background or foreground colors of tags.
By default, Oxygen XML Author does not display element tags. You can use the **Partial Tags** button from the **Author** toolbar to control the amount of displayed markup. *(on page 427)*

To configure the default background and foreground colors of the tags, open the **Preferences** dialog box *(Options > Preferences)* *(on page 79)*, go to **Editor > Edit modes > Author**, and set the desired colors in the **Tags background color** *(on page 132)* and **Tags foreground color** *(on page 132)* options.

If you want to be more specific and configure the colors using a CSS, the `-oxy-tags-background-color` and `-oxy-tags-color` properties allow you to control the background and foreground colors for any particular XML element.

**Example:**

```css
para {
  -oxy-tags-color:white;
  -oxy-tags-background-color:green;
}
title {
  -oxy-tags-color:yellow;
  -oxy-tags-background-color:black;
}
```

**Custom CSS Functions**

Oxygen XML Author provides a wide range of custom CSS extension functions that can be used to customize the visual **Author** editing mode.

**Arithmetic Functions**

Arithmetic Functions that are supported.

You can use any of the arithmetic functions implemented in the `java.lang.Math` class *(http://download.oracle.com/javase/6/docs/api/java/lang/Math.html)*.

In addition, the following functions are available:

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>oxy_add (param1, ..., paramN, 'returnType')</code></td>
<td>Adds the values of all parameters from <code>param1</code> to <code>paramN</code>.</td>
</tr>
<tr>
<td><code>oxy_subtract (param1, param2, ..., paramN, 'returnType')</code></td>
<td>Subtracts the values of parameters <code>param2</code> to <code>paramN</code> from <code>param1</code>.</td>
</tr>
<tr>
<td><code>oxy_multiply (param1, ..., paramN, 'returnType')</code></td>
<td>Multiplies the values of parameters from <code>param1</code> to <code>paramN</code>.</td>
</tr>
<tr>
<td><code>oxy_divide (param1, param2, 'returnType')</code></td>
<td>Performs the division of <code>param1</code> to <code>param2</code>.</td>
</tr>
</tbody>
</table>
### Syntax

```
oxy_modulo (param1, param2, 'returnType')
```

Returns the reminder of the division of `param1` to `param2`.

**Note:** The `returnType` can be 'integer', 'number', or any of the supported CSS measuring types.

### Example: `oxy_multiply` Function

If you have an image with **width** and **height** specified on it, this will compute the number of pixels on it:

```css
image:before{
    content: "Number of pixels: " oxy_multiply(attr(width), attr(height), "px");
}
```

### Actions: `oxy_action()` Function

This function allows you to define actions directly in the CSS, rather than referencing them from the associated framework.

The `oxy_action()` function is frequently used from the `oxy_button()` function (on page 2118) that provides a graphical button for invoking a custom action. The action is normally defined in the associated Document Type (framework configuration) but the `oxy_action()` function allows you to define it directly in the CSS instead of the framework configuration.

The arguments received by the `oxy_action()` function are a list of properties that define an action. The following properties are supported:

- **name** - The name of the action. It will be displayed as the label for the button or menu item.
- **description** (optional) - A short description with details about the result of the action.
- **icon** (optional) - A path relative to the CSS pointing to an image (the icon for the action). The path can point to resources that are packed in Oxygen XML Author (`oxygen.jar`) by starting its value with `/` (for example, `/images/Remove16.png`). It can also be expressed using an editor variable (on page 266).
- **operation** - The name of the Java class implementing the `ro.sync.ecss.extensions.api.AuthorOperation` interface. There is also a variety of predefined operations (on page 2022) that can be used.

**Note:** If the name of the operation specified in the CSS is not qualified (has no Java package name), then it is considered to be one of the built-in Oxygen XML Author operations from `ro.sync.ecss.extensions.commons.operations` package. If the class is not found in this package, then it will be loaded using the specified name.

- **arg-string** - All arguments with the `arg-` prefix are passed to the operation (the string that follows the `arg-` prefix is passed).
• **ID** - (optional) - The ID of the action from the *framework*. If this is specified, all others parameters are disregarded.

**Example: oxy_action function inside an oxy_button form control (on page 2118):**

```xml
oxy_button(
    action, oxy_action(
        name, 'Insert',
        description, 'Insert an element after the current one',
        icon, url('insert.png'),
        operation, 'InsertFragmentOperation',
        arg-fragment, '<element>${caret}</element>',
        arg-insertLocation, '.',
        arg-insertPosition, 'After'),
    showIcon, true)
```

**Example: oxy_action Function**

You can also create a button form control directly from an oxy_action function:

```xml
oxy_action(
    name, 'Insert',
    description, 'Insert an element after the current one',
    operation, 'InsertFragmentOperation',
    arg-fragment, '<element>${caret}</element>',
    arg-insertLocation, '.',
    arg-insertPosition, 'After')
```

**Tip:** A code template is available to make it easy to add the oxy_action function with the *Content Completion Assistant (on page 2792)* by pressing **Ctrl + Space (Command + Space on OS X)** and select the .oxy_action code template.

**Related Information:**

- **Button Form Control (on page 2118)**

**Action Lists: oxy_action_list() Function**

This function allows you to define a sequential list of actions directly in the CSS, rather than referencing them from the associated framework.
The `oxy_action_list()` function is used from the `oxy_buttonGroup()` function (on page 2121) that provides a graphical group of buttons with multiple custom actions. These actions are normally defined in the associated Document Type (framework configuration) but the `oxy_action_list()` function allows you to define the actions directly in the CSS instead of the framework configuration.

The arguments received by the `oxy_action_list()` function are a list of actions (executed sequentially) that are defined with the `oxy_action()` function (on page 2092). The following properties are supported in the `oxy_action()` function:

- **name** - The name of the action. The name of the first defined action will be displayed as the label for the button or menu item.
- **description** (optional) - A short description with details about the result of the action. The description of the first defined action will be displayed in a tooltip.
- **icon** (optional) - A path relative to the CSS pointing to an image (the icon for the action). The path can point to resources that are packed in Oxygen XML Author (oxygen.jar) by starting its value with `/` (for example, `/images/Remove16.png`). It can also be expressed using an editor variable (on page 266).
- **operation** - The name of the Java class implementing the `ro.sync.ecss.extensions.api.AuthorOperation` interface. There is also a variety of predefined operations (on page 2022) that can be used.

**Note:** If the name of the operation specified in the CSS is not qualified (has no Java package name), then it is considered to be one of the built-in Oxygen XML Author operations from `ro.sync.ecss.extensions.commons.operations` package. If the class is not found in this package, then it will be loaded using the specified name.

- **arg-<string>** - All arguments with the `arg-` prefix are passed to the operation (the string that follows the `arg-` prefix is passed).
- **ID** - (optional) - The ID of the action from the framework. If this is specified, all others parameters are disregarded.

**Example: oxy_action_list Function**

```css
p:after {
  content: oxy_buttonGroup(
    label, 'A group of actions',
    icon, url('http://www.oxygenxml.com/img/icn_oxy20.png'),
    actions,
    oxy_action_list(
      oxy_action{
        name, 'Insert a new paragraph',
        description, 'Insert an element after the current one',
      };
    );
  );
}
```
operation, 'InsertFragmentOperation',
arg-fragment, '<p></p>',
arg-insertLocation, '.',
arg-insertPosition, 'After'
},
oxy_action(
  name, 'Delete',
  description, 'Deletes the current element',
  operation, 'DeleteElementOperation'
)

Tip: A code template is available to make it easy to add the `oxy_action_list` function with the Content Completion Assistant (on page 2792) by pressing Ctrl + Space (Command + Space on OS X) and select the `.!! oxy_action_list code template.`

Related Information:

- Actions: `oxy_action()` Function (on page 2092)
- Button Group Form Control (on page 2121)

Attributes Concatenation: `oxy_attributes()` Function

This function concatenates the attributes for an element and returns the serialization.

**Syntax:**

```java
oxy_attributes()```

**Example: `oxy_attributes` Function**

```java
element{
  content: oxy_attributes();
}
```

For instance, if you have the following XML fragment: `<element att1="x" xmlns:a="2" x="&quot;"/>`, the CSS function will display:

```text
att1="x" xmlns:a="2" x=""
```
Base URL: oxy_base-uri() Function

This function evaluates the base URL in the context of the current node. It does not have any arguments and takes into account the xml:base context of the current node. See the XML Base specification for more details.

Example: oxy_base-uri Function

Suppose you have some image references but you want to see other thumbnail images that reside in the same folder (in Author mode):

```
image[href]{
    content: oxy_url(oxy_base-uri(), oxy_replace(attr(href), '.jpeg', 'Thumbnail.jpeg'));
}
```

Capitalization: oxy_capitalize() Function

This function capitalizes the first letter of the text received as argument.

Syntax:

```
oxy_capitalize( text )
```

The text in which the first letter will be capitalized.

Example: oxy_capitalize Function

```
*:before{
    content: oxy_capitalize(oxy_name()) "": "";
}
```

This would insert the capitalized qualified name as static text content before the element.

Compound Actions: oxy_compound_action() Function

This function allows you to define multiple actions that will be executed sequentially.

The oxy_compound_action() function is used from the oxy_button() form control function (on page 2118) or the oxy_buttonGroup() form control function (on page 2121).

The arguments received by the oxy_compound_action() function are a list of actions (executed sequentially) that are defined with the oxy_action() function (on page 2092).
You can use three optional properties (name, description, icon) in the oxy_compound_action() function to provide labels for the compound action. If you do not specify these three properties, those same properties defined in the first oxy_action function will be used for the labels.

- **name** - The name of the action. It will be displayed as the label for the action. If you want to reuse the name of an action already defined in your framework, you can use the oxy_getActionName function.

- **description** - A short description with details about the result of the action. It will be displayed in a tooltip when hovering over the button linked to this action. If you want to reuse the description of an action already defined in your framework, you can use the oxy_getActionDescription function.

- **icon** - A path relative to the CSS pointing to an image (the icon for the action). The path can point to resources that are packed in Oxygen XML Author (oxygen.jar) by starting its value with / (for example, /images/Remove16.png). It can also be expressed as an editor variable (on page 266). If you want to reuse the icon of an action already defined in your framework, you can use the oxy_getActionIcon function.

The oxy_getActionName, oxy_getActionDescription, and oxy_getActionIcon functions accept the following 2 parameters:

- **framework.defined.action.id** (required) - The ID of an action defined in the current framework that gets the name, description, or icon for that action.

- **fallback** (optional) - A fallback value in case the ID value provided in the framework.defined.action.id parameter is not found.

**Example: oxy_compound_action Function**

```xml
oxy_button{
  action,
    oxy_compound_action{
      name, oxy_getActionName('framework.id', 'Fallback'),
      description, 'Inserts a paragraph and uses form controls to edit its @audience attribute',
      icon, url('http://www.oxygenxml.com/img/icn_oxy20.png'),
      oxy_action{
        name, 'Insert',
        description, 'Insert an element after the current one',
        operation, 'ro.sync.ecss.extensions.commons.operations.InsertFragmentOperation',
        icon, url('insert.png'),
        arg-fragment, "<p audience=''></p>",
    }
  }
}
```
arg-insertLocation, '.',
arg-insertPosition, 'After'
},
oxy_action(
  name, 'Activate edit mode',
  description, 'Sets a pseudo class that will activate a CSS rule that will present a text field form control for the @audience attribute',
  operation, 'SetPseudoClassOperation',
  arg-name, 'edit-mode-on',
  arg-elementLocation, '. '
)

, showIcon, true)

Tip: A code template is available to make it easy to add the oxy_compound_action function with the Content Completion Assistant (on page 2792) by pressing Ctrl + Space (Command + Space on OS X) and select the .! oxy_action_list code template.

Related Information:

- Actions: oxy_action() Function (on page 2092)

- Button Form Control (on page 2118)

Concatenation: oxy_concat() Function

This function concatenates the received string arguments.

Syntax:

oxy_concat ( str_1, str_2 )

str_1 ... str_n

The string arguments to be concatenated.

Example: oxy_concat Function

If an XML element has an attribute called padding-left:

```xml
<p padding-left="20">...
```
and you want to add a padding before it with that specific amount specified in the attribute value:

```css
* [padding-left] {
  padding-left: oxy_concat(attr(padding-left), "px");
}
```

**Get Text: oxy_getSomeText(text, length) Function**

This function allows you to truncate a long string and to set a maximum number of displayed characters.

**Syntax:**

```javascript
oxy_getSomeText (text, length, endsWithPoints)
```

- **text**
  - Displays the actual text.

- **length**
  - Sets the maximum number of characters that are displayed.

- **endsWithPoints**
  - Specifies if the truncated text ends with ellipsis.

**Example: oxy_getSomeText Function**

If an attribute value is very large, you can trim its content before it is displayed as static content:

```css
* [longdesc]:before{
  content: oxy_getSomeText(attr(longdesc), 200);
}
```

**Indexing: oxy_indexof() Function**

This function is used to define searches.

The `oxy_indexof()` function has two signatures:

**Syntax 1:**

```javascript
oxy_indexof (text, toFind)
```

- **text**
  - Returns the index within `text` string of the first occurrence of the `toFind` substring.
toFind
  The searched substring.

Syntax 2:

    oxy_indexof ( text, toFind, fromOffset )

Returns the index within text string of the first occurrence of the toFind substring. The search starts from fromOffset index.

  text
  Text to search in.

  toFind
  The searched substring.

  fromOffset
  The index to start the search from.

Example: oxy_indexof Function

    oxy_indexof('abcd', 'bc') returns 1.
    oxy_indexof('abcdbc', 'bc', 2) returns 4.

If you only want to display part of an attribute value, for instance the part that comes before an Appendix string:

```
image[longdesc]{
  content: oxy_substring(attr(longdesc), 0,
             oxy_indexof(attr(longdesc), "Appendix"));
}
```

Label: oxy_label() Function

This function can be used in conjunction with the CSS content property to change the style of generated text.

The arguments of the function are property name - property value pairs. The following properties are supported:

- text - This property specifies the built-in form control you are using.
- width - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units. The width property takes precedence over the columns property (if the two are used together).
• **color** - Specifies the foreground color of the form control. If the value of the `color` property is `inherit`, the form control has the same color as the element in which it is inserted.

• **background-color** - Specifies the background color of the form control. If the value of the `background-color` property is `inherit`, the form control has the same color as the element in which it is inserted.

• **styles** - Specifies styles for the form control. The values of this property are a set of CSS properties:
  ◦ `font-weight`, `font-size`, `font-style`, `font`  
  ◦ `text-align`, `text-decoration`  
  ◦ `width`  
  ◦ `color`, `background-color`  
  ◦ `link` - For more information about this property, see the [link property section](on page 2088).

```xml
element{
  content: oxy_label(text, "Label Text", styles,
                   "font-size:2em;color:red;link:attr(href);"));
}
```

Instead of using the values of the `styles` property individually, you can define them in a CSS file as in the following example:

```css
* {
    width: 40%;
    text-align: center;
}
```

Then refer that file with an `@import` directive, as follows:

```xml
elem {
  content: oxy_label(text, 'my_label', styles, "@import 'labels.css';")
}
```

⚠️ **CAUTION:** Extensive use of the `styles` property may lead to performance issues.

If the text from an `oxy_label()` function contains new lines, for example `oxy_label(text, 'LINE1\A LINE2', width, 100px)`, the text is split in two. Each of the two new lines has the specified width of 100 pixels.

⚠️ **Note:** The text is split after \A, which represents a new line character.

You can use the `oxy_label()` function together with a built-in form control ([on page 2112](on page 2112)) function to create a form control based layouts.
Example: \texttt{oxy\_label} Function

An example of a use case is if you have multiple attributes on a single element and you want use form controls on separate lines and style them differently. Consider the following CSS rule:

```css
person:before {
  content: "Name:*" oxy_textfield(edit, '@name', columns, 20)
  "\A Address:" oxy_textfield(edit, '@address', columns, 20)
}
```

Suppose you only want the \texttt{Name} label to be set to \texttt{bold}, while you want both labels aligned to look like a table (the first column with labels and the second with a text field). To achieve this, you can use the \texttt{oxy\_label()} to style each label differently.

```css
person:before {
  content: oxy_label(text, "Name:*", styles, "font-weight:bold;width:200px")
    oxy_textfield(edit, '@name', columns, 20) "\A "
    oxy_label(text, "Address:", styles, "width:200px")
    oxy_textfield(edit, '@address', columns, 20)
}
```

\textbf{Tip:} A code template is available to make it easy to add the \texttt{oxy\_label} function with the \textit{Content Completion Assistant (on page 2792)} by pressing \texttt{Ctrl + Space (Command + Space on OS X)} and select the .\texttt{.} \texttt{oxy\_label} code template.

Last Occurrence: \texttt{oxy\_lastindexof()} Function

This function is used to define last occurrence searches.

The \texttt{oxy\_lastindexof()} function has two signatures:

\textbf{Syntax 1:}

\begin{verbatim}
 oxy_lastindexof ( text , toFind )

defines the index within text string of the rightmost occurrence of the toFind substring.

text
  Text to search in.

toFind
  The searched substring.
\end{verbatim}

\textbf{Syntax 2:}

\begin{verbatim}
 oxy_lastindexof ( text , toFind , fromOffset )
\end{verbatim}
The search starts from **fromOffset** index. Returns the index within **text** string of the last occurrence of the **toFind** substring, searching backwards starting from the **fromOffset** index.

**text**

Text to search in.

**toFind**

The searched substring.

**fromOffset**

The index to start the search backwards from.

**Example: oxy_lastindexOf Function**

```
oxy_lastindexOf('abcdbc', 'bc')  returns 4.
oxylastindexOf('abcdbccdbc', 'bc', 2)  returns 1.
```

If you only want to display part of an attribute value, for instance the part that comes before an **Appendix** string:

```json
image[longdesc]{
  content: oxy_substring(attr(longdesc), 0,
  oxy_lastindexOf(attr(longdesc), "Appendix"));
}
```

**Link Text: oxy_link-text() Function**

You can use this function on the CSS **content** property to obtain a text description from the source of a reference.

By default, the **oxy_link-text()** function resolves DITA and DocBook references. For further details about how you can also extend this functionality to other **frameworks (on page 2794)**, go to **Configuring an Extensions Bundle (on page 1962)**.

**DITA Support**

For DITA, the **oxy_link-text()** function resolves the **xref** element and the elements that have a **keyref** attribute. The text description is the same as the one presented in the final output for those elements. If you use this function for a **topicref** element that has the **navtitle** and **locktitle** attributes set, the function returns the value of the **navtitle** attribute.
DocBook Support

For DocBook, the `oxy_link-text()` function resolves the `xref` element that defines a link in the same document. The text description is the same as the one presented in the final output for those elements.

**Example: `oxy_link-text` Function**

For the following XML and associated CSS fragments the `oxy_link-text()` function is resolved to the value of the `xreflabel` attribute.

```xml
<para>
  <code id="para.id" xreflabel="The reference label">my code</code>
</para>
<para>
  <xref linkend="para.id"/></para>

```xref {
  content: oxy_link-text();
}
```

If the text from the target cannot be extracted (for instance, if the `href` is not valid), you can use an optional argument to display fallback text.

```css
*{class~="map/topicref"]:before{
  content: oxy_link-text("Cannot find the topic reference");
  link:attr(href);
}
```

**Local Name: `oxy_local-name()` Function**

This function evaluates the local name of the current node.

It does not have any arguments.

**Example: `oxy_local-name` Function**

To insert the local name as static text content before the element, use this CSS selector:

```css
*:before{
  content: oxy_local-name() ": ";
}
```

**Lowercase: `oxy_lowercase()` Function**

This function transforms the text received as argument to lower case.
Syntax:

oxy_lowercase( text )

text

The text to be lower cased.

**Example: oxy_lowercase Function**

To insert a lower-cased qualified name as static text content before the element, use this CSS selector:

```
*:before{
  content: oxy_lowercase(oxy_name()) " : " ;
}
```

**Name: oxy_name() Function**

This function evaluates the qualified name of the current node.

It does not have any arguments.

**Example: oxy_name Function**

To insert a qualified name as static text content before the element, use this CSS selector:

```
*:before{
  content: oxy_name() " : " ;
}
```

**Parent URL: oxy_parent-url() Function**

This function evaluates the parent URL of a URL received as string.

**Syntax:**

oxy_parent-url( URL )

URL

The URL as string.

**Replace: oxy_replace() Function**

This function is used to replace a string of text.

The oxy_replace() function has two signatures:
Syntax 1:

```
oxy_replace ( text, target, replacement )
```

This function replaces each substring of the text that matches the literal target string with the specified literal replacement string.

- **text**
  
  The text in which the replace will occur.

- **target**
  
  The target string to be replaced.

- **replacement**
  
  The string replacement.

**Example:** Suppose that you have image references but you want to see other thumbnail images that reside in the same folder in the visual **Author** editing mode:

```
image[href]{
  content:oxy_url(oxy_base-uri(), oxy_replace(attr(href), 
    '.jpeg', 'Thumbnail.jpeg'));
}
```

Syntax 2:

```
oxy_replace ( text, target, replacement, isRegExp )
```

This function replaces each substring of the text that matches the target string with the specified replacement string.

- **text**
  
  The text in which the replace will occur.

- **target**
  
  The target string to be replaced.

- **replacement**
  
  The string replacement.

- **isRegExp**
  
  If `true` the target and replacement arguments are considered regular expressions, if `false` they are considered literal strings.

**Example:** Suppose that you want to use a regular expression to replace all space sequences with an underscore:
Substring of Text: oxy_substring() Function

This function is used to return a string of text.

The oxy_substring() function has two signatures:

**Syntax 1:**

\[
\text{oxy_substring}( \text{text}, \text{startOffset} )
\]

Returns a new string that is a substring of the original text string. It begins with the character at the specified index and extends to the end of text string.

- **text**
  - The original string.
- **startOffset**
  - The beginning index, inclusive

**Syntax 2:**

\[
\text{substring}( \text{text}, \text{startOffset}, \text{endOffset} )
\]

Returns a new string that is a substring of the original text string. The substring begins at the specified startOffset and extends to the character at index endOffset - 1.

- **text**
  - The original string.
- **startOffset**
  - The beginning index, inclusive.
- **endOffset**
  - The ending index, exclusive.

**Example: oxy_substring Function**

- \( \text{oxy_substring('abcd', 1) \ returns the string 'bcd'}. \)
- \( \text{oxy_substring('abcd', 4) \ returns an empty string.} \)
- \( \text{oxy_substring('abcd', 1, 3) \ returns the string 'bc'}. \)
If you only want to display part of an attribute value, for instance the part that comes before an Appendix string:

```xml
image[longdesc] {
    content: oxy_substring(attr(longdesc), 0, oxy_indexof(attr(longdesc), "Appendix"));
}
```

**Unescape URL Value: oxy_unescapeURLValue(string) Function**

This function returns the unescaped value of a URL-like string given as a parameter.

For example, if the value contains `%20` it will be converted to a simple space character.

**Example: oxy_unescapeURLValue Function**

```xml
oxy_unescapeURLValue("http://www.example.com/a%20simple%20example.html") returns the following value:
```

```xml
http://www.example.com/a simple example.html
```

**Unparsed Entity URI: oxy_unparsed-entity-uri() Function**

This function returns the URI value of an unparsed entity name.

**Syntax:**

```xml
oxy_unparsed-entity-uri(unparsedEntityName)
```

unparsedEntityName

The name of an unparsed entity defined in the DTD.

This function can be useful to display images that are referenced with unparsed entity names.

**Example: oxy_unparsed-entity-uri Function**

CSS for displaying the image in Author for an `imagedata` with `entityref` to an unparsed entity:

```xml
imagedata[entityref] {
    content: oxy_url(oxy_unparsed-entity-uri(attr(entityref)));
}
```

**Uppercase: oxy_uppercase() Function**

This function transforms the text received as argument to upper case.
Syntax:

oxy_uppercase (text)

text

The text to be capitalized.

Example: oxy_uppercase Function

To insert the upper-cased qualified name as static text content before the element, use this CSS selector:

*:before{
    content: oxy_uppercase(oxy_name()) " : ";
}

URL: oxy_url() Function

This function extends the standard CSS url() function by allowing you to specify additional relative path components (parameters loc_1 to loc_n).

Oxygen XML Author uses all these parameters to construct an absolute location. Note that any of the parameters that are passed to the function can be either relative or absolute locations. These locations can be expressed as String objects, functions, or editor variables (on page 266) (built-in or custom).

Syntax:

oxy_url (base_location, loc_1, loc_2)

base_location

String representing the base location. If not absolute, will be solved relative to the CSS file URL.

loc_1 ... loc_n (optional)

Strings representing relative location path components.

Examples: oxy_url Function

The following function receives String objects as input parameters:

and returns:

'http://www.oxygenxml.com/dir1/dir4/dir5/test.xml'
The following function receives the result of the evaluation of two other functions as parameters (for instance, this is useful if you have image references and you want to see thumbnail images stored in the same folder):

```xml
image[href]{
  content:oxy_url(oxy_base-uri(), oxy_replace(attr(href), '.jpeg', 'Thumbnail.jpeg'));
}
```

The following function uses an editor variable (on page 266) as the first parameter to point to the Oxygen XML Author installation location:

```xml
image[href] {
  content: oxy_url('${oxygenHome}', 'logo.png');
}
```

Related Information:
- Editor Variables (on page 266)

**XPath: oxy_xpath() Function**

This function is used to evaluate XPath expressions.

**Syntax:**

```xml
oxy_xpath(XPathExpression [, processChangeMarkers , value ] [, evaluate , value ])
```

It evaluates the given XPath 2.0 expression using Saxon 9 and returns the result. XPath expressions that depend on the cursor location can be successfully evaluated only when the cursor is located in the actual XML content. Evaluation fails when the current editing context is inside a referenced `xi:include` section or inside artificially referenced content (for example, DITA `conref` or `topicref` references).

The parameters of the function are as follows:

- A required `expression` parameter, which is the XPath expression to be evaluated.
- An optional `processChangeMarkers` parameter, followed by its value, which can be either `true` or `false` (default value). When you set the parameter to `true`, the function returns the resulting text with all the change markers accepted (`delete` changes are removed and `insert` changes are preserved).
- An optional `evaluate` parameter, followed by its value, which can be one of the following:
- dynamic - Evaluates the XPath each time there are changes in the document.
- dynamic-once - Separately evaluates the XPath for each node that matches the CSS selector. It will not re-evaluate the expression when changes are made to other nodes in the document. This will lead to improved performance, but the displayed content may not be updated to reflect the actual document content.
- static - If the same XPath is evaluated on several nodes, the result for the first evaluation will be used for all other matches. Use this only if the XPath does not contain a relationship with the node on which the CSS property is evaluated. This will lead to improved performance, but the static displayed content may not be updated to reflect the actual document content.

**Note:** When XPath expressions are evaluated, the entities and `xi:include` elements are replaced with the actual content that is referenced. For example, consider the following code snippet:

```
<article>
  <xi:include href="section1.xml" xmlns:xi="http://www.w3.org/2001/XInclude"/>
</article>
```

where `section1.xml` contains the following content:

```
<section>
  <p>Referenced content</p>
</section>
```

The latter will be the actual content in which the XPath expression is executed.

**Example: `oxy_xpath` Function**

The following example counts the number of words from a paragraph (including tracked changes (on page 2800)) and displays the result in front of it:

```
para:before{
  content: concat("|Number of words: ",
    oxy_xpath("count(tokenize(normalize-space(string-join(text(), ' ')), ' '))", 
      processChangeMarkers, 
      true),
    "| ");
}
```
**Note:** The `oxy_xpath()` function supports *editor variables (on page 266)*, as in the following example:

```xml
* {
    content:
    oxy_concat("Result: ",
        oxy_xpath('count(collection("${cfdu}/?select=*.xml")')
    );
}
```

### Form Controls

Oxygen XML Author provides a variety of built-in form controls that allow users to interact with documents with familiar user interface objects. These form controls are defined in CSS stylesheets that are used to render Author mode. For customization purposes, Oxygen XML Author also supports custom form controls in Java *(on page 2144)*.

### How to Add a Built-in Form Control in Author Mode

Form controls can be added by defining them in the CSS associated with the XML document.

1. Create a custom CSS file.
2. Define the form control in the CSS using its dedicated CSS function. For example, to add a *date picker form control (on page 2129)*, its dedicated function is `oxy_datePicker`.
3. Associate the CSS file with the XML document in one of the following ways:
   - If you have a framework (document type) already created for this XML vocabulary, create a CSS in the framework directory and associate the CSS with the framework *(on page 1917)*. This approach is recommended if you intend on sharing the customization with others.
   - If you do not have a framework, you can associate the CSS to the XML document through a Processing Instruction *(on page 2048)*.

Audio File Player Form Control

The oxy_audio built-in form control is used for providing a mechanism to play audio clips.

The oxy_audio form control supports the following properties:

• href - The absolute or relative location of a resource. This property is mandatory. Relative values are resolved relative to the CSS. If you have media resources relative to the XML document, you can specify their paths like this:

```css
oxy_audio(href, oxy_url(oxy_base-uri(), 'ex.mp3'), width, 400px)
```

• width - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units.

Example: oxy_audio Form Control

```css
object {
  content:
  oxy_audio(
    href, 'resources/audio.mp3',
    width, 200px),
}
```

Tip: To insert a sample of the oxy_audio form control in a CSS file (or LESS file), invoke the Content Completion Assistant (on page 2792) by pressing Ctrl + Space (Command + Space on OS X) and select the : oxy_audio code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Author, see the sample files in the following directory: [OXYGEN_INSTALL_DIR]/samples/form-controls.

For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzkMSLM

Related Information:

Browser Form Control

The `oxy_browser` built-in form control is used for providing a mechanism to integrate HTML frames or interact with SVG documents directly in the Author mode editor. It can also be used to load HTML that executes JavaScript and from that JavaScript you can access the Oxygen XML Author workspace.

The `oxy_browser` form control supports the following properties:

- **href** - The absolute or relative location of a resource. This property is mandatory. Relative values are resolved relative to the CSS. If you have media resources relative to the XML document, you can specify their paths like this:

  ```xml
  oxy_browser(href, oxy_url(oxy_base-uri(), 'ex.svg'), width, 50%, height, 50%)
  ```

- **width** - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units.
- **height** - Specifies the height of the form control area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units.

**Example: oxy_browser Form Control**

```xml
object {
  content:
    oxy_browser{
      href, 'http://example.page',
      width, 600px,
      height, 400px,
    }
}
```

**Tip:** To insert a sample of the `oxy_browser` form control in a CSS file (or LESS file), invoke the Content Completion Assistant (on page 2792) by pressing Ctrl + Space (Command + Space on OS X) and select the `.oxy_browser` code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Author, see the sample files in the following directory: `[OXYGEN_INSTALL_DIR]/samples/form-controls`. 
### Interacting with the Oxygen XML Author Workspace

The `oxy_browser` form control also provides the possibility of creating custom form control without having to use the Java-based API. You can use the `oxy_browser` form control to load HTML that executes JavaScript. In the JavaScript, you can use some predefined global variables that provide a gateway between the JavaScript and the Oxygen XML Author Java API. This allows you to perform changes in the document, open resources, and more, solely from the JavaScript.

⚠️ **Important:** This will only work if the loaded HTML is located inside a framework or plugin directory (on page 93), such as: `[OXYGEN_INSTALL_DIR]/frameworks/` or `[OXYGEN_INSTALL_DIR]/plugins/`.

The following global variables can be used:

- **authorAccess** - This object is an instance of `ro.sync.ecss.extensions.api.AuthorAccess`.
- **contextElement** - An instance of `ro.sync.ecss.extensions.api.node.AuthorNode`. The form control is added over this node.
- **fcArguments** - A `java.util.Map` implementation with the properties (name and value pairs) passed on the form control function.
- **apiHelper** - A helper object for creating Java objects. It allows you to create Java objects from within the JavaScript code. These objects can then be passed to the Java methods as in the following example:

```javascript
var newAttrValue = apiHelper.newInstance(
    "ro.sync.ecss.extensions.api.node.AttrValue",
    "normalizedValue", "rawValue", true));
authorAccess.getDocumentController().setAttribute(
    "counter", newAttrValue, contextElement);
...
```

You can also specify the constructor signature:

```javascript
var newAttrValue = apiHelper.newInstance(
    "ro.sync.ecss.extensions.api.node.AttrValue",
    (java.lang.String, java.lang.String, boolean),
    "normalizedValue", "rawValue", true));
authorAccess.getDocumentController().setAttribute(
    "counter", newAttrValue, contextElement);
...
```
For more information, open the `form-controls.xml` file in the `[OXYGEN_INSTALL_DIR]/samples/form-controls` directory and go to section 11.1 - Interacting with the Oxygen Workspace.

**Warning:** On Mac OS X, you need to use asynchronous calls to the API, due to the following JDK bug: [https://bugs.openjdk.java.net/browse/JDK-8087465](https://bugs.openjdk.java.net/browse/JDK-8087465). By default, the API is called synchronously, but you can change this behavior for each API object by calling two methods: `sync()` and `async()`.

```javascript
// By default, the methods are invoke synchronously.
var ctrl = authorAccess.getDocumentController();
try {
    // On Mac, methods that change the document must be executed asynchronously.
    ctrl.async();
    ctrl.setAttribute("counter", newAttrValue, contextElement);
} finally {
    ctrl.sync();
}
```

**Listening for Changes in the Document**

If the form control presents some information from the document (for example, the value of an attribute), then it needs to be notified on changes in the document so that it can update that information. To do this, follow these steps:

1. In the JavaScript, the `bridgeReady()` method is invoked as soon as the form control is loaded and the API bridge is installed. This is where you can add a listener:

```javascript
function bridgeReady () {
    // We declare a member function for each method of the
    // ro.sync.ecss.extensions.api.AuthorListener interface (same function signature)
    var handler = {
        attributeChanged : function(event) {
            var node = event.getOwnerAuthorNode();
            var attrName = event.getAttributeName();

            if (node.equals(contextElement) && attrName === "counter") {
                init();
            }
        },
        contentDeleted : function(event) {},
        contentInserted : function(event) {}
    };
```
// We create a proxy over an ro.sync.ecss.extensions.api.AuthorListener that
// will
delegate its methods to the JS object's functions.
// We assign the listener to a global variable so that we can remove it later
// on,
// on the dispose() method.
authorDocumentListener = apiHelper.createProxyListener(
    "ro.sync.ecss.extensions.api.AuthorListener", handler);

var ctrl = authorAccess.getDocumentController();

// Add the proxy listener.
ctrl.addAuthorListener(authorDocumentListener);
}

2. Since a listener was added on the document, it is important to remove it once the form control is
not used anymore. When a form control is discarded, you can call the dispose() method from
the JavaScript. This is where the previously created listener can be removed:

```javascript
/**
 * The form control will not be used anymore. Clean up.
 */
function dispose() {
    // Dispose all added listeners.
    var ctrl = authorAccess.getDocumentController();
    ctrl.removeAuthorListener(authorDocumentListener);
}
```

### Debugging JavaScript Used for Custom Form Controls

If you encounter unexpected results when using the method described above (on page 2115), you
can debug the script by using the following guidelines:

- **Calls to** alert("message.to.present") or console.log("message.to.present") will be
  presented in the Results panel (on page 343).
- **You can install the Firebug extension** by executing the following script:

```javascript
function installFB() {
    if (!document.getElementById('FirebugLite')) {
        E = document['createElement' + 'NS'] && document.documentElement.namespaceURI;
```
E = E ? document['createElement' + 'NS'](E, 'script') : document['createElement']('script');
E['setAttribute']('id', 'FirebugLite');
E['setAttribute']('src',
    'https://getfirebug.com/' + 'firebug-lite.js
+ '#startOpened');
E['setAttribute']('FirebugLite', '4');
(document['getElementsByTagName']['head'][0]
 || document['getElementsByTagName']['body'][0]).appendChild(E);
E = new Image;
E['setAttribute']('src', 'https://getfirebug.com/' + '#startOpened');
}

{code}

**Note:** To force the Browser Form Control to reload after making changes to the JavaScript file, you need to use the Reload page action from the form control's contextual menu.

For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzkMSLM

**Related Information:**

- Custom CSS Functions *(on page 2091)*
- URL: oxy_url() Function *(on page 2109)*

**Button Form Control**

The oxy_button built-in form control is used for graphical user interface objects that invoke a custom Author mode action (defined in the associated Document Type) referencing it by its ID, or directly in the CSS.

The oxy_button form control supports the following properties:

- **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be true or false (default value). To make the form control inherit its font from its parent element, set the fontInherit property to true.
- **color** - Specifies the foreground color of the form control. If the value of the color property is inherit, the form control has the same color as the element in which it is inserted.
• **visible** - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.

• **transparent** - Flattens the aspect of the button form control, removing its border and background. The values of this property can be `true` or `false` (default value).

• **showText** - Specifies if the action text should be displayed on the button form control. If this property is missing then the button displays the icon only if it is available, or the text if the icon is not available. The values of this property can be `true` or `false`.

```xml
element {
  content: oxy_button(actionID, 'remove.attribute', showText, true);
}
```

• **showIcon** - Specifies if the action icon should be displayed on the button form control. If this property is missing then the button displays the icon only if it is available, or the text if the icon is not available. The values of this property can be `true` or `false`.

```xml
element {
  content: oxy_button(actionID, 'remove.attribute', showIcon, true);
}
```

• **enableInReadOnlyContext** - To enable button form controls (on page 2118) or groups of buttons form controls (on page 2121) this property needs to be set to `true`. This property can be used to specify areas as read-only (by setting the `-oxy-editable` property to `false`). This is useful when you want to use an action that does not modify the context.

• **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```xml
p:before {
  content: oxy_button(hoverPseudoclassName, 'showBorder');
}
p:showBorder {
  border: 1px solid red;
}
```

• **actionContext** - Specifies the context in which the action associated with the form control is executed. Its possible values are `element` (default value) and `caret`. If you select the `element` value, the context is the element that holds the form control. If you select the `caret` value, the action is invoked at the cursor location. If the cursor is not inside the element that holds the form control, the `element` value is selected automatically.

• **actionID** - The ID of the action, specified in the document type association (on page 102), that is invoked when you click the button.
Note: The element that contains the form control represents the context where the action is invoked.

- action - Defines an action directly, rather than using the actionID parameter to reference an action from the document type association (on page 102). This property is defined using the oxy_action function (on page 2092).

Tip: You can also create a button form control directly from an oxy_action function (on page 2093).

```xml
oxy_button(action, oxy_action(
    name, 'Insert',
    description, 'Insert an element after the current one',
    icon, url('insert.png'),
    operation, 'InsertFragmentOperation',
    arg-fragment, '<element>${caret}</element>',
    arg-insertLocation, '.',
    arg-insertPosition, 'After'
))
```

Tip: To execute multiple actions sequentially, you can use the oxy_compound_action function (on page 2096).

Example: oxy_button Form Control

```css
button:before {
  content: "Label:"
  oxy_button{
    /* This action is declared in the document type associated with the XML document. */
    actionID, "insertpopupWithMultipleSelection";
  }
}
```

Tip: To insert a sample of the oxy_button form control in a CSS file (or LESS file), invoke the Content Completion Assistant (on page 2792) by pressing Ctrl + Space (Command + Space on OS X) and select the oxy_button code template. Also, an oxy_button_in_place_action code template is available that inserts an oxy_button function that includes an action parameter.

To see more detailed examples and more information about how form controls work in Oxygen XML Author, see the sample files in the following directory: \[OXYGEN_INSTALL_DIR\]/samples/form-controls.

For more information about form controls, watch our video demonstration:
**Button Group Form Control**

The `oxy_buttonGroup` built-in form control is used for a graphical user interface group of buttons that invokes one of several custom **Author** mode actions (defined in the associated Document Type) referencing it by its ID, or directly in the CSS.

The `oxy_buttonGroup` form control supports the following properties:

- **label** - Specifies the label to be displayed on the button. This label can be translated using the `$(i18n)()` editor variable (on page 272).
- **icon** - The path to the icon to be displayed on the button.
- **visible** - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.
- **tooltip** - Specifies a tooltip to be displayed when you hover over the form control.
- **transparent** - Makes the button transparent without any borders or background colors. The values of this property can be `true` or `false`.
- **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.
- **enableInReadOnlyContext** - To enable **button form controls** (on page 2118) or **groups of buttons form controls** (on page 2121) this property needs to be set to `true`. This property can be used to specify areas as read-only (by setting the `oxy-editable` property to `false`). This is useful when you want to use an action that does not modify the context.
- **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```html
p:before {
  content: oxy_buttonGroup(hoverPseudoclassName, 'showBorder');
}
p:showBorder {
  border: 1px solid red;
}
```
• **actionIDs** - The IDs of the actions that will be presented in the group of buttons.
• **actionID** - The ID of the action, specified in the _document type association (on page 102)_ , that is invoked when you click the button.

Note: The element that contains the form control represents the context where the action is invoked.

• **actions** - Defines a sequential list of actions directly, rather than using the **actionID** parameter to reference actions from the _document type association (on page 102)_ . This property is defined using the _oxy_action_list function (on page 2093)_ .

```xml
oxy_buttonGroup(
    label, 'A group of actions',
    icon, url('http://www.oxygenxml.com/img/icn_oxy20.png'),
    actions,
    oxy_action_list(
        oxy_action(
            name, 'Insert',
            description, 'Insert an element after the current one',
            operation, 'InsertFragmentOperation',
            arg-fragment, '<element></element>',
            arg-insertLocation, '.',
            arg-insertPosition, 'After'
        ),
        oxy_action(
            name, 'Delete',
            description, 'Deletes the current element',
            operation, 'DeleteElementOperation'
        )
    )
)
```

Tip: To execute multiple actions sequentially, you can use the _oxy_compound_action function (on page 2096)_ in the _oxy_action_list function (on page 2093)_ .

```xml
p:before {
    content:
        oxy_buttonGroup(
            label, 'A group of actions',
            icon, url('http://www.oxygenxml.com/img/icn_oxy20.png'),
            actions,
            oxy_action_list(
```
oxy_compound_action{
    name, oxy_getActionName('framework.id', 'Fallback'),
    description, 'Inserts a paragraph and uses form controls to edit its @audience attribute',
    icon, url('http://www.oxygenxml.com/img/icn_oxy20.png'),
    oxy_action(
        name, 'Insert',
        description, 'Insert an element after the current one',
        operation, 'ro.sync.ecss.extensions.commons.operations.InsertFragmentOperation',
        icon, url('insert.png'),
        arg-fragment, '<p audience"></p>',
        arg-insertLocation, '.',
        arg-insertPosition, 'After'
    ),
    oxy_action(
        name, 'Activate edit mode',
        description, 'Sets a pseudo class that will activate a CSS rule that will present a text field form control for the @audience attribute',
        operation, 'SetPseudoClassOperation',
        arg-name, 'edit-mode-on',
        arg-elementLocation, '.'
    ),
    oxy_action(
        name, 'Delete',
        description, 'Deletes the current element',
        operation, 'DeleteElementOperation'
    )
}

- **actionContext** - Specifies the context in which the action associated with the form control is executed. Its possible values are *element* (default value) and *caret*. If you select the *element* value, the context is the element that holds the form control. If you select the *caret* value, the action is invoked at the cursor location. If the cursor is not inside the element that holds the form control, the *element* value is selected automatically.

- **actionStyle** - Specifies what to display for an action in the form control. The values of this property can be *text* (default value), *icon*, or *both*. 
**Example: oxy_buttonGroup Form Control**

```css
class oxy_buttonGroup:

  /* The action IDs are declared in the document type associated with the XML document. */
  actionIDs,
  "insert.popupWithMultipleSelection,insert.popupWithSingleSelection",
  actionStyle, "both";)
```

Tip: To insert a sample of the oxy_buttonGroup form control in a CSS file (or LESS file), invoke the Content Completion Assistant (on page 2792) by pressing Ctrl + Space (Command + Space on OS X) and select the .oxy_buttonGroup code template. Also, an .oxy_buttonGroup_in_place_action code template is available that inserts an oxy_buttonGroup function that includes an oxy_action_list function.

To see more detailed examples and more information about how form controls work in Oxygen XML Author, see the sample files in the following directory: [OXYGEN_INSTALL_DIR]/samples/form-controls.

For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzkMSLM

**Related Information:**

- Label: oxy_label() Function (on page 2100)
Checkbox Form Control

The `oxy_checkbox` built-in form control is used for a graphical user interface box that you can click to enable or disable an option. A single checkbox or multiple checkboxes can be used to present and edit the value on an attribute or element.

The `oxy_checkbox` form control supports the following properties:

- **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  - **@attribute_name** - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a QName (on page 2798) and the CSS must have a namespace declaration for the prefix.
  - **#text** - Specifies that the presented/edited value is the simple text value of an element.

  **Note:** You can set the value of the `visibility` property to `-oxy-collapse-text` (on page 2084) to render the text only in the form control that the `oxy_editor` function specifies.

- **resultSeparator** - If multiple check-boxes are used, the separator is used to compose the final result. If not specified, the space character is used.

- **tooltips** - Associates tooltips to each value in the values property. The value of this property is a list of tooltip messages separated by commas. If you want the tooltip to display a comma, use the `${comma}` variable (on page 271).

- **visible** - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.

- **values** - Specifies the values that are committed when the check-boxes are selected. If these values are not specified in the CSS, they are collected from the associated XML Schema.

  **Note:** Typically, when you use a comma in the values of a form control, the content that follows a comma is considered a new value. If you want to include a comma in the values, precede the comma with two backslashes. For example, `(values, '1\, 2\, 3, 4, edit, false)` will display a form control that has `1, 2, 3` for the first value and `4` for the second value.

- **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.

- **uncheckedValues** - Specifies the values that are committed when check-boxes are not selected.

- **labels** - This property must have the same number of items as the values property. Each item provides a literal description of the items listed in the values property. These labels can be translated using the `${i18n()} editor variable (on page 272)`. If this property is not specified, the values property is used as the label.

- **columns** - Controls the layout of the form control. The check boxes will be grouped in a number of columns equal to the given value.
• **color** - Specifies the foreground color of the form control. If the value of the `color` property is `inherit`, the form control has the same color as the element in which it is inserted.

• **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```css
p:before {
    content: oxy_checkbox(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
    border: 1px solid red;
}
```

**Example: Single *oxy_checkbox* Form Control**

```css
checkBox[attribute]:before {
    content: "A check box editor that edits a two valued attribute (On/Off)
    The values are specified in the CSS:
    oxy_checkbox(
        edit, "@attribute",
        values, "On",
        uncheckedValues, "Off",
        labels, "On/Off")
}
```

**Example: Multiple *oxy_checkbox* Form Controls**

```css
multipleCheckBox[attribute]:before {
    content: "Multiple checkboxes editor that edits an attribute value.
    Depending whether the check-box is selected,
    a different value is committed:
    oxy_checkbox(
        edit, "@attribute",
        values, "true, yes, on",
        uncheckedValues, "false, no, off",
        resultSeparator, ",",
        labels, "Present, Working, Started")
}
```

**Tip:** To insert a sample of the *oxy_checkbox* form control in a CSS file (or LESS file), invoke the *Content Completion Assistant (on page 2792)* by pressing **Ctrl + Space (Command + Space on OS X)** and select the `.oxy_checkbox` code template.
To see more detailed examples and more information about how form controls work in Oxygen XML Author, see the sample files in the following directory: \[OXYGEN_INSTALL_DIR]/samples/form-controls.

https://www.youtube.com/embed/-WY3wzkMSLM

Related Information:

• Custom CSS Functions (on page 2091)

• Collapse Text: -oxy-collapse-text Property Value (on page 2084)

Combo Box Form Control

The oxy_combobox built-in form control is used for providing a graphical user interface object that is a drop-down menu of proposed values. This form control can also be used for a combination of a drop-down menu and an editable single-line text field.

The oxy_combobox form control supports the following properties:

• **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  * @attribute_name - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a QName (on page 2798) and the CSS must have a namespace declaration for the prefix.
  * #text - Specifies that the presented/edited value is the simple text value of an element.

  **Note:** You can set the value of the **visibility property to -oxy-collapse-text (on page 2084)** to render the text only in the form control that the oxy_editor function specifies.

• **columns** - Controls the width of the form control. The unit size is the width of the **w** character.

• **width** - Specifies the width of the content area using relative (**em**, **ex**), absolute (**in**, **cm**, **mm**, **pt**, **pc**, **px**), and percentage (followed by the **%** character) length units. The **width** property takes precedence over the **columns** property (if the two are used together).

• **visible** - Specifies whether or not the form control is visible. The possible values of this property are **true** (default value) and **false**.

• **editable** - This property accepts the **true** and **false** values. In addition to a drop-down menu, the **true** value also generates an editable text field box that allows you to insert other values than the proposed ones. The **false** value generates a drop-down menu that only accepts the proposed values.
• **tooltips** - Associates tooltips to each value in the `values` property. The value of this property is a list of tooltip messages separated by commas. If you want the tooltip to display a comma, use the `${comma}` variable (on page 271).

• **values** - Specifies the values that populate the list of proposals. If these values are not specified in the CSS, they are collected from the associated XML Schema.

**Note:** Typically, when you use a comma in the values of a form control, the content that follows a comma is considered a new value. If you want to include a comma in the values, precede the comma with two backslashes. For example, `{values, '1\, 2\, 3', 4, edit, false}` will display a form control that has 1, 2, 3 for the first value and 4 for the second value.

• **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.

• **labels** - This property must have the same number of items as the `values` property. Each item provides a literal description of the items listed in the `values` property. These labels can be translated using the `$i18n()` editor variable (on page 272).

**Note:** This property is only available for read-only combo boxes (the `editable` property is set to `false`).

• **color** - Specifies the foreground color of the form control. If the value of the `color` property is `inherit`, the form control has the same color as the element in which it is inserted.

• **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```css
class oxy_combobox { 
  background-color: #ffffff; 
}
class oxy_combobox:hover { 
  background-color: #f0f0f0; 
}
```

• **canRemoveValue** - If the value is set to `true` and the combo box is not editable, then a new `<Empty>` value is added in that combo box. This clears or removes the value being edited, depending on if it edits an element or attribute.

• **onChange** - Can be used to invoke an action when the value of the combo box changes. The action can be created in the CSS using the `oxy_action()` function (on page 2092) or referenced from the `framework` (on page 2794) by its ID. After the action is executed, the cursor remains in the combo box. Note that this property does not support actions defined by JavaScript code.

**Example:** `oxy_combobox Form Control`

```css
class combobox { 
  background-color: #ffffff; 
}
class combobox:hover { 
  background-color: #f0f0f0; 
}
```
content: "A combo box that edits an attribute value. The possible values are provided from CSS:"

oxy_combobox(
    edit, "@attribute",
    editable, false,
    values, "value1, value2, value3",
    labels, "Value no1, Value no2, Value no3",
    onChange, oxy_action(
        name, 'Insert',
        operation, 'XQueryUpdateOperation',
        arg-script, 'insert node <product>{xs:string(@attribute)}</product>
            as last into .'));
}

Tip: To insert a sample of the oxy_combobox form control in a CSS file (or LESS file), invoke the Content Completion Assistant (on page 2792) by pressing Ctrl + Space (Command + Space on OS X) and select the .oxy_combobox code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Author, see the sample files in the following directory: [OXYGEN_INSTALL_DIR]/samples/form-controls.

For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzkMSLM

- Collapse Text: -oxy-collapse-text Property Value (on page 2084)

Date Picker Form Control

The oxy_datePicker built-in form control is used for offering a text field with a calendar browser that allows the user to choose a certain date in a specified format.

The oxy_datePicker form control supports the following properties:
- edit - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  - @attribute_name - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a QName (on page 2798) and the CSS must have a namespace declaration for the prefix.
  - #text - Specifies that the presented/edited value is the simple text value of an element.

  Note: You can set the value of the visibility property to -oxy-collapse-text (on page 2084) to render the text only in the form control that the oxy_editor function specifies.

- columns - Controls the width of the form control. The unit size is the width of the w character.
- width - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units. The width property takes precedence over the columns property (if the two are used together).
- color - Specifies the foreground color of the form control. If the value of the color property is inherit, the form control has the same color as the element in which it is inserted.
- fontInherit - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be true or false (default value). To make the form control inherit its font from its parent element, set the fontInherit property to true.
- format - This property specifies the format of the inserted date. The pattern value must be a valid Java date (or date-time) format. If this property is missing, the format of the date is determined from the associated schema.
- visible - Specifies whether or not the form control is visible. The possible values of this property are true (default value) and false.
- validateInput - Specifies if the form control is validated. If you introduce a date that does not respect the format, the datePicker form control is rendered with a red foreground. By default, the input is validated. To disable the validation, set this property to false.
- hoverPseudoclassName - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```xml
p:before {
  content: oxy_datePicker(edit, "@attribute", hoverPseudoclassName, 'showBorder')
}
p:showBorder {
  border: 1px solid red;
}
```

Example: oxy_datePicker Form Control
Tip: To insert a sample of the oxy_datePicker form control in a CSS file (or LESS file), invoke the Content Completion Assistant (on page 2792) by pressing Ctrl + Space (Command + Space on OS X) and select the .i: oxy_datePicker code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Author, see the sample files in the following directory: [OXYGEN_INSTALL_DIR]/samples/form-controls.

For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzkMSLM

- Custom CSS Functions (on page 2091)
- Label: oxy_label() Function (on page 2100)

HTML Content Form Control

The oxy_htmlContent built-in form control is used for rendering HTML content. This HTML content is displayed as a graphical element shaped as a box. The shape of the box is determined by a given width and the height is computed based upon the length of the text.

The oxy_htmlContent form control supports the following properties:

- href - The absolute or relative location of a resource. The resource needs to be a well-formed HTML file.
- id - The unique identifier of an item. This is a div element that has a unique id and is a child of the body element. The div element is the container of the HTML content to be rendered by the form control.
- content - An alternative to the href and id pair of elements. It provides the HTML content that will be displayed in the form control.
• width - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units. The width property takes precedence over the columns property (if the two are used together).

• hoverPseudoclassName - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```css
p:before {
  content: oxy_htmlContent(hoverPseudoclassName, 'showBorder');
}
p:showBorder {
  border: 1px solid red;
}
```

You can customize the style of the content using CSS that is either referenced by the file identified by the href property or is defined inline. If you change the HTML content or CSS and you want your changes to be reflected in the XML that renders the form control, then you need to refresh the XML file. If the HTML does not have an associated style, then a default text and background color will be applied.

**Example: oxy_htmlContent Form Control**

In the following example, the form control collects the content from the p_description div element found in the descriptions.html file. The box is 400 pixels wide and is displayed before a paragraph identified by the intro_id attribute value.

```css
p#intro_id:before {
  content:
  oxy_htmlContent{
    href, "descriptions.html",
    id, "p_description",
    width, 400px);
  }
}
```

An alternative example, using the content property:

```css
p#intro_id:before {
  content:
  oxy_htmlContent{
    content, "<div style='font-weight:bold;'>My content</div>",
    width, 400px);
  }
}
Tip: To insert a sample of the `oxy_htmlContent` form control in a CSS file (or LESS file), invoke the Content Completion Assistant (on page 2792) by pressing Ctrl + Space (Command + Space on OS X) and select the `.oxy_htmlContent` code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Author, see the sample files in the following directory: `[OXYGEN_INSTALL_DIR]/samples/form-controls`.

For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzkMSLM

Related Information:

- Custom CSS Functions (on page 2091)

### Pop-up Form Control

The `oxy_popup` built-in form control is used to offer a contextual menu that provides quick access to various actions. A pop-up form control can display single or multiple selections.

The `oxy_popup` form control supports the following properties:

- **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  - `@attribute_name` - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a QName (on page 2798) and the CSS must have a namespace declaration for the prefix.
  - `#text` - Specifies that the presented/edited value is the simple text value of an element.

  **Note:** You can set the value of the `visibility` property to `-oxy-collapse-text` (on page 2084) to render the text only in the form control that the `oxy_editor` function specifies.

- **rows** - This property specifies the number of rows that the form control presents.

  **Note:** If the value of the `rows` property is not specified, the default value of 12 is used.

- **color** - Specifies the foreground color of the form control. If the value of the `color` property is `inherit`, the form control has the same color as the element in which it is inserted.

  **Note:** This property is used for rendering in the Author mode.

- **visible** - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.
• tooltips - Associates tooltips to each value in the values property. The value of this property is a list of tooltip messages separated by commas. If you want the tooltip to display a comma, use the ${comma} variable (on page 271).

Example:

```css
link:before{
  content: oxy_popup{
    edit, '@href',
    values, "Spring, Summer, Autumn, Winter",
    tooltips, "Iris${comma}Snowdrop, Gardenia${comma}Liliac,
               Chrysanthemum${comma}Salvia, Gerbera",
    selectionMode, single;
  }
}
```

• values - Specifies the values that populate the list of proposals. If these values are not specified in the CSS, they are collected from the associated XML Schema.

Note: Typically, when you use a comma in the values of a form control, the content that follows a comma is considered a new value. If you want to include a comma in the values, precede the comma with two backslashes. For example, (values, '1\\, 2\\, 3, 4, edit, false) will display a form control that has 1, 2, 3 for the first value and 4 for the second value.

• resultSeparator - If multiple check-boxes are used, the separator is used to compose the final result. If not specified, the space character is used.

Note: The value of the resultSeparator property cannot exceed one character.

• selectionMode - Specifies whether the form control allows the selection of a single value or multiple values. The predefined values of this property are single (default value) and multiple.

• labels - Specifies the label associated with each entry used for presentation. If this property is not specified, the values property is used instead.

• columns - Controls the width of the form control. The unit size is the width of the w character. This property is used for the visual representation of the form control.

• width - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units. The width property takes precedence over the columns property (if the two are used together).

• rendererSort - Specifies the sorting of the values (labels) displayed on the form control before clicking the popup control. The possible values of this property are ascending and descending.

• editorSort - Specifies the sorting of the values displayed after clicking the popup control (for example, clicking a drop-down arrow button). The possible values of this property are ascending and descending.

• rendererSeparator - Defines a separator used when multiple values are rendered. If not specified, the value of the resultSeparator property is used.
• sort - Specifies the default sorting of the form control values (the values displayed before and after clicking the popup control). However, the editorSort and rendererSort properties have a higher priority. The possible values of this property are ascending and descending.

• fontInherit - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be true or false (default value). To make the form control inherit its font from its parent element, set the fontInherit property to true.

• hoverPseudoclassName - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```css
p:before {
  content: oxy_popup(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
  border: 1px solid red;
}
```

**Example: oxy_popup Form Control**

```css
popupWithMultipleSelection:before {
  content: "This editor edits an attribute value. The possible values are specified inside the CSS:"
  oxy_popup(
    edit, "@attribute",
    values, "value1, value2, value3, value4, value5",
    labels, "Value no1, Value no2, Value no3, Value no4, Value no5",
    resultSeparator, "|",
    columns, 10,
    selectionMode, "multiple",
    color, "blue",
    fontInherit, true);
  font-size: 30px;
}
```

**Tip:** To insert a sample of the oxy_popup form control in a CSS file (or LESS file), invoke the Content Completion Assistant (on page 2792) by pressing Ctrl + Space (Command + Space on OS X) and select the . oxy_popup code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Author, see the sample files in the following directory: [OXYGEN_INSTALL_DIR]/samples/form-controls.
Text Area Form Control

The oxy_textArea built-in form control is used for entering multiple lines of text in a graphical user interface box. A text area may include optional syntax highlight capabilities to present the form control.

The oxy_textArea form control supports the following properties:

- **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  - **@attribute_name** - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a QName (on page 2798) and the CSS must have a namespace declaration for the prefix.
  - **#text** - Specifies that the presented/edited value is the simple text value of an element.
  - **#content** - This parameter is useful when an element has mixed or element-only content and you want to edit its content inside a text area form control.

> Note: You can set the value of the visibility property to -oxy-collapse-text (on page 2084) to render the text only in the form control that the oxy_editor function specifies.

For example, if you have the following XML content:

```xml
<codeblock outputclass="language-xml" >START_TEXT<ph>phase</ph>
  <apiname><text>API</text></apiname></codeblock>
```

and your CSS includes the following snippet:

```css
codeblock:before{
  content:
  oxy_textArea{
    edit, '#content',
    contentType, 'text/xml'};
```
then the text area form control will edit the following fragment:

```xml
<codeblock outputclass="language-xml">START_TEXT
</ph><apiname><text>API</text></apiname>
</codeblock>
```

**Note:** When the value of the `edit` property is `#content`, the text area form control will also offer content completion proposals.

- **#content** - This parameter is useful when an element has mixed or element-only content and you want to edit its content inside a text area form control.

For example, if you have the following XML content:

```xml
<codeblock outputclass="language-xml">START_TEXT
</ph><apiname><text>API</text></apiname>
</codeblock>
```

and your CSS includes the following snippet:

```css
codeblock:before{
  content:
  oxy_textArea{
    edit, '#content',
    contentType, 'text/xml'};
}
```

then the text area form control will edit the following fragment:

```xml
<codeblock outputclass="language-xml">START_TEXT
</ph><apiname><text>API</text></apiname>
</codeblock>
```

**Note:** When the value of the `edit` property is `#content`, the text area form control will also offer content completion proposals.

- **columns** - Controls the width of the form control. The unit size is the width of the `w` character.
- **width** - Specifies the width of the content area using relative (`em`, `ex`), absolute (`in`, `cm`, `mm`, `pt`, `pc`, `px`), and percentage (followed by the `%` character) length units. The `width` property takes precedence over the `columns` property (if the two are used together).
- **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.
- **visible** - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.
- **rows** - This property specifies the number of rows that the form control presents. If the form control has more lines, you can scroll and see them all.
- **contentType** - Specifies the type of content for which the form control offers syntax highlighting. The following values are supported: `text/css; text/shell; text/cc; text/xquery; text/xml;`
• **indentOnTab** - Specifies the behavior of the Tab key. If the value of this property is set to true (default value), the Tab key inserts characters. If it is set to false, Tab is used for navigation, jumping to the next editable position in the document.

• The **white-space** CSS property influences the value that you edit, as well as the form control size:
  - **pre** - The whitespaces and new lines of the value are preserved and edited. If the rows and columns properties are not specified, the form control calculates its size on its own so that all the text is visible.
  - **pre-wrap** - The long lines are wrapped to avoid horizontal scrolling.

  [Tip] Note: The rows and columns properties must be specified. If these are not specified, the form control considers the value to be pre.

  - **normal** - The white spaces and new lines are normalized.

• **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```css
p:before {
  content: oxy_textArea(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
  border: 1px solid red;
}
```

**Example: oxy_textArea Form Control**

The following example presents a text area with CSS syntax highlighting that calculates its own dimension, and a second one with XML syntax highlighting with defined dimension.

```css
textarea {
  visibility: -oxy-collapse-text;
  white-space: pre;
}

textarea[language="CSS"]:before {
  content: oxy_textArea({'
    edit, '#text',
    contentType, 'text/css'});
}
**Tip:** To insert a sample of the `oxy_textArea` form control in a CSS file (or LESS file), invoke the **Content Completion Assistant (on page 2792)** by pressing **Ctrl + Space (Command + Space on OS X)** and select the `.oxy_textArea` code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Author, see the sample files in the following directory: `[OXYGEN_INSTALL_DIR]/samples/form-controls`.

---

**Text Field Form Control**

The `oxy_textfield` built-in form control is used for entering a single line of text in a graphical user interface box. A text field may include optional content completion capabilities, used to present and edit the value of an attribute or an element.

The `oxy_textfield` form control supports the following properties:

- **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  - `@attribute_name` - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a `QName (on page 2798)` and the CSS must have a namespace declaration for the prefix.
  - `#text` - Specifies that the presented/edited value is the simple text value of an element.
**Note:** You can set the value of the `visibility` property to `-oxy-collapse-text` (on page 2084) to render the text only in the form control that the `oxy_editor` function specifies.

- **columns** - Controls the width of the form control. The unit size is the width of the `w` character.
- **width** - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the `%` character) length units. The `width` property takes precedence over the `columns` property (if the two are used together).
- **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.
- **visible** - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.
- **values** - Specifies the values that populate the list of proposals. If these values are not specified in the CSS, they are collected from the associated XML Schema.
- **tooltips** - Associates tooltips to each value in the `values` property. The value of this property is a list of tooltip messages separated by commas. If you want the tooltip to display a comma, use the `{$comma}` variable (on page 271).
- **tooltip** - Specifies a tooltip to be displayed when you hover over the form control.
- **color** - Specifies the foreground color of the form control. If the value of the `color` property is `inherit`, the form control has the same color as the element in which it is inserted.
- **hasMultipleValues** - Specifies if the text field allows multiple values separated by spaces or just a single value.

**Note:** If the value is `false`, the **Content Completion Assistant** (on page 2792) considers the entire text as the prefix for its proposals. If the value is `true` (the default value), the space is the delimiter for the values and thus it is not included in the prefix (the prefix will be whatever comes after the space).

For example, suppose the possible values for your text field are: `value a, value b, and other values`. If the `hasMultipleValues` property is set to `true` and the user enters `"value "` (notice the space character after `value`) in the text field, the **Content Completion Assistant** will suggest all three values because the prefix is whatever comes after the space, and in this case the user did not enter anything after the space. If the `hasMultipleValues` property was set to `false`, the **Content Completion Assistant** would only suggest `value a` and `value b` because the space is considered part of the prefix.

- **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```css
p:before {
  content: oxy_textfield(hoverPseudoclassName, 'showBorder')
}```
Example: oxy_textfield Form Control

```xml
element {
    content: "Label: ">
    oxy_textfield(
        edit, "@my_attr",
        values, "value1, value2",
        color, "red",
        columns, 40);
}
```

Tip: To insert a sample of the oxy_textfield form control in a CSS file (or LESS file), invoke the Content Completion Assistant (on page 2792) by pressing Ctrl + Space (Command + Space on OS X) and select the .oxy_textfield code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Author, see the sample files in the following directory: [OXYGEN_INSTALL_DIR]/samples/form-controls.

For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzkMSLM

URL Chooser Form Control

The oxy_urlChooser built-in form control is used for a dialog box that allows you to select the location of local or remote resources. The inserted reference is made relative to the URL of the currently opened editor.

The oxy_urlChooser editor supports the following properties:
• edit - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  ◦ @attribute_name - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a QName (on page 2798) and the CSS must have a namespace declaration for the prefix.
  ◦ #text - Specifies that the presented/edited value is the simple text value of an element.

  **Note:** You can set the value of the visibility property to -oxy-collapse-text (on page 2084) to render the text only in the form control that the oxy_editor function specifies.

• columns - Controls the width of the form control. The unit size is the width of the w character.
• width - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units. The width property takes precedence over the columns property (if the two are used together).
• color - Specifies the foreground color of the form control. If the value of the color property is inherit, the form control has the same color as the element in which it is inserted.
• visible - Specifies whether or not the form control is visible. The possible values of this property are true (default value) and false.
• fontInherit - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be true or false (default value). To make the form control inherit its font from its parent element, set the fontInherit property to true.
• fileFilter - string value that holds comma-separated file extensions. The URL chooser uses these extensions to filter the displayed files. A value such as "jpg,png,gif" is mapped to a single filter that will display all jpg, png, and gif files.
• hoverPseudoclassName - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```javascript
p:before {
  content: oxy_urlChooser(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
  border: 1px solid red;
}
```

**Example: oxy_urlChooser Form Control**

```javascript
urlChooser[file]:before {
  content: "A URL chooser editor that allows browsing for a URL.
The selected URL is made relative to the currently edited file:"
  oxy_urlChooser{
    edit, '@file',
  }
```
Tip: To insert a sample of the oxy_urlChooser form control in a CSS file (or LESS file), invoke the Content Completion Assistant (on page 2792) by pressing Ctrl + Space (Command + Space on OS X) and select the .oxy_urlChooser code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Author, see the sample files in the following directory: [OXYGEN_INSTALL_DIR]/samples/form-controls.

For more information about form controls, watch our video demonstration:

Video Player Form Control

The oxy_video built-in form control is used for providing a mechanism to play videos.

The oxy_video form control supports the following properties:

• href - The absolute or relative location of a resource. This property is mandatory. Relative values are resolved relative to the CSS. If you have media resources relative to the XML document, you can specify their paths like this:

oxy_video(href, oxy_url(oxy_base-uri(), 'ex.mp4')), width, 400px, height, 300px)

• width - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units.

• height - Specifies the height of the form control area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units.

Example: oxy_video Form Control

object {
  content:
    oxy_video{
      href, 'resources/video.mp4',
    }
Tip: To insert a sample of the oxy_video form control in a CSS file (or LESS file), invoke the Content Completion Assistant (on page 2792) by pressing Ctrl + Space (Command + Space on OS X) and select the .oxy_video code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Author, see the sample files in the following directory: [OXYGEN_INSTALL_DIR]/samples/form-controls.

For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzkMSLM

• URL: oxy_url() Function (on page 2109)

Implementing Custom Form Controls

If the built-in form controls are not sufficient for your needs, you can implement custom form controls in Java.

Custom Form Controls Implementation

You can specify custom form controls using the following properties:

• rendererClassName - The name of the class that draws the edited value. It must be an implementation of ro.sync.ecss.extensions.api.editor.InplaceRenderer. The renderer has to be a SWING implementation and can be used both in the standalone and Eclipse distributions.

• swingClassName - You can use this property for the standalone (Swing-based) distribution to specify the name of the class used for editing. It is a Swing implementation of ro.sync.ecss.extensions.api.editor.InplaceEditor.

•.swtClassName - You can use this property for the Eclipse plugin distribution to specify the name of the class used for editing. It is a SWT implementation of the ro.sync.ecss.extensions.api.editor.InplaceEditor.
Note: If the custom form control is intended to work in the Oxygen XML Author standalone distribution, the declaration of `swtEditorClassName` is not required. The `renderer` (the class that draws the value) has different properties from the `editor` (the class that edits the value) because you can present a value in one way and edit it in another.

- `classpath` - You can use this property to specify the location of the classes used for a custom form control. The value of the `classpath` property is an enumeration of URLs separated by comma.

- `edit` - If your form control edits the value of an attribute or the text value of an element, you can use the `@attribute_name` and `#text` predefined values and Oxygen XML Author will perform the commit logic by itself. You can use the `custom` value to perform the commit logic yourself.

- `saHeavyFormControlClassName` - This type of form control is effectively present at all times at its allocated bounds. This is useful if you need a form control that renders dynamic or interactive SVG documents (for example, if you have an SVG document that displays tooltips when hovering over certain areas). It is also helpful if you want to use JavaFX, since JavaFX-based form controls are not compatible with the classic form control architecture.

The value of this property is a class name that must implement the `ro.sync.ecss.extensions.api.editor.InplaceHeavyEditor` method. The JAR (on page 2795) that contains this implementation can either be added in the Classpath tab in the Document Type Configuration dialog box (on page 98) for your particular framework (on page 2794) or specified with the `classpath` property (on page 2145).

Example: Java Code

The following is a sample Java code for implementing a custom combo box form control that inserts an XML element in the content when the editing stops:

```java
public class ComboBoxEditor extends AbstractInplaceEditor {
    /**
     * @see ro.sync.ecss.extensions.api.editor.InplaceEditor#stopEditing()
     */
    @Override
    public void stopEditing() {
        Runnable customCommit = new Runnable() {
            @Override
            public void run() {
                AuthorDocumentController documentController =
                    context.getAuthorAccess().getDocumentController();
                documentController.insertXMLFragment("<custom/>", offset);
            }
        };
```
The custom form controls can use any of the predefined properties of the built-in form controls (on page 2112), as well as specified custom properties.

**Example: CSS**

The following is an example of how to specify a custom form control in the CSS:

```css
myElement {
  content: oxy_editor(
    rendererClassName, "com.custom.editors.CustomRenderer",
    swingEditorClassName, "com.custom.editors.SwingCustomEditor",
    swtEditorClassName, "com.custom.editors.SwtCustomEditor",
    edit, "@my_attr",
    customProperty1, "customValue1",
    customProperty2, "customValue2"
  )
}
```

How to Implement Custom Form Controls

To implement a custom form control, follow these steps:

1. Download the Oxygen XML Author SDK at: https://www.oxygenxml.com/oxygen_sdk.html.
2. Implement the custom form control by extending `ro.sync.ecss.extensions.api.editor.InplaceEditorRendererAdapter`. You could also use `ro.sync.ecss.extensions.api.editor.AbstractInplaceEditor`, which offers some default implementations and listeners management.
3. Pack the previous implementation in a Java JAR (on page 2795) library.
4. Copy the JAR library to the `[OXYGEN_INSTALL_DIR]/frameworks/[FRAMEWORK_DIR]` directory.
5. In Oxygen XML Author, open the Preferences dialog box (Options > Preferences) (on page 79), go to Document Type Association, edit the appropriate framework, and add the JAR library in the Classpath tab.
6. Specify the custom form control in your CSS, as described above.
Tip: To see more detailed examples and more information about how form controls work in Oxygen XML Author, see the sample files in the following directory: \[OXYGEN_INSTALL_DIR\]/samples/form-controls.

For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzkMSLM

Editing Processing Instructions Using a Form Control

Oxygen XML Author allows you to edit processing instructions, comments, and CDATA by using CSS extensions.

Note: You can edit both the content and the attribute value from a processing instruction.

**Example: Editing an Attribute from a Processing Instruction**

**PI content:**

```xml
<?pi_target attr="val"/>
```

**CSS:**

```css
@namespace oxy "http://www.oxygenxml.com/extensions/author";

oxy|processing-instruction:before {
    display:inline;
    content: "EDIT attribute: " oxy_textfield(edit, '@attr', columns, 15);
    visibility:visible;
}
oxy|processing-instruction{
    visibility:-oxy-collapse-text;
}
```

**Related Information:**

- Text Field Form Control (on page 2139)
- Collapse Text: -oxy-collapse-text Property Value (on page 2084)
- Displaying Processing Instructions from Other XML Editors (on page 2051)
Custom CSS Pseudo-classes

You can set your custom CSS pseudo-classes on the nodes from the AuthorDocument model. These are similar to the normal XML attributes, with the important difference that they are not serialized, and by changing them, the document does not create undo and redo edits (the document is considered unmodified). You can use custom pseudo-classes for changing the style of an element (and its children) without altering the document.

In Oxygen XML Author they are used to hide/show the colspec elements from CALS tables. To take a look at the implementation, see:

1. \[\text{\{OXYGEN\_INSTALL\_DIR\}/frameworks/docbook/css/cals_table.css}\] (Search for -oxy-visible-colspecs)
2. The definition of action table.toggle.colspec from the DocBook framework (on page 2794) makes use of the pre-defined TogglePseudoClassOperation Author mode operation.

Here are some examples:

**Example: Controlling the visibility of a section using a pseudo-class**

You can use a non standard (custom) pseudo-class to impose a style change on a specific element. For instance, you can have CSS styles matching the custom pseudo-class access-control-user, like the one below:

```css
section {
  display:none;
}

section:access-control-user {
  display:block;
}
```

By setting the pseudo-class access-control-user, the element section will become visible by matching the second CSS selector.

**Example: Coloring the elements at the current cursor location**

You could create an AuthorCaretListener that sets the caret-visited pseudo-class to the element at the cursor location. The effect will be that all the elements traversed by the cursor become red.

```css
*:caret-visited {
  color:red;
}
```

The API that you can use from the CaretListener:
ro.sync.ecss.extensions.api.AuthorDocumentController#setPseudoClass(java.lang.String, ro.sync.ecss.extensions.api.node.AuthorElement)

ro.sync.ecss.extensions.api.AuthorDocumentController#removePseudoClass(java.lang.String, ro.sync.ecss.extensions.api.node.AuthorElement)

**Predefined Pseudo-Class Author Mode Operations**

Pre-defined Author mode operations can be used directly in your framework to work with custom pseudo-classes:

1. **TogglePseudoClassOperation**
2. **SetPseudoClassOperation**
3. **RemovePseudoClassOperation**

**Debugging CSS Stylesheets**

To assist you with debugging and customizing CSS stylesheets the Author mode includes a CSS Inspector view (on page 425) to examine the CSS rules that match the currently selected element.

This tool is similar to the Inspect Element development tool that is found in most browsers. The CSS Inspector view allows you to see how the CSS rules are applied and the properties defined. Each rule that is displayed in this view includes a link to the line in the CSS file that defines the styles for the element that matches the rule. You can use the link to open the appropriate CSS file and edit the style rules. Once you have found the rule you want to edit, you can click the link in the top-right corner of that rule to open the CSS file in the editor.

**Figure 497. CSS Inspector View**

There are two ways to open the CSS Inspector view:

1. Select **CSS Inspector** from the Window > Show View menu.
2. Select the **Inspect Styles** action from the contextual menu in Author mode.

**Related Information:**
• CSS Inspector View (on page 425)

Using the Oxygen XML SDK

Oxygen XML Author has an SDK that can be used as a base to develop frameworks (on page 2794) and plugins (on page 2797). It can be also used to create projects that use the Oxygen XML Author Component or Oxygen XML Web Author. The SDK is a Java library available under the Oxygen XML SDK licensing terms and is delivered with a set of examples that demonstrate how to extend Oxygen XML functionality through API calls. The SDK is available at https://www.oxygenxml.com/oxygen_sdk.html.

Extending Oxygen XML Author with Plugins

A plugin (on page 2797) is a software component that adds extra functionality to the standalone version of the application using a series of application-provided extension points.

This chapter explains how to write and install a plugin for the standalone version of Oxygen XML Author. The Plugins Development Kit contains sample plugins (source and compiled Java code) and the Javadoc API necessary for developing custom plugins.

If you want to customize the Oxygen XML Author Eclipse plugin you can look at the Eclipse IDE Integration Sample Project to see how an Eclipse plugin can interact with the Oxygen XML Author APIs.

General Configuration of an Oxygen XML Author Plugin

The Oxygen XML Author functionality can be extended with plugins (on page 2797) that implement a clearly specified API. On the Oxygen XML Author website, there is an SDK with sample plugins (source and compiled Java code) and the Javadoc API necessary for developing custom plugins.

The minimal implementation of a plugin must provide:

- A Java class that extends the ro.sync.exml.plugin.Property class.
- A Java class that implements the ro.sync.exml.plugin.PluginExtension interface.
- A plugin descriptor file called plugin.xml.

A ro.sync.exml.plugin.PluginDescriptor object is passed to the constructor of the subclass of the ro.sync.exml.plugin.Plugin class. It contains the following data items about the plugin:

- basedir (File object) - The base directory of the plugin.
- **description** (*String object*) - The description of the plugin.
- **name** (*String object*) - The name of the plugin.
- **vendor** (*String object*) - The vendor name of the plugin.
- **version** (*String object*) - The plugin version.
- **id** (*String object*) - A unique identifier.
- **classLoaderType** - You can choose between `preferOxygenResources` (default value) and `preferReferencedResources`. When choosing `preferOxygenResources`, the libraries that are referenced in the Oxygen XML Author `lib` directory will have precedence over those referenced in the plugin.xml configuration file, if they have the same package names. When choosing `preferReferencedResources`, the libraries that are referenced in the plugin.xml configuration file will have precedence over those found in the Oxygen XML Author `lib` directory, if they have the same package names.

The plugin descriptor is an XML file that defines how the plugin is integrated in Oxygen XML Author and what libraries are loaded. The structure of the plugin descriptor file is fully described in a DTD grammar located in `[OXYGEN_INSTALL_DIR]/plugins/plugin.dtd`. Here is a sample plugin descriptor used by the Capitalize Lines sample plugin:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE plugin SYSTEM "../plugin.dtd">
<plugin
   name="Capitalize Lines"
   description="Capitalize the first character on each line"
   version="1.0.0"
   vendor="SyncRO"
   class="ro.sync.sample.plugin.caplines.CapLinesPlugin">
   <runtime>
      <library name="lib/caplines.jar"/>
   </runtime>
   <extension type="selectionProcessor"
      class="ro.sync.sample.plugin.caplines.CapLinesPluginExtension"
      keyboardShortcut="ctrl shift EQUALS"/>
</plugin>
```

If your plugin is of the Selection, Document or General types, and thus contributes an action either to the contextual menu or to the main menu of the Text editing mode, then you can assign a keyboard shortcut for it. You can use the `keyboardShortcut` attribute for each `extension` element to specify the desired shortcut.

**Tip:** To compose string representations of the desired shortcut keys you can go to the Oxygen XML Author Menu Shortcut Keys preferences page, press **Edit** on any action, press the desired key sequence and use the representation that appears in the **Edit** dialog box.
Referencing Libraries

To reference libraries, use either of the following elements:

- `<library name="path/libraryName" scope="global"/>` - To point to specific libraries. Notice that the value of `library name` includes the path (relative or absolute) to the library.

  Note: You can use the `${oxygenInstallDir}` editor variable (on page 272) as part of the value of the `name` attribute. You can also use a system variable (`${system(var.name)}`) or environment variable (`${env(VAR_NAME)}`).

- `<librariesFolder name="path/libraryFolderPath" scope="global"/>` - To point to multiple libraries located in the specified folder. Notice that the value of `libraryFolder name` includes the path (relative or absolute) to the library folder.

Both elements support the `scope` attribute that defines the loading priority. It can have one of the following three values:

- **local** - The library is loaded in the plugin's own class loader. This is the default behavior.
- **global** - The library is loaded in the main application class loader as the last library in the list (as if it would be present in the application `lib` directory).
- **globalHighPriority** - The library is loaded in the main application class loader as the first library in the list (useful to patch certain resources located in other JARs on page 2795) of the application.

Installing an Oxygen XML Author Plugin

Choose one of the following methods to install a plugin (on page 2797) in Oxygen XML Author:

**Manual Method**

To manually install a plugin in Oxygen XML Author, follow these steps:

1. Go to the Oxygen XML Author installation directory and locate the `plugins` directory.

   Note: The `plugins` directory contains all the plugins available to Oxygen XML Author.

2. In the `plugins` directory, create a subfolder to store the plugin files (for example, `{OXYGEN_INSTALL_DIR}/plugins/myPlugin`).

3. In the new folder, place the plugin descriptor file (`plugin.xml`), the Java classes of the plugin, and the other files that are referenced in the descriptor file.

Automatic Method

To install an add-on that is hosted on a remote update site, follow these steps:

1. Go to Help > Install new add-ons.
2. In the displayed dialog box, enter or paste the update site that hosts the add-on in the **Show add-ons from** field (or select it from the drop-down menu, if applicable). The default add-ons are hosted on https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml. If you want to see a list of all the default and sample add-ons that are available on the Oxygen remote update sites, choose ALL AVAILABLE SITES from the drop-down menu. The add-ons list contains the name, status, update version, Oxygen XML Author version, and the type of the add-on (either **framework**, or **plugin**). A short description of each add-on is presented under the add-ons list.

   **Note:** To see all the versions of the add-ons, deselect **Show only compatible add-ons** and **Show only the latest version of the add-ons**. Incompatible add-ons are shown only to acknowledge their presence on the remote update site, but you cannot install an incompatible add-on.

3. Choose the add-ons you want to install, press the **Next** button, then follow the on-screen instructions.

   **Note:** Accepting the license agreement of the add-on is a mandatory step in the installation process.

   **Note:** All add-ons are installed in the extensions directory inside the Oxygen XML Author preferences directory (on page 80).

Types of Plugin Extensions Available with the SDK

A plugin (on page 2797) can have one or more defined plugin extensions that provide functionality to the application. This section presents the plugin extensions that are available.

Workspace Access Plugin Extension

This type of plugin (on page 2797) allows you to contribute actions to the main menu and toolbars, create custom views, interact with the application workspace, make modifications to opened documents, and add listeners for various events.

Many complex integrations (such as integrations with Content Management Systems) usually requires access to some workspace resources such as toolbars, menus, views, and editors. This type of plugin is also useful because it allows you to make modifications to the XML content of an opened editor.
The plugin must implement the `ro.sync.exml.plugin.workspace.WorkspaceAccessPluginExtension` interface. The callback method `applicationStarted` of this interface allows access to a parameter of the `ro.sync.exml.workspace.api.standalone.StandalonePluginWorkspace` type (allows for API access to the application workspace).

The `StandalonePluginWorkspace` interface has three methods that can be called to customize toolbars, menus, and views:

**addToolbarComponentsCustomizer**

Contributes to or modifies existing toolbars. You can specify additional toolbar IDs in the associated `plugin.xml` descriptor file using the following construct:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE plugin SYSTEM "../plugin.dtd">
<plugin name="CustomWorkspaceAccess" ..............>
  <runtime>........</runtime>
  ..............
  <extension type="WorkspaceAccess" ............../>
  ..............
  <toolbar id="SampleID" initialSide="NORTH" initialRow="1"/>
</plugin>
```

The `toolbar` element adds a toolbar in the Oxygen XML Author interface and allows you to contribute your own plugin-specific actions. The following attributes are supported:

- **id** - Unique identifier for the toolbar.
- **initialSide** - Specifies the place where the toolbar is initially displayed. The allowed values are `NORTH` and `SOUTH`.
- **initialRow** - Specifies the initial row on the specified side where the toolbar is displayed. For example, the first toolbar has an initial row of 0 and the next toolbar has an initial row of 1.

The `ro.sync.exml.workspace.api.standalone.ToolbarInfo` toolbar component information with the specified ID will be provided to you by the customizer interface. Therefore, you will be able to provide Swing components that will appear on the toolbar when the application starts.

**addViewComponentCustomizer**
Contributes to or modifies existing views, or contributes to the reserved custom view. You can specify additional view IDs in the associated plugin.xml descriptor using the following construct:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE plugin SYSTEM "../plugin.dtd">
<plugin name="CustomWorkspaceAccess" .........>
  <runtime>
       .......
  </runtime>
  <extension type="WorkspaceAccess" ........./>
  ............
  <view id="SampleID" initialSide="WEST" initialRow="0"/>
</plugin>
```

The view element adds a view in the Oxygen XML Author interface and allows you to contribute your own plugin-specific UI components. The following attributes are supported:

- **id** - Unique identifier of the view component.
- **initialSide** - Specifies the place where the view is initially displayed. The allowed values are: NORTH, SOUTH, EAST, and WEST.
- **initialRow** - Specifies the initial row on the specified side where the view is displayed. For example, in Oxygen XML Author, the **Project view (on page 320)** has an initial row of 0 and the **Outline view (on page 334)** has an initial row of 1. Both views are in the WEST part of the workbench.
- **initialState** - Specifies the initial state of the view. The allows values are: hidden, docked, autohide, and floating. By default, the view is visible and docked.

The ro.sync.exml.workspace.api.standalone.ViewInfo view component information with the specified ID will be provided to you by the customizer interface. Therefore, you will be able to provide Swing components that will appear on the view when the application starts.

**addMenuBarCustomizer**

Contributes to or modifies existing menu components.

Access to the opened editors can be done by first getting access to all URLs opened in the workspace using the **StandalonePluginWorkspaces.getAllEditorLocations(int editingArea)** API method. There are two available editing areas: the DITA Maps Manager editing area and the
Using the URL of an opened resource, you can gain access to it using the \texttt{StandalonePluginWorkspace.getEditorAccess(URL location, int editingArea)} API method. A \texttt{ro.sync.exml.workspace.api.editor.WSEditor} then allows access to the current editing page.

A special editing API is supported for the \texttt{Text} mode (\texttt{ro.sync.exml.workspace.api.editor.page.text.WSTextEditorPage}) and the \texttt{Author} mode (\texttt{ro.sync.exml.workspace.api.editor.page.author.WSAuthorEditorPage}).

To be notified when editors are opened, selected, and closed, you can use the \texttt{StandalonePluginWorkspace.addEditorChangeListener} API method to add a listener.

\textbf{Examples:}

- A simple Maven-based sample of a workspace access plugin is available here: \url{https://github.com/oxygenxml/sample-plugin-workspace-access}.
- A more complex sample of a workspace access plugin mimicking a CMS integration is available in the Author SDK: \url{https://www.oxygenxml.com/oxygen_sdk.html}.

\textbf{Adding a Custom View in Oxygen XML Author}

To add a custom view in Oxygen XML Author, follow this procedure:

1. Locate the \texttt{plugin.xml} descriptor file for your plugin (should be located inside the \texttt{plugins} folder, for example, \texttt{[OXYGEN_INSTALL_DIR]/plugins/myPlugin}). Define the ID of the view you want to add and specify the location where it will be placed:

\begin{verbatim}
<view id="SampleWorkspaceAccessID" initialSide="WEST" initialRow="0"/>
\end{verbatim}

2. In your Workspace Access Plugin Extension \textit{(on page 2154)} implementation, where the \texttt{applicationStarted} callback is received, add a view component customizer like this:

\begin{verbatim}
public void customizeView(ViewInfo viewInfo) {
    if (//The view ID defined in the "plugin.xml"
        "SampleWorkspaceAccessID".equals(viewInfo.getViewID())) {
        cmsMessagesArea = new JTextArea("CMS Session History:");
        viewInfo.setComponent(new JScrollPane(cmsMessagesArea));
        viewInfo.setTitle("CMS Messages");
        viewInfo.setIcon(Icons.getIcon(Icons.CMS_MESSAGES_CUSTOM_VIEW_STRING));
    }
}
\end{verbatim}
3. Define the `cmsMessagesArea` as a static field (if you can access the messages area from anywhere in your code).

Related Information:

- https://www.oxygenxml.com/oxygen_sdk/oxygen_standalone_plugins.html

Workspace Access Plugin Extension (JavaScript-Based)

This is a JavaScript-based plugin (on page 2797) extension that allows you to contribute actions to the main menu and toolbars, create custom views, interact with the application workspace, make modifications to opened documents, and add listeners for various events.

This extension can use the same API as the Workspace Access plugin extension (on page 2154), but the implementation is JavaScript-based and uses the bundled Rhino library to create and work with Java API from the JavaScript code.

First, you need to create a custom plugin folder inside the `plugins` folder (for example, `{OXYGEN_INSTALL_DIR}/plugins/myPlugin`). This folder will contain your custom plugin descriptor file (`plugin.xml`) and all other resources for the plugin.

The plugin descriptor file (named `plugin.xml`) needs to reference a JavaScript file, as in the following example:

```xml
<!DOCTYPE plugin PUBLIC "-//Oxygen Plugin" "../plugin.dtd">
<plugin
    id="unique.id.value"
    name="Add Action To DITA Maps Manager popup-menu"
    description="Plugin adds action to DITA Maps Manager contextual menu."
    version="1.0"
    vendor="Syncro Soft"
    class="ro.sync.exml.plugin.Plugin"
    classLoaderType="preferReferencedResources">
    <extension type="WorkspaceAccessJS" href="wsAccess.js"/>
</plugin>
```

In the example above, the JavaScript file `wsAccess.js` (located in your custom plugin folder (on page 2158)) will be called. This JavaScript file needs to have two JavaScript methods defined inside. Methods that will be called when the application starts and when it ends:

```javascript
function applicationStarted(pluginWorkspaceAccess) {
    ...........
}  
```
With regard to the `applicationStarted` callback, besides using the `ro.sync.exml.workspace.api.standalone.StandalonePluginWorkspace` API with the `pluginWorkspaceAccess` parameter, you can also use a globally defined field called `jsDirURL` that points to the folder where the JavaScript file is located.

Below is a much larger example with a JavaScript Workspace Access plugin extension implementation that adds a new action in the contextual menu of the DITA Maps Manager view (on page 2503). The action starts the `notepad.exe` application and passes the reference to the currently selected `topicref` to it.

```javascript
function applicationStarted(pluginWorkspaceAccess) {
    Packages.java.lang.System.err.println("Application started "+ pluginWorkspaceAccess);
    edChangedListener = {
        /*Called when a DITA Map is opened*/
        editorOpened: function (editorLocation) {
            Packages.java.lang.System.err.println("\nrunning "+ editorLocation);
        },
        /*Get the opened DITA Map*/
        editor = pluginWorkspaceAccess.getEditorAccess(editorLocation,
            Packages.ro.sync.exml.workspace.api.PluginWorkspace.DITA_MAPS_EDITING_AREA);
        ditaMapPage = editor.getCurrentPage();
        /*Add listener called when right-click is done in the DITA Maps manager*/
        customizeObj = {
            customizePopUpMenu: function (popUp, ditaMapDocumentController) {
                Packages.java.lang.System.err.println("RIGHT CLICK" + popUp);
                tree = ditaMapPage.getDITAMapTreeComponent();
                /*Selected tree path*/
                sel = tree.getSelectionPath();
                if (sel != null) {
                    selectedElement = sel.getLastPathComponent();
                    /*Reference attribute*/
                    href = selectedElement.getAttribute("href");
                    if (href != null) {
                        try {
                            /*Create absolute reference*/
                        }
                    }
                }
            }
        }
    }
}
```
absoluteRef = new Packages.java.net.URL(selectedElement.getXMLBaseURL(),
   href.getValue());
Packages.java.lang.System.err.println("Computed absolute reference "+ absoluteRef);
mi = new Packages.java.swing.JMenuItem("Run notepad");
   popup.add(mi);
   actionPerfObj = {
      actionPerformed: function (e) {
         try {
            Packages.java.lang.Runtime.getRuntime().exec("notepad.exe "
            + pluginWorkspaceAccess.getUtilAccess().locateFile(absoluteRef));
         }
         catch (e1) {
            e1.printStackTrace();
         }
      }
   }
   mi.addActionListener(new Packages.java.awt.event.ActionListener
      {
         actionPerformed: function (e) {
            try {
               Packages.java.lang.Runtime.getRuntime().exec("notepad.exe "
               + pluginWorkspaceAccess.getUtilAccess().locateFile(absoluteRef));
            }
            catch (e1) {
               e1.printStackTrace();
            }
         }
      });
ditaMapPage.setPopUpMenuCustomizer(new Packages.ro.sync.exml.workspace.api.
editor.page.ditamap.DITAMapPopupMenuCustomizer(customizerObj));
edChangedListener = new JavaAdapter(Packages.ro.sync.exml.workspace.api.
   listeners.WSEditorChangeListener, edChangedListener);
pluginWorkspaceAccess.addEditorChangeListener(edChangedListener,
   Packages.ro.sync.exml.workspace.api.PluginWorkspace.DITA_MAPS_EDITING_AREA);

function applicationClosing(pluginWorkspaceAccess) {
Declaring Multiple Modules

JavaScript-based plugins can include multiple modules of JavaScript files in the plugin. In those files, you can declare functions that can be used in the main `WorkspaceAccessJS` JavaScript file. Thus, you can use those external script files as a library of functions. The modules must be declared in the plugin descriptor file (`plugin.xml`).

For example:

```xml
<!DOCTYPE plugin PUBLIC "-//Oxygen Plugin" "../plugin.dtd">
<plugin
  id="unique.id.value"
  name="Add Action To DITA Maps Manager popup-menu"
  description="Plugin adds action to DITA Maps Manager contextual menu."
  version="1.0"
  vendor="Syncro Soft"
  class="ro.sync.exml.plugin.Plugin"
  classLoaderType="preferReferencedResources">
  <extension type="WorkspaceAccessJS" href="wsAccess.js"/>
  <extension type="WorkspaceAccessJSModule" href="wsAccessModule1.js"/>
  <extension type="WorkspaceAccessJSModule" href="wsAccessModule2.js"/>
</plugin>
```

For more information and some samples, see GitHub Project with Multiple Workspace Access JavaScript-Based Plugin Samples.

Author Stylesheet Plugin Extension

This type of plugin (on page 2797) allows you to add a stylesheet (CSS or LESS) that renders elements in Author mode.

To specify additional stylesheets, edit the plugin descriptor and add extension elements that point to them, as in the following example:

```xml
<extension type="AuthorStylesheet" href="showTables.css"/>
<extension type="AuthorStylesheet" href="hideButtons.css"/>
```
Using this mechanism, you can add one or more CSS stylesheets to merge with the existing ones. Whenever you add a new stylesheet using this plugin, it will have priority over all other stylesheets applied on the file edited in Author mode.

If your implementation requires more flexibility (such as a dynamic change of the stylesheet), you should consider using the StylesFilter plugin extension (on page 2169).

Additional Framework Plugin Extension

This type of plugin (on page 2797) allows you to add a new framework straight from the plugin.

To specify additional frameworks, edit the plugin descriptor and add extension elements that point to them, as in the following example:

```
<extension type="AdditionalFrameworks" path="framework_directory"/>
```

The path attribute should be a sub-directory of the plugin. If the plugin is installed as an add-on (on page 75), the new framework will be set as read-only and editing it will only be possible if you duplicate it (on page 92). If the plugin is installed in the \[OXYGEN_INSTALL_DIR]/plugins directory, the new frameworks will be editable.

Additional XProc Engine Plugin Extension

This type of plugin (on page 2797) contributes a folder that contains an external XProc engine.

The name of the plugin extension is AdditionalXProcEngine and it makes it easier to integrate an external XProc engine (on page 1363). After the plugin is installed, when you run an XProc transformation scenario, your external XProc engine can be selected from the Processor drop-down menu in the XProc tab.

An example of the plugin.xml file looks like this:

```
<plugin id="morgana.xproc.addon"
   name="Contribute Morgana XProc"
   description="Contribute Morgana XProc"
   version="1.0"
   vendor="Syncro Soft"
   class="ro.sync.exml.plugin.Plugin"
   classLoaderType="preferReferencedResources">
  <extension type="AdditionalXProcEngine" path="MorganaXProcEngine/"/>
</plugin>
```

The path attribute points to the XProc engine folder that contains the engine.xml and all the libraries necessary to run it.
Components Validation Plugin Extension

This type of plugin (on page 2797) allows you to customize the menus, toolbars, and other components by enabling or filtering them from the user interface.

This plugin provides the following API:

**ComponentsValidatorPluginExtension interface**

There is one method that must be implemented:

```java
getComponentsValidator()
```

Returns a ro.sync.exml.ComponentsValidator implementation class used for validating the menus, toolbars, and their actions.

**ComponentsValidator interface**

Provides methods to filter various features from being added to the GUI of Oxygen XML Author:

```java
validateMenuOrTaggedAction(String[] menuOrActionPath)
```

Checks if a menu or a tag action from a menu is allowed and returns a boolean value. A tag is used to uniquely identifying an action. The String[] argument is the tag of the menu / action and the tags of its parent menus if any.

```java
validateToolbarTaggedAction(String[] toolbarOrAction)
```

Checks if an action from a toolbar is allowed and returns a boolean value. The String[] argument is the tag of the action from a toolbar and the tag of its parent toolbar if any.

```java
validateComponent(String key)
```

Checks if the given component is allowed and returns a boolean value. The String argument is the tag identifying the component. You can remove toolbars entirely using this callback.

```java
validateAccelAction(String category, String tag)
```

Checks if the given accelerator action is allowed to appear in the GUI and returns a boolean value. An accelerator action can be uniquely identified so it will be removed both from toolbars or menus. The first argument represents the action category, the second is the tag of the action.

```java
validateContentType(String contentType)
```

Checks if the given content type is allowed and returns a boolean value. The String argument represents the content type. You can instruct Oxygen
XML Author to ignore content types such as text/xsl or text/xquery.

validateOptionPane(String optionPaneKey)
Checks if the given options page can be added in the preferences option tree and returns a boolean value. The String argument is the option pane key.

validateOption(String optionKey)
Checks if the given option can be added in the option page and returns a boolean value. The String argument is the option key. This method is mostly used for internal use and it is not called for each option in a preferences page.

validateLibrary(String library)
Checks if the given library is allowed to appear listed in the About dialog box and returns a boolean value. The String argument is the library. This method is mostly for internal use.

validateNewEditorTemplate(EditorTemplate editorTemplate)
Checks if the given template for a new editor is allowed and returns a boolean value. The EditorTemplate argument is the editor template. An EditorTemplate is used to create an editor for a given extension. You can thus filter what appears in the list of the New dialog box.

isDebuggerperspectiveAllowed()
Checks if the debugger perspective (on page 2797) is allowed and returns a boolean value.

validateSHMarker(String marker)
Checks if the given marker is allowed and returns a boolean value. The String argument represents the syntax highlight marker to be checked. If you decide to filter certain content types, you can also filter the syntax highlight options so that the content type is no longer present in the Preferences options tree.

validateToolbarComposite(String toolbarCompositeTag)
Checks if the toolbar composite is available. A toolbar composite is a toolbar component such as a drop-down menu.

Tip: The best way to decide what to filter is to observe the values that Oxygen XML Author passes when these callbacks are called. You have to create an implementation for this interface that lists in the console all values received by each function. Then you can decide on the values to filter and act accordingly.
Contribute Additional Languages Plugin Extension

This type of plugin (on page 2797) allows you to contribute new translation languages to the Oxygen XML Author UI.

The AdditionalUITranslation plugin extension provides the ability to contribute new translation languages to the interface in Oxygen XML Author.

A sample plugin.xml file looks like this:

```xml
<plugin
   id="romanian.i18n.provider"
   name="Add Romanian as an user interface language"
   description="Add Romanian as an user interface language"
   version="1.0"
   vendor="Syncro Soft"
   class="ro.sync.exml.plugin.Plugin">
   <extension type="AdditionalUITranslation" href="translation.xml"/>
</plugin>
```

where the translation.xml has a structure like this:

```xml
<translation>
   <languageList>
      <language description="Romanian" lang="ro_RO" localeDescription="Romana"/>
   </languageList>
   <key value="Error">
      <val lang="ro_RO">Eroare</val>
   </key>
</translation>
```

If all error keys are not translated in the custom translation.xml contributed by the plugin, the fallback is the default English translation. Once this plugin is installed, the Languages drop-down menu in the Options > Preferences > Global (on page 81) will be updated to include the newly added languages. The end user will still need to select that language in the drop-down menu to use it.

Contribute External DITA-OT Distribution Plugin Extension

This type of plugin (on page 2797) allows you to contribute an external DITA-OT distribution to Oxygen XML Author.
Oxygen XML Author comes bundled with DITA-OT version 3.3.1. If you want to use a different DITA-OT version, the **AdditionalDITAOT** plugin extension provides the ability to contribute an external distribution of the *DITA Open Toolkit* to Oxygen XML Author.

**Example**

For instance, if you wanted to use a DITA-OT version 1.8, your `plugin.xml` file might look like this:

```xml
<plugin
  id="dita-ot-18"
  name="Contribute DITA OT 1.8"
  description="Contributes DITA OT 1.8"
  version="1.0"
  vendor="Syncro Soft"
  class="ro.sync.exml.plugin.Plugin">
  <extension
type="AdditionalDITAOT"
  path="DITA-OT1.8.5"
  description="DITA OT 1.8"/>
</plugin>
```

The `path` attribute points to a folder located relative to the `plugin.xml` file and this folder is where the additional distribution of DITA-OT would be located.

When Oxygen XML Author is started with this plugin enabled, that addition DITA-OT version can now be selected in the *DITA Open Toolkit* option in the *DITA preferences page* *(on page 214)*.

**Custom Protocol Plugin Extension**

This type of `plugin` *(on page 2797)* allows you to work with a custom designed protocol for retrieving and storing files.

It provides the following API:

**`URLStreamHandlerPluginExtension` interface**

There is one method that must be implemented:

```java
getURLStreamHandler(String protocol)
```

It takes as an argument the name of the protocol and returns a `URLStreamHandler` object, or null if there is no URL handler for the specified protocol.

This type of `plugin` extension can be usually combined with a *Workspace Access plugin extension* *(on page 2154)* that can add a custom toolbar with custom actions for opening documents from a certain source.
As an alternative, two older plugin extensions can also be used to add a toolbar action for showing a custom URL chooser:

**URLChooserPluginExtension2 interface**

Makes it possible to create your own dialog box that works with the custom protocol. This interface provides two methods:

- **chooseURLs(StandalonePluginWorkspace workspaceAccess)**
  Returns a URL[] object that contains the URLs the user decided to open with the custom protocol. You can invoke your own URL chooser dialog box here and then return the chosen URLs having your own custom protocol. You have access to the workspace of Oxygen XML Author.

- **getMenuName()**
  Returns a String object that is the name of the entry added in the File menu.

**URLChooserToolbarExtension interface**

Makes it possible to provide a toolbar entry that is used for launching the custom URLs chooser from the URLChooserPluginExtension implementation. This interface provides two methods:

- **getToolbarIcon()**
  Returns the javax.swing.Icon image used on the toolbar.

- **getToolbarTooltip()**
  Returns a String that is the tooltip used on the toolbar button.

Lock Handler Plugin Extension

This type of plugin extension (on page 2797) is used for locking resources from a specific protocol. It provides the following API:

**LockHandlerFactoryPluginExtension interface**

You need to implement the following two methods:

- **LockHandler getLockHandler()**
  Gets the lock handler for the current handled protocol. Might be null if not supported.

- **boolean isLockingSupported(String protocol)**
  Checks if a lock handler can be provided for a specific protocol.
To use this type of extension in your plugin, create an extension of `LockHandlerFactory` type in your `plugin.xml` file and specify the class implementing `LockHandlerFactoryPluginExtension`:

```xml
<extension type="LockHandlerFactory"
            class="LockHandlerFactoryPluginExtensionImpl"/>
```

Open Redirect Plugin Extension

This type of plugin (on page 2797) is useful for opening multiple files with only one open action.

For example, when a zip archive or an ODF file or an OOXML file is open in the Archive Browser view (on page 1807) a plugin of this type can decide to open a file also from the archive in an XML editor panel. This file can be the document.xml main file from an OOXML file archive or a specific XML file from a zip archive.

The plugin must implement the interface `OpenRedirectExtension`. It only has one callback: `redirect(URL)` that receives the URL of the file opened by the Oxygen XML Author user. If the plugin decides to open also other files it must return an array of information objects (`OpenRedirectInformation[]`) that correspond to these files. Such an information object must contain the URL that is opened in a new editor panel and the content type (for example, `text/xml`). The content type is used for determining the type of editor panel. A null content type allows auto-detection of the file type.

Option Page Plugin Extension

This type of plugin extension (on page 2797) allows you to add custom Preferences pages.

The extension must implement the `ro.sync.exml.plugin.option.OptionPagePluginExtension` class. The provided callbacks allow you to create a custom Swing component that will be added to the page and to react to various calls to persistently save the page settings using the OptionsStorage API.
All preferences pages that are contributed by a plugin are listed in the Preferences dialog box in the Plugins category. As long as the added preferences page has the same name as its plugin, it will be promoted to the first level of the hierarchy within the Plugins category.

The plugin.xml configuration file can specify one or more such extensions using constructs like this:

```
<extension type="OptionPage" class="my.pack.CustomOptionPagePluginExtension"/>
```

Resource Locking Custom Protocol Plugin Extension

This type of plugin (on page 2797) allows you to work with a custom designed protocol for retrieving and storing files and it can lock a resource when opening it in Oxygen XML Author.

This type of plugin extends the custom protocol plugin type with resource locking support and provides the following API:

**URLStreamHandlerWithLockPluginExtension interface**

The plugin receives callbacks following the simple protocol for resource locking and unlocking imposed by Oxygen XML Author.

There are two additional methods that must be implemented:

- **getLockHandler()**

  Returns a LockHandler implementation class with the implementation of the lock specific methods from the plugin.

- **isLockingSupported(String protocol)**

  Returns a boolean that is true if the plugin accepts to manage locking for a certain URL protocol scheme (such as ftp, http, https, or customName).

Styles Filter Plugin Extension

This type of plugin (on page 2797) allows you to dynamically modify the CSS styles used to render elements in the Author mode.

The plugin must extend the ro.sync.exml.plugin.author.css.filter.GeneralStylesFilterExtension class. This class has a callback on which you can alter the styles for an Author mode element.

This extension point is similar with the Styles Filter that you set at the framework (on page 2794) level. The only difference is that the plugin filters styles are used for any opened XML document, regardless of the document type. The changes made by this plugin are prioritized over the changes made by the framework-level filter.
Note: Alternatively, you can use the AuthorStylesheet plugin extension (on page 2161), which does not require any additional Java development and is compatible with Oxygen XML Web Author.

Related Information:

• Customizing the CSS Styles Filter (on page 1995)

Targeted URL Stream Handler Plugin Extension

This type of plugin (on page 2797) can be used when it is necessary to impose custom URL stream handlers for specific URLs.

This plugin extension can handle the following protocols: http, https, ftp or sftp, for which Oxygen XML Author usually provides specific fixed URL stream handlers. If it is set to handle connections for a specific protocol, this extension will be asked to provide the URL stream handler for each opened connection of a URL having that protocol.

To use this type of plugin, you have to implement the ro.sync.exml.plugin.urlstreamhandler.TargetedURLStreamHandlerPluginExtension interface, that provides the following methods:

boolean canHandleProtocol(String protocol)

This method checks if the plugin can handle a specific protocol. If this method returns true for a specific protocol, the getURLStreamHandler(URL) method will be called for each opened connection of a URL having this protocol.

URLStreamHandler getURLStreamHandler(URL url)

This method provides the URL handler for the specified URL and it is called for each opened connection of a URL with a protocol for which the canHandleProtocol(String) method returns true.

If this method returns null, the default Oxygen XML Author URLStreamHandler is used.

To use this type of extension in your plugin, create an extension of TargetedURLHandler type in your plugin.xml file and specify the class that implements TargetedURLStreamHandlerPluginExtension:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE plugin SYSTEM "../plugin.dtd">
<plugin name="CustomTargetedURLStreamHandlerPlugin" .............>
  <runtime>
    ........
  </runtime>
</plugin>
```
This extension can be useful in situations when connections opened from a specific host must be handled in a particular way. For example, the Oxygen XML Author HTTP URLStreamHandler may not be compatible for sending and receiving SOAP using the SUN Web Services implementation. In this case, you can override the stream handler (set by Oxygen XML Author) to use the default SUN URLStreamHandler, since it is more compatible with sending and receiving SOAP requests.

```java
public class CustomTargetedURLStreamHandlerPluginExtension
    implements TargetedURLStreamHandlerPluginExtension {

    @Override
    public boolean canHandleProtocol(String protocol) {
        boolean handleProtocol = false;
        if ("http".equals(protocol) || "https".equals(protocol)) {
            // This extension handles both HTTP and HTTPS protocols
            handleProtocol = true;
        }
        return handleProtocol;
    }

    @Override
    public URLStreamHandler getURLStreamHandler(URL url) {
        // This method is called only for the URLs with a protocol
        // where canHandleProtocol(String) method returns true (HTTP and HTTPS)
        URLStreamHandler handler = null;
        String host = url.getHost();
        String protocol = url.getProtocol();
        if ("some_host".equals(host)) {
            // When there are connections opened from some_host, the SUN HTTP(S)
            // handlers are used
            if ("http".equals(protocol)) {
```
```java
} else {
    handler = new sun.net.www.protocol.https.Handler();
}
return handler;
}
```

XML Refactoring Operations Plugin Extension

This type of plugin (on page 2797) allows you to specify one or more directories where the XML Refactoring operation resources are loaded.

The RefactoringOperationsProvider extension can be used to specify the location where custom XML Refactoring operation resources (XQuery Update script or XSLT stylesheet and Operation Descriptor files) are stored. Oxygen XML Author will scan the specified locations to load the custom operations when the XML Refactoring tool is opened, and allows you to share your custom refactoring operations.

**Example: XML Refactoring Operations Plugin Extension**

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE plugin PUBLIC "-//Oxygen Plugin" ".//plugin.dtd">

<plugin
    id="refactoring.operations"
    name="Refactoring operations plugin"
    description="Contains operation descriptors and related scripts"
    version="1.0">
    <extension type="RefactoringOperationsProvider">
        <folder path="customDir/">
        <folder path="customDir2"/>
    </extension>
</plugin>
```

Plugin Extensions Designed to Work only in the Text Editing Mode

These plugin (on page 2797) extensions operate only when editing documents in the Text mode. They are mounted automatically by the application on the contextual menu in the Plugins submenu.
General Plugin Extension

This type of plugin (on page 2797) allows you to invoke custom code to interact with the workspace in Text mode.

This plugin is the most general plugin type and provides a limited API:

**GeneralPluginExtension interface**

Intended for general-purpose plugins, kind of external tools but triggered from the Plugins menu. The implementing classes must provide the method `process(GeneralPluginContext)`, which must provide the plugin processing. This method takes as a parameter a `GeneralPluginContext` object.

**GeneralPluginContext class**

Represents the context in which the general plugin extension does its processing. The `getPluginWorkspace()` method allows you access to the workspace of Oxygen XML Author.

Selection Plugin Extension

This type of plugin (on page 2797) allows you to manage selections of text.

A selection plugin can be applied to both XML and non-XML documents. The plugin is started by making a selection in the editor, then selecting the corresponding menu item from the Plugins submenu in the contextual menu of Text mode.

This plugin type provides the following API:

**SelectionPluginExtension interface**

The context containing the selected text is passed to the extension and the processed result is going to replace the initial selection. The `process(GeneralPluginContext)` method must return a `SelectionPluginResult` object that contains the result of the processing. The `String` value returned by the `SelectionPluginResult` object can include editor variables (on page 266) such as `${caret}` and `${selection}`.

**SelectionPluginContext object**

Represents the context and provides four methods:

- `getSelection()` - Returns a `String` that is the current selection of text.
- `getFrame()` - Returns a `Frame` that is the editing frame.
- `getPluginWorkspace()` - Returns access to the workspace of Oxygen XML Author.
- `getDocumentURL()` - Returns the URL of the current edited document.

Related Information:
Example - Uppercase Plugin

The following plugin (on page 2797) is called **UppercasePlugin** and is an example of a Selection plugin. (on page 2173). It is used in Oxygen XML Author for capitalizing the characters in the current selection. This example consists of two Java classes and the plugin descriptor file (plugin.xml):

- UppercasePlugin.java:

```java
package ro.sync.sample.plugin.uppercase;

import ro.sync.exml.plugin.Plugin;
import ro.sync.exml.plugin.PluginDescriptor;

public class UppercasePlugin extends Plugin {
    /**
     * Plugin instance.
     */
    private static UppercasePlugin instance = null;

    /**
     * UppercasePlugin constructor.
     *
     * @param descriptor Plugin descriptor object.
     */
    public UppercasePlugin(PluginDescriptor descriptor) {
        super(descriptor);

        if (instance != null) {
            throw new IllegalStateException("Already instantiated !");
        }

        instance = this;
    }

    /**
     * Get the plugin instance.
     */
    * return the shared plugin instance.
```
• **UppercasePluginExtension.java:**

```java
defpackage ro.sync.sample.plugin.uppercase;

import ro.sync.exml.plugin.selection.SelectionPluginContext;
import ro.sync.exml.plugin.selection.SelectionPluginExtension;
import ro.sync.exml.plugin.selection.SelectionPluginResult;
import ro.sync.exml.plugin.selection.SelectionPluginResultImpl;

public class UppercasePluginExtension implements SelectionPluginExtension {
    /**
     * Convert the text to uppercase.
     *
     * @param context Selection context.
     * @return Uppercase plugin result.
     */
    public SelectionPluginResult process(SelectionPluginContext context) {
        return new SelectionPluginResultImpl(
            context.getSelection().toUpperCase());
    }
}
```

• **plugin.xml:**

```xml
<!DOCTYPE plugin SYSTEM "../plugin.dtd">
<plugin
    name="UpperCase"
    description="Convert the selection to uppercase"
    version="1.0.0"
    vendor="SyncRO"
    class="ro.sync.sample.plugin.uppercase.UppercasePlugin">
    <runtime>
        <library name="lib/uppercase.jar"/>
    </runtime>
    <extension type="selectionProcessor"/>
</plugin>
```
Document Plugin Extension

This type of plugin (on page 2797) allows you to manage the current document.

The document plugin type can only be applied to an XML document. It can modify the current document that is received as a callback parameter.

The plugin is started by selecting the corresponding menu item from the Plugins submenu in the contextual menu of Text mode. It provides the following API:

**DocumentPluginExtension interface**

Receives the context object containing the current document. The `process(GeneralPluginContext)` method can return a `DocumentPluginResult` object containing a new document.

**DocumentPluginContext object**

Represents the context and provides three methods:

- `getDocument()` - Returns a `javax.swing.text.Document` object that represents the current document.
- `getFrame()` - Returns a `java.awt.Frame` object that represents the editing frame.
- `getPluginWorkspace()` - Returns access to the workspace of Oxygen XML Author.

How to Write a CMS Integration Plugin

To have a complete integration between Oxygen XML Author and a CMS, you usually have to write a plugin (on page 2797) that combines the following two available plugin extensions:

- Workspace Access (on page 2154)
- Custom protocol (on page 2181)

The usual set of requirements for an integration between Oxygen XML Author and the CMS are as follows:

1. Contribute to the Oxygen XML Author toolbars and main menu with your custom Check Out and Check In actions:

   - **Check Out** triggers your custom dialog boxes that allow you to browse the remote CMS and choose the resources you want to open.
   - **Check In** allows you to send the modified content back to the server.
You can use the **Workspace Access plugin extension** (and provided sample Java code) for all these operations.

2. When **Check Out** is called, use the Oxygen XML Author API to open your custom URLs (URLs created using your custom protocol). It is important to implement and use a **Custom Protocol** extension to be notified when the files are opened and saved and to be able to provide the content for the relative references the files may contain to Oxygen XML Author. Your custom `java.net.URLStreamHandler` implementation checks out the resource content from the server, stores it locally and provides its content. Sample **Check Out** implementation:

```java
/**
 * Sample implementation for the "Check Out" method.
 *
 * @param pluginWorkspaceAccess (Workspace Access plugin).
 * @throws MalformedURLException
 */
private void checkOut(StandalonePluginWorkspace pluginWorkspaceAccess) throws MalformedURLException {
    //TODO Show the user a custom dialog box for browsing the CMS
    //TODO after user selected the resource create a URL with a custom protocol
    //which will uniquely map to the resource on the CMS using the URLHandler
    //something like:
    URL customURL = new URL("mycms://host/path/to/file.xml");
    //Ask Oxygen to open the URL
    pluginWorkspaceAccess.open(customURL);
    //Oxygen will then your custom protocol handler to provide the contents for
    //the resource "mycms://host/path/to/file.xml"
    //Your custom protocol handler will check out the file in a temporary
    //directory, for example, and provide the content from it.
    //Oxygen will also pass through your URLHandler if you have any relative
    //references which need to be opened/obtained.
}
```

Figure 498. Check Out Process Diagram
The phases are:

- 1 - Browse CMS repository
- 2 - User chooses a resource
- 3 - Use API to open custom URL: `mycms://path/to/file.xml`
- 4 - Get content of URL: `mycms://path/to/file.xml`
- 5 - Get content of resource
- 6 - Store on disk for faster access
- 7 - Retrieve content from disk if already checked out
- 8 - Retrieved content

3. Contribute a special **Browse CMS** action to every dialog box in Oxygen XML Author where a URL can be chosen to perform a special action (such as the **Reuse Content** or **Insert Image** action).

Sample code:

```java
//Add an additional browse action to all dialog boxes/places
//where Oxygen allows selecting a URL.
pluginWorkspaceAccess.addInputURLChooserCustomizer(new InputURLChooserCustomizer() {
    public void customizeBrowseActions(List<Action> existingBrowseActions, final InputURLChooser chooser) {
        //IMPORTANT, you also need to set a custom icon on the action
        //for situations when its text is not used for display.
        Action browseCMS = new AbstractAction("CMS") {
            public void actionPerformed(ActionEvent e) {
```
When inserting references to other resources using the actions already implemented in Oxygen XML Author, the reference to the resource is made by default relative to the absolute location of the edited XML file. You can gain control over the way in which the reference is made relative for a specific protocol like this:

```java
//Add a custom relative reference resolver for your custom protocol.
//Usually when inserting references from one URL to another Oxygen
//makes the inserted path relative.
//If your custom protocol needs special relativization techniques then
//it should set up a custom relative
//references resolver to be notified when resolving needs to be done.
pluginWorkspaceAccess.addRelativeReferencesResolver(
    //Your custom URL protocol for which you already have a
    //custom URLStreamHandlerPluginExtension set up.
    "mycms",
    //The relative references resolver
    new RelativeReferenceResolver() {
        public String makeRelative(URL baseURL, URL childURL) {
            //Return the referenced path as absolute for example.
            //return childURL.toString();
            //Or return null for the default behavior.
            return null;
        }
    });
```

4. Write the `plugin.xml` descriptor file. Your `plugin` combines the two extensions using a single set of libraries. The descriptor would look like this:
5. Create a cmsaccess.jar JAR (on page 2795) archive containing your implementation classes.
6. Copy your new plugin directory in the plugins subfolder of the Oxygen XML Author install folder (for example, `{OXYGEN_INSTALL_DIR}/plugins/myPlugin`) and start Oxygen XML Author.

Class Loading Issues

It is possible that the Java libraries you have specified in the plugin libraries list conflict with the ones already loaded by Oxygen XML Author. To instruct the plugin to prefer its libraries over the ones used by Oxygen XML Author, you can add the following attribute on the <plugin> root element:

```
classListerType="preferReferencedResources"
```

from the plugin.xml descriptor file.

A Late Delegation Class Loader (the main class loader in Oxygen XML Author) is a `java.net.URLClassLoader` extension that prefers to search classes in its own libraries list and only if a class is not found there to delegate to the parent class loader.

The main Oxygen XML Author Class Loader uses all JARS specified in the `{OXYGEN_INSTALL_DIR}\lib` directory. Its parent class loader is the default JVM Class loader.

For each plugin instance, a separate class loader is created having as parent the Oxygen XML Author Class Loader.
The **plugin** class loader can be either a standard `java.net.URLClassLoader` or a `LateDelegationClassLoader` (depending on the attribute `classLoaderType` in the `plugin.xml`). Its parent class loader is always the Oxygen XML Author `LateDelegationClassLoader`.

If you experience additional problems, such as:

```
java.lang.LinkageError: ClassCastException:
  attempting to cast
  jar:file:/C:/jdk1.6.0_06/jre/lib/rt.jar/
  javax/xml/ws/spi/Provider.class
to jar:file:/D:/Program
  Files/Oxygen XML Editor
12/plugins/wspcaccess/../../xdocs/lib/jaxws/
  jaxws-api.jar!/javax/xml/ws/spi/Provider.class
  at javax.xml.ws.spi.Provider.provider(Provider.java:94)
at javax.xml.ws.Service.<init>(Service.java:56)
```

The cause could be the fact that some classes are instantiated using the context class loader of the current thread. The most straightforward fix is to write your code in a `try/finally` statement:

```java
ClassLoader oldClassLoader = 
  Thread.currentThread().getContextClassLoader();
try {
  //This is the implementation of the
  //WorkspaceAccessPluginExtension plugin interface.
  Thread.currentThread().setContextClassLoader(
    new CustomWorkspaceAccessPluginExtension().
      getClass().getClassLoader());
  //WRITE YOUR CODE HERE
} finally {
  Thread.currentThread().
    setContextClassLoader(oldClassLoader);
}
```

**How to Write A Custom Protocol Plugin**

To create a custom protocol plugin (on page 2797), follow these steps:

1. Write the handler class for your protocol that implements the `java.net.URLStreamHandler` interface.
Be careful to provide ways to encode and decode the URLs of your files.

2. Write the plugin class by extending ro.sync.exml.plugin.Plugin.

3. Write the plugin extension class that implements the ro.sync.exml.plugin.urlstreamhandler.URLStreamHandlerPluginExtension interface.

It is necessary that the plugin extension for the custom protocol implements the URLStreamHandlerPluginExtension interface. Without it, you cannot use your plugin, because Oxygen XML Author is not able to find the protocol handler.

You can choose also to implement the URLChooserPluginExtension interface. It allows you to write and display your own customized dialog box for selecting resources that are loaded with the custom protocol.

An implementation of the extension URLHandlerReadOnlyCheckerExtension allows you to:

- Mark a resource as read-only when it is opened.
- Switch between marking the resource as read-only and read-write while it is edited.

It is useful when opening and editing CMS resources.

4. Write the plugin.xml descriptor file.

Remember to set the name of the plugin class to the one from the second step and the plugin extension class name with the one you have chosen at step 3.

5. Create a JAR (on page 2795) archive with all these files.

6. Create a custom plugin folder inside the plugins folder (for example, [OXYGEN_INSTALL_DIR]/plugins/myPlugin) that contains your new plugin.

How to Share a Class Loader Between a Framework and Plugin

In some cases you may need to extend the functionality of Oxygen XML Author both through a framework (on page 2794) and through a plugin (on page 2797). Normally, a framework and a plugin both run in their own private classloader. If the framework and the plugin use the same JAVA extensions/classes, it is recommended that they share the same classloader. This way, the common classes are loaded by only one Class Loader and they will both use the same static objects and have the ability to cast objects between one another.

To do this, open the Preferences dialog box (Options > Preferences) (on page 79), go to Document Type Association, select the document type, go to the Classpath tab, and in the Use parent classloader from plugin with ID fields introduce the ID of the plugin. This ID is declared in the configuration file of the plugin (on page 2152).
Important: The shared classes must be specified only in the configuration files of the plugin, and not in the configuration file and the document type class path at the same time.

Packing and Deploying Plugins as Add-ons

Packing a Plugin as an Add-on

This first procedure is suitable for developers who want a better control over the add-on package or those who want to automate some of the steps:

1. Pack the plugin as a ZIP file or a Java Archive. Note that you should pack the entire root directory not just its contents.
2. Digitally sign the package. Note that you can perform this step only if you have created a Java Archive at the previous step. You will need a certificate signed by a trusted authority. To sign the JAR you can either use the jarsigner command-line tool inside Oracle's Java Development Kit. ([JDK_DIR]/bin/jarsigner.exe) or, if you are working with Apache Ant, you can use the signjar task (a front for the jarsigner command-line tool).

Note: The benefit of having a signed add-on is that you can verify the integrity of the add-on issuer. If you do not have such a certificate you can generate one yourself using the keytool command-line tool. This approach is mostly recommended for tests since anyone can create a self signed certificate.
3. Create a descriptor file. You can use a template that Oxygen XML Author provides. To use this template, go to File > New and select the Oxygen add-ons update site template. Once deployed, this descriptor file is referenced as update site.

Alternatively, you can use the Add-ons Packager plugin by following this procedure:

1. Install the Add-ons Packager plugin following the procedure described in Installing Add-ons (on page 75).
2. Restart Oxygen XML Author. If the add-on is correctly installed, the Add-ons packager toolbar action is available.
3. Invoke the Add-ons packager toolbar action and input the required information in the displayed dialog box.
4. Press OK to complete the packaging process.

Deploying an Add-on

To deploy an add-on, copy the ZIP or Java Archive file and the descriptor file to an HTTP server. The URL to this location serves as the Update Site URL.
Related Information:

- Packing and Deploying Frameworks as Add-ons (on page 1943)

Testing Plugins and Java Extensions

In the various procedures for creating a plugin (on page 2797), you are usually instructed to copy your plugin folder to the \(\text{OXYGEN\_INSTALL\_DIR}/\text{plugins/}\) directory. If you want to test the code in your plugin without copying it to that folder, follow this procedure:

1. Create a file called `plugin.redirect` that contains the full file path references to your project (for example, `C:\Users\john_doe\Documents\sample-plugin-folder`).
2. Save that file in any folder (for example, called `sample_test_folder`) inside the \(\text{OXYGEN\_INSTALL\_DIR}/\text{plugins/}\) directory.

**Step Result:** Oxygen XML Author will automatically load the plugin from your project location.

3. Now you can modify the Java code, the IDE will automatically compile it, and if the `plugin.xml` file has a classpath reference to the compiled classes folder, you can restart Oxygen XML Author and test your changes.

Creating and Running Automated Tests

If you have developed complex custom plugins (on page 2797) or frameworks (on page 2794) (document types), the best way to test your implementation and ensure that further changes will not interfere with the current behavior is to make automated tests for your customization.

An Oxygen XML Author standalone installation includes a main `oxygen.jar` library located in the \(\text{OXYGEN\_INSTALL\_DIR}\). That JAR (on page 2795) library contains a base class for testing developer customizations named: `ro.sync.exml.workspace.api.PluginWorkspaceTCBase`.

To develop JUnit tests for your customizations using the Eclipse workbench, follow these steps:

1. Create a new Eclipse Java project and copy the entire contents of the \(\text{OXYGEN\_INSTALL\_DIR}\) folder to the new project.
2. Add all JAR libraries present in the \(\text{OXYGEN\_INSTALL\_DIR}/\text{lib}\) directory to the Java Build Path->Libraries tab. Make sure that the main JAR library `oxygen.jar` or `oxygenAuthor.jar` is the first one in the Java classpath by moving it up in the Order and Export tab.
3. Click Add Library and add the JUnit and JFCUnit libraries.
4. Create a new Java class that extends `ro.sync.exml.workspace.api.PluginWorkspaceTCBase`.
5. Pass the following parameters to the constructor of the super class:
• **File installationFolder** - The file path to the main application installation directory. If not specified, it defaults to the folder where the test is started.

• **File frameworksFolder** - The file path to the `frameworks` directory. It can point to a custom `framework` directory where it resides.

• **File pluginsFolder** - The file path to the `plugins` directory. It can point to a custom `plugin` directory where it resides.

• **File optionsFolder** - The folder that contains the application options. If not specified, the application will auto-detect the location based on the started product ID.

• **String licenseKey** - The license key used to license the test class.

• **int productID** - The ID of the product and should be one of the following: `PluginWorkspaceTCBase.XML_AUTHOR_PRODUCT`, `PluginWorkspaceTCBase.XML_EDITOR_PRODUCT`, or `PluginWorkspaceTCBase.XML_DEVELOPER_PRODUCT`.

6. Create test methods that use the API in the base class to open XML files and perform various actions on them. Your test class could look something like this:

```java
public class MyTestClass extends PluginWorkspaceTCBase {

    /**
     * Constructor.
     */
    public MyTestClass() throws Exception {
        super(null, new File("frameworks"), new File("plugins"), null,
            "------START-LICENSE-KEY------
            Registration_Name=Developer
            Company=
            Category=Enterprise
            Component=XML-Editor, XSLT-Debugger, Saxon-SA
            Version=14
            Number_of_Licenses=1
            Date=09-04-2012
            Trial=31
            
```
public void testOpenFileAndBoldEXM_20417() throws Exception {

    WSEditor ed = open(new File("D:/projects/eXml/test/authorExtensions/dita/sampleSmall.xml").toURL());
    //Move caret
    moveCaretRelativeTo("Context", 1, false);

    //Insert <b>
    invokeAuthorExtensionActionForID("bold");
    assertEquals("<?xml version="1.0" encoding="utf-8"?>
<!DOCTYPE task PUBLIC "-//OASIS//DTD DITA Task//EN" "http://docs.oasis-open.org/dita/v1.1/OS/dtd/task.dtd">
<task id="taskId">
    <title>Task <b>title</b></title>
    <prolog/>
    <taskbody>
        <context>
            <p>Context for the current task</p>
        </context>
        <steps>
            <step>
                <cmd>Task step.</cmd>
            </step>
        </steps>
    </taskbody>
</task>
", getCurrentEditorXMLContent());
}
Debugging a Plugin Using IntelliJ IDEA

To use IntelliJ IDEA to debug problems in the code of a plugin (on page 2797) without having to re-bundle the plugin’s Java classes in a JAR (on page 2795) library, follow these steps:

1. **Download** and install Oxygen XML Author.
2. Set up the Oxygen SDK following this set of instructions.
3. Create a Java Project (for example, MyPluginProject) from one of the sample plugins (for example, the Workspace Access plugin).
4. In the MyPluginProject folder, create a folder called myPlugin. In this new folder, copy the plugin.xml file from the sample plugin. Modify the added plugin.xml to add a library reference to the directory where IntelliJ IDEA copies the compiled output. To find out where this directory is located, go to File > Project Structure. Then select the Modules category and inspect the value of the Output path text box from the Path tab.

   **Example:** If the output path is C:/Users/myUser/Documents/MyPluginProject/target/classes, then in the plugin.xml, you need to add the following library reference in the runtime element:

   ```xml
   <library name="../target/classes"/>
   ```

5. Copy the plugin.dtd from the [OXYGEN_INSTALL_DIR]/plugins folder in the root MyPluginProject folder.
6. In the MyPluginProject dependences (File > Project Structure > Modules > Dependences), add external JAR references to all the JAR libraries in the [OXYGEN_INSTALL_DIR]/lib folder.
   Now your MyPluginProject should compile successfully.
7. In IntelliJ IDEA, create a new Java Application configuration for debugging (Run > Edit Configurations... > + > Application). Set the Main class box to ro.sync.exml.Oxygen and add the following code snippet in the VM options input box, making sure that the path to the plugins directory is the correct one:

   ```
   -Dcom.oxygenxml.app.descriptor=ro.sync.exml.EditorFrameDescriptor -Xmx1024m
   -XX:MaxPermSize=384m -Dcom.oxygenxml.editor.plugins.dir=D:\projects\MyPluginProject
   ```

**Note:** If you need to configure the plugin for Oxygen XML Author, set the com.oxygenxml.app.descriptor to ro.sync.exml.AuthorFrameDescriptor.
Debugging a Plugin Using the Eclipse Workbench

To use the Eclipse workbench to debug problems in the code of a plugin (on page 2797) without having to re-bundle the plugin's Java classes in a JAR (on page 2795) library, follow these steps:

1. [Download](#) and install Oxygen XML Author.
2. Set up the Oxygen SDK following [this set of instructions](#).
3. Create an Eclipse Java Project (for example, MyPluginProject) from one of the sample plugins (for example, the Workspace Access plugin).
4. In the MyPluginProject folder, create a folder called myPlugin. In this new folder, copy the plugin.xml file from the sample plugin. Modify the added plugin.xml to add a library reference to the directory where Eclipse copies the compiled output. To find out where this directory is located, invoke the contextual menu of the project (in the Project view (on page 320)), and go to Build Path > Configure Build Path. Then inspect the value of the Default output folder text box.

**Example:** If the compiled output folder is classes, then in the plugin.xml, you need to add the following library reference:

```
<library name="%classes"/>
```

5. Copy the plugin.dtd from the [OXYGEN_INSTALL_DIR]/plugins folder in the root MyPluginProject folder.
6. In the MyPluginProject build path, add external JAR references to all the JAR libraries in the [OXYGEN_INSTALL_DIR]/lib folder. Now your MyPluginProject should compile successfully.
7. In the Eclipse IDE, create a new Java Application configuration for debugging. Set the Main class box to ro.sync.exml.Oxygen. Click the Arguments tab and add the following code snippet in the VM arguments input box, making sure that the path to the plugins directory is the correct one:

```
-Dcom.oxygenxml.app.descriptor=ro.sync.exml.EditorFrameDescriptor -Xmx1024m
-XX:MaxPermSize=384m -Dcom.oxygenxml.editor.plugins.dir=D:\projects\MyPluginProject
```

**Note:** If you need to configure the plugin for Oxygen XML Author, set the com.oxygenxml.app.descriptor to ro.sync.exml.AuthorFrameDescriptor.

Debugging an Oxygen SDK Extension Using the Eclipse Workbench

To use the Eclipse workbench to debug problems in the code of an extension (on page 2797) without having to bundle its Java classes in a JAR (on page 2795) library, perform the following steps:

1. [Download](#) and install Oxygen XML Author.
2. Create an Eclipse Java Project (for example, MySDKProject) with the corresponding Java sources (for example, a custom implementation of the ro.sync.ecss.extensions.api.StylesFilter interface).

3. In the Project build path, add external JAR references to all the JAR libraries in the \[OXYGEN_INSTALL_DIR\]/lib folder. In the build path Order and Export panel, make sure that the oxygen.jar entry is before all other libraries. Now your Project should compile successfully.

4. Start the standalone version of Oxygen XML Author from the \[OXYGEN_INSTALL_DIR\] and in the Document Type Association preferences page (on page 92), edit the document type (for example, DITA) to open the Document Type configuration dialog box (on page 94). In the Classpath tab, add a reference to your Project's classes directory and in the Extensions tab, select your custom StylesFilter extension as a value for the CSS styles filter property. Close the application to save your changes.

5. Create a new Java Application configuration for debugging. The Main Class should be ro.sync.exml.Oxygen. The given VM Arguments should be:

-Dcom.oxygenxml.app.descriptor=ro.sync.exml.EditorFrameDescriptor -Xmx1024m

Disabling a Plugin

To disable a plugin (on page 2797), use one of the following two methods:

- Open the Preferences dialog box (Options > Preferences) (on page 79), go to Plugins, and deselect the plugin that you want to disable.
- Create an empty file called plugin.disable next to the plugin configuration file (plugin.xml). The plugin will be disabled and will no longer be loaded by the application on startup.

Note: This is useful if you want to temporarily stop work on a plugin and use the application without it.

Oxygen XML Author Component

The Oxygen XML Author Component was designed as a subset of Oxygen XML Author that can be integrated into another application under the terms of the Oxygen XML Author SDK agreement to provide functionality for editing and authoring XML documents. The component can be embedded in a third-party standalone Java application to provide WYSIWYG-like XML editing directly in your application.

More information about the setup for the Oxygen XML Author Component can be found on the Oxygen SDK page.
Licensing

The licensing terms and conditions for the Oxygen XML Author Component are defined in the Oxygen SDK License Agreement. To obtain the licensing terms and conditions and other licensing information as well, you can also contact the support team at support@oxygenxml.com. You may also obtain a free of charge evaluation license key for development purposes, subject to registration. Any deployment of an application developed using the Oxygen XML Author Component is also subject to the terms of the SDK agreement.

There are two main categories of Oxygen XML Author Component integrations:

- **Integration for internal use.**

  You develop an application that embeds the Author Component to be used internally (in your company or by you). You can buy and use previously purchased Oxygen XML Author floating licenses to enable the runtime usage of the Oxygen XML Author Component as it was integrated into the application.

- **Integration for external use.**

  Using the Oxygen XML Author Component, you create an application that you distribute to other users outside your company (with a CMS for example). In this case, you should apply for a Value Added Reseller (VAR) partnership by contacting the Oxygen Sales Team (https://www.oxygenxml.com/sales_support.html).

From a technical point of view, the Oxygen XML Author Component provides the Java API to:

- Inject floating license server details in the Java code.

  The following link provides details about how to configure an HTTP floating license server: https://www.oxygenxml.com/license_server.html#floating_license_servlet.

  ```java
  AuthorComponentFactory.getInstance().init(frameworkZips, optionsZipURL, codeBase, appID, 
  //The servlet URL
  "http://www.host.com/servlet",
  //The HTTP credentials user name
  "userName",
  //The HTTP credentials password
  "password");
  ...
  ```

- Display the license registration dialog box, where the user will paste their license key.
This is the default behavior if a null license key is set using the API (as in the following example). This transfers the licensing responsibility to the end user. The user can license an Oxygen XML Author Component using standard, named-user based Oxygen XML Author license keys. The license key will be saved to the local user's disk and on subsequent runs, the user will not be asked again to provide a license key.

```java
AuthorComponentFactory.getInstance().init(
    frameworkZips, optionsZipURL, codeBase, appID,
    //Null license key, will ask the user.
    null);
...
```

• Inject the licensing information key directly in the component's Java code.

Note that this method can only be used for evaluation and site license keys. For example:

```java
AuthorComponentFactory.getInstance().init(
    frameworkZips, optionsZipURL, codeBase, appID,
    //The license key if it is a fixed license.
    licenseKey);
...
```

Related Information:

• [https://www.oxygenxml.com/sdk_agreement.html](https://www.oxygenxml.com/sdk_agreement.html)

Installation Requirements

Running the Oxygen XML Author Component embedded in a third-party Java/Swing application requires:

• Oracle (Sun) Java JRE version 1.8.
• At least 100 MB disk space and 100MB free memory.

Customization

For a special type of XML, you can create a custom framework (on page 2794) (which also works in a standalone version of Oxygen XML Author). Oxygen XML Author already has frameworks for editing DocBook, DITA, TEI, and so on. Their sources are available in the Oxygen SDK. This custom framework is then packed in a zip archive and used to deploy the component.
Multiple *frameworks* can coexist in the same component and can be used at the same time for editing XML documents.
You can add on your custom toolbar all actions available in the standalone Oxygen XML Author application for editing in the **Author** mode. You can also add custom actions defined in the **framework** customized for each XML type.

The Oxygen XML Author Component can also provide the **Outline (on page 334)**, **Model (on page 340)**, **Elements (on page 418)**, and **Attributes (on page 412)** views, which can be added to your own developed containers.

The main entry point for the Oxygen XML Author Component Java API is the **AuthorComponentFactory** class.

### Related Information:

- Creating and Configuring Custom Frameworks *(on page 1893)*
- Oxygen XML Author Component *(on page 2189)*
- AuthorComponentFactory API

### Example - Customizing the DITA Framework

If you look inside the `bundle-frameworks\oxygen-frameworks` folder distributed with the Oxygen XML Author Component sample project, it contains a `frameworks` folder. Customizations that affect the **framework** configuration for the component should first be done in a standalone installation of Oxygen XML Author.

An Oxygen XML Author standalone installation also includes a `frameworks` folder that contains the **dita framework** located in `\OXYGEN_INSTALL_DIR\frameworks\dita`. The **dita framework** contains a bundled **DITA-OT** distribution that contains the DTDs used for DITA editing. If your DTD specialization is a DITA OT plugin, it should be installed *(on page 2768)* in the **DITA-OT-\DIR\plugins** folder.

To make changes to the DITA **framework** configuration, open the **Preferences** dialog box *(Options > Preferences) *(on page 79)*, go to **Document Type Association**, and edit or extend the framework. These changes will affect the `\OXYGEN_INSTALL_DIR\frameworks\dita\dita.framework` configuration file.

After you do this, you can re-pack the Oxygen XML Author Component following the instructions from the README.html file located in the Oxygen XML Author Component sample project. The **Author Component** sample project and the Oxygen XML Author standalone installation should be of the same version.
Related Information:

- Advanced Framework Customization (on page 1893)

Packing a Fixed Set of Options

The Oxygen XML Author Component shares a common internal architecture with the standalone application, although it does not have Preferences dialog boxes. However, the Author Component can be configured to use a fixed set of user options on startup.

The sample project contains a module called bundle-options. The module contains a file called options.xml in the oxygen-options folder. Such an XML file can be obtained by exporting the options to an XML format from an installation of Oxygen XML Author.

To create an options file in the Oxygen XML Author:

- Make sure the options that you want to set are not stored at project level (on page 255).
- Set the values you want to impose as defaults in the Preferences pages (on page 79).
- Select Options > Export Global Options.

Adding MathML support in the Oxygen XML Author Component

By default, the Oxygen XML Author Component does not come with the libraries necessary for viewing and editing MathML equations in the Author mode. You can view and edit MathML equations either by adding support for JEuclid (on page 2194) or by adding support for MathFlow (on page 2195).

Adding MathML Support Using JEuclid

By default, the JEuclid library is excluded from the Oxygen SDK artifact dependencies. To enable it, comment the following lines in the pom.xml file:

```xml
<exclusion>
  <artifactId>jeuclid-core</artifactId>
  <groupId>net.sourceforge.jeuclid</groupId>
</exclusion>
```

To edit specialized DITA Composite documents with MathML content, include the entire MathML2 framework directory (for example, the default location is: [OXYGEN_INSTALL_DIR]/frameworks/
mathml2) in the frameworks (on page 2794) bundled with the component in the bundle-frameworks module. This directory is used to solve references to MathML DTDs.

Adding MathML Support Using MathFlow

In the pom.xml file, add dependencies to the following additional libraries used by the MathFlow library to parse MathML equations:

1. MFComposer.jar
2. MFExtraSymFonts.jar
3. MFSimpleEditor.jar
4. MFStructureEditor.jar
5. MFStyleEditor.jar

**Note:** For MathFlow 2.1, all of these JAR (on page 2795) files are packaged into one file called MathFlow.jar.

You can reference these additional libraries from the MathFlow SDK as in the example below:

```xml
<dependency>
  <groupId>com.dessci</groupId>
  <artifactId>MFComposer</artifactId>
  <version>1.0.0</version>
  <scope>system</scope>
  <systemPath>${MathFlowSDKDir}/lib/MFComposer.jar</systemPath>
</dependency>
```

In addition, you must obtain fixed MathFlow license keys for editing and composing MathML equations and register them using these API methods: 
`AuthorComponentFactory.setMathFlowFixedLicenseKeyForEditor` and `AuthorComponentFactory.setMathFlowFixedLicenseKeyForComposer`.

To edit specialized DITA Composite with MathML content, include the entire 
`{OXYGEN_INSTALL_DIR}/frameworks/mathml2` Mathml2 framework directory in the frameworks (on page 2794) bundled with the component in the bundle-frameworks module. This directory is used to solve references to MathML DTDs.

More documentation is available on the Design Science MathFlow website.
Adding Support to Insert References from a WebDAV Connection

Predefined actions that insert references, such as the Insert Image action, includes a URL chooser field with a drop-down menu that allows you to select a Browse Data Source Explorer action. This action opens the Data Source Explorer (on page 1814) that allows you to view a WebDAV connection.

To use a WebDAV connection in the Oxygen XML Author Component, follow these steps:

1. Open a standalone Oxygen XML Author 21.1 and configure a WebDAV connection (on page 1866).
2. Pack the fixed set of options (on page 2194) from the standalone application to use them with the Oxygen XML Author Component project.
3. In the Oxygen XML Author Component, the defined connection still does not work when expanded because the additional JAR libraries used to browse the WebDAV repository are missing. By default, the httpclient dependency of the Oxygen SDK artifact is excluded. You can enable it by commenting the following lines:

   ```xml
   <exclusion>
     <artifactId>httpclient</artifactId>
     <groupId>org.apache.httpcomponents</groupId>
   </exclusion>
   
   If you want to have multiple WebDAV connection URLs, user names, and passwords (depending on the user who started the component), you can use a more flexible approach by using the following API:

   ```java
   //DBConnectionInfo(String id, String driverName, String url, String user, String passwd, String host, String port)
   DBConnectionInfo info = new DBConnectionInfo("WEBDAV", "WebDAV FTP", "http://host/webdav-user-root", "userName", "password", null, null);
   AuthorComponentFactory.getInstance().setObjectProperty("database.stored.sessions1", new DBConnectionInfo[] {info});
   ```

Using Plugins with the Oxygen XML Author Component

To bundle Workspace Access plugins (on page 2797) that are developed for the standalone application with the Oxygen XML Author Component, follow these steps:

- The bundle-plugins module must contain the additional plugin directories in the dropins subdirectory. The content must also contain a plugin.dtd file. Copy the plugin.dtd file from an {OXYGEN_INSTALL_DIR}\plugins folder.
• In the class that instantiates the AuthorComponentFactory (for example the ro.sync.ecss.samples.AuthorComponentSample class), call the methods AuthorComponentFactory.getPluginToolbarCustomizers(), AuthorComponentFactory.getPluginViewCustomizers(), and AuthorComponentFactory.getMenubarCustomizers(), obtain the customizers that have been added by the plugins and call them to obtain the custom swing components that they contribute. There is a commented-out example for this in the AuthorComponentSample.reconfigureActionsToolbar() method for adding the toolbar from the Acrolinx plugin.

⚠️ Important: As the Oxygen XML Author Component is just a subset of the entire application, there is no guarantee that all the functionality of the plugin will work.

Frequently Asked Questions

Installation and Licensing

1. Are there any client requirements beyond the Java VM?

   Oracle (formerly Sun) Java JRE version 1.8. At least 200 MB disk space and 200MB free memory is necessary for the Oxygen XML Author Component.

2. Does the Oxygen XML Author Component support multiple documents being open simultaneously? What are the licensing ramifications?

   A single AuthorComponentFactory instance can create multiple EditorComponentProvider editors that can then be added and managed by the developer who customizes the component in a Swing JTabbedPane. A single license (floating or user-based) is enough for this.

   If you need to run multiple distinct Java processes using the Oxygen XML Author Component, the current floating license model allows for only two concurrent components from the same computer when using the HTTP floating license server. An additional started component will take an extra license seat.

Functionality

1. What graphic formats can be directly rendered in the Oxygen XML Author Component?

   GIF, JPEG, PNG, BMP and SVG.

2. Can links be embedded to retrieve (from the server) and “play” other types of digital assets, such as audio or video files?
You could add listeners to intercept clicks and open the clicked links. This would require a good knowledge of the Oxygen SDK. The Oxygen XML Author Component can only render static images (no GIF animations).

3. Does the Oxygen XML Author Component provide methods for uploading ancillary files (new graphics, for instance) to the hosting server?

No.

4. Does the Oxygen XML Author Component provide any type of autosave functionality?

By default no, but you could customize it to save its content periodically to a file on disk.

5. Assuming multiple documents can be edited simultaneously, can content be copied, cut, and pasted from one Oxygen XML Author Component “instance” to another?

Yes.

6. Does the Oxygen XML Author Component support pasting content from external sources (such as a web page or a Microsoft Word document and, if so, to what extent?

If no customizations are available, the content is pasted as simple text. Customizations are provided for the major frameworks (DITA, DocBook, TEI, etc.) that use a conversion XSLT stylesheet to convert HTML content from clipboard to the target XML.

7. Can UTF-8 characters (such as Greeks, mathematical symbols, etc.) be inserted and rendered?

Any UTF-8 character can be inserted and rendered, provided that the font used for editing supports rendering the characters. The font can be changed by developers but not by the users. When using a logical font (by default, Serif for the Oxygen XML Author Component), the JVM will know how to map all characters to glyphs. There is no character map available but you could implement one.

**Customization**

1. Describe, in general terms, the menus, toolbars, contextual menu options, helper panes, and so on, that are available for the Oxygen XML Author Component out-of-the-box.

You can mount all actions available in the standalone Oxygen XML Author application on your custom toolbar. This includes custom actions defined in the framework customized for each XML type.

The Oxygen XML Author Component also can provide the Outline (on page 334), Model (on page 340), Elements (on page 418), and Attributes (on page 412) views that can be added to your own panels.
2. Describe, in general terms, the actions, project resources (for example, DTD/Schema for validation purposes, CSS/XSL for styling, etc.) and typical level of effort that would be required to deploy a Oxygen XML Author Component solution for a customer with a proprietary DTD.

The Author mode internal engine uses CSS to render XML.

For a special type of XML, you can create a custom framework (which also works in an Oxygen XML Author standalone version) that would also contain default schemas and custom actions. A simple framework would probably need 2-3 weeks development time. For a complex framework with many custom actions, it could take a long time. Oxygen XML Author already has frameworks for editing (DocBook, DITA, TEI, etc.) and sources for them are available in the Oxygen SDK.

Multiple frameworks can co-exist in the same Oxygen XML Author instance and can be used at the same time for editing XML documents.

3. Many customers desire a very simplistic interface for contributors (with little or no XML expertise) but a more robust XML editing environment for editors (or other users with more advanced XML expertise). How well does the Oxygen XML Author Component support varying degrees of user interface complexity and capability?

- **Showing/hiding menus, toolbars, helpers, etc.**

  You assemble all the UI parts from the Oxygen XML Author Component. For example, you could provide two implementations: one for advanced users and one for content authors.

- **Forcing behaviors (for example, ensuring change tracking (on page 2800) is on and preventing it from being shut down).**

  You could avoid placing the change tracking toolbar actions in the UI. You could also use the API to turn change tracking ON when the content has been loaded.

- **Preventing access to “privileged” editor processes (for example, accept/reject changes).**

  You can remove the change tracking actions completely in a custom implementation, including the ones from the contextual menu.

- **Presenting and/or describing XML constructs (for example, tags) in “plain-English”.**

  Using our API, you can customize what the Outline view orBreadcrumb displays for each XML tag. You can also customize the in-place content completion list.

- **Presenting a small subset of the overall XML tag set (rather than the full tag set) for use by contributors (for example, allowing an author to only insert Heading, Para, and inline emphasis).**

  The API allows for a content completion filter that also affects the Elements view.

4. Does the Oxygen XML Author Component API provide access to the XML document, for manipulation purposes, using common XML syntax (such as DOM, XPath, etc.)?
Yes, using the Oxygen XML Author Component API.

5. Can custom dialog boxes be developed and launched to collect information in a “form” (with scripting behind to push tag the collection information and embed it in the XML document)?

Yes.

6. Can project resources and customizations be readily shared between the desktop and component versions of your Oxygen XML Author Component product line?

A framework developed for the standalone version of the Oxygen XML Author application can then be bundled with the Oxygen XML Author Component. For example, you could use the same framework that you use in the Oxygen XML Author standalone distribution.

A custom editing solution can deploy one or more frameworks that can be used at the same time.

Print Document Within the Oxygen XML Author Component

**Question**

Can a document be printed within the Oxygen XML Author Component?

**Answer**

You can use the following API method to either print the document content to the printer or to show the Print Preview dialog box, depending on the preview parameter value:

```java
AuthorComponentProvider.print(boolean preview)
```

Here is the online Javadoc for this method: https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/ecss/extensions/api/component/AuthorComponentProvider.html#print(boolean)

Oxygen XML Web Author Component

The Oxygen SDK provides the ability to integrate the Oxygen XML Web Author into your existing content ecosystem and it allows anyone in your organization to access your content from anywhere they have an internet connection. Oxygen XML Web Author is highly versatile and can be customized to work with any XML vocabulary, most file repository systems, and virtually any type of workflow.

**Web Author Component Integration**

For information about integrating Oxygen XML Web Author into your environment, see Web Author Integration.
Web Author Customization

For detailed information about customizing Web Author, see the Oxygen XML Web Author Customization Guide.

Using Web Author

For information about using the Web Author product, see the Oxygen XML Web Author User Manual.

Web Author vs. Web Author Component

The purpose of this topic is to help you choose which distribution of Oxygen XML Web Author is appropriate for your particular use-case.

Oxygen XML Web Author has two distributions:

1. **Oxygen XML Web Author (product)** - This version can be downloaded from the Oxygen website and is licensed according to the Web Author License Agreement.
2. **Web Author Component** - Provided as a Maven artifact (according to the SDK Agreement) that is used in the Web Author Component integration project. This project can be used as a starting point for your integration.

   **Note:** The formal definition for Web Author Component inside the SDK agreement is: "Web Author Component" is a subset of Software composed of a server component operating as a service application and a client component deployed to a web browser, such as an HTML5 based application, where the client component is not installed on the client machine but is in use by the client machine while the browser is connected to the server component."

For End Users

For end users, the recommended distribution is **Oxygen XML Web Author (product)**.

For Plugin and Framework Developers

If you develop frameworks or plugins that provides enhanced functionality for Oxygen XML Web Author, it is recommended to distribute the plugin or framework separately from Web Author. They will work with both types of distributions and the end users can choose:

- To install your plugin or framework in Web Author.
- To use a solution based on Web Author that has the plugin or framework installed by default.
- To use a solution based on Web Author and install the plugin or framework themselves.
Example of such plugins/frameworks:

- Integration with a terminology database.
- Adding support to edit embedded SVG snippets.
- Providing support for a specific XML language.

For Integration Developers

If you want to integrate Oxygen XML Web Author into another application (for example, a CMS), that you distribute to your end users, there are several aspects to consider when choosing between the two distributions:

**Functionality**

Both versions have the same features.

**Legal**

If you want to use the Web Author Component, you must have your own application that is not called Oxygen XML Web Author, but will contain Web Author as a software component provided by Syncro Soft. Hence, Syncro Soft does not have a direct legal link with your users, you will handle the licensing of your application to your end users.

For the official details, you can consult the license agreements for both distributions:

2. **Web Author Component**: [https://www.oxygenxml.com/sdk_agreement.html](https://www.oxygenxml.com/sdk_agreement.html)

**Financial**

If you choose to use the Web Author product to distribute as a plugin or framework, then you act as a channel reseller, basically reselling Oxygen XML Web Author to your end users and you must pay Syncro Soft the corresponding cost of the license.

The Web Author Component is available with more flexible pricing alternatives that are negotiated for each contract and include:

- Subscription packages similar to the ones used for the Web Author product, but you may get a discount depending on the partnership level (Gold, Silver, Bronze).
• Solution OEM license.

If you choose to integrate the Web Author Component into your application, the cost is based on royalties, rather than a cost for the license. That means you do not need to pay for the ability to include the component in your application, but when you distribute your application you must pay a royalty to Syncro Soft.

Customization

It is strongly recommended to implement any customization as a combination of plugins, frameworks, and options. If you are using Web Author Component, you can also alter the Web Author files, but this is discouraged since those files are not considered API and may change in a future version.

Deployment

If you want to use Oxygen XML Web Author (product), you can install it using the installation kits, then configure the plugins, frameworks, and options using a browser-based UI. Alternatively, you can configure Oxygen XML Web Author to load the configuration from a custom directory (Oxygen Data Directory) along with desired plugins, frameworks, and options.

If you want to use Web Author Component, you can use the Web Author Component integration project to build a custom WAR file with plugins, frameworks, and options bundled. This WAR file can be deployed in any Servlet container (for example, Tomcat).

Distribution

If you want to use Oxygen XML Web Author (product), your users must download Oxygen XML Web Author from the Oxygen website, while you will distribute your plugins/frameworks to your users. You should provide instructions on how to deploy and use Oxygen XML Web Author. Alternatively, you can install and configure it for them.

If you want to use Web Author Component, you will distribute the customized WAR file.

SDK Common Use Cases

This section contains details for specific use cases regarding customizations using the Oxygen SDK, Author Component (on page 2189), or plugins (on page 2151).

For additional questions, contact the Oxygen support team. The preferred approach is via email because these types of questions must be analyzed thoroughly. The Oxygen support team also provides code snippets, if applicable.
To stay up-to-date with the latest changes, discuss issues, and ask for solutions from other developers working with the Oxygen SDK, register on the Oxygen-SDK mailing list.

Add Custom Actions to the Contextual Menu?

**Question**

How do I add my own custom actions to the contextual menu using an API?

**Answer**

The `WSAuthorEditorPageBase.addPopUpMenuCustomizer` and `WSTextEditorPage.addPopUpMenuCustomizer` API methods allow you to customize the contextual menu shown either in the Author or Text modes. The API is available both in the standalone application and in the Eclipse plugin.

Here is an elegant way to add actions to the Author page from your Eclipse plugin extension:

1. Create a pop-up menu customizer implementation:

```java
import org.eclipse.jface.action.ContributionManager;
import org.eclipse.ui.PlatformUI;
import org.eclipse.ui.menus.IMenuService;
import ro.sync.ecss.extensions.api.AuthorAccess;
import ro.sync.ecss.extensions.api.structure.AuthorPopupMenuCustomizer;

/**
 * This class is used to create the possibility to attach certain
 * menuContributions to the {@link ContributionManager}, which is used for the
 * popup menu in the Author Page of the Oxygen Editor.<br />
 * You just need to use the org.eclipse.ui.menus extension and add a
 * menuContribution with the locationURI: <b>menu:oxygen.authorpage</b>
 */

public class OxygenAuthorPagePopupMenuCustomizer implements AuthorPopupMenuCustomizer {

    @Override
    public void customizePopUpMenu(Object menuManagerObj, AuthorAccess authoraccess) {
        if (menuManagerObj instanceof ContributionManager) {
            ContributionManager contributionManager = (ContributionManager) menuManagerObj;
            IMenuService menuService = (IMenuService) PlatformUI.getWorkbench();
```
2. Add a workbench listener and add the pop-up customizer when an editor is opened in the Author page:

```java
Workbench.getInstance().getActiveWorkbenchWindow().getPartService()
    .addPartListener(
        new IPartListener() {
            @Override
            public void partOpened(IWorkbenchPart part) {
                if (part instanceof ro.sync.exml.workspace.api.editor.WSEditor) {
                    WSEditorPage currentPage = ((WSEditor)part).getCurrentPage();
                    if (currentPage instanceof WSAuthorEditorPage) {
                        ((WSAuthorEditorPage)currentPage).addPopUpMenuCustomizer(
                            new OxygenAuthorPagePopupMenuCustomizer());
                    }
                }
            }
        });
```

3. Implement the extension point in your plugin.xml file:

```xml
<extension
    point="org.eclipse.ui.menus">
    <menuContribution
        allPopups="false"
        locationURI="menu:oxygen.authorpage">
        <command
            commandId="eu.doccenter.kgu.client.tagging.removeTaggingFromOxygen"
            style="push"/>
    </menuContribution>
</extension>
```
Add Custom Callouts

Question

I want to highlight validation errors, instead of underlining them (for example, changing the text background color to red or yellow). Also, I want a message displayed directly at the error position that describes the problem. Is this possible using the API?

Answer

The Plugins API allows you to set a `ValidationProblemsFilter` that gets notified when automatic validation errors are available. Then you can map each of the problems to an offset range in the `Author` mode using the API `WSTextBasedEditorPage.getStartEndOffsets(DocumentPositionedInfo)`. For each of those offsets, you can add either persistent or non-persistent highlights. If you add persistent highlights, you can also customize callouts to appear for each of them. The downside is that they need to be removed before the document gets saved. The result would look something like this:

Figure 501. Custom Callouts with Persistent Highlights

Here is a working example:

```java
/**
 * Plugin extension - workspace access extension.
 */

public class CustomWorkspaceAccessPluginExtension
    implements WorkspaceAccessPluginExtension {
```
public void applicationStarted(
    final StandalonePluginWorkspace pluginWorkspaceAccess) {
    pluginWorkspaceAccess.addEditorChangeListener
        (new WSEditorChangeListener() {
            @Override
            public void editorOpened(URL editorLocation) {
                final WSEditor currentEditor = pluginWorkspaceAccess.getEditorAccess(editorLocation, StandalonePluginWorkspace.MAIN_EDITING_AREA);
                WSEditorPage currentPage = currentEditor.getCurrentPage();
                if(currentPage instanceof WSAuthorEditorPage) {
                    final WSAuthorEditorPage currentAuthorPage = (WSAuthorEditorPage)currentPage;
                    currentAuthorPage.getPersistentHighlighter().setHighlightRenderer(new PersistentHighlightRenderer() {
                        @Override
                        public String getTooltip(AuthorPersistentHighlight highlight) {
                            return highlight.getClonedProperties().get("message");
                        }
                        @Override
                        public HighlightPainter getHighlightPainter(AuthorPersistentHighlight highlight) {
                            //Depending on severity could have different color.
                            ColorHighlightPainter painter = new ColorHighlightPainter(Color.COLOR_RED, -1, -1);
                            painter.setBgColor(Color.COLOR_RED);
                            return painter;
                        }
                    });
                    currentAuthorPage.getReviewController().getAuthorCalloutsController().setCalloutsRenderingInformationProvider(new CalloutsRenderingInformationProvider() {
                        @Override
                        public String getClonedProperties(AuthorPersistentCallout callout) {
                            return callout.getProperties().get("message");
                        }
                    });
                }
            }
        });
    }};
```java
public boolean shouldRenderAsCallout(AuthorPersistentHighlight highlight) {
    // All custom highlights are ours
    return true;
}

@Override
public AuthorCalloutRenderingInformation getCalloutRenderingInformation(
    final AuthorPersistentHighlight highlight) {
    return new AuthorCalloutRenderingInformation() {
        @Override
        public long getTimestamp() {
            // Not interesting
            return -1;
        }
        @Override
        public String getContentFromTarget(int limit) {
            return "";
        }
        @Override
        public String getComment(int limit) {
            return highlight.getClonedProperties().get("message");
        }
        @Override
        public Color getColor() {
            return Color.COLOR_RED;
        }
        @Override
        public String getCalloutType() {
            return "Problem";
        }
        @Override
        public String getAuthor() {
            return "";
        }
        @Override
        public Map<String, String> getAdditionalData() {
            return null;
        }
    };
```
currentEditor.addValidationProblemsFilter(new ValidationProblemsFilter() {
    List<int[]> lastStartEndOffsets = new ArrayList<int[]>();
    /**
     * @see ro.sync.exml.workspace.api.editor.validation.ValidationProblemsFilter
     * filterValidationProblems
     */
    @Override
    public void filterValidationProblems(ValidationProblems validationProblems) {
        List<int[]> startEndOffsets = new ArrayList<int[]>();
        List<DocumentPositionedInfo> problemsList = validationProblems.getProblemsList();
        if (problemsList != null) {
            for (int i = 0; i < problemsList.size(); i++) {
                try {
                    startEndOffsets.add(currentAuthorPage.getStartEndOffsets(problemsList.get(i)));
                } catch (BadLocationException e) {
                    e.printStackTrace();
                }
            }
            if (lastStartEndOffsets.size() != startEndOffsets.size()) {
                //Continue
            } else {
                boolean equal = true;
                for (int i = 0; i < startEndOffsets.size(); i++) {
                    int[] o1 = startEndOffsets.get(i);
                    int[] o2 = lastStartEndOffsets.get(i);
                    if (o1 == null && o2 == null) {
                        //Continue
                    } else if (o1 != null && o2 != null
                        && o1[0] == o2[0] && o1[1] == o2[1]) {
                        //Continue
                    } else {
                        equal = false;
                        break;
                    }
                }
                if (equal) {
                    //Same list of problems already displayed.
                }
return;
}
}
//Keep last used offsets.
lastStartEndOffsets = startEndOffsets;

try {
    if (! SwingUtilities.isEventDispatchThread()) {
        SwingUtilities.invokeLater(new Runnable() {
            @Override
            public void run() {
                //First remove all custom highlights.
                currentAuthorPage.getPersistentHighlighter().removeAllHighlights();
            }
        });
    }
    try {
        if (problemsList != null) {
            for (int i = 0; i < problemsList.size(); i++) {
                //A reported problem (could be warning, could be error).
                DocumentPositionedInfo dpi = problemsList.get(i);
                try {
                    final int[] currentOffsets = startEndOffsets.get(i);
                    if (currentOffsets != null) {
                        //These are offsets in the Author content.
                        final LinkedHashMap<String, String> highlightProps =
                            new LinkedHashMap<String, String>();
                        highlightProps.put("message", dpi.getMessage());
                        highlightProps.put("severity", dpi.getSeverityAsString());
                        if (! SwingUtilities.isEventDispatchThread()) {
                            SwingUtilities.invokeLater(new Runnable() {

                                        currentOffsets[0], currentOffsets[1] - 1,
                                        highlightProps);
                                }
                            });
                        }
                    }
                }
            }
        }
    }
    catch (InterruptedException e1) {
        e1.printStackTrace();
    }
    catch (InvocationTargetException e1) {
        e1.printStackTrace();
    }
}
catch (InterruptedException e) {
    e.printStackTrace();
}

try {
    if (!SwingUtilities.isEventDispatchThread()) {
        SwingUtilities.invokeLater(new Runnable() {
            @Override
            public void run() {
                // Remove all persistent highlights before saving
                currentAuthorPage.getPersistentHighlighter().removeAllHighlights();
            }
        });
    }
}

catch (InvocationTargetException e) {
    e.printStackTrace();
}

return true;

}
Add Custom Highlights to Content

**Question**

How can I add custom highlights to the document content in **Author** mode?

**Answer**

There are two types of highlights you can add:

1. **Non-Persistent Highlights** - Such highlights are removed when the document is closed and then re-opened.

   You can use the following API method:

   ```java
   ro.sync.exml.workspace.api.editor.page.author.WSAuthorEditorPageBase.getHighlighter()
   ```

   to obtain an **AuthorHighlighter** that allows you to add a highlight between certain offsets with a specified painter.

   For example, you can use this support to implement your own spell checker with a custom highlight for the unrecognized words.

2. **Persistent Highlights** - Such highlights are saved in the XML content as processing instructions.

   You can use the following API method:

   ```java
   ro.sync.exml.workspace.api.editor.page.author.WSAuthorEditorPageBase.getPersistentHighlighter()
   ```

   to obtain an **AuthorPersistentHighlighter** class that allows you to add a persistent highlight between certain offsets, set new properties for a specific highlight, and render it with a specified painter.

   For example, you can use this support to implement your own way of adding review comments.
Auto-Generate an ID When a Document is Opened or Created

**Question**

Is it possible to configure how the application generates IDs? For project compliance, I need IDs that have a certain format for each created topic.

**Answer**

This could be done implementing a plugin (on page 2797) for Oxygen XML Author using the Plugins SDK:

There is a type of plugin called "Workspace Access" that can be used to add a listener to be notified when an editor is opened.

The implemented plugin would intercept the opened editor and editor page change events (which occur when a new editor is created) and generate a new ID attribute value on the root element.

The Java code would look like this:

```java
pluginWorkspaceAccess.addEditorChangeListener(new WSEditorChangeListener() {
    /**
     * @see WSEditorChangeListener#editorOpened(java.net.URL)
     */
    @Override
    public void editorOpened(URL editorLocation) {
        WSEditor ed = pluginWorkspaceAccess.getEditorAccess
                     (editorLocation, PluginWorkspace.MAIN_EDITING_AREA);
        generateID(ed);
    }
    /**
     * @see WSEditorChangeListener#editorPageChanged(java.net.URL)
     */
    @Override
    public void editorPageChanged(URL editorLocation) {
        WSEditor ed = pluginWorkspaceAccess.getEditorAccess
```
```java
private void generateID(WSEditor ed) {
    if (ed.getCurrentPage() instanceof WSAuthorEditorPage) {
        WSAuthorEditorPage authorEditPage = (WSAuthorEditorPage) ed.getCurrentPage();
        AuthorDocumentController ctrl = authorEditPage.getDocumentController();
        AuthorElement root = ctrl.getAuthorDocumentNode().getRootElement();
        if (root.getAttribute("id") == null ||
                !root.getAttribute("id").getValue().startsWith("generated_")) {
            ctrl.setAttribute("id", new AttrValue("generated_" + Math.random()), root);
        }
    }
}
```

Change the Default Track Changes (Review) Author Name

**Question**

How can I change the default author name used for *Tracked Changes (on page 2800)* in the *Author Component*?

**Answer**

The *Track Changes (Review)* author name is determined in the following order:

1. **API** - The review user name can be imposed through the following API:

   ```java
   ro.sync.ecss.extensions.api.AuthorReviewController.setReviewerAuthorName(String)
   ```

2. **Options** - If the author name was not imposed from the API, it is determined from the *Author* option set in the *Review preferences page (on page 139)*.

3. **System properties** - If the author name was not imposed from the API or from the application options then the following system property is used:

   ```java
   System.getProperty("user.name")
   ```

So, to impose the *Track Changes* author, use one of the following approaches:
1. Use the API to impose the reviewer author name. Here is the online Javadoc of this method: 
https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/ecss/extensions/api/
AuthorReviewController.html#setReviewerAuthorName(java.lang.String)

2. Customize the default options and set a specific value for the Author name option set in the Review preferences page (on page 139).

3. Set the value of user.name system property when the Author Component is initializing and before any document is loaded.

Change the DOCTYPE of an Opened XML Document

Question

How to change the DOCTYPE of a document opened in the Author mode?

Answer

The following API:

ro.sync.ecss.extensions.api.AuthorDocumentController.getDoctype()

allows you to get the DOCTYPE of the current XML file opened in the Author mode.

There is also an API method available that would allow you to set the DOCTYPE back to the XML:

ro.sync.ecss.extensions.api.AuthorDocumentController.setDoctype(AuthorDocumentType)

Here is an example of how this solution would work:

```java
AuthorDocumentType dt = new AuthorDocumentType("article", "testSystemID", "testPublicID",
        "<!DOCTYPE article PUBLIC \"testPublicID\" \"testSystemID\">");
docController.setDoctype(dt);
```

Basically, you could take the entire content from the existing DOCTYPE,

ro.sync.ecss.extensions.api.AuthorDocumentType.getContent()

modify it to your needs, and create another AuthorDocumentType object with the new content and with the same public, system IDs.

For example, you could use this API if you want to add unparsed entities in the XML DOCTYPE.
Control XML Serialization in the Oxygen XML Author Component

**Question**

How can I force the Oxygen XML Author Component to save the XML with zero indent size and not to break the line inside block elements *(on page 2792)*?

**Answer**

Usually, in a standalone version of Oxygen XML Author, the *Editor > Format* and *Editor > Format > XML* preferences pages allow you to control the way the XML is saved on the disk after you edit it in the *Author* mode.

Also, the `APIAccessibleOptionTags` interface contains a list of all accessible keys that can be read or set from the options.

In the Oxygen XML Author application, you can either bundle a default set of options *(on page 252)* or use the `PluginWorkspace.setGlobalObjectProperty(String, Object)` API:

```java
//For not breaking the line
//Long line
pluginWorkspace.setObjectProperty
    (APIAccessibleOptionTags.EDITOR_LINE_WIDTH, new Integer(100000));

//Do not break before inline elements
pluginWorkspace.setObjectProperty
    (APIAccessibleOptionTags.EDITOR_FORMAT_INDENT_INLINE_ELEMENTS, false);

//For forcing zero indent
//Force indent settings to be controlled by us
pluginWorkspace.setObjectProperty
    (APIAccessibleOptionTags.EDITOR_DETECT_INDENT_ON_OPEN, false);

//Zero indent size
pluginWorkspace.setObjectProperty
    (APIAccessibleOptionTags.EDITOR_INDENT_SIZE, 0);
```

In the Oxygen XML Author Component, you can either bundle a fixed set of options *(on page 2232)*, or use the Java API to set properties that overwrite the default options:

```java
//For not breaking the line
//Long line
AuthorComponentFactory.getInstance().setObjectProperty
    (APIAccessibleOptionTags.EDITOR_LINE_WIDTH, new Integer(100000));
```
//Do not break before inline elements
AuthorComponentFactory.getInstance().setObjectProperty
(APIAccessibleOptionTags.EDITOR_FORMAT_INDENT_INLINE_ELEMENTS, false);

//For forcing zero indent
//Force indent settings to be controlled by us
AuthorComponentFactory.getInstance().setObjectProperty
(APIAccessibleOptionTags.EDITOR_DETECT_INDENT_ON_OPEN, false);

//Zero indent size
AuthorComponentFactory.getInstance().setObjectProperty
(APIAccessibleOptionTags.EDITOR_INDENT_SIZE, 0);

Customize the Default Icons for Toolbars/Menus

Question

How can I change the default icons used for the built-in actions?

Answer

If you look inside the main JAR library {OXYGEN_INSTALL_DIR}\lib\oxygen.jar or
{OXYGEN_INSTALL_DIR}\lib\author.jar, it contains an images folder that contains all the images
used for buttons, menus, and toolbars.

To overwrite them with your own creations, follow these steps:

1. In the {OXYGEN_INSTALL_DIR}\lib directory create a folder called endorsed.
2. In the endorsed folder create another folder called images.
3. Add your own images in the images folder.

You can use this mechanism to overwrite any kind of resource located in the main Oxygen JAR
library. The folder structure in the endorsed directory and in the main Oxygen JAR must be identical.
Customize the Outline View in Text Mode?

Question

How do I customize the Outline view (on page 334) in Text mode?

Answer

Suppose that you have the following XML document:

```xml
<doc startnumber="15">
  <sec counter="no">
    <info/>
    <title>Introduction</title>
  </sec>
  <sec>
    <title>Section title</title>
    <para>Content</para>
  </sec>
  <sec>
    <title>Section title</title>
    <para>Content</para>
  </sec>
  <sec>
    <title>Section title</title>
    <para>Content</para>
  </sec>
</doc>
```

and you want to display the XML content in a simplified Outline view like this:

```
doc "15"
  sec Introduction
  sec 15 Section title
  sec 15.1 Section title
  sec 16 Section title
```

Usually, an Outline view should have the following characteristics:

1. Double-clicking a node in the Outline view would select the corresponding XML content in the editor.
2. When the cursor moves in the opened XML document, the Outline view would select the proper entry.
3. When modifications occur in the document, the Outline view would refresh.

A simple implementation using a Workspace Access plugin type could be something like this:

```java
/**
 * Simple Outline for Text mode based on executing XPaths over the text content.
 */
public class CustomWorkspaceAccessPluginExtension implements WorkspaceAccessPluginExtension {

    /**
     * The custom outline list.
     */
    private JList customOutlineList;

    /**
     * Maps outline nodes to ranges in document
     */
    private WXMLTextNodeRange[] currentOutlineRanges;

    /**
     * The current text page
     */
    private WXMLTextEditorPage currentTextPage;

    /**
     * Disable CaretListener when we select from the CaretListener.
     */
    private boolean enableCaretListener = true;

    /**
     * @see WorkspaceAccessPluginExtension#applicationStarted
     */
    @Override
    public void applicationStarted(final StandalonePluginWorkspace pluginWorkspaceAccess) {
        pluginWorkspaceAccess.addViewComponentCustomizer(new ViewComponentCustomizer() {
            /**
             * ...
             */
        });
    }
```
@see ViewComponentCustomizer#customizeView
@see ViewComponentCustomizer#customizeView
{ro.sync.exml.workspace.api.standalone.ViewInfo}

@see ViewComponentCustomizer#customizeView

@Override
public void customizeView(ViewInfo viewInfo) {
    if
        //The view ID defined in the "plugin.xml"
        "SampleWorkspaceAccessID".equals(viewInfo.getViewID())
            customOutlineList = new JList();
        //Render the content in the Outline.
        customOutlineList.setCellRenderer(new DefaultListCellRenderer() {
            @Override
            public Component getListCellRendererComponent(
                JList<?> list, Object value, int index, boolean isSelected, boolean cellHasFocus) {
                final JLabel label = (JLabel) super.getListCellRendererComponent(
                    list, value, index, isSelected, cellHasFocus);
                String val = null;
                if
                    Element element = ((Element)value);
                    val += " " + element.getAttribute("startnumber") + "";
                
                NodeList titles = element.getElementsByTagName("title");
                if(titles.getLength() > 0) {
                    val += " 
" + titles.item(0).getTextContent() + "";
                }
                label.setText(val);
                return label;
            }
        });
        //When we click a node, select it in the text page.
        customOutlineList.addMouseListerner(new MouseAdapter() {
            @Override
            public void mouseClicked(MouseEvent e) {
                ListCell listCell = (ListCell) e.getSource();
                if(listCell != null) {
                    int index = listCell.getIndex();
                    if(index >= 0) {
                        ViewInfo viewInfo = (ViewInfo) viewInfoArray.get(index);
                        String viewID = viewInfo.getViewID();
                        if(viewID != null) {
                            String workspaceName = "SampleWorkspace";
                            String fileExtension = "workspace.jsxm";
                            String resourceName = workspaceName + fileExtension;
                            if(resourceName != null) {
                                String resourcePath = resourcePath + resourceName;
                                if(resourcePath != null) {
                                    ViewInfo view =...
                                }
                            }
                        }
                    }
                }
            }
        });
public void mouseClicked(MouseEvent e) {
    if (SwingUtilities.isLeftMouseButton(e) && e.getClickCount() == 2) {
        int sel = customOutlineList.getSelectedIndex();
        enableCaretListener = false;
        try {
            currentTextPage.select(currentTextPage.getOffsetOfLineStart
                (currentOutlineRanges[sel].getStartLine()) +
                currentOutlineRanges[sel].getStartColumn() - 1,
                currentTextPage.getOffsetOfLineStart
                (currentOutlineRanges[sel].getEndLine()) +
                currentOutlineRanges[sel].getEndColumn());
        } catch (BadLocationException e1) {
            e1.printStackTrace();
        }
        enableCaretListener = true;
    }
}
}

viewInfo.setTitle("Custom Outline");

pluginWorkspaceAccess.addEditorChangeListener(new WSEditorChangeListener() {
    /**
     * @see WSEditorChangeListener#editorOpened(java.net.URL)
     */
    @Override
    public void editorOpened(URL editorLocation) {
        //An editor was opened
        WSEditor editorAccess = pluginWorkspaceAccess.getEditorAccess
            (editorLocation, StandalonePluginWorkspace.MAIN_EDITING_AREA);
        if (editorAccess != null) {
            WSEditorPage currentPage = editorAccess.getCurrentPage();
            if (currentPage instanceof WSXMLTextEditorPage) {
                //User editing in Text mode an opened XML document.
                final WSXMLTextEditorPage xmlTP = (WSXMLTextEditorPage) currentPage;
                //Reconfigure outline on each change.

        }
        customOutlineList.setModel(listModel);
    } catch (XPathException ex) {

Difference Between a Framework (Document Type) and a Plugin Extension

**Question**

What is the difference between a Framework (on page 2794) and a Plugin (on page 2797) Extension?

**Answer**

There are two possible ways to customize the application:

1. Implement a plugin.

   A plugin serves a general purpose and influences any type of XML file that you open in Oxygen XML Author.

   For the Oxygen XML Author Plugins API, Javadoc, samples, and documentation, go to https://www.oxygenxml.com/oxygen_sdk.html#Developer_Plugins

2. Create or modify the document type (on page 1893) that is associated to your specific XML vocabulary.

   This document type can be used, for instance, to provide custom actions for your type of XML files and to mount them on the toolbar, menus, and contextual menus.

   For example, if the end users are editing DITA documents, all the toolbar actions that are specific for DITA are provided by the DITA framework. If you look in the Document Type Association preferences page (on page 92) there is a DITA document type. If you edit that document type you
will see that it has an **Author** tab in the **Document Type Configuration** dialog box (on page 94). The subtabs in this tab can be used to define custom DITA actions and add them to the toolbars, main menus, or contextual menus.

For information about developing your own document types (**frameworks**), see the **Advanced Framework Customization** (on page 1893) section.

If you look on disk in the `{OXYGEN_INSTALL_DIR}\frameworks\dita` folder, there is a file called `dita.framework`. That file gets updated when you edit a document type from the **Document Type Association** preferences page (on page 92). Then you can share that updated file with all users.

The same folder contains some **JAR** (on page 2795) libraries. These libraries contain custom Java operations that are called when the user presses certain toolbar actions.

The **Oxygen SDK** contains the Java sources from all the DITA Java customizations:

https://www.oxygenxml.com/oxygen_sdk.html#XML_Editor_Authoring_SDK

⚠️ **Important:** It is possible for a **plugin** to share the same classes with a **framework**. For further details, go to How to Share the Classloader Between a Framework and a Plugin (on page 2182).

---

**Related Information:**

- Adding a Custom Operation to an Existing Framework (on page 2047)

**Disable Context-Sensitive Menu Items for Custom Author Actions**

**Question**

Is there a way to disable menu items for custom **Author** mode actions depending on the cursor context?

**Answer**

By default, Oxygen XML Author does not toggle the enabled/disabled states for actions based on whether or not the activation XPath expressions for that certain **Author** mode action are fulfilled. This is done because the actions can be many and evaluating XPath expression on each cursor move can lead to performance problems. However, if you have your own `ro.sync.ecss.extensions.api.ExtensionsBundle` implementation you can overwrite the method:
ro.sync.ecss.extensions.api.ExtensionsBundle.createAuthorExtensionStateListener()

and when the extension state listener gets activated, you can use the API like this:

```java
/**
 * @see ro.sync.ecss.extensions.api.AuthorExtensionStateListener#activated
 (ro.sync.ecss.extensions.api.AuthorAccess)
 */

public void activated(final AuthorAccess authorAccess) {

    //Add a caret listener to enable/disable extension actions:
    authorAccess.getEditorAccess().addAuthorCaretListener(new AuthorCaretListener()
    {
        @Override
        public void caretMoved(AuthorCaretEvent caretEvent) {
            try {
                Map<String, Object> authorExtensionActions =
                authorAccess.getEditorAccess().getActionsProvider().getAuthorExtensionActions();

                //Get the action used to insert a paragraph. It's ID is "paragraph"
                AbstractAction insertParagraph = (AbstractAction) authorExtensionActions.get("paragraph");

                //Evaluate an XPath expression in context of the current node
                Object[] evaluateXPath = authorAccess.getDocumentController().evaluateXPath
                ("*[ancestor-or-self::p]", false, false, false, false);

                if (evaluateXPath != null && evaluateXPath.length > 0 &&
                evaluateXPath[0] != null) {
                    //We are inside a paragraph, disable the action.
                    insertParagraph.setEnabled(false);
                } else {
                    //Enable the action
                    insertParagraph.setEnabled(true);
                }
            } catch (AuthorOperationException e) {
                e.printStackTrace();
            }
        }
    });
```

When the extension is deactivated, you should remove the `CaretListener` to avoid adding multiple listeners that perform the same functionality.
Dynamically Add Form Controls Using a Styles Filter

**Question**

How do I add form controls using an API?

**Answer**

Usually, a form control is added from the CSS using one of the built-in form controls (on page 2112). However, in some cases you do not have all the information you need to properly initialize the form control at CSS level. In these cases you can add the form controls by using the API, more specifically ro.sync.ecss.extensions.api.StylesFilter.

For instance, if you want a combo box form control and the values to populate the combo are specified inside a file (or they come from a database). Here is how to add the form control from the API:

```java
public class SDFStylesFilter implements StylesFilter {

    public Styles filter(Styles styles, AuthorNode authorNode) {
        if (authorNode.getType() == AuthorNode.NODE_TYPE_PSEUDO_ELEMENT
            && "before".equals(authorNode.getName())) {
            authorNode = authorNode.getParent();
        }

        if ("country".equals(authorNode.getName())) {
            // This is the BEFORE pseudo element of the "country" element.
            // Read the supported countries from the configuration file.
            Map<String, Object> formControlArgs = new HashMap<String, Object>();
            formControlArgs.put(InplaceEditorArgumentKeys.PROPERTY_EDIT, "#text");
            formControlArgs.put(InplaceEditorArgumentKeys.PROPERTY_TYPE, InplaceEditorArgumentKeys.TYPE_COMBOBOX);
            // This will be a comma separated enumeration: France, Spain, Great Britain
            String countries = readCountriesFromFile();
            formControlArgs.put(InplaceEditorArgumentKeys.PROPERTY_VALUES, countries);
            formControlArgs.put(InplaceEditorArgumentKeys.PROPERTY_EDITABLE, "false");

            // We also add a label in form of the form control.
            Map<String, Object> labelProps = new HashMap<String, Object>();
            labelProps.put("text", "Country: ");
            labelProps.put("styles", "* {width: 100px; color: gray;}");
            StaticContent[] mixedContent = new StaticContent[]
        }
```
{new LabelContent(labelProps),new EditorContent(formControlArgs)};
styles.setProperty(Styles.KEY_MIXED_CONTENT, mixedContent);

// The added form control is the only way the element can be edited.
if ("country".equals(authorNode.getName())) {
    styles.setProperty(Styles.KEY_VISIBILITY, "-oxy-collapse-text");
}

return styles;
}

If the execution of the  formControlArgs.put(InplaceEditorArgumentKeys.PROPERTY_VALUES, countries); line consumes too much execution time (for example, if it connects to a database or if it needs to extract data from a very large file), you can choose to delay it until the values are actually needed by the form control. This approach is called lazy evaluation and can be implemented as follows:

formControlArgs.put(InplaceEditorArgumentKeys.PROPERTY_VALUES,
    new LazyValue<List<CIValue>>() {
        public java.util.List<CIValue> get() {
            // We avoid reading the possible values until they are actually requested.
            // This will be a List with CIValues created over countries:
            France, Spain, Great Britain
            return readCountriesFromFile();
        }
    });

The lazy evaluation approach can be used for the following form controls properties:

- InplaceEditorArgumentKeys.PROPERTY_VALUES
- InplaceEditorArgumentKeys.PROPERTY_LABELS
- InplaceEditorArgumentKeys.PROPERTY_TOOLTIP

The full source code for this example is available inside the Oxygen SDK.
Dynamically Modify the Content Inserted by the Author

Question

Is there a way to insert typographic quotation marks instead of double quotes?

Answer

By using the API you can set a document filter to change the text that is inserted in the document in Author mode. You can use this method to change the insertion of double quotes with the typographic quotes.

Here is some sample code:

```java
authorAccess.getDocumentController().setDocumentFilter(new AuthorDocumentFilter() {
    /**
     * @see ro.sync.ecss.extensions.api.AuthorDocumentFilter#insertText
     * (ro.sync.ecss.extensions.api.AuthorDocumentFilterBypass, int, java.lang.String)
     */
    @Override
    public void insertText(AuthorDocumentFilterBypass filterBypass, int offset, String toInsert) {
        if (toInsert.length() == 1 && "\"".equals(toInsert)) {
            // User typed a quote but he actually needs a smart quote.
            // So we either have to add \u201E (start smart quote)
            // Or we add \u201C (end smart quote)
            // Depending on whether there's already a start smart quote inserted
            // in the current paragraph.

            try {
                AuthorNode currentNode = authorAccess.getDocumentController().getNodeAtOffset(offset);
                int startofTextInCurrentNode = currentNode.getStartOffset();
                if (offset > startofTextInCurrentNode) {
                    Segment seg = new Segment();
                    authorAccess.getDocumentController().getChars(startofTextInCurrentNode, offset - startofTextInCurrentNode, seg);
                    String previousTextInNode = seg.toString();
                    boolean insertStartQuote = true;
```
```java
for (int i = previousTextInNode.length() - 1; i >= 0; i--) {
    char ch = previousTextInNode.charAt(i);
    if ('\u201C' == ch) {
        // Found end of smart quote, so yes, we should insert a start one
        break;
    } else if ('\u201E' == ch) {
        // Found start quote, so we should insert an end one.
        insertStartQuote = false;
        break;
    }
}
if (insertStartQuote) {
    toInsert = "\u201E";
} else {
    toInsert = "\u201C";
}

try {
    super.insertText(filterBypass, offset, toInsert);
} catch (BadLocationException e) {
    e.printStackTrace();
}
}
```

You can find the online Javadoc for `AuthorDocumentFilter` API here: https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/ecss/extensions/api/AuthorDocumentFilter.html

An alternative to using a document filtering is the use of a `ro.sync.ecss.extensions.api.AuthorSchemaAwareEditingHandlerAdapter`, which has clear callbacks indicating the source from where the API is called (Paste, Drag and Drop, Typing).
Extend the Java Functionality of an Existing Framework (Document Type)

**Question**

How can I change the way a DocBook 4 `xref` displays in Author mode based on what element is at the `linkend`?

**Answer**

Follow these steps:

1. Create a Maven Java project and add a dependency on the Oxygen XML Author classes:

   ```xml
   <dependency>
     <groupId>com.oxygenxml</groupId>
     <artifactId>oxygen-sdk</artifactId>
     <version>${oxygen.version}</version>
   </dependency>
   
   where `${oxygen.version}` is the version of Oxygen XML Author.

   Alternatively, if the project does not use Maven, all the transitive dependencies of the above Maven artifact need to be added to the classpath of the project.

2. Also add the `[OXYGEN_INSTALL_DIR]/frameworks/docbook/docbook.jar` to the classpath of the project.

4. For your custom resolver implementation you can start from the Java sources of the `ro.sync.ecss.extensions.docbook.link.DocbookLinkTextResolver` (the Java code for the entire DocBook customization is present in a subfolder in the Oxygen SDK).

5. Pack your extension classes in a JAR (on page 2795) file. Copy the JAR to:

   `[OXYGEN_INSTALL_DIR]/frameworks/docbook/custom.jar`.

7. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Document Type Association. Edit the DocBook 4 document type. In the Classpath list add the path to the new JAR. In the extensions list select your custom extension instead of the regular DocBook one.

8. You can rename the document type and the docbook framework folder to something else (such as `custom_docbook`) and share it with others. A document type can also be installed using the add-on support (on page 1943).
Impose Custom Options for Authors

Question

How to enable Track Changes (on page 2800) at startup?

Answer

There are two ways to enable Track Changes for every document that you open:

1. You could customize the default options (on page 252) that are used by your authors and set the Track Changes - Initial State option (on page 138) to Always On.
2. Use an API to toggle the Track Changes state after a document is opened in Author mode:

   ```java
   // Check the current state of Track Changes
   boolean trackChangesOn = authorAccess.getReviewController().isTrackingChanges();
   if (!trackChangesOn) {
      // Set Track Changes state to On
      authorAccess.getReviewController().toggleTrackChanges();
   }
   ```

Insert an Element with all the Required Content

Question

I am inserting a DITA image element using the API that points to a certain resource and has required content. Can the required content be automatically inserted by the application?

Answer

The API ro.sync.ecss.extensions.api.AuthorSchemaManager can propose valid elements that can be inserted at the specific offset. Using the method AuthorSchemaManager.createAuthorDocumentFragment(CIElement), you can convert the proposed elements to document fragments (on page 2793) (which have all the required content filled in) that can then be inserted in the document.

```java
AuthorSchemaManager schemaManager =
this.authorAccess.getDocumentController().getAuthorSchemaManager();
```
```java
WhatElementsCanGoHereContext context = 
schemaManager.createWhatElementsCanGoHereContext
(this.authorAccess.getEditorAccess().getCaretOffset());

List<CIElement> possibleElementsAtCaretPosition = 
schemaManager.whatElementsCanGoHere(context);
loop: for (int i = 0; i < possibleElementsAtCaretPosition.size(); i++) {
    CIElement possibleElement = possibleElementsAtCaretPosition.get(i);
    List<CIAttribute> attrs = possibleElement.getAttributes();
    if (attrs != null) {
        for (int j = 0; j < attrs.size(); j++) {
            CIAttribute ciAttribute = attrs.get(j);
            if (ciAttribute.getName().equals("class")) {
                if (ciAttribute.getDefaultValue() != null
                    && ciAttribute.getDefaultValue().contains("  topic/image ")) {
                    //Found a CIElement for image
                    //Create a fragment that contains all required child elements already built.
                    AuthorDocumentFragment frag = 
schemaManager.createAuthorDocumentFragment(possibleElement);
                    //Now set the @href to it.
                    //Ask the user and obtain a value for the @href
                    //Then:
                    String href = "test.png";
                    List<AuthorNode> nodes = frag.getContentNodes();
                    if (!nodes.isEmpty()) {
                        AuthorElement imageEl = (AuthorElement) nodes.get(0);
                        imageEl.setAttribute("href", new AttrValue(href));
                    }
                    //And insert the fragment.
                    this.authorAccess.getDocumentController().insertFragment
                    (this.authorAccess.getEditorAccess().getCaretOffset(), frag);
                    break loop;
                }
            }
        }
    }
}
```

Modify the XML Content on Open

Question

I have a bunch of DITA documents that have a fixed path the image src attributes. These paths are not valid and I am trying to move away from this practice by converting it into relative paths. When an XML document is opened, can I trigger the Java API to change the fixed path to a relative path?

Answer

The Plugins SDK contains a sample plugin type called WorkspaceAccess. Such a plugin is notified when the application starts and it can do what you want in a couple of ways:

1. Add a listener that notifies you when the user opens an XML document. Then if the XML document is opened in the Author visual editing mode you can use the Author API to change attributes:

```java
pluginWorkspaceAccess.addEditorChangeListener(new WSEditorChangeListener() {
    /**
     * @see WSEditorChangeListener#editorOpened(java.net.URL)
     */
    @Override
    public void editorOpened(URL editorLocation) {
        WSEditor openedEditor = pluginWorkspaceAccess.getCurrentEditorAccess
            (StandalonePluginWorkspace.MAIN_EDITING_AREA);
        if (openedEditor.getCurrentPage() instanceof WSAuthorEditorPage) {
            WSAuthorEditorPage authPage = (WSAuthorEditorPage)
                openedEditor.getCurrentPage();
            AuthorDocumentController docController = authPage.getDocumentController();
            try {
                //All changes will be undone by pressing Undo once.
                docController.beginCompoundEdit();
                fixupImageRefs(docController, docController.getAuthorDocumentNode());
            } finally {
                docController.endCompoundEdit();
            }
        }
    }
});
```
private void fixupImageRefs(AuthorDocumentController docController, AuthorNode authorNode) {
    if (authorNode instanceof AuthorParentNode) {
        // Recurse
        List<AuthorNode> contentNodes = ((AuthorParentNode) authorNode).getContentNodes();
        if (contentNodes != null) {
            for (int i = 0; i < contentNodes.size(); i++) {
                fixupImageRefs(docController, contentNodes.get(i));
            }
        }
    }
    if (authorNode.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
        AuthorElement elem = (AuthorElement) authorNode;
        if ("image".equals(elem.getLocalName())) {
            if (elem.getAttribute("href") != null) {
                String originalHref = elem.getAttribute("href").getValue();
                URL currentLocation = docController.getAuthorDocumentNode().getXMLBaseURL();
                // TODO here you compute the new href.
                String newHref = null;
                docController.setAttribute("href", new AttrValue(newHref), elem);
            }
        }
    }
}

2. An API to open XML documents in the application:

ro.sync.exml.workspace.api.Workspace.open(URL)

So you can create a plugin that automatically opens XML documents one at a time from a certain
folder in the application, makes modifications to them, and saves the content by calling:

ro.sync.exml.workspace.api.editor.WSEditorBase.save()

then closes the editor by calling:
Modify the XML Content on Save

Question

Is it possible to get Oxygen XML Author to update the revised date on a DITA document when it is saved?

Answer

The Plugins SDK contains a sample plugin type called WorkspaceAccess. Such a plugin is notified when the application starts.

You can add a listener that notifies you before the user saves an XML document. Then if the XML document is opened in the Author visual editing mode you can use the Author API to change attributes before the save takes place:

```java
@override
public void applicationStarted(final StandalonePluginWorkspace pluginWorkspaceAccess) {
    pluginWorkspaceAccess.addEditorChangeListener(new WSEditorChangeListener(){
        // An editor was opened
        @Override
        public void editorOpened(URL editorLocation) {
            final WSEditor editorAccess = pluginWorkspaceAccess.getEditorAccess(editorLocation, PluginWorkspace.MAIN_EDITING_AREA);
            if(editorAccess != null){
                editorAccess.addEditorListener(new ro.sync.exml.workspace.api.listeners.WSEditorListener(){
                    // Editor is about to be saved
                    @Override
                    public boolean editorAboutToBeSavedVeto(int operationType) {
                        if(EditorPageConstants.PAGE_AUTHOR.equals(editorAccess.getCurrentPageID())){
                            WSAuthorEditorPage authorPage = (WSAuthorEditorPage) editorAccess.getCurrentPage();
                            AuthorDocumentController controller = authorPage.getDocumentController();
                        }
                    }
                });
            }
        }
    });
}
```
```java
try {
    //Find the revised element
    AuthorNode[] nodes = controller.findNodesByXPath("//revised", true, true, true);
    if (nodes != null && nodes.length > 0) {
        AuthorElement revised = (AuthorElement) nodes[0];
        //Set the modified attribute to it...
        controller.setAttribute("modified", new AttrValue(new Date().toString()), revised);
    }
} catch (AuthorOperationException e) {
    e.printStackTrace();
}
//And let the save continue..
return true;
}

Multiple Rendering Modes for the Same Document in Author Mode

**Question**

How can I add multiple buttons, each showing a different visualization mode of the same document in Author mode?

**Answer**

In the toolbar in Author mode, there is a Styles drop-down menu that contains alternate CSS styles (on page 2791) for the same document. To add an alternate CSS stylesheet, open the Preferences dialog box (Options > Preferences) (on page 79), go to Document Type Association, select the document type associated with your documents and press Edit. In the Document Type configuration dialog box (on page 94) that appears, go to the Author tab, and in the CSS subtab add references to alternate CSS stylesheets.
For example, one of the alternate CSS stylesheets offered for the DITA document type is located here (by default):

```
[OXYGEN_INSTALL_DIR]/frameworks/dita/css_classed/hideColspec.css
```

If you open it, you will see that it imports the main CSS (on page 2796) and then adds selectors of its own.

**Obtain a DOM Element from AuthorNode or AuthorElement**

**Question**

Can a DOM Element be obtained from an AuthorNode or an AuthorElement?

**Answer**

No, a DOM Element cannot be obtained from an AuthorNode or an AuthorElement. The AuthorNode structure is also hierarchical but the difference is that all the text content is kept in a single text buffer instead of having individual text nodes.

There is an image in the Javadoc documentation that explains this situation: [https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/ecss/extensions/api/node/AuthorDocumentFragment.html](https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/ecss/extensions/api/node/AuthorDocumentFragment.html)

**Obtain the Currently Selected Element Using the Author API**

**Question**

In Author mode, if an element is fully selected, I want to perform an action on it. If not, I want to perform an action on the node that is located at the cursor position. Is this possible via the API?

**Answer**

When an element is fully selected by the user the selection start and end offsets are actually outside of the node's offset bounds. So using `AuthorDocumentController.getNodeAtOffset` will actually return the parent of the selected node. A special API is available that makes it easier for you to determine this situation: `WSAuthorEditorPageBase.getFullySelectedNode()`.

```
AuthorDocumentController controller = authorPageAccess.getDocumentController();
AuthorAccess authorAccess = authorPageAccess.getAuthorAccess();
int caretOffset = authorAccess.getEditorAccess().getCaretoffset();
```
AuthorElement nodeAtCaret =
(AuthorElement) authorAccess.getEditorAccess().getFullySelectedNode();

if (nodeAtCaret == null) {
    // We have no fully selected node. We can look at the cursor offset.
    nodeAtCaret = (AuthorElement)
        authorAccess.getDocumentController().getNodeAtOffset(caretOffset);
    // Or we could look at the selection start and end, see which node is
    // the parent of each offset and get the closest common ancestor.
}

Open a Document in Oxygen from Another Application

⚠️ **Restriction:** This feature is currently only available for Mac OS X users.

The Oxygen XML Author installation kit for Mac OS X comes with a special protocol handler that can be used if you want to open remote resources in the application (for example, opening a file from a CMS). The protocol is *edit-in-oxygen* and you can use it from a command line like this:

```
open edit-in-oxygen:protocol://host/path/file.xml
```

For example, if you start the following from the command line:

```
```

Oxygen XML Author will start and open the HTML content from the URL `http://www.oxygenxml.com/index.html`.

Run XSLT or XQuery Transformations

**Question**

Can I run XSL 2.0 / 3.0 transformation with Saxon EE using the *Oxygen SDK*?

**Answer**

The API class *ro.sync.exml.workspace.api.util.XMLUtilAccess* allows you to create an XSLT Transformer that implements the JAXP interface *javax.xml.transform.Transformer*. Then this type of transformer can be used to transform XML. Here's just an example of transforming when you have an *AuthorAccess* API available:

```
InputSource is = new org.xml.sax.InputSource
```
If you want to create the transformer from the plugin side, you can use this method instead:

```java
ro.sync.exml.workspace.api.PluginWorkspace.getXMLUtilAccess().
```

Save a New Document with a Predefined File Name Pattern

**Question**

Is it possible to get Oxygen XML Author to automatically generate a file name comprising a UUID plus file extension using the SDK?

**Answer**

This could be done implementing a plugin (on page 2797) for Oxygen XML Author using the Plugins SDK.

There is a type of plugin called Workspace Access that can be used to add a listener to be notified before an opened editor is saved. The implemented plugin would intercept the save events when a newly created document is untitled and display an alternative chooser dialog box, then save the topic with the proper name.

The Java code would look like this:

```java
private static class CustomEdListener extends WSEditorListener {
    private final WSEditor editor;
    private final StandalonePluginWorkspace pluginWorkspaceAccess;
    private boolean saving = false;

    public CustomEdListener (StandalonePluginWorkspace pluginWorkspaceAccess, WSEditor editor) {
        this.pluginWorkspaceAccess = pluginWorkspaceAccess;
        this.editor = editor;
    }

    @Override
    public boolean editorAboutToBeSavedVeto (int operationType) {
        return false;
    }
}
```
if(! saving &&
    editor.getEditorLocation().toString().contains("Untitled")) {
    File chosenDir = pluginWorkspaceAccess.chooseDirectory();
    if(chosenDir != null) {
        **final** File chosenFile =
        **new** File(chosenDir, UUID.randomUUID().toString() + ".dita");
        SwingUtilities.invokeLater(**new** Runnable() {
            @Override
            public void run() {
                **try** {
                    saving = true;
                    editor.saveAs(**new** URL(chosenFile.toURI().toASCIIString()));
                } **catch** (MalformedURLException e) {
                    e.printStackTrace();
                } **finally** {
                    saving = false;
                }
            }
        });
    } //Reject the original save request.
    return false;
} return true;
}

@Override
public void applicationStarted (**final** StandalonePluginWorkspace pluginWorkspaceAccess) {
    pluginWorkspaceAccess.addEditorChangeListener(**new** WSEditorChangeListener() {
        @Override
        public void editorOpened(URL editorLocation) {
            **final** WSEditor editor = pluginWorkspaceAccess.getEditorAccess(editorLocation, PluginWorkspace.MAIN_EDITING_AREA);
            if(editor != null && editor.getEditorLocation().toString().contains("Untitled")) {
                //Untitled editor
editor.addEditorListener(new CustomEdListener(pluginWorkspaceAccess, editor));
}
}
,
PluginWorkspace.MAIN_EDITING_AREA);
................................................

Split Paragraph on Enter (Instead of Showing Content Completion List)

**Question**

Is it possible to split the paragraph on **Enter** instead of showing the content completion list?

**Answer**

Yes, it is possible by creating your own custom operation.

To obtain this behavior, follow this procedure:

1. Create a custom **Author** mode operation ([on page 2047](#)) that handles the split. You can use the `AuthorDocumentController.split` API to achieve this.
2. Create a JAR library that contains its compiled version.
3. Open the **Preferences** dialog box ([Options > Preferences](#)) ([on page 79](#)), go to **Document Types Association**, and select your framework.
4. Click **Edit** and in the **Document Type** configuration dialog box ([on page 94](#)), go to the **Classpath tab** ([on page 98](#)) and add a reference to the JAR library for your custom operation.
5. Go to the **Author** tab, then go to the **Actions** subtab.
6. Click the + **New** button and use the **Action** dialog box ([on page 102](#)) to create your own paragraph split action.
7. Make sure you assign **Enter** as the **Shortcut Key** and specify your custom operation in the **Operations** section.

**Result:** Now, when you press **Enter**, your Java operation will be invoked to split the paragraph instead of opening the **Content Completion Assistant**.

**Tip:** The **Content Completion Assistant** can still be invoked by using the **Ctrl+Space** keyboard shortcut.
Use Custom Rendering Styles for Entity References, Comments, or PIs

Problem

Is there a way to display entity references in the Author mode without the distinct gray background and tag markers?

Solution

There is a built-in CSS stylesheet in the Oxygen XML Author libraries that is used when styling content in the Author mode, no matter what CSS you use. This CSS has the following content:

```css
@namespace oxy url('http://www.oxygenxml.com/extensions/author');
@namespace xi "http://www.w3.org/2001/XInclude";
@namespace xlink "http://www.w3.org/1999/xlink";

}

svg|svg|svg{

display:none !important;
white-space:normal;
}

mml|math{

display:inline !important;
white-space: trim-when-ws-only;
}
In the CSS used for rendering the XML in Author mode, do the following:

1. Import the special Author mode namespace.
2. Use a special selector to customize the entity node.

Example:

```css
@namespace oxy url('http://www.oxygenxml.com/extensions/author');
oxy|entity {
    background-color: inherit !important;
    margin: 0px !important;
    padding: 0px !important;
    -oxy-display-tags:none;
}
```

You can overwrite styles in the predefined CSS to customize style comments, processing instructions, and CData sections. You can also customize the way xi:include elements are rendered.
Oxygen XML Author offers various default add-ons that can be installed to provide additional functionality to Oxygen XML Author. Some additional community submissions are also available, although community add-ons are not officially supported or endorsed. For more information see the Oxygen XML SDK Add-on Repositories web page.

This chapter contains information about the default add-ons that are available to install directly from Oxygen XML Author.

To install one of the default add-ons, follow this procedure:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field or select it from the drop-down menu.
3. Select the add-on you want to install and click Next.
4. Restart the application.

**Batch Converter Add-on**

Oxygen XML Author offers an add-on that contributes actions in the Tools menu and contextual menu to enable batch conversion between various formats. You can convert between the following formats:

- HTML to XHTML
- HTML to DITA
- Markdown to XHTML
- Markdown to DITA
- XML to JSON
- JSON to XML
- HTML to DocBook4
- HTML to DocBook5
- Markdown to DocBook4
- Markdown to DocBook5
- Excel to DITA

To install it the add-on, follow these instructions:
1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field or select it from the drop-down menu.
3. Select the Batch Converter add-on and click Next.
4. Select the I accept all terms of the end user license agreement option and click Finish.
5. Restart the application.

**Result:** A Batch Converter submenu will now be available in the Tools menu and in the contextual menu of the Project view. This submenu will contain a list of the various types of available conversions. Selecting one of the types of conversions will open a dialog box where you can configure options for the conversion.

For more information, see the details for this Batch Converter add-on in GitHub.

---

**CGM Image Support Add-on**

Oxygen XML Author offers two add-ons that provide experimental support for CGM 1.0 images. To allow the rendering of CGM images in Author mode, follow this procedure:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field or select it from the drop-down menu.
3. Select the Oxygen CGM support add-on and click Next.
4. Select the I accept all terms of the end user license agreement option and click Finish.
5. Restart the application.

**Result:** You should be able to see CGM images in Author mode.

For more information, see the details about this CGM Support add-on in GitHub.

---

**Alternate Method Using the ISOView Active X Component**

⚠️ **Restriction:** This support will only work on 32 bit versions of Oxygen XML Author.

If you already have the ISOView Active X component for Internet Explorer installed, you may want to use it to render CGM images instead of the components provided in the plugin described above.

To use your existing ISOView Active X component to render CCM images, follow these steps:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field or select it from the drop-down menu.
3. Select CGM Form control (Active X-based) plugin and click Next.
4. Select the **I accept all terms of the end user license agreement** option and click **Finish**.
5. Restart the application.
6. The **CGM Form Control** plugin automatically renders CGM files in DITA, DocBook, and XHTML, so for those **frameworks**, this step is not necessary. For other **frameworks (on page 2794)**, modify your CSS according to your particular **framework**.

If you have an XML:

```xml
<image href="MyCGMFile.cgm"/>
```

You need a CSS rule like this:

```css
image[href$=".cgm"],
image[href$=".CGM"]{
  content: oxy_editor(
    saHeavyFormControlEvents, "com.oxygenxml.activex.fctrl.ActiveXFormControl",
    href, oxy_url(oxy_base-uri() , attr(href)))
}
```

**Result:** After performing these steps, you should now be able to see CGM images in **Author** mode.

### Content Fusion Connector Add-on

Oxygen XML Author includes an **Oxygen Content Fusion Connector** add-on that comes bundled and pre-installed. **Oxygen Content Fusion** is a flexible, intuitive collaboration platform designed to adapt to virtually any type of workflow that a collaborative team may use for their documentation review process. The add-on provides access to the **Show Content Fusion Tasks Manager** toolbar button. Clicking this button will open the **Content Fusion Tasks Manager** view where you can create tasks, manage them, attach documents, and upload them to the **Content Fusion** server. You can also go to **Window > Show View > Content Fusion Tasks Manager** to open the view. If the button is not displayed on the toolbar or the view is not listed in the **Show View** menu, see **Re-installing the Content Fusion Connector Add-on**.

To fully take advantage of all of the benefits and features, your organization will need an **Oxygen Content Fusion Enterprise Server**. This solution allows you to host, setup, and configure your own server and control your data. With this model, you are also able to upload custom frameworks and plugins, and to configure various settings. It is possible to evaluate **Content Fusion** free of charge, for a limited time. For more information, see the **Oxygen Content Fusion** website.
For more information about using Content Fusion in Oxygen XML Author, see the Oxygen Content Fusion User Guide.

DITA Prolog Updater Add-on

Oxygen XML Author offers an add-on that contributes a preferences page (Options > Preferences > Plugins > DITA Prolog Updater) that includes various options for updating the prolog section of a DITA topic or map.

Installing the Add-on

To install it the add-on, follow these instructions:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field or select it from the drop-down menu.
3. Select the DITA Prolog Updater add-on and click Next.
4. Select the I accept all terms of the end user license agreement option and click Finish.
5. Restart the application.

Result: The DITA Prolog Updater preferences page will now be available in Options > Preferences > Plugins.

DITA Prolog Updater Preferences Page

The contributed preferences page includes the following general options:

Author

Specifies the name of the author. By default, it is the system user name.

Date format

Specifies the format of the date that will be added in the prolog section. If the date format entered is invalid, the yyy/MM/dd format is used by default.

These options are followed by the following options that can be set for DITA topics or maps (or both):

Enable automatic prolog update on save

When this option is selected, the prolog is updated anytime the document is saved.

Set creator name

When this option is selected, the author is set as the document’s creator in the prolog when the document is saved. This option is only applicable for new documents.
Set created date

When this option is selected, a created date is added to the prolog when the document is saved. This option is only applicable for new documents.

Update contributor names

When this option is selected, the author is set as a contributor in the prolog when the document is saved. This option is only applicable for already existing documents.

Update revised dates

When this option is selected, a revised date is added to the prolog when the document is saved. This option is only applicable for already existing documents.

For more information, see the details for this DITA Prolog Updater add-on in GitHub.

DITA OT 3.x Publishing Engine Add-on

Oxygen XML Author offers an add-on that contributes an option in the DITA preferences page (Options > Preferences > DITA) to provide the ability to publish DITA content using DITA-OT 3.x, by default.

To install it the add-on, follow these instructions:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field or select it from the drop-down menu.
3. Select the DITA OT 3.x Publishing Engine add-on and click Next.
4. Select the I accept all terms of the end user license agreement option and click Finish.
5. Restart the application.

Result: The DITA preferences page will now include a radio button where you can select DITA-OT 3.x as the default publishing engine.

For more information, see the details for this DITA OT 3.x Publishing Engine add-on in GitHub.

DITA Translation Package Builder Add-on

Oxygen XML Author offers an add-on that contributes contextual menu actions that help you build a translation package for DITA files that can be sent to translators. You can also extract the changed files back into your project once you receive the package back from the translators.

To install it the add-on, follow these instructions:
1. Go to Help > Install new add-ons to open an add-on selection dialog box.

2. Enter or paste `https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml` in the Show add-ons from field or select it from the drop-down menu.

3. Select the Translation Package Builder add-on and click Next.

4. Select the I accept all terms of the end user license agreement option and click Finish.

5. Restart the application.

**Result:** A Translation Package Builder submenu will now be available in the contextual menu of the DITA Maps Manager. This submenu includes actions to generate a package of modified files that can be sent to translators, as well as an action to extract translated files back into your DITA project.

For more information, see the details for this Translation Package Builder add-on in GitHub.

**DocBook Checker Add-on**

Oxygen XML Author offers an add-on that allows you to validate DocBook files. It reports issues such as broken internal and external links, problems with images, or profiling conditions that conflict with profiling preferences.

To install the add-on, follow these instructions:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.

2. Enter or paste `https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml` in the Show add-ons from field or select it from the drop-down menu.

3. Select the DocBook Checker add-on and click Next.

4. Select the I accept all terms of the end user license agreement option and click Finish.

5. Restart the application.

**Result:** A Check DocBook for Completeness action will now be available on the toolbar and in the contextual menu. This action opens a dialog box that offers various validation options for running a completeness check on the current DocBook document.

For more information, see the details for this DocBook Checker add-on in GitHub.

**Embed Images Add-on**

Oxygen XML Author offers an add-on that contributes a contextual menu action to embed all images referenced in a DITA, DocBook, or XHTML document as base 64 encoded. This is helpful if you want to transfer a document with image references over media designed to deal with textual data (for example, uploading as a blog post or sending via email) and you want to ensure the data remains intact.
To install the add-on, follow these instructions:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste `https://raw.githubusercontent.com/oxygenxml/oxygen-embed-images/master/addon.xml` in the Show add-ons from field or select it from the drop-down menu.
3. Select the Oxygen Embed Images add-on and click Next.
4. Select the I accept all terms of the end user license agreement option and click Finish.
5. Restart the application.

**Result:** An Embed all referenced images as Base64-encoded action will now be available in the contextual menu when editing DITA, DocBook, or XHTML documents in Author mode.

---

**Excel XLSX Libraries Add-on**

To import spreadsheet data from Excel 2007 or newer (.xlsx), Oxygen XML Author needs additional libraries from the Apache POI project. Oxygen XML Author offers an add-on that provides this support.

To add this support, follow this procedure:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste `https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml` in the Show add-ons from field or select it from the drop-down menu.
3. Select Excel XLSX libraries add-on and click Next.
4. Select the I accept all terms of the end user license agreement option and click Finish.
5. Restart the application.

**Result:** You can now use the Import wizard (on page 1882) to import data from Excel 2007 or newer.

---

**Related Information:**

- Exporting XML Content to Excel (on page 834)

---

**Git Support Add-on**

Oxygen XML Author offers an add-on that contributes a built-in Git client directly into Oxygen XML Author. Once this add-on is installed, a Git Staging view is available that includes various actions that perform common Git commands, such as push, pull, change branch, commit, and more. It also includes a built-in tool for comparing and merging changes.
To install it the add-on, follow these instructions:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste `https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml` in the Show add-ons from field or select it from the drop-down menu.
3. Select the Git Support (Experimental) add-on and click Next.
4. Select the I accept all terms of the end user license agreement option and click Finish.
5. Restart the application.

**Result:** A Git Staging view will now be available in Oxygen XML Author. If it is not visible, go to Window > Show View and select Git Staging. This view acts as a basic Git client integrated directly into Oxygen XML Author and it provides support for committing changes to a Git repository, comparing and merging changes, and other Git commands.

For more information, see the details for this Git Support add-on in GitHub.

**ICU4J Library Add-on**

Oxygen XML Author offers an add-on that provides the entire ICU4 JAR library used for sorting and collations with XSLT processors. The Saxon 9 XSLT processor has an xsl:sort element that can be used to sort elements based on their text content. If the XML elements contain text in exotic languages, Saxon needs a more powerful sort algorithm and this JAR library adds this capability.

To install it the add-on, follow these instructions:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste `https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml` in the Show add-ons from field or select it from the drop-down menu.
3. Select the Contribute ICU4J Library add-on and click Next.
4. Select the I accept all terms of the end user license agreement option and click Finish.
5. Restart the application.

**Result:** The ICU4J library is now contributed to the Oxygen installation directory.

For more information, see the details for this Contribute ICU4J Library add-on in GitHub.

**PDF Image Rendering Add-on**

Starting with Oxygen XML Author version 20.0, PDF images are rendered in Author mode and PDF output. For previous versions, they are not rendered by default. However, Oxygen XML Author does provide an add-on that contributes the Apache PDFBox library to offer support for rendering of PDF images.
Installing the PDF Image Rendering Add-on

Oxygen XML Author offers an add-on that contributes the Apache PDFBox library for you. To install this add-on, follow these steps:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field or select it from the drop-down menu.
3. Select the PDF Image Rendering add-on and click Next.
4. Select the I accept all terms of the end-user license agreement option and click Finish.
5. Restart the application.

Result: The Apache PDFBox libraries are now contributed to the Oxygen installation directory and you should be able to see PDF images in Author mode.

For more information, see the details about this PDF Image Rendering add-on in GitHub.

Saxon XSLT and XQuery Transformer Add-on

Oxygen XML Author offers an add-on that installs an external Saxon XSLT and XQuery processor and allows you to validate and transform XSLT and XQuery documents with that external processor. The default add-on update site includes versions for Saxon 9.6, 9.7, 9.8, and 9.9.

To install it the add-on, follow these instructions:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field or select it from the drop-down menu.
3. Select one of the versions of the Saxon XSLT and XQuery Transformer add-on (9.6, 9.7, 9.8, or 9.9) and click Next.
4. Select the I accept all terms of the end user license agreement option and click Finish.
5. Restart the application.

Result: When you configure the validation or transformation scenario, you will now have the option to choose the particular Saxon transformer.

⚠️ Restriction: Debugging XSLT/XQuery transformations based on this engine is NOT supported.
Oxygen XML Author includes a variety of helpful tools to help you accomplish XML-related tasks. This section presents many of those tools. These tools are available in the Tools menu and some of them can be launched through keyboard shortcuts or command-line scripts.

Refactoring XML Documents

In the life cycle of XML documents there are instances when the XML structure needs to be changed to accommodate various needs. For example, when an associated schema is updated, an attribute may have been removed, or a new element added to the structure.

These types of situations cannot be resolved with a traditional Find/Replace tool, even if the tool accepts regular expressions. The problem becomes even more complicated if an XML document is computed or referenced from multiple modules, since multiple resources need to be changed.

To assist you with these types of refactoring tasks, Oxygen XML Author includes a specialized XML Refactoring tool that helps you manage the structure of your XML documents.

XML Refactoring Tool

The XML Refactoring tool is presented in the form of an easy to use wizard that is designed to reduce the time and effort required to perform various structure management tasks. For example, you can insert, delete, or rename an attribute in all instances of a particular element that is found in all documents within your project.

To access the tool, select the XML Refactoring action from one of the following locations:

- The Tools menu.
- The Refactoring submenu from the contextual menu in the Project view (on page 320).
- The Refactoring submenu from the contextual menu in the DITA Maps Manager view (on page 2503).

Note: The built-in refactoring operations are also available from the Refactoring submenu in the contextual menu of Author or Text mode. This is useful because by selecting the operations from the contextual menu, Oxygen XML Author considers the editing context to skip directly to the wizard page of the appropriate operation and to help you by preconfiguring some of the parameter values.
For your convenience, the last 5 operations that were finished (on page 1083) or previewed (on page 1083) also appear in the Refactoring submenu of the contextual menu in the Project view and the DITA Maps Manager.

**XML Refactoring Wizard**

The XML Refactoring tool includes the following wizard pages:

**Refactoring operations**

The first wizard page presents the available operations, grouped by category. To search for an operation, you can use the filter text box at the top of the page.

Figure 502. XML Refactoring Wizard

![XML Refactoring Wizard](image)

**Configure Operation Parameters**

The next wizard page allows you to specify the parameters for the refactoring operation. The parameters are specific to the type of refactoring operation that is being performed. For example, to delete an attribute you need to specify the parent element and the qualified name of the attribute to be removed.
Figure 503. XML Refactoring 2nd Wizard Page (Delete Attribute Operation)

Scope and Filters

The last wizard page allows you to select the set of files that represent the input of the operation.

Figure 504. XML Refactoring - Scope and Filters Wizard Page

Scope section

In the **Scope** section, you can select from predefined resource sets (such as the current file, your whole project, the current DITA map (on page 2793) hierarchy for DITA projects, etc.) or you can define your own set of resources by creating a **working set (on page 2800)**.

Filters
The Filters section includes the following options:

- **Include files** - Allows you to filter the selected resources by using a file pattern. For example, to restrict the operation to only analyze build files you could use `build*.xml` for the file pattern.
- **Restrict only to known XML file types** - When selected, only resources with a known XML file type will be affected by the operation.
- **Look inside archives** - When selected, the resources inside archives will also be affected.

**Preview**

You can use the Preview button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.

**Finish**

After clicking the Finish button, the operation will be processed and Oxygen XML Author provides no automatic means for reverting the operations. Any Undo action will only revert changes on the current document.

⚠️ **Troubleshooting:** If an operation fails, a notification will be displayed in the Results panel with some information about the error. For example, if the operation was invoked on a read-only resource, the error will indicate that a read-only file cannot be converted.

ℹ️ **Tip:** If an operation takes longer than expected you can use the Stop button in the progress bar to cancel the operation.

⚠️ **Restriction:** XML refactoring operations cannot preserve CDATA sections. If your document contains XML CDATA sections, the refactoring operations will convert them to plain text nodes.

**Built-in Refactoring Operations**

The XML Refactoring tool includes a variety of built-in operations that can be used for common refactoring tasks. They are grouped by category in the Refactoring operations wizard page. You can also access the operations from the Refactoring submenu in the contextual menu of Author or Text mode. The operations are also grouped by category in this submenu. When selecting the operations from the contextual menu, Oxygen XML Author considers the editing context to get the names and namespaces of the current element or attribute, and uses this information to preconfigure some of the parameter values for the selected refactoring operation.
Tip: Each operation includes a link in the lower part of the wizard that opens the XML / XSLT-FO-XQuery / XPath preferences page where you can configure XPath options and declare namespace prefixes.

The following built-in operations are available:

**Refactoring Operations for Attributes**

**Add/Change attribute**

Use this operation to change the value of an attribute or insert a new one. This operation allows you to specify the following parameters:

**Parent element section**

*Element*

The parent element of the attribute to be changed, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

**Attribute section**

*Local name*

The local name of the affected attribute.

*Namespace*

The namespace of the affected attribute.

*Value*

The value for the affected attribute.

**Options section**

You can choose between one of the following options for the **Operation mode**:

*Add the attribute in the parent elements where it is missing*

Adds the attribute to all instances of the specified parent element.

*Change the value in the parent elements where the attribute already exists*

Replacing the value of the already existing attribute in all instance of the specified parent element.

*Both*
Adds the attributes to the instances where it is missing and replaces the value in instances where the attribute already exists.

**Convert attribute to element**

Use this operation to convert a specified attribute to an element. This operation allows you to specify the following parameters:

**Parent element section**

**Element**

The parent element of the attribute to be converted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

**Attribute section**

**Local name**

The local name of the affected attribute.

**Namespace**

The namespace of the affected attribute.

**New element section**

**Local name**

The local name of the new element.

**Namespace**

The namespace of the new element.

**Delete attribute**

Use this operation to remove one or more attributes. This operation requires you to specify the following parameters:

**Element**

The parent element of the attribute to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

**Attribute**

The name of the attribute to be deleted.

**Rename attribute**
Use this operation to rename an attribute. This operation requires you to specify the following parameters:

**Element**

The parent element of the attribute to be renamed, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

**Attribute**

The name of the attribute to be renamed.

**New local name**

The new local name of the attribute.

**Replace in attribute value**

Use this operation to search for a text fragment inside an attribute value and change the fragment to a new value. This operation allows you to specify the following parameters:

**Target attribute section**

**Element**

The parent element of the attribute to be modified, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

**Attribute**

The name of the attribute to be modified.

**Find / Replace section**

**Find**

The text fragments to find. You can use Perl-like regular expressions.

**Replace with**

The text fragment to replace the target with. This parameter can bind regular expression capturing groups ($1, $2, etc.) from the find pattern.

**Refactoring Operations for Comments**

**Delete comments**
Use this operation to delete comments from one or more elements. This operation requires you specify the following parameter:

**Element**

The target element (or elements) for which comments will be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

**Note:** Comments that are outside the root element will not be deleted because the serializer preserves the content before and after the root.

### Refactoring Operations for DITA

**Change topic ID to file name**

Use this operation to change the ID of a topic to be the same as its file name.

**Convert CALS tables to simple tables**

Use this operation to convert DITA CALS tables to simple tables.

**Convert conrefs to conkeyrefs**

Use this operation to convert `conref` attributes to `conkeyref` attributes. For more information and instructions for using this operation, see [Converting Conrefs to Conkeyrefs](on page 2645).

**Convert simple tables to CALS tables**

Use this operation to convert DITA simple tables to CALS tables.

**Convert Nested Topics to New Topics** (Available from the contextual menu of editable maps/nodes in the DITA Maps Manager (on page 2503))

Use this operation on topics that contain nested `<topic>` elements to convert each nested topic to a new topic. Also, the new topics are added in the DITA Maps Manager as the first child topics of the original topic.

**Convert Sections to New Topics** (Available from the contextual menu of editable maps/nodes in the DITA Maps Manager (on page 2503))

Use this operation on topics that contain multiple sections to convert each section to a new topic. Also, the new topics are added in the DITA Maps Manager as the first child topics of the original topic.

**Convert to Concept**

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept). For more information, see [Converting DITA Topics to Another Type](on page 2571).
Convert to General Task
Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). For more information, see Converting DITA Topics to Another Type (on page 2571).

Convert to Reference
Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference). For more information, see Converting DITA Topics to Another Type (on page 2571).

Convert to Task
Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task). For more information, see Converting DITA Topics to Another Type (on page 2571).

Convert to Topic
Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic). For more information, see Converting DITA Topics to Another Type (on page 2571).

Convert to Troubleshooting
Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting). For more information, see Converting DITA Topics to Another Type (on page 2571).

Rename Key
Use this operation to rename a key. It also updates all references to it. Note that it does not work on DITA 1.3 key scopes.

All of these DITA refactoring actions allow you to choose a scope for the operation and some filters:

Scope
Select from a variety of options to define the scope for which resources will be affected by the operation. For example, you can choose to affect all resources in the Project, All opened files, Current DITA map hierarchy, or just the Current file.

Filters section

Include files
Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as * or?).

Restrict to known XML file types only
Excludes non-XML file types from the operation.

**Look inside archives**

If this option is selected, the scope of the operation will include files inside archives.

### Refactoring Operations for *Elements*

**Delete element**

Use this operation to delete elements. This operation requires you to specify the following parameter:

**Element**

The target element to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

**Delete element content**

Use this operation to delete the content of elements. This operation requires you to specify the following parameter:

**Element**

The target element whose content is to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

**Insert element**

Use this operation to insert new elements. This operation allows you to specify the following parameters:

**Element section**

**Local name**

The local name of the element to be inserted.

**Namespace**

The namespace of the element to be inserted.

**Location section**

**XPath**
An XPath expression that identifies an existing element to which the new element is relative, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

**Position**

The position where the new element will be inserted, in relation to the specified existing element. The possible selections in the drop-down menu are: After, Before, First child, or Last child.

**Rename element**

Use this operation to rename elements. This operation requires you to specify the following parameters:

**Target elements (XPath)**

The target elements to be renamed, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

**New local name**

The new local name of the element.

**Unwrap element**

Use this operation to remove the surrounding tags of elements, while keeping the content unchanged. This operation requires you to specify the following parameter:

**Target elements (XPath)**

The target elements whose surrounding tags will be removed, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

**Wrap element**

Use this operation to surround elements with element tags. This operation allows you to specify the following parameters:

**Target elements (XPath)**

The target elements to be surrounded with tags, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

**Wrapper element section**
Local name
The local name of the Wrapper element.

Namespace
The namespace of the Wrapper element.

Wrap element content
Use this operation to surround the content of elements with element tags. This operation allows you to specify the following parameters:

Target elements (XPath)
The target elements whose content will be surrounded with tags, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

Wrapper element section

Local name
The local name of the Wrapper element that will surround the content of the target.

Namespace
The namespace of the Wrapper element that will surround the content of the target.

Refactoring Operations for Fragments

Insert XML fragment
Use this operation to insert an XML fragment. This operation allows you to specify the following:

XML Fragment
The XML fragment to be inserted.

Location section

XPath
An XPath expression that identifies an existing element to which the inserted fragment is relative, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

Position
The position where the fragment will be inserted, in relation to the specified existing element. The possible selections in the drop-down menu are: After, Before, First child, or Last child.

Replace element content with XML fragment

Use this operation to replace the content of elements with an XML fragment. This operation allows you to specify the following parameters:

Target elements (XPath)

The target elements whose content will be replaced, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

XML Fragment

The XML fragment with which to replace the content of the target element.

Replace element with XML fragment

Use this operation to replace elements with an XML fragment. This operation allows you to specify the following parameters:

Target elements (XPath)

The target elements to be replaced, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

XML Fragment

The XML fragment with which to replace the target element.

Refactoring Operations for JATSKit

Add BITS DOCTYPE - NLM/NCBI Book Interchange 2.0

Use this operation to add an NLM 'BITS' 2.0 DOCTYPE declaration.

Add Blue DOCTYPE - NISO JATS Publishing 1.1

Use this operation to add a JATS 'Blue' 1.1 DOCTYPE declaration.

Normalize IDs

Use this operation to normalize assigned IDs and assigned IDs to elements that are missing them.

All of these JATSKit refactoring actions allow you to choose a scope for the operation and some filters:
Scope

Select from a variety of options to define the scope for which resources will be affected by the operation. For example, you can choose to affect all resources in the Project, All opened files, or just the Current file.

Filters section

Include files

Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as * or?).

Restrict to known XML file types only

Excludes non-XML file types from the operation.

Look inside archives

If this option is selected, the scope of the operation will include files inside archives.

Refactoring Operations for Publishing Template

These operations are for those who use Oxygen Publishing Templates for WebHelp Responsive output customization.

Migrate HTML Page Layout Files to v21

Use this operation to convert custom HTML page layout files (on page 1525) that are included in a custom Publishing Template that was created in Oxygen XML Author version 20.0 or 20.1 so that they will be compatible with Oxygen XML Author version 21.0.

Update HTML Pages

⚠️ Attention: This operation is only used by Oxygen XML Author and should not be used manually.

Additional Notes

ℹ️ Note: There are some operations that allow <ANY> for the local name and namespace parameters. This value can be used to select an element or attribute regardless of its local name or namespace. Also, the <NO_NAMESPACE> value can be used to select nodes that do not belong to a namespace.

ℹ️ Note: Some operations have parameters that accept XPath expressions to match elements or attributes. In these XPath expressions you can only use the prefixes declared in the Options >
Preferences > XML > XSLT-FO-XQUERY > XPath (on page 203) page. This preferences page can be easily opened by clicking the link in the note (Each prefix used in an XPath expression must be declared in the Default prefix-namespace mappings section) at the bottom of the Configure Operation Parameters wizard page.

Storing and Sharing Refactoring Operations

Oxygen XML Author scans the following locations when looking for XML Refactoring operations to provide flexibility:

- A refactoring folder, created inside a directory that is associated to a framework you are customizing. To associate the parent directory to the framework, you need to add it in the Classpath tab of the Document type configuration dialog box (on page 98).
- A folder that you specify in the Load additional refactoring operations from text box (on page 214) in the XML Refactoring preferences page (on page 214).

Note: If you share a project with your team, you can also share the custom operation by doing the following:
1. Save the custom operation in a folder that is part of your project.
2. Switch the XML Refactoring option page to project level (on page 2798):
   a. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to XML > XML Refactoring (on page 214).
   b. Select Project Options (on page 2798) at the bottom of the dialog box.
3. In the Load additional refactoring operations from text box (on page 214), use the ${pdj} editor variable (on page 272) so that the folder path is declared relative to the project.
- A folder specified by the XML Refactoring Operations Plugin Extension (on page 2172).
- The refactoring folder from the Oxygen XML Author installation directory ([OXYGEN_INSTALL_DIR]/refactoring/).

Sharing Refactoring Operations

The purpose of Oxygen XML Author scanning multiple locations for the XML Refactoring operations is to provide more flexibility for developers who want to share the refactoring operations with the other team members. Depending on your particular use case, you can attach the refactoring operations to other resources, such as framework (on page 2794) or projects.

After storing operations, you can share them with other users by sharing the resources.

Localizing XML Refactoring Operations

Oxygen XML Author includes localization support for the XML refactoring operations.
The translation keys for the built-in refactoring operations are located in \[OXYGEN_INSTALL_DIR]/refactoring/i18n/translation.xml.

Generate Sample JSON Files

Oxygen XML Author includes a tool for generating sample JSON files. To generate sample JSON files from a JSON Schema, select Generate Sample JSON Files from the menu. The action opens a dialog box where you can configure a variety of options for generating the files.

Figure 505. Generate Sample JSON Files Dialog Box

The Generate Sample JSON Files dialog box includes the following fields and options:

**Schema URL**

The URL of the Schema location. You can specify the path by using the text field, the history drop-down menu, or the browsing actions in the Browse drop-down list.

**Output folder**

Path to the folder where the generated JSON instances will be saved.

**File name**

The name of the instance(s) that will be generated. By default, instance.json is used.

**Number of instances**

The desired number of JSON instances to be generated. When more than one instance is generated, the index of the instance will be added to its file name.

**Property Value**

You can specify the way the values of the properties are generated. The following options are available:
• *None* - Assigns empty values for properties (a template file will be generated). This is the default value.
• *Default* - Assigns the name of the property as the value (for strings) or assigns the specified minimum value (for numbers).
• *Random* - Assigns random values according to schema restrictions.

**Generate optional properties**

If selected, the JSON instance will be generated with optional properties that are defined in the JSON schema. Otherwise, only the required properties will be generated.

**Generate additional content**

If selected, the JSON instance will be generated with additional properties that are defined in the JSON schema as `additionalProperties` and additional items that are defined as `additionalItems` (in the case of an Array).

**Choice strategy**

You can specify the way an instance will be generated from a schema that contains a `CombinedSchema` (with either `oneOf` or `anyOf`). The following options are available:

• *First* - The first defined schema in `oneOf` or `anyOf` will be used.
• *Random* - A random schema defined in `oneOf` or `anyOf` will be used.

**Recursion level**

This option controls the maximum allowed depth (must be a number), in case the selected schema contains recursive calls of `$ref` schemas referencing one another. By default, it is set to 1, meaning that the generation for the recursive calls will stop after the first iteration.

**Open first instance in editor**

If selected, the first generated instance is opened in the editor.

You can click **OK** at any point to generate the sample JSON files.

**Format and Indent (Pretty-Print) Multiple Files**

Oxygen XML Author provides support for formatting and indenting (*pretty-print* (on page 2798)) multiple files at once. This action is available for any document in XML format, as well as for CSS, JavaScript, and JSON documents.
To format and indent multiple files, use the **Format and Indent Files** action that is available in the contextual menu of the **Project view (on page 320)** or from the **Tools** menu. This opens the **Format and Indent Files** dialog box that allows you to configure options for the action.

**Figure 506. Format and Indent Files Dialog Box**

The **Scope** section allows you choose from the following scopes:

- **All opened files** - The *pretty-print (on page 2798)* is performed in all opened files.
- **Directory of the current file** - All the files in the folder of the current edited file.
- **Project files** - All files from the current project.
- **Selected project files** - The selected files from the current project.
- **Specified path** - The *pretty-print (on page 2798)* is performed in the files located at a specified path.

The **Options** section includes the following options:

- **File filter** - Allow you to filter the files from the selected scope.
- **Recurse subdirectories** - When selected, the *pretty-print (on page 2798)* is performed recursively for the specified scope. The one exception is that this option is ignored if the scope is set to **All opened files**.
- **Include hidden files** - When selected, the *pretty-print (on page 2798)* is also performed in the hidden files.
- **Make backup files with extension** - When selected, Oxygen XML Author makes backup files of the modified files. The default extension is `.bak`, but you can change the extension as you prefer.
Canonicalizing Files

You can select the canonicalization (on page 2792) algorithm to be used for a document from the dialog box that is displayed by using the Canonicalize action that is available from the Source submenu when invoking the contextual menu in Text mode or from the Tools menu.

Figure 507. Canonicalization Settings Dialog Box

The Canonicalize dialog box allows you to set the following options:

- **Input URL** - Available if the Canonicalize action was selected from the Tools menu. It allows you to specify the location of the input file.

- **Exclusive** - If selected, the exclusive (uncommented) canonicalization (on page 2792) method is used.

  **Note:** Exclusive Canonicalization just copies the namespaces you are actually using (the ones that are a part of the XML syntax). It does not look into attribute values or element content, so the namespace declarations required to process these are not copied. This is useful if you have a signed XML document that you want to insert into other XML documents (or you need self-signed structures that support placement within various XML contexts), as it will ensure the signature is verified correctly each time.

- **Exclusive with comments** - If selected, the exclusive with comments canonicalization (on page 2792) method is used.

- **Inclusive** - If selected, the inclusive (uncommented) canonicalization (on page 2792) method is used.
Note: Inclusive Canonicalization copies all the declarations, even if they are defined outside of the scope of the signature, and all the declarations you might use will be unambiguously specified. Inclusive Canonicalization is useful when it is less likely that the signed data will be inserted in other XML document and it is the safer method from the security standpoint because it requires no knowledge of the data that are to be secured to safely sign them. A problem may occur if the signed document is moved into another XML document that has other declarations because the Inclusive Canonicalization will copy them and the signature will be invalid.

• Inclusive with comments - If selected, the inclusive with comments canonicalization method is used.
• XPath - The XPath expression provides the fragments of the XML document to be signed.
• Output - Available if the Canonicalize action was selected from the Tools menu. It allows you to specify the output file path where the signed XML document will be saved.
• Open in editor - If selected, the output file will be opened in the editor.

Related Information:

- Digital Signatures Overview (on page 1095)

Signing Files

You can select the type of signature to be used for documents from a signature settings dialog box. To open this dialog box, select the Sign action from the Source submenu when invoking the contextual menu in Text mode or from the Tools menu.

Figure 508. Signature Settings Dialog Box
The following options are available:

**Note:** If Oxygen XML Author could not find a valid certificate, a link is provided at the top of the dialog box that opens the XML Signing Certificates preferences page (on page 213) where you can configure a valid certificate.

- **Input** - Available if the **Sign** action was selected from the **Tools** menu. Specifies the location of the input URL.
- **Transformation Options** - See the Digital Signature Overview (on page 1095) section for more information about these options.
  - **None** - If selected, no canonicalization (on page 2792) algorithm is used.
  - **Exclusive** - If selected, the exclusive (uncommented) canonicalization (on page 2792) method is used.

**Note:** Exclusive Canonicalization just copies the namespaces you are actually using (the ones that are a part of the XML syntax). It does not look into attribute values or element content, so the namespace declarations required to process these are not copied. This is useful if you have a signed XML document that you want to insert into other XML documents.
(or you need self-signed structures that support placement within various XML contexts), as it will ensure the signature is verified correctly each time.

- **Exclusive with comments** - If selected, the exclusive with comments canonicalization (on page 2792) method is used.
- **Inclusive** - If selected, the inclusive (uncommented) canonicalization (on page 2792) method is used.

**Note:** Inclusive Canonicalization copies all the declarations, even if they are defined outside of the scope of the signature, and all the declarations you might use will be unambiguously specified. Inclusive Canonicalization is useful when it is less likely that the signed data will be inserted in other XML document and it is the safer method from the security standpoint because it requires no knowledge of the data that are to be secured to safely sign them. A problem may occur if the signed document is moved into another XML document that has other declarations because the Inclusive Canonicalization will copy them and the signature will be invalid.

- **Inclusive with comments** - If selected, the inclusive with comments canonicalization (on page 2792) method is used.

- **XPath** - The XPath expression provides the fragments of the XML document to be signed.
- **ID** - Provides ID of the XML element to be signed.
- **Envelope** - If selected, the enveloped signature is used. See the Digital Signature Overview (on page 1095) for more information.
- **Detached** - If selected, the detached signature is used. See the Digital Signature Overview (on page 1095) for more information.
- **Append KeyInfo** - If this option is selected, the ds:KeyInfo element will be added in the signed document.
- **Signature algorithm** - The algorithm used for signing the document. The following options are available: RSA with SHA1, RSA with SHA256, RSA with SHA384, and RSA with SHA512.
- **Output** - Available if the Sign action was selected from the Tools menu. Specifies the path of the output file where the signed XML document will be saved.
- **Open in editor** - If selected, the output file will be opened in Oxygen XML Author.

**Related Information:**

- Digital Signatures Overview (on page 1095)
- Verifying Signature (on page 1102)
- Example of How to Digitally Sign XML Files or Content (on page 1102)
Verifying Signature

You can verify the signature of a file by selecting the **Verify Signature** action from the **Source** submenu when invoking the contextual menu in **Text** mode or from the **Tools** menu. The **Verify Signature** dialog box then allows you to specify the location of the file whose signature is verified.

If the signature is valid, a dialog box displays the name of the signer. Otherwise, an error shows details about the problem.

**Related Information:**

- Signing Files *(on page 1100)*
- Example of How to Digitally Sign XML Files or Content *(on page 1102)*

Large File Viewer

XML files tend to become larger and larger mostly because they are frequently used as a format for database export or for porting between multiple database formats. Traditional XML text editors simply cannot handle opening these huge export files, some having sizes exceeding one gigabyte, because all of the file content must be loaded in memory before the user can actually view it.

The best performance of the viewer is obtained for encodings that use a fixed number of bytes per character (such as UTF-16 or ASCII). The performance for UTF-8 is very good for documents that use mostly characters of the European languages. For the same encoding, the rendering performance is higher for files consisting of long lines (up to few thousands characters) and may degrade for short lines. In fact, the maximum size of a file that can be rendered in the Large File Viewer decreases when the total number of the text lines of the file increases. Trying to open a very large file (for example, a file of 4 GB) with a very high number of short lines (100 or 200 characters per line) may produce an *out of memory* error (**OutOfMemoryError**) that would require either increasing the Java heap memory with the **-Xmx** startup parameter or decreasing the total number of lines in the file.

The powerful **Large File Viewer** is available from the **Tools** menu or as a standalone application. You can also right-click a file in your project and choose to open it with the viewer. It uses an efficient structure for indexing the opened document. No information from the file is stored in the main memory, just a list of indexes in the file. In this way the viewer can open very large files, up to 10 gigabytes. If the opened file is XML, the encoding used to display the text is detected from the XML
prolog of the file. For other file types, the encoding is taken from the Oxygen XML Author options. See Encoding for non-XML files (on page 122).

Figure 509. Large File Viewer

Large File Viewer components:

- The menu bar provides menu driven access to all the features and functions that are available in Large File Viewer:

  File > Open
  Opens files in the viewer (also available in the contextual menu).

  File > Exit
  Closes the viewer.

  Edit > Copy
  Copies the selected text to clipboard (also available in the contextual menu).

  Find > Find
  Opens a reduced Find dialog box that provides some basic search options, such as:
  
  ◦ Case sensitive - When selected, operations are case-sensitive.
  ◦ Regular Expression - When selected, allows you to use any regular expression in Perl-like syntax (on page 695).
• **Wrap around** - Continues the find operation from the start/end of the document after reaching the end/, depending on whether the search is in forward or backward direction.

**Help > Help**

Provides access to the User Manual.

- The status bar provides information about the current opened file path, the Unicode representation of the character at cursor position and the line and column in the opened document where the cursor is located.

⚠️ **Attention:** For faster computation the **Large File Viewer** uses a fixed font (plain, monospace font of size 12) to display characters. The font is not configurable from the **Preferences page (on page 79).**

ℹ️ **Tip:** The best performance of the viewer is accomplished for encodings that use a fixed number of bytes per character (such as UTF-16 or ASCII). The performance for UTF-8 is very good for documents that use mostly characters of the European languages. For the same encoding the rendering performance is high for files consisting of short lines (up to a few thousand characters) and may degrade for long lines.

## Hex Viewer

When the Unicode characters that are visible in a text viewer or editor are not enough and you need to see the byte values of each character of a document, you can start the **Hex Viewer** that is available on the **Tools** menu. It has two panels: the characters are rendered in the right panel and the bytes of each character are displayed in the left panel. There is a 1:1 correspondence between the characters and their byte representation: the byte representation of a character is displayed in the same matrix position of the left panel as the character in the matrix of the right panel.

Figure 510. Hex Viewer
To open a file in **Hex Viewer** use the **File > Open** action. Alternatively, you can drag a file and drop it in the **Hex Viewer** panel.

**Standalone SVG Viewer**

Oxygen XML Author includes a simple **SVG Viewer** that allows you to work with SVG images.

To open the viewer, select **SVG Viewer** from the **Tools** menu.

**Figure 511. SVG Viewer**

You can browse for and open any SVG file that has the `.svg` or `.svgz` extension.
If the file is included in the current project, you can open it in the viewer by right-clicking the image file in the Project view (on page 320) and selecting Open with > SVG Viewer.

**Actions Available in the SVG Viewer**

The following actions are available in the SVG Viewer:

**Zoom in**

To zoom in on an image, use any of the following methods:

- Scroll **forward** with the mouse wheel.
- Select **Zoom in** from the contextual menu.
- Use the **Ctrl + I (Command + I on OS X)** keyboard shortcut.

**Zoom out**

To zoom in on an image, use any of the following methods:

- Scroll **backward** with the mouse wheel.
- Use the **Ctrl + O (Command + O on OS X)** keyboard shortcut.
- Select **Zoom out** from the contextual menu.

**Rotate**

To rotate an image, use either of the following methods:

- Use the **Ctrl + Right-Click + Drag (Command + Right-Click + Drag on OS X)** shortcut.
- Select **Rotate** from the contextual menu. This rotates the image exactly 90 degrees clockwise.

**Refresh**

To refresh (or reset) an image, use either of the following methods:

- Use the **Ctrl + T (Command + T on OS X)** keyboard shortcut.
- Select **Refresh** from the contextual menu.

**Move**

To move an image, use either of the following methods:

- Use the **Arrow Keys** on your keyboard.
- Use the **Shift + Left-Click + Drag** shortcut.

**Pan**
To pan an image, **click and drag** the image with your mouse.

Related Information:

- Editing SVG Files *(on page 1117)*

## Compare Files

The **Compare Files** tool can be used to compare files or XML file fragments. The tool provides a mechanism for comparing two files or fragments, as well as the mechanism for a three-way comparison. The utility is available from the **Tools** menu or can be opened as a stand-alone application from the Oxygen XML Author installation folder (`diffFiles.exe`).

![Compare Files Tool](image)

**Figure 512. Compare Files Tool**

### Two-Way Comparisons

The **Compare Files** tool can be used to compare the differences between two files or XML fragments.
To perform a two-way comparison, follow these steps:

1. Open a file in the left panel and the file you want to compare it to in the right panel. You can specify the path by using the text field, the history drop-down, or the browsing actions in the Browse drop-down menu.

   **Step Result:** The selected files are opened in the two side-by-side editors. A text editing mode is used to offer a better view of the differences.

2. To highlight the differences between the two files, click the Perform File Differencing button from the toolbar.

3. You can use the drop-down menu on the left side of the toolbar to change the algorithm (on page 2287) for the operation.

4. You can also use the Diff Options button to access the Files Comparison preferences page where you can choose to ignore certain types of markup and configure various options.

5. If you are comparing XML documents using the XML Fast or XML Accurate algorithms, you can enter an XPath 2.0 expression in the Ignore nodes by XPath text field to ignore certain nodes from the comparison.

The resulting comparison will show you differences between the two files. The line numbers on each side and colored marks on the right-side vertical stripe help you to quickly identify the locations of the differences. Adjacent changes are grouped into blocks of changes. This layout allows you to easily identify and focus on a group of related changes.

**Figure 513. Two-Way Differences**

**Highlighting Colors**

The differences are also highlighted in several colors, depending on the type of change, and dynamic lines connect the compared fragments in the middle section between the two panes. The highlighting colors can be customized in the Files Comparison / Appearance preferences page (on page 232), but the default colors and their shades mean the following:

- **Pink** - Identifies modifications on either side.
- **Gray** - Identifies an addition of a node in the left side (your outgoing changes).
- **Blue** - Identifies an addition of a node in the right side (incoming changes).
- **Lighter Shade** - Identifies blocks of changes that can be merged in their entirety.
- **Darker Shade** - Identifies specific changes within the blocks that can be merged more precisely.

**Comparing Fragments (Copy/Paste)**
To compare XML file fragments, you need to copy and paste the fragments you want to compare into each side, without selecting a file. If a file is already selected, you need to close it using the Close (Ctrl + W (Command + W on OS X)) button, before pasting the fragments. Other notes for pasting fragments:

- As long as the fragment is more than 10 characters, the application will attempt to automatically detect the content type. It can detect the following types: XML, DTD, CSS, JSON, and Markdown (if it starts with #). If one of those content types is detected, the fragments will be displayed with syntax highlights.
- If you save modified fragments, a dialog box opens that allows you to save the changes as a new document.

**Navigate Differences**

To navigate through differences, do one of the following:

- Use the navigation buttons on the toolbar (or in the Compare menu).
- Select a block of differences by clicking its small colored marker in the overview ruler located in the right-most part of the window. At the top of the overview ruler there is a success indicator that turns green where there are no differences, or red if differences are found.
- Click a colored area in between the two text editors.

**Editing Actions**

You can edit the files directly in either editing pane. The two editors are constantly synchronized and the differences are refreshed when you save the modified document or when you click the Perform File Differencing button.

A variety of actions are available on the toolbar (on page 2296) and in the various menus (on page 2300) (these same actions are also available in the contextual menu in both editing panes). The tool also includes some inline actions to help you merge, copy, or remove changes. When you select a change, the following inline action widgets are available, depending on the type of change:

- **Append left change to right** and **Append right change to left**
  
  Copies the content of the selected change from one side and appends it on the other, according to the content of the corresponding change. As a result, the side where the arrow points to will contain the changes from both sides.

- **Copy change from left to right** and **Copy change from right to left**

  Replaces the content of a change from one side with the content of the corresponding change from the other side.

- **Remove change**
Rejects the change on the particular side and preserves the particular content on the other side.

Two-Way Diff Algorithms

Oxygen XML Author offers the following two-way diff algorithms to compare files or fragments:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Characters** - Computes the differences at character level, meaning that it compares two files or fragments looking for identical characters. This algorithm is not available when the file comparison is in **Author** mode.
- **Words** - Computes the differences at word level, meaning that it compares two files or fragments looking for identical words. This algorithm is not available when the file comparison is in **Author** mode.
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text. This algorithm is not available when the file comparison is in **Author** mode.
- **Syntax Aware** - Computes differences for known file types or fragments. This algorithm splits the files or fragments into sequences of *tokens* and computes the differences between them. The meaning of a *token* depends on the type of compared files or fragments.

Known file types include those listed in the **New** dialog box, such as XML file types (XSLT files, XSL-FO files, XSD files, RNG files, NVDL files, etc.), XQuery file types (`.xquery`, `.xq`, `.xqy`, `.xqm` extensions), DTD file types (`.dtd`, `.ent`, `.mod` extensions), TEXT file type (`.txt` extension), or PHP file type (`.php` extension).

For example:

- When comparing XML files or fragments, a token can be one of the following:
  - The name of an XML tag
  - The `<` character
  - The `/>` sequence of characters
  - The name of an attribute inside an XML tag
  - The `=` sign
  - The " character
  - An attribute value
  - The text string between the start tag and the end tag (a text node that is a child of the XML element corresponding to the XML tag that encloses the text string)
- When comparing plain text, a token can be any continuous sequence of characters or any continuous sequence of whitespaces, including a new line character.

- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
• **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

**Three-Way Comparisons**

Oxygen XML Author also includes a three-way comparison feature to help you solve conflicts and merge changes between multiple modifications. It is especially helpful for teams who have multiple authors editing and committing the same documents. It provides a comparison between a local change, another change, and the original base revision. Some additional advantages include:

- Visualize and merge content that was modified by you and another member of your team.
- Marks differences correctly even when the document structure is rearranged.
- Allows you to merge XML-relevant modifications.

**Figure 514. Three-Way Comparison**

**Compare Files**

To perform a three-way comparison, follow these steps:

1. Open a file in the left panel and the file you want to compare it to in the right panel. You can specify the path by using the text field, the history drop-down, or the browsing actions in the `Browse` drop-down menu.

   **Step Result:** The selected files are opened in the two side-by-side editors. A text editing mode is used to offer a better view of the differences.

2. Click the `Three-Way Comparison` button on the toolbar and select the base file in the `Base` field. You can specify the path by using the text field, the history drop-down, or the browsing actions in the `Browse` drop-down menu.

3. To highlight the differences, click the `Perform File Differencing` button on the toolbar.

4. You can use the drop-down menu on the left side of the toolbar to change the algorithm (on page 2287) for the operation.
5. You can also use the Diff Options button to access the Files Comparison preferences page where you can choose to ignore certain types of markup and configure various options.

The resulting comparison will show you differences between the two files, as well as differences between either of them and the base (ancestor) file. The line numbers on each side and colored marks on the right-side vertical stripe help you to quickly identify the locations of the differences. Adjacent changes are grouped into blocks of changes.

Figure 515. Three-Way Differences

Highlighting Colors

The differences are also highlighted in several colors, depending on the type of change, and dynamic lines connect the compared fragments in the middle section between the two panes. The highlighting colors can be customized in the Files Comparison / Appearance preferences page (on page 232), but the default colors and their shades mean the following:

- **Pink** - Identifies blocks of changes that include conflicts.
- **Gray** - Identifies your outgoing changes that do not include conflicts.
- **Blue** - Identifies incoming changes that do not include conflicts.
- **Lighter Shade** - Identifies blocks of changes that can be merged in their entirety.
- **Darker Shade** - Identifies specific changes within the blocks that can be merged more precisely.

Navigate Differences

To navigate through differences, do one of the following:

- Use the navigation buttons on the toolbar (or in the Compare menu).
- Select a block of differences by clicking its small colored marker in the overview ruler located in the right-most part of the window. At the top of the overview ruler there is a success indicator that turns green where there are no differences, or red if differences are found.
- Click a colored area in between the two text editors.

Editing Actions

You can edit the files directly in either editing pane. The two editors are constantly synchronized and the differences are refreshed when you save the modified document or when you click the Perform File Differencing button.

A variety of actions are available on the toolbar (on page 2296) and in the various menus (on page 2300) (these same actions are also available in the contextual menu in both editing panes). The tool
also includes some inline actions to help you merge, copy, or remove changes. When you select a change, the following inline action widgets are available, depending on the type of change:

- **Append left change to right** and **Append right change to left**
  
  Copies the content of the selected change from one side and appends it on the other, according to the content of the corresponding change. As a result, the side where the arrow points to will contain the changes from both sides.

- **Copy change from left to right** and **Copy change from right to left**
  
  Replaces the content of a change from one side with the content of the corresponding change from the other side.

- **Remove change**
  
  Rejects the change on the particular side and preserves the particular content on the other side.

### Three-Way Diff Algorithms

Oxygen XML Author offers the following three-way diff algorithms to compare files:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text. This algorithm is not available when the file comparison is in **Author** mode.
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

### Second-Level Comparisons

For both two-way and three-way comparisons, Oxygen XML Author automatically performs a second-level comparison for the **Lines**, **XML Fast**, and **XML Accurate** algorithms. After the first comparison is finished, the second-level comparisons for the **Lines** algorithm is processed on text nodes using a word level comparison, meaning that it looks for identical words. For the **XML Fast** and **XML Accurate** algorithms, the second-level comparison is processed using a syntax-aware comparison (on page 2287), meaning that it looks for identical tokens. This second-level comparison makes it easier to spot precise differences and you can merge or reject the precise modifications.

Figure 516. Second-Level Diff Comparison
Note: If a modified text fragment contains XML markup (such as processing instructions, XML comments, CData, or elements), the second-level comparison will not automatically be performed. In this case you can manually select a second-level comparison by doing a word level or character level comparison.

To do a word level comparison, select Show word level details from the contextual menu or Compare menu.

Figure 517. Word Level Comparison

To do a character level comparison, select Show Character Level details from the contextual menu or Compare menu.

Figure 518. Character Level Comparison

Author Visual Mode

The Compare Files tool includes an Author mode that displays the files in a visual mode similar to the Author editing mode in Oxygen XML Editor/Author. This makes it easier to see how the compared changes will look in the final output. This visual mode is available when the compared files are
detected as being XML. To determine whether the files are initially opened in the merge tool's **Text** or **Author** mode, it detects the **Initial Edit Mode** in the **Document Type Association** configuration (on page 95) and the mode the files were last opened in **Oxygen XML Editor/Author**.

**Note:** This mode is not available if the **Enable file comparison in Author mode** option (on page 229) is not selected in the **Diff > Files Comparison** preferences page.

This visual mode includes unique features such as a **Tags Display Mode** drop-down button (on page 2298) on the toolbar that allows you to select the amount of tags to display in this visual mode. This mode also presents differences that were made using the **Track Changes** feature (although the **Track Changes** feature is not available in the comparison tool).

**Figure 519. File Comparison Tool - Author Mode**

---

**Author Mode Algorithms**

The visual **Author** mode offers the following diff algorithms to compare files:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.
Author Mode Second-Level Comparisons

The visual Author mode automatically performs a second-level comparison for the XML Fast and XML Accurate algorithms. After the first comparison is finished, the second-level comparisons is processed on text nodes using a word level comparison, meaning that it looks for identical words. This second-level comparison makes it easier to spot precise differences and you can merge or reject the precise modifications.

Starting File Comparison Tool from a Command Line

The file comparison tool can be started by using command-line arguments. In the installation folder there is an executable shell (diffFiles.bat on Windows, diffFiles.sh on OS X and Linux). To specify the files to compare, you can pass command-line arguments using the following construct:

```
diffFiles.bat/diffFiles.sh [path to left file] [path to right file] [path to 3-way base file]
```

If three files are specified, the tool will start in the 3-way comparison mode (on page 2288). If only two files are specified, the tool will start in the 2-way comparison mode (on page 2284). The first specified file will be added to the left panel in the comparison tool, the second file to the right panel, and the optional third file will be the base (ancestor) file used for a 3-way comparison. If you pass only one argument, you are prompted to manually choose another file.

If you want to launch the file comparison tool from an external application with specified files and you want the file browsing buttons at the top of both panels to be hidden, you should use the -ext argument as the first command. There are some additional arguments that are allowed and to see all the details for the command-line construct, type `diffFiles.bat --help` in the command line.

**Example:**

To do a 3-way comparison, the command line might look like this:

**Windows**

```
diffFiles.bat "c:\docs\file 1" "c:\docs\file 2" c:\docs\basefile
```
Tip: If there are spaces in the path names, surround the paths with quotes.

Linux

diffFiles.sh home/file1 home/file2 home/basefile

Mac OS X

diffFiles.sh documents/file1 documents/file2 documents/basefile

How to Integrate the File Comparison Tool with Git

The file comparison tool can be integrated with Git clients. It requires that you configure your .gitconfig file and then you can simply start the tool from the command line.

To integrate the Compare Files tool with your Git client, follow this procedure:

1. Use one of the following methods to instruct your Git client to use the Oxygen Compare Files tool:
   
   • Manual Configuration - Locate your Git user-specific configuration file (.gitconfig) and edit it with a text editor (for example, in Windows, the .gitconfig file is most likely located in your user home directory). Add (or replace) the following lines:

   |diff|
   ---|
   tool = oxygendiff

   |merge|
   ---|
   tool = oxygendiff

   |difftool "oxygendiff"|
   ---|
   cmd = '[[pathToOxygenInstallDir]/diffFiles.exe' -ext $REMOTE $LOCAL $LOCAL

   |mergetool "oxygendiff"|
   ---|
   cmd = '[[pathToOxygenInstallDir]/diffFiles.exe' -ext $LOCAL $REMOTE $BASE $MERGED

   trustExitCode = true

   |difftool|
   ---|
   prompt = false

   Note: For Mac OS X, the cmd lines would start with something like: `sh "/Applications/Oxygen XML Editor/diffFiles.sh"`. For Linux, the cmd lines would start with something like: `sh "/Oxygen XML Editor/diffFiles.sh"`.

   • Command Line Configuration - To automatically configure the .gitconfig file, you can run the following commands from a command line:

   `git config --global diff.tool oxygendiff`
git config --global difftool.oxygendiff.cmd '([Oxygen install dir]/diffFiles.exe -ext $REMOTE $LOCAL $LOCAL')

Note: For Mac OS X, the Oxygen file comparison tool would be specified in the second and fourth commands with something like: `sh "/Applications/Oxygen XML Editor/diffFiles.sh"`. For Linux, it would be something like: `sh "/Oxygen XML Editor/diffFiles.sh"`.

2. To start the Compare Files tool and see a comparison of changes for a particular file, run the following command from a command line:

   ```bash
git difftool [PathToFile]
   ```

   Tip: If the file you want to compare has conflicts, you can start the Compare Files tool as a merge conflict resolution tool by running the following command:

   ```bash
git mergetool [PathToFile]
   ```

For more information about the Git `difftool` syntax, see https://git-scm.com/docs/git-difftool.

For more information about the Git `mergetool` syntax, see https://git-scm.com/docs/git-mergetool.

How to Integrate the File Comparison Tool with SourceTree

The file comparison tool can be integrated with SourceTree so that you can use it to compare changes. The advantages of doing this include:

- The Oxygen Compare Files tool presents the files side-by-side and makes it much easier to determine real changes.
- The Oxygen Compare Files tool includes XML comparison algorithms.
- The Oxygen Compare Files tool includes various options for configuring the comparison.
- The Oxygen Compare Files tool allows you to navigate through changes.

To integrate the Compare Files tool with SourceTree, follow this procedure, depending on your operating system:

**Windows**

1. In SourceTree, go to Tools > Options.
2. Go to the **Diff** tab.

3. In the **External Diff/Merge** section, configure the settings as follows:
   - **External Diff Tool** - Select Custom.
   - **Diff Command** - Enter the path of the *Oxygen diffFile.exe* file (for example: `c:\Programs\Oxygen XML Editor 19\diffFiles.exe`).
   - **Arguments** - Enter `-ext $REMOTE $LOCAL $LOCAL`.
   - **Merge Tool** - Select Custom.
   - **Diff Command** - Enter the path of the *Oxygen diffFile.exe* file (for example: `c:\Programs\Oxygen XML Editor 19\diffFiles.exe`).
   - **Arguments** - Enter `-ext $LOCAL $REMOTE $BASE $MERGED`.

4. Click **OK**.

   **Result:** In SourceTree, you can now compare file changes with the *Oxygen Compare Files* tool by simply selecting **External Diff** from the contextual menu, **Actions** menu, or **Ctrl+D**.

**Mac OS X**

1. In SourceTree, go to **SourceTree > Preferences**.

2. Go to the **Diff** tab.

3. In the **External Diff/Merge** section, configure the settings as follows:
   - **External Diff Tool** - Select Custom.
   - **Diff Command** - Enter a command-line argument to launch the *Oxygen diffFiles.sh* file (for example: `sh "/Applications/Oxygen XML Editor/diffFiles.sh"`).
   - **Arguments** - Enter `-ext $REMOTE $LOCAL $LOCAL`.
   - **Merge Tool** - Select Custom.
   - **Diff Command** - Enter a command-line argument to launch the *Oxygen diffFiles.sh* file (for example: `sh "/Applications/Oxygen XML Editor/diffFiles.sh"`).
   - **Arguments** - Enter `-ext $LOCAL $REMOTE $BASE $MERGED`.

4. Close the preferences dialog box.

   **Result:** In SourceTree, you can now compare file changes with the *Oxygen Compare Files* tool by simply selecting **External Diff** from the contextual menu or **Actions** menu.

**Toolbar and Contextual Menu Actions of the Compare Files Tool**

The toolbar of the **Compare Files** tool contains operations that can be performed on the source and target files or XML fragments. Many of the actions are also available in the contextual menu.
Figure 520. Compare Toolbar

The following actions are available:

**Algorithm**

This drop-down menu allows you to select one of the following diff algorithms (depending on whether it is a two-way or three-way comparison):

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Characters** - Computes the differences at character level, meaning that it compares two files or fragments looking for identical characters. This algorithm is not available when the file comparison is in **Author** mode.
- **Words** - Computes the differences at word level, meaning that it compares two files or fragments looking for identical words. This algorithm is not available when the file comparison is in **Author** mode.
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text. This algorithm is not available when the file comparison is in **Author** mode.
- **Syntax Aware** - Computes differences for the file types or fragments known by Oxygen XML Author, taking the syntax (the specific types of tokens) into consideration. This algorithm is not available when the file comparison is in **Author** mode.
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

**Diff Options**

Opens the **Files Comparison preferences page** (on page 229) where you can configure various options.

**Three-Way Comparison**

Toggle action that allows you to perform a three-way comparison between the two files displayed in the two editing panes and a base (ancestor) file.
Looks for differences between the two files displayed in the left and right side panels.

**Synchronized scrolling**

Toggles synchronized scrolling on or off so that a selected difference can be seen on both sides of the application window. This option is on by default.

**Ignore Whitespaces**

Enables or disables the whitespace ignoring feature. Ignoring whitespace means that before performing the comparison, the application normalizes the content and trims its leading and trailing whitespaces. This option is not available when the file comparison is in Author mode.

**Format and Indent Both Files (Ctrl + Shift + P (Command + Shift + P on OS X))**

Formats and indents both files before comparing them. Use this option for comparisons that contain long lines that make it difficult to spot differences. This option is not available when the file comparison is in Author mode.

*Note:* When comparing two JSON files, the Format and Indent Both Files action will automatically sort the keys in both files the same to make it easier to compare.

**Tags Display Mode**

Allows you to select the amount of markup to be displayed in the Author visual mode (on page 2291). You can choose between: Full Tags with Attributes, Full Tags, Block Tags, Inline Tags, Partial Tags, or No Tags.

**Copy Change from Right to Left**

Copies the selected difference from the file in the right panel to the file in the left panel.

**Copy All Changes from Right to Left**

Copies all changes from the file in the right panel to the file in the left panel.

**Next Block of Changes (Ctrl + Period (Command + Period on OS X))**

Jumps to the next block of changes. This action is not available when the cursor is positioned on the last change block or when there are no changes.

*Note:* A change block groups one or more consecutive lines that contain at least one change.

**Previous Block of Changes (Ctrl + Comma (Command + Comma on OS X))**

Jumps to the previous block of changes. This action is not available when the cursor is positioned on the first change block or when there are no changes.
Next Change (Ctrl + Shift + Period (Command + Shift + Period on OS X))

Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is not available when the cursor is positioned on the last change or when there are no changes.

Previous Change (Ctrl + Shift + Comma (Command + Shift + M on OS X))

Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is not available when the cursor is positioned on the first change or when there are no changes.

Copy All Changes from Left to Right

Copies all changes from the file in the left panel to the file in the right panel.

Copy Change from Left to Right

Copies the selected difference from the file in the left panel to the file in the right panel.

Ignore Nodes by XPath

You can use this text field to enter an XPath expression (on page 1798) to ignore certain nodes from the comparison. It will be processed as XPath version 2.0. You can also enter the name of the node to ignore all nodes with the specified name (for example, if you want to ignore all ID attributes from the document, you could simply enter @id). This field is only available when comparing XML documents using the XML Fast or XML Accurate algorithms.

Note: If an XPath expression is specified in the Ignore nodes by XPath option (on page 231) in the Diff / File Comparison preferences page, that one is used as a default when the application is started. If you then enter an expression in this field on the toolbar, this one will be used instead of the default. If you delete the expression from this field, neither will be used.

First Change (Ctrl + B (Command + B on OS X))

Jumps to the first change.

Base

Available for three-way comparisons (on page 2288). It is the base file that will be compared with the files opened in the left and right editors. You can specify the path to the file by using the text field, its history drop-down, or the browsing actions in the Browse drop-down menu.

Left-Side (Source) File
You can specify the path to the file to be compared on the left side (source) by using the text field, its history drop-down, or the browsing actions in the Browse drop-down menu.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Save" /></td>
<td>Saves the changes made in the source (left-side) file.</td>
</tr>
<tr>
<td><img src="image" alt="Reload" /></td>
<td>Reloads the source (left-side) file.</td>
</tr>
<tr>
<td><img src="image" alt="Close" /></td>
<td>Closes the source (left-side) file.</td>
</tr>
</tbody>
</table>

**Right-Side (Target) File**

You can specify the path to the file to be compared on the right side (target) by using the text field, its history drop-down, or the browsing actions in the Browse drop-down menu.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Save" /></td>
<td>Saves the target (right-side) file.</td>
</tr>
<tr>
<td><img src="image" alt="Reload" /></td>
<td>Reloads the target (right-side) file.</td>
</tr>
<tr>
<td><img src="image" alt="Close" /></td>
<td>Closes the target (right-side) file.</td>
</tr>
</tbody>
</table>

**Compare Files Tool Menus**

The menus in the Compare Files tool contain some of the same actions that are on the toolbar, as well as some common actions that are identical to the same actions in the Oxygen XML Author menus. The menu actions include:

**File Menu**

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Source</strong> &gt; <img src="image" alt="Open" /></td>
<td>Browses for a file that will be displayed in the left panel.</td>
</tr>
<tr>
<td><strong>Source</strong> &gt; <img src="image" alt="Open URL" /></td>
<td>Browses for a remote file that will be displayed in the left panel.</td>
</tr>
<tr>
<td><strong>Source</strong> &gt; <img src="image" alt="Open File from Archive" /></td>
<td></td>
</tr>
</tbody>
</table>
Oxygen XML Author 21.1 User Guide | 18 - Tools | 2301

Browses an archive for a file that will be displayed in the left panel.

**Source >  Reload**

Reloads the file in the left panel.

**Source >  Save**

Saves the changes made to the file in the left panel.

**Source > Save As**

Allows you to choose a destination to save the file in the left panel.

**Source >  Close**

Closes the file in the left panel.

**Target >  Open**

Browses for a file that will be displayed in the right panel.

**Target >  Open URL**

Browses for a remote file that will be displayed in the right panel.

**Target >  Open File from Archive**

Browses an archive for a file that will be displayed in the right panel.

**Target >  Reload**

Reloads the file in the right panel.

**Target >  Save**

Saves the changes made to the file in the right panel.

**Target > Save As**

Allows you to choose a destination to save the file in the right panel.

**Target >  Close**

Closes the file in the right panel.

**Base >  Open**

Browses for a file that will be compared with both files in a three-way comparison (on page 2288).

**Base >  Open URL**

Browses for a remote file that will be compared with both files in a three-way comparison (on page 2288).

**Base >  Open File from Archive**
Browses an archive for a file that will be compared with both files in a three-way comparison (on page 2288).

Close (Ctrl + W (Command + W on OS X))
Closes the application.

**Edit Menu**

✅ **Cut**
Cut the selection from the currently focused editor panel to the clipboard.

✂️ **Copy**
Copy the selection from the currently focused editor panel to the clipboard.

📋 **Paste**
Paste content from the clipboard into the currently focused editor panel.

**Select all**
Selects all content in the currently focused editor panel.

.undo **Undo**
Undo changes in the currently focused editor panel.

.redo **Redo**
Redo changes in the currently focused editor panel.

**Find Menu**

🔍 **Find/Replace**
Perform find/replace operations in the currently focused editor panel.

**Find Next**
Go to the next match using the same options as the last find operation. This action runs in both editor panels.

**Find Previous**
Go to the previous match using the same options as the last find operation. This action runs in both editor panels.

**Compare Menu**

 ninguém **Three-Way Comparison**
Toggle action that allows you to perform a three-way comparison between the two files displayed in the two editing panes and a base (ancestor) file.

**Perform Files Differencing**

Looks for differences between the two files displayed in the left and right side panels.

**Next Block of Changes (Ctrl + Period (Command + Period on OS X))**

Jumps to the next block of changes. This action is not available when the cursor is positioned on the last change block or when there are no changes.

**Note:** A change block groups one or more consecutive lines that contain at least one change.

**Previous Block of Changes (Ctrl + Comma (Command + Comma on OS X))**

Jumps to the previous block of changes. This action is not available when the cursor is positioned on the first change block or when there are no changes.

**Next Change (Ctrl + Shift + Period (Command + Shift + Period on OS X))**

Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is not available when the cursor is positioned on the last change or when there are no changes.

**Previous Change (Ctrl + Shift + Comma (Command + Shift + M on OS X))**

Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is not available when the cursor is positioned on the first change or when there are no changes.

**Last Change (Ctrl + E (Command + E on OS X))**

Jumps to the last change.

**First Change (Ctrl + B (Command + B on OS X))**

Jumps to the first change.

**Copy All Changes from Right to Left**

Copies all changes from the file in the right panel to the file in the left panel.

**Copy All Changes from Left to Right**

Copies all changes from the file in the left panel to the file in the right panel.

**Copy Change from Right to Left**

Copies the selected difference from the file in the right panel to the file in the left panel.
Copy Change from Left to Right
Copies the selected difference from the file in the left panel to the file in the right panel.

Show Word Level Details
Provides a word-level comparison of the selected change.

Show Character Level Details
Provides a character-level comparison of the selected change.

Format and Indent Both Files (Ctrl + Shift + P (Command + Shift + P on OS X))
Formats and indents both files before comparing them. Use this option for comparisons that contain long lines that make it difficult to spot differences.

Note: When comparing two JSON files, the Format and Indent Both Files action will automatically sort the keys in both files the same to make it easier to compare.

Options Menu
Preferences
Opens the preferences dialog box that includes numerous pages of options that can be configured.

Menu Shortcut Keys
Opens the Menu Shortcut Keys option page where you can configure keyboard shortcuts available for menu items.

Reset Global Options
Resets options to their default values. Note that this option appears only when the tool is executed as a stand-alone application.

Import Global Options
Allows you to import an options set that you have previously exported.

Export Global Options
Allows you to export the current options set to a file.

Help Menu
Help (F1)
Opens a Help dialog box that displays the User Manual at a section that is appropriate for the context of the current cursor position.

Use Online Help
If this option is selected, when you select Help or press F1 while hovering over any part of the interface, Oxygen XML Author attempts to open the help documentation in online mode. If this option is not selected or an internet connection fails, the help documentation is opened in offline mode.

**Report problem**

Opens a dialog box that allows the user to write the description of a problem that was encountered while using the application. You can change the URL where the reported problem is sent by using the `com.oxygenxml.report.problems.url` system property. The report is sent in XML format through the `report` parameter of the POST HTTP method.

**Support Center**

Opens the Oxygen XML Author Support Center web page in a browser.

---

**Compare Directories**

The **Compare Directories** tool can be used to compare and manage changes to files and folders within the structure of your directories. The utility is available from the **Tools** menu or can be opened as a stand-alone application from the Oxygen XML Author installation folder (`diffDirs.exe`).

Figure 521. Compare Directories Tool
### Starting the Tool from a Command Line

The directory comparison tool can also be started by using command-line arguments. In the installation folder there is an executable shell (`diffDirs.bat` on Windows, `diffDirs.sh` on OS X and Linux). To specify the directories to compare, you can pass command-line arguments using the following construct: `diffDirs.bat/diffDirs.sh [directory path 1] [directory path 2].`

If you pass only one argument, you are prompted to manually choose the second directory or archive.

**Example:**

To do a comparison between two directories, the command line would look like this:

**Windows**

```
diffDirs.bat "c:\documents new" "c:\documents old"
```

**Tip:** If there are spaces in the path names, surround the paths with quotes.

**Linux**

```
diffDirs.sh home/documents1 home/documents2
```

**Mac OS X**

```
diffDirs.sh documents1 documents2
```

### Directory Comparisons

To perform a directory comparison, follow these steps:

1. Select a folder in the left panel and the folder you want to compare it to in the right panel. You can specify the path by using the text field, the history drop-down, or the **Browse for local directory** action in the **Browse** drop-down menu.

   **Step Result:** The selected directory structures are opened in the two side-by-side panels.

2. To highlight the differences between the two folders, click the **Perform Directories Differencing** button from the toolbar.

3. You can also use the **Diff Options** button to access the **Directories Comparison preferences page** (on page 232) where you can configure various options.

To compare the content of two archives, follow these steps:

1. Use the **Browse for archive file** action in the **Browse** drop-down menu to select the archives in the left and right panels.
2. By default, the supported archives are not treated as directories and the comparison is not performed on the files inside them. To make Oxygen XML Author treat supported archives as directories, select the Look in archives option (on page 233) in the Directories Comparison preferences page.

3. To highlight the differences, click the Perform Directories Differencing button from the toolbar.

The directory comparison results are presented using two tree-like structures showing the files and folders, including their name, size, and modification date. A column that contains graphic symbols separates the two tree-like structures. The graphic symbols can be one of the following:

- An \( \times \) symbol, when a file or a folder exists in only one of the compared directories.
- A \( \neq \) symbol, when a file exists in both directories but the content differs. The same sign appears when a collapsed folder contains differing files.

The color used for the symbol and the directory or file name can be customized in the Directories Comparison / Appearance preferences page (on page 234). You can double-click lines marked with the \( \neq \) symbol to open a Compare Files window, which shows the differences between the two files.

The directories that contain files that differ are expanded automatically so that you can focus directly on the differences. You can merge the contents of the directories by using the copy actions. If you double-click (or press Enter) on a line with a pair of files, Oxygen XML Author starts a file comparison (on page 2284) between the two files, using the Compare Files tool.

Related Information:

- Compare Files (on page 2284)

Toolbar and Contextual Menu Actions of the Compare Directories Tool

The toolbar of the Compare Directories tool contains operations that can be performed on the compared directory structure. Some of the toolbar actions are also available in the contextual menu.

Figure 522. Compare toolbar

![Compare toolbar](image)

**Toolbar Actions**

- Perform Directories Differencing
Looks for differences between the two directories displayed in the left and right side of the application window.

- **Perform Files Differencing**
  Opens the Compare Files tool (on page 2284) that allows you to compare the currently selected files.

- **Copy Change from Right to Left**
  Copies the selected change from the right side to the left side (if there is no file/folder in the right side, the left file/folder is deleted).

- **Copy Change from Left to Right**
  Copies the selected change from the left side to the right side (if there is no file/folder in the left side, the right file/folder is deleted).

- **Binary Compare**
  Performs a byte-level comparison on the selected files.

- **Diff Options**
  Opens the Directory Comparison preferences page (on page 232) where you can configure various options.

- **Show Only Modifications**
  Displays a more uncluttered file structure by hiding all identical files.

**File and folder filters**
Differences can be filtered using three combo boxes: **Include files**, **Exclude files**, and **Exclude folders**. They come with predefined values and are editable to allow custom values. All of them accept multiple comma-separated values and the * and ? wildcards. For example, to filter out all JPEG and GIF image files, edit the Exclude files filter box to read *.jpeg, *.png. Each filter includes a drop-down menu with the latest 15 filters applied.

**Contextual Menu Actions**

- **Perform Files Differencing**
  Opens the Compare Files tool (on page 2284) that allows you to compare the currently selected files.

- **Binary Compare**
  Performs a byte-level comparison on the selected files.
Copy Change from Right to Left

Copies the selected difference from the file in the right panel to the file in the left panel.

Copy Change from Left to Right

Copies the selected difference from the file in the left panel to the file in the right panel.

Open

If the action is invoked on a file, the selected file is opened in Oxygen XML Author. If the action is invoked on a directory, the selected directory is opened in the default file browser for your particular operating system.

Open in System Application

Opens the selected file in the system application that is associated with that type of file. The action is available when launching the Compare Directories tool from the Tools menu in Oxygen XML Author.

Show in Explorer

Opens the default file browser for your particular operating system with the selected file highlighted.

Compare Directories Tool Menus

The menus in the Compare Directories tool contain some of the same actions that are on the toolbar, as well as some common actions that are identical to the same actions in the Oxygen XML Author menus. The menu actions include:

File Menu

Close (Ctrl + W (Command + W on OS X))

Closes the application.

Compare Menu

Perform Directories Differencing

Looks for differences between the two directories displayed in the left and right side of the application window.

Perform Files Differencing

Opens the Compare Files tool (on page 2284) that allows you to compare the currently selected files.

Copy Change from Right to Left
Copies the selected change from the right side to the left side (if there is no file/folder in the right side, the left file/folder is deleted).

**Copy Change from Left to Right**

Copies the selected change from the left side to the right side (if there is no file/folder in the left side, the right file/folder is deleted).

**Options Menu**

**Preferences**

Opens the preferences dialog box that includes numerous pages of options that can be configured.

**Menu Shortcut Keys**

Opens the **Menu Shortcut Keys** option page where you can configure keyboard shortcuts available for menu items.

**Reset Global Options**

Resets options to their default values. Note that this option appears only when the tool is executed as a stand-alone application.

**Import Global Options**

Allows you to import an options set that you have previously exported.

**Export Global Options**

Allows you to export the current options set to a file.

**Help Menu**

**Help (F1)**

Opens a **Help** dialog box that displays the User Manual at a section that is appropriate for the context of the current cursor position.

**Use Online Help**

If this option is selected, when you select Help or press F1 while hovering over any part of the interface, Oxygen XML Author attempts to open the help documentation in online mode. If this option is not selected or an internet connection fails, the help documentation is opened in offline mode.

**Report problem**

Opens a dialog box that allows the user to write the description of a problem that was encountered while using the application. You can change the URL where the reported problem is sent by using the `com.oxygenxml.report.problems.url` system property.
The report is sent in XML format through the `report` parameter of the POST HTTP method.

**Support Center**

Opens the Oxygen XML Author Support Center web page in a browser.

**Compare Images**

You can use the **Compare Directories** tool to compare images. If you double-click a line that contains two different images, the **Compare images** window is displayed. This dialog box presents the images in the left and right sides, scaled to fit the available view area. You can use the contextual menu actions to scale the images to their original size or scale them down to fit in the view area.

The supported image types are: GIF, JPG, JPEG, PNG, and BMP.

**Compare Directories Against a Base (3-Way)**

The **Compare Directories Against a Base (3-way)** tool allows you to perform three-way comparisons on directories to help you identify and merge changes between multiple modifications of the same directory structure. It is especially helpful for teams that have multiple authors contributing documents to the same directory system. It offers information about conflicts and changes, and includes actions to easily merge, accept, overwrite, or ignore changes to the directory system.

**How to Perform 3-Way Directory Comparisons**

To perform a 3-way directories comparison, follow these steps:

1. Select ³**Compare Directories Against a Base (3-way)** from the **Tools** menu.

   **Step Result:** This opens a dialog box that allows you to select the 3 file sets that will be used for the comparison.

   Figure 523. Compare Directories Against a Base File Set Chooser
2. Select the file sets to be compared:
   - **Base directory** - This is the original (base) file set before any modifications were made by your or others.
   - **Directory with your changes** - This is the file set with changes that you have made. This file set will be displayed in the left panel in the comparison tool.
   - **Directory with changes made by others** - This is the file set with changes made by others that you want to merge with your changes. This file set will be displayed in the right panel in the comparison tool.

3. Click the **Compare** button to compare the file sets and open the comparison and merge tool.

4. Use the features and actions described in the next section to identify and merge the changes.

**3-Way Directory Comparison and Merge Tool**

Figure 524. Comparison and Merge Tool
The 3-way directory comparison and merge tool includes the following information, features, and actions:

**Number of Changes and Conflicts**

The first thing you see in top-left corner of the tool is grand total of all the changes made by others, changes made by you, and the number of conflicts.

**Filter Buttons**

In the top-right corner you can use the toggle buttons to filter the list of modifications:

- **Show all files**
  
  Use this button to show all modified and unmodified files, as well as conflicts.

- **Show only files modified by you and others**
  
  Filters the list to show all files that have been modified, including conflicts.

- **Show only files modified by others**
  
  Filters the list to only show the files that were modified by others.

- **Show only files modified by you**
  
  Filters the list to only show the files that were modified by you.
Filters the list to only show the files that were modified by you.

Show only conflicting files
Filters the list to only show files that contain conflicts.

List of Files Panel
This panel shows the list of files in the compared file sets based upon the filter button that is selected. This panel includes the following sortable columns:

- **Name** - The file names.
- **Status** - An icon that represents the file status. Red icons indicate some sort of conflict. Gray icons indicate modifications made by you. Blue icons indicate modifications made by others.
- **Description** - A description of the file status.
- **Merge Action** - This column provides a drop-down menu for each file that allows you to choose some merge actions depending upon its status. A default action is always set to **Automatically merge** the changes made by others with your changes. If there is a conflict, the default is **Select action** and you are required to make a selection. Click this column to access the drop-down menu where you can make a selection. The same actions are available in the contextual menu.

You can click a file to open it in the file comparison panel (the file from your file set is shown in the left panel while the file from the other file set is shown in the right panel). For image files, the comparison panel shows a preview of the image. For other binary files, a preview is not available and you will just see its status.

File Comparison Panels
If you click a file in the top panel, the file is opened in this file comparison section. The file from your file set is shown in the left panel and the file from the other file set is shown in the right panel.

**Note:** If Oxygen XML Author does not recognize the file type, a dialog box will be displayed that allows you to select the type of editor you want it to be associated with for this comparison (if you want Oxygen XML Author to remember this association, you can select the **Associate file type with editor** option at the bottom of the dialog box).

This panel includes the following information and toolbar actions:

**File Path**
The first thing you see in this panel is the file path where merge actions will be applied if you make changes.

**Close**
Closes the file comparison panel.

**Algorithm Drop-Down Menu**

This drop-down menu allows you to select one of the following diff algorithms to be used for file comparisons:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text. This algorithm is not available when the file comparison is in **Author** mode.
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

**Diff Options**

Opens the **Files Comparison preferences page (on page 229)** where you can configure various options.

**Perform Files Differencing**

Looks for differences between the two files displayed in the left and right side panels.

**Synchronized scrolling**

Toggles synchronized scrolling. When toggled on, a selected difference can be seen in both panels.

**Ignore Whitespaces**

Enables or disables the whitespace ignoring feature. Ignoring whitespace means that before performing the comparison, the application normalizes the content and trims its leading and trailing whitespaces. This option is not available when the file comparison is in **Author** mode.

**Tags Display Mode**

Allows you to select the amount of markup to be displayed in the **Author** visual mode. You can choose between: **Full Tags with Attributes**, **Full Tags**, **Block Tags**, **Inline Tags**, **Partial Tags**, or **No Tags**.
**Copy Change from Right to Left**

Copies the selected difference from the file in the right panel to the file in the left panel.

**Copy All Changes from Right to Left**

Copies all changes from the file in the right panel to the file in the left panel.

**Next Block of Changes (Ctrl + Period (Command + Period on OS X))**

Jumps to the next block of changes. This action is not available when the cursor is positioned on the last change block or when there are no changes.

**Note:** A change block groups one or more consecutive lines that contain at least one change.

**Previous Block of Changes (Ctrl + Comma (Command + Comma on OS X))**

Jumps to the previous block of changes. This action is not available when the cursor is positioned on the first change block or when there are no changes.

**Next Change (Ctrl + Shift + Period (Command + Shift + Period on OS X))**

Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is not available when the cursor is positioned on the last change or when there are no changes.

**Previous Change (Ctrl + Shift + Comma (Command + Shift + M on OS X))**

Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is not available when the cursor is positioned on the first change or when there are no changes.

**First Change (Ctrl + B (Command + B on OS X))**

Jumps to the first change.

**Left-Side File (Your changes)**

Above the panel you can see the file path and the following two buttons:

**Save**

Saves changes made to the file.
**Reload**

Reloads the file.

**Right-Side File (Changes made by others)**

Above the panel you can see the file path and the following two buttons:

**Reload**

Reloads the file.

**Displaying Changes in the File Comparison Panels**

The line numbers on each side and colored marks on the right-side vertical stripe help you to quickly identify the locations of the differences. Adjacent changes are grouped into blocks of changes.

Figure 525. File Comparison Panels

The differences are also highlighted in several colors, depending on the type of change, and dynamic lines connect the compared fragments in the middle section between the two panes. The highlighting colors can be customized in the Files Comparison / Appearance preferences page (on page 232), but the default colors and their shades mean the following:

- **Pink** - Identifies modifications on either side.
- **Gray** - Identifies an addition of a node in the left side (your outgoing changes).
- **Blue** - Identifies an addition of a node in the right side (incoming changes).
- **Lighter Shade** - Identifies blocks of changes that can be merged in their entirety.
- **Darker Shade** - Identifies specific changes within the blocks that can be merged more precisely.

**Direct Editing Actions in the File Comparison Panels**

In addition to selecting merge actions from the drop-down menus in the Merge Action column in the top panel, you can also edit the files directly in the left pane (your local changes). The two editors are constantly synchronized and the differences are refreshed when you save the modified document (Save button or Ctrl+S) or when you click the Perform File Differencing button.
A variety of actions are available in the contextual menu in both editing panes. The tool also includes some inline actions to help you merge, copy, or remove changes. When you select a change, the following inline action widgets are available, depending on the type of change:

- **Append right change to left**
  
  Copies the content of the selected change from the right side and appends it on the left side.

- **Copy change from right to left**
  
  Replaces the content of a change in the left side with the content of the change in the right side.

- **Remove change**
  
  Removes the change from the left side.

Any time you save manual changes (Save button or Ctrl+S), the selection in the **Merge Action** column in the top panel automatically changes to **Use merged** and a copy of the original file is kept so that you can revert to the original file if necessary.

To discard your manual changes and revert to your original changes, select a different action in the **Merge Action** drop-down menu.

**Open Merged Files**

If you select this option, all the files that will be modified by the merge operation will be opened in the editor after the operation is finished.

**Applying Changes**

When you click the Apply button, all the merge actions you have selected and the changes you have made will be processed.

If there are unresolved conflicts (conflicts where no merge action is selected in the **Merge Action** drop-down menu), a dialog box will be displayed that allows you to choose how to solve the conflicts. You can choose between the following:

- **Keep your changes** - If you select this option and then click Apply, your local changes will be preserved for the unresolved conflicts.

- **Overwrite your changes** - If you select this option and then click Apply, your local changes will be overwritten with the changes made by others, for the unresolved conflicts.

- **Cancel** - You can click the Cancel button to go back to the merge tool to resolve the conflicts individually.

**Cancelling Changes**
If you click the Cancel button at the bottom of the merge tool, all the changes you made in the tool will be lost.

Author Visual Mode

The Comparison and Merge tool includes an Author mode that displays the files in a visual mode similar to the Author editing mode in Oxygen XML Editor/Author. This makes it easier to see how the compared changes will look in the final output. This visual mode is available when the compared files are detected as being XML. To determine whether the files are initially opened in the merge tool's Text or Author mode, it detects the Initial Edit Mode in the Document Type Association configuration (on page 95) and the mode the files were last opened in Oxygen XML Editor/Author.

Note: This mode is not available if the Enable file comparison in Author mode option (on page 229) is not selected in the Diff > Files Comparison preferences page.

This visual mode includes unique features such as a Tags Display Mode drop-down button (on page 760) on the toolbar that allows you to select the amount of tags to display in this visual mode. This mode also presents differences that were made using the Track Changes feature (although the Track Changes feature is not available in the comparison tool).

Figure 526. File Comparison Tool - Author Mode

Author Mode Algorithms

The visual Author mode offers the following diff algorithms to compare files:
• **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
• **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
• **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

### Author Mode Second Level Comparisons

The visual **Author** mode automatically performs a second level comparison for the **XML Fast** and **XML Accurate** algorithms. After the first comparison is finished, the second level comparisons is processed on text nodes using a word level comparison, meaning that it looks for identical words. This second level comparison makes it easier to spot precise differences and you can merge or reject the precise modifications.

**Related Information:**

- Compare Directories *(on page 750)*
- Compare Files *(on page 2284)*

### Syncro SVN Client (Deprecated)

The Syncro SVN Client is a client application for the Apache Subversion™ version control system, compatible with Subversion 1.6, 1.7, and 1.8 servers. It manages files and directories that change over time and are stored in a central repository. The version control repository is much like an ordinary file server, except that it remembers every change ever made to your files and directories. This allows you to access older versions of your files and examine the history of how and when your data changed.

To start Syncro SVN Client, go to **Tools > SVN Client**.

⚠️ **Attention:** The Syncro SVN Client that comes bundled with Oxygen XML Author is considered deprecated as of version 21.0.

### Main Window

This section explains the main window of Syncro SVN Client.
Views

The main window consists of the following views:

- **Repositories view (on page 2411)** - Allows you to define and manage Apache Subversion™ repository locations.
- **Working Copy view (on page 2416)** - Allows you to manage with ease the content of the working copy.
- **History view (on page 2431)** - Displays information (author name, revision number, commit message) about the changes made to a resource during a specified period of time.
- **Editor view (on page 2437)** - Allows you to edit various types of text files, with full syntax-highlight.
- **Annotations view (on page 2438)** - Displays a list with information regarding the structure of a document (author and revision for each line of text).
- **Compare view (on page 2440)** - Displays the differences between two revisions of a text file from the working copy.
- **Image Preview panel (on page 2444)** - Allows you to preview standard image files supported by Syncro SVN Client: JPG, GIF and PNG.
- **Compare Images view (on page 2444)** - Displays two images side by side.
- **Properties view (on page 2444)** - Displays the SVN properties of a resource under version control.
- **Console view (on page 2446)** - Displays information about the currently running operation, similar with the output of the Subversion command-line client.
- **Dynamic Help view (on page 2446)** - Shows information about the currently selected view.

The main window's status bar presents in the left side the operation in progress or the final result of the last performed action. In the right side there is a progress bar for the running operation and a stop button to cancel the operation.

SVN Main Menu

The main menu of the Syncro SVN Client is composed of the following menus:

**File Menu**

New submenu:

**New File**

This operation creates a new file as a child of the selected folder from the **Repositories view (on page 2411)** tree or the **Working Copy view (on page 2416)** tree, depending on the view that was last used. Note that for the **Working Copy view**
(on page 2416), the file is added to version control only if the selected folder is under version control.

**New Folder** (Ctrl (Command on OS X) + Shift + F)

This operation creates a new folder as a child of the selected folder from the Repositories view (on page 2411) tree or the Working Copy view (on page 2416) tree, depending on the view that was last used. Note that for the Working Copy view (on page 2416), the file is added to version control only if the selected folder is under version control.

**New External Folder** (Ctrl (Command on OS X) + Shift + W)

This operation allows you to add a new external definition on the selected folder. An external definition is a mapping of a local directory to a URL of a versioned directory (on page 2452), and ideally a particular revision, stored in the `svn:externals` property of the selected folder.

**Tip:** You can specify a particular revision of the external item by using a peg revision (on page 2454) at the end of the URL (for example, `URL@rev1234`). You can also use peg revisions to access external items that were deleted, moved, or replaced.

The URL used in the external definition format can be relative. You can specify the repository URL that the external folder points to by using one of the following relative formats:

- `../` - Relative to the URL of the directory that the `svn:externals` property is set.
- `^/` - Relative to the root of the repository in which the `svn:externals` property is versioned.
- `//` - Relative to the scheme of the URL of the directory that the `svn:externals` property is set.
- `/` - Relative to the root URL of the server in which the `svn:externals` property is versioned.

**Important:** To change the target URL of an external definition, or to delete an external item, do the following:
1. Modify or delete the item definition found in the `svn:externals` property that is set on the parent folder.

2. For the change to take effect, use the Update operation on the parent folder of the external item.

**Note:** Syncro SVN Client does not support definitions of local relative external items.

**Open (Ctrl (Command on OS X) + O)**

This action opens the selected file in an editor where you can modify it. The action is active only when a single item is selected. The action opens a file with the internal editor or the external application associated with that file type. This action works on any file selection from the Repositories view (on page 2411), Working Copy view (on page 2416), History view (on page 2431), or Directory Change Set view (on page 2435), depending on the view that was last used to invoke it. In the case of a folder, the action opens the selected folder with the system application for folders (for example, Windows Explorer on Windows or Finder on OS X, etc). Note that opening folders is available only for folders selected in the Working Copy view (on page 2416).

**Open with (Ctrl (Command on OS X) + Shift + O)**

Displays the Open with dialog box for specifying the editor in which the selected file is opened. If multiple files are selected only external applications can be used to open the files. This action works on any file selection from Repositories view (on page 2411), Working Copy view (on page 2416), History view (on page 2431), or Directory Change Set view (on page 2435), depending on the view that was last used to invoke it.

**Show in Explorer/Show in Finder**

Opens the parent directory of the selected working copy file and selects the file.

**Save (Ctrl (Command on OS X) + S)**

Saves the local file currently opened in the editor or the Compare view.

**Save as**

Saves any file selected in the Repositories, History, or Directory Change Set view.

**Copy URL Location (Ctrl (Command on OS X) + Alt + U)**
Copies the URL location of the resource currently selected in the
Repositories view to clipboard.

### Copy to

Copies the currently selected resource, either in Repositories or Working
copy view, to a specified location.

**Note:** This action can also be used from History and Directory Change
Set views to recover older versions of a repository item.

### Move to (Ctrl (Command on OS X) + M)

Moves the currently selected resource, either in Repositories or Working
copy view, to a specified location.

### Rename (F2)

Renames the resource currently selected, either in Repositories or Working
copy view.

### Delete (Delete)

Deletes the resource currently selected either, in Repositories or Working
copy view.

### Locking:

- **Scan for locks (Ctrl (Command on OS X) + L)** - Contacts the repository
  and recursively obtains the list of locks for the selected resources. A
dialog box containing the locked files and the lock description will be
displayed. This is only active for resources under version control. For
more details see Scanning for locks (on page 2353).

- **Lock (Ctrl (Command on OS X) + K)** - Allows you to lock certain
  files that need exclusive access. You can write a comment describing
  the reason for the lock and you can also force (steal) the lock. This
  action is active only on files under version control. For more details on
  the use of this action see Locking a file (on page 2354).

- **Unlock (Ctrl (Command on OS X) + Alt + K)** - Releases the
  exclusive access to a file from the repository. You can also choose to
  unlock it by force (break the lock).

### Show SVN Properties (Ctrl (Command on OS X) + P)

Opens the Properties view (on page 2444) and displays the SVN
properties for a selected resource from Repositories view (on page 2411)
or **Working Copy** view *(on page 2416)*, depending on the view that was last used to invoke it.

1 Show SVN Information *(Ctrl (Command on OS X) + I)*

Provides additional information for a selected resource. For more details, go to Obtain information for a resource *(on page 2370)*.

**Exit** *(Ctrl (Command on OS X) + Q)*

Closes the application.

**Edit Menu**

- **Undo** *(Ctrl (Command on OS X) + Z)*
  
  Undo edit changes in the local file that is currently opened in the editor or the Compare view.

- **Redo** *(Ctrl (Command on OS X) + Y)*
  
  Redo edit changes in the local file that is currently opened in the editor or the Compare view.

- **Cut** *(Ctrl (Command on OS X) + X)*
  
  Cut selection from the local file that is currently opened in the editor view or the Compare view to clipboard.

- **Copy** *(Ctrl (Command on OS X) + C)*
  
  Copy selection from the local file that is currently opened in the editor or the Compare view to clipboard.

- **Paste** *(Ctrl (Command on OS X) + V)*
  
  Paste selection from clipboard into the local file that is currently opened in editor or the Compare view.

- **Find/Replace** *(Ctrl (Command on OS X) + F)*
  
  Perform find and replace operations in the local file that is currently opened in the editor or the Compare view.

- **Find Next** *(F3)*
  
  Go to the next match using the same find options of the last find operation. This action runs in the editor panel and in any non-editable text area (for example, the **Console** view).

- **Find Previous** *(Shift + F3)*
Go to the previous match using the same find options of the last find operation. This action runs in the editor panel and in any non-editable text area (for example, the Console view).

**Repository Menu**

- **New Repository Location (Ctrl + Alt + N (Command + Alt + N on OS X))**
  Displays the Add SVN Repository dialog box. This dialog box allows you to define a new repository location.

  Figure 527. Add SVN Repository Dialog Box

  ![Add SVN Repository Dialog Box](image)

  If the Validate repository connection option is selected, the URL connection is validated before being added to the Repositories view.

- **Edit Repository Location (Ctrl + Alt + E (Command + Alt + E on OS X))**
  Context-dependent action that allows you to edit the selected repository location using the Edit SVN Repository dialog box. It is active only when a repository location root is selected.

- **Change the Revision to Browse (Ctrl + Alt + B (Command + Alt + B on OS X))**
  Context-dependent action that allows you to change the selected repository revision using the Change the Revision to Browse dialog box. It is active only when a repository location root is selected.

- **Remove Repository Location (Ctrl + Alt + R (Command + Alt + R on OS X))**
  Allows you to remove the selected repository location from the view. It shows you a confirmation dialog box before removal. It is active only when a repository location root is selected.

- **Refresh (F5)**
  Refreshes the resource selected in the Repositories view.

- **Check out (Ctrl + Alt + O (Command + Alt + O on OS X))**
  Allows you to create a working copy from a repository directory, on your local file system. To read more about this operation, see the section Check out a working copy (on page 2343).
Export

Opens the Export dialog box (on page 2406) that allows you to configure options for exporting a folder from the repository to the local file system.

Import:

Import folder (Ctrl + Shift + L (Command + Shift + L on OS X))

Allows you to import the contents of a specified folder from the file system into the selected folder in a repository. To read more about this operation, see the section Importing resources into a repository (on page 2404).

Note: The difference between the Import folder and Share project actions is that the latter also converts the selected directory into a working copy.

Import Files (Ctrl + Shift + I (Command + Shift + I on OS X))

Imports the files selected from the file system into the selected folder in the repository.

Working Copy Menu

Working Copies Manager (on OS X)

Opens a dialog box with a list of working copies that the Apache Subversion™ client is aware of. In this dialog box you can add existing working copies or remove those that are no longer needed.

Switch to

Selects one of the following view modes:  

- All Files,  
- Modified,  
- Incoming,  
- Outgoing, or  
- Conflicts.

Refresh (F5)

Refreshes the state of the selected resources or of the entire working copy (if there is no selection).

Synchronize (Ctrl (Command on OS X) + Shift + S)

Connects to the repository and determines the working copy and repository changes made to the selected resources. The application switches to Modified view mode if the Always switch to 'Modified' mode option (on page 226) is selected.

Update (Ctrl (Command on OS X) + U)
Updates all the selected resources that have incoming changes to the HEAD revision. If one of the selected resources is a directory then the update for that resource will be recursive.

**Update to revision/depth**

Allows you to update the selected resources from the working copy to an earlier revision from the repository. You can also select the update depth for the current folder. You can find out more about the depth term in the sparse checkouts section.

**Commit**

Collects the outgoing changes from the selected resources in the working copy and allows you to choose exactly what resources to commit. A directory will always be committed recursively. Unversioned resources will be deselected by default. In the Commit dialog box you can also enter a comment before sending your changes to the repository.

**Update all** (Ctrl (Command on OS X) + Shift + U)

Updates all resources from the working copy that have incoming changes. It performs a recursive update on the synchronized resources.

**Commit all**

Commits all the resources with outgoing changes. It is disabled when Incoming mode is selected or the synchronization result does not contain resources with outgoing changes. It performs a recursive commit on the synchronized resources.

**Revert** (Ctrl (Command on OS X) + Shift + V)

Undoes all local changes for the selected resources. It does not contact the repository and the files are obtained from Apache Subversion™ pristine copy. It is available only for modified resources. See Revert your changes section for more information.

**Edit conflict** (Ctrl (Command on OS X) + E)

Opens the Compare editor, allowing you to modify the content of the currently conflicting resources. For more information about editing conflicts, see Edit conflicts section.

**Mark Resolved** (Ctrl (Command on OS X) + Shift + R)

Instructs the Subversion system that you resolved a conflicting resource. For more information, see Merge conflicts section.

**Mark as Merged** (Ctrl (Command on OS X) + Shift + M)
Instructs the Subversion system that you resolved the pseudo-conflict by merging the changes and you want to commit the resource. Read the Merge conflicts (on page 2363) section for more information about how you can solve the pseudo-conflicts.

Override and Update

Drops any outgoing change and replaces the local resource with the HEAD revision. This action is available on resources with outgoing changes, including conflicting ones. See the Revert your changes (on page 2361) section.

Override and Commit

Drops any incoming changes and sends your local version of the resource to the repository. This action is available on conflicting resources. For more information see Drop incoming modifications (on page 2363).

Mark as copied

You can use this action to mark an item from the working copy as a copy of an other item under version control, when the copy operation was performed outside of an SVN client. The Mark as copied action is available when you select two items (both the new item and source item), and it depends on the state of the source item.

Mark as moved

You can use this action to mark an item from the working copy as being moved from another location of the working copy, when the move operation was performed outside of an SVN client. The Mark as moved action is available when you select two items from different locations (both the new item and the source item that is usually reported as missing), and it depends on the state of the source item.

Mark as renamed

You can use this action to mark an item from the working copy as being renamed outside of an SVN client. The Mark as renamed action is available when you select two items from the same directory (both the new item and the source item that is usually reported as missing), and it depends on the state of the source item.

Add to "svn:ignore" (Ctrl (Command on OS X) + Alt + I)

Allows you to add files that should not participate in the version control operations inside your working copy. This action can only be performed on resources not under version control. It actually modifies the value of the svn:ignore property in the parent directory of the resource. Read more
about this in the *Ignore Resources Not Under Version Control* (*on page 2349*) section.

**Add to version control (Ctrl (Command on OS X) + Alt + V)**

Allows you to add resources that are not under *version control*. For further details, see *Add Resources to Version Control* (*on page 2347*) section.

**Remove from version control**

Schedules selected items for deletion from repository upon the next commit. The items are not removed from the file system after committing.

**Clean up (Ctrl (Command on OS X) + Shift + C)**

Performs a maintenance cleanup operation on the selected resources from the working copy. This operation removes the Subversion maintenance locks that were left behind. This is useful when you already know where the problem originated and want to fix it as quickly as possible. It is only active for resources under *version control*.

**Expand All (Ctrl (Command on OS X) + Alt + X)**

Displays all descendants of the selected folder. The same behavior is obtained by double-clicking a collapsed folder.

**Collapse all (Ctrl (Command on OS X) + Alt + Z)**

Collapses all descendants of the selected folder. The same behavior is obtained by double-clicking a expanded folder.

**Compare Menu**

**Perform Files Differencing**

Looks for differences between the two files displayed in the left and right side panels.

**Next Block of Changes (Ctrl + Period (Command + Period on OS X))**

Jumps to the next block of changes. This action is not available when the cursor is positioned on the last change block or when there are no changes.

**Note:** A change block groups one or more consecutive lines that contain at least one change.

**Previous Block of Changes (Ctrl + Comma (Command + Comma on OS X))**
Jumps to the previous block of changes. This action is not available when the cursor is positioned on the first change block or when there are no changes.

**Next Change (Ctrl + Shift + Period (Command + Shift + Period on OS X))**

Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is not available when the cursor is positioned on the last change or when there are no changes.

**Previous Change (Ctrl + Shift + Comma (Command + Shift + M on OS X))**

Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is not available when the cursor is positioned on the first change or when there are no changes.

**Last Change (Ctrl + E (Command + E on OS X))**

Jumps to the last change.

**First Change (Ctrl + B (Command + B on OS X))**

Jumps to the first change.

**Copy All Changes from Right to Left**

Copies all changes from the file in the right panel to the file in the left panel.

**Copy Change from Right to Left**

Copies the selected difference from the file in the right panel to the file in the left panel.

**Show Word Level Details**

Provides a word-level comparison of the selected change.

**Show Character Level Details**

Provides a character-level comparison of the selected change.

**Format and Indent Both Files (Ctrl + Shift + P (Command + Shift + P on OS X))**

Formats and indents both files before comparing them. Use this option for comparisons that contain long lines that make it difficult to spot differences.
Note: When comparing two JSON files, the **Format and Indent Both Files** action will automatically sort the keys in both files the same to make it easier to compare.

**Ignore Whitespaces**

Enables or disables the whitespace ignoring feature. Ignoring whitespace means that before performing the comparison, the application normalizes the content and trims its leading and trailing whitespaces.

**History Menu**

**Show History** *(Ctrl (Command on OS X) + H)*

Displays the history for a SVN resource at a given revision. The resource can be one selected from the **Repositories** view, **Working Copy** view, or from the **Affected Paths** table from the **History** view, depending on which view was last focused when this action was invoked.

**Show Annotation** *(Ctrl + Shift + A (Command + Shift + A on OS X))*

Opens the **Show Annotation** dialog box that computes the annotations for a file and displays them in the **Annotations** view *(on page 2438)*, along with the history of the file in the **History** view.

**Repositories**

This operation is available for any resource selected from view, **Working Copy** view, **History** view or **Directory Change Sets** view, depending on which view was last focused when this action was invoked.

**Revision Graph** *(Ctrl (Command on OS X) + G)*

This action allows you to see the graphical representation of a resource's history. For more details about a resource's revision graph see the section **Revision Graph** *(on page 2447)*. This operation is available for any resource selected in the **Repositories** view or **Working Copy** view.

**Tools Menu**

**Share project**

Allows you to share a new project *(on page 2340)* using an SVN repository. The local project is automatically converted into an SVN working copy.

**Branch / Tag**

Allows you to copy the selected resource from the **Repositories** view or **Working Copy** view to a branch or tag into the repository. To read more
about this operation, see the section Creating a Branch / Tag (on page 2372).

Merge (Ctrl (Command on OS X) + J)
Allows you to merge the changes made on one branch back into the trunk, or vice versa, using the selected resource from the working copy. To read more about this operation, see the section Merging (on page 2374).

Switch (Ctrl (Command on OS X) + Alt + W)
Allows you to change the repository location of a working copy, or only of a versioned item of the working copy, within the same repository. It is available when the selected item of the working copy is a versioned resource, except for external items. To read more about this action, see the Switching the Repository Location (on page 2389) section.

Relocate
Allows you to change the base URL of the root folder of the working copy to a new URL when the base URL of the repository changed. For example, if the repository itself was moved to a different server. This operation is only available for the root item of the working copy. To read more about this operation, see the Relocate a Working Copy (on page 2391) section.

Create patch (Ctrl (Command on OS X) + Alt + P)
Allows you to create a file containing all the differences between two resources, based on the `svn diff` command. To read more about creating patches, see the section about patches (on page 2394).

Working copy format
This submenu contains the following two operations:

Upgrade
Upgrades the format of the currently loaded working copy to the newest one known by Syncro SVN Client. This allows you to benefit of all the new features of the client.

Downgrade
Downgrades the format of the currently loaded working copy to SVN 1.7 format. This is useful if you want to use older SVN clients with the current working copy, or, by mistake, you have upgraded the format of an older working copy to SVN 1.8.

Note: SVN 1.7 working copies cannot be downgraded to older formats.
See the section Working Copy Format (on page 2423) to read more about this subject.

Options Menu

Preferences

Opens the Preferences dialog box.

Menu Shortcut Keys

Opens the Menu Shortcut Keys preferences page (on page 238), where users can configure in one place the keyboard shortcuts available for menu items available in Syncro SVN Client.

Global Run-Time Configuration

Allows you to configure SVN general options, that should be used by all the SVN clients you may use:

- Edit 'config' file - In this file you can configure various SVN client-side behaviors.
- Edit 'servers' file - In this file you can configure various server-specific protocol parameters, including HTTP proxy information and HTTP timeout settings.

Export Options

Allows you to export the current options to an XML file.

Import Options

Allows you to import options you have previously exported.

Reset Options

Resets all your options to the default ones.

Reset Authentication

Resets the Subversion authentication information.

Window Menu

Show View

Allows you to select the view you want to bring to front.

Show Toolbar

Allows you to select the toolbar you want to be visible.

Enable flexible layout
Toggles between a fixed and a flexible layout. When the flexible layout is enabled, you can move and dock the internal views to adapt the application to various viewing conditions and personal requirements.

**Reset Layout**
- Resets all the views to their default position.

**Help Menu**

**Help (F1)**
- Opens the Help dialog box.

**Use online help (selected by default)**
- If this option is selected, when you select Help or press F1 while hovering over any part of the interface, Oxygen XML Author attempts to open the help documentation in online mode. If this option is not selected or an internet connection fails, the help documentation is opened in offline mode.

**Show Dynamic Help view**
- Displays the Dynamic Help view.

**Report Problem**
- Opens a dialog box that allows you to write the description of a problem that was encountered while using the application.

**Support Center**
- Opens the Support Center web page in a browser.

**About**
- Opens the About dialog box.

**SVN Main Toolbar**

The toolbar of the Syncro SVN Client SVN Repositories window contains the following actions:

**Check out**
- Checks out a working copy from a repository. The repository URL and the working copy format must be specified.

**Synchronize**
- Synchronizes the current working copy with the repository.
**Update All**

Updates all resources of the working copy that have an older revision that repository.

**Commit All**

Commits all resources of working copy that have a newer version compared to that of the repository.

**Refresh**

Refreshes the whole content of the current working copy from disk starting from the root folder. At the end of the operation, the modified files and folders that were not committed to repository yet, are displayed in the **Working Copy** view.

**Compare**

The selected resource is compared with:

- The **BASE** revision, when the selected resource is:
  - Locally modified and the **All Files** view mode is currently selected (no matter if there are incoming changes).
  - Locally modified and there are no incoming changes when any other view mode is selected.
- The remote version of the same resource, when remote information is available after a **Synchronize** operation (only when one of **Modified**, **Incoming**, **Outgoing** and **Conflicts** view modes is selected).
- The working copy revision, when the selected resource is from the **History** view.

**Show History**

Displays the history of the selected resource (from the **Working Copy** or **Repository** views) in the **History** view.

**Show Annotation**

Displays the annotations of the selected resource. The selected resource can be in the **Working Copy** or the **History** views.

**Revision Graph**

Displays the revision graph of the selected resource. The selected resource can be in the **Working Copy** or the **Repositories** views.
Enable/Disable flexible layout

Toggles between a fixed and a flexible layout. When the flexible layout is enabled, you can move and dock the internal views to adapt the application to various viewing conditions and personal requirements.

Status Bar

The status bar of the Syncro SVN Client window displays important details of the current status of the application. This information is available only in the Working Copy view.

Figure 528. Status bar

The status bar is composed of the following areas:

• The path of the currently processed file from the current working copy (during an operation such as Check out or Synchronize) or the result of the last operation.
• The current status of the following working copy options:
  ◦ Show ignored files ( ).
  ◦ Show deleted files ( ).
  ◦ Process svn:externals definitions ( ).

The options for ignored and deleted files are switched on and off from the Settings menu (on page 2422) of the Working Copy panel:

• The format of the currently loaded working copy.
• The current numbers of incoming changes ( ), outgoing changes ( ) and conflicting changes ( ).
• A progress bar for the currently running SVN operation and a button ( ) that allows you to stop it.

Getting Started

This section explains the basic operations that can be done in Syncro SVN Client.

SVN Repository Location

This section explains how to add and edit the repository locations in Syncro SVN Client.
Add / Edit / Remove Repository Locations

Usually, team members do all of their work separately, in their own working copy, and then must share their work by committing their changes. This is done using an Apache Subversion™ repository. Oxygen XML Author supports versions 1.4, 1.5, 1.6, 1.7, and 1.8 of the SVN repository format.

Before you can begin working with a Subversion repository, you must define a repository location in the Repositories view (on page 2411).

To create a repository location, use the New Repository Location action that is available in the Repository menu, the Repositories view toolbar, and in the contextual menu. This action opens the New Repository Location dialog box, which prompts you for the URL of the repository (on page 2452) you want to connect to. You can also use peg revisions at the end of the URLs (on page 2454) (for example, URL@rev1234) to browse only that specific revision. No authentication information is requested at the time the location is defined. It is left to the Subversion client to request the user and password information when it is needed. The main benefit of allowing Subversion to manage your password is that it prompts you for a new password only when your password changes.

Once you enter the repository URL, Oxygen XML Author tries to contact the server to get the content of the repository for displaying it in the Repositories view (on page 2411). If the server does not respond in the timeout interval set in the preferences, an error is displayed. If you do not want to wait until the timeout expires, you can use the Stop button from the toolbar of the view.

To edit a repository location, use the Edit Repository Location action that is available in the Repository menu and in the contextual menu. This action opens the Edit Repository Location dialog box, which prompts you for the URL of the repository (on page 2452) you want to connect to. You can also use peg revisions at the end of the URLs (on page 2454) (for example, URL@rev1234) to browse only that specific revision.

To remove a repository location, use the Remove Repository Location action that is available in the Repository menu and in the contextual menu. A confirmation dialog box is displayed to make sure that you do not accidentally remove the wrong locations.

The order of the repositories can be changed in the Repositories view at any time with the Up arrow and Down arrow buttons on the toolbar of the view. For example, pressing the up arrow once moves the selected repository in the list up one position.

To set the reference revision number of an SVN repository use the Change the Revision to Browse action that is available in the Repository menu and in the contextual menu. The revision number of the repository is used for displaying the contents of the repository when it is viewed in the Repositories view (on page 2411). Only the files and folders that were present in the repository at the moment when this revision number was generated in the repository are displayed as contents of the repository.
tree. Also, this revision number is used for all the operations executed directly from the Repositories view (on page 2411).

**Authentication**

Five protocols are supported: HTTP, HTTPS, SVN, SVN + SSH and FILE. If the repository that you are trying to access is password protected, the Enter authentication data dialog box requests a user name and a password. If the Store authentication data checkbox is selected, the credentials are stored in Apache Subversion™ default directory:

- **Windows** - %HOME%\Application Data\Subversion\auth. Example: C:\Documents and Settings\John\Application Data\Subversion\auth
- **Linux and OS X** - $HOME/.subversion/auth. Example: /home/John/.subversion/auth

There is one file for each server that you access. If you want to make Subversion forget your credentials, you can use the Reset authentication command from the Options menu. This causes Subversion to forget all your credentials. When you reset the authentication data, restart Oxygen XML Author for the change to take effect.

**Tip:** The FILE protocol is recommended if the SVN repository and Oxygen XML Author are located on the same computer as it ensures faster access to the SVN repository compared with other protocols.

For HTTPS connections where client authentication is required by your SSL server, you must choose the certificate file and enter the corresponding certificate password that is used to protect your certificate.

When using a secure HTTP (HTTPS) protocol for accessing a repository, a Certificate Information dialog box is displayed and asks you whether you want to accept the certificate permanently, temporarily, or simply deny it.

If the repository has SVN+SSH protocol, the SSH authentication can also be made with a private key and a pass phrase.

Figure 529. SSH Authentication Dialog Box
After the SSH authentication dialog box, another dialog box appears for entering the SVN user name that accesses the SVN repository. The SVN user name is recorded as the *committer* in SVN operations.

When connecting for the first time to a Subversion repository through SVN+SSH protocol, you will be asked to confirm if you trust the SSH host. The same dialog box is also displayed when the server changed the SSH key or when the key was deleted from the local Subversion cache folder.

**Figure 530. SSH server name and key fingerprint**

Share a Project

Even if you start developing a new project, or you want to migrate an existing one to Subversion, the Syncro SVN Client allows you to easily share it with the rest of your team. The shared project directory is automatically converted to a working copy and added under Syncro SVN Client management. The **Share project** action is available in the **Tools** menu and the contextual menu of the **Repositories** view.
The following options can be configured in the **Share project** dialog box:

**Project**

The location of the project folder (on page 2452) on the local disk by using the text box or the **Browse** button. This folder should not be empty or already under version control.

⚠️ **Important:** By default, the SVN system only imports the content of the specified folder, and not the root folder itself. Therefore, it is recommended to use the **Browse** button to select the project folder so that the client will automatically append the name of it to the specified URL.

**URL**

The new location of the project (on page 2452) (inside the repository) that will be used to access it.

⚠️ **Note:** Peg revisions have no effect for this operation since it is used to send information to the repository.

⚠️ **Attention:** If the new location already exists, make sure that it is an empty directory to avoid mixing your project content with other files (if items exist with the same name, an error will occur and the operation will not proceed). Otherwise, if the address does not exist, it is created automatically.

**Format**

The SVN format of the working copy. You can choose between **SVN 1.8** or **SVN 1.7**.

**Share files matching global ignore patterns**
When selected, the file names that match the patterns defined in either of the following locations are also imported into the repository:

- The `global-ignores` property in the SVN configuration file (on page 2451).
- The File name ignore patterns option (on page 227) in the SVN > Working Copy preferences page (on page 226).

**Enable automatic properties/Disable automatic properties**

Enables or disables automatic property assignment (per runtime configuration rules), overriding the `enable-auto-props` runtime configuration directive, defined in the SVN configuration file (on page 2451).

Note: This option is available only when there are defined properties to be applied automatically for newly added items under version control. You can define these properties in the SVN config file (in the `auto-props` section). Based on the value of the `enable-auto-props` runtime configuration directive, the presented option is either Enable automatic properties, or Disable automatic properties.

Defining a Working Copy

An Apache Subversion™ working copy is an ordinary directory tree on your local system, containing a collection of files. You can edit these files however you want, your working copy being your private work area. To make your own changes available to others or incorporate changes made by others, you must explicitly tell Subversion to do so. You can even have multiple working copies of the same project.

Figure 532. Working Copy View
A Subversion working copy also contains some extra files, created and maintained by Subversion, to help it keep track of your files. In particular, each directory in your working copy contains a subdirectory named `.svn`, also known as the working copy administrative directory. This administrative directory contains an unaltered copy of the last updated files from the repository. This copy is usually referred to as the pristine copy or the BASE revision of the working copy. These files help Subversion recognize which files contain unpublished changes, and which files are out-of-date with respect to others' work.

A typical Subversion repository often holds the files (or source code) for several projects. Usually each project is a subdirectory in the repository’s file system tree. In this arrangement, a user's working copy usually corresponds to a particular sub-tree of the repository.

### Check Out a Working Copy

*Check out* means to make a copy of a project from a repository to your local file system. This copy is called a working copy. An Apache Subversion™ working copy is a specially formatted directory structure that contains additional `.svn` directories that store Subversion information, as well as a pristine copy of each item that is checked out.

To check out a working copy, locate and select the desired directory in the Repositories view and select the Check out action from the contextual menu, the toolbar, or the Repository menu.
The following options can be configured in the **Check out** dialog box:

**URL**

The location of the repository directory *(on page 2452)* to be checked out.

*Note:* To check out an item that was deleted, moved, or replaced, you need to specify the original URL (before the item was removed) and use a *peg revision* *(on page 2454)* at the end (for example, `URL@rev1234`).

**Revision**

You can choose between the **HEAD** or **Other** revision. If you need to **check out** a specific revision, specify it in the **Other** text box or use the **History** button and choose a revision from the **History** dialog box *(on page 2345)*.

**Check out to**

Specify the **location where you want to check out** *(on page 2452)* the new working copy by typing the local path in the text box or by using the **Browse** button. If the specified local path does not point to an existing directory, it will automatically be created.

*Important:* By default, the SVN system only checks out the content of the directory specified by the URL, and not the directory itself. Therefore, it is recommended to use the **Browse** button to select the **check out** location so that the client will automatically append the name of the remote directory to the path of the selected directory.

*Warning:* The destination directory should be empty. If files exist, they are skipped (left unchanged) by the **check out** operation and displayed as **modified** *(on page 2419)* after the operation has finished. Also, the destination directory must not already be under version control.

**Format**
The SVN format of the working copy. You can choose between **SVN 1.8** or **SVN 1.7**.

**Depth**

The depth is useful if you want to check out only a part of the selected repository directory and bring the rest of the files and subdirectories in a future update. You can find out more about the checkout depth in the sparse checkouts (on page 2409) section. You can choose between the following depths:

- **Recursive (infinity)** - Checks out all the files and folders contained in the selected folder.
- **Immediate children (immediates)** - Checks out only the child files and folders without recursing subfolders.
- **File children only (files)** - Checks out only the child files.
- **This folder only (empty)** - Checks out only the selected folder (no child file or folder is included).

**Ignore "svn:externals" definitions**

When selected, external items are ignored in the check out operation. This option is only available if you choose the **Recursive (infinity)** depth.

After a check out, the new working copy is added to the list in the Working Copy view (on page 2416) and loaded automatically.

**History Dialog Box**

The **History** dialog box presents a list of revisions for a resource. It is opened from the dialog boxes that require setting an SVN revision number, such as the **Check Out** dialog box (on page 2343) or the **Branch / Tag** dialog box (on page 2372). It presents information about revision, commit date, author, and commit comment.

Figure 534. History Dialog Box
The initial number of entries in the list is 50. Additional revisions can be added to the list using the Get next 50 and Get all buttons. The list of revisions can be refreshed at any time with the Refresh button. You can group revisions in predefined time frames (today, yesterday, this week, this month), by pressing the Group by date button from the toolbar.

The Affected Paths area displays all paths affected by the commit of the revision selected in history. You can see the changes between the selected revision and the file's previous state using the Compare with previous version action, available in the contextual menu.

Use an Existing Working Copy

Using an existing working copy is the process of taking a working copy that exists on your file system and connecting it to Apache Subversion™ repository. If you have a brand new project that you want to import into your repository, then see the section Import resources into the repository (on page 2404).

The following procedure assumes that you have an existing valid working copy on your file system.

1. Click the Working Copies Manager toolbar button (on Mac OS X) in the Working Copy view (on page 2416).

   This action opens the Working copies list dialog box.
2. Press the **Add** button.

3. Select the working folder copy from the file system. The name is useful to differentiate between working copies located in folders with the same name. The default name is the name of the root folder of the working copy.

   **Note:** For SVN 1.7 and newer working copies, all the internal information is kept only in the root directory. Thus, Syncro SVN Client needs to load the whole working copy.

4. Press the **OK** button.

The selected working copy is loaded and presented in the Working Copy view (on page 2416).

   **Note:** You can add working copies older than SVN 1.7. However, to load any of them, Syncro SVN Client will require to upgrade the working copy to SVN 1.8 format.

Manage Working Copy Resources

This section explains how to work with the resources that are displayed in the Working Copy view.

**Edit Files**

You can edit files from the Working Copy view (on page 2416) by double clicking them or by right clicking them and choosing **Open** from the contextual menu.

Note that only one file can be edited at a time. If you try to open another file, it is opened in the same editor window. The editor has syntax highlighting for known file types, meaning that a different color is used for each type of recognized token in the file. If the selected file is an image, then it is previewed in the editor, with no access to modifying it.

After modifying and saving a file from a working copy, a modified marker - an asterisk (*) - will be added to the file's icon in the Working Copy view (on page 2416). The asterisk marks the files that have local modifications that were not committed to the repository.

**Add Resources to Version Control**

To share new files and folders (created in your working copy), add them to version control using the **Add to version control** option from the Working Copy view (on page 2416).

You can easily spot resources not under version control by the unversioned ( [](unversioned) ) icon displayed in the **Local file status** column. Resources scheduled for addition are displayed with this added ( [](added) ) icon in the Working Copy view and are added in the repository after you commit them.

   **Note:** Do not make a confusion between the and icons. The former icon stands for resources that are actually copies of resources already committed in the repository, meaning they are scheduled for addition with history.
When you use the **Add to version control** option on a directory, its entire structure is scanned and all the resources that can be added under version control are presented.

Although it is not mandatory to add resources under version control explicitly, it is recommended. If you forgot to add a resource, when you commit your changes (on page 2365), the resource is presented in the commit dialog box, but not selected. When you commit and unversioned resource, it is automatically added under version control before starting the commit operation.

**Figure 535. Add to Version Control Dialog Box**

![Add to version control dialog box](image)

**Note:** Ignored items can also be added under version control.

The **Depth** column is displayed only when directories are also presented in the dialog box. For any directory, you can use one of the available values to instruct Subversion to limit the scope of the operation to a particular tree depth.

**Note:** The initial value of the **Depth** field can have the following values, depending on the listing mode of the items in the working copy view (on page 2422):

- **infinity** - When the working copy items are presented as a tree.
- **files** - When the working copy items are presented compressed.
- **empty** - When the working copy items are presented flat.

When you add unversioned or ignored directories, the initial value of the **Depth** field also depends on the state of the **Show unversioned directories content** and **Show ignored directories content** options. If these options are selected, the value is based on the listing mode of the items in the working copy view. When they are not selected, the value is **empty**.

The following options are available in this dialog box:
• **Enable automatic properties** or **Disable automatic properties** - enables or disables automatic property assignment (per runtime configuration rules), overriding the `enable-auto-props` runtime configuration directive, defined in the `config` file of the Subversion configuration directory.

   **Note:** This option is available only when there are defined properties to be applied automatically for resources newly added under version control. You can define these properties in the `config` file of the Subversion configuration directory, in the `auto-props` section. Based on the value of the `enable-auto-props` runtime configuration directive, the presented option is either **Enable automatic properties**, or **Disable automatic properties**.

• **No ignore** - when you select this option, file-name patterns defined to ignore unversioned resources do not apply. Resources that are located inside an unversioned directory selected for addition, and match these patterns, are also scheduled for addition in the repository.

   **Note:** This option is available only when directories are also presented in the dialog box.

You can define file-name patterns to ignore unversioned resources in one of the following locations:

- In the `config` file of the Subversion configuration directory (the `global-ignores` option from the `miscellany` section).
- In the Oxygen XML Author options (open the Preferences dialog box (Options > Preferences) (on page 79) and go to SVN > Working copy > Application global ignores).

Each of the above two options is activated only when you select an item for which the option can be applied.

### Ignore Resources Not Under Version Control

Some resources inside your working copy do not need to be subject to version control. These resources can be files created by the compiler, `*.obj`, `*.class`, `*.lst`, or output folders used to store temporary files. Whenever you commit changes (on page 2365), Apache Subversion™ shows your modified files in the commit dialog box, but the unversioned files are also listed. Since the unversioned files are committed unless otherwise specified, it is difficult to see exactly what you are committing.

The best way to avoid these problems is to add the derived files to the Subversion ignore list. That way they are never displayed in the commit dialog box and only genuine unversioned files that must be committed are displayed.

You can choose to ignore a resource by using the **Add to svn:ignore** action in the contextual menu of the Working Copy view (on page 2416).
In the **Add to svn:ignore** dialog box, you can specify the resource to be ignored by name or by a custom pattern. The custom pattern can contain the following wildcard characters:

- `*` - Matches any string of characters of any size, including the empty string.
- `?` - Matches any single character.

For example, you can choose to ignore all text documents by using the pattern: `*.txt`.

The action **Add to svn:ignore** adds a predefined Subversion property called `svn:ignore` to the parent directory of the specified resource. In this property, there are specified all the child resources of that directory that must be ignored. The result is visible in the **Working Copy** view. The ignored resources are represented with gray icons.

### Delete Resources

The **Delete** action is available in the contextual menu of the **Working Copy** view (on page 2416). When you delete an item from the working copy, it is marked as deleted (scheduled for deletion from repository upon the next commit) and removed from the file system. Depending on the state of each item, you are prompted to confirm the operation.

If a resource is deleted from the file system without Subversion's knowledge, the resource is marked as missing (⚠️) in your working copy. You can decide what you want to do with a missing item:

- In the case of a commit, any missing item is first automatically deleted and then committed.

  **Note:** Not any missing item can be committed as deleted, and removed from the repository. For example, you cannot commit an item that no longer exists on the disk and that was scheduled for addition (➕) previously, since this item does not exist in the repository, but you can use the Delete action instead.

- If you want to recover missing items, either update (on page 2364) the items themselves or one of their parent directories. This fetches their latest version from the repository.

You can also delete conflicting items (file content conflicts, property conflicts, tree-conflicts) and Syncro SVN Client automatically marks them as resolved.

  **Note:** It is recommended that you resolve conflicts manually to avoid loosing any important remote modifications.

Finally, you can change your mind and revert (on page 2361) the deleted items to their initial, pristine, state.
Copy Resources

You can copy resources from various locations of the working copy. You select them in the Working Copy view (on page 2416) and then use Copy to from the contextual menu. This is not a simple file system copy, but an Apache Subversion™ command. It will copy the resource and the copy will also have the original history. This is one of the important features of Subversion, as you can keep track of where the copied resources originated.

Based on the selected items, the Copy to action is available only if it can be performed. Even if the operation would not normally be possible in SVN (due to some invalid local file states against copy), Oxygen XML Author performs the copy operation as a simple file system operation. This means no SVN versioning meta-data is affected.

**Note:**

- If you copy an item to a directory that is not under version control (on page 2419) (unversioned or ignored), the history of the item is not preserved. For example, when copying directories, all items inside them will also be copied without history.
- If you copy a directory that contains external (on page 2418) items, these are not copied. This is specific for SVN 1.7 working copies only. To fetch the external items, use the Update operation on the copied directory.

In the Copy to dialog box, you can navigate through the working copy directories to choose a target directory, to copy inside it. If you try to copy a single resource you are also able to change that resource’s name. For versioned items, you can select Ignore resource history to copy them without their history (similar to a simple file system copy).

**Note:** The Copy to dialog box only presents all the local directories that are a valid destination against the copy operation, based on their local file status. Also, the working copy settings (on page 2422) are taken into account.

In the Commit dialog box, only the directory in question will appear without its children.

Move Resources

As in the case of the copy command, you can move several resources at once. Select the resources in the Working Copy view (on page 2416) and choose the Move to action from the contextual menu. The move command actually behaves as if a copy followed by a delete command were issued. You will find the moved resources at the desired destination and also at their original location, but marked as deleted.

**Note:** External items cannot be moved using the Move to action, because they cannot be deleted. Instead, you should edit the svn:externals property defining the external item and use the Update operation on the item’s parent folder for the change to take effect.
Attention: For SVN 1.8 working copies: when committing items that were moved and/or renamed, make sure you select both the source and the destination. Otherwise, the commit operation will fail.

Rename Resources

The Rename action is available in the contextual menu of the Working Copy view (on page 2416) and can be performed on a single resource. This action acts as a move command with the destination directory being the same as the original location of the resource. A copy of the original item is created with the new name, also keeping its history. The original item is marked as deleted.

Note: External items cannot be renamed using the Rename action because they cannot be deleted. Instead, you should edit the svn:externals property defining the external item, then use the Update operation on the item's parent folder for the change to take effect.

Attention: For SVN 1.8 working copies: when committing items that were moved and/or renamed, make sure you select both the source and the destination. Otherwise, the commit operation will fail.

Lock / Unlock Resources

The idea of version control is based on the copy-modify-merge model of file sharing. This model states that each user contacts the repository and creates a local working copy (check out). Users can then work independently and modify their working copies according to their needs. When their goal has been accomplished, it is time for the users to share their work with the others, to send them to the repository (commit). When a user has modified a file that has been also modified on the repository, the two files will have to be merged. The version control system assists the user with the merging as much as it can, but in the end the user is the one that must make sure it is done correctly.

The copy-modify-merge model only works when files are contextually mergeable: this is usually the case of line-based text files (such as source code). However this is not always possible with binary formats, such as images or sounds. In these situations, the users must each have exclusive access to the file, ending up with a lock-modify-unlock model. Without this, one or more users could end up wasting time on changes that cannot be merged.

An SVN lock is a piece of metadata that grants exclusive access to a user. This user is called the lock owner. A lock is uniquely identified by a lock token (a string of characters). If someone else attempts to commit the file (or delete a parent of the file), the repository demands two pieces of information:

- User authentication - the user performing the commit must be the lock owner
- Software authorization - the user's working copy must have the same lock token as the one from the repository, proving that it is the same working copy where the lock originated from.
Scanning for Locks

When starting to work on a file that is not contextually mergeable (usually a binary file), it is better to verify if someone else is not already working on that file. You can do this in the Working Copy view (on page 2416) by selecting one or more resources, then right-clicking them and choosing the Scan for Locks action from the contextual menu.

Figure 536. Locked Items Dialog Box

The Locked items dialog box contains a table with all the resources that were found locked on the repository. For each resource there are specified: resource path, state of the lock, owner of the lock, lock comment, creation and expiration date for the lock (if any).

The state of the lock can be one of the following:

• 🗝 - Appears when one of the following conditions apply:
  ◦ Another user has locked the file in the repository.
  ◦ The file was locked by the same user from another working copy.
  ◦ The file was locked from the Repositories view.

• 🗝 - Displayed after you have locked a file from the current working copy.

• 🗝 - A file already locked from your working copy is no longer locked in the repository (it was unlocked by another user).

• 🗝 - A file already locked from your working copy is being locked by another user. Now the owner of the file lock is the user who stole the lock from you.

You can unlock a resource by selecting it and pressing the Unlock button.

Related Information:

• Working Copy Locks (on page 2420)
Locking a File

By locking a file, you have exclusive write access to it in the repository.

You can lock a file from your working copy or directly from the Repositories view.

⚠️ Note: You can only lock files (not directories). This is a restriction imposed by Apache Subversion™.

The Lock dialog box allows you to write a comment when you set a lock or when you steal an existing one. Note that you should steal a lock only after you made sure that the previous owner no longer needs it. Otherwise, you may cause an unsolvable conflict, which could be the reason the lock was put there in the first place. The Subversion server can have a policy concerning lock stealing, as it may not allow you to do this if certain conditions are not met.

The lock stays in place until you unlock the file or until someone breaks it. There is also the possibility that the lock expires after a period of time specified in the Subversion server policy.

Unlocking a File

A file can be unlocked from the contextual menu of the Working Copy view (on page 2416). A dialog box will prompt you to confirm the unlocking and it will also allow you to break the lock (unlock it by force).

Synchronize with Repository

In the work cycle you will need to incorporate other people's changes (update) and to make your own work available to others (commit). This is what the Incoming and Outgoing modes of the Working Copy view (on page 2416) was designed for, to help you send and receive modifications from the repository.

The Incoming and Outgoing modes of this view focus on incoming and outgoing changes. The incoming changes are the changes that other users have committed in the repository since you last updated your working copy. The outgoing changes are the modifications you made to your working copy as a result of editing, removing or adding resources.

The view presents the status of the working copy resources against the BASE revision after a Refresh operation. You can view the state of the resources versus a repository HEAD revision by using the Synchronize action from the Working Copy view (on page 2416).
View Differences

One of the most common requirements in project development is to see what changes have been made to the files from your Working Copy or to the files from the repository. You can examine these changes after a synchronize operation with the repository, by using the Open in compare editor action from the contextual menu.

The text files are compared using a built-in Compare view (on page 2440) that uses a line differencing algorithm or a specified external diff application (if such an application is set in the SVN Diff preferences page (on page 227)). When a file with outgoing status is involved, the compare is performed between the file from the working copy and the BASE revision of the file. When a file with incoming or conflict status is involved, the differences are computed using a three-way algorithm that means that the local file and the repository file are each compared with the BASE revision of the file. The results are displayed in the same view. The differences obtained from the local file comparison are considered outgoing changes and the ones obtained from the repository file comparison are considered incoming changes. If any of the incoming changes overlap outgoing changes then they are in conflict.

A special case of difference is a diff pseudo-conflict. This is the case when the left and the right sections are identical but the BASE revision does not contain the changes in that section. By default, this type of changes are ignored. If you want to change this, you can go to the SVN preferences page and select the Allow unversioned obstructions option (on page 225).

The right editor of the internal compare view presents either the BASE revision or a revision from the repository of the file so its content cannot be modified. By default, when opening a synchronized file in the Compare view, a compare is automatically performed. After modifying and saving the content of the local file presented in the left editor, another compare is performed. You will also see the new refreshed status in the Working Copy view (on page 2416).

Figure 537. Compare View
At the top of each of the two editors, there are presented the name of the opened file, the corresponding SVN revision number (for remote resources) and the author who committed the associated revision.

There are three types of differences:

- **Incoming changes** - Changes committed by other users and not present yet in your working copy file. They are marked with a blue highlight and on the middle divider the arrows point from right to left.
- **Outgoing changes** - Changes you have done in the content of the working copy file. They are marked with a gray highlight and the arrows on the divider are pointing from left to right.
- **Conflicting changes** - This is the case when the same section of text that you already modified in the local file has been modified and committed by some other person. They are marked with a red highlight and red diamonds on the divider.

There are numerous actions and options available in the Compare View toolbar (on page 2442) or in the Compare menu from the main menu. You can decide that some changes need adjusting or that new ones must be made. After you perform the adjustments, you may want to perform a new compare between the files. For this case there is an action called Perform files differencing.
After each files differencing operation the first found change will be selected. You can navigate from one change to another by using the actions **Go to first**, **Go to previous**, **Go to next** and **Go to last modification**. If you decide that some incoming change needs to be present in your working file you can use the action **Copy change from right to left**. This is useful also when you want to override the outgoing modifications contained in a conflicting section. The **Copy all non-conflicting changes from right to left** action copies all incoming changes that are not contained inside a conflicting section in your local file.

Suppose that only a few words or letters are changed. Considering that the differences are performed taking whole lines of text into account, the change will contain all the lines involved. To find exactly what words or letters have changed, the **Word Details** and **Character Details** dialog boxes are available. They present a more detailed comparison result when you double-click the middle divider of a difference.

When you want to examine only the changes in the real text content of the files, while disregarding the changes in the number of white spaces between words or lines, there is an option available in the **SVN Preferences (on page 224)** that allows you to enable or disable the white space ignoring feature of the compare algorithm.

### Conflicts

A file conflict occurs when two or more developers have changed the same few lines of a file or the properties of the same file. As Subversion knows nothing of your project, it leaves resolving the conflicts to the developers. Whenever a conflict is reported, you should open the file in question, and try to analyze and resolve the conflicting situation.

### Real Conflicts vs Mergeable Conflicts

There are two types of conflicts:

- **real conflict** ([a icon in Name column]) - Syncro SVN Client considers the following resource states to be real conflicts:
  - **conflicted state** - A file reported by SVN as being in this state is obtained after it was updated/merged while having incoming and outgoing content or property changes at the same time, changes that could not be merged. A content conflict ([c icon in Local file status column]) is reported when the modified file has binary content or it is a text file and both local and remote changes were found on the same line. A properties conflict ([e icon in Local properties status column]) is reported when a property's value was modified both locally and remotely.
  - **tree conflicted state** ([k icon in Local file status column]) - Obtained after an update or merge operation, while having changes at the directory structure level (for example, file is locally modified and remotely deleted or locally scheduled for deletion and remotely modified).
• **obstructed state** ( annunciator icon in Local file status column) - Obtained after a resource was versioned as one kind of object (file, directory, symbolic link), but has been replaced outside Syncro SVN Client by a different kind of object.

• **pseudo-conflict** ( icon in Name column) - A file is considered to be in pseudo-conflict when it contains both incoming and outgoing changes. When incoming and outgoing changes do not intersect, an update operation may automatically merge the incoming file content into the existing locally one. In this case, the pseudo-conflict marker is removed. This marker is used only as a warning that should prevent you to run into a real conflict.

**Note:**

• A conflicting resource cannot be committed to repository. You have to resolve it first, by using **Mark Resolved** action (after manually editing/merging file contents) or by using **Mark as Merged** action (for pseudo-conflicts).

• and icons are presented only when one of the following view modes is selected: **Modified, Incoming, Outgoing, Conflicts**.

• The icon is used also for folders to signal that they contain a file in real conflict or pseudo-conflict state.

### Content Conflicts vs Property Conflicts

A **Content conflict** appears in the content of a file. A merge occurs for every inbound change to a file that is also modified in the working copy. In some cases, if the local change and the incoming change intersect each other, Apache Subversion™ cannot merge these changes without intervention. So if the conflict is real when updating the file in question the conflicting area is marked like this:

```
<<<<<<<<< filename
your changes
----------
code merged from repository
>>>>>>>>> revision
```

Also, for every conflicted file Subversion places three additional temporary files in your directory:

• **filename.ext.mine** - This is your file as it existed in your working copy before you updated your working copy, that is without conflict markers. This file has your latest changes in it and nothing else.

• **filename.ext.rOLDREV** - This is the file that was the BASE revision before you updated your working copy, that is the file revision that you updated before you made your latest edits.
• **filename.ext.rNEWREV** - This is the file that Subversion client just received from the server when you updated your working copy. This file corresponds to the HEAD revision of the repository.

OLDREV and NEWREV are revision numbers. If you have conflicts with binary files, Subversion does not attempt to merge the files by itself. The local file remains unchanged (exactly as you last changed it) and you will get **filename.ext.r* files also.**

A **Property conflict** is obtained when two people modify the same property of the same file or folder. When updating such a resource a file named **filename.ext.prej** is created in your working copy containing the nature of the conflict. Your local file property that is in conflict will not be changed. After resolving the conflict, you should use the **Mark resolved** action to commit the file. Note that the **Mark resolved** action does not really resolve the conflict. It just removes the conflicted flag of the file and deletes the temporary files.

**Edit Real Content Conflicts**

The conflicts of a file in the conflicted state (a file with the red double arrow icon) can be edited visually with the **Compare** view (the built-in file comparison tool) or with an **external diff application** (**on page 224**). Resolving the conflict means deciding for each conflict if the local version of the change will remain or the remote one instead of the special conflict markers inserted in the file by the SVN server.

The **Compare** view (or the external diff application set in **Preferences** (**on page 224**)) is opened with the **Edit Conflict** action, which is available on the contextual menus of the **Working Copy** view (**on page 2416**) for files in the conflicted state (an update operation was executed but the differences could not be merged without conflicts). The external diff application is called with 3 parameters because it is a 3-way diff operation between the local version of the file from the working copy and the HEAD version from the SVN repository with the BASE version from the working copy as common ancestor.

If the **Show warning dialog when edit conflicts** option (**on page 228**) is selected, you will be warned at the beginning of the operation that the operation will overwrite the conflict version of the file received from the SVN server (the version that contains the conflict markers `<<<<<<<, =======, >>>>>>>`) with the original local version of the file that preceded the update operation. If you press the OK button the visual conflict editing will proceed and a backup file of the conflict version received from the SVN server is created in the same working copy folder as the file with the edited conflicts. The name of the backup file is obtained by appending the extension `.sync.bak` to the file as stored on the SVN server. If you press the **Cancel** button the visual editing will be aborted.

The usual actions on the differences between two versions of a file are available on the toolbar of this view:
Save

Saves the modifications of the local version of the file displayed in the left side of the view.

Perform Files Differencing

Looks for differences between the two files displayed in the left and right side panels.

Ignore Whitespaces

Enables or disables the whitespace ignoring feature. Ignoring whitespace means that before performing the comparison, the application normalizes the content and trims its leading and trailing whitespaces.

Synchronized scrolling

Toggles synchronized scrolling. When toggled on, a selected difference can be seen in both panels.

Format and Indent Both Files (Ctrl + Shift + P (Command + Shift + P on OS X))

Formats and indents both files before comparing them. Use this option for comparisons that contain long lines that make it difficult to spot differences.

Note: When comparing two JSON files, the Format and Indent Both Files action will automatically sort the keys in both files the same to make it easier to compare.

Copy Change from Right to Left

Copies the selected difference from the file in the right panel to the file in the left panel.

Copy All Changes from Right to Left

Copies all changes from the file in the right panel to the file in the left panel.

Next Block of Changes (Ctrl + Period (Command + Period on OS X))

Jumps to the next block of changes. This action is not available when the cursor is positioned on the last change block or when there are no changes.

Note: A change block groups one or more consecutive lines that contain at least one change.

Previous Block of Changes (Ctrl + Comma (Command + Comma on OS X))

Jumps to the previous block of changes. This action is not available when the cursor is positioned on the first change block or when there are no changes.

Next Change (Ctrl + Shift + Period (Command + Shift + Period on OS X))
Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is not available when the cursor is positioned on the last change or when there are no changes.

Previous Change (Ctrl + Shift + Comma (Command + Shift + M on OS X))

Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is not available when the cursor is positioned on the first change or when there are no changes.

First Change (Ctrl + B (Command + B on OS X))

Jumps to the first change.

The operation begins by overwriting the conflict version of the file received from the SVN server (the version that contains the conflict markers <<<<<<<<, ========, >>>>>>>>) with the original local version of the file before running the update action that created the conflict. After that the differences between this original local version and the repository version are displayed in the Compare view.

If you want to edit the conflict version of the file directly in a text editor instead of the visual editing offered by the Compare view you should work on the local working copy file after the update operation without running the action Edit Conflict. If you decide that you want to edit the conflict version directly after running the action Edit Conflict you have to work on the .sync.bak file.

If you did not finish editing the conflicts in a file at the first run of the action Edit Conflict you can run the action again and you will be prompted to choose between resuming the editing where the previous run left it and starting again from the conflict file received from the SVN server.

After the conflicts are edited and saved in the local version of the file you should run one of the following:

- The Mark Resolved action on the file so that the result of the conflict editing process can be committed to the SVN repository.
- The Revert action so that the repository version overwrites all the local modifications.

Both actions remove the backup file and other temporary files created with the conflict version of the local file.

Revert Your Changes

If you want to undo changes made in your working copy, since the last update, select the items you are interested in, right-click to display the contextual menu and select Revert. A dialog box will open that shows you the files and folders that you have changed and can be reverted. Select those you
want to revert and click the OK button. Revert will undo only your local changes. It does not undo any changes that have already been committed. If you choose to revert a conflicting item to its pristine copy, then the eventual conflict is solved by losing your outgoing modifications. If you try to revert a resource not under version control, the resource will be deleted from the file system.

Note: By default, a directory will be recursively reverted (including any other modified item it contains). However, if the directory has only property changes, you need to explicitly choose if the operation will include any modified items found inside it.

If you want some of your outgoing changes to be overridden you must first open the file in Compare view (on page 2440) and choose the sections to be replaced with ones from the repository file. This can be achieved either by editing directly the file or by using the action Copy change from right to left from the Compare view toolbar (on page 2442). After editing the conflicting file you have to run the action Mark as merged before committing it.

If you want to drop all local changes and bring all incoming changes into your working copy resource, you can use the Override and update action. It discards the changes in the local file and updates it from the repository. A dialog box will display the files that will be affected.

Figure 538. Override and Update Dialog Box
In the first table of the dialog box you will be able to see the resources that will be overridden. In the second table you will find the list of resources that will be updated. Only resources that have an incoming status are updated.

**Tip:** If you want to roll-back out of your working copy changes that have already been committed to the repository, see *Merge Revisions* (on page 2379).

**Merge Conflicted Resources**

Before you can safely commit your changes to the repository you must first resolve all conflicts. In the case of pseudo-conflicts they can be resolved in most cases with an update operation that will merge the incoming modifications into your working copy resource. In the case of real conflicts, conflicts that persist after an update operation, it is necessary to resolve the conflict using the built-in compare view and editor or, in the case of properties conflict, the *Properties view* (on page 2444). Before you can commit you must *mark as resolved* the affected files.

Both pseudo and real conflicts can be resolved without an update. You should open the file in the compare editor and decide which incoming changes need to be copied locally and which outgoing changes must be overridden or modified. After saving your local file you have to use the *Mark as merged* action from the contextual menu before committing.

**Drop Incoming Modifications**

In the situation when your file is in conflict but you decide that your working copy file and its content is the correct one, you can decide to drop some or all of the incoming changes and commit afterwards. The action *Mark as merged* proves to be useful in this case too. After opening the conflicting files with *Compare view* (on page 2440), *Editor* (on page 2437) or editing their properties in the *Properties view* and deciding that your file can be committed in the repository replacing the existing one, you should use the *Mark as merged* action. When you want to override completely the remote file with the local file you should run the *Override and commit* action, which drops any remote changes and commits your file.

In general it is much safer to analyze all incoming and outgoing changes using the *Compare view* and only after to update and commit.

**Tree Conflicts**

A *tree conflict* is a conflict at the directory tree structure level and occurs when the user runs an update action on a resource that has the following conditions:

- It is locally modified and the same resource was deleted from the repository (or deleted as a result of being renamed or moved).
• It was locally deleted (or deleted as a result of being renamed or moved) and the same resource is incoming as modified from the repository.

The same conflict situation can occur after a merge or a switch action. The action ends with an error and the folder containing the file that is now in the tree conflict state is also marked with a conflict icon.

Such a conflict can be resolved in one of the following ways that are available when the user double clicks on the conflicting resource or when running the Edit conflict action:

Figure 539. Resolve a tree conflict

- Keep local change (delete resource) - Keeps the incoming change that comes from the repository.
- Keep incoming modified resource - If there is a renamed version of the file committed by other user that will be added to the working copy too.

Update the Working Copy

While you are working on a project, other members of your team may be committing changes to the project repository. To get these changes, you have to update your working copy. Updating may be done on single files, a set of selected files, or recursively on entire directory hierarchies. The update operation can be performed from Working Copy view (on page 2416). It updates the selected resources to the last synchronized revision (if remote information is available) or to the HEAD revision of the repository.

There are three different kinds of incoming changes:
- **Non-conflicting** - A non-conflicting change occurs when a file has been changed remotely but has not been modified locally.

- **Conflicting, but auto-mergeable** - An auto-mergeable conflicting change occurs when a text file has been changed both remotely and locally (for example, has non-committed local changes) but the changes are on different lines of text. Not applicable to binary resources (for example, multimedia files, PDFs, executable program files).

- **Conflicting** - A conflicting change occurs when one or more of the same lines of a text file have been changed both remotely and locally.

If the resource contains only incoming changes or the outgoing changes do not intersect with incoming ones then the update will end normally and the Subversion system will merge incoming changes into the local file. In the case of a conflicting situation the update will have as result a file with conflict status.

The Oxygen XML Author allows you to update your working copy files to a specific revision, not only the most recent one. This can be done by using the **Update to revision/depth** action from the **Working Copy** view (All Files view mode) or the **Update to revision** action from the **History** view (on page 2431) contextual menu.

If you select multiple files and folders and then you perform an **Update** operation, all of those files and folders are updated one by one. The Subversion client makes sure that all files and folders belonging to the same repository are updated to the exact same revision, even if between those updates another commit occurred.

When the update fails with a message saying that there is already a local file with the same name Subversion tried to check out a newly versioned file, and found that an unversioned file with the same name already exists in your working folder. Subversion will never overwrite an unversioned file unless you specifically do this with an **Override and update** action. If you get this error message, the solution is simply to rename the local unversioned file. After completing the update, you can check to see if the renamed file is still needed.

**Send Your Changes to the Repository**

Sending the changes you made to your working copy is known as **committing** the changes. If your working copy is up-to-date and there are no conflicts, you are ready to commit your changes.

The **Commit** action sends the changes from your local working copy to the repository. The **Commit** dialog box presents all the items that you can commit.

Figure 540. Commit dialog box
Enter a message to associate with the commit, or choose a previous message from the Previous messages list (the last 10 commit messages will be remembered even after restarting the SVN client application).

An item that can be committed has one of the following states: added, modified (content or properties), replaced, and deleted. All items that have one of these states are selected in the dialog box by default. If you do not want to commit one of the items, deselect it.

⚠️ Attention: For SVN 1.8 working copies: when committing items that were moved and/or renamed, make sure you select both the source and the destination. Otherwise, the commit operation will fail.

Besides the items that have one of the mentioned states, Syncro SVN Client also includes the files being unversioned or missing and these items are handled automatically:

- **Unversioned** items are added under version control.
- **Missing** items are deleted.

💡 Note: If the Show unversioned directories content option is not selected, the Commit dialog box does not display the items inside an unversioned directory.
Unversioned or missing items are not selected by default in the Commit dialog box, unless you have selected them explicitly when issuing the commit command.

Note: In some cases, items that have one of the above states are not presented in the Commit dialog box.

For example:

- Items that have been added or replaced previously, but now are presented as missing after being removed from the file system, outside of an SVN client. Such items do not exist in the repository and you should use the Delete action to remove them from your working copy.
- Items that have incoming changes from the repository, after a synchronization. You need to have your working copy up-to-date before committing your changes.
- Files that, after a synchronization, appear as locked by other users or from other locations than the current working copy.

Note: Due to dependencies between items, when you select or clear an unversioned (unversioned) or added (added) item in the Commit dialog box, other items with one of these states can be selected or cleared automatically.

The modifications that will be committed for each file can be reviewed in the compare editor window by double clicking a file in the Commit dialog box, or by right clicking and selecting the Show Modifications action from the contextual menu. This option is available to review only file content changes, not property changes.

The Local file status column indicates the actual state of the items and the Local properties status column indicates whether or not the properties of an item are modified.

The Lock information column is displayed if at least one of the files in the Commit dialog box has lock information associated with it, valid against the commit operation.

The following options are available in this dialog box:

- Enable automatic properties or Disable automatic properties - enables or disables automatic property assignment (per runtime configuration rules), overriding the enable-auto-props runtime configuration directive, defined in the config file of the Subversion configuration directory.

  Note: This option is available only when there are defined properties to be applied automatically for resources newly added under version control. You can define these properties in the config file of the Subversion configuration directory, in the auto-props section. Based on the value of the enable-auto-props runtime configuration directive, the presented option is either Enable automatic properties, or Disable automatic properties.

- Keep locks - selecting the Keep locks option preserves any locks you set on various files.
Note: This option is available only when files that you locked are presented in the dialog box.

Each of the above options is activated only when you select an item for which the option can be applied.

Your working copy must be up-to-date with respect to the resources you commit. This is ensured by using the Update action prior to committing, resolving conflicts and re-testing as needed. If your working copy resources you are trying to commit are out of date you will get an appropriate error message.

Committing to Multiple Locations

Although Subversion does not support committing to multiple locations at once, Syncro SVN Client offers this functionality regarding external items.

If items to be committed belong to different external definitions than those found in the working copy, they are grouped under the corresponding item that indicates their repository origin. Each parent item is rendered bold and its corresponding repository location is presented when hovering it. Parent items are decorated with a small arrow (▼) if they are external definitions. The working copy root directory is never decorated and is not presented if there are no external items listed (all items belong to the main working copy). Each child item is presented relative to the parent item.

Note: When an external directory has modifications of its own, it is presented both as a parent item and as an item that you can select and commit. This is always the case for external files.

The sets of items belonging to external definitions from the same repository are committed together, resulting a single revision. So, the number of revisions can be smaller than the number of externals. External definitions are considered from the same repository if they have the same protocol, server address, port, and repository address within the server.

Note: External files are always from the same repository as the parent directory that defines them, so they are always committed together with the changes from their parent directory.

Integration with Bug Tracking Tools

Users of bug tracking systems can associate the changes they make in the repository resources with a specific ID in their bug tracking system. The only requirement is that the user includes the bug ID in the commit message that they enter in the Commit dialog box. The format and the location of the ID in the commit message are configured with SVN properties.

To make the integration possible Syncro SVN Client needs some data about the bug tracking tool used in the project. You can configure this using the following SVN properties (on page 2371) that must be
set on the folder that contains resources associated with the bug tracking system (usually they are set recursively on the root folder of the working copy):

- **bugtraq:message** - A string property. If it is set the **Commit dialog box** (on page 2365) will display a text field for entering the bug ID. It must contain the string `%BUGID%`, which is replaced with the bug number on commit.

- **bugtraq:label** - A string property that sets the label for the text field configured with the **bugtraq:message** property.

- **bugtraq:url** - A string property that is the URL pointing to the bug tracking tool. The URL string should contain the substring `%BUGID%` which Syncro SVN Client replaces with the issue number. That way the resulting URL will point directly to the correct issue.

- **bugtraq:warnifnoissue** - A boolean property with the values `true/yes` or `false/no`. If set to `true`, the Syncro SVN Client will warn you if the bug ID text field is left empty. The warning will not block the commit, only give you a chance to enter an issue number.

- **bugtraq:number** - A boolean property with the value `true` or `false`. If this property is set to `false`, then any character can be entered in the bug ID text field. If the property is set to `true` or is missing then only numbers are allowed as the bug ID.

- **bugtraq:append** - A boolean property. If set to `false`, then the bug ID is inserted at the beginning of the commit message. If `yes` or not set, then it is appended to the commit message.

- **bugtraq:logregex** - This property contains one or two regular expressions, separated by a newline. If only one expression is set, then the bug ID's must be matched in the groups of the regular expression string (for example, `\[iI]ssue #?\(\d+\)`). If two expressions are set, then the first expression is used to find a string which relates to a bug ID but may contain more than just the bug ID (for example, `Issue #123` or `resolves issue 123`). The second expression is then used to extract the bug ID from the string extracted with the first expression. An example: if you want to catch every pattern `issue #XXX` and `issue #890, #789` inside a log message you could use the following strings:

  - `\[iI]ssue #?\(\d+\)\(,? ?#?\(\d+\)\)+
  - `(\d+)`

The data configured with these SVN properties is stored on the repository when a revision is committed. A bug tracking system or a statistics tool can retrieve the revisions that affected a bug from the SVN server and present the commits related to that bug to the user of the bug tracking system.

If the **bugtraq:url** property was filled in with the URL of the bug tracking system and this URL includes the `%BUGID%` substring as specified above in the description of the **bugtraq:url** property then the **History view** (on page 2431) presents the bug ID as a hyperlink in the commit message. Clicking such a hyperlink in the commit message of a revision opens a Web browser at the page corresponding to the bug affected by that commit.
Obtain Information for a Resource

This section explains how to obtain information for a SVN resource:

Request Status Information for a Resource

While you are working with the SVN Client you often need to know which files you have changed, added, removed, or renamed, or even which files got changed and committed by others. This is where the Synchronize action from the Working Copy view (on page 2416) comes in handy. The Working Copy view shows you every file that has changed your working copy, as well as any unversioned files you may have.

If you want more detailed information about a given resource, you can use the Show SVN Information action. This action is available from the File menu or the contextual menu of the Working Copy, Repositories, History, or Directory Change Set views, or from the Revision Graph dialog box. The SVN Information dialog box will be displayed, showing information about the selected resource. The information displayed depends on the location of the item (local or remote) and may include the following:

- Local path and repository location
- Revision number
- Last change author, revision and date
- Information about locks
- Local file status
- Local properties status
- Local directory depth
- Repository location and revision number for copied files or directories
- Path information about locally moved items
- Path information about conflict generated files
- Remote file status
- Remote properties status
- File size and other information

The value of a property of the resource displayed in the dialog box can be copied by right-clicking the property and selecting the Copy action.

Request History for a Resource

In Apache Subversion™, both files and directories are versioned and have a history. If you want to examine the history for a selected resource and find out what happened at a certain revision you can use the History view that can be accessed from Repositories view (on page 2411), Working Copy view (on page 2416), Revision Graph (on page 2447), or Directory Change Set view (on page 2435).
From the **Working copy view** you can display the history of local versioned resources. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

**Related Information:**

- **History View (on page 2431)**

### Management of SVN Properties

In the **Properties view (on page 2444)** you can read and set the Apache Subversion™ properties of a file or folder. There is a set of predefined properties with special meaning to Subversion. For more information about properties in Subversion see the SVN Subversion specification. Subversion properties are revision dependent. After you change, add or delete a property for a resource, you have to commit your changes to the repository.

If you want to change the properties of a given resource you need to select that resource from the **Working Copy view (on page 2416)** and run the **Show properties** action from the contextual menu. The **Properties view (on page 2444)** will show the local properties for the resource in the working copy. Once the **Properties** view is visible, it will always present the properties of the currently selected resource. There are actions available in the **Properties view toolbar (on page 2446)** that allow you to add, change, and delete the properties.

If you choose the **Add a new property** action, a new dialog box will appear that contains the following:

- **Name** - Combo box that allows you to enter the name of the property. The drop-down menu of the combo box presents the predefined Subversion properties (such as `svn:ignore`, `svn:externals`, `svn:needs-lock`, etc.)
- **Current value** - Text area that allows you to enter the value of the new property.

If the selected item is a directory, you can also set the property recursively on its children by selecting the **Set property recursively** checkbox.

If you want to change the value for a previously set property, you can use the **Edit property** action, which will display a dialog box with the following information:

- **Name** - Property name (cannot be changed).
- **Current value** - The current value (can be changed).
- **Base value** - The value of the property, if any, from the resource in the pristine copy (cannot be changed).
If you want to completely remove a property previously set you can choose the **Remove property** action. It will display a confirmation dialog box in which you can also choose if the property will be removed recursively.

There is a **Refresh** action in the **Properties view (on page 2444)** that can be used when the properties have been changed from outside the view. This can happen, for example, when the view was already presenting the properties of a resource and they have been changed after an **Update** operation.

**Branches and Tags**

One of the fundamental features of version control systems is the ability to create a new line of development from the main one. This new line of development will always share a common history with the main line if you look far enough back in time. This line is known as a **branch**. Branches are mostly used to try out features or fixes. When the feature or fix is finished, the branch can be merged back into the main branch (**trunk**).

Another feature of version control systems is the ability to take a snapshot of a particular revision, so you can at any time recreate a certain build or environment. This is known as **tagging**. Tagging is especially useful when making release versions.

In Apache Subversion™, there is no difference between a **tag** and a **branch**. On the repository, both are ordinary directories that are created by copying. The trick is that they are cheap copies instead of physical copies. Cheap copies are similar to hard links in Unix, which means that they merely link to a specific tree and revision without making a physical copy. As a result, branches and tags occupy little space on the repository and are created very quickly.

Provided that nobody ever commits to the directory in question, it remains a tag. If people start committing to it, it becomes a branch.

**Create a Branch / Tag**

To create a branch or tag by copying a directory, use the **Branch/Tag** action that is available in the **Tools** menu when an item is selected in the **Working Copy view (on page 2416)** or **Repositories view (on page 2411)**, or from the contextual menu of the **Repositories** view.

**Figure 541. Branch/Tag Dialog Box**
You can configure the following options in this dialog box:

You can specify the source revision of the copy in the **Copy from** section. You can choose between the following options:

- **HEAD revision in the repository** - The new branch or tag will be copied in the repository from the **HEAD** revision. The branch will be created very quickly, as the repository will make a *cheap* copy.

- **Specific revision in the repository** - The new branch will be copied into the repository, but you can specify the exact desired revision. For example, this is useful if you forgot to make a branch or tag when you released your application. If you click the **History** button you can select the revision number from the **History** dialog box (*on page 2345*). This type of branch will also be created very quickly.

- **Working copy** - (Available only if the item is selected from the **Working copy** view). The new branch will be a copy of your local working copy. If you have updated some files to an older revision in your working copy, or if you have made local changes, that is exactly what goes into the copy. This involves transferring some data from your working copy back to the repository, or more specifically, the locally modified files.

You can specify the location of the new branch or tag in the **Destination** section:

- **Into repository's directory** - The URL of the parent directory (*on page 2452*) of the new branch or tag.
Note: Peg revisions have no effect for this operation since it is used to send information to the repository.

- **Under the name** - You can specify another branch or tag name other than the name of the resource selected in the Repositories or Working copy view.

The new branch or tag will be created as a child of the specified URL of the repository directory and will have the new name.

**Merging**

At some stage during the development process, you will want to merge the changes made on a branch back into the trunk, or vice-versa. The merge is accomplished by comparing two points (branches or revisions) in the repository and applying the obtained differences to your working copy. This process is closely related to the diff concept.

Note: A branch is a line of development that exists independently of another line, yet still shares a common history if you look far enough back in time. A branch always begins life as a copy of something (such as a trunk, another branch, or tag), and moves on from there, generating its own history.

The Merge action is available in the **Tools** menu. The working copy item selected when you issued the command will be the one receiving the generated changes. If there is no item selected, the merge operation will be performed on the entire working copy.

Figure 542. **Merge Wizard**
The four types of merging are as follows:

- **Merge revisions** *(on page 2377)* - Port changes from one branch to another. Note that the trunk can also be considered a branch, in this context.
- **Synchronize branch** *(on page 2379)* - Fetch all the changes made on a parent branch (or the trunk) to a child branch.
- **Reintegrate a branch** *(on page 2381)* - Merge a branch back to its parent branch (can also be the trunk).
- **Merge two different trees** *(on page 2383)* - Integrate the changes done on a branch to a different branch.

It is recommended that you enable the following pre-merge check:

**Perform pre-merge best practices checks of the working copy target** *(on page 2376)* - When selected, the SVN Client checks if the working copy target item is ready for the merge operation and displays the pre-merge checks wizard page.

**Remember**: It is a good idea to perform a merge into an unmodified working copy. If you have made changes to your working copy, commit them first. If the merge does not go as you expect, you may want to revert the changes and revert cannot recover your uncommitted modifications.
Important: The above recommendation becomes mandatory when reintegrating a branch (on page 2374).

Pre-Merge Checks

Before performing a merge, it is recommended to make sure that the working copy target item is ready for the merge operation. The SVN Client includes a best practices step that checks various conditions of the working copy target item to ensure that the merge operation will succeed. By selecting the Perform pre-merge best practices checks of the working copy target option in the first page of the Merge wizard, the Pre-merge checks wizard page is displayed to give you a summary of the verified conditions.

Figure 543. Pre-Merge Checks Wizard Page

The following conditions are checked in this operation:

No local modifications

The working copy item (or any of its children) receiving the merge should not contain uncommitted changes, to make it easier to revert merge-generated changes if you encounter unexpected results.

Tip: If this condition fails, you should commit or revert the local modifications before merging.
No switched children

None of the children of the working copy item receiving the merge should be switched, to avoid incomplete merges and subtree mergeinfo.

Tip: If this condition fails, you should switch back all the children before merging.

Complete working copy tree

The working copy item receiving the merge should be a complete directory tree structure with an infinite depth, to avoid incomplete merges and subtree mergeinfo.

Tip: If this condition fails, you should change the sticky depth of the working copy item receiving the merge to infinity value.

No mixed revisions

To avoid unexpected merge conflicts, the working copy item that is receiving the merge should not contain items that were updated to other revisions.

Tip: If this condition fails, you should update the working copy before merging.

Each condition is marked with an icon that represents the state of the condition. The possible states are as follows:

- ✔️ (Successful) - The condition is fulfilled successfully.
- 🔄 (Warning) - The condition is not fulfilled, but it is not mandatory.
- ⚠️ (Error) - The condition is not fulfilled and is mandatory (therefore, the operation cannot proceed until you solve the error).

Tip: For each condition state, a message is displayed that gives you additional information about the results and, for warning or errors, a hint that explains how you can solve them.

⚠️ Important: After solving any of the warnings or errors, it is recommended that you perform the pre-merge checks again to make sure your new changes are valid.

Merge Revisions

This case is when you have made one or more changes to a branch and you want to duplicate them in another branch. For example, suppose you know that a problem has been fixed by committing revisions 17, 20, and 25 on branch B1. These changes are also needed in branch B2. Thus, to merge them, you need a working copy of the B2 branch.

To merge revisions from a different branch, follow these steps:

1. Go to menu Tools > Merge.
The Merge wizard is opened.

2. Select the Merge revisions option.

3. It is recommended that you select the Perform pre-merge best practices checks of the working copy target option to make sure that the working copy target item is ready for the merge operation.

   a. Press the Next button.

   If the Perform pre-merge best practices checks of the working copy target option is selected, the Pre-Merge Checks wizard page (on page 2376) is displayed.

   Note: If errors are found you need to solve them before proceeding.

4. Press the Next button.

   The Merge revisions wizard page is displayed.

5. In the Merge from (URL) text box, enter the URL of the branch or tag (on page 2452) that contain the changes that you want to duplicate in your working copy.

   You may also click the Browse button to browse the repository and find the desired branch. If you have previously merged from this branch, then you can simply use the drop down menu, which displays a history of previously used URLs.

   Note: If the URL belongs to a different repository than the working copy, the Ignore ancestry / Disable merge tracking option (in the Merge Options wizard page (on page 2386)) will be selected automatically (and you cannot change this). This is because the Subversion client cannot track changes between different repositories (on page 2389).

   Tip: You can also specify a peg revision (on page 2454) at the end of the URL (for example, URL@rev1234). The peg revision does not affect the merge range you select. By default, the HEAD revision is assumed.

6. In the Revisions to merge section, choose between the all revisions and specific revision(s) options.

   • all revisions - The operation will include all eligible revisions that were not yet merged.

   • specific revision(s) - You can specify one or more individual revisions and/or revision ranges. Also, you can mix forward ranges (for example, 1–5), backward ranges (for example, 20–15), and subtract specific revisions from a range (for example, 1–5, -3).

   Note: If using the Subversion command-line client, a revision range of the form 1–5 means all changes starting from revision 2 up to revision 5 (the changes necessary to reach revision 5, committed after revision 1). Unlike the Subversion command-line client, in Syncro SVN Client the revision ranges are inclusive, meaning that it will process all revisions, starting with revision 1, up to and including revision 5.
Attention: The HEAD revision is the only non-numerical revision allowed, and it can only be used when specifying revision ranges as one of the ends of the range (for example, 10-HEAD). Be careful when using it, as it might not refer to the desired revision, if it has recently been committed by another user.

Tip: If you want to perform a reverse merge and roll-back your working copy changes that have already been committed to the repository, use the negative revisions notation (for example, -7) or backward revision ranges (for example, 20-10).

a. If you press the History button, the History dialog box (on page 2345) is displayed, which allows you to select one or more revisions to be merged.

7. Optionally, if you want to configure the options (on page 2386) for your merge, press the Next button. The Merge Options wizard page (on page 2386) is displayed that allows you to configure options for the operation.

Warning: If the Ignore ancestry / Disable merge tracking option is selected and you chose all revisions in the Revisions to merge section, revisions that were previously merged will also be included, which may result in conflicts.

8. Press the Merge button. The merge operation is performed.

If the merge is completed successfully, all the changes corresponding to the selected revisions should be merged in your working copy.

It is recommended to look at the results of the merge, in the working copy, to review the changes and see if it meets your expectations. Since merging can sometimes be complicated, you may need to resolve conflicts (on page 2388) after making major changes.

Note: The merge result is only in your local working copy and needs to be committed to the repository for it to be available to others.

Synchronize a Branch

While working on your own branch, other people on your team might continue to make important changes in the parent branch (which can be the trunk itself or any other branch). It is recommended to periodically duplicate those changes in your branch to make sure your changes are compatible with them. This is done by performing a synchronize merge, which will bring your branch up-to-date with any changes made to its ancestral parent branch since your branch was last created or synchronized.
Subversion is aware of the history of your branch and can detect when it split away from the parent branch.

Frequently keeping your branch in sync with the parent branch helps you to prevent unexpected conflicts when the time comes for you to duplicate your changes back into the parent branch. The synchronization uses *merge tracking* to skip all those revisions that have already been merged, thus a sync merge can be repeated periodically to fetch all the latest changes of the parent branch to keep up-to-date with it.

**Important:** It is recommended to synchronize the whole working copy that was created from the child branch (the root of the working copy), rather than just a part of it.

After running the *synchronize merge*, your working copy from the child branch now contains new local modifications, and these edits are duplications of all of the changes that have happened on the trunk since you first created your branch. At this point, your private branch is now synchronized with the trunk.

To synchronize your branch with its parent branch, follow these steps:

1. Go to **Tools > Merge**. The Merge wizard is opened.

2. Select the **Synchronize branch** option.

3. It is recommended that you select the **Perform pre-merge best practices checks of the working copy target** option to make sure that the working copy target item is ready for the merge operation.
   a. Press the Next button.
      If the **Perform pre-merge best practices checks of the working copy target** option is selected, the Pre-Merge Checks wizard page *(on page 2376)* is displayed.

   **Note:** If errors are found you need to solve them before proceeding.

4. Press the Next button. The **Synchronize branch** wizard page is displayed.

5. In the **Parent branch (URL)** text box, enter the URL of the branch from which you created your branch *(on page 2452)*. This means that the URL must belong to the same repository as your working copy that was created from the child branch.
   You may also click the Browse button to browse the repository and find the desired branch. If you have previously merged from this branch, then you can simply use the drop down menu, which displays a history of previously used URLs.
Tip: You can also specify a peg revision (on page 2454) at the end of the URL (for example, URL@rev1234). The peg revision specifies both the peg revision of the URL and the latest revision that will be considered for merging. By default, the HEAD revision is assumed.

6. Optionally, if you want to configure the options (on page 2386) for your merge, press the Next button.
   The Merge Options wizard page (on page 2386) is displayed that allows you to configure options for the operation.

   Note: The Ignore ancestry / Disable merge tracking option is not available for this merge type, since a synchronization merge should always be recorded in the destination branch.

7. Press the Merge button.
   The merge operation is performed.

If the merge is completed successfully, all the changes corresponding to the selected revisions should be merged in your working copy.

It is recommended to look at the results of the merge, in the working copy, to review the changes and see if it meets your expectations. Since merging can sometimes be complicated, you may need to resolve conflicts (on page 2388) after making major changes.

   Note: The merge result is only in your local working copy and needs to be committed to the repository for it to be available to others.

Reintegrate a Branch

There are some conditions that apply to reintegrate a branch:

• The server must support merge tracking.
• The source branch (to be reintegrated) must be coherently synchronized with its parent branch. This means that all revisions between the branching point and the last revision merged from the parent branch to the child branch must be merged to the latter one (there must be no missing revisions in-between).
• The working copy must not contain the following:
  ◦ Local modifications.
  ◦ A mixture of revisions (all items must point to the same revision).
  ◦ Sparse directories (all directories must be of infinity depth).
  ◦ Switched items.
• The revision of the working copy must be greater than or equal to the last revision of the parent branch with which the child branch was synchronized.
Tip: You can use the **pre-merge checks** option ([on page 2376](#)) to make sure these conditions are fulfilled.

This method is useful when you have a feature branch on which the development has concluded and it should be merged back into its parent branch. Since you have kept the feature branch synchronized with its parent, the latest versions of them will be absolutely identical except for your feature branch changes. These changes can be reintegrated into the parent branch by using a working copy of it and the **Reintegrate a branch** option.

This method uses the *merge-tracking* features of Apache Subversion™ to automatically calculate the correct revision ranges and to perform additional checks that will ensure that the branch to be reintegrated has been fully updated with its parent changes. This ensures that you do not accidentally undo work that others have committed to the parent branch since the last time you synchronized the child branch with it. After the merge, all branch development will be completely merged back into the parent branch, and the child branch will be redundant and can be deleted from the repository.

Tip: Before reintegrating the child branch it is recommended to synchronize it with its parent branch one more time, to help avoid any possible conflicts.

To reintegrate a child branch into its parent branch, follow these steps:

1. Go to menu **Tools > Merge**.
   The **Merge** wizard is opened.

2. Select the **Reintegrate a branch** option.

   **Note:** This option is not available if the selected working copy item (or if it is a directory, any of the items inside of it) has any type of modification. This is because it is mandatory for the target item to have no modifications.

3. It is recommended that you select the **Perform pre-merge best practices checks of the working copy target** option to make sure that the working copy target item is ready for the merge operation.

   a. Press the **Next** button.
   If the **Perform pre-merge best practices checks of the working copy target** option is selected, the **Pre-Merge Checks** wizard page ([on page 2376](#)) is displayed.

   **Note:** If errors are found you need to solve them before proceeding.

4. Press the **Next** button.
   The **Reintegrate a branch** wizard page is displayed.
5. In the **Child branch (URL)** text box, enter the **URL of the child branch to be reintegrated** (on page 2452). This means that the URL must belong to the same repository as your working copy that was created from the parent branch.

You may also click the **Browse** button to browse the repository and find the desired branch. If you have previously merged from this branch, then you can simply use the drop down menu, which displays a history of previously used URLs.

**Tip:** You can also specify a **peg revision** (on page 2454) at the end of the URL (for example, URL@rev1234). The peg revision specifies both the peg revision of the URL and the latest revision that will be considered for merging. By default, the HEAD revision is assumed.

The **Merge Options** wizard page (on page 2386) is displayed that allows you to configure options for the operation.

**Note:** Since a **reintegrate merge** is so specialized, most of the merge options are not available, except for those in the **File Comparison** category.

6. Press the **Merge** button.

The merge operation is performed.

If the merge is completed successfully, all the changes corresponding to the selected revisions should be merged in your working copy.

It is recommended to look at the results of the merge, in the working copy, to review the changes and see if it meets your expectations. Since merging can sometimes be complicated, **you may need to resolve conflicts** (on page 2388) after making major changes.

**Note:** The merge result is only in your local working copy and needs to be committed to the repository for it to be available to others.

**Merge Two Different Trees**

This merge type is useful when you need to duplicate changes from one child branch (for example, CB1) to another child branch (CB2) from the same parent branch. The SVN client will calculate the changes necessary to get from the **HEAD** revision of the parent branch (or the **trunk**) to the **HEAD** revision of one of its child branches (CB1), and apply those changes to your working copy of the other branch (CB2). The result is that the latter child branch (CB2) will also include the changes made on the original child branch (CB1), although that branch was not reintegrated into the parent branch.

This merge type could also be used to reintegrate a child branch back into its parent when the repository does not support **merge tracking**.
Note: If the server does not support *merge-tracking*, then this is the only way to merge a branch back to its parent.

1. Go to menu **Tools > Merge**.
   The **Merge** wizard is opened.

2. Select the option **Merge two different trees**.

3. It is recommended that you select the **Perform pre-merge best practices checks of the working copy target** option to make sure that the working copy target item is ready for the merge operation.
   a. Press the **Next** button.
      If the **Perform pre-merge best practices checks of the working copy target** option is selected, the **Pre-Merge Checks** wizard page (on page 2376) is displayed.
      
      Note: If errors are found you need to solve them before proceeding.

4. Press the **Next** button.
   The **Merge two different trees** wizard page is displayed.

5. In the **From (starting URL and revision)** section enter the URL of the first branch (on page 2452).
   You may also click the **Browse** button to browse the repository and find the desired branch. If you have previously merged from this branch, then you can simply use the drop down menu, which displays a history of previously used URLs.

   Tip: If you are using this method to merge a feature branch back to its parent branch, you need to start the merge wizard from within a working copy of the parent. In this field enter the full URL of the parent branch. This may sound wrong, but remember that the parent is the starting point to which you want to add the branch changes.

   Note: If the URL belongs to a different repository than the working copy, the **Ignore ancestry / Disable merge tracking** option (in the **Merge Options** wizard page (on page 2386)) will be selected automatically (and you cannot change this). This is because the Subversion client cannot track changes between different repositories (on page 2389).

   Tip: You can also specify a **peg revision (on page 2454)** at the end of the URL (for example, **URL@rev1234**). By default, the **HEAD** revision is assumed.

6. Enter the last revision number at which the two trees were synchronized by choosing between **HEAD revision** and **other revision**.
   - **HEAD revision** - Use this option if you are sure that no one else has committed changes since the last synchronization.
7. In the **To (ending URL and revision)** section enter the URL of the second branch *(on page 2452).* You may also click the **Browse** button to browse the repository and find the desired branch. If you have previously merged from this branch, then you can simply use the drop down menu, which displays a history of previously used URLs.

**Tip:** If you are using this method to merge a feature branch back to its parent branch, enter the URL of the feature branch. This way, only the changes unique to this branch will be merged, since the branch should have been periodically synchronized with its parent.

**Attention:** The URL must point to the same repository as the one in the **From (starting URL and revision)** field. Otherwise, the operation will not be allowed, since Subversion cannot compute changes between items from different repositories.

**Tip:** You can also specify a **peg revision (on page 2454)** at the end of the URL (for example, `URL@rev1234`). By default, the **HEAD** revision is assumed.

8. Select a revision to compute all changes committed up to that point by choosing between **HEAD revision** and **other revision**.

- **HEAD revision** - This is the default selected revision.
- **other revision** - Use this option if you want to enter a previous revision. You can use the **History** button to see a list of all revisions.

9. Optionally, if you want to **configure the options (on page 2386)** for your merge, press the **Next** button.

The **Merge Options** wizard page *(on page 2386)* is displayed that allows you to configure options for the operation.

**Warning:** If the **Ignore ancestry / Disable merge tracking** option is selected and you chose **all revisions** in the **Revisions to merge** section, revisions that were previously merged will also be included, which may result in conflicts.

10. Press the **Merge** button.

The merge operation is performed.

If the merge is completed successfully, all the changes corresponding to the selected revisions should be merged in your working copy.

It is recommended to look at the results of the merge, in the working copy, to review the changes and see if it meets your expectations. Since merging can sometimes be complicated, **you may need to resolve conflicts (on page 2388)** after making major changes.
Note: The merge result is only in your local working copy and needs to be committed to the repository for it to be available to others.

Merge Options

Here is the list of options that can be used when merging:

Figure 544. Merge Wizard - Advanced Options

- **Depth** (This option is applicable only for directories) - sets the depth of the merge operation. You can specify how far down into your working copy the merge should go by selecting one of the following values:
  - **Current depth** - Obeys the depths registered for the directories in the working copy that are to be switched.
  - **Recursive (infinity)** - Merges all the files and folders contained in the selected folder. This is the recommended depth for most users, to avoid incomplete merges and subtree mergeinfo.
  - **Immediate children (immediates)** - Merges only the child files and folders without recursing subfolders.
  - **File children only (files)** - Merges only the child files.
  - **This folder only (empty)** - Merges only the selected folder (no child files or folders are included).

Note: The depth term is described in the Sparse checkouts (on page 2409) section. The default depth is the current depth of the working copy item receiving the merge.
• **Ignore ancestry / Disable merge tracking** - Changes the way two items are merged if they do not share a common ancestry. Most merges involve comparing items that are ancestrally related to one another. However, occasionally you may want to merge unrelated items. If this option is not selected, the first item will be replaced with the second item. In these situations, you would want the merge to do a path-based comparison only, ignoring any relations between the items. For example, if two different files have the same name and are in the same relative location, deselecting the option replaces one of the files with the other one, and selecting it merges their contents.

**Note:** If the URL of the merge source belongs to a different repository than the URL of the target working copy item (the one receiving the changes), this option is selected automatically (and you cannot change this). This is because the Subversion client cannot track changes between different repositories (on page 2389).

• **Force deletion of modified or non-versioned items, if necessary** - If not selected, when the merge operation involves deleting locally modified or non-versioned items, it will fail. This is done to prevent data loss. This option is only available if there are uncommitted changes in the working copy.

• **Only record the merge (block revisions from getting merged)** - Available when the **Ignore ancestry / Disable merge tracking** option (on page 2387) is not selected. It enables a special mode of the merge operation that just records it in the local merge tracking information, without actually performing it (does not modify any file contents or the structure of your working copy). You might want to select this option for two possible reasons:
  - You made (or will make) the merge manually, and therefore need to mark the revisions as being merged to make the merge tracking system aware of them. This will exclude them from future merges.
  - You want to prevent one or more particular changes from being fetched in subsequent merges.

• **Ignore line endings** - Allows you to specify how the line ending changes should be handled. By default, all such changes are treated as real content changes, but you can ignore them if you select this option.

• **Ignore whitespaces** - Allows you to specify how the whitespace changes should be handled. By default, all such changes are treated as real content changes, but you can ignore them if you select this option.
  - **Ignore whitespace changes** - Ignores changes in the amount of whitespaces or to their type (for example, when changing the indentation or changing tabs to spaces).

**Note:** Whitespaces that were added where there were none before, or that were removed, are still considered to be changes.
  - **Ignore all whitespaces** - Ignores all types of whitespace changes.

• **Test merge** - Performs a dry run of the merge operation, allowing you to preview it without actually performing the merge. In the **Console** view you will see a list of the working copy items
that will be affected and how they will be affected. This is helpful in detecting whether or not a merge will be successful, and where conflicts may occur.

Resolving Merge Conflicts

After the merge operation is finished, it is possible to have some items in conflict. This means that some incoming modifications for an item could not be merged with the current working copy version. If there are such conflicts, the **Merge conflicts** dialog box will appear, presenting the items that are in conflict. This dialog box offers you choices for resolving the conflicts.

Figure 545. Merge Conflicts Dialog Box

![Merge conflicts dialog box](image)

The options to resolve a conflict are as follows:

- **Resolve later** - Used for leaving the conflict as it is, to manually resolve it later.
- **Keep incoming** - This option keeps all the incoming modifications and discards all current ones from your working copy.
- **Keep outgoing** - This option keeps all current modifications from your working copy and discards all incoming ones.
- **Mark resolved** - You should choose this option after you have manually solved the conflict, to instruct the Subversion that it was resolved. To do this, use the **Edit conflict** button, which displays a dialog box that presents the contents of the conflicting items (the content of the working copy version versus the incoming version).
Additional Notes About the Merge Operation

**Sub-tree Merges**

It is recommended to perform a merge on the whole working copy (select its root directory when triggering the operation) to avoid *sub-tree mergeinfo*. *Sub-tree mergeinfo* is the *mergeinfo* recorded to describe a *sub-tree merge*. That is, a merge done directly to a child of a branch root that might be needed in certain situations. There is nothing special about *sub-tree merges* or *sub-tree mergeinfo* except that the complete record of merges to a branch may not be contained solely in the *mergeinfo* on the branch root and you may have to look to any *sub-tree mergeinfo* to get a full accounting. Fortunately, Subversion does this for you and rarely will you need to look for it.

**Merging from Foreign Repositories**

Subversion supports merging from foreign repositories. While all merge source URLs must point to the same repository, the merge target (from the working copy) may come from a different repository than the source. However, copies made in the merge source will be transformed into plain additions in the merge target. Also, *merge-tracking* is not supported for merges from foreign repositories.

**Note:** When performing merges from repositories other than the one corresponding to the target item (from the working copy), the *Ignore ancestry / Disable merge tracking* option (on page 2387) in the *Merge Options* wizard page (on page 2386) will be selected automatically (and you cannot change this).

**General Merge Recommendations**

As a recommendation, you should only merge into clean working copies that *do not* contain any of the following:

- Modifications.
- Sparse directories (all directories must be of depth *infinity*).
- Switched items.

**Important:** This recommendation becomes mandatory when performing a *reintegrate merge* (on page 2381) operation. Also, trying to merge to mixed-revision working copies will fail in all types of merge operations.

**Remember:** The merge result is only in your local working copy and needs to be committed to the repository for it to be available to others.
Switch the Repository Location

The **Switch** action is useful when the repository location of a working copy, or an already committed item in the working copy, must be changed within the same repository. The action is available on the **Tools** menu when a versioned resource is selected in the current working copy that is displayed in the **Working Copy** view (on page 2416).

**Note:** *External* items cannot be switched using this action. Instead, change the value of the *svn:externals* property set on the parent directory of the external item and update the parent directory.

Figure 546. Switch Dialog Box

The following options can be configured in the **Switch** dialog box:

**Switch to URL**

*The new location in the same repository (on page 2452) you are switching to.*

**Tip:** You can switch to items that were deleted, moved, or replaced, by specifying the original URL (before the item was removed) and use a *peg revision* (on page 2454) at the end (for example, `URL@rev1234`).

**Note:** For items that are already switched (on page 2418) that you want to switch back, the proposed URL is the original location of the item.

**Revision**

*The specific version of the location that you are switching to.*

**Depth** - *(This option is applicable only for directories)*

*Current depth*
Obeys the depths registered for the directories in the working copy that are to be switched.

**Recursive (infinity)**

Switches the location of the selected folder and all of its files and folders.

**Immediate children (immediates)**

Switches the location of the selected folder and its child files and folders without recursing subfolders.

**File children only (files)**

Switches the location of the selected folder and its child files.

**This folder only (empty)**

Switches the location of the selected folder (no child files or folders are included).

**Ignore "svn:externals" definitions**

When selected, external items are ignored in the switch operation. This option is only available if you choose the **Current depth** or **Recursive (infinity)** depth.

**Change the working copy item to the specified depth**

Changes the sticky depth on the directory in the working copy.

**Ignore ancestry**

When not selected, the SVN system does not allow you to switch to a location that does not share a common ancestry with the current location. If selected, the SVN does not check for a common ancestry.

**Relocate a Working Copy**

Sometimes the base URL of the repository is changed after a working copy is checked out from that URL. For example, if the repository itself is moved to a different server. In such cases, you do not have to check out a working copy from the new repository location. It is easier to change the base URL of the root folder of the working copy to the new URL of the repository (on page 2452).

Note: Peg revisions have no effect for this operation.

This **Relocate** action is available in the **Tools** menu when selecting the root item of the working copy.

Note: *External* items that are defined using absolute URLs and that point to the same repository as the working copy are not affected by the **Relocate** action (the URL is not updated). To relocate these items, change the value of the **svn:externals** property for each external item (set on their parent directories). For example, if an external item is defined as `externalDir http://host/path/to/repo/to/dir` and the repository was moved to another server (`host2`) and its protocol changed to
https, then the value of the property needs to be updated to `externalDir https://host2/path/to/ repo/to/dir`.

<i>Tip:</i> If you edit external items using the method described in the previous note, on the next update the system will try to fetch the external items again. To avoid this, you can invoke the **Relocate** action on each of these external items.

### Patches

This section explains how to work with patches in Syncro SVN Client.

#### What is a Patch

Suppose you are working with a set of XML files that you want to tag the project and distribute releases to other team members. While working on the project and correcting problems, you may need to distribute the corrections to other team members. In this case, you can distribute a patch (a collection of differences) that would correct the problems when applied over the last distribution. By default, the Syncro SVN Client generates patches in the **Unified Diff format**, but it can also use the **Git format** *(on page 2404)*.

Creating a patch in Apache Subversion™ implies the access to either two revisions of a versioned item, or two different versioned items from the repository:

- **Two revisions of a version item** - the item can be local or remote and you can select two versions of it. This also applies when you need to generate a patch that only contains the changes in the working copy that were not yet committed.
- **Two different versioned items from the repository** - the items are remote and you need to specify a revision for both.

<i>Warning:</i> The resulting patch file may contain content that was written using a mix of encodings, based upon the encodings of the files that were compared. If you open the generated patch file in a text editor, it may result in unrecognizable content.

#### Generating a Patch - Local Items

Based on a versioned item (already committed or scheduled for addition) in the working copy, you can generate patches that contain the local changes, the differences between a specific revision of that item and the item itself, or differences between the pristine item and another item from the repository. There are four options for generating a patch based upon local items.

To open the **Create patch** wizard, use the ✏️ **Create patch** action from the **Tools** menu or from the contextual menu in the **Modified, Incoming, Outgoing**, or **Conflicts** modes.
Create Patch from Local Modifications

This is the most commonly used type of patch and contains only the local changes for the selected item.

This option is useful if you want to share changes with other team members and you are not yet ready to commit them. This option is only available for local items that contain modifications. It is not available for items in which the local file status is unversioned or ignored, and in some cases missing or obstructed (on page 2419).

The steps are as follows:

1. Go to menu Tools > Create patch.
   This opens the Create patch wizard.

2. Select the Create patch from local modifications option in the dialog box.

3. Optionally, if you want to configure the options (on page 2401) for your patch, press the Next button.
   This options page does not remember your selections when creating future patches. It will revert to the default values.
   The Options wizard page is displayed.

4. Press the Create patch button.
If the patch is applied on a folder of the working copy and that folder contains unversioned files (on page 2419), this step of the wizard offers the option of selecting the ones that will be included in the patch.

Create Patch Against a Specific Revision

This type of patch contains changes between an old revision and the current content from the selected item within the working copy.

This option is useful if you want to obtain differences between an older revision and the current state of the working copy (for instance, to test how current changes apply to an older version).

The steps are as follows:

1. Go to menu Tools > Create patch.
   This opens the Create patch wizard.

2. Select the Create patch against a specific revision option in the dialog box.

3. Press the Next button.
   The second step of the wizard is opened:

   Figure 549. Create Patch Wizard - Step 2
4. Select the revision to create patch against.
   You can select between the HEAD revision and a specific revision number. For the other revision option, you can press the History button (on page 2345) to display a list of the item revisions.

   Note: If the revision to create patch against is older than the revision for which the working copy item was updated, the patch will include changes that were made after the selected revision.

5. Optionally, if you want to configure the options (on page 2401) for your patch, press the Next button.
   This options page does not remember your selections when creating future patches. It will revert to the default values.
   The Options wizard page is displayed.

6. Press the Create patch button.
   The patch is created and stored in the path specified in the Output section of the Options page (on page 2401) or in the default location.

Create Patch Between Two Revisions of an Item

This type of patch contains historical changes between two revisions of a selected item.

This option is useful if you want to share changes between two revisions with other team members.
Tip: If you need to generate a patch between two revisions of a previously deleted, moved, or replaced item, you should use the Create patch between two repository items option (on page 2397) instead.

The steps are as follows:

1. Go to menu **Tools > Create patch**.
   This opens the Create patch wizard.

2. Select the Create patch between two revisions of an item option in the dialog box.

3. Press the **Next** button.
   The second step of the wizard is opened:

   Figure 550. Create Patch Wizard - Step 2

4. Select the starting and ending revisions in the **From** and **To** sections.
   You can select between the HEAD revision and a specific revision number. For the other revision option, you can press the History button (on page 2345) to display a list of the item revisions.

   **Note:** The patch will only include changes between the two specified revisions, starting with the changes that were made after the older revision.

   **Tip:** If you want to reverse changes done between two revisions by using a patch file, you can specify the newer revision in the **From** section and the older version in the **To** section.

5. Optionally, if you want to configure the options (on page 2401) for your patch, press the **Next** button.
   This options page does not remember your selections when creating future patches. It will revert to the default values.
   The Options wizard page is displayed.

6. Press the **Create patch** button.
   The patch is created and stored in the path specified in the Output section of the Options page (on page 2401) or in the default location.
Create Patch Between Two Repository Items

This type of patch contains changes between one version of an item and a specific version of another item.

This option is useful for generating a patch that contains changes between existing, or even previously deleted, moved, or replaced items from different branches. This is the default option when you do not have a working copy loaded, when no repository items are selected, or when exactly two repository items of the same kind are selected.

**Tip:** To access an item that was deleted, moved, or replaced, you need to specify the original URL (before the item was removed) and use a **peg revision** (on page 2454) at the end (for example, `URL@rev1234`).

The steps are as follows:

1. Go to menu **Tools > Create patch**.
   
   This opens the **Create patch** wizard.

2. Select the **Create patch between two repository items** option in the dialog box.

3. Press the **Next** button.
   
   The second step of the wizard is opened:

   Figure 551. Create Patch Wizard - Step 2
4. Select the starting and ending URLs (on page 2452) and revisions in the From and To sections. You can select between the HEAD revision and a specific revision number. For the other revision option, you can press the History button (on page 2345) to display a list of the item revisions.

⚠️ **Important:** Both URLs must point to items from the same repository.

⚠️ **Note:** If you use a peg revision in the URL field, anything specified in the other revision field is ignored.

5. Optionally, if you want to configure the options (on page 2401) for your patch, press the Next button. This options page does not remember your selections when creating future patches. It will revert to the default values. The Options wizard page is displayed.

6. Press the Create patch button. The patch is created and stored in the path specified in the Output section of the Options page (on page 2401) or in the default location.

---

Generating a Patch - Remote Items

Based on a repository item, you can generate patches that contain the differences between two specific revisions of that item, or between a revision of that same item and another revision of another item from the repository. There are two options for generating a patch based upon remote items.

To open the Create patch wizard, use the Create patch action from the Tools menu.

Figure 552. Create Patch Wizard - Remote Items
Create Patch Between Two Revisions of an Item

This type of patch contains historical changes between two revisions of a selected item.

This option is useful if you want to share changes between two revisions with other team members.

**Tip:** If you need to generate a patch between two revisions of a previously deleted, moved, or replaced item, you should use the Create patch between two repository items option (on page 2397) instead.

The steps are as follows:

1. Go to menu **Tools > Create patch**.
   This opens the Create patch wizard.

2. Select the Create patch between two revisions of an item option in the dialog box.

3. Press the **Next** button.
   The second step of the wizard is opened:

   Figure 553. Create Patch Wizard - Step 2

4. Select the starting and ending revisions in the **From** and **To** sections.
   You can select between the HEAD revision and a specific revision number. For the other revision option, you can press the History button (on page 2345) to display a list of the item revisions.

   **Note:** The patch will only include changes between the two specified revisions, starting with the changes that were made after the older revision.

   **Tip:** If you want to reverse changes done between two revisions by using a patch file, you can specify the newer revision in the From section and the older version in the To section.

5. Optionally, if you want to configure the options (on page 2401) for your patch, press the **Next** button.
   This options page does not remember your selections when creating future patches. It will revert to the default values.
   The Options wizard page is displayed.
6. Press the **Create patch** button.
   The patch is created and stored in the path specified in the **Output** section of the **Options page (on page 2401)** or in the default location.

Create Patch Between Two Repository Items

This type of patch contains changes between one version of an item and a specific version of another item.

This option is useful for generating a patch that contains changes between existing, or even previously deleted, moved, or replaced items from different branches. This is the default option when you do not have a working copy loaded, when no repository items are selected, or when exactly two repository items of the same kind are selected.

**Tip:** To access an item that was deleted, moved, or replaced, you need to specify the original URL (before the item was removed) and use a *peg revision (on page 2454)* at the end (for example, URL@rev1234).

The steps are as follows:

1. Go to menu **Tools > Create patch**.
   This opens the **Create patch** wizard.

2. Select the **Create patch between two repository items** option in the dialog box.

3. Press the **Next** button.
   The second step of the wizard is opened:

   Figure 554. Create Patch Wizard - Step 2
4. Select the starting and ending URLs (on page 2452) and revisions in the From and To sections. You can select between the HEAD revision and a specific revision number. For the other revision option, you can press the History button (on page 2345) to display a list of the item revisions.

⚠️ Important: Both URLs must point to items from the same repository.

*)(Note: If you use a peg revision in the URL field, anything specified in the other revision field is ignored.

5. Optionally, if you want to configure the options (on page 2401) for your patch, press the Next button.

This options page does not remember your selections when creating future patches. It will revert to the default values.

The Options wizard page is displayed.

6. Press the Create patch button.

The patch is created and stored in the path specified in the Output section of the Options page (on page 2401) or in the default location.

Patch Options

Figure 555. Create Patch Wizard - Options

Depth - (This option is applicable only for directories)

Current depth

The depth of recursing the folder for creating the patch is the same as the depth of that same folder in the working copy (available only when generating patches that contain changes from the working copy).

Recursive (infinity)

The patch is created on all the files and folders contained in the selected folder.

Immediate children (immediates)

The patch is created only on the child files and folders without recursing subfolders.

File children only (files)

The patch is created only on the child files.

This folder only (empty)
The patch is created only on the selected folder (no child file or folder is included in the patch).

**Ignore content of added files**

When selected, the patch file does not include the content of the added items. This option corresponds to the `--no-diff-added` option of the `svn diff` command.

**Ignore content of delete files**

When selected, the patch file does not include the content of the deleted items. This option corresponds to the `--no-diff-deleted` option of the `svn diff` command.

**Treat copied files as newly added**

When selected, copied items are treated as new, rather than comparing the items with their sources. This option corresponds to the `--show-copies-as-adds` option of the `svn diff` command.

**Include files having a binary MIME type**

When selected, the application is forced to compare items that are considered binary file types. This option corresponds to the `--force` option of the `svn diff` command.

**Ignore properties**

When selected, differences in the properties of items are ignored. This option corresponds to the `--ignore-properties` option of the `svn diff` command.

**Properties only**

When selected, only differences in the properties of the items are included in the patch file (file content is ignored). This option corresponds to the `--properties-only` option of the `svn diff` command.

> **Note:** The Ignore properties and Properties only options are mutually exclusive.

**Notice ancestry**

If selected, the SVN common ancestry is taken into consideration when calculating the differences. This option corresponds to the `--notice-ancestry` option of the `svn diff` command.

**Files Comparison Section**

**Ignore line endings**

If selected, the differences in line endings are ignored when the patch is generated. This option corresponds to the `--ignore-eol-style` option of the `svn diff` command.

**Ignore whitespaces**
If selected, it allows you to specify how the whitespace changes should be handled. When selected, you can then choose between two options:

- **Ignore whitespace changes** (`--ignore-space-change`) - Ignores changes in the amount of whitespaces or changes to their type (for example, when changing the indentation or changing tabs to spaces).

  Note: Whitespaces that are added or removed are still considered to be changes.

- **Ignore all whitespaces** (`--ignore-all-space`) - Ignores all types of whitespace changes.

Output Section

**Save as**

The patch will be created and saved in the specified file.

**Use Git extended diff format**

When selected, the patch is generated using the *Git* format. This option corresponds to the `--git` option of the `svn diff` command.

Working with Repositories

This section explains how to locate and browse SVN repositories in Syncro SVN Client.

**Importing Resources Into a Repository**

Importing resources into a repository is the process of copying local files and directories into a repository so that they can be managed by an Apache Subversion™ server. If you have already been using Subversion and you have an existing working copy you want to use, then you will likely want to follow the procedure for using an existing working copy ([on page 2346](#)).

The **Import folder** and **Import Files** actions are available from the **Import** submenu of the **Repository** menu or of the contextual menu in the **Repositories** view. These actions open a dialog box that allow you to select the directories or files that will be imported into the selected repository location.

The **Import folder** action opens the **Import folder** dialog box.

Figure 556. **Import Folder** Dialog Box
You can configure the following options:

**Folder**

Specify the local folder *(on page 2452)* by using the text box or the **Browse** button. This folder should not be empty or already under version control.

⚠️ **Important:** By default, the SVN system only imports the content of the specified folder, and not the folder itself. Therefore, it is recommended to use the **Browse** button to select the local folder so that the client will automatically append the name of it to the specified URL.

**URL**

Specify the repository location *(on page 2452)* that will be used to access the folder to be imported.

⚠️ **Note:** Peg revisions have no effect for this operation since it is used to send information to the repository.

⚠️ **Attention:** If the new location already exists, make sure that it is an empty directory to avoid mixing your project content with other files (if items exist with the same name, an error will occur and the operation will not proceed). Otherwise, if the address does not exist, it is created automatically.

**Depth**

- **Recursive (infinity)**
  
  Imports all the files and folders contained in the selected folder.

- **Immediate children (immediates)**
  
  Imports only the child files and folders without recursing subfolders.

- **File children only (files)**
  
  Imports only the child files.
This folder only (empty)
Imports only the selected folder (no child file or folder is included).

Share files matching global ignore patterns
When selected, the file names that match the patterns defined in either of the following locations are also imported into the repository:

• The global-ignores property in the SVN configuration file (on page 2451).
• The File name ignore patterns option (on page 227) in the SVN > Working Copy preferences page (on page 226).

Enable automatic properties/Disable automatic properties
Enables or disables automatic property assignment (per runtime configuration rules), overriding the enable-auto-props runtime configuration directive, defined in the SVN configuration file (on page 2451).

Note: This option is available only when there are defined properties to be applied automatically for newly added items under version control. You can define these properties in the SVN config file (in the auto-props section). Based on the value of the enable-auto-props runtime configuration directive, the presented option is either Enable automatic properties, or Disable automatic properties.

Exporting Resources From a Repository

This is the process of taking a resource from the repository and saving it locally in a clean form, with no version control information. This is very useful when you need a clean build for an installation kit.

The Export dialog box is similar to the Check out dialog box:

Figure 557. Export from Repository Dialog Box
You can configure the following options:

**URL**

Specify the source directory from the repository (on page 2452) by using the text box or the Browse button.

Tip: To export an item that was deleted, moved, or replaced, you need to specify the original URL (before the item was removed) and use a peg revision (on page 2454) at the end (for example, URL@rev1234).

Note: The content of the selected directory from the repository and not the directory itself will be exported to the file system.

**Revision**

You can choose between the HEAD or Other revision. If you need to export a specific revision, specify it in the Other text box or use the History button and choose a revision from the History dialog box.

**Export to**

Specify the location where you want to export (on page 2452) the repository directory by typing the local path in the text box or by using the Browse button. If the specified local path does not point to an existing directory, it will automatically be created.

Important: By default, the SVN system only exports the content of the directory specified by the URL, and not the directory itself. Therefore, it is recommended to use the Browse button to select the export location so that the client will automatically append the name of the remote directory to the path of the selected directory.

Warning: The destination directory should be empty. If files exist, they will be overwritten by exported files with matching names.

**Depth**

Recursive (infinity)

Exports all the files and folders contained in the selected folder.

Immediate children (immediates)

Exports only the child files and folders without recursing subfolders.

File children only (files)

Exports only the child files.

This folder only (empty)

Exports only the selected folder (no child file or folder is included).
Ignore "svn:externals" definitions

When selected, external items are ignored in the export operation. This option is only available if you choose the **Recursive (infinity)** depth.

**EOL style**

Defines the *end-of-line (EOL)* marker that should be used when exporting files that have the value or the *svn:eol-style* property set to *native*. You can choose between the following styles:

- **Default** - It uses the system-specific end-of-line marker.
- **CRLF** - The Windows-specific end-of-line marker (*carriage return - line feed*).
- **LF** - The Unix / OS X-specific end-of-line marker (*line feed*).
- **CR** - The Mac OS 9 (or older)-specific end-of-line marker (*carriage return*).

**Ignore keywords**

When selected, the export operation does not expand the *SVN keywords* found inside the files.

### Copy / Move / Delete Resources From a Repository

Once you have a location defined in the **Repositories view (on page 2411)**, you can run commands (such as copy, move, and delete) directly on the repository. The commands correspond to the following actions in the contextual menu:

The **Copy to** and **Move to** action allows you to copy and move individual or multiple resources to a specific directory from the **HEAD** revision of the repository.

Figure 558. Copy/Move Items in Repository
The dialog box used to copy or move items allows you to browse the HEAD revision of the repository and select the destination of the items, presenting its repository URL below the tree view.

The **Source** section presents relevant options regarding the item(s) that you move or copy:

- **URL** - This field is displayed only if you copy/move a single item.
- **Revision** - Presents the revision from which you copy one or more items, allowing you to also choose another revision.

**Note:** Since only items from the HEAD revision can be moved, the Revision options are not presented for the Move to action.

**Note:** When you copy a single item while browsing a revision other than HEAD, the Revision options present this revision but does not allow you to change it. The same applies if copying multiple items.

- **New name** - This option is presented when you copy or move a single item, allowing you to also rename it.

Another useful action is **Delete**, allowing you to erase resources directly from the repository.

All three actions are commit operations and you will be prompted with the **Commit message** dialog box.
Sparse Checkout

Sometimes you only need to check out certain parts of a directory tree. In this case, you can check out the top directory (using the **Check out** action from the **Repositories view (on page 2412)**) and then recursively update only the needed directories (using the **Update** action from the **Working Copy view (on page 2424)**). Each directory then has a depth set to it, with four possible values:

- **Recursive (infinity)** - Updates all descendant directories and files recursively.
- **Immediate children (immediates)** - Updates the directory, including direct child directories and files, but does not populate the child directories.
- **File children only (files)** - Updates the directory, including only child files without the child directories.
- **This folder only (empty)** - Updates only the selected directory, without updating any children.

For some operations, you can use as depth the current depth registered on the directories from the working copy (the value **Current depth**). This is the depth value defined in a previous check out or update operation.

The sparse checked out directories are presented in the **Working Copy view (on page 2416)** with a marker corresponding to each depth value, in the top left corner, as follows:

- 🌐 **Recursive (infinity)** - This is the default value and it is has no mark. The directory has no limiting depth.
- 🍃 **Immediate children (immediates)** - The directory is limited to direct child directories (without contents) and files.
- 🍃 **File children only (files)** - The directory is limited to direct child files only.
- 🍃 **This folder only (empty)** - The directory has *empty* depth set.

A depth set on a directory means that some operations process only items within the specified depth range. For example, **Synchronize** on a working copy directory reports the repository modified items within the depth set on the directory and those existing in the working copy outside of this depth.

The depth information is also presented in the **SVN Information** dialog box and in the tool tip displayed when hovering a directory in the **Working Copy** view.

Syncro SVN Client Views

The main working area occupies the center of the application window, which contains the most important views:

- **Repositories View (on page 2411)**
- **Working Copy View (on page 2416)**
• History View (on page 2431)
• Console View (on page 2446)

The other views that support the main working area are also presented in this section.

Repositories View

The Repositories view allows you to define and manage Apache Subversion™ repository locations and browse repositories. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

If no connections to your repository are available, you can add a new repository location (on page 2337). Repository files and folders are presented in a tree view with the repository locations at the first level, where each location represents a connection to a specific repository. More information about each resource is displayed in a tabular form:

• Date - Date when the resource was last modified.
• Revision - The revision number at the time the resource was last modified.
• Author - Name of the person who made the last modification on the resource.
• Size - Resource size on disk.
• Lock information - Information about the lock status of a file. When a repository file is locked by a user the lock icon is displayed in this column. If no icon is displayed the file is not locked. The tooltip of this column displays the details about the lock:
  ◦ Owner - The name of the user who created the lock.
  ◦ Date - The date when the user locked the file.
  ◦ Expires on - Date when the lock expires. Lock expiry policy is set in the repository options, on the server side.
  ◦ Comment - The message attached when the file was locked.
• Type - Contains the resource type or file extension.

Figure 559. Repositories View
The Repositories view’s toolbar contains the following buttons:

- **New Repository Location** - Allows you to enter a new repository location by means of the Add SVN Repository dialog box.
- **Move Up** - Move the selected repository up one position in the list of repositories in the Repositories view.
- **Move Down** - Move the selected repository down one position in the list of repositories in the Repositories view.
- **Collapse all** - Collapses all repository trees.
- **Stop** - Stops the current repository browsing operation executed when a repository node is expanded. This is useful when the operation takes too long or the server is not responding.
- **Settings** - Allows you to configure the resource table appearance.

Repositories View Contextual Menu Actions

The Repositories view contextual menu contains various actions, depending on the selected item. If a repository location is selected, the following management actions are available:
New Repository Location (Ctrl + Alt + N (Command + Alt + N on OS X))

Displays the Add SVN Repository dialog box. This dialog box allows you to define a new repository location.

Figure 560. Add SVN Repository Dialog Box

If the Validate repository connection option is selected, the URL connection is validated before being added to the Repositories view.

Edit Repository Location (Ctrl + Alt + E (Command + Alt + E on OS X))

Context-dependent action that allows you to edit the selected repository location using the Edit SVN Repository dialog box. It is active only when a repository location root is selected.

Change the Revision to Browse (Ctrl + Alt + B (Command + Alt + B on OS X))

Context-dependent action that allows you to change the selected repository revision using the Change the Revision to Browse dialog box. It is active only when a repository location root is selected.

Remove Repository Location (Ctrl + Alt + R (Command + Alt + R on OS X))

Allows you to remove the selected repository location from the view. It shows you a confirmation dialog box before removal. It is active only when a repository location root is selected.

The following actions are common to all repository resources:

Open

Opens the selected file in the Editor view in read-only mode.

Open with

Displays the Open with dialog box to specify the editor in which the selected file is opened. If multiple files are selected, only external applications can be used to open the files.

Save as

Saves the selected files locally, as they are in the browsed revision.

Refresh (F5)
Refreshes the resource selected in the Repositories view.

**Check out (Ctrl + Alt + O (Command + Alt + O on OS X))**

Allows you to create a working copy from a repository directory, on your local file system. To read more about this operation, see the section Check out a working copy (on page 2343).

**Branch/Tag**

Allows you to create a branch or a tag from the selected folder in the repository. To read more about how to create a branch/tag, see the Creation and management of Branches/Tags (on page 2372) section.

**Share project**

Allows you to share a new project (on page 2340) using an SVN repository. The local project is automatically converted into an SVN working copy.

**Import:**

**Import folder (Ctrl + Shift + L (Command + Shift + L on OS X))**

Allows you to import the contents of a specified folder from the file system into the selected folder in a repository. To read more about this operation, see the section Importing resources into a repository (on page 2404).

**Note:** The difference between the Import folder and Share project actions is that the latter also converts the selected directory into a working copy.

**Import Files (Ctrl + Shift + I (Command + Shift + I on OS X))**

Imports the files selected from the files system into the selected folder in the repository.

**Export**

Opens the Export dialog box (on page 2406) that allows you to configure options for exporting a folder from the repository to the local file system.

**Show History (Ctrl + H (Command + T on OS X))**

Displays the history of the selected resource. At the start of the operation, you can set filtering options.

**Show Annotation (Ctrl + Shift + A (Command + Shift + A on OS X))**

Opens the Show Annotation dialog box that computes the annotations for a file and displays them in the Annotations view (on page 2438), along with the history of the file in the History view.
Revision Graph (\texttt{Ctrl} + G (\texttt{Command} + G on OS X))

This action allows you to see the graphical representation of a resource history. For more details about a resource revision graph see Revision Graph \textit{(on page 2447)}. This operation is available for any resource selected in the Repositories view or Working Copy view.

Copy URL Location (\texttt{Ctrl} + Alt + U (\texttt{Command} + Alt + U on OS X))

Copies to clipboard the URL location of the selected resource.

Copy to

Copies to a specified location the currently selected resource(s). This action is also available when you browse other revisions than the latest one (\textit{HEAD}), to allow restoring previous versions of an item.

Move to (\texttt{Ctrl} + M (\texttt{Command} + M on OS X))

Moves to a specified location the currently selected resource(s).

Rename (\texttt{(F2)})

 Renames the selected resource.

Delete (\texttt{(Delete)})

 Deletes selected items from the repository via an immediate commit.

New Folder (\texttt{Ctrl} + Shift + F (\texttt{Command} + Shift + F on OS X))

Allows you to create a folder in the selected repository path (available only for folders).

Locking

The following options are available only for files:

Lock (\texttt{Ctrl} + K (\texttt{Command} + K on OS X))

Allows you to lock certain files for which you need exclusive access. For more details on the use of this action, see Locking a file \textit{(on page 2354)}.

Unlock (\texttt{Ctrl} + Shift + K (\texttt{Command} + Shift + K on OS X))

Releases the exclusive access to a file from the repository. You can also choose to unlock it by force (\textit{break the lock}).

Show SVN Properties (\texttt{Ctrl} + Shift + P (\texttt{Command} + Shift + P on OS X))

Brings up the Properties view \textit{(on page 2444)} displaying the SVN properties for the selected resource. This view does not allow adding, editing, or removing SVN properties of a repository resource. These operations are allowed only for working copy resources.

Show SVN Information (\texttt{Ctrl} + I (\texttt{Command} + I on OS X))
Provides additional information for the selected resource. For more details, go to Obtain information for a resource (on page 2370).

Assistant Actions

When there is no repository configured, the Repositories view mode lists the following two actions:

Figure 561. Repositories View Actions

Drag and Drop Operations

The structure of the files tree can be changed with drag and drop operations inside the Repositories view. These operations behave in the same way with the Copy to/Move to operations.

Working Copy View

The Working Copy view allows you to manage the content of an SVN working copy. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

The toolbar contains the following:

- The list of defined working copies.
- A set of view modes that allow you to filter the content of the working copy based on the resource status (such as incoming or outgoing changes).
- Settings menu.

If you click any of the view modes (All Files, Modified, Incoming, Outgoing, Conflicts), the information displayed changes as follows:

- **All Files** - Resources (files and folders) are presented in a hierarchical structure with the root of the tree representing the location of the working copy on the file system. Each resource has an icon representation that describes the type of resource and also depicts the state of that resource with a small overlay icon.

Figure 562. Working Copy View - All Files View Mode
- **Modified** - The resource tree presents resources modified locally (including those with conflicting content) and remotely. Decorator icons are used to differentiate between various resource states:

  - **Incoming modification from repository:**
    - File content or properties modified remotely.
    - New file added remotely.
    - File deleted remotely.
  
  - **Outgoing modification to repository:**
    - File content or properties modified locally.
    - New file added locally.
    - File deleted locally.

- **Pseudo-conflict state** - A resource being locally and remotely modified at the same time, or a parent directory of such a resource.

- **Real conflict state** - A resource that had both incoming and outgoing changes and not all the differences could be merged automatically through the update operation (manually editing the local file is necessary for resolving the conflict).

Figure 563. Working Copy View - Modified View Mode
• **Incoming** - The resource tree presents only incoming changes.

• **Outgoing** - The resource tree presents only outgoing changes.

• **Conflicts** - The resource tree presents only conflicting changes (real conflicts and pseudo-conflicts).

The following columns provide information about the resources:

• **Name** - Resource name. Resource icons can have the following decorator icons:
  - Additional status information:
    - **Propagated modification marker** - A folder marked with this icon indicates that the folder itself presents some changes (such as modified properties) or a child resource has been modified.
    - **External** - This indicates a mapping of a local directory to the URL of a versioned resource. It is declared with a `svn:externals` property in the parent folder and it indicates a working copy not directly related with the parent working copy that defines it.
    - **Switched** - This indicates a resource that has been switched from the initial repository location to a new location within the same repository. The resource goes to this state as a result of the **Switch action** *(on page 2389)* executed from the contextual menu of the Working Copy view.
    - **Grayed** - A resource with a grayed-out icon, but no overlaid icon, is an ignored resource. It is obtained with the **Add to svn:ignore** action.
Current SVN depth of a folder:

- **Immediate children (immediates)** (a variant of sparse checkout (on page 2409)) - The directory contains only direct file and folder children. Child folders ignore their content.
- **File children only (files)** (a variant of sparse checkout (on page 2409)) - The directory contains only direct file children, disregarding any child folders.
- **This folder only (empty)** (a variant of sparse checkout (on page 2409)) - The directory discards any child resource.

Note:
- Any folder not marked with one of the depth icons, has recursive depth (infinity) set by default (presents all levels of child resources).
- Although folders not under version control can have no depth set, Oxygen XML Author presents **unversioned** and **ignored** folders with empty depth when **Show unversioned directories content** or **Show ignored directories content** options are not selected.

- **Local file status** - Shows the changes of working copy resources that were not committed to the repository yet. The following icons are used to mark resource status:
  - 📁 - Resource is **not under version control** (unversioned).
  - ⏵️ - Resource is being **ignored** because it is not under version control and its name matches a file name pattern defined in one of the following places:
    - global-ignores section in the SVN client-side config file (on page 2334).
  - ⚠️ **Attention**: If you do not explicitly set the global-ignores runtime configuration option (either to your preferred set of patterns or to an empty string), Subversion uses the default value.
  - **Application global ignores** option (on page 227) of Oxygen XML Author.
  - The value of a svn:ignore property (on page 2349) set on the parent folder of the resource being ignored.
  - 📥 - Marks a newly created resource, **scheduled for addition** to the version control system.
  - 📥 - Marks a resource **scheduled for addition**, created by copying a resource already under version control and inheriting all its SVN history.
  - 📶 - The content of the resource has been **modified**.
  - 📥 - Resource has been **replaced** in your working copy (the file was scheduled for deletion, and then a new file with the same name was scheduled for addition in its place).
  - 📹 - Resource is **deleted** (scheduled for deletion from Repository upon the next commit).
  - 📶 - The resource is **incomplete** (as a result of an interrupted check out or update operation).
  - 📹 - The resource is **missing** because it was moved or deleted without using an SVN-aware application.
  - 📹 - The contents of the resource is in **real conflict state** (on page 2357).
  - 📹 - Resource is in a **name conflict** state.
- Resource is in tree conflict state after an update operation because:
  - Resource was locally modified and incoming deleted from repository.
  - Resource was locally scheduled for deletion and incoming modified.
- Resource is obstructed (versioned as one kind of object: file, directory, or symbolic link, but has been replaced outside Syncro SVN Client by a different kind of object).

- Local properties status - Marks the resources that have SVN properties, with the following possible states:
  - The resource has SVN properties set.
  - The resource properties have been modified.
  - Properties for this resource are in real conflict with property updates received from the repository.

- Revision - The current revision number of the resource.
- Date - Date when the resource was last time modified on the disk.
- BASE Revision - The revision number of the pristine version of the resource.
- BASE Date - Date when the pristine version of the resource was last time committed in the repository.
- Author - Name of the person who made the last modification on the pristine version of the resource.

- Remote file status - Shows changes of resources recently modified in the repository. The following icons are used to mark incoming resource status:
  - Resource is newly added in repository.
  - The content of the resource has been modified in repository.
  - Resource was replaced in repository.
  - Resource was deleted from repository.

- Remote properties status - Resources marked with the icon have incoming modified properties from the repository.

- Remote revision - Revision number of the resource latest committed modification.
- Remote date - Date of the resource latest modification committed on the repository.
- Remote author - Name of the author who committed the latest modification on the repository.

- Lock information - Shows the lock state of a resource. The lock mechanism is a convention intended to help you signal other users that you are working with a particular set of files. It minimizes the time and effort wasted in solving possible conflicts generated by clashing commits. A lock gives you exclusive rights over a file, only if other users follow this convention and they do not try to bypass the lock state of a file.

A folder can be locked only by the SVN client application, completely transparent to the user, if an operation in progress was interrupted unexpectedly. As a result, folders affected by the operation are marked with the symbol. To clear the locked state of a folder, use the Clean up action.

Note: Users can lock only files.
The following lock states are displayed:

- **no lock** - the file is not locked. This is the default state of a file in the SVN repository.

- **remotely locked** - shown when:
  - Another user has locked the file in the repository.
  - The file was locked by the same user from another working copy.
  - The file was locked from the **Repositories** view.

If you try to commit a new revision of the file to the repository, the server does not allow you to bypass the file lock.

**Note:** To commit a new revision, you need to wait for the file to be unlocked. Ultimately, you might try to **break** or **steal** the lock, but this is not what other users expect. Use these actions carefully, especially when you are not the file lock owner.

- **locked** - displayed after you have locked a file from the current working copy. Now you have exclusive rights over the corresponding file, being the only one who can commit changes to the file in the repository.

**Note:** Working copies keep track of their locked files, so the locks are presented between different sessions of the application. Synchronize your working copy with the repository to make sure that the locks are still valid (not **stolen** or **broken**).

- **stolen** - a file already locked from your working copy is being locked by another user. Now the owner of the file lock is the user who stole the lock from you.

- **broken** - a file already locked from your working copy is no longer locked in the repository (it was unlocked by another user).

**Note:** To remove the **stolen** or **broken** states from your working copy files, you have to **Update** them.

If one of your working copy files is locked, hover the mouse pointer over the lock icon to see more information:

- **Lock type** - current file lock state
- **Owner** - the name of the user who created the lock
- **Date** - the date when the user locked the file
- **Expires on** - date when the lock expires. Lock expiry policy is set in the repository options, on the server side
- **Comment** - the message attached when the file was locked

**Note:** The working copy table allows you to show or hide any of its columns and also to sort its contents by any of the displayed columns. The table header provides a contextual menu that allows you to customize the displayed information.
The toolbar contains the following options for switching to a different working copy:

- **List of Defined Working Copies** - A drop-down menu that contains all the working copies Oxygen XML Author is aware of. When you select a different working copy from the list, the newly selected working copy content is scanned and displayed in the **Working Copy** view.

- **Working Copies Manager (on Mac OS X)** - Opens a dialog box that displays the working copies Oxygen XML Author is aware of. In this dialog box, you can add existing working copies or remove those you no longer need. If you try to add a folder that is not a valid Subversion working copy, Oxygen XML Author warns you that the selected directory is not under version control.

  **Note:** Removing a working copy from this dialog box does NOT remove it from your file system; you will have to do that manually.

**Working Copy Settings**

The **Settings** button from the toolbar of the **Working Copy** view provides the following options:

- **Show unversioned directories content** - Displays the content of unversioned directories.

  **Note:** If this option is not selected, it will be ignored for items that, after a synchronize, are reported as incoming from the repository. This applies for all working copy modes, except **All Files**.

- **Show ignored items** - Displays the ignored resource when **All Files** mode is selected.

- **Show ignored directories content** - Displays the content of ignored directories when **All Files** mode is selected.

  **Note:** Although ignored items are not presented in the **Modified**, **Incoming**, and **Conflicts** modes, they will be if, after a synchronize, they are reported as incoming from the repository.

- **Show deleted items** - Displays the deleted resource when **All Files** mode is selected. All other modes always display deleted resources, disregarding this option.

- **Tree / Compressed / Flat** - Affect the way information is displayed inside the **Modified**, **Incoming**, **Outgoing**, and **Conflicts** view modes.

- **Configure columns** - Allows you to customize the structure of the **Working Copy** view data. This action opens the following dialog box:

 Figure 564. Configure Columns of Working Copy View
The order of the columns can be changed with the two arrow buttons. The column size can be edited in the **Width of selected column** field. The **Restore Defaults** button reverts all columns to the default order, width, and enabled/disabled state from the installation of the application.

**Working Copy Format**

When an SVN working copy is loaded, Syncro SVN Client first checks the format of the working copy:

- If the format is older than SVN 1.7, you are prompted to upgrade it to SVN 1.8 to load it.
- If the format is 1.7, Syncro SVN Client takes into account the state of the [When loading an old format working copy](on page 226).

To change how working copy formats are handled, open the **Preferences** dialog box (Options > Preferences) (on page 79), go to SVN > Working copy, and configure the options in the Administrative area (on page 226) section.

**Note:**

- The format of the working copy can be downgraded or upgraded at any time with the **Upgrade** and **Downgrade** actions available in the Tools menu. These actions allow switching between SVN 1.7 and SVN 1.8 working copy formats.
- SVN 1.7 working copies cannot be downgraded to older formats.
Refresh a Working Copy

A refresh is a frequent operation triggered automatically when you switch between two working copies using the toolbar selector of the Working Copy view and when you switch between Oxygen XML Author and other applications.

The Working Copy view features a fast refresh mechanism: the content is cached locally when loading the working copy for the first time. Later on, when the same working copy is displayed again, the application uses this cache to detect the changes between the cached content and the current content found on disk. The refresh operation is run on these changes only, thus improving the response time. Improvement is noticeable especially when working with large working copies.

Working Copy View Contextual Menu Actions

The contextual menu in the Working Copy view contains the following actions:

- **Edit conflict (Ctrl (Command on OS X) + E)**
  
  Opens the Compare editor, allowing you to modify the content of the currently conflicting resources. For more information about editing conflicts, see Edit conflicts (on page 2359).

- **Open in Compare Editor (Ctrl (Command on OS X) + Alt + C)**
  
  Displays changes made in the currently selected file.

- **Open (Ctrl (Command on OS X) + O)**
  
  Opens the selected resource from the working copy. Files are opened with an internal editor or an external application associated with that file type, while folders are opened with the default file system browsing application (Windows Explorer on Windows, Finder on OS X, etc).

- **Open with...**
  
  Submenu that allows you to open the selected resource either with Oxygen XML Author or with another application.

- **Show in Explorer/Show in Finder**
  
  Opens the parent directory of the selected working copy file and selects the file.

- **Expand All (Ctrl (Command on OS X) + Alt + X)**
  
  Displays all descendants of the selected folder. The same behavior is obtained by double-clicking a collapsed folder.

- **Refresh (F5)**
  
  Re-scans the selected resources recursively and refreshes their status in the working copy view.
Synchronize (Ctrl (Command on OS X) + Shift + S)

Connects to the repository and determines the working copy and repository changes made to the selected resources. The application switches to Modified view mode if the Always switch to 'Modified' mode option (on page 226) is selected.

Update (Ctrl (Command on OS X)+ U)

Updates the selected resources to the HEAD revision (latest modifications) from the repository. If the selection contains a directory, it will be updated depending on its depth.

Update to revision/depth

Allows you to update the selected resources from the working copy to an earlier revision from the repository. You can also select the update depth for the current folder. You can find out more about the depth term in the sparse checkouts (on page 2409) section.

Commit

Collects the outgoing changes from the selected resources in the working copy and allows you to choose exactly what resources to commit. A directory will always be committed recursively. Unversioned resources will be deselected by default. In the Commit dialog box you can also enter a comment before sending your changes to the repository.

Revert (Ctrl (Command on OS X) + Shift + V)

Undoes all local changes for the selected resources. It does not contact the repository and the files are obtained from Apache Subversion™ pristine copy. It is available only for modified resources. See Revert your changes (on page 2361) for more information.

Override and Update

Drops any outgoing change and replaces the local resource with the HEAD revision. This action is available on resources with outgoing changes, including conflicting ones. See the Revert your changes (on page 2361) section.

Override and Commit

Drops any incoming changes and sends your local version of the resource to the repository. This action is available on conflicting resources. For more information see Drop incoming modifications (on page 2363).

Mark Resolved (Ctrl (Command on OS X) + Shift + R)

Instructs the Subversion system that you resolved a conflicting resource. For more information, see Merge conflicts (on page 2363).

Mark as Merged (Ctrl (Command on OS X) + Shift + M)
Instructs the Subversion system that you resolved the pseudo-conflict by merging the changes and you want to commit the resource. Read the Merge conflicts (on page 2363) section for more information about how you can solve the pseudo-conflicts.

❌ Create patch (Ctrl (Command on OS X) + Alt + P)

Allows you to create a file containing all the differences between two resources, based on the `svn diff` command. To read more about creating patches, see the section about patches (on page 2394).

Compare with:

- **Latest from HEAD (Ctrl (Command on OS X) + Alt + H)** - Performs a 3-way diff operation between the selected file and the HEAD revision from the repository and displays the result in the Compare view. The common ancestor of the 3-way diff operation is the BASE version of the file from the local working copy.

- **BASE revision (Ctrl (Command on OS X) + Alt + C)** - Compares the working copy file with the BASE revision file (the so-called pristine copy).

- **Revision (Ctrl (Command on OS X) + Alt + R)** - Displays the History view that contains the log history of that resource.

- **Branch/Tag** - Opens the Compare with Branch/Tag dialog box that allows you to specify another file from the repository (on page 2452) (To URL field) to compare with the working copy file. You can specify the revision of the repository file by choosing between HEAD revision or specific Other revision.

  ❭ **Tip:** To compare with a file that was deleted, moved, or replaced, you need to specify the original URL (before the file was removed) and use a peg revision (on page 2454) at the end (for example, `URL@rev1234`).

- **Each other** - Compares two selected files with each other.

These compare actions are available only if the selected resource is a file.

Replace with:

- **Latest from HEAD** - Replaces the selected resources with their versions from the HEAD revision of the repository.

- **BASE revision** - Replace the selected resources with their versions from the pristine copy (the BASE revision).

**Note:** In some cases it is impossible to replace the currently selected resources with their versions from the BASE/HEAD revision:

- For the Replace with BASE revision action, the resources being unversioned or added have no BASE revision, and thus cannot be replaced. However, they will be
deleted if the action is invoked on a parent folder. The action will never work for missing folders or for obstructing files (folders being obstructed by a file), since you cannot recover a tree of folders.

• For the Replace with latest from HEAD action, you must be aware that there are cases when resources will be completely deleted or reverted to the BASE revision and then updated to a HEAD revision to avoid conflicts. These cases are:
  ◦ The resource is unversioned, added, obstructed, or modified.
  ◦ The resource is affected by a svn:ignore or svn:externals property that is locally added on the parent folder and not yet committed to the repository.

Show History (Ctrl (Command on OS X) + H)
Displays the History view where the log history for the selected resource will be presented. For more details about resource history, see the sections about the resource history view (on page 2431) and requesting the history for a resource (on page 2370).

Show Annotation (Ctrl + Shift + A (Command + Shift + A on OS X))
Opens the Show Annotation dialog box that computes the annotations for a file and displays them in the Annotations view (on page 2438), along with the history of the file in the History view.

Revision Graph (Ctrl (Command on OS X) + G)
This action allows you to see the graphical representation history of a resource. For more details about the revision graph of resources, see Revision Graph (on page 2447).

Copy URL Location (Ctrl (Command on OS X) + Alt + U)
Copies the encoded URL of the selected resource from the Working Copy to the clipboard.

Mark as copied
You can use this action to mark an item from the working copy as a copy of an other item under version control, when the copy operation was performed outside of an SVN client. The Mark as copied action is available when you select two items (both the new item and source item), and it depends on the state of the source item.

Mark as moved
You can use this action to mark an item from the working copy as being moved from another location of the working copy, when the move operation was performed outside of an SVN client. The Mark as moved action is available when you select two items from different locations (both the new item and the source item that is usually reported as missing), and it depends on the state of the source item.

Mark as renamed
You can use this action to mark an item from the working copy as being renamed outside of an SVN client. The Mark as renamed action is available when you select two items from the same directory (both the new item and the source item that is usually reported as missing), and it depends on the state of the source item.

Copy to

Copies the currently selected resource to a specified location.

Move to   Ctrl + M (Command + M on OS X)

Moves the currently selected resource to a specified location.

Rename (F2)

As with the move command, a copy of the original resource will be made with the new name and the original will be marked as deleted. Note that you can only rename one resource at a time.

Delete (Delete)

Schedules selected items for deletion upon the next commit and removes them from the disk. Depending on the state of each item, you are prompted to confirm the operation.

New:

- New File - Creates a new file inside the selected folder. The newly created file will be added under version control only if the parent folder is already versioned.

- New Folder (Ctrl (Command on OS X)+ Shift + F) - Creates a child folder inside the selected folder. The newly created folder will be added under version control only if its parent is already versioned.

- New External Folder (Ctrl (Command on OS X) + Shift + W) - This operation allows you to add a new external definition on the selected folder. An external definition is a mapping of a local directory to a URL of a versioned directory (on page 2452), and ideally a particular revision, stored in the svn:externals property of the selected folder.

Tip: You can specify a particular revision of the external item by using a peg revision (on page 2454) at the end of the URL (for example, URL@rev1234). You can also use peg revisions to access external items that were deleted, moved, or replaced.

The URL used in the external definition format can be relative. You can specify the repository URL that the external folder points to by using one of the following relative formats:

- ../ - Relative to the URL of the directory that the svn:externals property is set.
◦ ^/ - Relative to the root of the repository in which the `svn:externals` property is versioned.
◦ // - Relative to the scheme of the URL of the directory that the `svn:externals` property is set.
◦ / - Relative to the root URL of the server in which the `svn:externals` property is versioned.

⚠️ Important: To change the target URL of an external definition, or to delete an external item, do the following:

1. Modify or delete the item definition found in the `svn:externals` property that is set on the parent folder.
2. For the change to take effect, use the **Update** operation on the parent folder of the external item.

💡 Note: Syncro SVN Client does not support definitions of local relative external items.

**Add to "svn:ignore" (Ctrl (Command on OS X) + Alt + I)**

Allows you to add files that should not participate in the version control operations inside your working copy. This action can only be performed on resources not under version control. It actually modifies the value of the `svn:ignore` property in the parent directory of the resource. Read more about this in the Ignore Resources Not Under Version Control (on page 2349) section.

**Add to version control (Ctrl (Command on OS X) + Alt + V)**

Allows you to add resources that are not under version control. For further details, see Add Resources to Version Control (on page 2347) section.

**Remove from version control**

Schedules selected items for deletion from repository upon the next commit. The items are not removed from the file system after committing.

⚠️ **Clean up (Ctrl (Command on OS X) + Shift + C)**

Performs a maintenance cleanup operation on the selected resources from the working copy. This operation removes the Subversion maintenance locks that were left behind. This is useful when you already know where the problem originated and want to fix it as quickly as possible. It is only active for resources under version control.

**Locking:**

- **Scan for locks (Ctrl (Command on OS X) + L)** - Contacts the repository and recursively obtains the list of locks for the selected resources. A dialog box containing the locked files and the lock description will be displayed. This is only
active for resources under version control. For more details see Scanning for locks (on page 2353).

- **Lock (Ctrl (Command on OS X) + K)** - Allows you to lock certain files that need exclusive access. You can write a comment describing the reason for the lock and you can also force (steal) the lock. This action is active only on files under version control. For more details on the use of this action see Locking a file (on page 2354).

- **Unlock (Ctrl (Command on OS X) + Alt + K)** - Releases the exclusive access to a file from the repository. You can also choose to unlock it by force (break the lock).

**Show SVN Properties (Ctrl + P (Command + P on OS X))**

Brings up the Properties view (on page 2444) and displays the SVN properties for the selected resource.

**Show SVN Information (Ctrl + I (Command + I on OS X))**

Provides additional information for the selected resource from the working copy. For more details, go to Obtain information for a resource (on page 2370).

**Drag and Drop Operations**

The structure of the files tree can be changed with drag and drop operations inside the Working Copy view. These operations behave in the same way with the Copy to/Move to operations.

Also, files and folders can be added to the file tree of the view as unversioned resources by drag and drop operations from other applications (for example, from Windows Explorer or Mac OS X Finder). In this case, the items from the file system are only copied, without removing them from their original location.

**Attention:** When you drag items from the working copy to a different application, the performed operation is controlled by that application. This means that the moved items are left as missing in the working copy (items are moved in the file system only, but no SVN versioning meta-data is changed).

**Assistant Actions**

To ensure a continuous and productive work flow, when a view mode has no files to present, it offers a set of guiding actions with some possible paths to follow.

Initially, when there is no working copy configured the All Files view mode lists the following two actions:

**Figure 565. All Files Panel**
For Modified, Incoming, Outgoing, Conflicts view modes, the following actions may be available, depending on the current working copy state in various contexts:

- **Synchronize with Repository** - Available only when there is nothing to present in the Modified and Incoming view modes.
- **Switch to Incoming** - Selects the Incoming view mode.
- **Switch to Outgoing** - Selects the Outgoing view mode.
- **Switch to Conflicts** - Selects the Conflicts view mode.
- **Show all changes/incoming/outgoing/conflicts** - Depending on the currently selected view mode, this action presents the corresponding resources after a synchronize operation was executed only on a part of the working copy resources.
- **(Information message)** - Informs you why there are no resources presented in the currently selected view mode.

**History View**

In Apache Subversion™, both files and directories are versioned and have a history. If you want to examine the history for a selected resource and find out what happened at a certain revision you can use the History view that can be accessed from Repositories view (on page 2411), Working Copy view (on page 2416), Revision Graph (on page 2447), or Directory Change Set view (on page 2435). From the Working copy view you can display the history of local versioned resources. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

The view consists of four distinct areas:

- The table showing details about each revision, such as revision number, commit date and time, number of changes (more details available in the tooltip), author’s name, and a fragment of the commit message.

Some revisions may be highlighted to emphasize:

- The current revision of the resource for which the history is displayed - a bold font revision.
- The last revision in which the content or properties of the resource were modified - blue font revision.

**Note:** Both font highlights may be applied for the same revision.
• The complete commit message for the selected revision.
• A tree structure showing the folders where the modified resources are located. You can compress this structure to a more compact form that focuses on the folders that contain the actual modifications.
• The list of resources modified in the selected revision. For each resource, the type of action done against it is marked with one of the following symbols:
  ◦ - A newly created resource.
  ◦ - A newly created resource, copied from another repository location.
  ◦ - The content/properties of the resource were modified.
  ◦ - Resource was replaced in the repository.
  ◦ - Resource was deleted from the repository.

Figure 566. History View

You can group revisions in predefined time frames (today, yesterday, this week, this month), by pressing the Group by date button from the toolbar.

History Filter Dialog Box

The History view does not always show all the changes ever made to a resource because there may be thousands of changes and retrieving the entire list can take a long time. Normally you are interested in the more recent ones. That is why you can specify the criteria for the revisions displayed
in the **History view** by selecting one of several options presented in the **History** dialog box that is displayed when you invoke the **Show History** action.

**Figure 567. History Filters Dialog Box**

Options for the set of revisions presented in the **History view** are:

- All revisions of the selected resource.
- Only revisions between a start revision number and an end revision number.
- Only revisions added in a period of time (such as today, last week, last month, etc.)
- Only revisions between a start and an end date.
- Only revisions committed by a specified SVN user.

The toolbar of the **History view** has two buttons for extending the set of revisions presented in the view: **Get next 50** and **Get all**.

**History Filter Field**

When only the history entries that contain a specified substring need to be displayed in the **History view**, the filter field displayed at the top of this view is a useful tool. Just enter the search string in the field next to the **Find** label. Only the items (with an author name, commit message, revision number, or date) that match the search string are kept in the **History view**. When you press the **Search** button, the filter action is executed and the content of the table is updated.

**History View Contextual Menu Actions**

The **History view** contains the following contextual menu actions:

- **Compare with working copy**
Comparer la révision sélectionnée avec le fichier de travail. Il est disponible uniquement lorsque vous sélectionnez un fichier.

**Open**

Ouvre la révision sélectionnée du fichier dans l'éditeur. Cela est disponible uniquement pour les fichiers.

**Open with**

Affiche la boîte de dialogue Open with pour spécifier l'éditeur dans lequel le fichier sélectionné sera ouvert.

**Get Contents**

Remplace la version actuelle dans le fichier de travail par le contenu de la révision sélectionnée de l'historique du fichier. La version BASE du fichier n'est pas modifiée dans le fichier de travail, ce qui signifie que cette action fera que le fichier apparaîtra comme modifié dans une opération de synchronisation, même si le contenu provient d'une version plus ancienne de l'historique.

**Save as**

Permet de sauvegarder le contenu d'un fichier comme il a été commis à une certaine révision. Cette option est disponible uniquement lorsque vous accédez à l'historique d'un fichier.

**Copy to**

Copie dans le repository l'item dont l'historique est affiché en utilisant la révision sélectionnée. Cette option est active uniquement lors de l'affichage de l'historique pour un item du repository (URL).

- **Note:** Cet action peut être utilisée pour réanimer des items supprimés.

**Revert changes from this revision**

Revert les modifications faites dans les révisions sélectionnées. Les modifications sont révertées uniquement dans le fichier de travail et n'affectent pas les items du repository. Cette action n'échange pas les items du fichier de travail avec ceux de la sélection de révision. Cette action est disponible lorsque la ressource historique a été lancée pour un local fichier de travail.

- **Note:** Pour les items affichés dans la section Affected Paths qui sont ajoutés, supprimés ou remplacés, cette action n'affecte pas parce que ces modfications sont considérées comme des modifications au niveau du répertoire parent. Pour révertner ces types de modifications, suivez ces étapes:
  1. Demandez l'historique pour le répertoire parent.
  2. Identifiez la révision qui contient les modifications que vous souhaitez révertner.
  3. Appelez l'action sur cette révision.

- **Warning:** Il y a des cas où le SVN Client n'est pas capable de trouver l'item de travail correspondant pour l'item sélectionné dans Affected Paths. Dans ce cas, l'action ne se poursuit et un message d'erreur est affiché. Par exemple,
the selected item in the **Affected Paths** section is from a different repository location than the working copy item for which the history is displayed.

### Update to revision

Updates your working copy resource to the selected revision. This is useful if you want your working copy to reflect a time in the past. It is best to update a whole directory in your working copy, not just one file. Otherwise, your working copy is inconsistent and you are unable to commit your changes.

### Check out

Checks out a new working copy of the directory for which the history is presented, from the selected revision.

### Export

Opens the Export dialog box (on page 2406) that allows you to configure options for exporting a folder from the repository to the local file system.

### Show Annotation (Ctrl + Shift + A (Command + Shift + A on OS X))

Opens the Show Annotation dialog box that computes the annotations for a file and displays them in the Annotations view (on page 2438), along with the history of the file in the History view.

### Change

Allows you to change commit data for a file:

- **Author** - Changes the name of the SVN user that committed the selected revision.
- **Message** - Changes the commit message of the selected revision.

When two resources are selected in the History view, the contextual menu contains the following actions:

### Compare revisions

When the resource is a file, the action compares the two selected revisions using the Compare view. When the resource is a folder, the action displays the set of all resources from that folder that were changed between the two revision numbers.

### Revert changes from these revisions

Similar to the `svn merge` command, it merges two selected revisions into the working copy resource. This action is only available when the resource history was requested for a working copy item.

For more information about the History view and its features, see the Request history for a resource (on page 2370) and Using the resource history view (on page 2431) sections.
Directory Change Set View

The result of comparing two reference revisions from the history of a folder resource is a set with all the resources changed between the two revision numbers. The changed resources can be contained in the folder or in a subfolder of that folder. These resources are presented in a tree format. For each changed resource all the revisions committed between the two reference revision numbers are presented.

Figure 568. Directory Change Set View

The set of changed resources displayed in the tree is obtained by running the action Compare revisions available on the contextual menu of the History view when two revisions of a folder resource are selected in the History view.

The left side panel of the view contains the tree hierarchy with the names of all the changed resources between the two reference revision numbers. The right side panel presents the list with all the revisions of the resource selected in the left side tree. These revisions were committed between the two reference revision numbers. Selecting one revision in the list displays the commit message of that revision in the bottom area of the right side panel.

Double-clicking a file listed in the left-side tree performs a diff operation between the two revisions of the file corresponding to the two reference revisions. Double-clicking one of the revisions displayed in the right side list of the view performs a diff operation between that revision and the previous one of the same file.

The contextual menu of the right side list contains the following actions:

- **Compare with previous version**
  
  Performs a diff operation between the selected revision in the list and the previous one.

- **Open**
Opens the selected revision in the associated editor type.

**Open with**

Displays a dialog box with the available editor types and allows you to select the editor type for opening the selected revision.

**Save as**

Saves the selected file as it was in the selected revision.

**Copy to**

Copies to the repository the item whose history is displayed, using the selected revision.

Note: This action can be used to resurrect deleted items also.

**Check out**

Checks out a new working copy of the selected directory, from the selected revision.

**Export**

Opens the Export dialog box (on page 2406) that allows you to configure options for exporting a folder from the repository to the local file system.

**Show Annotation (Ctrl + Shift + A (Command + Shift + A on OS X))**

Opens the Show Annotation dialog box that computes the annotations for a file and displays them in the Annotations view (on page 2438), along with the history of the file in the History view.

**Show SVN Information (Ctrl (Command on OS X) + I)**

Provides additional information for a selected resource. For more details, go to Obtain information for a resource (on page 2370).

---

**Editor Panel of SVN Client**

You can open a file for editing in an internal built-in editor. There are default associations between frequently used file types and the internal editors in the File Types preferences panel (on page 240).

The internal editor can be accessed either from the Working copy view (on page 2416) or from the History view (on page 2431). No actions that modify the content are allowed when the editor is opened with a revision from history.

Only one file at a time can be edited in an internal editor. If you try to open another file it will be opened in the same editor window. The editor provides syntax highlighting for known file types. This means that a different color will be used for each recognized token type found in the file. If the file's content type is unknown you will be prompted to choose the proper way the file should be opened.
After editing the content of the file in an internal editor you can save it to disk by using the **Save** action from the **File** menu or the **Ctrl + S (Command + S on OS X)** key shortcut. After saving your file you can see the file changed status in the **Working Copy** view.

If the internal editor associated with a file type is not the XML Editor, then the encoding set in the **preferences for Encoding for non XML files** is used for opening and saving a file of that type. This is necessary because in the case of XML files, the encoding is usually declared at the beginning of the XML file in a special declaration or it assumes the default value UTF-8, but in the case of non-XML files, there is no standard mechanism for declaring the encoding for the file.

**Annotations View**

Sometimes you need to know not only what was changed in a file, but also who made those changes. The **Annotations** view displays the revision and the author that changed every line in a file. The annotations of a file are computed and this view is opened with the **Show Annotation** action, which is available in the **History** menu, and from the contextual menu of the following views: the **Repositories** view, **Working copy** view, **History** view, and **Directory Change Set** view.

This action opens a dialog box that allows you to configure some options for showing the annotations.

**Figure 569. Show Annotation Options Dialog Box**

Once you have configured the options and click **OK**, the **Annotations** view is displayed (by default, on the right side of the application). You can click a line in the editor panel where the file is opened to
see the revision in which the line was last modified. The same revision is highlighted in the History view and you can also see all the lines that were changed in the same revision highlighted in the editor panel. Also, the entries of the Annotations view corresponding to that revision are highlighted. Therefore, the Annotations view, History view, and annotations editor panel are all synchronized. Clicking a line in one of them highlights the corresponding lines in the other two.

Figure 570. Annotations View

The following options can be configured in the Show Annotation dialog box:

**From Revision Section**

Select the revision from which to start computing the annotation. If you press the History button, the History dialog box (on page 2345) is displayed, which allows you to select a revision.

**To Revision Section**

Select the ending revision by choosing between the HEAD revision or specify it in the Other text box. If you press the History button, the History dialog box (on page 2345) is displayed, which allows you to select a revision.

**Encoding**

Select the encoding to be used when the annotation is computed. For each line of text, the SVN Client looks through the history of the file to be annotated see when it was last modified, and by whom. It is required that it is in the form of a text file.
Therefore, encoding is needed to properly decode and read the file content. By default, the encoding of the operating system is used.

**Ignore MIME type**

If selected, the file is treated as a text file and ignores what the SVN system infers from the `svn:mime-type` property.

**Ignore line endings**

If selected, the differences in line endings are ignored when the annotation is computed.

**Ignore whitespaces**

If selected, it allows you to specify how the whitespace changes should be handled. When selected, you can then choose between two options:

- **Ignore whitespace changes** - Ignores changes in the amount of whitespaces or to their type (for example, when changing the indentation or changing tabs to spaces).

  ![Note:](image) Whitespaces that were added where there were none before, or that were removed, are still considered to be changes.

- **Ignore all whitespaces** - Ignores all types of whitespace changes.

**Tip:** Selecting any of these *ignore* options can help you better determine the last time a meaningful change was made to a given line of text.

After you configure the options and press **OK**, the annotations will be computed and the *Annotations* view is displayed, where all the users that modified the selected resource will be presented, along with the specific lines and revision numbers modified by each user.

**Note:** If the file has a very long history, the computation of the annotation data can take a long time to process.

**Compare View**

In the Oxygen XML Author, there are three types of files that can be checked for differences: text files, image files and binary files. For the text files and image files you can use the built-in *Compare* view. This view is automatically opened if you select two files and use the *Compare with > Each Other* action in the contextual menu.

**Figure 571. Compare View**
At the top of each of the two editors, there are presented the name of the opened file, the corresponding SVN revision number (for remote resources) and the author who committed the associated revision.

When comparing text, the differences are computed using a line differencing algorithm. The view can be used to show the differences between two files in the following cases:

- After obtaining the outgoing status of a file with a **Refresh** operation, the view can be used to show the differences between your working file and the pristine copy. In this way you can find out what changes you will be committing.
- After obtaining the incoming and outgoing status of the file with the **Synchronize** operation, you can examine the exact differences between your local file and the **HEAD** revision file.
- You can use the **Compare view** from the **History view** to compare the local file and a selected revision or compare two revisions of the same file.

The Compare view contains two editors. Edits are allowed only in the left editor and only when it contains the working copy file. To learn more about how the view can be used, see **View Differences (on page 2354)**.
Compare View Toolbar

The toolbar of the Compare view contains the operations that can be performed on the source and target files.

Figure 572. Compare View Toolbar

The following actions are available:

Algorithm

The algorithm to be used for performing a comparison. The following options are available:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text. This algorithm is not available when the file comparison is in Author mode.
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than XML Accurate.
- **XML Accurate** - Comparison that is more precise than XML Fast, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

Save action

Saves the content of the left editor when it can be edited.

Perform Files Differencing

Looks for differences between the two files displayed in the left and right side panels.

Ignore Whitespaces

Enables or disables the whitespace ignoring feature. Ignoring whitespace means that before performing the comparison, the application normalizes the content and trims its leading and trailing whitespaces.

Synchronized scrolling

Toggles synchronized scrolling. When toggled on, a selected difference can be seen in both panels.

Format and Indent Both Files (**Ctrl + Shift + P** (**Command + Shift + P** on **OS X**))
Formats and indents both files before comparing them. Use this option for comparisons that contain long lines that make it difficult to spot differences.

**Note:** When comparing two JSON files, the **Format and Indent Both Files** action will automatically sort the keys in both files the same to make it easier to compare.

**Copy Change from Right to Left**
Copies the selected difference from the file in the right panel to the file in the left panel.

**Copy All Changes from Right to Left**
Copies all changes from the file in the right panel to the file in the left panel.

**Next Block of Changes (Ctrl + Period (Command + Period on OS X))**
Jumps to the next block of changes. This action is not available when the cursor is positioned on the last change block or when there are no changes.

**Note:** A change block groups one or more consecutive lines that contain at least one change.

**Previous Block of Changes (Ctrl + Comma (Command + Comma on OS X))**
Jumps to the previous block of changes. This action is not available when the cursor is positioned on the first change block or when there are no changes.

**Next Change (Ctrl + Shift + Period (Command + Shift + Period on OS X))**
Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is not available when the cursor is positioned on the last change or when there are no changes.

**Previous Change (Ctrl + Shift + Comma (Command + Shift + M on OS X))**
Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is not available when the cursor is positioned on the first change or when there are no changes.

**Ignore Nodes by XPath**
You can use this text field to enter an XPath expression (on page 1798) to ignore certain nodes from the comparison. It will be processed as XPath version 2.0. You can also enter the name of the node to ignore all nodes with the specified name (for example, if you want to ignore all ID attributes from the document, you could simply enter @id). This field is only available when comparing XML documents using the **XML Fast** or **XML Accurate** algorithms.
Note: If an XPath expression is specified in the Ignore nodes by XPath option (on page 231) in the Diff / File Comparison preferences page, that one is used as a default when the application is started. If you then enter an expression in this field on the toolbar, this one will be used instead of the default. If you delete the expression from this field, neither will be used.

First Change (Ctrl + B (Command + B on OS X))

Jumps to the first change.

Most of these actions are also available from the Compare (on page 2321) menu.

Image Preview

You can view your local files by using the built-in Image Preview component. The view can be accessed from the Working copy view (on page 2416) or from the Repository view (on page 2411). It can also be used from the History view (on page 2431) to view a selected revision of an image file.

Only one image file can be opened at a time. If an image file is opened in the Image preview and you try to open another one it will be opened in the same window. Supported image types are GIF, JPEG/JPG, PNG, BMP. Once the image is displayed in the Image Preview panel using the actions from the contextual menu, you can scale the image at its original size (1:1 action) or scale it down to fit in the view’s available area (Scale to fit action).

Compare Images View

The images are compared using the Compare Images view. This view is automatically opened if you select two image files and use the Compare with > Each Other action in the contextual menu. The images are presented in the left and right part of the view, scaled to fit the available area. You can use the contextual menu actions to scale the images at their original size or scale them down to fit the view's available area.

The supported image types are: GIF, JPG/JPEG, PNG, BMP.

Properties View

The properties view presents Apache Subversion™ properties for the currently selected resource from either the Working Copy view or the Repositories view. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

Figure 573. Properties View
The table includes four columns:

- **State** - Can be one of the following:
  - *(empty)* - Normal unmodified property (same current and base values)
  - *(asterisk)* - Modified property (current and base values are different)
  - *(plus sign)* - New property
  - *(minus sign)* - Removed property
- **Name** - The property name.
- **Current value** - The current value of the property.
- **Base value** - The base (original) value of the property.

**svn:externals Property**

The `svn:externals` property can be set on a folder or a file. In the first case, it stores the URL of a folder from another repository (on page 2428).

In the second case, it stores the URL of a file from another repository. The external file will be added into the working copy as a versioned item. There are a few differences between directory and external file:

- The path to the external file must be in a working copy that is already checked out. While external directories can place the external directory at any depth and it will create any intermediate directories, external files must be placed into a working copy that is already checked out.
- The external file URL must be in the same repository as the URL that the external file will be inserted into (inter-repository external files are not supported).
- While commits do not descend into an external directory, a commit in a directory containing an external file will commit any modifications to the external file.
The difference between a normal versioned file and an external file is that external files cannot be moved or deleted (the `svn:externals` property must be modified instead. However, external files can be copied).

An external file is displayed as an X in the switched status column.

**Toolbar / Contextual Menu**

The properties view toolbar and contextual menu contain the following actions:

- **➕ Add a new property** - This button invokes the *Add property* dialog box in which you can specify the property name and value.
- **📝 Edit property** - This button invokes the *Edit property* dialog box in which you can change the property value and also see its original (base) value.
- **✗ Remove property** - This button will prompt a dialog box to confirm the property deletion. You can also specify if you want to remove the property recursively.
- ** رغم رقم خ م RefRESH** - This action will refresh the properties for the current resource.

**Console View**

The *Console View* shows the traces of all the actions performed by the application. If the view is not displayed, it can be opened by selecting it from the *Window > Show View* menu.

Part of the displayed messages mirror the communication between the application and the Apache Subversion™ server. The output is expressed as subcommands to the Subversion server and simulates the Subversion command-line notation. For a detailed description of the Subversion console output read the *SVN User Manual*.

The view has a simple layout, with most of its space occupied by a message area. On its right side, there is a toolbar holding the following buttons:

- **✗ Clear**
  
  Erases all the displayed messages.

- **.isFile** Lock scroll

  Disables the automatic scrolling when new messages are appended in the view.

The maximum number of lines displayed in the console (length of the buffer) can be modified in the *Preferences (on page 224)* page. By default, this value is set to 100.
Dynamic Help View

Dynamic Help view is a help window that changes its content to display the help section that is specific to the currently selected view. As you change the focused view, you can read a short description of it and its functionality. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

Revision Graph of a SVN Resource

The history of a SVN resource can be watched on a graphical representation of all the revisions of that resource together with the tags in which the resource was included. The graphical representation is identical to a tree structure and very easy to follow.

The graphical representation of a resource history is invoked with the Revision graph action available on the right-click menu of a SVN resource in the Working Copy view (on page 2416) and the Repository view (on page 2411).

Figure 574. Revision Graph of a File Resource

In every node of the revision graph an icon and the background color represent the type of operation that created the revision represented in that node. The commit message associated with that revision, the repository path, and the revision number are also contained in the node. The tooltip displayed when the mouse pointer hovers over a node specifies the URL of the resource, the SVN user who...
created the revision of that node, the revision number, the date of creation, the commit message, the modification type and the affected paths (on page 2345).

The types of nodes used in the graph are:

**Added resource**
- The icon for a new resource added to the repository and a green background.

**Copied resource**
- The icon for a resource copied to other location (for example, when a SVN tag is created and a green background).

**Modified resource**
- The icon for a modified resource and a blue background.

**Deleted resource**
- The icon for a resource deleted from the repository and a red background.

**Replaced resource**
- The icon for a resource removed and replaced with another one on the repository and a orange background.

**Indirect resource**
- The icon for a revision from where the resource was copied or an indirectly modified resource, that is a directory in which a resource was modified and a gray background.
- The Modification type field of the tooltip specifies how that revision was obtained in the history of the resource.

A directory resource is represented with two types of graphs:

**Simplified graph**
- Lists only the changes applied directly to the directory;

**Complete graph**
- Lists also the indirect changes of the directory resource, that is the changes applied to the resources contained in the directory.

Figure 575. Revision Graph of a Directory (Direct Changes)
The Revision graph toolbar contains the following actions:
Save as image

Saves the graphical representation as image. For a large revision graph you have to set more memory in the startup script (on page 280). The default memory size is not enough when there are more than 100 revisions that are included in the graph.

Show/Hide indirect modifications

Switches between simplified and complete graph.

Zoom In

Zooms in the graph.

Zoom Out

Zooms out the graph. When the font reaches its minimum size, the graph nodes will display only the icons, leading to a very compact representation of the graph.

Reset scale

Resets the graphical scale to a default setting.

Print

Prints the graph.

Print preview

Offers a preview of the graph to allow you to check the information to be printed.

The contextual menu of any of the graph nodes contains the following actions:

Open

Opens the selected revision in the editor panel. Available only for files.

Open with

Opens the selected revision in the editor panel. Available only for files.

Save as

Saves the file for which the revision graph was generated, based on the selected node revision.

Copy to

Copies to the repository the item whose revision graph is displayed, using the selected revision.

Note: This action can be used to resurrect deleted items also.

Compare with HEAD
Compares the selected revision with the HEAD revision and displays the result in the diff panel. Available only for files.

Show History

Displays the history of the resource in the History view (on page 2431). Available for both files and directories.

Check out

Checks out (on page 2343) the selected revision of the directory. Available only for directories.

Export

Opens the Export dialog box (on page 2406) that allows you to configure options for exporting a folder from the repository to the local file system.

When two nodes are selected in the revision graph of a file the right-click menu of this selection contains only the Compare for comparing the two revisions corresponding to the selected nodes. If the resource for which the revision graph was built is a folder then the right-click menu displayed for a two nodes selection also contains the Compare action but it computes the differences between the two selected revisions as a set of directory changes. The result is displayed in the Directory Change Set (on page 2435) view.

Attention: Generating the revision graph of a resource with many revisions may be a slow operation. You should enable caching for revision graph actions so that future actions on the same repository will not request the same data again from the SVN server, which will finish the operation much faster.

Oxygen XML Author SVN Preferences

The options used in the SVN client are saved and loaded independently from the Oxygen XML Author options. However, if Oxygen XML Author cannot determine a set of SVN options to be loaded at startup, some of the preferences are imported from the XML Editor options (such as the License key and HTTP Proxy settings).

There is also an additional set of preferences applied to the SVN client that are set in global SVN files. There are two editing actions available in the Global Runtime Configuration submenu of the Options menu. These actions, Edit 'config' file and Edit 'servers' file, contain parameters that act as defaults applied to all the SVN client tools that are used by the same user on their login account.
Entering Local Paths and URLs

The Oxygen XML Author includes a variety of option configuration pages or wizards that contain text boxes where you specify paths to local resources or URLs of items inside remote repositories. The Oxygen XML Author provides support in these text boxes to make it easier to specify these paths and URLs.

Local Item Paths

The text boxes used for specifying local item paths support the following:

- **Absolute Paths** - In most cases, the Oxygen XML Author expects absolute paths for local file system items.
- **Relative Paths** - The Oxygen XML Author only accepts relative paths in the form ~[/...], where ~ is the user home directory.
- **Path Validation** - Oxygen XML Author validates the path as you type and invalid text becomes red.
- **Drag and Drop** - You can drag files and folders from the file system or other applications and drop them into the text box.
- **Automatic Use of Clipboard Data** - If the text box is empty when its dialog box is opened, any data that is available in the system clipboard is used, provided that it is valid for that text box.

Repository Item URLs

- **Local Repository Paths** - You can use local paths (absolute or relative) to access local repositories. When you use the **Browse** button, the Oxygen XML Author will convert the file path to a file:// form of URL, provided that the location is a real repository.
  - **Absolute Paths** - In most cases, the Oxygen XML Author expects absolute paths for local file system items.
  - **Relative Paths** - The Oxygen XML Author only accepts relative paths in the form ~/[/...], where ~ is the user home directory.
- **Peg Revisions** - For URL text boxes found inside dialog boxes where you are pulling information from the repository, you can use peg revisions at the end of the URLs (on page 2454) (for example, URL@rev1234).

Note: If you try to use a peg revision number in a dialog box where you are sending information to the repository then the peg revision number will become part of the name of the item rather than searching for the specified revision. For example, in the URL http://host/path/inside/repo/item@100, the item name is considered to be item@100.

Tip: You can even use peg revisions with local repository paths. For example, C:\path\to\local\repo@100 will be converted to file:///C:/path/to/local/repo@100 and the Repository browser will display the content of the local repository as it is at revision 100.
• **URL Validation** - Oxygen XML Author validates the URLs as you type and invalid text becomes red. Even paths to local repositories are not accepted unless using the **Browse** button to convert them to valid URLs.

• **Drag and Drop** - You can drag URLs from other applications or text editors and drop them into the URL text box. You can also drag folders that point to local repositories, from the local file system or from other applications, and they are automatically converted to valid `file://` type URLs.

• **Automatic Use of Clipboard Data** - If the URL text box is empty when its dialog box is opened, any data that is available in the system clipboard is used, provided that it is valid for that text box. Even valid local paths will be automatically converted to `file://` type URLs.

**Note:** The text boxes that are in the form of a combo box also allow you to select previously used URLs, or URLs defined in the **Repositories** view.

---

**Technical Issues**

This section contains special technical issues found during the use of Syncro SVN Client.

**Authentication Certificates Not Saved**

If Syncro SVN Client prompts you to enter the authentication certificate, although you already provided it in a previous session, then you should make sure that your local machine user account has the necessary rights to store certificate files in the **Subversion** configuration folder (write access to **Subversion** folder and all its subfolders). Usually, it is located in the following locations:

- **Windows:** `%HOME_DIR%\AppData\Roaming\Subversion`
- **Mac OS X** and **Linux:** `%HOME_DIR%/.subversion`

**Updating Newly Added Resources**

When you want to get a resource that is part of a newly created structure of folders from the repository, you need to also get its parent folders.

Figure 577. Incoming Changes
Syncro SVN Client allows you to choose how you want to deal with the entire structure from that moment onwards:

**Update ancestor directories recursively**

This option brings the entire newly added folders structure into your working copy. In this case, the update time depends on the total number of newly incoming resources, because of the full update operation (not updating only selected resource).

**Update selected files only (leave ancestor directories empty)**

This option brings a skeleton structure composed of the resource's parent folders only, and the selected resource at the end of the operation. All of the parent directories will have depth set to *empty* in your working copy, thus subsequent *Synchronize* operations will not report any remote modifications in those folders. If you need to update the folders to full-depth, you can use the *Update to revision/depth* action (on page 2425) from the working copy view.

Accessing Old Items from a Repository

Usually, you point to an item from a repository using a URL. However, sometimes this might not be enough because the URL alone might point to a different item than the one you want and a *peg revision* is needed.

A Subversion repository tracks any change made to its items by using *revisions*, which contain information such as the name of the author who made the changes, the date when they were made, and a number that uniquely identifies each of them. Over time, an item from a specific location in a repository evolves as a result of committing changes to it. When an item is deleted, its entire life cycle (all changes made to it from the moment it was created) remains recorded in the history of the repository. If a new item is created, with the same name and in the same location of the repository as a previously existing one, then both items are identified by the same URL even though they are located in different time frames. This is when a *peg revision* comes in handy. A *peg revision* is nothing more than a normal revision, but the difference between them is made by their usage. Many of the Subversion commands also accept a peg revision as a way to precisely identify an item in time, beside an *operative revision* (the revision regarding the used command).

**Example:**

To illustrate an example, consider the following:

- A new repository file *config* was created, identified by the URL http://host.com/myRepository/dir/config.
- The file has been created at revision 10.
- Over time, the file was modified by committing revisions 12, 15, 17.
To access a specific version of the file identified by the URL, you need to use a corresponding revision (the operative revision):

- If a revision number is used that is lower than 10, an error is triggered, because the file has not been created yet.
- If a revision number is used that is between 10 and 19, the specific version you are interested in would be obtained.

**Note:** Although the file was modified in revisions 12, 15, 17, it existed in all revisions between 10 and 19. Starting with a revision at which the file is modified, it has the same content across all revisions generated in the repository until another revision in which it is modified again.

At this point, the file is deleted, creating revision 20. Now, no version of the file can be accessed because it no longer exists in the latest repository revision. This is due to the fact that Subversion automatically uses the HEAD revision as a peg revision (it assumes any item currently exists in the repository if not instructed otherwise). However, using any of the revision numbers from the 10-19 interval (when the file existed) as a peg revision (beside the operative revision), will help Subversion to properly identify the time frame when the file existed, and access the file version corresponding to the operative revision. If you use a revision number greater than 19, this will also trigger an error.

Continuing the example, suppose that at revision 30, a directory called config is created in the same repository location as the deleted file. This means that the new directory will be identified by the same repository address: http://host.com/myRepository/dir/config. If you only use this URL in any Subversion command, you will access the new directory. You will also access the same directory if you use any revision number equal to or greater than 30 as peg revision. However, if you are interested in accessing an old version of the previously existing file, then you must use one of the revisions that existed (10-19), as a peg revision, similar to the previous case.

Checksum Mismatch Error

A Checksum Mismatch error could happen if an operation that sends or retrieves information from the repository to the working copy is interrupted. This means that there is a problem with the synchronization between a local item and its corresponding remote item.

If you encounter this error, try the following:

1. Identify the parent directory of the file that caused the error (the file name should be displayed in the error message).

**Note:** If the parent directory is the root of the working copy or if it contains a large amount of items it is recommended that you check out the working copy again, rather than continuing with the rest of this procedure.
2. Identify the **current depth** *(on page 2419)* of that directory.

3. Update the parent directory using the **Update to revision/depth** action that is available from the contextual menu or the **Working copy** menu. For the **Depth** option, select **This folder only** *(empty)*.

**⚠️ Warning:** If you have files with changes in this directory, those changes could be lost. You should commit your changes or move the files to another directory outside the working copy prior to proceeding with this operation.

4. After clicking OK the contents of the directory will be erased and the directory is be marked as having **an empty depth** *(on page 2419)*.

5. Once again, update the same directory using the **Update to revision/depth** action. This time, for the **Depth** option, select the depth that was previously identified in step 2.

6. If you moved modified files to another directory outside the working copy, move them back to the original location inside the working copy.

If this procedure does not solve the error, you need to check out the working copy again and move possible changes from the old working copy to the new one.

### External Tools

A command-line tool can be started in the Oxygen XML Author user interface as if from the command line of the operating system shell. Oxygen XML Author offers you the option of integrating such a tool by specifying just the command line for starting the executable file and its working directory. To integrate such a tool, open the **Preferences** dialog box *(Options > Preferences)* *(on page 79)* and go to **External Tools** *(on page 236)* *(or select Configure from the Tools > External Tools menu)*.

The **External Tools** preferences page *(on page 236)* presents a list of the external tools that have been configured. Once a tool has been configured *(on page 236)*, you can open it by selecting it from the **Tools > External Tools** menu or from the 🔗 **External Tools** drop-down menu on the toolbar *(the Tools toolbar needs to be selected in the Configure Toolbars dialog box *(on page 263))*). You can also assign a keyboard shortcut *(on page 238)* to be used to launch the tool.

If the external tool is applied on one of the files opened in Oxygen XML Author, the **Save all files before calling external tools** option *(on page 154)* *(in the Save preference page)* should be selected so that all edited files are automatically saved when an external tool is applied.

When an external tool is launched, the icon on the toolbar changes to a stop icon ( ■) and you can use this button to stop the tool. When the tool has finished running *(or you close it)*, the icon changes back to the original icon ( ▶).
Note: Even though you can stop the external tool by invoking the stop action while it is running, that does not necessarily mean it will also stop the processes spawned by that external tool. For instance, if you stop an external tool that runs a batch file, the batch may be stopped but without actually stopping the processes that the batch was running at that time.

Example: Integrating the Ant Tool

This is an example procedure for integrating the Ant build tool into Oxygen XML Author:

1. Download and install Apache Ant (on page 2791) on your computer.
2. Test your Ant installation from the command-line interface in the directory where you want to use Ant from. For example, run the clean target of your build.xml file C:\projects\XMLproject\build.xml:

   ant clean

3. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to External Tools (or select Configure from the Tools > External Tools menu).
4. Click the New button to create a new external tool entry and enter the following information:
   - **Name** - For example, Ant tool.
   - **Working directory** - For example, C:\projects\XMLproject.
   - **Command line** - For example, "C:\projects\XMLproject\ant.bat" clean.
5. Click OK to add the new tool to the list of external tools.
6. Run the tool from Tools > External Tools > Ant tool. You can see the output in the system console:

   Started: "C:\projects\XMLproject\ant.bat" clean
   Buildfile: build.xml

   clean:
   [echo] Delete output files.
   [delete] Deleting 5 files from C:\projects\XMLproject

   BUILD SUCCESSFUL
   Total time: 1 second
19. Common Problems

This section provides a collection of common performance and other types of problems that might be encountered when using Oxygen XML Author, along with their possible solutions.

Performance Problems and Solutions

This section contains solutions for some common performance problems that may appear when running Oxygen XML Author.

Related Information:

- Documents with Long Lines (on page 726)
- Loading Large Documents (on page 723)
- External Tools (on page 2456)

Display Problems on Linux or Solaris

Problem

I experience display problems (such as screen freezes) on Linux or Solaris.

Cause

This is possibly a rendering problem with the off-screen pixmap support.

Solution

Add the following startup parameter (on page 280): `-Dsun.java2d.pmoffscreen=false`. 
Out of Memory on External Processes

Problem

Oxygen XML Author throws an *Out Of Memory* error when trying to generate PDF output with the built-in Apache FOP processor.

Cause

The amount of allocated memory might be insufficient.

Solutions

• Open the Preferences dialog box (*Options > Preferences*) *(on page 79)*, go to XML > XSLT-FO-XQuery > FO Processors, and increase the value of the *Memory available to the built-in FOP* option *(on page 207)*.

• For external XSL-FO processors, XSLT processors, and external tools, the maximum value of the allocated memory is set in the command line of the tool using the `-Xmx` parameter set to the Java virtual machine.

Related Information:

• FO Processors Preferences *(on page 206)*

• Custom Engines Preferences *(on page 204)*

• External Tools Preferences *(on page 236)*

• How to Enable Debugging for FO Processor Transformations *(on page 1358)*

Too many nested apply-templates calls Error When Running a Transformation

Problem

I'm getting the error message *Too many nested apply-templates calls* when I try to transform my DocBook file to HTML using default Oxygen XML Author DocBook to HTML transformation scenario.
Cause

Most likely, this is the result of a masked stack overflow error.

Solution

Try setting a new VM option with the value `-Xss4m`. You can also try to slowly increase this to larger values (e.g. `-Xss5m` or `-Xss6m`). Note that this consumes memory on a per thread basis (Oxygen XML Author can have tens of threads), so using a very large value here can backfire and leave Oxygen XML Author without memory.

Related Information:

- Setting a Java Virtual Machine Parameter when Launching Oxygen XML Author (on page 280)
performance of the host system, ensure that the amount of memory available is optimally apportioned for each of the expected instances.

**Note:** When starting Oxygen XML Author from the icon created on the Start menu or Desktop in Windows (or from the shortcut created on the Linux desktop), the default maximum memory available to the application is set to 40% of the amount of physical RAM (but not more than 700 MB for 32-bit distributions or 4 GB for 64-bit distributions).

When starting Oxygen XML Author from a command-line script, the default maximum memory is 1 GB for 32-bit distributions or 4 GB for 64-bit distributions.

Performance Issues when Using Oxygen XML Author with Remote Desktop

**Problem**

When trying to run Oxygen XML Author in a Remote Desktop Protocol (RDP) environment, the performance is slow and choppy.

**Cause**

Running a standalone version of Oxygen XML Author over a slow RDP connection may result in performance issues.

**Solution**

As a workaround, you try to run Oxygen XML Author as an Eclipse plugin when working with a slow RDP connection.

Misc Problems and Solutions

This chapter presents common problems that may appear when running the application along with solutions for these problems.

'Address Family Not Supported by Protocol Family; Connect' Error

**Problem**

I have experienced the following error: "Address Family Not Supported by Protocol Family; Connect". How do I solve it?
**Cause**

This seems to be an IPv6 connectivity problem. By default, the Java runtime used by Oxygen XML Author prefers to create connections via IPv6, if the support is available. However, even though it is available in appearance, IPv6 sometimes happens to be configured incorrectly on some systems.

**Solution**

A quick solution for this problem is to set the `java.net.preferIPv4Stack` Java property to `true` (```java.net.preferIPv4Stack=true```), by following this procedure:

1. Create a file named `custom_commons.vmoptions` and on a single line, add `-Djava.net.preferIPv4Stack=true`. Then save the file and copy it to the Oxygen XML Author installation folder (may need admin access).
2. Restart Oxygen XML Author.
3. Make sure the procedure was successful by going to Help > About > System properties and check that the value of the `java.net.preferIPv4Stack` property is `true`.

**Application Takes Several Minutes to Start**

**Problem**

Oxygen XML Author seems to take an abnormally long amount of time to start.

**Cause**

Some anti-virus software can cause Java applications, such as Oxygen XML Author, to start very slowly due to scanning compressed archives (such as the JAR libraries that all Java applications use).

**Solution**

A possible solution is to add the Oxygen XML Author folder to the list of exceptions in the anti-virus software settings.
Archive Distribution Fails to Run on Mac OS 10.12 (Sierra)

Problem
For versions prior to 18.1, the classic archive distributions of Oxygen XML Author (.zip or .tar.gz) fail to run on Mac OS 10.12 (Sierra).

Cause
This happens because the archives get quarantined and Mac OS 10.12 (Sierra) treats quarantined apps differently than older versions and isolates them from their parent folder at launch. If Oxygen XML Author was already installed when you upgraded to Mac OS 10.12 (Sierra), there are no problems.

Solution
If Oxygen XML Author was not already installed, or you need to reinstall an older version (prior to version 18.1), the quarantine flag must be removed for the entire content of the Oxygen XML Author installation directory or the individual applications. To resolve this issue, follow these steps:

1. Open a Terminal window and change the directory to the folder where Oxygen XML Author is located.
2. Run the following command:

   ```bash
   xattr -dr com.apple.quarantine oxygen/
   ```

   where "oxygen" is the actual name of the Oxygen XML Author directory.

   If Oxygen XML Author is in a location that requires administrator privileges for write access, you need to run the command from an administrator account and prefix the command with `sudo`. You will then be prompted to enter your password.

Cannot Associate Oxygen XML Author With a File Type on My Windows Computer

Problem
I cannot associate the Oxygen XML Author application with a file type on my Windows computer by right clicking a file in Windows Explorer, selecting Open With > Choose Program and browsing to the file oxygenAuthor21.1.exe. When I select the file oxygenAuthor21.1.exe in the Windows file browser
dialog box, the Oxygen XML Author application is not added to the list of applications in the Open With dialog box.

**Cause**

The problem is usually due to old Windows registry entries remaining from previous versions of Oxygen XML Author.

**Solution**

Uninstall all your installed versions of Oxygen XML Author and reinstall your current version of Oxygen XML Author. If you only have the current version installed, you could try to reinstall it without uninstalling it first.

**Cannot Connect to SVN Repository from Repositories View**

**Problem**

I cannot connect to an SVN repository from the Repositories view of SVN Client. How can I find more details about the error?

**Solution**

First check that you entered the correct URL of the repository in the Repositories view. Also check that an SVN server is running on the server machine specified in the repository URL and is accepting connections from SVN clients. You can check that the SVN server accepts connections with the command-line SVN client from CollabNet.

If you try to access the repository with an `svn+ssh` URL, also check that an SSH server is running on port 22 on the server machine specified in the URL.

If the above conditions are verified and you cannot connect to the SVN repository, generate a logging file on your computer and send the logging file to support@oxygenxml.com. For generating a logging file, you need to create a text file called `log4j.properties` in the install folder with the following content:

```properties
log4j.rootCategory= debug, R2
log4j.appender.R2=org.apache.log4j.RollingFileAppender
log4j.appender.R2.File=logging.log
log4j.appender.R2.MaxFileSize=12000KB
```
Cannot Open XML Files in Internet Explorer

Problem

Before installing Oxygen XML Author I had no problems opening XML files in Internet Explorer. Now when I try to open an XML file in Internet Explorer, it opens the file in Oxygen XML Author. How can I load XML files in Internet Explorer again?

Cause

XML files are opened in Oxygen XML Author because Internet Explorer uses the Windows system file associations for opening files and you associated XML files with Oxygen XML Author in the installer panel called File Associations. Therefore, Internet Explorer opens XML files with the associated Windows application.

Solution

To open XML files in Internet Explorer, you have to set Internet Explorer as the default system application for XML files. For example, you can do so by following this procedure:

1. Right-click the XML file in Windows Explorer and select Open With > Choose Default Program.
2. Expand the section with the down-arrow and select IE in the list of applications.
3. Select the Always use the selected program option.

If XML files are still not opened in Internet Explorer, create a file named revert.vbs with the following content:

```vbnet
function revert()
    Set objShell = CreateObject("WScript.Shell")
    objShell.RegWrite "HKCR\.xml", "xmlfile", "REG_SZ"
    objShell.RegWrite "HKCR\.xml\Content Type", "text/xml", "REG_SZ"
end function

revert()
```
Then run the following command from a command line:

```
wscript revert.vbs
```

**Cannot Uninstall Oxygen XML Author in Windows**

**Problem**

When I try to uninstall Oxygen XML Author in Windows, I get an error that says it cannot find the `files.log` file.

**Cause**

The `install4j` installer that is used by Oxygen XML Author creates the `files.log` file during the installation process. If you cannot uninstall the product, then most likely something went wrong with this file during the installation process.

**Solution**

To solve this, simply reinstall the software in the same directory as the current installation. This will automatically uninstall the old version or overwrite it with a clean install. You should then be able to uninstall this new installation.

**Compatibility Issue Between Java and Certain Graphics Card Drivers**

**Problem**

Under certain settings, a compatibility issue can appear between Java and some graphics card drivers, which results in the text from the editor (in Author or Text mode) being displayed garbled.

**Solution**

If you encounter this problem, update your graphics card driver. Another possible workaround is, open the Preferences dialog box (Options > Preferences) (on page 79), go to Appearance > Fonts, and set the value of the Text antialiasing option (on page 89) to ON.

**Note:** If this workaround does not resolve the problem, set the Text antialiasing option (on page 89) to other values.
Crash at Startup on Windows with an Error About the nvogl32.dll File

**Problem**

I try to start Oxygen XML Author on Windows but it crashed with an error message about “Fault Module Name: nvogl32.dll”. What is the problem?

**Cause**

It is most likely an OpenGL driver issue.

**Solution**

This can be avoided by creating an empty file called `opengl32.dll` in the Oxygen XML Author install folder (if you start Oxygen XML Author with the shortcut created by the installer on the Start menu or on Desktop) or in the subfolder `bin` of the home folder of the Java virtual machine that runs Oxygen XML Author (if you start Oxygen XML Author with the `oxygen.bat` script). The home folder of the Java virtual machine that runs Oxygen XML Author is the value of the `java.home` property that is available in the System properties tab of the About dialog box (opened from the Help > About menu).

Crash in Java Runtime Thread

**Problem**

I encounter consistent crashes in one of the Java runtime threads (for example, `AWT-EventQueue`, `Java2D Queue Flusher`, or `C2 CompilerThread`).

**Cause**

This is usually caused by unknown errors somewhere in the implementation of the Java Runtime.

**Solution**

Although this does not guarantee that it will solve the problem, you could try updating the Java Runtime Environment (JRE) that comes bundled with Oxygen XML Author to the latest supported version.

⚠️ **Important:** You should only use a version of Java 8.

Windows/Linux
1. Download the latest Java 8 JRE from here: [http://www.oracle.com/technetwork/java/javase/downloads/jre8-downloads-2133155.html](http://www.oracle.com/technetwork/java/javase/downloads/jre8-downloads-2133155.html). Download the JRE in the `tar.gz` format with the same architecture as your Oxygen XML Author installation (x86=32bit / x64=64bit).
2. Navigate to the Oxygen XML Author installation folder and rename the `jre` folder to `jre.old` (you will need admin privileges if it is installed in `Program Files`).
3. Unpack the `tar.gz` and rename the extracted folder to `jre`.
4. Move that folder to the Oxygen XML Author installation folder.
5. Verify the paths in the `jre` folder. The path of the JRE `bin` folder should be: `oxygen/jre/bin`.
6. Start Oxygen XML Author and check the Java version in Help > About > System properties. The `java.runtime.version` should be match the one you unpacked.

**Mac OS X**

2. Extract the archive contents in a location of your choice (for example, `Downloads`). You will end up with a folder named something like this: `jre1.8.0_181.jre` (depending on the version).
3. Move or rename the JRE that was bundled with Oxygen XML Author. The bundled JRE folder (`jre.bundle`) is located inside a hidden folder named `.install4j` (in the Oxygen XML Author installation folder), so you can not see it in the Mac Finder. Thus, you need to move or rename it via the command line.

   For example, if you have Oxygen XML Author deployed in the Applications folder, the command should look similar to this:

   ```bash
   mv "/Applications/Oxygen XML Author/.install4j/jre.bundle" "/Applications/Oxygen XML Author/.install4j/jre.bundle.old"
   ```

4. Move the unpacked JRE folder from the location where you extracted it in the second step to a folder named `.install4j/jre.bundle` inside the Oxygen XML Author installation direction.

   For example, if you have Oxygen XML Author deployed in the Applications folder, the command should look similar to this:

   ```bash
   mv "~/Downloads/jre1.8.0_181.jre"/Applications/Oxygen XML Author/.install4j/jre.bundle"
   ```

   The default bundled JRE should now be successfully replaced by the newer one.
5. Start Oxygen XML Author and check the Java version in Help > About > System properties. The `java.runtime.version` should be match the one you unpacked.
Damaged File Associations on OS X

Problem

After upgrading OS X and Oxygen XML Author, it is no longer associated to the appropriate file types (such as XML, XSL, XSD). How can I re-create the file associations?

Cause

The upgrade damaged the file associations in the LaunchService Database on your OS X machine.

Solution

You can rebuild the LaunchService Database with the following procedure. This will reset all file associations and rescan the entire file system searching for applications that declare file associations and collect them in a database used by Finder.

1. Find all the Oxygen XML Author installations on your hard drive.
2. Delete them by dragging them to the Trash.
3. Clear the Trash.
4. Unpack the Oxygen XML Author installation kit on your desktop.
5. Copy the contents of the archive into the folder /Applications/Oxygen.
6. Run the following command in a Terminal:

   ```
   /System/Library/Frameworks/CoreServices.framework/Versions/A/Frameworks/LaunchServices.framework/Versions/A/Support/lsregister -kill -r -domain local -domain system -domain user
   ```

7. Restart Finder with the following command:

   ```
   killall Finder
   ```
8. Create an XML or XSD file on your desktop. It should have the Oxygen XML Author icon.
10. Accept the confirmation.

**Result:** When you start Oxygen XML Author, the file associations should work correctly.
Details to Submit in a Request for Technical Support Using the Online Form

Problem

What details should I add to my request for technical support on the online form in the product website?

Solution

When completing a request for Technical Support using the online form, include as many details as possible about your problem. For problems where a simple explanation may not be enough for the Technical Support team to reproduce or address the issue (such as server connection errors, unexpected delays while editing a document, an application crash, etc.), you should generate a log file and attach it to the problem report. In the case of a crash, you should also attach the crash report file generated by your operating system.

If the text content of an XML document you want to send to the support team contains sensitive or private information, you can use the Randomize XML text content action (on page 25) to create filler content. Before using this action, you need to copy the initial XML resources and save them in a separate folder. Otherwise, you might lose your original information.

To generate an Oxygen XML Author log file, follow these steps:

1. Create a text file called log4j.properties in the application installation folder, with the following content:

   ```
   log4j.rootCategory=debug, R2
   log4j.appenders.R2=org.apache.log4j.RollingFileAppender
   log4j.appenders.R2.File=${user.home}/Desktop/oxygenLog/oxygen.log
   log4j.appenders.R2.MaxFileSize=12000KB
   log4j.appenders.R2.MaxBackupIndex=20
   log4j.appenders.R2.layout=org.apache.log4j.PatternLayout
   log4j.appenders.R2.layout.ConversionPattern=%r %p [%t] %c - %m%n
   ```

2. Restart the application.
3. Reproduce the error.
4. Close the application.
5. Delete the log4j.properties file because it might cause performance issues if you leave it in the installation folder.
Tip: The logging mode may severely decrease the performance of the application. Therefore, do not forget to delete the log4j.properties file when you are done with the procedure.

Result: The resulting log file is named oxygen#.log (for example, oxygen.log, oxygen.log.1, oxygen.log.2, etc.) and is located in the Desktop\oxygenLog folder.

DITA Map Transformation Fails (Cannot Connect to External Location)

Problem

DITA map (on page 2793) transformation fails because it cannot connect to an external location.

Solution

The transformation is run as an external Ant process so you can continue using the application as the transformation unfolds. All output from the process appears in the DITA Transformation tab.

The HTTP proxy settings are used for the Ant transformation, so if the transformation fails because it cannot connect to an external location, you can check the Proxy preferences page (on page 244).

DITA Map WebHelp Transformation Fails (Duplicate Topic References Found)

Problem

DITA Map WebHelp transformation fails with a message that indicates duplicate topic references were found.

Cause

By default the WebHelp transformation uses the force-unique parameter set to true to force the transformation to create unique output files for each instance of a resource when a map contains multiple references to a single topic. However, there are cases when this feature does not work as expected and the duplicate topic references are not handled properly.

Solution

To solve this issue, you should manually set a unique copy-to attribute on any duplicate topic reference that was not handled automatically by DITA-OT:
DITA OT Transformation Takes a Long Time to Process

**Problem**

A DITA transformation takes an extremely long time to process (over an hour, for example).

**Cause**

Large delays in DITA OT processing are usually caused by intensive disk operations, CPU usage, or connections to remote websites. The DITA OT processing is very disk-intensive, each stage takes the entire content from the transformation temporary files folder, reads it, modifies it, and then writes it back.

**Solution**

There are several things you can try to troubleshoot this problem:

- If you are using a shared or remote drive, it is recommended to specify a local drive for the output and temporary files directory (edit the transformation scenario and in the **Output** tab, select a local directory for **Temporary files directory** and **Output directory**).
- If you want to test if the publishing has a problem downloading remote resources, you could disable the network adapter on the computer and then try to publish. The purpose is to see if the publishing finishes without any reported error about obtaining a certain HTTP resource.
- Using DTDs instead of XML Schemas is faster. This is because of a default transformation parameter called `args.grammar.cache` that only works for DTD-based DITA topics.
- You can increase the memory available to Oxygen XML Author (on page 2460). Sometimes, just increasing the amount of memory available to the DITA OT process may be enough to lower the time necessary for the publishing to run.
- You can enable some logging to help you determine which stage in the process is taking a long time. Edit the transformation scenario and in the **Advanced** tab, enter `logger org.apache.tools.ant.listener.ProfileLogger` in the **Additional arguments** field. Then go to **Options > Preferences > DITA > Logging** and select **Always** for the **Show console output** option.
• You could try disabling antivirus applications since the publishing process is very disk intensive and certain antivirus application might slow down the process.
• If the published DITA map is part of a larger DITA project with lots of maps and topics, references from topics in the current map to topics in other sub-projects might result in problems resolving those references. You could look in the output folder to see if the number of HTML documents match the number of DITA topics in your map.

DITA PDF Transformation Fails

**Problem**

The DITA to PDF transformation fails.

**Cause**

To generate the PDF output, Oxygen XML Author uses the DITA Open Toolkit. This process sometimes results in errors. For information about some of the most common errors, see DITA PDF Processing Common Errors (on page 2474).

**Solution**

If your transformation fails, you can detect some of the problems that caused the errors by running the Validate and Check for Completeness action (on page 2549). Depending on the options you select when you run it, this action reports errors such as topics referenced in other topics but not in the DITA map (on page 2793), broken links, and missing external resources.

You can analyze the Results tab of the DITA transformation and search for messages that contain text similar to `[fop] [ERROR]`. If you encounter this type of error message, edit the transformation scenario you are using and set the clean.temp parameter to no and the retain.topic.fo parameter to yes. Run the transformation, go to the temporary directory of the transformation, open the topic.fo file and go to the line indicated by the error. Depending on the XSL FO context try to find the DITA topic that contains the text that generates the error.

If none of the above methods helps you, go to Help > About > Components > Frameworks and check what version of the DITA Open Toolkit you are using. Copy the whole output from the DITA OT console output and either report the problem on the DITA User List or send it to support@oxygenxml.com.

Related Information:
DITA PDF Processing Common Errors

There are cases when the PDF processing fails when trying to publish DITA content to a PDF file. This topic lists some of the common problems and possible solutions.

Problem: Cannot Save PDF

The FO processor cannot save the PDF at the specified target. The console output contains messages like this:

```
[fop] [ERROR] Anttask - Error rendering fo file:
C:\samples\dita\temp\pdf\oxygen_dita_temp\topic.fo
<Failed to open C:\samples\dita\out\pdf\test.pdf>
Failed to open samples\dita\out\pdf\test.pdf
............
[fop] Caused by: java.io.FileNotFoundException:
C:\Users\default\Desktop\bev\out\pdf\test.pdf
(The process cannot access the file because it is being used by another process)
```

Solution: Cannot Save PDF

Such an error message usually means that the PDF file is already opened in a PDF reader application. The solution is to close the open PDF before running the transformation.

Problem: Table Contains More Cells Than Defined in Colspec

One of the DITA tables contains more cells in a table row than the defined number of `colspec` elements. The console output contains messages like this:

```
[fop] [ERROR] Anttask - Error rendering fo file:
D:\projects\eXml\samples\dita\flowers\temp\pdf\oxygen_dita_temp\topic.fo
<net.sf.saxon.trans.XPathException: org.apache.fop.fo.ValidationException: The column-number or number of cells in the row overflows the number of fo:table-columns specified for the table.
  (See position 179:-1)>net.sf.saxon.trans.XPathException:
org.apache.fop.fo.ValidationException: The column-number or number of cells in the row overflows the number of fo:table-columns specified for the table.
  (See position 179:-1)
```
Solution: Table Contains More Cells Than Defined in Colspec

To resolve this issue, correct the `colspec` attribute on the table that caused the issue. To locate the table that caused the issue:

1. Edit the transformation scenario and set the parameter `clean.temp` to `no`.
2. Run the transformation, open the `topic.fo` file in Oxygen XML Author, and look in it at the line specified in the error message (See position 179:-1).
3. Look around that line in the XSL-FO file to find relevant text content that you can use (for example, with the Find/Replace in Files action in the DITA Maps Manager view (on page 2503)) to find the original DITA topic for which the table was generated.

Problem: Broken Link

There is a broken link in the generated XSL-FO file. The PDF is generated but contains a link that is not working. The console output contains messages like this:

```
[fop] 1248 WARN [ main ] org.apache.fop.apps.FOUserAgent -
Page 6: Unresolved ID reference "unique_4_Connect_42_wrongID" found.
```

Solution: Broken Link

To resolve this issue:

1. Use the Validate and Check for Completeness action available in the DITA Maps Manager view (on page 2503) to find such problems.
2. If you publish to PDF using a DITAVAL filter, select the same DITAVAL file in the DITA Map Completeness Check dialog box.
3. If the Validate and Check for Completeness action does not discover any issues, edit the transformation scenario and set the `clean.temp` parameter to `no`.
4. Run the transformation, open the `topic.fo` file in Oxygen XML Author, and search for the unresolved ID references (for example: `unique_4_Connect_42_wrongID`).
5. Look in the XSL-FO file to find relevant text content that you can use (for example, with the Find/Replace in Files action in the DITA Maps Manager view (on page 2503)) to find the original DITA topic for which the table was generated.

Related Information:

- How to Enable Debugging for FO Processor Transformations (on page 1358)

DITA to CHM Transformation Fails - Cannot Open File

**Problem**

The DITA to CHM transformation fails with the following error: `[exec] HHC5010: Error: Cannot open "fileName.chm". Compilation stopped.`

**Cause**

This error occurs when the CHM output file is opened and the transformation scenario cannot rewrite its content.

**Solution**

To solve this issue, close the CHM help file and run the transformation scenario again.

*Tip:* It is a good practice to validate the DITA map (on page 2793) before executing the transformation scenario. To do so, run the Validate and Check for Completeness action (on page 2549). Depending on the selected options, this action reports errors, such as topics referenced in other topics (but not in the DITA map), broken links, and missing external resources.

Related Information:

- DITA Map to CHM (Compiled HTML Help) Transformation (on page 1282)
DITA to CHM Transformation Fails - Compilation Failed

Problem

The DITA to CHM transformation fails with the following error: [exec] HHC5003: Error: Compilation failed while compiling fileName.

Cause 1

One possible cause for this error is that the processed file does not exist.

Solution 1

To solve this issue, fix the file reference before executing the transformation scenario again.

Cause 2

Another possible cause for this error is that the processed file has a name that contains space characters.

Solution 2

To solve the issue, remove any spacing from the file name and run the transformation scenario again.

Tip: It is a good practice to validate the DITA map (on page 2793) before executing the transformation scenario. To do so, run the Validate and Check for Completeness action (on page 2549). Depending on the selected options, this action reports errors, such as topics referenced in other topics (but not in the DITA map), broken links, and missing external resources.

Related Information:

- DITA Map to CHM (Compiled HTML Help) Transformation (on page 1282)

Drag and Drop Without Initial Selection Does Not Work

Problem

When I try to drag with the mouse an unselected file from the Project view (on page 320) or the DITA Maps Manager view (on page 2503), the drag doesn't start, it only selects the resource. I need to drag
the resource again after it becomes selected. Therefore, any drag and drop action without an initial selection becomes a two step operation. How can I fix this?

**Solution**

This is a bug present in JVM versions prior to 1.5.0_09. This issue is fixed in 1.5.0_09 and newer versions. See the installation instructions (on page 33) for setting a specific JVM version for running the Oxygen XML Author application.

---

Gray Window on Linux With the Compiz / Beryl Window Manager

**Problem**

I try to run Oxygen XML Author on Linux with the Compiz / Beryl window manager but I only get a gray window that does not respond to user actions. Sometimes the Oxygen XML Author window responds to user actions but after opening and closing an Oxygen XML Author dialog, or after resizing the Oxygen XML Author window or a view of the Oxygen XML Author window, the content of this window becomes gray and it does not respond to user actions.

**Cause**

Sun Microsystems’ Java virtual machine does not support the Compiz window manager and the Beryl one very well. It is expected that better support for Compiz / Beryl will be added in future versions of their Java virtual machine.

**Solution**

Try turning off the special effects for the Compiz / Beryl window manager before starting the Oxygen XML Author application or switch to another window manager.

---

Handshake Failure Error When Accessing an HTTPS (SSL) Resource

**Problem**

When attempting to access an HTTPS (SSL) resource, I receive a **handshake_failure** error.

**Cause**

The issue is most likely due to the limitation of Java cryptography capabilities.
Solution

A solution might be to download and deploy Java Cryptography Extension (JCE) Unlimited Strength Jurisdiction Policy Files 8 (for Java 8).

⚠️ Warning: It is possible that this may not be legal in your country. Be advised that you bare legal responsibility for activating unlimited strength Java cryptography capabilities, so you must have the legal right to use such cryptography (consult your export/import control counsel or attorney to determine the exact requirements for your jurisdiction).

To deploy it in Oxygen XML Author, unpack the downloaded zip archive and move the two jar files (local_policy.jar and US_export_policy.jar) from UnlimitedJCEPolicyJDK8 to the following directory, overwriting existing files:

- **Windows** - `{OXYGEN_INSTALL_DIR}/jre/lib/security`
- **Linux** - `{OXYGEN_INSTALL_DIR}/jre/lib/security`
- **Mac OS X** - `{OXYGEN_INSTALL_DIR}/jre.bundle/Contents/Home/jre/lib/security`

Hunspell Spell Checker is Unusable on Your Platform Error

**Problem**

When trying to use the **Check Spelling** option, I receive the error **Hunspell spell checker is unusable on your platform. It has crashed the application in a previous session.**

**Cause**

There are instances where Oxygen XML Author determines that an internal component (such as the spell checker) has crashed the application and disables that component from running in the future (to prevent a possible future crash).

**Solution**

To re-enable the spell checker component, follow these steps:

2. Open the `%APPDATA%/com.oxygenxml` folder and look for a file called something like `HunspellCrashGuard*.txt`. Delete that file.
High Resolution Scaling Issues

Problem

I encounter scaling detection issues in a high resolution display. For example, some GUI components are too small.

Cause

This sometimes happens when using multiple displays with different resolutions because the application cannot detect the correct scaling setting.

Solution

You can use the `com.oxygenxml.hidpi.scaling` custom system property (on page 278) to force a specific scaling setting. For example: `-Dcom.oxygenxml.hidpi.scaling=1.5` for 150% scaling.

Images Appear Stretched Out in the PDF Output

Problem

When publishing XML content (DITA, DocBook, etc.), images are sometimes scaled up in the PDF outputs but are displayed perfectly in the HTML (or WebHelp) output.

Solution

PDF output from XML content is obtained by first obtaining an intermediary XML format called XSL-FO and then applying an XSL-FO processor to it to obtain the PDF. This stretching problem is caused by the fact that all XSL-FO processors take into account the DPI (dots-per-inch) resolution when computing the size of the rendered image.

The PDF processor that comes out of the box with the application is the open-source Apache FOP processor. Here is what Apache FOP does when deciding the image size:

1. If the XSL-FO output contains width, height or a scale specified for the image `external-graphic` tag, then these dimensions are used. This means that if in the XML (DITA, DocBook, etc.) you set explicit dimensions to the image they will be used as such in the PDF output.
2. If there are no sizes (width, height or scale) specified on the image XML element, the processor looks at the image resolution information available in the image content. If the image has such a
resolution saved in it, the resolution will be used and combined with the image width and height to obtain the rendered image dimensions.

3. If the image does not contain resolution information inside, Apache FOP will look at the FOP configuration file for a default resolution. The FOP configuration file for XSLT transformations that output PDF is located in \[OXYGEN_INSTALL_DIR\]/lib/fop.xconf. DITA publishing uses the DITA Open Toolkit that has the Apache FOP configuration file located in \[DITA-OT-DIR\]/plugins/org.dita.pdf2.fop/fop/conf/fop.xconf. The configuration file contains two XML elements called `source-resolution` and `target-resolution`. The values set to those elements can be increased (usually a DPI value of 110 or 120 should render the image in PDF the same as in the HTML output).

The commercial RenderX XEP XSL-FO processor behaves similarly but as a fallback it uses 120 as the DPI value instead of using a configuration file.

**Tip:** It is best to save your images without any DPI resolution information. For example, when saving a PNG image in the open-source GIMP image editor, you do not want to save the resolution.

This allows you to control the image resolution from the configuration file for all referenced images.

Increasing the Memory for the Ant Process

**Problem**

The Ant build process runs out of memory.

**Solution**

For details about setting custom JVM arguments to the Ant build process, see JVM Arguments (on page 2722).
Java Virtual Machine (JVM) Crash on Mac OS X

Problem
Oxygen XML Author crashed the Apple Java virtual machine or it could not start up on my OS X computer due to a JVM crash.

Cause
Usually it is an incompatibility between the Apple JVM and a native library of the host system. More details are available in the crash log file generated by OS X and reported in the crash error message.

Solution
If this happens, it is best to send a copy of the logs via email to support@oxygenxml.com. Usually, the operating system will offer a prompt that allows you to see the logs. If not, you should be able to find the logs in the Console app (Applications > Utilities, under ~/Library/Logs/DiagnosticReports. They are usually named JavaApplicationStub*.crash/.hang.

JPEG CMYK Color Space Issues

Problem
JPEG images with the CMYK color profile and have the color profiles embedded in the image aren't rendered in the Author mode.

Solution
If the color profile information is missing from the JPEG image but you have the ICC file available, you can copy the profileFileName.icc to the {OXYGEN_INSTALL_DIR}\lib directory.

If the color space profile is missing, JPEG images that have the CMYK color space are rendered without taking the color profile into account. The Unsupported Image Type message is displayed above the image.
Keyboard Language Resets to Default on Windows

**Problem**

In Windows, I have set a specific language for my keyboard and while using Oxygen XML Author, it keeps getting reset to the default language.

**Cause**

When multiple languages are enabled in Windows, the default shortcut key combination for switching the input language is **Left Alt + Shift**. Trying to use various shortcuts in Oxygen XML Author that involves combinations of those two keys is probably resetting your input language to the default setting if you press those two keys without a third combination.

**Solution**

You can change the Windows shortcut keys that are assigned to the input language by going to the control panel and searching for the **Switch input languages** option. For example, in Windows 10, go to **Control Panel > Language > Advanced Setting**. In the **Switching input methods** section, click on **Change language bar hot keys**. Click the **Change Key Sequence** button. This opens a dialog box that allows you to switch the shortcut keys for the input language or keyboard layout.

Keyboard Shortcuts Do Not Work At All

**Problem**

The keyboard shortcuts listed in the **Menu Shortcut Keys preferences page (on page 238)** do not work.

**Cause**

Usually this happens when a special keyboard layout is set (in the operating system) that generates non-standard characters. For example, an extended Greek layout will generate special characters that are not present in the default Greek layout. This causes the Java virtual machine that runs the application to receive unexpected key codes.

**Solution**

Reset the keyboard layout to the standard layout for your particular language.
Keyboard Shortcuts Result in Unexpected Behavior

Problem
In some rare cases, using certain keyboard shortcuts listed in the Menu Shortcut Keys preferences page (on page 238) result in something different than what is listed in that preferences page.

Cause
This is usually caused by the operating system intercepting the keyboard shortcut. For example, certain applications or hardware drivers intercept certain keyboard shortcuts by default. Another example is if you have multiple input sources configured, the operating system might intercept shortcuts if they match the ones used to change between the input sources.

Solution
Assign a different keyboard shortcut for the particular action in the Menu Shortcut Keys preferences page (on page 238) or refer to documentation for your operating system or hardware equipment to see if there are options to change the behavior.

Mac Touch Bar Function Keys Do Not Work

Problem
I am using a Mac that has a Touch Bar but its function keys do not work in Oxygen XML Author.

Causes
By default, the Touch Bar function keys are not enabled for Oxygen XML Author.

Solution
To enable the Touch Bar function keys for Oxygen XML Author, follow these steps:

1. Go to System Preferences and select Keyboard.
2. Click Shortcuts.
3. From the left sidebar, select Function Keys.
4. Click the + symbol, select Oxygen from the list of apps, and click Add.
Machine Signature Mismatch Error

Problem

I receive an error indicating that the current license was already activated on a License Server or that the License Server's Machine Signature does not match.

During the license activation process, the license key becomes bound to a particular license server deployment. This means that a code that uniquely identifies your license server deployment (called Machine Signature) is sent to the Oxygen XML Author servers, which in turn will sign the license key. The Machine Signature is computed from the list of network interfaces of the machine where you deployed the license.

When starting the license server, if you receive an error stating that your server's Machine Signature does not match, there are several possible causes:

Possible Cause 1

The license key was moved to a new machine that hosts your license server.

Solution

Revert to your previous configuration.

Possible Cause 2

A new network interface was changed, added, or activated in the machine that hosts your license server.

Note: A specific example of when this could happen is if the Bluetooth or the WiFi module is activated/deactivated.

Solution

If reverting is not possible, contact the Oxygen support team.

Possible Cause 3

The license server was restarted from a different location as the previous restart. For example, some server configurations will have the Apache Tomcat server installed in a versioned folder (/usr/local/apache-tomcat-V.V.V) with a symbolic link to the typical folder (/usr/local/tomcat).
The server can be restarted from either location, but it is recommended to always restart from the typical folder (/usr/local/tomcat) and always restart from the same location.

Solution

The server simply needs to always be restarted from the same location.

MSXML 4.0 Transformation Issues

Problem

When running a transformation scenario that uses the MSXML 4.0 transformer, I receive an error that looks like this:

```
Could not create the 'MSXML2.DOMDocument.4.0' object.
Make sure that MSXML version 4.0 is correctly installed on the machine.
```

Cause

It is likely that the latest MSXML 4.0 service pack is not installed on your computer.

Solution

To fix this issue, go to the Microsoft website and get the latest MSXML 4.0 service pack.

Navigation to a Web Page is Canceled when Viewing CHM on a Network Drive

Problem

When viewing a CHM on a network drive, I only see the TOC and an empty page that displays the message: **Navigation to the web page was canceled.**

Cause

This is actually normal behavior. The Microsoft viewer for CHM does not display the topics for a CHM opened on a network drive.
Solution

As a workaround, copy the CHM file on your local system and view it there.

Out Of Memory Error When Opening Large Documents

Problem

I am trying to open a file larger than 100 MB in Oxygen XML Author, but it runs out of memory (OutOfMemoryError).

Solution

You should make sure that the value of the Optimize loading in the Text edit mode for files over option (on page 152) is less than the size of your document. This will enable the optimized support for large documents. If that fails and you still get an Out Of Memory error you should increase the memory available to Oxygen XML Author (on page 2460).

Other tips:

• Make sure that you close other files before opening the large file.
• You can set the default editing mode in the Preferences dialog box (on page 125). The Text editing mode uses less memory than other editing modes.
• If the file is too large for the editor to handle, you can open it in for viewing in Large File Viewer (on page 2279).

Rectangular Selection Feature Does Not Work On Windows

Problem

When trying to use the Rectangular Selection feature (on page 785) on Windows using both the keyboard and mouse, releasing the Alt key shifts the focus to the main menu instead of entering the edit mode.

Cause

This seems to be an issue caused by something that was changed in Java 8u172.
Solution

A workaround is to use Shift or Ctrl along with Alt and release them simultaneously.

References Outside the Main DITA Map Folder

Problem

A reference to a DITA topic, map, or binary resource (for example, an image) that is located outside of the folder where the main DITA map (on page 2793) is located leads to problems when publishing the content using the DITA Open Toolkit.

Cause

DITA-OT often has trouble resolving references that are outside the directory where the published DITA map is found. By default, it does not even copy the referenced topics to the output directory.

Solution

To solve this, try one of the following solutions:

- Create another DITA map that is located in a folder path above all referenced folders and reference the original DITA map from this new map. Then transform this DITA map instead.
- Edit the transformation scenario and in the Parameters tab, change the value of the fix.external.refs.com.oxygenxml parameter to true. This parameter is used to specify whether or not the application tries to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content.

⚠️ Important: The fix.external.refs.com.oxygenxml parameter is only supported when the DITA OT transformation process is started from Oxygen XML Author.

- For PDF output, you can edit the transformation scenario and in the Parameters tab set the value of the generate.copy.outer parameter to 3. This parameter specifies whether to generate output files for content that is not located in or beneath the directory containing the DITA map file. By setting the value of this parameter to 3, the transformation scenario shifts the output directory so that it contains all output for the publication.

⚠️ Important: This method is recommended for transformation scenarios that use an external DITA-OT.
Saxon 9.7 Transformer Issues

Problem

I have upgraded to Oxygen XML Author version 19.0 (which comes bundled with Saxon 9.7) and I am experiencing issues when trying to use the Saxon 9.7 transformer. Is it possible to use the Saxon 9.6 transformer with Oxygen XML Author version 19.0 or later?

Solution

There is a plugin available that can be installed and it allows you to use Saxon 9.6. To install it, follow these instructions:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Select the default update site from the drop-down menu (https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml).
3. Select the Saxon 9.6 XSLT and XQuery Transformer plugin and click Next.
4. Select the I accept all terms of the end user license agreement option and click Finish.
5. Restart the application.

Result: When you configure the transformation scenario, you will now have the option to choose the Saxon 9.6 transformer.

Scroll Function of my Notebook Trackpad is Not Working

Problem

I got a new notebook (Lenovo Thinkpad™ with Windows) and noticed that the scroll function of my trackpad is not working in Oxygen XML Author.

Cause

It is most likely a problem with the Synaptics™ trackpads.

Solution

Try adding the following lines to the C:\Program Files\Synaptics\SynTP\TP4table.dat file (depending on your version of Oxygen XML Author). For example:

*.*,oxygen20.1.exe,*.*,*,WheelStd,1,9
Segmentation Fault Error on Mac OS X

Problem

On Mac OS X, the application gives a *Segmentation fault* error when I double-click the application icon. Sometimes it gives no error but it does not start.

Solution

Make sure you have the latest Java update from the Apple website installed. If this does not solve the problem, copy the *JavaApplicationStub* file from the `/System/Frameworks/JavaVM.framework` folder to the *OxygenAuthor.app/Contents/MacOS* folder. To browse the `.app` folder, you have to use the *Command* key while clicking the Oxygen XML Author icon and select *Show Package Contents*.

Special Characters are Replaced with a Square

Problem

My file was created with another application and it contains special characters (such as é, ©, ®, etc.) but Oxygen XML Author displays a square for these characters.

Solution

You must set a font that is able to render the special characters in the *Font preferences* (on page 88). If it is a text file, you must also set the *encoding used for non XML files* (on page 122). If you want to set a font that is installed on your computer but that font is not accessible in the *Font* preferences, this means the Java virtual machine is not able to load the system fonts (probably because it is not a True Type font). It is a problem of the Java virtual machine and a possible solution is to copy the font file in the `[JVM_DIR]/lib/fonts` folder. `[JVM_DIR]` is the value of the property `java.home` that is available in the *System properties* tab of the *About* dialog box that is opened from menu *Help > About*. 
TocJS Transformation Does not Generate All Files for a Tree-Like TOC

Problem

The TocJS transformation of a DITA map (on page 2793) does not generate all the files needed to display the tree-like table of contents.

Solution

To get a complete set of output files, follow these steps:

1. Run the XHTML transformation on the same DITA map. Make sure the output gets generated in the same output folder as for the TocJS transformation.
2. Copy the content of the DITA-OT-DIR/plugins/com.sophos.tocjs/basefiles folder to the transformation output folder.
3. Copy the DITA-OT-DIR/plugins/com.sophos.tocjs/sample/basefiles/frameset.html file to the transformation output folder.
5. Locate element <frame name="contentwin" src="concepts/about.html">.
6. Replace "concepts/about.html" with "index.html".

Windows Service Reports Incorrect Function Error When Starting (TCP Server)

Problem

My TCP floating license server reports an "Incorrect Function" error message when starting the Windows service.

Cause

This usually appears because the Windows service launcher cannot locate a Java virtual machine on your system.

Solution

Make sure that you have installed a 32-bit Java SE from Oracle (or Sun) on the system: http://www.oracle.com/technetwork/java/javase/downloads/index.html.
Windows Service Reports Process Terminated Unexpectedly Error (TCP Server)

Problem

My TCP floating license server reports a "Process Terminated Unexpectedly" error message for the Windows service.

Cause

This error message appears if the Windows service launcher quits immediately after being started. This problem usually happens because the license key has not been correctly deployed (license.txt file in the license folder).

Solution

Re-deploy your license key. For more information, see the Setting up a Floating License Server section (on page 67).

Wrong Words are Highlighted when Searching in a User Manual

Problem

When I do a keyword search in the User Manual that is included with the Oxygen XML Author application, the search highlights the wrong word in the text. Sometimes the highlighted word is several words after the matched word.

Cause

This does not happen when Oxygen XML Author runs with a built-in Java virtual machine that was installed by Oxygen XML Author in a subfolder of the installation folder (for example, on Windows and Linux when installing Oxygen XML Author with the installation wizard specific for that platform). However, when Oxygen XML Author runs from an All Platforms installation, it uses whatever JVM was found on the host system, which may be incompatible with the JavaHelp indexer used for creating the built-in User Manual. Such a JVM may offset the highlight of the matched word with several characters, usually to the right of the matched word.
Solution

To see the highlight the exact matched word, it is recommended to install the application with the specific installation wizard for your platform (available only for Windows and Linux).

XML Document Takes a Long Time to Open

Problem

Oxygen XML Author takes a long time to open an XML document.

Cause

It takes longer to open an XML document if the whole content of your document is on a single line or if the document size is very large.

Solution

If the content is on a single line, you can speed up loading by selecting the Format and indent the document on open option (on page 156) (in the Format preferences page).

If the document is very large (above 30 MB), make sure that the value of the Optimize loading in the Text edit mode for files over option (on page 152) (in the Open preferences page) is greater than the size of your document.

If that fails and you get an Out Of Memory error (OutOfMemoryError) you can increase the memory available to Oxygen XML Author. (on page 2460)
DITA Authoring

DITA is an XML standard, an architectural approach, and a writing methodology, developed by technical communicators for technical communicators. It provides a standardised architectural framework (on page 2794) for a common structure for content that promotes the consistent creation, sharing, and re-use of content.

Some of the benefits of using DITA include the following:

- **Flexibility** - DITA is a topic-based architecture and it offers flexibility in content organization.
- **Modularity** - DITA allows for content reuse that saves time and reduces the number of modifications.
- **Structured Authoring** - DITA offers a standardized, methodological approach that helps to reduce authoring time and improve consistency.
- **Single-Source Publishing** - DITA provides the ability to change content in one place and have the change propagate everywhere.
- **Multiple Output Formats** - DITA supports multiple types of output.
- **Inheritance** - The DITA inheritance model makes it easy to specialize topics or elements within topics and you only have to define how the element is different from its immediate ancestor.
- **Process Automation** - DITA offers various ways to automate processes, such as with index or glossary production, output delivery, validation, and more.
- **Specialization** - DITA allows you to define your own information types and semantic elements/attributes to suit the needs of your particular content model.
- **Multi-Lingual** - DITA is a translation-friendly structure that supports numerous languages and text encodings.
- **Conditional Profiling** - DITA supports conditional text processing and profiling to filter content in the publishing stage.

This chapter is designed to be a guide to help content authors who use DITA. It also presents the Oxygen XML Author features that are specific to working with DITA documents and concepts.

**DITA Resources**

For more general information and technical details about working with DITA, refer to the following resources:

- The DITA Specifications.
• **The DITA Style Guide Best Practices for Authors.**
• Various sample DITA topics and maps can be found in the `OXYGEN_INSTALL_DIR/samples/dita` folder.

• DITA Map Document Type (Framework) *(on page 1214)*

---

## Getting Started with DITA

The information in this topic is meant to be a very basic starting point for those who are just getting started using DITA in Oxygen XML Author. Oxygen XML Author makes it easy to create, edit, manage, and publish DITA content, but it requires at least some basic DITA knowledge. To truly get the most out of Oxygen XML Author and all of its DITA-related features, you should explore resources in the online DITA community to acquire knowledge of its concepts and uses.

### Understanding DITA Topics

It is important to understand the role that a DITA topic plays in a DITA project. A DITA topic is not associated with a single published document. It is a separate entity that can potentially be included in many different books, help systems, or websites. Therefore, when you write a DITA topic you are not writing a book, a help system, or a website. You are writing an individual piece of content. This affects how you approach the writing task and how Oxygen XML Author works to support you as you write.

Most of your topics are actually related to other topics, and those relationships can affect how you write and handle things such as links and content reuse. Oxygen XML Author helps you manage those relationships. Depending on how your topics are related, you can use the tools provided in Oxygen XML Author, along with the features of DITA, in a variety of ways.

### Creating a DITA Topic in Oxygen XML Author

To create a DITA topic *(on page 2562)*:

1. Select **File > New** or click the **New** button on the toolbar.

   **Step Result:** The **New Document Wizard** *(on page 619)* is displayed:

   Figure 578. New DITA Document Wizard
2. Go to Framework templates > DITA > topic and select the type of topic that you want to create.

   **Note:** If your organization has created DITA customizations, the appropriate template files may be in another location, and various types of topics may be provided for your use. Check with the person who manages your DITA system to see if you should be using templates from another directory.

3. Select a file path where it will be saved. You can also optionally specify a title.

4. Click Create.

**Result:** Your document is opened in the editor. Eventually you will need to add a reference to it in your DITA map (on page 16).

Your DITA topic is an XML document, thus all the editing features that Oxygen XML Author provides for editing XML documents (on page 7) also apply to DITA topics. Oxygen XML Author also provides additional specific DITA-related support for working with DITA topics (on page 2560), their associated DITA maps (on page 2501), and for creating DITA output (on page 2683).

**Role of Maps**

The basic method that DITA uses to express the relationship between topics is through a DITA map (on page 2793). Other relationships between topics, such as cross references, generally need to be made between topics in the same root map. DITA uses maps to determine which topics are part of
any output that you create. While customized DITA solutions can use other mechanisms, generally DITA is not used as a way to publish individual topics. Output is created from a map and includes all the topics referenced by the map.

A publication is not always represented by a single map. For instance, if you are writing a book, you might use a submap to create each chapter and then organize the chapters in a main root map to create the book. This helps you to manage your content, offers the possibility of reusing submaps, and segregates content to support multiple people working on the same project.

Creating a Map in Oxygen XML Author

To create a map (on page 2520):

1. Select File > New or click the New button on the toolbar.
2. Go to Framework templates > DITA Map > map and select the type of map you want to create.
3. Choose whether you want to open the map in the Editor or in the DITA Maps Manager (on page 2503). Usually, opening it in the DITA Maps Manager is the best choice. The DITA Maps Manager presents a view of the DITA map that is similar to a table of contents.

![DITA Maps Manager View](Figure 579. DITA Maps Manager View)

Adding Existing Topics to a Map in Oxygen XML Author

There are several ways to add a topic reference to a map (on page 2523). Perhaps the easiest method is to add a reference to a topic that is already open in the editor:

1. Open the DITA topic in the main editing window.
2. Right-click the *DITA map* in the **DITA Maps Manager** view (on page 2503) and choose **Reference to the currently edited file** from the **Append Child**, **Insert Before**, or **Insert After** submenu.

**Step Result:** This opens the **Insert Reference** dialog box (on page 2530) with all of the required fields already filled in for you.

Figure 580. Insert Reference Dialog Box

3. You can fill in additional information in the various tabs in this dialog box or add it to the map later.

4. Select **Insert and close** to add a reference to your topic in the map.

5. Save the *DITA map*.

**Adding New Topics to a Map in Oxygen XML Author**

As you add topics to your map, you may want to create a new topic as a child or sibling of another topic. This is usually done at the map level.

To **add a new topic to a map** (on page 2523), follow these steps:

1. In the **DITA Maps Manager** (on page 2503), right-click the node in the current map where you want to add the new topic.

2. Select one of the following actions:
   - **Append Child > New** - Select this action to insert the new topic as a child of the selected node. This action opens a **New file dialog box** (on page 2563) that allows you to select the
type of document and assists you with naming it. After you have configured your new topic, click Create.

- **Insert Before > New** - Select this action to insert the new topic as a sibling to the current node, before it. This action opens a New file dialog box (on page 2563) that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click Create.

- **Insert After > New** - Select this action to insert the new topic as a sibling to the current node, after it. This action opens a New file dialog box (on page 2563) that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click Create.

- **Duplicate** - Select this action to create a copy of the selected topic and insert it as a sibling. This action opens a dialog box that allows you to choose the file name and location for the newly created copy of the topic. After you have selected the name and path for your new topic, click OK.

**Step Result:** The new topic is now referenced (as a topicref) in the DITA map at the location where you inserted it and the new topic is opened in the editor.

3. Save the DITA map.

You can also change the order and nesting of topics in the DITA Maps Manager view by doing either of the following:

- Select the topic to move while holding down the Alt key and use the arrow keys to move it around.
- Use the mouse to drag and drop the topic to the desired location.

The way your parent and child topics are organized in any particular output depends on both the configuration of those topics in the map and the rules of the output transformation that is applied to them. Do not assume that your topics must have the same organization for all output types. The map defines the organization of the topics, not the topics themselves. It is possible to create a variety of maps, each with different organization and configuration options to produce a variety of outputs.

### Adding Submaps in Oxygen XML Author

If you have a large set of information, such as a long book or extensive help system, a single map can become long and difficult to manage. To make it easier to manage, you can break up the content into smaller submaps (on page 2521). A submap might represent a chapter of a book, a section of a user manual, or a page on a website. To build a publication out of these smaller maps, you must add them to a map that represents the overall publication.

To add a child map to the current map (on page 2521):
1. Right-click the parent DITA map in the DITA Maps Manager view (on page 2503) and choose Append child > Map reference.

   **Step Result:** This opens the Insert Reference dialog box (on page 2530) with all of the required fields already filled in for you.
2. You can fill in additional information in the various tabs in this dialog box or add it to the map later.
3. Select Insert and close to add a reference to your submap in the main map.
4. Save the main DITA map.

### Validating a Map in Oxygen XML Author

Just as it is with your individual topics, it is important to validate your maps (on page 2549). Oxygen XML Author provides a validation function for DITA maps that does more than simply validating that the XML is well formed. It also does the following:

- Validates all of the relationships defined in the maps.
- Validates all of the files that are included in the map.
- Validates all of the links that are expressed in the files.

Validating the map that describes your entire publication validates all the files that make up the publication and all of the relationships between them.

To validate a map:

1. Click the Validate and Check for Completeness button in the DITA Maps Manager view (on page 2503).

   **Step Result:** This opens the DITA Map Completeness Check dialog box (on page 2550).
2. Select any of the various options you want to check.
3. Click Check to run the validation process.

### Publishing Your Topics in Oxygen XML Author

As noted previously, in DITA standards you usually do not publish output from an individual topic. Instead, you create published output (on page 2683) by running a DITA transformation on a map. This collects all the topics that are referenced in the map, organizes them, and produces output in a particular format. By default, Oxygen XML Author uses the transformations provided by the DITA Open Toolkit for publishing to various output formats (such as PDF, WebHelp or EPUB). Your organization may have created various custom transformations or modified the built-in DITA Open Toolkit transformations. In either case, Oxygen XML Author manages them by using transformation scenarios.
To publish output for a map:

1. Click the **Configure Transformation Scenario(s)** button in the DITA Maps Manager view *(on page 2503).*

   **Step Result:** This opens the **Configure Transformation Scenario(s)** dialog box *(on page 1378).*

   ![Configure Transformation Scenarios Dialog Box](image)

   **Figure 581.** Configure Transformation Scenarios Dialog Box

2. Select the appropriate transformation depending on the type of output you desire.

3. To change or view the configuration or storage options for a transformation scenario, select the transformation and click **Edit**.

4. Click **Apply associated**.

   **Result:** Depending on the configuration of the transformation scenario, when the transformation is finished, your output may automatically be opened in the appropriate application.

**Related Information:**

- DITA Authoring *(on page 2494)*

- Editing XML Documents in Author Mode *(on page 835)*
Working with DITA Maps

In the DITA standard architecture you create documents by collecting topics into maps.

DITA Maps

A DITA map (on page 2793) organizes a set of topics into a hierarchy. In most output formats, the structure of the map becomes the structure of the table of contents. Oxygen XML Author provides support for creating (on page 2520) and managing DITA maps (on page 2523) through the DITA Maps Manager (on page 2503). There are also specialized types of DITA maps, such as a bookmap (on page 2792), which is intended for creating the structure of a book.

Submaps

You do not have to create an entire publication using a single map. It is generally good practice to break up a large publication into several smaller submaps (on page 2521) that are easier to manage. You can reuse submaps in multiple publications by including them in each of the main maps. The DITA Maps Manager (on page 2503) provides support for easily creating and managing submaps.

Opening a DITA Map

There are several ways to open a DITA map and you can choose to open it in the DITA Maps Manager (on page 2503) or in the XML Editor. Use any of the following methods to open a map:

• To open a submap in its own tab in the DITA Maps Manager, simply double-click it (or right-click it and select Open).
• To open a map in the XML editor from the DITA Maps Manager, right-click it and select Open Map in Editor.
• Drag a DITA map file from your system browser and drop it in the XML editor. This will open the map in the editor.
• If you open a file with the .ditamap or .bookmap extension (from the Project view (on page 320) or a system browser), a dialog box is opened that offers you the choice of opening it in the XML editor or in the DITA Maps Manager.

Note: If you select the Do not show the dialog again option, it will always be opened in the method that you choose and you will not be asked in the future. However, you can reset this by selecting Always ask for the When opening a map option in the DITA preferences page (on page 215).

• To open a map in the DITA Maps Manager, you can right-click a map file in the Project view (on page 320) and select Open with > DITA Maps Manager.
• If you have a DITA map file open in the XML editor, you can open it in the DITA Maps Manager by right-clicking the title tab and selecting Open in DITA Maps Manager View.
Chunking DITA Maps

By default, many output types place a single topic on each output page. In some cases you may want to output multiple topics as a single output page (also known as chunking) (on page 2548). To support this, Oxygen XML Author provides an Edit Properties dialog box (on page 2540) that allows you to easily configure the attributes of a topic to control how your table of contents and topics are rendered in the output.

Validating a Map

You should validate your maps (on page 2549) to make sure that the individual topics are valid and that the relationships between them are working. Oxygen XML Author provides a validation function for DITA maps that performs a comprehensive validation of a map and its topics.

For more information about DITA editing, watch our video demonstration:

https://www.youtube.com/embed/t2cG3Xe1TXY

Related Information:

- DITA Map Document Type (Framework) (on page 1214)
- DITA Map Author Mode Actions (on page 1216)

DITA Maps Manager

Oxygen XML Author provides a view for managing and editing DITA maps. The DITA Maps Manager view presents a DITA map as a Table of Contents. It allows you to navigate the topics and maps, make changes, and apply transformation scenarios to obtain various output formats. By default, it is located to the left of the main editor. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

The DITA Maps Manager includes a variety of useful actions to help you edit and organize the structure of your DITA maps and topics. The actions that are available and their functions depend on the type of nodes that are selected in the DITA Maps Manager. If you select multiple sibling nodes, the result of the actions will be applied to all the selected nodes. If you select multiple nodes that are not on the same hierarchical level, the actions will be applied to the parent node and the child nodes will inherit certain attributes from the parent node.

Figure 582. DITA Maps Manager View
Opening Maps in the DITA Maps Manager

The DITA Maps Manager view supports opening multiple maps at the same time, with each one presented in its own tab. To open a DITA map in the DITA Maps Manager, use any of the following methods:

- To open a submap in its own tab, simply double-click it (or right-click it and select Open).
- If you open a file with a .ditamap or .bookmap extension (from the Project view (on page 320) or a system browser), a dialog box is opened that offers you the choice of opening it in the DITA Maps Manager or the XML editor.

  Note: If you select the Do not show the dialog again option, it will always be opened in the method that you choose and you will not be asked in the future. However, you can reset this by selecting the Always ask choice for the When opening a map option in the DITA preferences page (on page 215).

- Right-click a map file in the Project view (on page 320) and select Open with > DITA Maps Manager.
- If you have a DITA map file open in the XML editor, you can right-click the title tab and select Open in DITA Maps Manager View.

By default, when a map is opened in the DITA Maps Manager, its index is automatically refreshed. You can disable this feature by deseleting the Refresh index when opening a map in DITA Maps Manager option (on page 241) in the Open/Find Resource preferences page.
Submap Nodes

If your root map (on page 2799) (main DITA map) references other maps (submaps), they can be expanded and you can navigate their content in the DITA Maps Manager, but the references within those submaps are not editable unless you open the submap separately in its own tab. The references within submap nodes are shown with a gray background.

Moving Nodes in the DITA Maps Manager

You can move topics or nodes within the same map, or other maps, by dragging and dropping them into the desired position. You can arrange the nodes by dragging and dropping one or more nodes at a time. You can arrange multiple topics by dragging them while pressing the Ctrl or Shift key. Drop operations can be performed before, after, or as child of the targeted node.

Operations include:

**Copy**

Select the nodes you want to copy and start dragging them. Before dropping them in the appropriate place, press and hold the Ctrl key. The mouse pointer changes to a symbol to indicate that a copy operation is being performed.

**Move**

Select the nodes you want to move and drag and drop them in the appropriate place.

**Promote (Alt + LeftArrow) / Demote (Alt + RightArrow)**

You can move nodes between child and parent nodes by using the Promote (Alt + LeftArrow) and Demote (Alt + RightArrow) operations.

DITA Maps Manager Toolbar

The toolbar includes the following actions (also available in the DITA Maps menu) and their availability depend on the nodes that are selected:

**Note:** If multiple nodes are selected, the availability of the actions depends on the nodes that are selected.

**Open Drop-down Menu**

You can use this drop-down menu to open new DITA maps or to reopen recently viewed maps. The drop-down menu contains the following:
• List of recently viewed DITA maps that can be selected to reopen them.

• Clear history - Clears the history list of the recently viewed DITA maps.

• Open - Allows you to open the map in the DITA Maps Manager view (on page 2503). You can also open a map by dragging it from the file system explorer and dropping it into the DITA Maps Manager view (on page 2503).

• Open URL - Displays the Open URL dialog box where you can specify a URL (defined by a protocol, host, resource path, and an optional port) or use the browsing actions in the Browse for remote file drop-down menu.

Save (Ctrl (Meta on Mac OS)+S)
Saves the current DITA map.

Validate and Check for Completeness
Checks the validity and integrity (on page 2549) of the map.

Apply Transformation Scenario(s)
Applies the DITA Map transformation scenario (on page 1259) that is associated with the current map.

Configure Transformation Scenario(s)
Opens the Configure Transformation Scenarios(s) dialog box (on page 1378) where you can edit or create transformation scenarios or associate a DITA Map transformation scenario (on page 1319) with the current map.

Refresh References
You can use this action to manually trigger a refresh and update of all referenced documents. This action is useful when the referenced documents are modified externally. When they are modified and saved from Oxygen XML Author, the DITA map is updated automatically.

Open Map in Editor with Resolved Topics
Opens the DITA map in the main editor area with content from all topic references, expanded in-place. Content from the referenced topics is presented as read-only and you have to use the contextual menu action Edit Reference to open the topic for editing.

Tip: If you want to print the expanded content, you should consider changing the Styles drop-down to + Print ready.

Open Map in Editor
For complex operations that cannot be performed in the simplified DITA Maps Manager view (for instance, editing a relationship table) you can open the map in the main editing area.

Note: You can also use this action to open referenced DITA maps in the Editor.

Profiling/Conditional Text Drop-down Menu

This drop-down menu contains the following actions:

- **Show Profiling Colors and Styles** - Select this option to turn on conditional styling. To configure the colors and styles open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Edit modes > Author > Profiling/Conditional Text > Colors and Styles.

- **Show Profiling Attributes** - Select this option to display the values of the profiling attributes at the end of the titles of topic references. When selected, the values of the profiling attributes are displayed in both the DITA Maps Manager view and in the Author view.

- **Show Excluded Content** - Controls if the content filtered out by a particular condition set is hidden or grayed-out in the editor area and in the Outline (on page 334) and DITA Maps Manager views. When this option is selected, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, deselect this option.

- **Profiling Settings** - Opens the preferences page for adding and editing the profiling conditions that you can apply in the DITA Maps Manager view and the Author mode editing pane. When a profiling condition set (on page 917) is applied, the keys that are defined in the DITA map are gathered by filtering out the excluded content.

Link with Editor

Toggles the synchronization between the file path of the current editor and the selected topic reference in the DITA Maps Manager view. If enabled, it results in the following types of synchronizations:

- If you select a topic tab in the main editing area and it is referenced in the map currently opened in the DITA Maps Manager, the reference to that topic is selected in the DITA Maps Manager.

- If you have a map opened in both the DITA Maps Manager and the main editor, selecting the map tab in the main editing area opens that map in the DITA Maps Manager.
• If you have a map opened in both the DITA Maps Manager and the main editor (Author mode) and, selecting one or more topicrefs in the DITA Maps Manager will also select the same topicrefs in the main editor.
• If you have a map opened in both the DITA Maps Manager and the main editor (Author mode) and, selecting one or more topicrefs in the main editor will also select the same topicrefs in the DITA Maps Manager.

Settings

Show extended toolbar

Toggles whether or not the extended toolbar will be displayed in the DITA Maps Manager toolbar.

Show root map toolbar

Toggles whether or not the Root map option (on page 2508) will be displayed in the DITA Maps Manager toolbar.

Show topic titles

Toggles how topics are presented in the DITA Maps Manager. If selected, the title of each topic is shown. Otherwise, the file path (value of the href attribute) for each topic is shown.

Root map

Specifies a master DITA map (root map (on page 2799)) that Oxygen XML Author uses to define a hierarchical structure of submaps and to establish a key space (on page 2795) that defines the keys that are propagated throughout the entire map structure. For more information, see Selecting a Root Map (on page 2520).

Browse Drop-down menu

You can use this drop-down menu to browse for root maps with the following choices:

• Browse for local file - Opens a local file browser dialog box, allowing you to select a local root map.
• Browse for remote file - Displays the Open URL dialog box (on page 636) that allows you to select a remotely stored root map.
• Browse for archived file - Displays the Archive Browser (on page 1807) that allows you to browse the content of an archive and choose a root map.
• Browse Data Source Explorer - Opens the Data Source Explorer (on page 1814) that allows you to browse the data sources defined in the Data Sources preferences page (on page 218).
Tip: You can open the Data Sources preferences page by using the Configure Database Sources shortcut from the Open URL dialog box.

- Search for file - Displays the Find Resource dialog box (on page 676) to search for a root map.

The following additional actions are displayed in the toolbar when the Show extended toolbar option is selected in the Settings menu:

- Insert Topic Reference
  Opens the Insert Reference dialog box (on page 2530) that allows you to insert references to targets such as topics, maps, topic sets, or key definitions.

- Edit Properties
  Opens the Edit Properties dialog box that allows you to configure the properties of a selected node. For more details about this dialog box, see Edit Properties Dialog Box (on page 2540).

- Edit Attributes
  Opens a small in-place editor that allows you to edit the attributes of a selected node. You can find more details about this action in the Attributes View in Author Mode (on page 412) topic.

- Delete
  Deletes the selected node.

- Move Up
  Moves the selected node up within the DITA map tree.

- Move Down
  Moves the selected node down within the DITA map tree.

- Promote (Alt + LeftArrow)
  Moves the selected node up one level to the level of its parent node.

- Demote (Alt + RightArrow)
  Moves the selected node down one level to the level of its child nodes.

Contextual Menu of the DITA Maps Manager

Root Map
The following actions can be invoked from the contextual menu on the root map (on page 2799) of an opened DITA map (many of them are also available in the DITA Maps menu):

- **Open Map in Editor**
  For complex operations that cannot be performed in the simplified DITA Maps Manager view (for instance, editing a relationship table) you can open the map in the main editing area.

- **Open Map in Editor with Resolved Topics**
  Opens the DITA map in the main editor area with content from all topic references, expanded in-place. Content from the referenced topics is presented as read-only and you have to use the contextual menu action **Edit Reference** to open the topic for editing.

- **Export DITA Map**
  Opens a dialog box that allows you to choose a destination for exporting the DITA map. It also includes an **Export as Zip archive** option that allows you to package the DITA map as a zip archive. The result will contain all directly and indirectly referenced topics from the DITA Map by following all topicref, conref, and xref elements.

- **Find Unreferenced Resources**
  Allows you to search for orphaned resources that are not referenced in the DITA maps.

- **Add to Review Task**
  This action can be used to add the selected documents to a task in the Content Fusion Tasks Manager view. Oxygen Content Fusion is a flexible, intuitive collaboration platform designed to adapt to any type of documentation review workflow. This functionality is available through a pre-installed connector add-on (on page 2250). To fully take advantage of all of the benefits and features of Content Fusion, your organization will need an Oxygen Content Fusion Enterprise Server. For more information, see the Oxygen Content Fusion website.

- **Edit Properties**
  Opens the Edit Properties dialog box that allows you to configure the properties of a selected node. For more details about this dialog box, see Edit Properties Dialog Box (on page 2540).

- **Fast Create Topics**
Opens the **Fast Create Topics** dialog box *(on page 2565)* that allows you to quickly create multiple skeleton topics at once and you can specify their hierarchical structure within the *DITA map (on page 2793)*.

### Append Child submenu

Container sub-menu for a number of actions that create a map node as a child of the currently selected node:

- **New** - Opens a dialog box that allows you to configure some options for inserting a new topic *(on page 2562)*.
- **Reference** - Inserts a reference to a topic file. You can find more details about this action in the *Inserting References (on page 2530)* topic.
- **Reference to the currently edited file** - Inserts a reference to the currently edited file. You can find more details about this action in the *Inserting References (on page 2530)* topic.
- **Key Reference** - Opens an *Insert Key Definition* dialog box that allows you to insert a targeted key definition *(on page 2539)* (for example, to target a resource such as an image or external link).
- **Key Reference with Keyword** - Opens an *Insert Key Definition* dialog box that allows you to define a key and a value inside a keyword *(on page 2539)*.
- A set of actions that open the *Insert Reference* dialog box *(on page 2530)* that allow you to insert various reference specializations (such as Anchor Reference, Glossary Reference, Map Reference, Navigation Reference, Topic Group, Topic Head, Topic Reference, Topic Set, Topic Set Reference).

### Search References

Searches all references to the current topic in the entire *DITA map (on page 2793)*.

### Refactoring submenu

The following actions are available from this submenu when invokes from a root map:

- **Rename resource**

  Allows you to change the name of a resource linked in the edited *DITA map (on page 2526)*.

- **Move resource**
Allows you to change the location on disk of a resource linked in the edited DITA map (on page 2526).

**Rename Key**

Use this operation to rename a key. It also updates all references to it. Note that it does not work on DITA 1.3 key scopes.

**Convert to Concept**

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

**Convert to General Task**

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA General Task is a less restrictive alternative to the Strict Task information type.

**Convert to Reference**

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

**Convert to Task**

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

**Convert to Topic**

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

**Convert to Troubleshooting**

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

**Other XML Refactoring Actions**

For your convenience, the last 5 XML Refactoring tool operations (on page 1080) that were finished or previewed will also appear in this submenu.

**XML Refactoring**

Opens the XML Refactoring tool wizard (on page 1080) that presents refactoring operations to assist you with managing the structure of your XML documents.
Find/Replace in Files

Opens the Find/Replace in Files dialog box (on page 687) that allows you to find and replace content across multiple files.

Check Spelling in Files

Allows you to spell check multiple files (on page 708).

Paste

Allows you to paste content from the clipboard into the DITA map.

Paste Before

Pastes the content of the clipboard (only if it is a part of the DITA map) before the currently selected DITA map node.

Paste After

Pastes the content of the clipboard (only if it is a part of the DITA map) after the currently selected DITA map node.

Expand All

Allows you to expand the entire DITA map structure.

Collapse All

Allows you to collapse the entire DITA map structure.

Editable Child Nodes

The following actions are available when the contextual menu is invoked on an editable child node of a DITA map (submaps need to be opened in the DITA Maps Manager to access these actions since they are in a read-only state in the parent map):

Note: If multiple nodes are selected, the availability of the actions depends on the nodes that are selected.

Open

Opens the selected resource in the editor.

Add to Review Task

This action can be used to add the selected documents to a task in the Content Fusion Tasks Manager view. Oxygen Content Fusion is a flexible, intuitive collaboration platform designed to adapt to any type of documentation review workflow. This functionality is available through a pre-installed connector add-on (on page 2250). To fully take advantage of all of the benefits and features of Content Fusion, your organization will
need an **Oxygen Content Fusion Enterprise Server**. For more information, see the **Oxygen Content Fusion** website.

**Edit Properties**

Opens the **Edit Properties** dialog box that allows you to configure the properties of a selected node. For more details about this dialog box, see **Edit Properties Dialog Box (on page 2540)**.

**Fast Create Topics**

Opens the **Fast Create Topics** dialog box *(on page 2565)* that allows you to quickly create multiple skeleton topics at once and you can specify their hierarchical structure within the **DITA map (on page 2793)**.

**Append Child submenu**

Container sub-menu for a number of actions that create a map node as a child of the currently selected node:

- **New** - Opens a dialog box that allows you to configure some options for **inserting a new topic (on page 2562)**.
- **Reference** - Inserts a reference to a topic file. You can find more details about this action in the **Inserting References (on page 2530)** topic.
- **Reference to the currently edited file** - Inserts a reference to the currently edited file. You can find more details about this action in the **Inserting References (on page 2530)** topic.
- **Key Reference** - Opens an **Insert Key Definition** dialog box that allows you to **insert a targeted key definition (on page 2539)** (for example, to target a resource such as an image or external link).
- **Key Reference with Keyword** - Opens an **Insert Key Definition** dialog box that allows you to **define a key and a value inside a keyword (on page 2539)**.
- A set of actions that open the **Insert Reference** dialog box *(on page 2530)* that allow you to insert various reference specializations (such as **Anchor Reference**, **Glossary Reference**, **Map Reference**, **Navigation Reference**, **Topic Group**, **Topic Head**, **Topic Reference**, **Topic Set**, **Topic Set Reference**).

**Insert Before submenu**

Container sub-menus for a number of actions that create a map node as a sibling of the currently selected node, above the current node in the map:
• **New** - Opens a dialog box that allows you to configure some options for inserting a new topic *(on page 2562).*

• **Reference** - Inserts a reference to a topic file. You can find more details about this action in the Inserting References *(on page 2530)* topic.

• **Reference to the currently edited file** - Inserts a reference to the currently edited file. You can find more details about this action in the Inserting References *(on page 2530)* topic.

• **Key Reference** - Opens an Insert Key Definition dialog box that allows you to insert a targeted key definition *(on page 2539)* (for example, to target a resource such as an image or external link).

• **Key Reference with Keyword** - Opens an Insert Key Definition dialog box that allows you to define a key and a value inside a keyword *(on page 2539).*

• A set of actions that open the Insert Reference dialog box *(on page 2530)* that allow you to insert various reference specializations (such as Anchor Reference, Glossary Reference, Map Reference, Navigation Reference, Topic Group, Topic Head, Topic Reference, Topic Set, Topic Set Reference).

**Insert After submenu**

Container sub-menus for a number of actions that create a map node as a sibling of the currently selected node, below the current node in the map:

• **New** - Opens a dialog box that allows you to configure some options for inserting a new topic *(on page 2562).*

• **Reference** - Inserts a reference to a topic file. You can find more details about this action in the Inserting References *(on page 2530)* topic.

• **Reference to the currently edited file** - Inserts a reference to the currently edited file. You can find more details about this action in the Inserting References *(on page 2530)* topic.

• **Key Reference** - Opens an Insert Key Definition dialog box that allows you to insert a targeted key definition *(on page 2539)* (for example, to target a resource such as an image or external link).

• **Key Reference with Keyword** - Opens an Insert Key Definition dialog box that allows you to define a key and a value inside a keyword *(on page 2539).*

• A set of actions that open the Insert Reference dialog box *(on page 2530)* that allow you to insert various reference specializations (such as Anchor Reference, Glossary Reference, Map Reference, Navigation Reference, Topic Group, Topic Head, Topic Reference, Topic Set, Topic Set Reference).

Search References

Searches all references to the current topic in the entire DITA map (on page 2793).

Refactoring submenu

The following actions are available from this submenu:

Convert Markdown to DITA Topic (Available for Markdown documents)

Opens a dialog box that allows you to configure options for converting the Markdown document into a DITA topic (on page 1139).

Rename resource

Allows you to change the name of a resource linked in the edited DITA map (on page 2526).

Move resource

Allows you to change the location on disk of a resource linked in the edited DITA map (on page 2526).

Extract to New DITA Map

Use this operation to extract editable topics into a new DITA map. The operation will open a map creation dialog box where you can select the type of map and configure the title or file name. Click Create to complete the operation and a new DITA map will be inserted at the location where the action was invoked with the selected topic references moved into the new map.

Rename Key

Use this operation to rename a key. It also updates all references to it. Note that it does not work on DITA 1.3 key scopes.

Convert Nested Topics to New Topics (Available from the contextual menu of editable maps/nodes in the DITA Maps Manager (on page 2503))
Use this operation on topics that contain nested `<topic>` elements to convert each nested topic to a new topic. Also, the new topics are added in the DITA Maps Manager as the first child topics of the original topic.

**Convert Sections to New Topics (Available from the contextual menu of editable maps/nodes in the DITA Maps Manager (on page 2503))**

Use this operation on topics that contain multiple sections to convert each section to a new topic. Also, the new topics are added in the DITA Maps Manager as the first child topics of the original topic.

**Convert to Concept**

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

**Convert to General Task**

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA *General Task* is a less restrictive alternative to the *Strict Task* information type.

**Convert to Reference**

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

**Convert to Task**

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

**Convert to Topic**

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

**Convert to Troubleshooting**

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

**Other XML Refactoring Actions**

For your convenience, the last 5 XML Refactoring tool operations (on page 1080) that were finished or previewed will also appear in this submenu.
XML Refactoring
Opens the XML Refactoring tool wizard (on page 1080) that presents refactoring operations to assist you with managing the structure of your XML documents.

Find/Replace in Files
Opens the Find/Replace in Files dialog box (on page 687) that allows you to find and replace content across multiple files.

Check Spelling in Files
Allows you to spell check multiple files (on page 708).

Cut
Deletes the currently selected node and copies it to the clipboard.

Copy
Copies the currently selected node to the clipboard.

Paste
Allows you to paste content from the clipboard into the DITA map.

Paste Before
Paste the content of the clipboard (only if it is a part of the DITA map) before the currently selected DITA map node.

Paste After
Paste the content of the clipboard (only if it is a part of the DITA map) after the currently selected DITA map node.

Delete
Deletes the currently selected node from the DITA map.

Remove from Disk
This action can be used to remove the selected resource(s) from disk. Selecting this action will open a confirmation dialog box where you can also choose to remove the descendants by selecting the Also remove all descendants option. If you proceed, a search for references is triggered. If multiple references are detected for any of the selected resources, you will have the option to review them since this would lead to broken links.

Organize
Allows you to organize the DITA map with the several submenu actions:
• ➡️ Move Up - Moves the selected node up within the DITA map tree.

• ⬇️ Move Down - Moves the selected node down within the DITA map tree.

• ➡️ Promote(Alt + LeftArrow) - Moves the selected node up one level to the level of its parent node.

• ➡️ Demote(Alt + RightArrow) - Moves the selected node down one level to the level of its child nodes.

- Expand All

   Allows you to expand the entire DITA map structure.

- Collapse All

   Allows you to collapse the entire DITA map structure.

Other Nodes

The following additional actions are available when the contextual menu is invoked from other nodes, such as a submap node or a relationship table:

Open Map in Editor (available when invoking on a submap)

   Opens the currently selected DITA map in the editor.

Open parent DITA map (available when invoking on a read-only topic reference or a submap reference)

   Opens the parent DITA map of the currently selected reference in the DITA Maps Manager.

  - Edit Attributes (only available for relationship table nodes)

   Opens a small in-place editor that allows you to edit the attributes of a selected node. You can find more details about this action in the Attributes View in Author Mode (on page 412) topic.

  Edit Profiling Attributes (only available for relationship table nodes)

   Allows you to change the profiling attributes (on page 911) defined on the selected node.

For more information about the DITA Maps Manager view and many of its features, watch our video demonstration:

https://www.youtube.com/embed/ozFZz6YZMCY

Related Information:
Creating a Map

To create a DITA map (on page 2793), subject scheme map (on page 2799), bookmap (on page 2792), or other types of DITA maps, follow these steps:

1. Use the New Document wizard (on page 619) to start creating your map.

   **Tip:** If you want the map to be a submap, you can create it the same way by right-clicking the place in the current map where you want to add it (in the DITA Maps Manager (on page 2503)) and selecting New from the Append Child, Insert Before, or Insert After submenu.

2. Select one of the DITA Map templates from the Framework templates folder.

3. Click the Create button.

4. Select whether you want to open the map in the DITA Maps Manager (on page 2503) or the Editor.

5. Save the map using the Save button on the toolbar of the DITA Maps Manager view (on page 2503).

Related Information:

- Customizing Profiling Values with a Subject Scheme Map (on page 2755)

- Managing DITA Maps (on page 2523)

Selecting a Root Map

Oxygen XML Author allows you to select a root map (on page 2799) (a master DITA map (on page 2793)) that defines a hierarchical structure of submaps and establishes a key space (on page 2795) that defines the keys used in all the other DITA maps and topics in the project. Specifying the correct root map helps to prevent validation problems when you work with keyrefs and also acts as the
foundation for content completion. All the keys that are defined in a root map are available in the submaps that are contained within the root map.

There are several ways to select or change the root map:

- The easiest method is to use the Root map drop-down menu (on page 2508) in the DITA Maps Manager (on page 2503) toolbar to select the appropriate root map.

- If you insert a key reference using the Cross Reference action from the Link drop-down menu (from the toolbar or Link submenu of the contextual menu) and keys are not gathered from the expected DITA map, you can change the root map by using the Change Root Map link in the Choose Key dialog box that is opened when you click the Choose Key Reference button.

- If you insert a content key reference or key reference using the Reuse Content action (from the toolbar, DITA menu, or Reuse submenu of the contextual menu) and keys are not gathered from the expected DITA map, you can change the root map by using the Change Root Map link in the Choose Key dialog box that is opened when you click the Choose Key Reference button.

For more information about the DITA root map support, watch our video demonstration:

https://www.youtube.com/embed/e81r3Y1qjnE

Creating DITA Submaps

You can break up a large DITA map (on page 2793) into more manageable pieces by creating submaps. A submap is simply a DITA map that is included by another DITA map. There is no separate markup for a submap.

For example, if you are creating a book, you might use one submap for each chapter of the book. If you are reusing a set of topics in multiple publications, you might collect them into a map and reuse the map as a submap in multiple other maps, rather than referencing the topics individually from the new maps.

You add a submap to a map the same way that you would add a new topic or insert an existing topic into a map (on page 2523), except you choose a map rather than a topic to create or add. When adding a submap to a map make sure that you use a mapref element or a topicref element with the format attribute set to ditamap. In most cases, Oxygen XML Author takes care of this for you.

Adding a Submap to a Map

To add a submap to a map:

1. Right-click the place in the current map where you want to add the new submap.
2. To insert the submap as a child of the selected node, select Append Child > New. To insert the submap as a sibling to the current node, select Insert After > New or Insert Before > New.

**Step Result:** This opens a New DITA file dialog box (on page 2562) that allows you to select the type of document and assists you with naming it.

3. Select the type of map in one of the folders inside the DITA Map folder and give it a name (the file type should be .ditamap).

4. Click Create to insert the submap.

You can also manage and move submaps the same as you would with topics. For more information, see Managing DITA Maps (on page 2523).

Creating a Bookmap in DITA

If you want to create a traditional book in DITA, you can use a bookmap (on page 2792) to organize your topics into a book. A DITA bookmap is a specialized type of map, intended for creating output that is structured like a book. A bookmap allows you to add book-specific elements such as frontmatter, part, chapter, appendix, and backmatter to the map. How these book-specific elements are processed for publication is up to the processing script for each media. See the DITA documentation for details.

You can find additional support for creating books in DITA in the DITA for Publishers plugin, which is included with Oxygen XML Author.

To create a book in DITA using a bookmap, follow these steps:

1. Create a new bookmap (on page 2522) (File > New > Framework templates > DITA Map > map > Bookmap). If you want the bookmap to be a submap, you can create it the same way by right-clicking the place in the current map where you want to add it (in the DITA Maps Manager (on page 2503)) and selecting New from the Append Child, Insert Before, or Insert After submenus.

2. Create the structure of your book by adding the appropriate book sections and defining containers for chapters and any appendices. To add sections to a bookmap, or children to a section, right-click the bookmap or section icon and choose any of the reference actions in the Append child menu. The selections offered in the menu will adjust depending on the element they are applied to. Consult the DITA documentation to fully understand the structure of a DITA bookmap and where to create each element.

3. Create special elements such as an index (on page 2547) and table of contents (on page 2546). The index and table of contents will be generated by the build process, based on the content of the map and the topics it points to.

4. Add topics (on page 2523) to your chapters to add content to your book. You may find it easier to manage if you use submaps (on page 2521) to create the content of your chapters. This keeps your bookmap from becoming long and difficult to manage.
Managing DITA Maps

You may want to manage your DITA maps (on page 2793) in a variety of ways, including:

- Change the order and nesting of topics in a map.
- Add topics to a map.
- Insert various types of references in a map.
- Find, move, or rename resources in a map.
- Change other properties of the items in a map.
- Use the Edit Properties dialog box to manage attributes, keys, metadata, or add profiling to any section of a map.

This section includes various topics that describe how you can manage DITA maps and resources.

For more information about the DITA Maps Manager view and many of its features, watch our video demonstration:

https://www.youtube.com/embed/ozFZz6YZMCY

Change the Order of Topics in DITA Maps

You can change the order and nesting of the topics in a map in several ways:

- By dragging and dropping topics within the DITA Maps Manager (on page 2503).
- By highlighting a topic in the DITA Maps Manager (on page 2503), holding down the Alt key, and pressing the arrow keys.
- By showing the extended DITA Maps Manager (on page 2503) toolbar (press the Settings icon on the DITA Maps Manager (on page 2503) toolbar and select the extended toolbar) and then using the node moving buttons (→↑↓←) on the toolbar to move topics around in the map.

To understand how to organize topics in a DITA map using the DITA Maps Manager (on page 2503), you can examine and experiment with the sample map called flowers.ditamap, located in the [OXYGEN_INSTALL_DIR]/samples/dita folder.

Adding Topics to a DITA Map

When you are working in DITA, there are several approaches that you can use to create topics and maps. You can start by first creating topics and then assembling your finished topics into one or more documents by creating one or more maps, or you can start by creating a map and then adding new topics to it as you work.
The topics-first approach is generally more appropriate if you intend to do a lot of content reuse, as it encourages you to think of each topic as an independent unit that can be combined with other topics in various ways. The map-first approach will be more familiar to you if you are used to creating books or manuals as a whole. Oxygen XML Author supports both approaches.

A DITA map (on page 2793) organizes content hierarchically, so you can add a topic as a child of the map root element or as a child or sibling of any item already in the map. Therefore, the first step to adding a topic to a map is always to choose the place it will be inserted into the map.

### Adding Existing Topics to a Map

At the XML-level, a topic is added to a map by adding a reference to the map that points to the topic. There are a variety of reference types that you can use. The default type is the topicref element. See the DITA documentation for the full range of reference elements and their uses. Oxygen XML Author provides several tools for inserting reference elements into a map:

**Using the Insert Reference Dialog Box**

The Insert Reference dialog box (on page 2530) allows you to create various reference types and configure the most commonly used attributes. You can open the Insert Reference dialog box with any of the following methods:

- Right-click an item in the current map where you want to add the reference, select Append Child, Insert Before, or Insert After and select the type of reference to enter.
- If the topic you want to add is currently open in the editor, you can right-click an item in the current map where you want to add the reference and select Reference to the currently edited file.
- Selecting an item in the map and click the Insert Reference button from the DITA Maps Manager (on page 2503) toolbar.
- Select Insert Reference from the DITA Maps menu.

**Dragging and Dropping a File into the DITA Maps Manager**

You can add a topic to a DITA map by dragging and dropping the file into the DITA Maps Manager (on page 2503). You can drag and drop files from any of the following:

- Your OS file system explorer.
- The Project view (on page 320).
- The Open/Find Resource view (on page 330).

Adding topics this way will not open the Insert Reference dialog box, but you can adjust all the same properties by invoking the contextual menu from the topic and selecting Edit Properties.
Adding a New Topic to a Map

To add a new topic to a map, follow these steps:

1. In the DITA Maps Manager (on page 2503), right-click the node in the current map where you want to add the new topic.
2. Select one of the following actions:
   - **Append Child > New**: Select this action to insert the new topic as a child of the selected node. This action opens a New file dialog box (on page 2563) that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click Create.
   - **Insert Before > New**: Select this action to insert the new topic as a sibling to the current node, before it. This action opens a New file dialog box (on page 2563) that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click Create.
   - **Insert After > New**: Select this action to insert the new topic as a sibling to the current node, after it. This action opens a New file dialog box (on page 2563) that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click Create.
   - **Duplicate**: Select this action to create a copy of the selected topic and insert it as a sibling. This action opens a dialog box that allows you to choose the file name and location for the newly created copy of the topic. After you have selected the name and path for your new topic, click OK.

   **Step Result**: The new topic is now referenced (as a topicref) in the DITA map at the location where you inserted it and the new topic is opened in the editor.
3. Save the DITA map.

Adding Multiple Skeleton Topics at Once

Oxygen XML Author includes a feature in the DITA Maps Manager (on page 2503) that allows you to quickly create multiple skeleton topics at once and you can specify their hierarchical structure within the DITA map (on page 2793).

To access this feature, right-click a node in the DITA Maps Manager where you want the new topics to be inserted and select Fast Create Topics. This opens the Fast Create Topics dialog box where you can configure the structure for the new topics.

For more information, see Fast Create Multiple DITA Topics (on page 2565).
Adding Multiple References to the Same Topic in a Map

Oxygen XML Author allows you to reuse entire topics by adding multiple references to the same topic in a DITA map. Whenever multiple references to the same topic are detected in the context of the current map in the DITA Maps Manager (on page 2503), an indicator will appear in the top-right corner of the Author mode editor that shows the number of times the topic is referenced in the DITA map. It also includes navigation arrows that allow you to jump to the next or previous reference.

Remove Topics from a Map

You can remove topics from a map in a number of ways. Some ways to remove a topic from a map include:

- Highlight the topic and press Delete or Backspace.
- Highlight the topic and click the ✗ Delete button on the DITA Maps Manager (on page 2503) extended toolbar.

Related Information:

- Fast Create Multiple DITA Topics (on page 2565)

Moving and Renaming Resources

You can move or rename resources on disk directly from Oxygen XML Author and you have the option of updating all the references to the moved or renamed resources. For DITA resources (such as topics and maps), you can do this from the DITA Maps Manager view (on page 2503). For non-DITA resources (such as folders, images, html files, audio, video, text files, Markdown documents), you can do this from the Project view (on page 320).

Moving or Renaming DITA Resources (Topics or Maps)

To move or rename normal DITA resources (such as topics or maps), use one of the following actions available in the Refactoring submenu of the contextual menu when invoked on the resource in the DITA Maps Manager view (on page 2503):

- Refactoring > Move resource
This action allows you to change the location of a resource linked in the edited DITA map, using the Move resource dialog box. This dialog box contains the following options:

- **Destination** - Specifies the target location of the edited resource.
- **File name** - Allows you to change the name of the edited resource.
- **Update references** - Select this checkbox to update all references of the file in the edited DITA map and in the files referenced from the DITA map, preserving the completeness of the DITA map.
- **Preview** - Select this button to display a preview of the changes Oxygen XML Author is about to make.
- **Move** - Moves the edited resource in the target location on disk.
- **Cancel** - Cancels the Move resource operation. No changes are applied.

**Refactoring > Rename resource**

This action allows you to change the name of a resource linked in the edited DITA map (on page 2793), using the Rename resource dialog box. This dialog box contains the following options:

- **New name** - Presents the current name and allows you to change it.
- **Update references** - Select this checkbox to update all references of the file in the edited DITA map and in the files referenced from the DITA map, preserving the completeness of the DITA map.
- **Preview** - Select this button to display a preview of the changes Oxygen XML Author is about to make.
- **Rename** - Executes the Rename resource operation.
- **Cancel** - Cancels the Rename resource operation. No changes are applied.

**Note:** If a root DITA map (on page 2799) is not defined, the move and rename actions are executed in the context of the current DITA map.

**Moving or Renaming Non-DITA Resources and Updating the References to Them**

To move or rename non-DITA resources (such as folders, images, html files, audio, video, text files, Markdown documents), you can simply follow the procedures described in Moving/Renaming Resources in the Project View (on page 662). However, this approach will not give you the option to update the references to the moved or renamed resources.

To perform move or rename operation on non-DITA resources while also updating all the references to them, use the following sets of procedures:
1. Enable *Master Files* support and add your root *DITA map* (on page 2799) to the *Master Files* folder by following the procedure found here: *How to Enable Master Files Support in DITA* (on page 2778).

2. Move or rename resources and update the references to them by following the procedure found here: *Moving or Renaming Non-DITA Resources and Updating the References to Them* (on page 2779).

**Related Information:**
- *Master Files Support in DITA* (on page 2778)
- *Finding Resources Not Referenced in DITA Maps* (on page 2528)

**Finding Resources Not Referenced in DITA Maps**

Over the course of time, large projects can accumulate a vast amount of resources from a variety of sources. Especially in organizations with a large number of content authors or complex project structures, organizing the project resources can become a challenge. Over time a variety of actions can cause resources to become orphaned from *DITA maps* (on page 2793). To assist you with organizing project resources, Oxygen XML Author includes the *Find Unreferenced Resources* action, that searches for such resources.

To perform this search, open the *DITA map* in the *DITA Maps Manager* (on page 2503), invoke the contextual menu on the *map*, and select the *Find Unreferenced Resources* action. It can also be selected from the *DITA Maps* menu. This action opens the *Find Unreferenced Resources* dialog box, shown below.

Figure 583. Find Unreferenced Resources Dialog Box
The Find Unreferenced Resources dialog box includes the following options:

- **DITA Maps** - Provides a list of *DITA maps* to be included in the search and allows you to Add maps to the list or Remove them.

- **Folders** - Provides a list of folders to be included in the search and allows you to Add or Remove specific folders. All files from this list of folders that are not referenced from the maps specified in the DITA Maps list will be reported.

- **Filters** - Provides three combo boxes that allow you to filter the search to include or exclude certain files or folders:
  - **Include files** - Allows you to filter specific files to include in the search.
  - **Exclude files** - Allows you to filter specific files to exclude from the search.
  - **Exclude folders** - Allows you to filter specific folders to exclude from the search.

  **Note:** In any of the filter combo boxes you can enter multiple filters by separating them with a comma and you can use the ? and * wildcards. Use the drop-down arrow to select a previously used filter pattern.

When you click the Find button, if the search operation finds unreferenced resources, they are displayed in the Results panel at the bottom of the editor. If you want to delete an unreferenced resource, you can right-click its result and select Remove from Disk. If you want to see the resource before deciding what to do with it, you can right-click its result and select Show in Explorer.
Inserting References in DITA Maps

A DITA map (on page 2793) may contain various types of references. The targets of the references can be a variety of references, such as chapters, maps, topics, topic sets, or key definitions. You can insert references to such targets with the Insert Reference dialog box (on page 2530).

This section explains how to insert and configure references (such as topic references, topic groups, topic headings, and key definitions) in a DITA map.

Insert Reference Dialog Box

The Insert Reference dialog box allows you to insert and configure references in DITA maps (on page 2793). There are numerous types of references that can be inserted into maps. They include references to topics, other maps, glossary terms, and keys. You can also use this dialog box to configure the attributes of a reference, add profiling or metadata, and define keys.

To open the Insert Reference dialog box, use one of the following methods:

• Select Reference, Reference to the currently edited file, or any of the other specific reference actions that are available from the Append Child, Insert Before, and Insert After submenus when invoking the contextual menu in the DITA Maps Manager (on page 2503).
  ◦ To insert the reference as a child of the current node, select the reference from the Append Child submenu.
  ◦ To insert the reference as a sibling of the current node, below the current node in the map, select the reference from the Insert After submenu.
  ◦ To insert the reference as a sibling of the current node, above the current node in the map, select the reference from the Insert Before submenu.

  Note: The content of these submenus depends on the node that is selected in the DITA map tree when the contextual menu is invoked. For example, if the selected node is a topic reference (topicref), its possible child nodes include the following elements: anchorref, chapter, keydef, mapref, topicgroup, topichead, topicref, topicset, and topicsetref.

• Click the Insert Reference button on the DITA Maps Manager extended toolbar. This action will insert the reference as a sibling of the current node (below the current node in the map).

• Select Insert Reference from the DITA Maps menu. This action will insert the reference as a sibling of the current node (below the current node in the map).

For the Reference or Reference to the currently edited file actions, a Reference type drop-down list is displayed at the top of the Insert Reference dialog box and you can select the type of reference you want to insert. Depending on the place where the reference will be inserted, Oxygen XML Author will propose only valid reference types. When you change the reference type, the fields in the various tabs of the dialog box are reconfigured depending upon the availability of the associated attributes. For the
other reference actions in the Append Child, Insert Before, and Insert After submenus, the reference type is automatically chosen based upon the invoked action and you cannot change it.

The main section of the dialog box includes the following tabs: Target, Keys, Attributes, Metadata, and Profiling.

**Target Tab**

Figure 584. Insert Reference Dialog Box - Target Tab

The Target tab of the Insert Reference dialog box allows you to specify information about the target reference. It includes the following sections and fields:

**Choose a file location section**

You can browse for and select the source target file by using the Look in drop-down list, browsing buttons, or file window in this section. You can use the Files of type drop-down menu to narrow the list of possible file types that will be displayed.

**URL**

Displays the path to the target and allows you to select or change it by using the combo box or browsing buttons.

**ID**
The drop-down list displays all of the target elements that are available for the selected target URL.

**Href**

The selected target automatically modifies this value to point to the corresponding `href` attribute of the target element.

**Note:** If the Reference type is a Navigation Reference, the Href field is changed to Mapref, since a `navref` element requires a `mapref` attribute instead.

### Keys Tab

Figure 585. Insert Reference Dialog Box - Keys Tab

The **Keys** tab allows you to use and define keys (on page 2537) for indirect referencing. For more information, see Working with Keys in DITA (on page 2628). This tab includes the following:

**Define keys**

Use this text field to define the `keys` attribute for the target.

**Key scopes**

Use this text field to define or edit the value of a `keyscope` attribute. Key scopes allow you to specify different sets of key definitions for different map branches.

**Key reference**

Instead of using the **Target** tab to select a file that contains the target reference, you can reference a key definition by using this text field. Use the **Choose key reference** button to access the list of keys that are already defined in the current root map (on page 2799).
Attributes Tab

Figure 586. Insert Reference Dialog Box - Attributes Tab

The Attributes tab of the Insert Reference dialog box allows you to insert and edit attribute values for the target reference. This tab includes the following sections and actions:

Navigation title

This text field allows you to specify a custom navigation title for the target reference. If you want this attribute to always be populated with a detected value (based on the specifications for the target file), select the Navigation title checkbox for the Always fill values for attributes option in the DITA preferences page (on page 216). For references to DITA resources, you can enforce the use of the specified title by selecting the Lock checkbox (otherwise, the topic <title> takes precedence).

Collection type

This drop-down list allows you to select the collection-type attribute to create hierarchical linking between topics in a DITA map (for example, unordered, sequence, choice, family, -dita-use-conref-target).

Type

Allows you to select a type attribute (such as topic, task, concept, etc.) for the target element. If you want this attribute to always be populated with a detected value (based on the specifications for the target file), select the Type checkbox for the Always fill values for attributes option in the DITA preferences page (on page 216).

Scope

This property corresponds to the scope attribute of the target element. It is populated automatically, based on the selected file type, unless its value for the selected target file is the same as the default attribute value. If you want this attribute to always be
populated with a detected value based on the specifications (regardless of the default value), select the **Scope** checkbox for the **Always fill values for attributes** option in the **DITA preferences page** (*on page 216*).

**Format**

This property corresponds to the `format` attribute of the target element. It is populated automatically, based on the selected file type, unless its value for the selected target file is the same as the default attribute value. If you want this attribute to always be populated with a detected value based on the specifications (regardless of the default value), select the **Format** checkbox for the **Always fill values for attributes** option in the **DITA preferences page** (*on page 216*).

**Processing Role**

This drop-down list allows you to set the `processing-role` attribute to one of the allowed values for DITA reference elements (for example, `resource-only`, `normal`, `-dita-use-conref-target`).

**Other attributes table**

This table contains the attributes that are available for the selected reference. You can use this table to insert or edit the values of any of the listed attributes. Clicking a cell in the **Value** column allows you to use the combo box to enter, edit, or select attribute values.

**Metadata Tab**

**Figure 587. Insert Reference Dialog Box - Metadata Tab**

The **Metadata** tab allows you to add metadata elements to the target reference. Use the buttons on the right side of the tab to insert specific metadata elements (you can add the following metadata elements: `navtitle`, `linktext`, `shortdesc`, `keyword`, `indexterm`). The metadata elements are inserted inside a `topicmeta` element. The editing window allows you to easily insert and modify the content of the metadata that will be inserted.
Profiling Tab

Figure 588. Insert Reference Dialog Box - Profiling Tab

The **Profiling** tab allows you to select or change profiling attributes for the selected reference. This tab displays profiling attributes and their values as determined by the following:

- If your root map (on page 2799) references a DITA subject scheme map (on page 2799) that defines values for the profiling attributes, those values are used.
- If your project defines project-level (on page 2798) configuration values for the profiling attributes (on page 142), those values are used.
- If Oxygen XML Author defines global-level (on page 2795) configuration values for the profiling attributes (on page 142), they are used.
- Otherwise, a basic default set of profiling attributes and values are used.

When you modify a selection of values in this tab, the change will also automatically be reflected in the **Attributes** tab. For more information, see DITA Profiling / Conditional Text (on page 2737).

**Finalizing Your Insert Reference Configuration**

Once you click **Insert** or **Insert and close**, the configured reference is added in the map.

**Tip:** You can easily insert multiple references by keeping the **Insert Reference** dialog box opened, using the **Insert** button.

**Related Information:**

- DITA Profiling / Conditional Text (on page 2737)
Inserting Topic Headings

The `topichead` element provides a title-only entry in a navigation map, as an alternative to the fully-linked title provided by the `topicref` element.

You can insert a topic heading by doing the following:

- Select **Topic Head** from the **Append Child, Insert Before, or Insert After** submenus when invoking the contextual menu in the **DITA Maps Manager view** (on page 2503).
- Open the **DITA map** in the XML editor (on page 2502) and select the **Insert Topic Heading** action from the main toolbar (or from the **Insert** submenu of the contextual menu).

Those actions open the **Insert Topic Head** dialog box (on page 2530) that allows you to easily insert a `topichead` element. A **Navigation title** (navtitle attribute) is required but other attributes can also be specified from this dialog box (such as Type, Scope, Format, etc.).

Figure 589. Insert Topic Heading Dialog Box

![Insert Topic Head Dialog Box](image)

**Related Information:**

- Insert Reference Dialog Box (on page 2530)
Inserting Topic Groups

The `topicgroup` element identifies a group of topics (such as a concepts, tasks, or references) or other resources. A `topicgroup` can contain other `topicgroup` elements, allowing you to express navigation or table-of-contents hierarchies, as well as implying relationships between the containing `topicgroup` and its children. You can set the collection-type of a container `topicgroup` to determine how its children are related to each other. Relationships end up expressed as links in the output (with each participant in a relationship having links to the other participants by default).

You can insert a topic group by doing the following:

- Select **Topic Group** from the **Append Child**, **Insert Before**, or **Insert After** submenus when invoking the contextual menu in the [DITA Maps Manager view](on page 2503).
- Open the **DITA map** in the XML editor (on page 2502) and select the [Insert Topic Group](on page 2502) action from the main toolbar (or from the **Insert** submenu of the contextual menu).

Those actions open the **Insert Topic Group** dialog box (on page 2530) that allows you to easily insert a `topicgroup` element and various attributes can be specified (such as **Collection type**, **Type**, **Scope**, **Format**, etc.)

Figure 590. Insert Topic Group Dialog Box

- Insert Reference Dialog Box (on page 2530)
Defining Keys in DITA Maps

DITA uses keys (on page 2628) to insert content that may have different values in various circumstances. Keys provide the means for indirect referencing in DITA. This can make it easier to manage and to reuse content. In DITA, keys are defined in maps and can then be reused and referenced throughout the whole structure of the map. It is considered best practice to create a separate submap that contains all of the key definitions and reference that submap in the main (root) map (on page 2799). This makes it easier to manage since they're all in one location.

There are two types of key definitions that can be created in a map.

- Key with a value inside a keyword.
- Key with a target (for example, to target a resource such as an image or external link).

The following example is a DITA map (on page 2793) (a key definition submap) that contains some key definitions with various values for the product key and some targets to external URLs:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE map PUBLIC "-//OASIS//DTD DITA Map//EN" "map.dtd">
<map id="keydefs">
  <!-- product name -->
  <title>Key Definitions</title>
  <keydef keys="product" product="basic">
    <topicmeta>
      <keywords>
        <keyword>Basic Widget</keyword>
      </keywords>
    </topicmeta>
  </keydef>
  <keydef keys="product" product="pro">
    <topicmeta>
      <keywords>
        <keyword>Professional Widget</keyword>
      </keywords>
    </topicmeta>
  </keydef>
  <keydef keys="uri_eula" href="https://www.example.com/eula.html" format="html" scope="external"/>
  <keydef keys="uri_eula2" href="https://www.example.com/eula2.html" format="html" scope="external"/>
</map>
```
Note: The profiling of the names is now contained in the map, where it only has to occur once to reuse throughout the whole map structure.

Key Definition with a Keyword Value

To define a key with a value inside a *keyword*, follow these steps:

1. [Optional but Recommended] Create a submap *(on page 2521)* that will contain all of your key definitions and reference the submap in your *main (root) map* (if you don't already have one created).
2. Open that map in the DITA Maps Manager *(on page 2503)*.
3. Right-click the map or an item in the map where you want to add the reference and select Key Definition with Keyword from the Append Child, Insert Before, or Insert After submenu (depending on where you want to insert the key definition). This opens an Insert Key Definition dialog box.
4. Enter the name of the key in the Key field.
5. Enter the key's value in the Keyword field.
6. Click Insert and close.

Tip: If you need to profile the key or add other attributes, you can right-click the key definition in the DITA Maps Manager, select Edit properties, and configure them in the Profiling tab or Attributes tab, respectively.

Key Definition with a Target

To insert a targeted key definition (for example, to target a resource such as an image or external link), follow these steps:

1. [Optional but Recommended] Create a submap *(on page 2521)* that will contain all of your key definitions and reference the submap in your *main (root) map* (if you don't already have one created).
2. Open that map in the DITA Maps Manager *(on page 2503)*.
3. Right-click the map or an item in the map where you want to add the reference and select Key Definition from the Append Child, Insert Before, or Insert After submenu (depending on where you want to insert the key definition in the DITA map). This opens an Insert Key Definition dialog box.
4. Go to the Keys tab and enter the name of the key in the Define keys field.
5. Go to the Target tab and select a target resource (such as an image or external link).

Tip: You can profile the key by using the Profiling tab and other attributes can also be defined in the Attributes tab.
6. Once you are done configuring the targeted key definition, click **Insert and close**.

**Related Information:**

- Working with Variable Text in DITA *(on page 2660)*
- Working with Keys in DITA *(on page 2628)*
- DITA 1.3 Specification: Indirect Key-based Addressing

**Edit Properties Dialog Box**

The **DITA Maps Manager view**(on page 2503) includes a feature that allows you to view and edit the properties of a selected node. The Edit properties action is available on both the DITA Maps Manager toolbar and in the contextual menu. This action is also available in the contextual menu when you edit a DITA map *(on page 2793)* document in Author mode. The action opens the Edit Properties dialog box and it includes several tabs with various functions and fields that are initialized with values based upon the node for which the action was invoked.

**Note:** If you select multiple sibling nodes and invoke the Edit properties action, only the Profiling tab will be available and your modifications in that tab will be applied to all the selected nodes. If you select multiple nodes that are not on the same hierarchical level, the other tabs will also be available and your modifications will be applied to the parent node (the child nodes will inherit the attributes of the parent node).

You can use the Edit Properties dialog box to modify or define attributes, metadata, profiling, or keys in DITA maps or topics. You can also use it to modify the title of root maps *(on page 2799)*.

At the top of the Edit Properties dialog box, the Reference type drop-down list displays the type of the selected node and it depends on the node for which the action was invoked.

The main section of the dialog box includes the following tabs: Target, Keys, Attributes, Metadata, and Profiling. The availability of the tabs and their functions depend on the selected node. For example, if you invoke the action on a root map *(on page 2799)*, only the Attributes, Metadata, and Profiling tabs are accessible and the Title property can be configured. Also, if you select multiple nodes, only the Profiling tab is available.

**Target Tab**

Figure 591. Edit Properties Dialog Box - Target Tab
The **Target** tab of the **Edit Properties** dialog box displays information about the target node on which the action was invoked and allows you to change the target. It includes the following sections and fields:

**Choose a file location section**

You can browse for and select the source target file by using the **Look in** drop-down list, browsing buttons, or file window in this section. You can use the **Files of type** drop-down menu to narrow the list of possible file types that will be displayed.

**URL**

Displays the path to the target and allows you to select or change it by using the combo box or browsing buttons.

**ID**

The drop-down list displays all of the target elements that are available for the selected target URL.

**Href**

The selected target automatically modifies this value to point to the corresponding `href` attribute of the target element.

**Note:** If the **Reference type** is a **Navigation Reference**, the **Href** field is changed to **Mapref**, since a `navref` element requires a `mapref` attribute instead.
The **Keys** tab allows you to use and define keys (on page 2537) for indirect referencing. For more information, see Working with Keys in DITA (on page 2628). This tab includes the following:

**Define keys**

Use this text field to define the `keys` attribute for the target.

**Key scopes**

Use this text field to define or edit the value of a `keyscope` attribute. Key scopes allow you to specify different sets of key definitions for different map branches.

**Key reference**

Use this combo box (or the ✗ Choose key reference button) to select a key that is already defined in the root map (on page 2799).

**Attributes Tab**

Figure 593. Edit Properties Dialog Box - Attributes Tab
The **Attributes** tab of the **Edit Properties** dialog box allows you to insert and edit attribute values for the target node for which the action was invoked.

If the target is a root map (on page 2799), the tab displays the title of the map. You can change it in the **Title** text field and assign it to an **Attribute**, **Element**, or **All**.

![Attributes tab for a Root Map](image)

**Figure 594. Attributes Tab for a Root Map**

For other types of targets, the tab includes the following sections and fields that can be used to edit the attributes of the target:

**Navigation title**

This text field allows you to specify a custom navigation title for the target reference. If you want this attribute to always be populated with a detected value (based on the specifications for the target file), select the **Navigation title** checkbox for the **Always fill values for attributes** option in the DITA preferences page (on page 216). For references to DITA resources, you can enforce the use of the specified title by selecting the **Lock** checkbox (otherwise, the topic `<title>` takes precedence).

**Tip:** You can also select the **Prefer navigation title for topicref rendering** option in the DITA preferences page (on page 216) to always enforce the use of the **navtitle** value rather than selecting this **Lock** option on individual topics.

**Collection type**
This drop-down list allows you to select the `collection-type` attribute to create hierarchical linking between topics in a DITA map (for example, unordered, sequence, choice, family, `-dita-use-conref-target`).

**Type**

Allows you to select a `type` attribute (such as `topic`, `task`, `concept`, etc.) for the target element. If you want this attribute to always be populated with a detected value (based on the specifications for the target file), select the **Type** checkbox for the **Always fill values for attributes** option in the DITA preferences page (on page 216).

**Scope**

This property corresponds to the `scope` attribute of the target element. It is populated automatically, based on the selected file type, unless its value for the selected target file is the same as the default attribute value. If you want this attribute to always be populated with a detected value based on the specifications (regardless of the default value), select the **Scope** checkbox for the **Always fill values for attributes** option in the DITA preferences page (on page 216).

**Format**

This property corresponds to the `format` attribute of the target element. It is populated automatically, based on the selected file type, unless its value for the selected target file is the same as the default attribute value. If you want this attribute to always be populated with a detected value based on the specifications (regardless of the default value), select the **Format** checkbox for the **Always fill values for attributes** option in the DITA preferences page (on page 216).

**Processing Role**

This drop-down list allows you to set the `processing-role` attribute to one of the allowed values for DITA reference elements (for example, `resource-only`, `normal`, `-dita-use-conref-target`).

**Other attributes table**

This table contains the attributes that are available for the selected reference. You can use this table to insert or edit the values of any of the listed attributes. Clicking a cell in the **Value** column allows you to use the combo box to enter, edit, or select attribute values.

**Metadata Tab**

Figure 595. Edit Properties Dialog Box - Metadata Tab
The Metadata tab allows you to add metadata elements to the target node. Use the buttons on the right side of the tab to insert specific metadata elements (you can add the following metadata elements: navtitle, linktext, shortdesc, keyword, indexterm). The metadata elements are inserted inside a topicmeta element. The editing window allows you to easily insert and modify the content of the metadata that will be inserted.

Profiling Tab

Figure 596. Edit Properties Dialog Box - Profiling Tab

The Profiling tab allows you to select or change profiling attributes for the selected target nodes. This tab displays profiling attributes and their values as determined by the following:

- If your root map (on page 2799) references a DITA subject scheme map (on page 2799) that defines values for the profiling attributes, those values are used.
- If your project defines project-level (on page 2798) configuration values for the profiling attributes (on page 142), those values are used.
- If Oxygen XML Author defines global-level (on page 2795) configuration values for the profiling attributes (on page 142), they are used.
- Otherwise, a basic default set of profiling attributes and values are used.
If you have a large list of profiling attributes, you can use the text filter field to search for attributes or values, and you can expand or collapse attributes by using the Expand All/ Collapse All buttons to the right of the text filter or the arrow button to the left of the profiling attribute name..

When you modify a selection of values in this tab, the change will also automatically be reflected in the Attributes tab. For more information, see DITA Profiling / Conditional Text (on page 2737).

**Note:** If you invoke the Edit properties action on a selection of multiple nodes that have different values for the same profiling attribute, a conflict panel will be displayed in the Profiling tab and you can choose between the following actions for resolving it:

- **Keep** - Preserves the current attribute values.
- **Change Now** - Allows you to edit the selection of values in this Profiling tab and the changes will be applied to all the selected nodes.

![Profiling Conflict Panel](image)

**Finalizing Your Modifications**

Once you click **OK**, all your changes are applied to the target node.

**Related Information:**

- DITA Profiling / Conditional Text (on page 2737)

Generating a Table of Contents in DITA

In DITA, the order and hierarchy of the table of contents of a document is based directly on the DITA map that defines the document (on page 2501). In most cases, the processor generates a table of contents (TOC) based on the hierarchy of the topics in a DITA map. By default, each topicref element in a map represents a node in the TOC.

It is also possible to instruct DITA where the table of contents should occur (or other content lists, such as a list of figures or tables). If you want to instruct the processor to generate a table of contents
at a particular location within your DITA map structure, you can use the `toc` element in a *bookmap (on page 2522)* (as in the example below). For more information about the `toc` element, see [https://docs.oasis-open.org/dita/v1.2/os/spec/langref/toc.html](https://docs.oasis-open.org/dita/v1.2/os/spec/langref/toc.html).

**Example:**

```xml
<bookmap>
    ......
    <frontmatter>
        <booklists>
            <toc href="chapter1.dita"/>
        </booklists>
    </frontmatter>
    ......
```

Creating an Index in DITA

In DITA, indexes are created from `indexterm` elements. You can insert index term elements:

- In the header of a topic. In paginated media, such as a printed book or a PDF, this results in an index entry that points to the page in which the topic starts, even if it is not the page in which the indexed term occurs.
- In the `topicref` element in a map that references the topic. This applies those index terms to that topic only when used in that map, allowing you to index topics differently in various publications. In paginated media, index entries point to the page in which the topic starts.
- In the body of a topic. In paginated media, this results in an index entry that points to the page in which the `indexterm` element occurs, even if that is not the page in which the topic starts.

To add index terms to the text of a topic or the topic header, *create the elements as you normally would in Oxygen XML Author (on page 2567)*. To add index terms to a map, open the map in the editor and add the elements, as you normally would, in a topic.

In some media, indexes will be generated automatically when index entries are found in the source. For other media, such as books, you may need to tell DITA where to place the index. For instance, to add an index to a *bookmap (on page 2792)*, you need to add an `indexlist` element to the `backmatter` of the book.

1. Open your *bookmap (on page 2522)* in the DITA Maps Manager (on page 2503).
2. Right-click the *bookmap* and select *Append Child > Backmatter*.
   The *Insert Reference* dialog box (on page 2530) appears.
3. Click *Insert and Close* to insert the *backmatter* element.
4. Right-click the `backmatter` element and create a `booklists` element using `Append Child > Book Lists`.

5. Use the same steps to create an `indexlist` element.

⚠️ **CAUTION:** Adding `index` entries and an `indexlist` to your project creates an instruction to the DITA publishing routines to create an index. There is no guarantee that all DITA output types or third-party customizations obey that instruction or create the index the way you want it. Modifying the output may be necessary to get the result you want.

### Resolving Topic References Through an XML Catalog

There are situations where you want to resolve URIs with an XML Catalog (on page 2800):

- You customized your DITA map (on page 2793) to reference topics using URIs instead of local paths.
- You have URI content references in your DITA topic files and you want to map them to local files when the map is transformed.

In such situations, you have to add the catalog to Oxygen XML Author. The DITA Maps Manager view (on page 2503) will solve the displayed topic refs through the added XML catalog, as well as DITA map transformations (for PDF output, XHTML output, etc.).

To add an XML catalog to the DITA framework (on page 2794), follow these steps:

1. Create an XML catalog using the guidelines described in Working with XML Catalogs (on page 1064).
2. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Document Type Association.
3. Select the DITA document type and use the Edit, Duplicate, or Extend button to open a Document type configuration dialog box (on page 94).
4. Go to the Catalogs tab (on page 118).
5. Click on the + Add button to open a dialog box that allows you to add your created XML Catalog to the list.
6. After adding your catalog, click OK. You may need to reopen any currently edited files that use the new catalog or run a manual Validate action (on page 1024) for the changes to take effect.

⚠️ **Note:** You could also add your created catalog to the list of global catalogs in the XML Catalog preferences (on page 183) page.
Chunking DITA Topics

By default, when a DITA map (on page 2793) is published to an online format, each topic becomes a separate page in the output. In some cases, you may want to combine multiple source topics into one output page. For instance, you may want to combine several types of information into a single page, or you may have chosen to create many small DITA topics for reuse purposes but feel they are too small to be useful to a reader by themselves. This is referred to as chunking.

To chunk DITA topics, you set the chunking attribute on the topicref that contains the sub-topics in a DITA map. There are several values that you can set on the chunking attribute (for example, by-topic or to-content). See the DITA documentation for full details. To achieve the effects you want in your topics and table of contents, you may also need to set the toc and collection-type attributes on the sub-topics or container topic to suitable values. See the DITA documentation for details.

You can set the collection-type attribute on your topics using the Edit Properties action in the DITA Maps Manager (on page 2503). To set the toc and chunk attributes, you must open the map file in the editor and add or edit the attributes directly (double-click the map icon in the DITA Maps Manager (on page 2503) to open the map in the editor).

DITA Map Validation and Completeness Check

You should validate your DITA maps (on page 2793) regularly to make sure that your maps and topics are valid, and all of the relationships between them are working. Changing one topic, image, or piece of metadata may create errors in references that rely on them. You may not discover these problems all at once. Validate your map to catch all of these kinds of problems. The longer you wait between validating your maps, the more difficult it may be to detect and correct any errors you find.

Validating a DITA Map

To validate a DITA, follow these steps:

1. In the DITA Maps Manager view (on page 2503), make sure that the tab that holds your root map (on page 2799) is selected and that the Root map selection is set either to the name of your root map or to <current map>.
2. It is a good practice to refresh your DITA map before running the validation process. To do so, select the DITA map in the DITA Maps Manager view and click C Reload (F5).
3. Click the Validate and Check for Completeness button on the DITA Maps Manager toolbar to open the DITA Map Completeness Check dialog box (on page 2550).
4. If you are using profiling, check the Use DITAVAL filters box and select the appropriate option.
5. Select any other options you want to check.
6. Click Check to run the validation process.
Validation Process

The validation process of a DITA map includes the following:

• Verifies that the file paths of the topic references are valid. For example, if an href attribute points to an invalid file path, it is reported as an error in the message panel at the bottom of the editor.
• Validates each referenced topic and map. Each topic file is opened and validated against the appropriate DITA DTD. If another DITA map is referenced in the main one, the referenced DITA map is verified recursively, applying the same algorithm as for the main map.
• If errors or warnings are found, they are displayed in a separate message pane at the bottom of the editor and clicking them takes you to the location of the error or warning in the file where it was found.

DITA Map Completeness Check Dialog Box

The DITA Map Completeness Check dialog box allows you to configure the DITA map validation.

Figure 598. DITA Map Completeness Check Dialog Box
You can configure the validation process with the following options that are available in the **DITA Map Completeness Check** dialog box:

**Batch validate referenced DITA resources**

This option specifies the level of validation that applies to referenced DITA files:

- If the checkbox is left unchecked (default setting), the DITA files will be validated using the rules defined in the DTD or XML Schema declared in the document.
- If the checkbox is selected, the DITA files will be validated using rules defined in their associated validation scenario (*on page 1035*).

**Check the existence of non-DITA references resources**

Extends the validation of referenced resources to non-DITA files.

**Include remote resources**

Select this option if you want to check that remote referenced binary resources (such as images, movie clips, ZIP archives) exist at the specified location.

**Use DITAVAL filters**

The content of the map is filtered by applying a profiling condition set (*on page 2737*) before validation. You can choose between the following options:

- **From the current condition set** - The map is filtered using the condition set currently applied in the DITA Maps Manager view (*on page 2503*). Clicking the Details icon opens a topic in the Oxygen XML Author User Guide that explains how to create a profiling condition set.
- **From all available condition sets** - For each available condition set, the map content is filtered using that set before validation.
- **From the associated transformation scenario** - The filtering condition set is specified explicitly as a DITAVAL file in the current transformation scenario associated with the DITA map.
- **Other DITAVAL files** - For each DITAVAL file from this list, the map content is filtered using the DITAVAL file before validation. Use the Add or Remove buttons to configure the list. The Add button opens a dialog box that allows you to select a local or remote path to a DITAVAL file. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (*on page 266*) button, or the browsing actions in the Browse drop-down list.

**Report references to resources outside of the DITA map folder**
If selected, it will report any references to DITA resources that are located outside the main DITA map (on page 2799) folder.

**Report links to topics not referenced in DITA maps**

Checks that all the topics referenced by other topics are also linked in the DITA map.

**Report multiple references to the same topic**

If selected, it will report warnings when a topic is referenced multiple times in the DITA map, unless a unique copy-to attribute is used on the topicref element for any topic that is referenced multiple times.

For example, it will **not** report a warning if there is a topic referenced twice, but the second topicref has a copy-to attribute set:

```xml
<topicref href="topic.dita"/>
.....
<topicref href="topic.dita" copy-to="topic2.dita"/>
```

On the other hand, it **will** report a warning if there is a topic referenced twice and none of the reference-type elements has a copy-to attribute set or both of them have the copy-to attribute set to the same value:

```xml
<topicref href="topic.dita" copy-to="topic2.dita"/>
.....
<topicref href="topic.dita" copy-to="topic2.dita"/>
```

**Check for duplicate topic IDs within the DITA map context**

Checks for multiple topics with the same ID in the context of the entire map.

**Report duplicate key definitions**

Checks the DITA map for multiple key references with the same key defined for them. This is helpful because if you have two different resources with the same value for the keys attribute, all references will point to the first one encountered and the other will be ignored.

**Note:** This option takes key scopes (on page 2663) into account. For example, if you have something like this:

```xml
<topicref href="t2.dita" keys="k2"/>
<topicgroup keyscope="ks">
  <topicref href="t2.dita" keys="k2"/>
</topicgroup>
```
it will not report the "k2" key as a duplicate because it is defined in a key scope (on page 2663) on the second occurrence.

Report unreferenced key definitions

Checks the entire DITA map and reports any key definitions that are not referenced anywhere. Note that if the Use DITAVAL filters option (on page 2551) is selected, this check will search for unreferenced key definitions based upon your selected filter.

Report unreferenced reusable elements

Checks the entire DITA map and reports any detected reusable elements that are not referenced anywhere. It looks for elements that have an ID specified in the following types of topic references:

- Any topicref that contains a processing-role attribute set to resource-only.
- Any other referenced topic that contains elements that are reused elsewhere through a conref or conkeyref.

Report table layout problems

Looks for table layout problems. The types of errors that may be reported include:

- If a row has fewer cells than the number of columns detected.
- For a CALS table, if a cell has a vertical span greater than the available rows count.
- For a CALS table, if the number of cols specs is different than the number of columns detected from the table cols attribute.
- For a CALS table, if the number of columns detected from the table cols attribute is different than the number of columns detected in the table structure.
- For a CALS table, if the value of the cols, rowsep, or colsep attributes are not numeric.
- For a CALS table, if the namest, nameend, or colname attributes point to an incorrect column name.

Identify possible conflicts in profile attribute values

When the profiling attributes of a topic contain values that are not found in parent topic profiling attributes, the content of the topic is overshadowed when generating profiled output. This option reports these possible conflicts.

Report attributes and values that conflict with profiling preferences

Looks for profiling attributes and values that are not defined in the Profiling / Conditional Text preferences page (on page 142) (you can click the Profiling Preferences button to open this preferences page). It also checks if profiling attributes defined as single-value have multiple values set in the searched topics.
Additional Schematron checks

Allows you to select a Schematron file that Oxygen XML Author will use for the validation of DITA resources. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 266) button, or the browsing actions in the Browse drop-down list.

Export settings

Allows you to export the settings assigned in this dialog box to an XML file that you can share with other users or use on other systems.

Import settings

Allows you to import settings for this dialog box from an XML file that was created by the Export settings action.

Check

Use the Check button to begin the validation process. The options that you choose in this dialog box are preserved between sessions.

Related Information:

• DITA Maps Manager (on page 2503)

DITA Map Author Mode Actions

A variety of actions are available in the DITA map (on page 2793) framework (on page 2794) that can be added to the DITA menu, the Author Custom Actions toolbar, the contextual menu, and the Content Completion Assistant (on page 2792).

DITA Map Toolbar and Menu Actions

When a DITA map is opened in Author mode, the following default actions are available on the DITA Map Author Custom Actions toolbar (by default, they are also available in the DITA menu and in various submenus of the contextual menu):

Insert New DITA Resource

Opens a New DITA file dialog box (on page 2562) where you can choose the type of DITA document to create and inserts a reference to it at the current position within the map.

Insert Topic Reference
Opens the **Insert Reference** dialog box ([on page 2530](#)) where you can configure a topic reference and inserts it at the current position within the map.

- **Reuse Content**
  Opens the **Reuse Content** dialog box ([on page 2647](#)) that allows you to insert and configure a content reference (`conref`), or a content key reference (`conkeyref`) at the cursor position.

- **Insert Topic Heading**
  Opens the **Insert Reference** dialog box ([on page 2530](#)) that allows you to insert a topic heading at the cursor position.

- **Insert Topic Group**
  Opens the **Insert Reference** dialog box ([on page 2530](#)) that allows you to insert a topic group at the cursor position.

- **Insert Relationship Table**
  Opens a dialog box that allows you to configure the relationship table to be inserted. The dialog box allows you to configure the number of rows and columns of the relationship table, if the header will be generated and if the title will be added.

- **Relationship Table Properties**
  Allows you to change the properties of rows in relationship tables.

- **Insert Relationship Row**
  Inserts a new table row with empty cells. The action is available when the cursor position is inside a table.

- **Insert Relationship Column**
  Inserts a new table column with empty cells after the current column. The action is available when the cursor position is inside a table.

- **Delete Relationship Column**
  Deletes the table column where the cursor is located.

- **Delete Relationship Row**
  Deletes the table row where the cursor is located.

- **Move Up**
  Moves the selected node up one position on its same level.

- **Move Down**
  Moves the selected node down one position on its same level.
Promote (Alt + LeftArrow)
Moves the selected node up one level to the level of its parent node.

Demote (Alt + RightArrow)
Moves the selected node down one level to the level of its child nodes.

DITA Menu Actions

The following additional actions can be found in the DITA menu when editing a DITA map in Author mode:

- Refresh References
  You can use this action to manually trigger a refresh and update of all referenced resources.

Tags display mode Submenu

- Full Tags with Attributes
  Displays full tag names with attributes for both block (on page 2792) and inline elements (on page 2795).

- Full Tags
  Displays full tag names without attributes for both block and inline elements.

- Block Tags
  Displays full tag names for block elements and simple tags without names for inline elements.

- Inline Tags
  Displays full tag names for inline elements, while block elements are not displayed.

- Partial Tags
  Displays simple tags without names for inline elements, while block elements are not displayed.

- No Tags
  No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

Configure Tags Display Mode
Use this option to go to the **Author preferences page (on page 129)** where you can configure the **Tags Display Mode** options.

**Profiling/Conditional Text Submenu**

**Edit Profiling Attributes**

Allows you to configure the **profiling attributes (on page 911)** and their values.

**Show Profiling Colors and Styles**

Select this option to turn on conditional styling.

**Show Profiling Attributes**

Select this option to turn on conditional text markers. They are displayed at the end of conditional text blocks, as a list of attribute name and their currently set values.

**Show Excluded Content**

When this option is selected, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, deselect this option.

**List of all profiling condition sets that match the current document type**

You can click a listed **condition set (on page 917)** to activate it.

**Profiling Settings**

Opens the **profiling options preferences page (on page 142)**, where you can manage profiling attributes and profiling conditions sets. You can also configure the profiling styles and colors options from the **colors/styles preferences page (on page 144)** and the **attributes rendering preferences page (on page 146)**.

**ID Options**

Opens the **ID Options** dialog box that allows you to configure options for generating IDs in **Author** mode. The dialog box includes the following:

**ID Pattern**

The pattern for the ID values that will be generated. This text field can be customized using constant strings or any of the Oxygen XML Author **Editor Variables (on page 266)**.

**Element name or class value to generate ID for**
The elements for which ID values will be generated, specified using class attribute values. To customize the list, use the Add, Edit, or Remove buttons.

**Auto generate IDs for elements**

If selected, Oxygen XML Author will automatically generate unique IDs for the elements listed in this dialog box when they are created in Author mode.

**Remove IDs when copying content in the same document**

When copying and pasting content in the same document, this option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs. To retain the element IDs, deselect this option.

**Note:** This option does not have an effect on content that is cut and pasted.

**Generate IDs**

Oxygen XML Author generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the ID Options dialog box that are found in the current selection.

**Note:** The Generate IDs action does not overwrite existing ID values. It only affects elements that do not already have an id attribute.

**DITA Map Contextual Menu Actions**

In addition to many of the DITA Map toolbar actions (on page 1216) and the general Author mode contextual menu actions (on page 1007), the following DITA map framework-specific actions are also available in the contextual menu when editing in Author mode:

**Add File to Review Task**

This action can be used to add the current document to a task in the Content Fusion Tasks Manager view. Oxygen Content Fusion is a flexible, intuitive collaboration platform designed to adapt to any type of documentation review workflow. This functionality is available through a pre-installed connector add-on (on page 2250).
To fully take advantage of all of the benefits and features of Content Fusion, your organization will need an Oxygen Content Fusion Enterprise Server. For more information, see the Oxygen Content Fusion website.

Edit Properties

Opens the Edit Properties dialog box that allows you to configure the properties of a selected node. For more details about this dialog box, see Edit Properties Dialog Box (on page 2540).

Generate IDs

Oxygen XML Author generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the ID Options dialog box that are found in the current selection.

Note: The Generate IDs action does not overwrite existing ID values. It only affects elements that do not already have an id attribute.

Search References

Finds the references to the href or keys attribute value of the topic/map reference element at the current cursor position, in all the topics from the current DITA map (opened in the DITA Maps Manager view (on page 2503)). The current topic/map reference element must have an href or keys attribute defined to complete the search.

Show Key Definition

Available for elements that have a conkeyref or keyref attribute set (or elements with an ancestor element that has a conkeyref or keyref attribute). It computes the key name and opens the DITA map (on page 2793) that contains the definition of the key with the element that defines that key selected.

DITA Map Drag/Drop Actions

Dragging a file from the Project view (on page 320) or DITA Maps Manager view (on page 2503) and dropping it into a DITA map document that is edited in Author mode creates a link to the dragged file (a topicref element, chapter, part, etc.) at the drop location.
Open Topic from DITA Map in Author Mode

When a DITA map is opened in Author mode, you can click the icon to the left of a topic to open that particular topic in the editor.

Tip: For information about customizing Author mode actions for a particular framework (on page 2794) (document type), see the Configuring Actions, Menus, Toolbars, Content Completion for a Framework (on page 1894) section.

Related Information:

• Configuring Actions, Menus, Toolbars, Content Completion for a Framework (on page 1894)

Working with DITA Topics

DITA is a structured writing format. Structure can have several meanings, all of which are relevant to DITA. This section includes information about working with DITA topics and the structure.

Information Types

The structure of a piece of content refers to how the words and images are selected and organized to convey information. One approach to structured writing is to divide content into discrete blocks that contain various types of information, and then to combine those blocks to form publications. DITA is based on this approach, and encourages the author to write in discrete blocks called topics. DITA provides three base topic types (concept, task, and reference), a number of extended topic types, and the capability to create new topic types through specialization.

Text Structure

Every piece of text is made up of certain text structures, such as paragraphs, lists, and tables. DITA supports text structures through XML elements such as \texttt{p}, \texttt{ol}, and \texttt{simpletable}. The DITA markup specifies the text structures, but not how they will be published in various types of media. The formatting of text structures is determined by the output transformations and may be customized to meet the needs of various organizations and type of media.

Semantic Structure

Semantic structure is structure that shows the meaning of things. For example:
• A **task** element specifies that a block of content contains the description of a task.
• A **codeblock** element specifies that a block of text consists of programming code.
• A **uicontrol** element specifies that a word is the name of a control in a computer GUI.
• The **platform** profiling attribute specifies that a particular piece of content applies only to certain computing platforms.

Semantic structure is important in a structured writing system because it allows both authors and readers to find content, and it allows processing scripts to process various pieces of content differently, based on their role or meaning. This can be used to do things such as filtering content related to a specific product so that you can produce documentation on many products from the same source.

There can be many forms of semantics captured in a document set. DITA captures some of these in topics and some of them in maps. If you are using a CMS, it may capture additional semantics.

**Document Semantics**

Documents consist of elements that may be made up of the same basic text structures as the rest of the text, but have a special function within the structure of the document. For instance, both tables of contents and indexes are lists, but they play a special role in the document. Chapters and sections are just sequences of paragraphs and other text structures, yet they are meaningful in the structure of the document. In some cases, such as indexes and tables of contents, these structures can be generated from semantic information embedded in the source. For instance, a table of contents can be built by reading the titles of chapters and sections. DITA provides elements to describe common document semantics.

**Subject Matter Semantics**

In some cases, the semantics of the content relate directly to the subject matter that the content describes. For instance, DITA supports tags that allow you to mark a piece of text as the name of a window in a software application (**wintitle**), or to mark a piece of text as applying only to a particular product.

**Audience Semantics**

In some cases, the semantics of the content relate to the audience that it is addressed to. For instance, a topic might be addressed to a particular role, or to a person with a particular level of experience. DITA provides an **audience** element to capture audience metadata.
Creating Topic Structures

Oxygen XML Author provides a number of tools to help you create topic structures:

- **Content Completion Assistant (on page 2792)** - Shows you which elements can be created at the current position.
- **Model view (on page 340)** - Shows you the complete structure supported by the current element.
- **Outline view (on page 334)** - Shows you the current structure of your document.
- **DITA** toolbar - Helps you to easily insert many common structures.

**Related Information:**

- Getting Started with DITA (on page 13)
- DITA Topics Document Type (Framework) (on page 1191)

Creating a New DITA Topic

The basic building block for DITA information is the DITA topic. DITA provides a variety of specialized topic types, the most common of which are:

- **Topic** - The base topic type from which all other topic types are specialized. Typically, it is used when a more specialized topic type is inappropriate.
- **Task** - For procedural information such as how to use a dialog box.
- **Concept** - For general, conceptual information such as a description of a product or feature.
- **Reference** - For reference information.

Oxygen XML Author also supports numerous other specialized topic types that you will find templates for in the various folders in the **New DITA file dialog box (on page 2563)**. They include DITA 1.3 specializations, Lightweight DITA templates, MathML composites, Markdown documents, and other DITA specialized topic and **DITA map (on page 2793)** types such as Glossentry, Troubleshooting, Bookmap (on page 2792), and Subject Scheme Map (on page 2799).

To create a new DITA topic and add a reference to it in your **DITA map (on page 2793)**, follow these steps:

1. In the **DITA Maps Manager (on page 2503)**, right-click the node in the current map where you want to add the new topic.
2. Select one of the following actions:
• **Append Child > New** - Select this action to insert the new topic as a child of the selected node. This action opens a New file dialog box *(on page 2563)* that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.

• **Insert Before > New** - Select this action to insert the new topic as a sibling to the current node, before it. This action opens a New file dialog box *(on page 2563)* that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.

• **Insert After > New** - Select this action to insert the new topic as a sibling to the current node, after it. This action opens a New file dialog box *(on page 2563)* that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.

• **Duplicate** - Select this action to create a copy of the selected topic and insert it as a sibling. This action opens a dialog box that allows you to choose the file name and location for the newly created copy of the topic. After you have selected the name and path for your new topic, click **OK**.

**Step Result:** The new topic is now referenced (as a topicref) in the DITA map at the location where you inserted it and the new topic is opened in the editor.

3. Save the *DITA map*.

**New DITA File Dialog Box**

The New DITA file dialog box allows you to create a new DITA topic using various types of DITA file templates and provides some options that help you to configure the new topic.

Figure 599. New DITA File Dialog Box
Note: The templates that appear in this dialog box include all templates that have an associated .properties file and the type property is set to dita, as well as templates that do not have an associated properties file or the type property is not defined. It will also include custom templates that you create using the procedures presented in Creating New Document Templates (on page 626).

The New DITA file dialog box includes the following features and options:

Choose a file template

Use the template preview pane to select the appropriate type of DITA file you want to create. Once you select a template, the other options will appear below the preview pane.

Tip: You can use the text filter field at the top of the dialog box to search for a specific template.

Title

Depending on the selected file template, the value of the Title field is set in:

- The title element of a DITA topic file. The title element needs to be the first child of the root element.
- The glossterm element of a Glossentry file.
New Topics Preferences

Pressing this button opens the DITA New Topics preference page (on page 217)

Save as

Use this option to specify a file name and path for the new file. You can specify the path by using the text field, the history drop-down, or the browsing actions in the Browse drop-down menu.

Create

When you click this button, a reference (topicref) to the new topic is added to the current DITA map and the new topic is opened in the editor.

Related Information:

- Getting Started with DITA (on page 13)
- Adding Topics to a DITA Map (on page 2523)
- Working with Markdown Documents in DITA (on page 1138)
- Fast Create Multiple DITA Topics (on page 2565)

Fast Create Multiple DITA Topics

The DITA Maps Manager (on page 2503) includes a feature that allows you to quickly create multiple skeleton topics at once and you can specify their hierarchical structure within the DITA map (on page 2793). A common use-case for using this feature is when you need to insert a new chapter or section that will include multiple topics and you have the structure and titles planned out in advance.

Note: The Fast Create Topics feature works for the following types of local and remote resource protocols: file, http, https, ftp, ftsp.

To access this feature, right-click a node in the DITA Maps Manager where you want the new topics to be inserted and select Fast Create Topics. This opens the Fast Create Topics dialog box where you can configure the structure for the new topics.

Figure 600. Fast Create Topics Dialog Box
The Fast Create Topics dialog box includes the following features and options:

**Hierarchy Text Pane**

Use this text area to enter the titles for your new topics, one per line, and specify the hierarchy by using indents (Tab or Space). Topic references will be created in the DITA map according to the hierarchy you enter in this section.

**File name generation rules**

The titles that you enter in the text pane will not only be used for the topic titles but also to generate their file names and you can click the File name generation rules link to configure the rules (on page 217) for how those file names will be generated.

**Tip:** If you have added a file name prefix or suffix to the properties file (on page 628) for DITA document templates, the generated file name will include that prefix or suffix.

**File name prefix**

Use this option to add a specified prefix to the file name. If you have added a file name prefix to the properties file (on page 628) for DITA document templates, the prefix you enter here will override the one from the properties file.
File name suffix

Use this option to add a specified suffix to the end of the file name. If you have added a file name suffix to the properties file (on page 628) for DITA document templates, the suffix you enter here will override the one from the properties file.

Topic type

All of the topics that will be created will have the same DITA topic type, which is detected from the most recently created topic. You can click the Change button to select a different type from a list of possible DITA templates.

Tip: You can convert any of these new files to a different DITA topic type at a later time by using another feature that allows you to easily convert DITA documents to other types (on page 2571).

Add created topic hierarchy relative to the selection as

By default, the hierarchy of topics will be added to the DITA map as the First Child of the node where the action was invoked. You can change this to Last Child, Preceding Sibling, or Following Sibling if the selected node allows topics to be inserted as such.

Create

When you click Create, the specified hierarchy is added as topic references in the DITA map. The new documents are created as bare skeleton topics with only the topic title and possibly the root ID populated.

Tip: You can easily change the order of the topics in the DITA map (on page 2523) at a later time,

Related Information:

- Adding Topics to a DITA Map (on page 2523)
- Converting DITA Topics to Another Type (on page 2571)

Editing DITA Topics

Oxygen XML Author provides a number of features to help you edit DITA topics. A DITA topic is an XML document, thus all the editing features that Oxygen XML Author provides for editing XML documents also apply to DITA topics. Oxygen XML Author also provides extensive additional support specifically for DITA.
Opening a DITA Topic

There are several ways to open a DITA topic in the XML editor. Use any of the following methods to open a topic:

- Double-click the topic in the DITA Maps Manager (on page 2503) (or right-click the topic and select Open).
- Double-click the file in the Project view (on page 320) (or right-click the file and select Open).
- If you have a DITA map (on page 2793) opened in the XML editor, you can click the icon to the left of the topic.
- Drag a DITA file from your system browser and drop it in the XML editor.

Visual Editing in Author Mode

DITA is an XML format (on page 7), although you do not have to write raw XML to create and edit DITA topics. Oxygen XML Author provides a graphical view of your topics in Author mode (on page 388). Your topics will likely open in Author mode by default, so this is the first view you will see when you open or edit a DITA topic. If your topic does not open in Author mode, just click Author at the bottom left of the editor window to switch to this mode.

Author mode presents a graphical view of the document you are editing, similar to the view you would see in a word processor. However, there are some differences, including:

- Author mode is not a WYSIWYG view. It does not show you exactly what your content will look like when printed or displayed on-screen. The appearance of your output is determined by the DITA publishing process, and your organization may have modified that process to change how the output is displayed. Oxygen XML Author has no way of determining what your final output will look like or where line breaks or page breaks will fall. Treat Author mode as a friendly visual editing environment, not a faithful preview of your output.
- Your document is still an XML document. Author mode creates a visual representation of your document by applying a CSS stylesheet to the XML. You can see the XML at any time by switching to Text mode (on page 290). You, or someone in your organization, can change how the Author view looks by changing the CSS stylesheet or providing an alternate stylesheet.
- Your aim in editing a DITA document is not to make it look right, but to create a complete and correct DITA XML document. Author mode keeps you informed of the correctness of your content by highlighting XML errors in the text and showing you the current status in a box at the top right of the editor window. Green means that your document is valid, yellow means valid with warnings, and red means invalid. Warnings and errors are displayed when you place the cursor on the error location.
Your XML elements may have attributes set on them. Conventionally, attributes are used to contain metadata that is not displayed to the reader. By default, attributes are not displayed in the Author view (though there are some exceptions) and cannot be edited directly in the Author view (though in some cases the CSS that drives the display may use form controls to let you edit attributes directly). To edit the attributes of an element, place your cursor on the element and press \texttt{Alt+Enter} to bring up the attribute editor. Alternatively, you can use the Attributes view (on page 412) to edit attributes.

\textbf{Tip:} You can select \texttt{Hints} from the Styles drop-down menu (available on the Author Styles toolbar) to display tooltips throughout the DITA document that offers additional information to help you with the DITA structure. For more information, see the Selecting and Combining Multiple CSS Styles (on page 1919) section.

\section*{Content Completion Assistance}

Since it is a structured format, DITA only allows certain elements in certain places. The set of elements allowed differ from one DITA topic type to another (this is what makes one topic type different from another). To help you figure out which elements you can add in any given place and help you understand what they mean, Oxygen XML Author has a number of Content Completion Assistant (on page 2792) features.

\begin{itemize}
\item \textbf{The Enter key:} In Author mode, the \texttt{Enter} key does not create line breaks, it brings up the Content Completion Assistant to help you enter a new element. In XML, you do not use line breaks to separate paragraphs. You create paragraphs by creating paragraph elements (element \texttt{p} in DITA) and tools insert the line breaks in the output and on-screen.
\end{itemize}

\begin{figure}[h]
\centering
\includegraphics[width=0.5\textwidth]{content-completion-assistant.png}
\caption{Content Completion Assistant}
\end{figure}

The Content Completion Assistant not only suggests new elements you can add. If you press \texttt{Enter} at the end of a block element (on page 2792) (such as a paragraph) it suggests creating a new element of the same type. If you press \texttt{Enter} in the middle of a block element, it suggests splitting that element into two elements.

A useful consequence of this behavior is that you can create a new paragraph simply by hitting \texttt{Enter} twice (just as you might in a text editor).
As you highlight an element name, a basic description of the element is displayed. Select the desired element and press **Enter** to create it.

To wrap an element around an existing element or piece of text, simply select it and press **Enter** and use the **Content Completion Assistant** to choose the wrapper element.

- **The Model view:** You can see the entire model of the current element by opening the **Model view** (Window > Show View > Model, if the view is not already open). The **Model view** shows you what type of content the current element can contain, all the child elements it can contain, all its permitted attributes, and their types.

  - **Tip:** You can also select **Inline actions** from the **Styles** drop-down menu (available on the **Author Styles** toolbar) to display possible elements that are allowed to be inserted at various locations throughout the DITA document. For more information, see the **Selecting and Combining Multiple CSS Styles** (on page 1919) section.

### DITA Editing Actions

A variety of actions are available in the DITA **framework** (on page 2794) to specifically assist you with editing DITA documents. These various actions are available in the contextual menu, the **DITA** menu, the **DITA (Author Custom Actions)** toolbar, or the **Content Completion Assistant**.

The **DITA** toolbar contains buttons for inserting a number of common DITA elements (elements that are found in most DITA topic types).

If the **DITA** toolbar is not displayed, right-click anywhere on the toolbar area, select **Configure Toolbars**, and select it from the displayed dialog box.

- **Note:** The **DITA** toolbar contains a list of the most common elements and actions for DITA, such as inserting an image, creating a link, inserting a content reference, or creating a table. It does not contain a button for inserting every possible DITA element. For a complete list of elements that you can insert at the current location in your document, press **Enter** to open the **Content Completion Assistant**.

Whenever the current document in the editor is a DITA document, the **DITA** menu is displayed in the menu bar. It contains a large number of actions for inserting elements, creating content references and keys, editing DITA documents, and controlling the display. These actions are specific to DITA and supplement the general editing commands available for all document types. Many of these actions are also conveniently available in the contextual menu. In addition to the **DITA framework-specific actions** (on page 1193), the contextual menu also includes various **general Author mode contextual menu actions** (on page 1007).
Converting DITA Topics to Another Type

Oxygen XML Author includes a feature that allows you to convert an existing DITA document to a different topic type. For example, if you want to convert a DITA Task to a DITA Topic, or vice versa. There are several ways to access these refactoring actions and you can choose a scope for the operation and some filtering options.

**DITA Conversion Refactoring Operations for DITA**

The following conversion operations are available:

- **Convert Nested Topics to New Topics (Available from the contextual menu of editable maps/nodes in the DITA Maps Manager (on page 2503))**
  
  Use this operation on topics that contain nested `<topic>` elements to convert each nested topic to a new topic. Also, the new topics are added in the DITA Maps Manager as the first child topics of the original topic.

- **Convert Sections to New Topics (Available from the contextual menu of editable maps/nodes in the DITA Maps Manager (on page 2503))**
  
  Use this operation on topics that contain multiple sections to convert each section to a new topic. Also, the new topics are added in the DITA Maps Manager as the first child topics of the original topic.

- **Convert to Concept**
  
  Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

- **Convert to General Task**
  
  Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA General Task is a less restrictive alternative to the Strict Task information type.

- **Convert to Reference**
Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

**Convert to Task**

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

**Convert to Topic**

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

**Convert to Troubleshooting**

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

**Methods for Accessing the DITA Conversion Refactoring Operations**

To access the conversion operations, use one of the following methods:

**Single Document Method**

With the document opened in the editor, right-click anywhere in the main editing pane (or right-click the topic reference in the DITA Maps Manager (on page 2503)), go to the Refactoring submenu, and choose whichever operation is appropriate for your needs.

**Multiple Documents At Once Method**

Select XML Refactoring from the Tools menu (or from the Refactoring submenu when you right-click one or more documents in the Project view (on page 320) or the DITA Maps Manager view (on page 2503)). Then select whichever operation is appropriate for your needs.

**XML Refactoring Wizard Dialog Box**

When you select any of the operations, Oxygen XML Author proceeds to the XML Refactoring Wizard. If you used the Multiple Documents At Once Method (on page 2572), the wizard page allows you to choose a scope for the operation and some filtering options:

- **Scope** - Select from a variety of options to define the scope for which resources will be affected by the operation. For example, you can choose to affect all resources in the Project, All opened files, Current DITA map hierarchy, Selected reference, and others depending on the context.
- **Filters** section
  - **Include files** - Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as * or ?).
- **Restrict to known XML file types only** - Excludes non-XML file types from the operation.
- **Look inside archives** - If this option is selected, the scope of the operation will include files inside archives.

If you used the **Single Document Method** *(on page 2572)*, the scope will be the current file so the scope and filtering options are not displayed.

You can then use one of the following buttons to proceed with the operation:

**Preview**

You can use the **Preview** button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.

**Warning:** It is always recommended to use the **Preview** button to make sure the operation is not going to do something unexpected and after you click the **Finish** button, any **Undo** action will only revert changes on the current document.

**Finish**

When you use the **Finish** button, behind the scenes Oxygen XML Author maps the structure of the previous DITA document type to a structure that fits the new type. In some cases, especially when the previous structure was very complex, the conversion might result in an invalid structure and some manual adjustments might be required.

**Handling Special Characters When Generating New File Names**

For refactoring operations that generate a new file, if special characters are detected in an element that will be used to generate the new file name, the special characters will automatically be replaced with their ASCII equivalents (for example, Ä is changed to AE). If an ASCII equivalent does not exist, it will be replaced with an underline character (_). The purpose of this functionality is to avoid generating invalid file names.

It is possible to customize the list of replaceable symbols by editing the following XSLT character map file:

`{OXYGEN_INSTALL_DIR}/frameworks/dita/refactoring/utils/character-map.xsl`

**Converting To and From DITA Specialization Document Types**

If you use your own **DITA specialization document type** *(on page 2772)*, you can modify the predefined conversion operations to work with your specialization by customizing the values of particular variables.

To use the conversion operations with your DITA specialization, follow these steps:
1. Locate the conversion stylesheets in the following directory: `\{OXYGEN_INSTALL_DIR\}/frameworks/dita/refactoring/dita-files-conversion-systlesheets`.

2. Each conversion operation has a stylesheet with the word `entrypoint` at the end of its name. Edit the appropriate `*-entrypoint.xsl` file (for example, to modify the Convert to Task operation, edit the `convert-resource-to-task-entrypoint.xsl` file).

3. Depending on whether you use a DTD, XML Schema, or Relax NG-based specialization, you can:
   a. Modify the values of the declared `root-element`, `public-literal-target`, and `system-literal-target` variables to match your specialization's DTD information.
   b. Modify the value of the declared `schema-location` variable to match the location of your specialization's XML schema.
   c. Modify the value of the declared `xml-model-location` variable to match your Relax NG specialization.

4. Save your changes to the stylesheet.

5. If you want to change the name of the operation that will be displayed in Oxygen XML Author, follow these substeps:
   a. Locate the resource XML file for the same conversion operation in the following directory: `\{OXYGEN_INSTALL_DIR\}/frameworks/dita/refactoring/` (for example, for the Convert to Task operation, it is `convertResource2Task.xml`).
   b. Edit that XML file and change the `name` attribute to match whatever you want to be displayed for that operation (for example, `name="Convert to My DocType"`).
   c. Save your changes to the XML file.

6. Restart Oxygen XML Author

**Result:** You should now see your changes when accessing the conversion operations (on page 2572).

**Related Information:**
- Editing DITA Topics (on page 2567)
- Refactoring XML Documents (on page 1080)

**Working with Images in DITA Topics**

There are several ways to add images to a DITA topic, depending on if you want to create a figure element (with a title and caption), just insert an image inline, or if you want to use multiple versions of a graphic depending on the situation. For instance, you might want to use a specific image for each different product version or output media.
Adding an Image Inline with the Insert Image Dialog Box

Use the following procedure to add an image inline:

1. Place the cursor in the position you want the graphic to be inserted.
2. Select the `Insert Image` action. The `Insert Image` dialog box appears.

3. Configure the options in this dialog box and click `Insert`.

The `Insert Image` dialog box includes the following options and features for inserting images into a DITA document:

**Location**

Use this option to specify a URL for the image as the value of an `@href` attribute inside the `<image>` element. You can type the URL of the image you want to insert or use browsing actions in the `Browse` drop-down menu (there is also a history drop-down).

**Key**

Use this option to insert the selected key as the value of a `@keyref` attribute inside the `<image>` element. All keys that are presented in the dialog box are gathered from the `root map (on page 2799)` of the current `DITA map`. You can use the `Choose Key Reference` button to open the `Choose Key` dialog box that presents the list of keys available in the selected `root map`. 
**Note:** If your defined keys are not listed in this dialog box, it is most likely trying to gather keys from the wrong *root map*. You can change the *root map* by using the Change Root Map link in the Choose Key dialog box or change it in the Root map option in the toolbar of the DITA Maps Manager.

**Figure title**

Use this text box to insert a `<title>` and `<image>` element inside a `<fig>`.

**Alternate text**

Use this text box to insert an `<alt>` element inside the `<image>`.

**Size**

Use this section to configure the *Width* and *Height* of the image, or *Scale* the image. Specifying a value in these options inserts a `@width`, `@height`, and `@scale` attribute, respectively.

**Layout**

Use the options in this section to insert `@placement` and `@align` attributes into the `<image>` element.

**Preview**

The Preview box shows a thumbnail of the selected image so that you can see a preview of the image before clicking **Insert**.

---

**Adding an Image Inline with Drag/Drop (or Copy/Paste) Actions**

You can drag images from your system explorer or the Project view (on page 320) and drop them into a DITA document (or copy and paste). This will insert the path of the image file as the value of the `@href` attribute in a DITA `<image>` element:

```xml
<image href="../images/image_file.png"/>
```

**Tip:** To replace an image, just drag and drop a new image over the existing one. Oxygen XML Author will automatically update the reference to the new image.

---

**Adding an Image in a Figure Element**

To add an image in a figure:

1. Add a `<fig>` element to your document at the appropriate place.
2. Add a `<title>` and/or `<desc>` element to `<fig>`, according to your needs.
3. Add an `<image>` element (on page 2575) to the `<fig>` element.
Note: The `<fig>` element has a number of other child elements that may be appropriate to your content. See the DITA documentation for complete information about `<fig>`.

Note: The order that the content of the `<image>`, `<title>`, and `<desc>` elements will appear in the output is determined by the output transformation. If you want to change how they appear, you may have to modify the output transformation, rather than your source content.

**Floating Images in DITA Topics for PDF or XHTML Output**

Oxygen XML Author provides the possibility of floating an image to the left or right of blocks of content in DITA topics, for both PDF and XHTML output.

To float an image, you simply need to set the `@outputclass` attribute on the `<image>` element. The possible values are:

- `float-left`
- `float-right`

For example, the following DITA structure will present the image to the right of the paragraph content in the output:

```dita
<p><image href="../../images/Lilac.jpg" scale="45" outputclass="float-right"/>
  <b>Lilac</b> (<b>Syringa</b>) is a genus of about 20–25 species of flowering plants in the olive family (<b>Oleaceae</b>), native to Europe and Asia.
</p>
```

Figure 603. Image Floated to the Right

![Lilac (Syringa) is a genus of about 20–25 species of flowering plants in the olive family (Oleaceae), native to Europe and Asia.](images/Lilac.jpg)

**Searching for References to Images**

You can search for all references to an image by selecting Search References from the contextual menu. The result depends on how the image is defined, as follows:

- If the action is invoked on an `<image>` element that contains a `@href` attribute but does not include an `@id` attribute, all direct references to the image are reported. If the `<image>` element does have an `@id` attribute, all links to the specified ID are also reported.
- If the action is invoked on an `<image>` element that contains a `@keyref` attribute but does not include an `@id` attribute, all direct references to the image are reported along with all instances
where the key is used. If the `<image>` element does have an `@id` attribute, all links to the specified ID are also reported.

Related Information:

- Image Maps in DITA (on page 972)

Adding Video, Audio, and Embedded HTML Resources in DITA Topics

You can insert references to media resources (such as videos, audio clips, or embedded HTML frames) in your DITA topics. The media resources can be played directly in Author mode and in all HTML5-based outputs. There is a toolbar button that allows you to insert and configure a reference to the media resource. You can also drag media files from your system explorer or the Project view (on page 320) and drop them into your documents (or copy and paste them).

</table>
Adding a Media Resource

To insert a media resource in a DITA document, use the following procedure:

1. Place the cursor at the location where you want the media resource.

2. Select the **Insert Media Resource** action from the toolbar. The **Insert Media** dialog box appears.

   **Note:** You can also drag media files from your system explorer or the **Project view** (on page 320) and drop them into your documents (or copy and paste them). Note that this method will bypass the **Insert Media** dialog box, so if you need to adjust the size you will need to adjust the @width or @height attributes manually.

![Insert Media Dialog Box](image)

3. Configure the options in this dialog box and click **Insert**.

The **Insert Media** dialog box includes the following options:

**Location**

Use this option to specify a URL for the media resource as the value of a @data attribute inside the `<object>` element. You can type the URL of the resource you want to insert or use browsing actions in the **Browse** drop-down menu (there is also a history drop-down).

**Key**

Use this option to insert the selected key as the value of a @datakeyref attribute inside the `<object>` element. All keys that are presented in the dialog box are gathered from the **root map** (on page 2799) of the current **DITA map**. You can use the **Choose Key Reference** button to open the **Choose Key** dialog box that presents the list of keys available in the selected **root map**.
Note: If your defined keys are not listed in this dialog box, it is most likely trying to gather keys from the wrong root map. You can change the root map by using the **Change Root Map** link in the Choose Key dialog box or change it in the **Root map** option in the toolbar of the **DITA Maps Manager**.

**Type**

Oxygen XML Author detects and automatically selects the media type based upon the specified resource in the URL field (on page 2579). You can manually change the type, but keep in mind that in the publishing stage the **object element** is converted to an HTML5 element (on page 2580) based upon the type selected here. You can choose between: **audio**, **video**, or **iframe**.

**Size**

Use this section to configure the **Width** and **Height** of the frame for the media resource. Specifying a value in these options inserts a **width** and **height** attribute, respectively. For audio clips, only the **Width** can be adjusted.

**Result in Author Mode:** A reference to the specified video, audio, or embedded HTML frame is inserted in an **object** element and it is rendered in Author mode so that it can be played directly from there.

**Attention:**

- On Ubuntu 17.10, if you receive an error when trying to play videos in Author mode, you need to install the **libavformat57** library.

**Result in Output:** In the publishing stage, the **object** element is converted to an HTML5 element so that it can be rendered properly and played in all HTML5-based outputs.

- **Videos** - The **object** element is converted to an HTML5 **video** element.
- **Audio Clips** - The **object** element is converted to an HTML5 **audio** element.
- **Embedded HTML Frames** - The **object** element is converted to an HTML5 **iframe** element.

**Tip:** There is an even faster way of inserting an embedded video (such as a YouTube or Vimeo). If you copy the embed code from the source (for example, you can right-click on a YouTube video and select **Copy embed code**), you can then paste the contents of the clipboard in the URL field (on page 2579) and the **Type** (on page 2580) will automatically be set on iframe, while the **Width and Height** (on page 2580) will be populated according to the detected size, and an **allowfullscreen** parameter will automatically be added (set the value of this parameter to **true** to allow videos to play in full screen mode once the document is converted to XHTML output).
Inserting Media in HTML Outputs That Do Not Support Embedded Media

For certain types of HTML output (for example, CHM) that do not support embedded media (such as videos or audio files), Oxygen XML Author provides a parameter that can be set in the transformation scenario to present the media object as a plain link in the output.

This can be achieved by following these steps:

1. Edit the DITA transformation scenario (on page 2708) for the output type that does not support embedded objects (for example, DITA Map CHM).
2. Go to the Parameters tab (on page 2717) and click the New button to add a new parameter.
3. For the Name, enter: com.oxygenxml.xhtml.linkToMediaResources.
4. For the Value, enter: true.
5. Click OK and continue on to run the transformation.

Result: The media object will appear in the output as a plain link instead of an embedded object.

For more information, see the following video demonstration:

Image Maps in DITA

Oxygen XML Author includes support for image maps in DITA documents through the use of the imagemap element. This feature provides an easy way to create hyperlinks in various areas within an image without having to divide the image into separate image files. The visual Author editing mode includes an Image Map Editor that helps you to easily create and configure image maps.

Figure 605. Image Map Editor in DITA
Image Map Editor Interface in DITA

The interface of the **Image Map Editor** consists of the following sections and actions:

**Toolbar**

- **New Rectangle**
  
  Use this button to draw a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

- **New Circle**

  Use this button to draw a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

- **New Polygon**

  Use this button to draw a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

- **New Free Form Shape**
Use this button to draw a free form shape over an area in the image. After selecting this button, left-click anywhere in the image to place the first point of your shape. Then move the cursor to the location of the next desired point and left-click to place the next point, and so on. To complete the shape (area), click the first point again and a line will automatically be added from the last point that was added, or simply double-click the last point to automatically add the line from the last point back to the first.

Duplicate
Use this button to create a duplicate of the currently selected shape.

Delete
Use this button to delete the currently selected shape.

Undo
Use this button to undo the last action.

Redo
Use this button to redo the last action that was undone.

Show/Hide Numbers
Use this button to toggle between showing or hiding the numbers for the shapes.

Bring Shape to Front
Use this button to bring the currently selected shape forward to the top layer.

Bring Shape Forward
Use this button to bring the currently selected shape forward one layer.

Send Shape Backward
Use this button to send the currently selected shape back one layer.

Send Shape to Back
Use this button to send the currently selected shape back to the bottom layer.

Color Chooser
Use this drop-down menu to select a color scheme for the lines and numbers of the shapes.
Zoom Slider

Use this slider to zoom the image in or out in the main image pane.

Image Pane

This main Image Pane is where you work with shapes to add hyperlinks to multiple areas within an image. The editing mechanisms that are supported in the Image Pane include the following:

Mouse Controls and Keyboard Shortcuts

- Use the mouse to select and move shapes around in the image pane. It is easy to see which shape is selected in this image pane because the border of the selected shape changes from a solid line to a dotted one.
- You can also drag any of the points of a selected shape to adjust its size and shape.
- You can hold down the Ctrl key to select multiple shapes and then move them simultaneously.
- You can also move shapes by using the arrow keys on your keyboard. In addition, you can hold down Shift while using the arrow keys to move the shape further or Alt to move it 1 pixel at a time.
- To zoom in or out, you can use the NumPad + or NumPad - keys respectively. Use Ctrl + NumPad 0 to reset the zoom level to its default value.
- You can use Ctrl + Z to undo an action or Ctrl + Y to redo the last action that was undone.

Contextual Menu Actions Available in the Image Pane

You can right-click the shapes, points, or anywhere in the Image Pane to invoke the contextual menu where the following actions are available:

+ Add Point
  Adds a point to Polygon or Free Form shapes.

× Remove Point
  Removes the current point from Polygon or Free Form shapes.

_duplicate
  Create a duplicate of the currently selected shape.
Delete
Delete the currently selected shape.

New Rectangle
Creates a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

New Circle
Creates a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

New Polygon
Creates a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

Undo
Use this action to undo the last action.

Redo
Use this action to redo the last action that was undone.

Shape Table
The table at the right of the Image Pane is a sequential list of all the areas (shapes) that have been added in the image. It shows their number, type, and description (if one has been added). If you select one of the entries in the table, the corresponding shape will be selected in the Image Pane.

Properties

Type
Displays information about the selected coordinate.

Target
Allows you to choose the target resource that you want the selected area (shape) to be linked to. Select a target by using the Link drop-down menu to the right of the text field. You can choose between the following types of links: Cross Reference, File Reference, or Web Link. All three types will open a dialog box that allows you to define the target resource. This linking process is similar to the normal process of inserting links in
DITA (on page 2676) by using the identical \( \text{Link} \) drop-down menu from the main toolbar.

When you click \text{OK} to finalize your changes in the \text{Image Map Editor}, an \text{xref} element will be inserted with either an \text{href} attribute or a \text{keyref} attribute. Additional attributes may also be inserted and their values depend on the target and the type of link. For details about the three types of links and their dialog boxes, see Inserting a Link in Oxygen XML Author (on page 2676).

**Description**

You can enter an optional description for the selected area (shape) that will be displayed in the \text{Image Map Details} section (on page 978) in \text{Author} mode and as a tooltip message when the end user hovers over the hyperlink in the output.

**How to Create an Image Map in DITA**

To create an image map on an existing image in a DITA document, follow these steps:

1. Right-click the image and select \text{Image Map Editor}.

   \textbf{Result:} This action will apply an \textit{image map} to the current image and open the \text{Image Map Editor} dialog box.

2. Add hyperlinks to the image by selecting one of the shape buttons (\text{New Rectangle}, \text{New Circle}, or \text{New Polygon}).

3. Move the shape to the desired area in the image and drag any of the points on the shape to adjust its size or form. You can use the \textit{other buttons on the toolbar} (on page 973) to adjust its layer and color, or to perform other editing actions.

   \textbf{Tip:} You can right-click any of the points, shapes, or anywhere in the Image Pane to access various helpful \textit{contextual menu actions} (on page 975). For example, the easiest way to remove a point is to right-click the point and select \text{Remove Point}.

4. With the shape selected, use one of the \textit{linking options} (on page 976) in the \( \text{Link} \) drop-down menu to select a target resource (or enter its path in the \text{Target} (on page 976) text field).

5. (Optional) Enter a \text{Description} (on page 977) for the selected area (shape).

6. If you want to add more hyperlinks to the image, select a shape button again and repeat the appropriate steps.

7. When you are finished creating hyperlinks, click \text{OK} to process your changes.

\textbf{Result:} The \textit{image map} is applied on the image and the appropriate elements and attributes are automatically added. In \text{Author} mode, the image map is now rendered over the image. If the image
includes an `alt` element, its value will be displayed under the image. The following two buttons will also now be available under the image in **Author** mode:

- **Image Map Editor** - Click this button to open the Image Map Editor.
- **Image Map Details** - Click this button to expand a section that displays the details of the image map and allows you to change the shape and coordinates of the hyperlinked areas. Keep in mind that if you change the shape in this section, you also need to add or remove coordinates to match the requirements of the new shape.

**Figure 606. Image Map Details**

![Image Map Details](image.png)

**How to Edit an Existing Image Map in DITA**

To edit an existing image map, use any of the following methods:

- Simply double-click the image.
- Right-click the image and select **Image Map Editor**.
- Click the **Image Map Editor** button below the image.

All three methods open the **Image Map Editor** where you can make changes to the image map using the various features described above. You can also make changes to the XML structure of the image map in the **Text** editing mode.

You can also click the **Image Map Details** button below the image to expand a section that displays the details of the image map and allows you to change the shape and coordinates of the hyperlinked areas. Keep in mind that if you change the shape in this section, you also need to add or remove coordinates to match the requirements of the new shape.

**Overlapping Areas**

If shapes overlap one another in the **Image Map Editor**, the one on the top layer takes precedence. The number shown inside each shape represent its layer (if the numbers are not displayed, click the ➔ **Show/Hide Numbers** button on the **Image Map Editor toolbar (on page 973)**). To change the layer
order for a shape, use the layer buttons on the **Image Map Editor** toolbar (*) (on page 973). If you insert a shape and all of its coordinates are completely inside another shape, the **Image Map Editor** will display a warning to let you know that the shape is entirely covered by a bigger shape. Keep in mind that if a shape is completely inside another shape, its hyperlink will only be accessible if its layer is on top of the bigger shape.

- Working with Images in DITA Topics (on page 2574)

## Adding Tables in DITA Topics

You can use the **Insert Table** action on the toolbar or from the contextual menu to add a table in a DITA topic. By default, DITA supports four types of tables:

- **DITA Simple table model (on page 941)** - This is the most commonly used model for basic tables.
- **CALS table model (OASIS Exchange Table Model) (on page 943)** - This is used for more advanced functionality.
- **DITA Choice table model (on page 946)** - This is used within a `step` element in a DITA Task document to describe a series of optional choices that a user must make before proceeding.
- **DITA Properties table model (on page 947)** - This is used in DITA Reference documents to describe a property (for example, its type, value, and description).

If you are using a specialized DITA vocabulary, it may contain specialized versions of these table models.

Since DITA is a structured format, you can only insert a table in places in the structure of a topic where tables are allowed. The Oxygen XML Author toolbar provides support for entering and editing tables. It also helps to indicate where you are allowed to insert a table or its components by disabling the appropriate buttons.
Inserting a Simple Table Model

To insert a Simple DITA table, select the **Insert Table** action on the toolbar or from the contextual menu (or the **Table** submenu from the **DITA** menu). The **Insert Table** dialog box appears. Select **Simple** for the table **Model**.

Figure 607. Insert Table Dialog Box - Simple Model

The dialog box allows you to configure the following options when you select the **Simple** table model:

**Title**

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

**Generate table header**

If selected, an extra row will be inserted at the top of the table to be used as the table header.

**Column widths**

Allows you to specify the type of properties for column widths (**colwidth** attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a **relcolwidth** attribute with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, **relcolwidth=”1* 2* 3*** causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the **relcolwidth** attribute are
automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the `relcolwidth` attribute is `1*`.

- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

**Frame**

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

**Note:** The options in the **Insert Table** dialog box for DITA documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, a simple table is inserted into your document at the current cursor position.

**Inserting a CALS Table Model (OASIS Exchange Table)**

To insert an OASIS Exchange Table (**CALS**), select the ![Insert Table](https://www.oxygenxml.com/dita/1.3/specs/langRef/actions/insertTable.html) action on the toolbar or from the contextual menu (or the **Table** submenu from the **DITA** menu). The **Insert Table** dialog box appears. Select **CALS** for the table **Model**. This model allows you to configure more properties than the **Simple** model.

Figure 608. Insert Table Dialog Box - CALS Model
The dialog box allows you to configure the following options when you select the CALS table model:

**Title**

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

**Table Size**

Allows you to choose the number of **Rows** and **Columns** for the table.

**Generate table header**

If selected, an extra row will be inserted at the top of the table to be used as the table header.

**Column widths**

Allows you to specify the type of properties for column widths (**colwidth** attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a **colwidth** attribute with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, **colwidth="1* 2* 3*"** causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in Author mode, the values of the **colwidth** attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the **colwidth** attribute is **1***.

- **dynamic** - If you choose this option, the columns are created without a specified width (**colwidth** attribute). Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in Author mode, a dialog
box will be displayed that asks you if you want to switch to proportional or fixed column widths.

- **fixed**: The width is specified in fixed units. By default, the `pt` unit is inserted, but you can change the units in the `colspecs` (column specifications) section above the table or in Text mode. The following units are allowed: `pt` (points), `cm` (centimeters), `mm` (millimeters), `pi` (picas), `in` (inches).

**Frame**

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none**: No border will be added.
- **all**: A border will be added to all frames.
- **top**: A border will be added to the top frame.
- **topbot**: A border will be added to the top and bottom frames.
- **bottom**: A border will be added to the bottom frame.
- **sides**: A border will be added to the side frames.

- **ditauseconreftarget**: Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

**Row separator**

Specifies whether or not to include row separators (`rowsep` attribute). The allowed values are: `0` (no separator) and `1` (include separators).

**Column separator**

Specifies whether or not to include column separators (`colsep` attribute). The allowed values are: `0` (no separator) and `1` (include separators).

**Alignment**

Specifies the alignment of the text within the table (`align` attribute). The allowed values are:

- **left**: Aligns the text to a left position.
- **right**: Aligns the text to a right position.
- **center**: Aligns the text to a centered position.
- **justify**: Stretches the line of text so that it has equal width.

**Note**: The **justify** value cannot be rendered in **Author** mode, so you will only see it in the output.
• **char** - Aligns text to the leftmost occurrence of the value specified on the `char` attribute for alignment.

• **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

**Note:** The options in the **Insert Table** dialog box for DITA documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, a CALS table is inserted into your document at the current cursor position.

When you insert a CALS table, you see a link for setting the `colspecs` (column specifications) of your table. Click the link to open the controls that allow you to adjust various column properties. Although they appear as part of the **Author mode (on page 388)**, the `colspecs` link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

**Figure 609. CALS Table in DITA**

**Inserting a Choice Table Model**

To insert a **Choice** table within a `step` element in a DITA Task document, select the **Insert Table** action on the toolbar or in the **Insert** submenu from the contextual menu (or the **Table** submenu from the **DITA** menu), or select `choicetable` from the **Content Completion Assistant (on page 2792)**. The **Insert Table** dialog box appears. Select **Simple** for the table **Model**.

**Figure 610. Insert Table Dialog Box - Choice Model**
The dialog box allows you to configure the following options when you insert a Choice table model within a DITA Task:

**Table Size**

Allows you to choose the number of Rows and Columns for the table.

**Generate table header**

If selected, an extra row will be inserted at the top of the table to be used as the table header.

**Column widths**

Allows you to specify the type of properties for column widths (colwidth attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a relcolwidth attribute with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, relcolwidth="1* 2* 3*" causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in Author mode, the values of the relcolwidth attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the relcolwidth attribute is 1*.

- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in Author mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

**Frame**

Allows you to specify a value for the frame attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

When you click **Insert**, a *Choice* table is inserted into your DITA Task document at the current cursor position (within a `step` element).

**Inserting a Properties Table Model**

To insert a *Properties* table within a `refbody` element in a DITA Reference document, select the

[Insert Table](#) action on the toolbar or in the **Insert** submenu from the contextual menu (or the **Table** submenu from the **DITA** menu), or select **properties(wizard)** from the [Content Completion Assistant](on page 2792). The **Insert Table** dialog box appears. Select **Properties** for the table **Model**.

![Insert Table Dialog Box - Properties Model](image)

The dialog box allows you to configure the following options when you insert a *Properties* table model within a DITA Reference:

**Table Size**

- Allows you to choose the number of **Rows** and **Columns** for the table.
Generate table header

If selected, an extra row will be inserted at the top of the table to be used as the table header.

Frame

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

When you click **Insert**, a **Properties** table is inserted into your DITA Reference document at the current cursor position (within a `refbody` element).

Editing an Existing Table

You can edit the structure of an existing table using the table buttons on the toolbar (or in the contextual menu) to add or remove cells, rows, or columns, and to set basic table properties. Additional attributes can be used to fine-tune the formatting of your tables by using the **Attributes view (on page 412)** (Window > Show View > Attributes). See the DITA documentation for a full explanation of these attributes.

You can also use the **Table Properties (Ctrl + T (Command + T on OS X))** (on page 952) action from the toolbar or contextual menu (or DITA menu) to modify many of the properties of the table (on page 952).

Also, remember that underneath the visual representation, both table models are really just XML. If necessary, you can edit the XML directly by switching to **Text mode (on page 290)**.

You can use normal copy/paste shortcuts to move content between cells. Oxygen XML Author includes a **Smart Paste feature (on page 860)** that preserves certain style and structure information when pasting content.
Tip: When copying a multiple selection of table cells and pasting them outside the table, a new table will be created. When pasting into space-preserved elements, the cell content will be pasted as plain text.

Related Information:

- Editing Tables in Author Mode (on page 927)

DITA Table Layouts

Depending on the context, DITA accepts the following table layouts:

- CALS table model (on page 950)
- Simple table model (on page 950)
- Choice table model (on page 950)
- Properties table model (on page 951)

CALS Table Model Layout

The CALS table model allows for more flexibility and table customization than other models. When choosing a CALS table model from the Insert Table dialog box, you have access to more configurable properties. The layout of a CALS table includes a colspecs section that allows you to easily configure some properties without opening the Table Properties dialog box. For example, you can change the value of column widths (colwidth attribute) or the text alignment (align attribute). Although they appear as part of the Author mode (on page 388), the colspecs link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

Figure 612. CALS Table in DITA
Simple Table Model Layout

When choosing a Simple table model from the Insert Table dialog box, you only have access to configure a few properties. For example, you can choose the number of rows and columns, specify values for frames, and choose from a few types of properties for the column width. The layout of this type of table is very simple, as the name suggests.

Choice Table Model Layout

A Choice table model is used within a step element in a DITA Task document to describe a series of optional choices that a user must make before proceeding. The choicetable element is a useful device for documenting options within a single step of a task. You can insert Choice tables in DITA Task documents either by selecting choicetable from the Content Completion Assistant (on page 2792) (within a step element) or by using the Insert Table action on the toolbar or from the contextual menu. The options and layout of a Choice table is similar to the Simple table model.

Figure 614. DITA Choice Table

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Opt A</td>
<td></td>
</tr>
<tr>
<td>Opt B</td>
<td></td>
</tr>
<tr>
<td>Opt C</td>
<td></td>
</tr>
</tbody>
</table>
Properties Table Model Layout

A Properties table model is used within a refbody element in a DITA Reference document to describe a property (for example, its type, value, and description). You can insert Properties tables in DITA Reference documents either by selecting properties(wizard) from the Content Completion Assistant (on page 2792) (within a refbody element) or by using the Insert Table action on the toolbar (or from the contextual menu) and selecting Properties for the Model. The layout of a Properties table is very simple. It allows for a maximum of 3 columns (typically for property type, value, and description) and the only options available are for whether or not you want a header row and for specifying frames (borders).

Figure 615. DITA Properties Table

<table>
<thead>
<tr>
<th>Property Type</th>
<th>Property Value</th>
<th>Property Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>B</td>
<td>C</td>
</tr>
</tbody>
</table>

Table Validation in DITA

Oxygen XML Author reports table layout problems that are detected in manual or automatic validations. When you validate a DITA map (on page 2793) with the Validate and Check for Completeness action, if the Report table layout problems option is selected in the DITA Map Completeness Check dialog box (on page 2553), table layout problems will be reported in the validation results. The types of errors that may be reported for DITA table layout problems include:

CALS Tables

- A row has fewer cells than the number of columns detected from the table cols attribute.
- A row has more cells than the number of columns detected from the table cols attribute.
- A cell has a vertical span greater than the available rows count.
- The number of colspecs is different than the number of columns detected from the table cols attribute.
- The number of columns detected from the table cols attribute is different than the number of columns detected in the table structure.
- The value of the cols, rowsep, or colsep attributes are not numeric.
- The namest, nameend, or colname attributes point to an incorrect column name.

Simple or Choice Tables

A row has fewer cells than the number of table columns.
Editing Table Properties in DITA

To customize the look of a table in DITA, place the cursor anywhere in a table and invoke the Table Properties (Ctrl + T (Command + T on OS X)) action from the toolbar or the Table submenu of the contextual menu (or DITA menu). This opens the Table properties dialog box.

The Table properties dialog box allows you to set specific properties to the table elements. The options that are available depend on the context and location within the table in which the action was invoked.

Note: Some properties allow the following special values, depending on the context and the current properties or values:

- <not set>- Use this value if you want to remove a property.
- <preserve>- If you select multiple elements that have the same property set to different values, you can choose this value to keep the values that are already set. In some cases it can also be used to keep the current non-standard value for a particular property.

Edit Table Properties for a CALS Table Model

For a CALS table model, the Table properties dialog box includes four tabs of options:

- Table tab - The options in this tab apply to the entire table.
- Row tab - The options in this tab apply to the current row or selection of multiple rows. A message at the bottom of the tab tells you how many rows will be affected.
- Column tab - The options in this tab apply to the current column or selection of multiple columns. A message at the bottom of the tab tells you how many columns will be affected.
- Cell tab - The options in this tab apply to the current cell or selection of multiple cells. A message at the bottom of the tab tells you how many cells will be affected.

The options in four tabs include a Preview pane that shows a representation of the modification.

Figure 616. Table Properties Dialog Box with Cell Tab Selected (DITA CALS Table Model)
The options in the four tabs include the following:

**Horizontal alignment (Available in the Table, Column, and Cell tabs)**

Specifies the horizontal alignment of text within the current table/column/cell or selection of multiple columns/cells (align attribute). The allowed values are as follows:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

**Note:** The justify value cannot be rendered in Author mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the char attribute for alignment.
- **-dita-use-conref-target** - Normally, when using a conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the conref target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

**Vertical alignment (Available in the Row and Cell tabs)**

Specifies the vertical alignment of text within the current row/cell or selection of multiple rows/cells (valign attribute). The allowed values are as follows:
• **top** - Aligns the text at the top of the cell.
• **middle** - Aligns the text in a vertically centered position.
• **bottom** - Aligns the text at the bottom of the cell.

**-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

### Column separator (Available in the Table, Column, and Cell tabs)

Specifies whether or not to include column separators (borders/grid lines) in the form of the `colsep` attribute. The allowed values are: 0 (no separator) and 1 (include separators).

### Row separator (Available in all four tabs)

Specifies whether or not to include row separators (borders/grid lines) in the form of the `rowsep` attribute. The allowed values are: 0 (no separator) and 1 (include separators).

### Frame (Available only in the Table tab)

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

• **none** - No border will be added.
• **all** - A border will be added to all frames.
• **top** - A border will be added to the top frame.
• **topbot** - A border will be added to the top and bottom frames.
• **bottom** - A border will be added to the bottom frame.
• **sides** - A border will be added to the side frames.

**-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

### Edit Table Properties for a Simple, Choice, or Properties Table Model

For a *Simple, Choice, Properties* table model, the **Table properties** dialog box only allows you to edit a few options.

**Table tab**

**Frame**
Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.

**-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

**Row tab (not available for Properties tables)**

**Row type**

Allows you change the row to a body or header type of row.

Related Information:

- Adding Tables in DITA Topics *(on page 941)*
- Editing Tables in Author Mode *(on page 927)*

**Adding MathML Equations in DITA Topics**

You can add MathML equations in a DITA document using one of the following methods:

- Embed MathML directly into a DITA topic. You can use **Insert > Σ Insert Equation** from the contextual menu to insert a MathML equation. Clicking on the equation will open a **MathML Editor** where you can edit the code.
- Reference an external MathML file as an image, using the **Insert Image** action that is available on the DITA toolbar (or from the **DITA > Insert** menu).
• MathML equations contained in DITA topics can be published out-of-the-box in PDF using the **DITA PDF** transformation scenario.

• The **DITA Map PDF - based on HTML5 & CSS** transformation scenario *(on page 1629)* support MathML equations *(on page 1761)*.

• For details about HTML output, see MathML Equations in HTML Output *(on page 1001)*.

• For other publishing formats, you might need to employ additional customizations for handling MathML content.

### Adding LaTeX Equations in DITA Topics

LaTeX is a high-quality typesetting system that includes features designed for the production of technical and scientific documentation. LaTeX can also be used to express mathematical formulas in a textual format. By default, web browsers and PDF readers do not have support to show mathematical equations written in LaTeX, but there are open-source projects that can read LaTeX and convert it to other image types.

Adding support for writing LaTeX equations in a DITA topic implies three stages:

1. Find a way to write the equation in the DITA XML content. You can either create a DITA DTD specialization and add a new element (for example, called `<latex>` and it extends the DITA `<foreign>` element). Alternatively, you can directly use the DITA `<foreign>` element with a specific `@outputclass` attribute value:

   ```xml
   <!DOCTYPE topic PUBLIC "-//OASIS//DTD DITA Topic//EN" "topic.dtd">
   <topic id="testEquation">
     <title>Test equation</title>
     <body>
       <p><foreign outputclass="embed-latex">L' = \{L\sqrt{1-\frac{v^2}{c^2}}\}</foreign></p>
     </body>
   </topic>
   ```

2. If you want Oxygen XML Author to properly present the LaTeX equation when editing in the **Author** visual mode, you need a plugin that converts the equation content to an image. There is a sample plugin that does that here: https://github.com/oxygenxml/wsaccess-javascript-sample-plugins/tree/master/latex-images-support. You can download and copy the plugin folder `latex-images-support` to the Oxygen XML Author **plugins** folder, then restart Oxygen XML Author.

3. The final stage would be to publish the content to HTML-based or PDF output. The following DITA Open Toolkit plugin automatically converts LaTeX images to SVG when publishing: https://github.com/oxygenxml/dita-latex.
DITA Topic Author Mode Actions

A variety of actions are available for the DITA framework that can be found on the toolbar, the contextual menu, or the DITA menu.

DITA Toolbar Actions

The following default actions are readily available on the DITA toolbar when editing in Author mode (by default, most of them are also available in the DITA menu and in various submenus of the contextual menu):

**Bold**

Surrounds the selected text with a `b` tag. You can use this action on multiple non-contiguous selections.

**Italic**

Surrounds the selected text with an `i` tag. You can use this action on multiple non-contiguous selections.

**Underline**

Surrounds the selected text with a `u` tag. You can use this action on multiple non-contiguous selections.

🔗 Link Actions Drop-Down Menu

The following link actions are available from this menu:

**Cross Reference**

Opens the Cross Reference dialog box that allows you to insert a link to a target DITA resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. Once the target resource has been selected, you can also target specific elements within that resource. For more information, see Linking in DITA Topics.

**File Reference**

Opens the File Reference dialog box that allows you to insert a link to a target non-DITA file resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. For more information, see Linking in DITA Topics.

**Web Link**
Opens the **Web Link** dialog box ([on page 2676](#)) that allows you to insert a link to a target web-related resource at the current location within a document. The target resource can be a URL or a key that is already defined in your *DITA map* structure. For more information, see [Linking in DITA Topics](#).

**Related Link to Topic**

Opens the **Cross Reference** (xref) dialog box ([on page 2677](#)) that allows you to insert a link to a target DITA resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your *DITA map* structure. Once the target resource has been selected, you can also target specific elements within that resource. If a related links section does not already exist, this action creates one. For more information, see [Linking in DITA Topics](#).

**Tip:** You can use the **Find Similar Topics** action that available in the DITA menu to quickly find related topics that can be added as related links. It opens the **Open/Find Resource** view and performs a search using text content from the `<title>`, `<shortdesc>`, `<keyword>`, and `<indexterm>` elements.

**Related Link to File**

Opens the **File Reference** dialog box ([on page 2677](#)) that allows you to insert a link to a target non-DITA file resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your *DITA map* structure. If a related links section does not already exist, this action creates one. For more information, see [Linking in DITA Topics](#).

**Related Link to Web Page**

Opens the **Web Link** dialog box ([on page 2677](#)) that allows you to insert a link to a target web-related resource in a related links section at the bottom of the current document. The target resource can be a URL or a key that is already defined in your *DITA map* structure. If a related links section does not already exist, this action creates one. For more information, see [Linking in DITA Topics](#).

**Insert Image**

Opens the **Insert Image** dialog box ([on page 2574](#)) that allows you to configure the properties of an image to be inserted into a DITA document at the cursor position.
**Insert Media Resource**

Opens the **Insert Media** dialog box *(on page 2578)* that allows you to select and configure the properties of a media object to be inserted into a DITA document at the cursor position. The result will be that a reference to the specified video, audio, or embedded HTML frame is inserted in an object element and it is rendered in Author mode so that it can be played directly from there.

### Insert Section Drop-Down Menu

The following insert actions are available from this menu:

- **Insert Section**
  
  Inserts a new section element in the document, depending on the current context.

- **Insert Concept**
  
  Inserts a new concept element, depending on the current context. Concepts provide background information that users must know before they can successfully work with a product or interface.

- **Insert Task**
  
  Inserts a new task element, depending on the current context. Tasks are the main building blocks for task-oriented user assistance. They generally provide step-by-step instructions that will help a user to perform a task.

- **Insert Topic**
  
  Inserts a new topic element, depending on the current context. Topics are the basic units of DITA content and are usually organized around a single subject.

- **Insert Reference**
  
  Inserts a new reference element, depending on the current context. A reference is a top-level container for a reference topic.

- **Insert Paragraph**

  Inserts a new paragraph at current cursor position.

**Reuse Content**

This action provides a mechanism for reusing content fragments. It opens the **Reuse Content** dialog box *(on page 2647)* that allows you to insert several types of references to reusable content at the cursor position. The types of references that you can insert using this dialog box include content references *(conref)* *(on page 2648)*, content key
references (conkeyref) (on page 2649), or key references to metadata (keyref) (on page 2653).

Insert step or list item

Inserts a new list or step item in the current list type.

Insert Unordered List

Inserts an unordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an unordered list.

Insert Ordered List

Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

Sort

Sorts cells or list items in a table.

Insert Table

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a block element (on page 2792)) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

Note: If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that Only lists, paragraphs, or inline content can be converted to tables.

Insert Row Below

Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

Delete Row(s)

Deletes the table row located at cursor position or multiple rows in a selection.

Insert Column After

Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

Delete Column(s)
Deletes the table column located at cursor position or multiple columns in a selection.

**Table Properties**

Opens the Table properties dialog box that allows you to configure properties of a table (such as frame borders).

**Join Cells**

Joins the content of the selected cells (both horizontally and vertically).

**Split Cell**

Splits the cell at the cursor location. If Oxygen XML Author detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

**DITA Contextual Menu Actions**

In addition to many of the DITA toolbar actions *(on page 1193)* and the general Author mode contextual menu actions *(on page 1007)*, there are numerous DITA-specific actions that are available in the contextual menu when editing DITA documents in Author mode (most of them are also available in the DITA menu at the top of the interface):

**Add File to Review Task**

This action can be used to add the current document to a task in the Content Fusion Tasks Manager view. Oxygen Content Fusion is a flexible, intuitive collaboration platform designed to adapt to any type of documentation review workflow. This functionality is available through a pre-installed connector add-on *(on page 2250)*. To fully take advantage of all of the benefits and features of Content Fusion, your organization will need an Oxygen Content Fusion Enterprise Server. For more information, see the Oxygen Content Fusion website.

**Edit Attributes**

Displays an in-place attributes editor *(on page 415)* that allows you to manage the attributes of an element.

**Edit Profiling Attributes**

Allows you to change the profiling attributes *(on page 911)* defined on all selected elements.

**Cut (Ctrl + X (Command + X on OS X))**

Removes the current selected content from the document and places it in the clipboard.

**Copy (Ctrl + C (Command + C on OS X))**
Places a copy of the current selected content in the clipboard.

**Paste (Ctrl + V (Command + V on OS X))**

Inserts the current clipboard content into the document at the cursor position.

**Paste special submenu**

This submenu includes the following special paste actions that are specific to the DITA framework:

**Paste as content reference**

Inserts a content reference (a DITA element with a `conref` attribute) to the DITA XML element from the clipboard. An entire DITA XML element with an ID attribute must be present in the clipboard when the action is invoked. The `conref` attribute will point to this ID value.

**Paste as content key reference**

Allows you to indirectly reference content using the `conkeyref` attribute. When the DITA content is processed, the key references are resolved using key definitions from *DITA maps (on page 2793)*. To use this action, you must first do the following:

1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
2. In the **DITA Maps Manager** view, make sure that the **Root map combo box (on page 2508)** points to the correct map that stores the keys.
3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the **DITA Maps Manager**, select **Edit Properties**, and enter a value in the **Keys** field.

**Paste as link**

Looks for the first element with an ID value in the clipboard and inserts an `xref` that points to that element. If no elements with an ID value are found, a message will appear that informs you that to use this action, the clipboard contents must include at least one element with a declared ID.

**Paste as link (keyref)**

Inserts a link to the element that you want to reference. To use this action, you must first do the following:

1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
2. In the **DITA Maps Manager** view, make sure that the **Root map combo box (on page 2508)** points to the correct map that stores the keys.

3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the **DITA Maps Manager**, select **Edit Properties**, and enter a value in the **Keys** field.

### Insert submenu

This submenu includes the following insert actions that are specific to the DITA framework:

- **Insert Table**
  
  Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a block element (on page 2792)) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

  **Note:** If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that **Only lists, paragraphs, or inline content can be converted to tables**.

- **Insert Image**
  
  Inserts an image reference (on page 963) at the cursor position. Depending on the current location, an image-type element is inserted.

- **Insert Media Resource**
  
  Opens a **Choose Media dialog box (on page 997)** that allows you to select the URL of a media object to be inserted into a document at the cursor position. The result will be that a reference to the specified video, audio, or embedded HTML frame is inserted and rendered in **Author** mode so that it can be played directly from there.

- **Insert Equation**
  
  Opens the **XML Fragment Editor** that allows you to insert and edit MathML notations (on page 999).

- **Insert Paragraph**
  
  Inserts a new paragraph at current cursor position.
**Insert Section**

Inserts a new `section` element in the document, depending on the current context.

**Insert Topic**

Inserts a new `topic` element, depending on the current context. Topics are the basic units of DITA content and are usually organized around a single subject.

**Insert Entity**

Allows you to insert a predefined entity or character entity. Surrogate character entities (range `#x10000` to `#x10FFFF`) are also accepted. Character entities can be entered in one of the following forms:

- `#<decimal value>` - e.g. `#65`
- `&<decimal value>`; - e.g. `&#65`
- `#x<hexadecimal value>` - e.g. `#x41`
- `&#x<hexadecimal value>`; - e.g. `&#x41`

**Image Map Editor**

This action is available in the contextual menu when it is invoked on an image. This action applies an image map to the current image (if one does not already exist) and opens the **Image Map Editor** dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.

**Table Actions**

The following table editing actions are available in the contextual menu when it is invoked on a table:

- **Insert Rows**
  
  Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (Above or Below the current row).

- **Delete Row(s)**
  
  Deletes the table row located at cursor position or multiple rows in a selection.

- **Insert Columns**
  
  Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (Above or Below the current column).
Delete Column(s)

Deletes the table column located at cursor position or multiple columns in a selection.

Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell

Splits the cell at the cursor location. If Oxygen XML Author detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

Sort

Sorts cells or list items in a table.

Table Properties

Opens the Table properties dialog box that allows you to configure properties of a table (such as frame borders).

Other Actions submenu

This submenu give you access to all the usual contextual menu actions.

Link submenu

The following link actions are available from this submenu:

Cross Reference

Opens the Cross Reference (xref) dialog box (on page 2676) that allows you to insert a link to a target DITA resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map (on page 2793) structure. Once the target resource has been selected, you can also target specific elements within that resource. For more information, see Linking in DITA Topics (on page 2675).

File Reference

Opens the File Reference dialog box (on page 2676) that allows you to insert a link to a target non-DITA file resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. For more information, see Linking in DITA Topics (on page 2675).

Web Link
Opens the **Web Link** dialog box *(on page 2676)* that allows you to insert a link to a target web-related resource at the current location within a document. The target resource can be a URL or a key that is already defined in your DITA map structure. For more information, see Linking in DITA Topics *(on page 2675)*.

**Related Link to Topic**

Opens the **Cross Reference (xref)** dialog box *(on page 2677)* that allows you to insert a link to a target DITA resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. Once the target resource has been selected, you can also target specific elements within that resource. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics *(on page 2675)*.

ℹ️ **Tip:** You can use the **Find Similar Topics** action that available in the DITA menu to quickly find related topics that can be added as related links. It opens the **Open/Find Resource** view and performs a search using text content from the `<title>`, `<shortdesc>`, `<keyword>`, and `<indexterm>` elements.

**Related Link to File**

Opens the **File Reference** dialog box *(on page 2677)* that allows you to insert a link to a target non-DITA file resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics *(on page 2675)*.

**Related Link to Web Page**

Opens the **Web Link** dialog box *(on page 2677)* that allows you to insert a link to a target web-related resource in a related links section at the bottom of the current document. The target resource can be a URL or a key that is already defined in your DITA map structure. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics *(on page 2675)*.

**Sort**

Available when invoked on a list, it opens a dialog box where you can configure a sorting operation for an entire list or a selection of list items.
Generate IDs

Oxygen XML Author generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the ID Options dialog box that are found in the current selection.

Note: The Generate IDs action does not overwrite existing ID values. It only affects elements that do not already have an id attribute.

Reuse submenu

This submenu includes the following actions regarding reusing content in DITA:

- **Reuse Content**
  
  This action provides a mechanism for reusing content fragments. It opens the Reuse Content dialog box (on page 2647) that allows you to insert several types of references to reusable content at the cursor position. The types of references that you can insert using this dialog box include content references (conref) (on page 2648), content key references (conkeyref) (on page 2649), or key references to metadata (keyref) (on page 2653).

- **Push Current Element**
  
  Opens the Push current element dialog box (on page 2656) that allows content from a source topic to be inserted into another topic without any special coding in the topic where the content will be re-used.

- **Edit Content Reference**
  
  This action is available for elements with a conref or conkeyref attribute. It opens the Edit Content Reference dialog box that allows you to edit the source location (or key) and source element of a content reference (or content key reference), and the reference details (conref / conkeyref and conrefend attributes). For more information, see Reuse Content Dialog Box (on page 2647).

- **Replace Reference with Content**
  
  Replaces the referenced fragment (conref or conkeyref) at the cursor position with its content from its source. This action is useful if you
want to make changes to the content in the currently edited document without changing the referenced fragment in its source location. If the source content includes references to other topics/resources (\textit{hrefs}), the operation also resolves those references relative to the new location. Attributes are preserved according to the following priority:

1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a \texttt{-dita-use-conref-target} value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for \texttt{id} attributes.

\textbf{Replace All References with Content}

Replaces all referenced fragments (\texttt{keyref}, \texttt{conref}, or \texttt{conkeyref}) in the current document with the content. Attributes are preserved according to the following priority:

1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a \texttt{-dita-use-conref-target} value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for \texttt{id} attributes.

For \texttt{keyrefs} inside \texttt{xref} or \texttt{link} elements, the \texttt{keyref} attribute is changed to an \texttt{href} attribute, while the rest of the content for the \texttt{keyref} is replaced with its source content.

If the source content includes references to other topics/resources (\textit{hrefs}), the operation also resolves those references relative to the new location.

\textbf{Remove Content Reference}

Removes the content reference (\texttt{conref} or \texttt{conkeyref}) inside the element at the cursor position.

\textbf{Create Reusable Component}

Creates a reusable component from the selected fragment of text. For more information, see \textit{Creating a Reusable Content Component (on page 2659)}.

\textbf{Insert Reusable Component}

Inserts a reusable component at cursor location. For more information, see \textit{Inserting a Reusable Content Component (on page 2660)}.
Search References (Ctrl + Shift + G)

Finds the references to the `id` attribute value for the element at the current cursor position, in all the topics contained in the current DITA map (on page 2793) (opened in the DITA Maps Manager view (on page 2503)). If no references are found for the current element, a dialog box will be displayed that offers you the option of searching for references to its ancestor elements.

Figure 617. Search References to Ancestors Dialog Box

Tip: If you are invoking the action on an image, see Searching for References to Images (on page 2577) for details about what will be reported.

Show Key Definition

Available for elements that have a `conkeyref` or `keyref` attribute set (or elements with an ancestor element that has a `conkeyref` or `keyref` attribute). It computes the key name and opens the DITA map (on page 2793) that contains the definition of the key with the element that defines that key selected.

About Element submenu

This submenu includes the following actions:

Style Guide

Opens the DITA Style Guide Best Practices for Authors in your browser and displays a topic that is relevant to the element at the cursor position. When editing DITA documents, this action is available in the contextual menu of the editing area (under the About Element sub-menu), in the DITA menu, and in some of the documentation tips that are displayed by the Content Completion Assistant (on page 2792).

Browse reference manual

Opens a reference to the documentation of the XML element closest to the cursor position in a web browser.

Go to Definition

Moves the cursor to the definition of the current element.

Select submenu
This submenu allows you to select the following:

**Element**
Selects the entire element at the current cursor position.

**Content**
Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

**Parent**
Selects the entire parent element at the current cursor position.

**Text submenu**
This submenu contains the following actions:

**To Lower Case**
Converts the selected content to lower case characters.

**To Upper Case**
Converts the selected content to upper case characters.

**Capitalize Sentences**
Converts to upper case the first character of every selected sentence.

**Capitalize Words**
Converts to upper case the first character of every selected word.

**Count Words**
Counts the number of words and characters (no spaces) in the entire document or in the selection for regular content and read-only content.

**Note:** The content marked as deleted with change tracking (on page 2800) is ignored when counting words.

**Convert Hexadecimal Sequence to Character (Ctrl + Shift + X (Command + Shift + X on OS X))**
Converts a sequence of hexadecimal characters to the corresponding Unicode character (on page 712). The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters.
and may or may not be preceded by the \texttt{0x} or \texttt{0X} prefix. Examples of valid sequences and the characters they will be converted to:

- \texttt{0x0045} \textbf{will be converted to} \texttt{E}
- \texttt{0X0125} \textbf{to} \texttt{#}
- \texttt{265} \textbf{to} \texttt{#}
- \texttt{2190} \textbf{to} \texttt{#}

\begin{itemize}
\item \texttt{Note:} For more information about finding the hexadecimal value of a character, see \textit{Finding the Decimal, Hexadecimal, or Character Entity Equivalent (on page 721)}.
\end{itemize}

\textbf{Refactoring submenu}

Contains a series of actions designed to alter the XML structure of the document:

\begin{itemize}
\item \textbf{Toggle Comment}
\begin{itemize}
\item Encloses the currently selected text in an XML comment, or removes the comment if it is commented.
\end{itemize}
\item \textbf{Move Up (Alt + UpArrow)}
\begin{itemize}
\item Moves the current node or selected nodes in front of the previous node.
\end{itemize}
\item \textbf{Move Down (Alt + DownArrow)}
\begin{itemize}
\item Moves the current node or selected nodes after the subsequent node.
\end{itemize}
\item \textbf{Split Element (Alt + Shift + D (Ctrl + Alt + D on OS X))}
\begin{itemize}
\item Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.
\end{itemize}
\item \textbf{Join Elements}
\begin{itemize}
\item Joins two adjacent \textit{block elements (on page 2792)} that have the same name. The action is available only when the cursor position is between the two adjacent \textit{block elements}. Also, joining two \textit{block elements} can be done by pressing the \texttt{Delete} or \texttt{Backspace} keys and the cursor is positioned between the boundaries of these two elements.
\end{itemize}
\item \textbf{Surround with Tags (Ctrl + E (Command + E on OS X))}
\begin{itemize}
\item Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.
\end{itemize}
\end{itemize}
• If the **Position cursor between tags** option *(on page 164)* is selected in the **Content Completion** preferences page, the cursor is placed between the start and end tag.
• If the **Position cursor between tags** option *(on page 164)* is not selected in the **Content Completion** preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

**Surround with [tag]** *(Ctrl + ForwardSlash (Command + ForwardSlash on OS X))*

Surround the selected content with the last tag used.

**Rename Element**

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the **Rename** dialog box.

**Delete Element Tags**

Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the **Delete** or **Backspace** keys.

**Remove All Markup**

Removes all the XML markup inside the selected block of content and keeps only the text content.

**Remove Text**

Removes the text content of the selected block of content and keeps the markup intact with empty elements.

**DITA Refactoring Actions**

A variety of built-in XML refactoring operations that pertain to DITA documents with some of the information preconfigured based upon the current context.

**Change Topic ID to File Name**

Use this operation to change the ID of a topic to be the same as its file name.

**Convert CALS Tables to Simple Tables**

Use this operation to convert DITA CALS tables to simple tables. If you invoke this operation from a nested table (a table inside a table), only the nested table will be affected. If
it is invoked on a parent table that contains nested tables, all of the contained tables will be converted.

Convert conrefs to conkeyrefs

Use this operation to convert conref attributes to conkeyref attributes.

Convert Simple Tables to CALS Tables

Use this operation to convert DITA simple tables to CALS tables. If you invoke this operation from a nested table (a table inside a table), only the nested table will be affected. If it is invoked on a parent table that contains nested tables, all of the contained tables will be converted.

Convert to Concept

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

Convert to General Task

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA General Task is a less restrictive alternative to the Strict Task information type.

Convert to Reference

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

Convert to Task

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

Convert to Topic

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

Convert to Troubleshooting

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

Rename Key
Available when invoked on a key, and can be used to quickly rename a key. It also updates all references to it. Note that it does not work on DITA 1.3 key scopes.

Attributes Refactoring Actions

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

Add/Change attribute

Allows you to change the value of an attribute or insert a new one.

Convert attribute to element

Allows you to change an attribute into an element.

Delete attribute

Allows you to remove one or more attributes.

Rename attribute

Allows you to rename an attribute.

Replace in attribute value

Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

Comments Refactoring Actions

Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

Delete comments

Allows you to delete comments found inside one or more elements.

Elements Refactoring Actions

Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

Delete element

Allows you to delete elements.

Delete element content

Allows you to delete the content of elements.

Insert element
Allows you to insert new elements.

**Rename element**

Allows you to rename elements.

**Unwrap element**

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

**Wrap element**

Allows you to surround elements with element tags.

**Wrap element content**

Allows you to surround the content of elements with element tags.

**Fragments Refactoring Actions**

Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

**Insert XML fragment**

Allows you to insert an XML fragment.

**Replace element content with XML fragment**

Allows you to replace the content of elements with an XML fragment.

**Replace element with XML fragment**

Allows you to replace elements with an XML fragment.

**Review submenu**

This submenu includes the following actions:

- **Track Changes**
  
  Enables or disables the *Track Changes (on page 2800)* support for the current document.

- **Accept Change(s) and Move to Next**
  
  Accepts the *Tracked Change (on page 2800)* located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is accepted.

- **Accept All Changes**
Accepts all Tracked Changes (on page 2800) in the current document.

**Reject Change(s) and Move to Next**

Rejects the Tracked Change (on page 2800) located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is rejected.

**Reject All Changes**

Rejects all Tracked Changes (on page 2800) in the current document.

**Comment Change**

Opens a dialog box that allows you to add a comment to an existing Tracked Change (on page 2800). The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

**Highlight**

Enables the highlighting tool that allows you to mark text in your document.

**Colors**

Allows you to select the color for highlighting text.

**Stop highlighting**

Use this action to deactivate the highlighting tool.

**Remove highlight(s)**

Use this action to remove highlighting from the document.

**Add Comment**

Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).

**Show/Edit Comment**

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

**Remove Comment**

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.
Manage Reviews
Opens the Review view (on page 906).

Folding submenu
This submenu includes the following actions:

- **Toggle Fold**
  Toggles the state of the current fold.

- **Collapse Other Folds (Ctrl + NumPad/ (Command + NumPad/ on OS X))**
  Folds all the elements except the current element.

- **Collapse Child Folds (Ctrl + NumPad. (Command + NumPad. on OS X))**
  Folds the elements indented with one level inside the current element.

- **Expand Child Folds**
  Unfolds all child elements of the currently selected element.

- **Expand All (Ctrl + NumPad* (Command + NumPad* on OS X))**
  Unfolds all elements in the current document.

Inspect Styles
Opens the CSS Inspector view (on page 425) that allows you to examine the CSS rules that match the currently selected element.

Options
Opens the Author mode preferences page (on page 129) where you can configure various options in regards to the Author editing mode.

DITA Drag/Drop (or Copy/Paste) Actions
Dragging a file from the Project view (on page 320) or DITA Maps Manager view (on page 2503) and dropping it into a DITA document that is edited in Author mode, creates a link to the dragged file (the xref DITA element with the href attribute) at the drop location. Copy and paste actions work the same.

You can also drag images or media files from your system explorer or the Project view (on page 320) and drop them into a DITA document (or copy and paste). This will insert the appropriate element at the drop or paste location (for example, dropping/pasting an image will insert the DITA image element with an href attribute).
Tip: For information about customizing Author mode actions for a particular framework (on page 2794) (document type), see the Configuring Actions, Menus, Toolbars, Content Completion for a Framework (on page 1894) section.

Working with Markdown Documents in DITA

Oxygen XML Author includes some unique features that allow you to easily integrate Markdown documents in a DITA project. This is especially helpful for teams that have contributors who are familiar with the Markdown syntax, but they want their output to be generated from DITA projects. The integration between the Markdown editor and DITA includes actions to export or convert Markdown documents to DITA topics and the DITA tab in the Preview pane provides a visualization of how the topic will look after conversion.

Export Markdown as a DITA Topic

The Markdown editor includes an option to quickly convert the current Markdown document into a DITA topic. The Export as DITA Topic action is available in the contextual menu.

The conversion creates a new XML file that is defined as a DITA topic and opens it in the Text editing mode. You can then work with the document as you would with any other DITA topic, although you may need to manually correct some issues where the parser could not properly map Markdown syntax to DITA markup.

Working with Markdown Documents in the DITA Maps Manager

Oxygen XML Author has some specialized features that allow you to integrate Markdown documents directly into your DITA project using the DITA Maps Manager (on page 2503). The following features are available for Markdown documents in the DITA Maps Manager view:

- Insert Reference to Markdown Document - You can use the New, Reference, and Reference to the currently edited file actions from the Append Child, Insert Before, or Insert After submenu when invoking the contextual menu in the DITA Maps Manager to insert a reference to a Markdown document at the selected location in the map. Markdown documents will be inserted as a topic reference (topicref element) with the format attribute set to markdown.
- **Validate Markdown Documents in DITA Maps** - When you use the Validate and Check for Completeness action from the DITA Maps Manager toolbar to check the integrity of the structure of a DITA map, Markdown documents that are referenced in the DITA map will be converted to DITA topics in the background and validated the same as any other DITA topic.

- **Transforming DITA Maps with Markdown Documents** - When transforming DITA maps that have Markdown documents referenced, the transformation will convert the Markdown documents to normal DITA output without you needing to manually convert the Markdown documents to DITA topics.

- **Manually Convert Markdown Documents to DITA Topics** - If you need to use DITA semantics that are not possible in Markdown syntax (such as content references, related links, and other DITA-specific syntax), you can manually convert the Markdown document into a DITA topic. To do so, right-click the Markdown document in the DITA Maps Manager and select Refactoring > Convert Markdown to DITA Topic. This will open a dialog box that allows you to configure options for converting the document to an XML file that is defined as a DITA topic.

Figure 618. Convert Markdown to DITA Topic Dialog Box

This dialog box includes the following options:

**Destination**

The destination path for the new DITA topic.

**File Name**

Presents the current name and allows you to change it.

**Update references**

Select this option to update all references of the file in the DITA map and in the files referenced from the DITA map.

**Delete Markdown file**

If selected, the Markdown version of the file is deleted when the document is converted into a DITA file. If deselected (default value), when the document is converted into a DITA file, the original Markdown file is also preserved in its current location.
**Preview**

Select this button to display a preview of the changes Oxygen XML Author is about to make.

**Convert**

Select this button to perform the conversion. If the Markdown file has `format="markdown"`, it will be converted to a DITA topic. If it has `format="mdita"`, it will be converted to a LightWeight DITA topic.

ℹ️ Tip: Oxygen XML Author comes with a sample ditamap project for converting Markdown to DITA. Go to the [Project view](on page 320), open the sample.xpr project, and navigate to the `dita/markdown-dita` folder.

### Converting Multiple Markdown Documents to DITA

Oxygen XML Author offers an add-on that contributes actions in the Tools menu and contextual menu to enable batch conversion between various formats, including Markdown to DITA. For more information and instructions for installing the add-on, see [Batch Converter Add-on](on page 2248).

**Working with Keys in DITA**

DITA uses keys to insert content that may have different values in various circumstances. Keys provide a way to reference something indirectly. This can make it easier to manage and to reuse content in a number of ways.
You can think of keys as like renting a post office box. Instead of the mail going directly from the sender to your house, it now goes to the post office box. You then go to the post office box and bring the mail back to your house. If you move to a new house, your mail still gets to you because it comes to the same post office box. You do not have to send change of address cards to all the people who send you mail. Your mailbox address is the key that makes sure your mail always reaches you, even if you move.

Similarly, if you use keys in your content to reference other content, you do not have to update the source content to change the value of the key or what it points to. You just change the definition of the key.

**Defining Keys in DITA Maps**

Keys are defined in maps and can then be reused and referenced throughout the whole structure of the map. It is considered best practice to create a separate submap that contains all of the key definitions and reference that submap in the main (root) map (on page 2799). This makes it easier to manage since they're all in one location.

There are two types of key definitions that can be created in a map:

- Key with a value inside a *keyword*. To define this type of key, follow these instructions: Key Definition with a Keyword Value (on page 2539).
- Key with a target (for example, to target a resource such as an image or external link). To define this type of key, follow these instructions: Key Definition with a Target (on page 2539).

**Using Keys for Values**

You can use keys to represent values that may vary depending on the type of output. For instance, you may have several products that share a common feature. When you want to describe that feature, you need a way to insert the name of the product, even though that name is different depending on which product the feature description is being used for. For more information, see Working with Variable Text in DITA (on page 2660).

**Assigning Keys to Topics**

You can assign a key to a topic and use that key to reference that topic for various purposes, such as reuse or linking. As always, keys are defined in maps, so the key definition is done using the keys attribute of the `topicref` element:

```xml
<topicref href="quick-heat.dita" keys="feature.quick-heat"/>
```
The easiest way to assign keys to a topic (and insert the `topicref` element in its DITA map) is to use the Keys tab in the Edit Properties dialog box. In the DITA Maps Manager, invoke the contextual menu on the topic for which you want to assign a key and select Edit Properties. Go to the Keys tab and enter the name of the key in the Define keys field.

Once a key is assigned to a topic, you can use it to reference that topic for various purposes:

- You can create a link to it using `<xref keyref="feature.quick-heat"/>`. This allows you to change the target of the link by changing the topic that is pointed to by the key (for example, by profiling).
- You can use it in a map to create a reference to a topic by key: `<topicref keyref="feature.quick-heat">`. This allows you to change which topic is inserted in the map by the build, by changing the topic that is pointed to by the key.
- You can use it to insert a content reference. In this case, the content reference uses the key to locate the topic to pull content from. It uses a `conkeyref` attribute: `<procedure conkeyref="feature.quick-heat/preheat-procedure"/>`. In this example, `feature.quick-heat` is the key, and `preheat-procedure` is the ID of a procedure within the topic for that key. Using this mechanism, you could have multiple versions of the preheat procedure in various topics and control which one is inserted by changing the topic that is pointed to by the key.

### Assigning Keys to Graphics

You can assign a key to an image (using a map to point to the image file) and then insert the image using the key.

Example of a key definition for a targeted image file:

```xml
<map id="keydefs">
<!-- product name -->
<title>Key Definitions</title>
<keydef keys="image1" href="../img/image1.png" format="png"/>
</map>
```

- Defining Keys in DITA Maps
- Creating a DITA Content Key Reference
Working with a Glossary of Terms in DITA

There are several ways to manage a Glossary of Terms in DITA, but it is considered best practices to create a separate submap for the glossary and embed that glossary map in the main (root) map (on page 2799). The actual glossary terms are small glossary entry topics that are referenced in the glossary map. You can add links to the glossary terms (on page 2632) in the output and you can even define abbreviated forms (on page 2633) for terms that have an acronym or some other type of abbreviation.

How to Create a Glossary of Terms in Oxygen XML Author

Even though there are several ways to create a glossary and reference the glossary terms, the following is the recommended approach:

1. Create a new submap (on page 2521) for your glossary and embed it in your main map.
2. Create a glossary entry topic ( <glossentry> ) for each glossary term. The <glossentry> element may contain numerous optional glossentry elements, but every glossentry topic must contain a <glossterm> and <glossdef> element. The <glossterm> is the name of the term while the <glossdef> is its definition.

Here is an simple example:

```xml
<glossentry id="ddl">
  <glossterm>Data Definition Language</glossterm>
  <glossdef>A language used for defining database schemas.</glossdef>
</glossentry>
```

The easiest way to create a glossentry topic in Oxygen XML Author:

a. Click the New file wizard button on the toolbar.
b. Type glossentry in the search field at the top of the dialog box.
c. Select the Glossentry DITA topic type, configure the name and optionally the title, and click Create.
3. Reference each glossary entry topic in your glossary submap using the `<glossref>` element. This element requires a `@keys` attribute.

```xml
<glossref keys="gloss_ddl" href="ddl.dita"/>
```

The easiest way to reference a glossentry in Oxygen XML Author:

a. With the glossary entry topic opened in the main editor, open the glossary submap in the DITA Maps Manager, right-click the map node and select **Append Child > Reference to the currently edited file** (if you already have existing glossentry topics, you can right-click the glossentry where you want to insert the new one and select **Insert After > Reference to the currently edited file**).

   **Step Result:** This opens the **Insert Reference** dialog box (on page 2530).

b. Go to the **Keys** tab and enter a name in the **Define keys** field.

c. Go to the **Attributes** tab and select **Glossary Reference** from the **Reference type** drop-down list at the top of the dialog box.

d. Click **Insert and Close**.

**Tip:** You could also group multiple glossentry topics into a single collection by using the `<glossgroup>` element.

### How to Create Links to Glossary Terms

To specify that a link is generated in the output from the glossary term to its definition, use the `<term>` element (or `<abbreviated-form>` element as described in the next section (on page 2633)) with a `@keyref` attribute that references the corresponding key specified in the `<glossref>` element. Of course, the glossref points to the glossentry topic where the glossary term is defined.

```xml
<term keyref="gloss_ddl"/>
```

In the output, the text specified in the `<glossterm>` element is displayed for the glossary term with a link to its glossentry topic that contains its definition.

The easiest way to add a `<term>` element and reference the glossary term in Oxygen XML Author:

1. Place the cursor at the location where you want to insert a link to the glossary term.
2. In the DITA Reusable Componts view (on page 2666), go to the **Keys** tab and use the search filter field at the top of the view to find the key for the particular glossary term.
3. Right-click the key and select **Insert as Keyref > More > Term**.
Using Abbreviated Forms (Acronyms) with Glossary Terms

The `<abbreviated-form>` element can be used for glossary terms that you want to appear in an abbreviated form (such as an acronym). Abbreviated forms are expanded to their full form the first time that they appear in a document, and then all subsequent instances will display the short form (or acronym). You would need to define the long and short forms in the `<glossentry>` and then reference it with the `<abbreviated-form>` element (instead of the `<term>` element).

The recommended best practices for defining the long and short forms would be to use a structure similar to this:

```xml
<glossentry id="ddl">
  <glossterm>Data Definition Language</glossterm>
  <glossBody>
    <glossSurfaceForm>Data Definition Language (DDL)</glossSurfaceForm>
    <glossAlt>
      <glossAcronym>DDL</glossAcronym>
    </glossAlt>
  </glossBody>
</glossentry>
```

The long form is declared using the `<glossSurfaceForm>` element while the short form is declared using the `<glossAcronym>` element.

Then you need to reference the glossentry that contains the long and short forms using the `<abbreviated-form>` element:

```xml
<abbreviated-form keyref="gloss_ddl"/>
```

For more information about the recommended best practices for using abbreviations, including information about using multiple languages, see: [http://www.oasis-open.org/committees/download.php/29734/AcronymBestPractice_08112008.doc](http://www.oasis-open.org/committees/download.php/29734/AcronymBestPractice_08112008.doc).

- [https://docs.oasis-open.org/dita/v1.2/os/spec/langref/abbreviated-form.html](https://docs.oasis-open.org/dita/v1.2/os/spec/langref/abbreviated-form.html)
Reusing DITA Content

Reusing content is one of the key features of DITA. DITA provides several methods for reusing content. Oxygen XML Author provides support for each of these methods.

Reusing Topics in DITA Maps

A DITA topic does not belong to any one publication. You add a DITA topic to a publication by referencing it in a map. You can reference the same topic in multiple maps (on page 2637).

Reusing Content with References and Keys

DITA allows you to reuse content by referencing it in another topic. DITA provides several mechanisms for including content by reference (on page 2638) (conref, conkeyref, coderef). A conref (content reference) (on page 2640) creates a direct reference to a specific element of another topic. A conkeyref (content key reference) (on page 2642) creates a reference to a key, which then points to a specific element in another topic. The advantage of using a conkeyref is that you can change the element that is included by changing the key reference. For example, since keys are defined in maps, if you include a topic in multiple maps, you can use a different key reference in each map. A coderef references an external file that contains literal code.

Oxygen XML Author provides support for all of these mechanisms.

While the conref and conkeyref mechanisms can be used to reference any content element, it is considered best practice to only conref or conkeyref content that is specifically set and managed as reusable content. This practice helps reduce expensive errors, such as an author accidentally deleting the source element that other topics are including by conref. Oxygen XML Author can help you create a reusable component from your current content.

Reusing Content with Reusable Components

DITA allows you to select content in a topic, create a reusable component (on page 2658) from it and reference that component in other locations. Each reusable component is created as a separate file. Anytime the content needs to be edited, you only need to update it in the component file and all the locations in your topics that reference it will also be updated. This can help you to maintain continuity and accuracy throughout your documents.

Reusing Content with Variables

DITA allows you to replace the content of certain elements with a value that is pointed to by a key. This mechanism effectively means that you can create variables in your content (on page 2660),
which you can then create multiple outputs by changing the value that the key points to. This is done by profiling the definition of the key value, or by substituting another map with a different key value.

**Reusing Content with DITA 1.3 Concepts**

DITA 1.3 allows you to use some advanced concepts to expand content reuse possibilities even further. *Key Scopes (or scoped keys) (on page 2663)* allow you to reuse topics with variable content depending on the particular context and it maximizes reuse possibilities for keys. *Branch Filtering (on page 2664)* allows you to reuse the same content that is profiled in multiple ways within the same publication, each time using a different filter.

**DITA Reusable Components View**

If you use a large amount of keys or reusable components in your DITA project, the [DITA Reusable Components view (on page 2666)](2666) can be quite helpful. It collects all of the keys and reusable components that are defined in the [root map (on page 2799)](2799) and presents them in a dynamic table where you can easily locate and insert references to them.

**Reuse Actions in Oxygen XML Author**

Oxygen XML Author includes some actions that are specifically designed for DITA reusable content. These actions are available in the contextual menu, the DITA menu, and some are available on the toolbar.

### Reuse Content

This action provides a mechanism for reusing content fragments. It opens the [Reuse Content dialog box (on page 2647)](2647) that allows you to insert several types of references to reusable content at the cursor position. The types of references that you can insert using this dialog box include content references (*conref* (on page 2648)), content key references (*conkeyref* (on page 2649)), or key references to metadata (*keyref* (on page 2653)).

### Push Current Element

Opens the [Push current element dialog box (on page 2656)](2656) that allows content from a source topic to be inserted into another topic without any special coding in the topic where the content will be re-used.

### Edit Content Reference

This action is available for elements with a *conref* or *conkeyref* attribute. It opens the [Edit Content Reference dialog box that allows you to edit the source location (or key) and source element of a content reference (or content key reference), and the reference](2653).
Replace Reference with Content

Replaces the referenced fragment (conref or conkeyref) at the cursor position with its content from its source. This action is useful if you want to make changes to the content in the currently edited document without changing the referenced fragment in its source location. If the source content includes references to other topics/resources (hrefs), the operation also resolves those references relative to the new location.

Attributes are preserved according to the following priority:

1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a -dita-use-conref-target value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for id attributes.

Replace All References with Content

Replaces all referenced fragments (keyref, conref, or conkeyref) in the current document with the content. Attributes are preserved according to the following priority:

1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a -dita-use-conref-target value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for id attributes.

For keyrefs inside xref or link elements, the keyref attribute is changed to an href attribute, while the rest of the content for the keyref is replaced with its source content.

If the source content includes references to other topics/resources (hrefs), the operation also resolves those references relative to the new location.

Remove Content Reference

Removes the content reference (conref or conkeyref) inside the element at the cursor position.

Create Reusable Component

Creates a reusable component from the selected fragment of text. For more information, see Creating a Reusable Content Component (on page 2659).

Insert Reusable Component

Inserts a reusable component at cursor location. For more information, see Inserting a Reusable Content Component (on page 2660).
Reusing DITA Topics in Multiple Maps

You can reuse an entire DITA topic simply by referencing it in multiple maps (or multiple locations within the same map) using one of the following procedures:

Reuse Topics Using the DITA Maps Manager

1. Make sure the DITA map is opened in the DITA Maps Manager.
2. Add a reference to an existing topic by using one of the following methods (depending on your particular situation):
   a. If the topic already exists in this DITA map, do one of the following:
      • Simply drag the topic and press Ctrl (or Alt on OS X) at the new location within the map (or use the Copy and Paste contextual menu actions).
      • If the topic is the currently opened document in the main editor, determine the new location in the map (in the DITA Maps Manager), right-click a parent or sibling topic, and select Append Child > Reference to the currently edited file or Insert After > Reference to the currently edited file.
   b. If the topic already exists in another DITA map, do one of the following:
      • Open the other map in the DITA Maps Manager, right-click the topic, select Copy, switch back to the original DITA map in the DITA Maps Manager, determine the new location in the map, right-click a parent or sibling topic, and use one of the Paste contextual menu actions (Paste, Paste Before, or Paste After).
      • If the topic is the currently opened document in the main editor, determine the new location in the map (in the DITA Maps Manager), right-click a parent or sibling topic, and select Append Child > Reference to the currently edited file or Insert After > Reference to the currently edited file.
   c. If the topic exists in the project, but has not yet been added to a DITA map, do one of the following:
      • Right-click the topic in the Project view (or the file system), select Copy, switch to the DITA Maps Manager view, determine the new location in the map, right-click a parent or sibling topic, and use one of the Paste contextual menu actions (Paste, Paste Before, or Paste After).
      • If the topic is the currently opened document in the main editor, determine the new location in the map (in the DITA Maps Manager), right-click a parent or
sibling topic, and select Append Child > Reference to the currently edited file or Insert After > Reference to the currently edited file.

3. If your topic uses a key reference (on page 2628), set up the appropriate key definition in your map (on page 2537).

4. If you want to define relationships between topics, other than those defined in the topics themselves, you can add a relationship table to your map (on page 2681).

5. When you have finished adding topics, check that your map is complete and that all topic links and keys resolve correctly. To do this validation, click the Validate and Check for Completeness action (on page 2549) on the toolbar in the DITA Maps Manager.

Reuse Topics Using Author Mode Editor

1. Open the DITA map (on page 2502) in the Author mode editor.

2. Add a reference to an existing topic by dragging it from the Project view (on page 320) (or the file system) and dropping it in the desired location in the DITA map opened in Author mode. You can also accomplish the same thing by using the Copy and Paste contextual menu actions.

3. If your topic uses a key reference (on page 2628), set up the appropriate key definition in your map (on page 2537).

4. If you want to define relationships between topics, other than those defined in the topics themselves, you can add a relationship table to your map (on page 2681).

5. When you have finished adding topics, check that your map is complete and that all topic links and keys resolve correctly. To do this validation, click the Validate and Check for Completeness action (on page 2549) on the toolbar in the DITA Maps Manager.

Displaying Multiple References to the Same Topics

Whenever multiple references to the same topic are detected in the context of the current map in the DITA Maps Manager (on page 2503), an indicator will appear in the top-right corner of the Author mode editor that shows the number of times the current topic is referenced in the DITA map. It also includes navigation arrows that allow you to jump to the next or previous reference in the DITA Maps Manager.

Working with Content References

The DITA conref feature (short for content reference) lets you insert a piece of source content by referencing it from its source. When you need to update that content, you only need to do it in one place.
There are several strategies for managing content references:

- **Reusable components** - With this strategy, you create a new file for each piece of content that you want to reuse and you insert references from the content of the reusable component files. For example, suppose that you have a disclaimer that needs to be included in certain sections of your documentation. You can create a reusable component that contains your disclaimer and reuse it as often as you need to. If the disclaimer ever needed to be updated, you only have to edit it in one file.

- **Single-source content references** - You may prefer to keep many pieces of reusable content in one file. For example, you might want to create a single file that contains all the actions that are available in various menus or toolbars for your software application. Then, wherever you need to describe or display an action in your documentation, you can reuse content from that single file by inserting content references. This strategy requires more setup than reusable components, but might make it easier to centrally managing the reused content and it allows for more flexibility in the XML structure of the reusable content.

- **Arbitrary content references** - Although it is not recommended, you can create content references among topics without storing the reusable content in components or a single file. This strategy might make it difficult to manage content that is reused and to maintain continuity and accuracy, since you may not have any indication that content you are editing is reused elsewhere.

Oxygen XML Author creates a reference to the external content by adding a `conref` attribute to an element in the local document. The `conref` attribute defines a link to the referenced content, made up of a path to the file and the topic ID within the file. The path may also reference a specific element ID within the topic. Referenced content is not physically copied to the referencing file. However, by default Oxygen XML Author displays it in Author mode as if it is there in the referencing file. If you do not want referenced content displayed, open the Preferences dialog box (Options > Preferences) (on page 79), go to Editor > Edit modes > Author, and deselect the Display referenced content option (on page 130).

[Note]: A reference also displays tracked changes (on page 2800) and comments that are included in the source fragment. To edit these comments (or accept/reject changes) right-click the comment or tracked change and select Edit Reference.

[Tip]: To search for references made through a direct content reference, use the Search References action from the contextual menu.

Creating a DITA Content Reference

DITA Content Reference

A DITA content reference, or `conref`, is one of the main content reuse features of DITA. It is a mechanism for re-using the same content in multiple topics (or even in multiple locations within the same topic).

For a `conref` to be created, the source content must have an `id` attribute that the `conref` can reference. Therefore, creating a `conref` requires that you add an `id` to the content to be reused before inserting a `conref` into the topic that reuses the referenced content.

Assigning an ID to the Referenced Content

To add an `id` to a DITA element in a topic, place the cursor on the element and select `Alt+Enter` to open the in-place attribute editor. Enter `id` as the Name of the attribute and a value of your choice in the Value field. You can also use the Attributes view (on page 412) to enter a value in the id attribute.

Note: The element may already have an `id`, since in some cases, Oxygen XML Author automatically generates an ID value when the `id` attribute is created.

Creating a Content Reference

To create a content reference (`conref`), follow these steps:

1. Make sure the element you want to reference has an ID assigned to it (on page 2640).
2. In Author mode (on page 388), place the cursor at the location where you want the reused content to be inserted.
3. Select the Reuse Content action on the main toolbar (or from the DITA menu or Reuse submenu of the contextual menu). The Reuse Content dialog box (on page 2647) is displayed.
4. In the Location field of the Reuse Content dialog box, select the topic that contains the element you want to reference. The elements that you can reference are presented in a table.
5. Select the Target ID of the element (or elements) from which you want to insert the content, and verify the content in the Preview pane. The id value of the element that you select is automatically added to the Reference to (conref) field.
6. Make any other selections you need in the Reuse Content dialog box (on page 2647). If you select multiple elements, the Expand to (conrefend) field is automatically filled with the id value of the last element in your selection.
7. Click Insert or Insert and close to create the content reference.

Using Copy/Paste Actions to Create a Content Reference

Oxygen XML Author also includes support for creating content references with simple copy/paste actions. The copied content must be an entire DITA XML element with an ID attribute. Also, the location in the document where you paste the element must be valid, although as long as the Smart paste and drag and drop option (on page 136) is selected in the Schema Aware preferences page, if you try to paste it in an invalid location, Oxygen XML Author will attempt to place it in a valid location, and may prompt you with one or more choices for where to place it.

To create a content reference (conref) using copy/paste actions, follow these steps:

1. Copy an entire DITA element that has an ID attribute assigned to it.
2. Place the cursor at a location where the copied element will be valid.
3. Select the Paste as Content Reference action from the Paste Special submenu from the contextual menu.

Other Ways to Reuse Content

- You can use the Components tab in the DITA Reusable Components view (on page 2670) to easily insert content references.
- An alternate way to reuse content is to use the Oxygen XML Author Create Reusable Component (on page 2659) and Insert Reusable Component (on page 2660) actions (available in the DITA menu and the Reuse submenu of the contextual menu). They handle the details of creating an ID and conref and create reusable component files, separate from your normal content files. This can help you manage your reusable content more effectively.
- You can also insert reusable content using content key references (on page 2642). This may also make reusable content easier to manage, depending on your particular situation and needs.
- Other topics in this section include information about more specialized or advanced ways or reusing content, such as code references (on page 2655), the conref push mechanism (on page 2656), variable text (on page 2660), key scopes (on page 2663), and branch filtering (on page 2664).
Creating a DITA Content Key Reference

**DITA Content Key Reference**

A DITA content key reference, or `conkeyref`, is a mechanism for inserting a piece of content from one topic into another. It is a version of the [DITA content reference mechanism](on page 2640) that uses keys ([on page 2628](on page 2628)) to locate the content to reuse rather than direct references to topics that contain reused content.

As with a `conref`, a `conkeyref` requires that the element to be reused has an `id` attribute. It also requires the topic that contains the reusable content to be assigned a `key` ([on page 2628](on page 2628)) in a map. As with all uses of keys, you can substitute multiple maps or use profiling ([on page 2737](on page 2737)) to create multiple definitions of keys in a single map. This allows the same `conkeyref` to pull in content from various sources, depending on how your build is configured. This can make it easier to create and manage sophisticated content reuse scenarios.

**Creating a Content Key Reference**

To create a content key reference (`conkeyref`), follow these steps:

1. Make sure the topic that contains the reusable content is assigned a key in the *DITA map* and the element you want to reference has an `ID` assigned to it.
2. In **Author mode** ([on page 388](on page 388)), place the cursor at the location where you want the reused content to be inserted.
3. Select **Reuse Content** on the main toolbar (or from the **DITA** menu or **Reuse** submenu of the contextual menu). The **Reuse Content** dialog box ([on page 2647](on page 2647)) is displayed.
4. Select the **Key** radio button for the content source and use the [Choose Key Reference](#) button to select the key for the topic that contains the reusable content (you can also select one from the drop-down list in the **Key** field). The elements that you can reference from the source are presented in the table in the middle of the **Reuse Content** dialog box.

5. Select the **Target ID** of the element (or elements) that you want to insert, and verify the content in the **Preview** pane. The `id` value of the element that you select is automatically added to the **Reference to (conkeyref)** field.

6. Make any other selections you need in the **Reuse Content** dialog box (on page 2649). If you select multiple elements, the **Expand to (conrefend)** field is automatically filled with the `id` value of the last element in your selection.

7. Click **Insert** or **Insert and close** to create the content reference.

**Note:** If you are using **Text mode** (on page 290), when you insert a **conkeyref** attribute, after you enter the first quote (` conkeyref=`), the **Content Completion Assistant** will list all the defined keys that you can select from. Also, after you select the key, the **Content Completion Assistant** will then list the element IDs from the referenced topic, allowing you to insert an anchor. Note that this only works for local files.

### Using Copy/Paste Actions to Create a Content Key Reference

Oxygen XML Author also includes support for creating content key references with simple copy/paste actions. When the DITA content is processed, the key references are resolved using key definitions from **DITA maps**. The copied content must be an entire DITA XML element with an ID attribute and the topic that contains the reusable content must have a key assigned in a **DITA map**. Also, the location in the document where you paste the element must be valid, although as long as the **Smart paste and drag and drop option** (on page 136) is selected in the **Schema Aware** preferences page, if you try to paste it in an invalid location, Oxygen XML Author will attempt to place it in a valid location, and may prompt you with one or more choices for where to place it.

To create a content key reference (`conkeyref`) using copy/paste actions, follow these steps:

1. In the **DITA Maps Manager view** (on page 2503), make sure that the **Root map combo box** (on page 2508) points to the correct map that stores the keys.
2. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the **DITA Maps Manager** (on page 2503), select **Edit Properties**, and enter a value in the **Keys** field.
3. In a topic with an assigned key, copy an entire DITA element that has an ID attribute assigned to it.
4. Place the cursor at a location where the copied element will be valid.
5. Select the **Paste as Content Key Reference** action from the [Paste Special](#) submenu from the contextual menu.
Other Ways to Reuse Content

- You can use the Components tab in the DITA Reusable Components view (on page 2670) to easily insert content key references.
- You can also insert reusable content using content references (conref) (on page 2640).
- Other topics in this section include information about more specialized or advanced ways or reusing content, such as code references (on page 2655), the conref push mechanism (on page 2656), variable text (on page 2660), key scopes (on page 2663), and branch filtering (on page 2664).

Related Information:

- Reuse Content Dialog Box (on page 2647)
- Working with Reusable Components (on page 2658)
- Editing DITA Content References (on page 2644)
- DITA Reusable Components View (on page 2666)
- Creating a DITA Content Reference (on page 2640)

Editing DITA Content References

Oxygen XML Author also includes some actions that allows you to quickly edit existing content references. When the element that contains a content reference (conref or conkeyref) is selected, the following actions are available in the DITA menu and the Reuse submenu of the contextual menu:

**Edit Content Reference**

This action is available for elements with a conref or conkeyref attribute. It opens the Edit Content Reference dialog box that allows you to edit the source location (or key) and source element of a content reference (or content key reference), and the reference details (conref / conkeyref and conrefend attributes). For more information, see Reuse Content Dialog Box (on page 2647).

**Replace Reference with Content**

Replaces the referenced fragment (conref or conkeyref) at the cursor position with its content from it source. This action is useful if you want to make changes to the content in the currently edited document without changing the referenced fragment in
its source location. If the source content includes references to other topics/resources (hres), the operation also resolves those references relative to the new location. Attributes are preserved according to the following priority:

1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a -dita-use-conref-target value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for id attributes.

**Replace All References with Content**

Replaces all referenced fragments (keyref, conref, or conkeyref) in the current document with the content. Attributes are preserved according to the following priority:

1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a -dita-use-conref-target value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for id attributes.

For keyrefs inside xref or link elements, the keyref attribute is changed to an href attribute, while the rest of the content for the keyref is replaced with its source content.

If the source content includes references to other topics/resources (hres), the operation also resolves those references relative to the new location.

**Remove Content Reference**

Removes the content reference (conref or conkeyref) inside the element at the cursor position.

**Converting Conrefs to Conkeyrefs**

Oxygen XML Author includes a DITA refactoring operation called Convert conrefs to conkeyrefs that will find all content references (that reference content outside the current document) and convert them to content key references. You can also use it to quickly convert all content references in the current document or multiple documents at once.

To access the Convert conrefs to conkeyrefs operation, use one of the following methods:

**Single Document Method**

With the document opened in the editor, right-click anywhere in the main editing pane (or right-click the topic reference in the DITA Maps Manager (on page 2503)), go to the Refactoring submenu, and choose Convert conrefs to conkeyrefs.

**Multiple Documents At Once Method**
Select **XML Refactoring** from the **Tools** menu (or from the **Refactoring** submenu when you right-click a document in the **Project view** (on page 320) or the **DITA Maps Manager view** (on page 2503)). Then select **Convert conrefs to conkeyrefs** from the **DITA** section and click **Next**.

Either method will proceed to the **XML Refactoring Wizard**. If you used the **Multiple Documents At Once Method** (on page 2645), the wizard page allows you to choose a scope for the operation and some filtering options:

- **Scope** - Select from a variety of options to define the scope for which resources will be affected by the operation. For example, you can choose to affect all resources in the **Project**, **All opened files**, **Current DITA map hierarchy**, or just the **Current file**.

- **Filters** section
  - **Include files** - Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as * or ?).
  - **Restrict to known XML file types only** - Excludes non-XML file types from the operation.
  - **Look inside archives** - If this option is selected, the scope of the operation will include files inside archives.

If you used the **Single Document Method** (on page 2645), the scope will be the current file so the scope and filtering options are not displayed.

You can then use one of the following buttons to proceed with the operation:

**Preview**

You can use the **Preview** button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.

⚠️ **Warning:** It is always recommended to use the **Preview** button to make sure the operation is not going to do something unexpected and after you click the **Finish** button, any **Undo** action will only revert changes on the current document.

**Finish**

When you use the **Finish** button, the operation will be processed and all **content references** will be converted to **content key references** (either all content references in the current document or all content references in all of the documents specified in the scope). The file name for each converted document is used as the value for its new key. However, the operation does NOT automatically add the key to the **DITA Map** (on page 2793), so you still need to manually **define each key in your DITA map** (on page 2537).

**Related Information:**
Reuse Content Dialog Box

The **Reuse Content** dialog box provides a mechanism for reusing content fragments. DITA `conref`, `conkeyref`, and `keyref` attributes can be used to insert references to reusable content. The `conref` attribute stores a reference to another element and is processed to replace the referencing element with the referenced element. The `conkeyref` attribute uses keys (on page 2628) to locate the content to reuse rather than direct references to the topic that contains the reusable content. The `keyref` attribute also uses keys (on page 2628) and can be used to indirectly reference metadata that may have different values in various circumstances.

**Note:** For a `conref` or `conkeyref`, to reference the content inside a DITA element, the source element must have an `id` attribute assigned to it. The element containing the content reference acts as a placeholder for the referenced element. For more details about DITA `conref` and `conkeyref` attributes, go to [https://www.oxygenxml.com/dita/1.3/specs/archSpec/base/conref.html](https://www.oxygenxml.com/dita/1.3/specs/archSpec/base/conref.html).

**Note:** For the purposes of using a `keyref`, keys are defined at map level and referenced afterwards. For more information about the DITA `keyref` attribute, go to [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/thekeyrefattribute.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/thekeyrefattribute.html).

Oxygen XML Author displays the referenced content (on page 842) of a DITA content reference if it can resolve it to a valid resource. If you use URIs instead of local paths in your XML documents and your DITA-OT transformation needs an XML Catalog (on page 2800) to map the URIs to local paths, you need to add the catalog in Oxygen XML Author (on page 1064). If the URIs can be resolved, the referenced content is displayed in **Author** mode and in the transformation output.

In **Author** mode, a reference to reusable content (`conref`, `conkeyref`, or `keyref`) can easily be inserted at the cursor position by using the **Reuse Content** dialog box. It can be opened with any of the following methods:

- Click the ![Reuse Content](https://www.oxygenxml.com/dita/1.3/specs/archSpec/base/conref.html) action on the main toolbar.
- In the contextual menu of the editing area, go to **Reuse** > ![Reuse Content](https://www.oxygenxml.com/dita/1.3/specs/archSpec/base/conref.html).
- Go to **DITA** > ![Reuse Content](https://www.oxygenxml.com/dita/1.3/specs/archSpec/base/conref.html).
Your selection at the top of the dialog box for choosing the content source determines whether Oxygen XML Author will insert a `conref`, `conkeyref`, or `keyref`.

If you select Location for the content source, a content reference (`conref`) will be inserted. If you select Key for the content source, keys will be used to insert a content key reference (`conkeyref`) or a key reference (`keyref`).

**Content Reference (conref) Options Using the Reuse Content Dialog Box**

Figure 619. Reuse Content Dialog Box (with the Default Insert Content Reference Options Displayed)

Choose the content source Section

When Location is selected for the content source, a content reference (`conref`) will be inserted. Here you can specify the path of the topic that contains the content you want to reference.

The dialog box offers the following options:
Select an element from the content source Section

Show elements of type

You can use this drop-down list to select specific types of elements to be displayed in the subsequent table. This can help you narrow down the list of possible source elements that you can select.

Text Filter Field

You can also use the text filter field to narrow down the list of possible source elements to be displayed in the subsequent table.

Element Table

Presents all the element IDs defined in the source topic. Use this table to select the Target ID of the element that you want to reference. You can select multiple contiguous elements to reference a block of content.

Preview Pane

Displays the content that will be referenced. If you select multiple elements in the element table, the content from all the selected elements is displayed.

Source Pane

Displays the source code of the element to be referenced.

Reference details Section

Reference to (conref)

Oxygen XML Author automatically fills this text field with the value of the conref attribute to be inserted. However, you can edit this value if need be.

Reference to range end (conrefend)

If you select multiple elements (of the same type) in the element table, Oxygen XML Author automatically fills this text field with the id value of the last element in your selection. This value will be inserted as a conrefend attribute, defining the end of the conref range.

Content Key Reference (conkeyref) Options Using the Reuse Content Dialog Box

Figure 620. Insert Content Key Reference Options
Choose the content source Section

When Key is selected for the content source, you can use keys to reference content. You can use the Choose Key Reference button to open the Choose Key dialog box that allows you to select one from a list of all the keys that are gathered from the root map (on page 2799) (you can also select one from the drop-down list in the Key field).

Note: If the current DITA map is not selected as the root map, no keys will be listed.

Tip: You can also use the DITA Reusable Components view (on page 2666) for similar purposes.

Figure 621. Choose Key Dialog Box
The **Choose Key** dialog box includes the following:

- **Change Root Map** - Opens a small dialog box that allows you to select a root map (on page 2520).
- **Search Filter** - You can enter text in the filter field at the top of the dialog box to filter the list and search for a specific key.
- **Sortable Columns** - The dialog box includes the following columns that can be sorted by clicking on the heading:
  - **Key** - The name of the key (the value of the `keys` attribute).
  - **Description** - The description of the key that is obtained from its definition. Keys that are defined with a text value in the `navtitle` or `keyword` element have that value listed in this column.
  - **Href** - Keys that are defined with a value in an `href` attribute have that href value listed in this column.
  - **Definition Location** - The name of the DITA map (on page 2793) where the key is defined.
- **Group by Definition Location** - A contextual menu action that can be used to group (and sort) all the keys based upon the value in the Definition Location column.

To insert a content key reference (`conkeyref`), select the key that contains the content you want to reference. Notice that the file path is shown in the Href column. Keys that do not have a value in the Href column are for referencing metadata with a `keyref` attribute. Therefore, to insert a `conkeyref`, you need to select a key that does have a value (file path) in the Href column.

After you select a key, click OK to return to the **Reuse Content** dialog box.

When a key that is defined as a content key reference has been selected, the **Reuse Content** dialog box offers the following additional options for inserting a `conkeyref`:

- **Select an element from the content source** Section
  - **Show elements of type**
You can use this drop-down list to select specific types of elements to be displayed in the subsequent table. This can help you narrow down the list of possible source elements that you can select.

**Text Filter Field**

You can also use the text filter field to narrow down the list of possible source elements to be displayed in the subsequent table.

**Element Table**

Presents all the element IDs defined in the source topic. Use this table to select the **Target ID** of the element that you want to reference. You can select multiple contiguous elements to reference a block of content.

**Preview Pane**

Displays the content that will be references. If you select multiple elements in the element table, the content from all the selected elements is displayed.

**Source Pane**

Displays the source code of the element to be referenced.

**Reference details Section**

**Reference type**

The type of reference that will be inserted. If you selected a key that references a DITA resource, you will notice that **conkeyref** value is automatically selected.

**Reference to**

Oxygen XML Author automatically fills this text field with the value of the **conkeyref** attribute to be inserted. However, you can edit this value if need be.

**Fallback to (conref)**

You can select this option to define a **conref** attribute to be used as a fallback to determine the content reference relationship if the specified **conkeyref** cannot be resolved.

**Reference to range end (conrefend)**

If you select multiple elements (of the same type) in the element table, Oxygen XML Author automatically fills this text field with the **id** value of the last element in your selection. This value will be inserted as a **conrefend** attribute, defining the end of the **conkeyref** range.
Key Reference to Metadata (keyref) Options Using the Reuse Content Dialog Box

Choose the content source Section

When Key is selected for the content source, you can use keys to reference content. You can use the Choose Key Reference button to open the Choose Key dialog box that allows you to select one from a list of all the keys that are gathered from the root map (on page 2799) (you can also select one from the drop-down list in the Key field).

Note: If the current DITA map is not selected as the root map, no keys will be listed.

Tip: You can also use the DITA Reusable Components view (on page 2666) for similar purposes.

Figure 623. Choose Key Dialog Box
The **Choose Key** dialog box includes the following:

- **Change Root Map** - Opens a small dialog box that allows you to select a root map (on page 2520).

- **Search Filter** - You can enter text in the filter field at the top of the dialog box to filter the list and search for a specific key.

- **Sortable Columns** - The dialog box includes the following columns that can be sorted by clicking on the heading:
  - **Key** - The name of the key (the value of the `keys` attribute).
  - **Description** - The description of the key that is obtained from its definition. Keys that are defined with a text value in the `navtitle` or `keyword` element have that value listed in this column.
  - **Href** - Keys that are defined with a value in an `href` attribute have that href value listed in this column.
  - **Definition Location** - The name of the DITA map (on page 2793) where the key is defined.

- **Group by Definition Location** - A contextual menu action that can be used to group (and sort) all the keys based upon the value in the **Definition Location** column.

To insert a key reference to metadata (`keyref`), select the key you want to reference. Keys that do not have a value in the `Href` column are for referencing metadata with a `keyref` attribute. Therefore, to insert a `keyref`, you need to select a key that does not have a value (file path) in the `Href` column.

After you select a key, click OK to return to the **Reuse Content** dialog box.

When a key that references metadata has been selected, the **Reuse Content** dialog box offers the following additional options for inserting a `keyref`:

- **Select an element from the content source Section**
  - This section is not used when referencing metadata.

- **Reference details Section**
Reference type

The type of reference that will be inserted. If you selected a key that does not reference a DITA resource, you will notice that keyref value is automatically selected.

Reference to

Oxygen XML Author automatically fills this text field with the value of the keyref attribute to be inserted.

Element name

Oxygen XML Author automatically selects the element that is most commonly used for the selected type of key reference, but you can use the drop-down list to choose another element to use for the reference.

Finalizing Your Content Reference Configuration

Once you click Insert or Insert and close, the configured content reference is inserted into your document.

Tip: You can easily insert multiple content references by keeping the Reuse Content dialog box opened, using the Insert button.

Working with Code References

Code References

The DITA coderef element can be used to reference an external file that contains literal code. This is especially useful if you need to reference code from an external source that may occasionally change. Another advantage is that you don't have to convert illegal characters into their character equivalents. When the coderef is processed, the referenced code file is imported and delimiting characters (such as < or >) are displayed as standard text, rather than treated as XML markup.

For more information about code references, see DITA 1.3 Specification: Coderef.

Example of using a Coderef

```xml
<p>This code is an example of how to use a coderef.</p>
<codeblock><coderef href="MyExternalCode.xsl"/></codeblock>
```
Defining Line Ranges

DITA-OT provides additional code reference processing support that allows you to define line ranges in case you only want to reference certain parts of the external file, rather than the whole file.

For information and examples of how to define line ranges, see DITA Open Toolkit Documentation: Extended Code Reference Processing.

Working with the Conref Push Mechanism

Content Reference Push Mechanism

The usual method of using content references pulls element content from a source element and inserts it in the current topic. DITA 1.2 introduced an alternative method of content referencing, allowing element content to be pushed, or injected, from a source topic to another topic without any special coding in the topic where the content will be re-used. This technique is known as a content reference push mechanism (conref push).

The conref push mechanism requires elements in the target topic (the topic where the content is to be pushed) to have ID elements, as the push mechanism inserts elements before or after a named element, or replaces the named element. Assuming the source topic is included in the DITA map (on page 2793), the conref push will be processed during publishing stage for the DITA map.

Example of a Conref Push Scenario

An example of a scenario in which a conref push would be useful is where a car manufacturer produces driver manuals that are distributed to various regions with their own specific regulations and certain sections need to be customized by the local car dealers before publishing. The local dealer could use a conref push technique to insert specific content without modifying the manufacturer-supplied content.

Push Current Element Action

Oxygen XML Author includes an action that allows you to easily reference content with a conref push mechanism. The Push Current Element action is available in the DITA menu and in the Reuse subfolder of the contextual menu when editing in Author mode. Selecting this action opens the Push current element dialog box that allows you to select a target resource and element, and where to insert the current element content.

Figure 624. Push Current Element Dialog Box
This dialog box allows you to configure the following options for the *conref* push action:

**Choose the target resource**

Allows you to select a **Location** URL or a **Key** for the target resource and the table in the next section of the dialog box will be populated using the information from the specified resource.

**Select the target element**

The table in this section contains the available elements (identified by their ID) that belong to the same class as the current element on which the action was invoked.

**Push action**

Allows you to choose one of the following options for where you want to insert the current element content:

- **replace the target element**
  
  The target element will be replaced with the current element content.
  
  On the technical side, the value of the *conaction* attribute in the current element will be set to `pushreplace` and the *conref* or *conkeyref* attribute will be set to the specified reference.

- **push before**
  
  The current element content will be inserted before the specified target element in the target resource.
On the technical side, the value of the `conaction` attribute in the current element will be set to `pushbefore`. Another element with the same name and class as the target element will be inserted in the document after the current element. The new element will have the `conaction` attribute set to `mark` and the `conref` or `conkeyref` attribute will be set to the specified reference.

**push after**

The current element content will be inserted after the specified target element in the target resource.

On the technical side, the value of the `conaction` attribute in the current element will be set to `pushafter`. Another element with the same name and class as the target element will be inserted in the document before the current element. The new element will have the `conaction` attribute set to `mark` and the `conref` or `conkeyref` attribute will be set to the specified reference.

You can also use the **Preview** panel to view the content that will be pushed and the **Source** panel to see the XML code for the content to be pushed. After you click **OK**, the `conref push` mechanism is inserted in the current document. The changes in the target resource will be processed when you transform the **DITA map**.

**Related Information:**

For more technical details about the `conref push` mechanism, refer to “The Conref Push Technique” section of The DITA Style Guide Best Practices for Authors.

**Working with Reusable Components**

In DITA, the content of almost any element can be made reusable simply by adding an `id` attribute to the element. The DITA content reference mechanism can reuse any element with an `ID`. However, it is not considered best practice to arbitrarily reuse pieces of text from random topics due to the difficulties this creates in trying to manage it. It also creates the possibility of authors deleting or changing content that is reused in other topics without being aware that the content is reused.

To prevent these types of problems, you can create reusable components to manage a separate set of topics that contain topics designed specifically for reuse. Then, all of your reusable content can be referenced from the reusable components and if the content needs to be updated you only need to edit it in one place.
Oxygen XML Author allows you to select content in a topic, create a reusable component from it and reference that component in other locations by using the Create Reusable Component and Insert Reusable Component actions.

**Related Information:**
- [DITA Reusable Components View](on page 2666)

Creating a Reusable Content Component

Oxygen XML Author makes it easy to create reusable content components from existing topic content.

**Note:** To ensure that the topic file that contains the reusable component is a valid container for just the reusable content component, without having to include the other elements required by a standard topic type, Oxygen XML Author creates a specialized topic type on the fly. This specialization is designed to make sure that the content is compatible with the topic type from which it is created.

Follow these steps to create a reusable component:

1. In Author mode, select the content you want to make into a reusable component.

2. Select the Create Reusable Component action that is available in the DITA menu or the Reuse submenu of the contextual menu.
   The Create Reusable Component dialog box is displayed.

3. Use the Reuse Content drop-down list to select the scope of the content to be made reusable. It allows you to select how much of the current content you want to make reusable. The choices presented include the element at the current cursor position and its ancestor elements.

4. Add a description. This becomes the title of the topic that contains the reusable component, but is not part of the reusable content. It is just to help you identify the reusable content and will not become part of your output.

5. If you want to replace the extracted content with a reference to the new component you should leave the Replace selection with content reference option selected. This is recommended, since the point of reuse is to maintain only one copy of the content.

6. Select a file name and location to save the topic containing the reusable component and click Save. It is considered best practice to save or store reusable components in an area set aside for that purpose.
   If the Replace selection with content reference option was selected, Oxygen XML Author replaces the current content with a `conref` attribute. The content of the content reference will be
displayed in your current topic with a gray background, but it will no longer be editable since it is stored in a separate file. To edit the source of the reusable component, click the Edit Content icon at the beginning of the inserted content.

You now have a reusable component that you can include in other topics by using the Insert Reusable Component action that is available in the DITA menu or the Reuse submenu of the contextual menu. You can also reference this new reusable component by using a content reference (on page 2640) or content key reference (on page 2642).

Inserting a Reusable Content Component

Oxygen XML Author includes an Insert Reusable Content action that allows you to easily insert a reusable content component that you created using the Create Reusable Component action (on page 2659).

⚠️ CAUTION: This action is only designed to insert reusable components created using the Oxygen XML Author Create Reusable Component action. It assumes certain things about the structure of the reusable content file that may not be true of reusable content created by other methods and it may not provide the expected results if used with content that does not have the same structure.

The Insert Reusable Content action creates a DITA conref to insert the content, and creates a parent element for the conref attribute based on the type of the reusable element in the reusable component file. This action ensures that the correct element is used to create the conref. However, that element must still be inserted at a point in the current topic where that element type is permitted.

To insert a reusable component that was created using the Create Reusable Component action, follow these steps:

1. Place the cursor at the insertion point where you want the reusable component to be inserted.

2. Select the Insert Reusable Component action that is available in the DITA menu or the Reuse submenu of the contextual menu.
   The Insert Reusable Component dialog box is displayed.

3. Locate the reusable content file in which you want to insert its content.

4. If you select Content reference in the Insert as drop-down list, the action will add a conref attribute to the DITA element at the current location. If you select Copy in the drop-down list, the content of the reusable component file will simply be pasted at the current location (assuming the content is valid at the current location).

5. Click Insert to perform the action.
Working with Variable Text in DITA

You may often find that you want a certain piece of text in a topic to have a different value in various circumstances. For example, if you are reusing a topic about a feature that is shared between several products, you might want to make the name of the product a variable so that the correct product name is used in the manual for each product.

For example, you might have a sentence like this:

The quick-heat feature allows [product-name] to come up to temperature quickly.

You need a way to substitute the correct product name for each product.

One way to do this would be to use conditional profiling to provide conditional values using the `product profiling` attribute, as in the following example:

```xml
<p>The quick-heat feature allows
    <ph product="basic">Basic Widget</ph>
    <ph product="pro">Pro Widget</ph>
    to come up to temperature quickly.</p>
```

However, this approach means that you are repeating the product names over and over again everywhere the product name is mentioned. This is time consuming for authors and will create a maintenance problem if the product names change.

The alternative is to use a key reference, as in the following example:

```xml
<p>The quick-heat feature allows <ph keyref="product"/>
to come up to temperature quickly.</p>
```

The definition of the key reference determines the name of the product:

```xml
<keydef keys="product" product="basic">
    <topicmeta>
        <keywords>
            <keyword>Basic Widget</keyword>
        </keywords>
    </topicmeta>
</keydef>

<keydef keys="product" product="pro">
    <topicmeta>
        <keywords>
            <keyword>Pro Widget</keyword>
        </keywords>
    </topicmeta>
</keydef>
```
When the content is published, the value defined in the `product` key will be inserted for each product.

**Inserting a Keyref**

To insert a defined key reference (on page 2537) into a document in Oxygen XML Author Author mode, use one of the following methods (the method you choose simply depends on which Oxygen XML Author feature you prefer):

- **DITA Reusable Components View Method**
  
  Use the DITA Reusable Components view (on page 2666) to insert a variable reference to the defined key (on page 2537). For example, in the Keys tab, find a key defined as a variable and double-click it. Oxygen XML Author will insert the variable as a `<ph>` element with a `@keyref` attribute that references the specified key.

- **Code Template Method**
  
  Add the source code pattern of the defined key (on page 2537) to a code template (on page 167) so that it appears in the list of proposals in the Content Completion Assistant (on page 2792). For example, the code pattern could be something like `<ph keyref="product"/>` for defined `product` key.

- **Reuse Content Dialog Box Method**
  
  Use the Reuse Content action on the main toolbar to open the Reuse Content dialog box (on page 2647). Use the Key option to select a key that is defined as a variable (key reference to metadata) (on page 2653) and Oxygen XML Author will insert the variable as a `<ph>` element with a `@keyref` attribute that references the specified key.

- **Manual Method**

  Manually insert the `keyref` attribute using the attributes editor as follows:

  1. Press `Enter` and select a DITA element (for example, `<ph>`) that supports the `keyref` attribute.
  2. Select `Edit Attributes` from the contextual menu (or simply press `Alt+Enter`) to bring up the attributes editor (on page 415).
  3. In the Name field, select `keyref`.
  4. In the Value field, select or enter the name of the defined key (on page 2537).

**Related Information:**
Working with DITA 1.3 Key Scopes

DITA 1.3 includes the possibility of using a concept called Key Scopes (or scoped keys). It allows you to reuse a topic in multiple places within the same DITA map, but with slightly different content in each instance.

Key Scopes Use-Case

Suppose that you develop a software product and you have a topic in your user guide that explains how to install your product on a Windows operating system. Suppose that the steps are exactly the same for installing it on Linux and the only difference is the name of the operating system. Therefore, it would be helpful if you could reuse the exact same content in two different topics, but with the name of the operating system different in each instance. In DITA 1.2, this is not possible since keys can only be resolved to a single value. However, with the DITA 1.3 Key Scopes mechanism, you can define multiple values for the same key depending on the context.

How to Use Key Scopes in Oxygen XML Author

To use DITA 1.3 key scopes in Oxygen XML Author, follow these steps:

1. Define the keys (on page 2628) to be used in multiple places within your DITA map.
2. For each particular topic that contains the keys, define the key scopes:
   a. Right-click the topic in the DITA Maps Manager (on page 2503) and select Edit properties.
   b. In the Keys tab (on page 2542), enter a value (or multiple values) in the Key scopes field.
   c. Click OK to save your changes.
3. Save the DITA map.

Result: In the DITA Maps Manager (on page 2503), you can now see the key scopes in brackets and when you open each topic reference.
The content will also be expanded in **Author** mode according to the context of the key scope you defined for that particular topic. Also, when you transform the **DITA map**, the scoped keys will be reflected in the published content.

**Resources**

- You can find a more detailed example and download samples for reuse possibilities based on key scopes in the *DITA 1.3 Key Scopes - Next Generation of Reuse* blog post.
- You can also watch our **DITA 1.3 video tutorial** to see how key scopes can be used in Oxygen XML Author.

**Related Information:**

- Working with DITA 1.3 Branch Filtering (*on page 2664*)
- Oxygen XML Blog: DITA 1.3 Key Scopes - Next Generation of Reuse
- Oxygen Video Tutorial: DITA 1.3 (Key Scopes, Branch Filtering)

**Working with DITA 1.3 Branch Filtering**

DITA 1.3 allows you to use a mechanism called **Branch Filtering** that enables you to set filtering conditions for specific branches of a **DITA map** (*on page 2793*). This makes it possible for multiple conditional profiles to be applied within a single publication, each time with a different filter.

**Branch Filtering Use-Case**

Suppose that you sell two models of a mobile phone and you need to create a brochure for each model. You want both brochures to have the same structure and most of the content is the same for both brochures. The only differences are in the values for certain details (for example, the model name, size dimensions, battery life, etc.) Therefore, it would be helpful if you could use the same topic and reference it twice in the same map, with each reference using different filtering conditions. In DITA 1.2, this is not possible since you can only apply one DIATAL filter to a map. However, with the DITA 1.3 **Branch Filtering** mechanism, you can reuse content multiple times within the same map, each time using different filters.
How to Use Branch Filtering in Oxygen XML Author

To use DITA 1.3 branch filtering in Oxygen XML Author, follow these steps:

1. The support for DITA 1.3 must be enabled in the DITA preferences page (on page 214).
2. Assuming you have already defined your profiling attributes (on page 912), create a DITAVAL filter file (on page 2761).
3. Insert a reference to the DITAVAL filter file in the DITA map:
   a. Right-click the DITA map reference in the DITA Maps Manager (on page 2503) and select Append Child > DITAVAL Reference.
   b. Select the DITAVAL file.
   c. Click Insert and Close.
4. Save the DITA map.

Result: You can now see the ditaval files referenced in the DITA Maps Manager (on page 2503) and when you transform the DITA map, filtered content will be reflected in the published output.

Figure 626. Branch Filtering in DITA Maps Manager

Resources

- You can find a more detailed example and download samples for reuse possibilities based on key scopes in the DITA 1.3 Branch Filtering - Next Generation of Reuse blog post.
- You can also watch our DITA 1.3 video tutorial to see how branch filtering can be used in Oxygen XML Author.

- Working with DITA 1.3 Key Scopes (on page 2663)
- Oxygen XML Blog: DITA 1.3 Branch Filtering - Next Generation of Reuse
DITA Reusable Components View

The **DITA Reusable Components** view is helpful if you use a large amount of keys or reusable components in your DITA project. It collects all of the keys and reusable components that are defined in the *root map* (**on page 2799**) and presents them in a side view where you can easily locate and insert references to them. It re-collects the keys anytime the *root map is changed* (**on page 2520**) or you switch the editor focus to a different file.

If the view is not displayed, it can be opened by selecting it from **Window > Show View**. By default, it will appear in the bottom-right section of the editor.

**Tip**: You can also assign a keyboard shortcut to open the view using the **Menu Shortcut Keys** preference page (**on page 238**).

It includes two tabs:

- **Keys** (**on page 2666**) - Displays all the *keys* that are defined in the *root map* (**on page 2799**) and provides ways to easily insert references to them as cross reference links, key references, or variables. It includes a search field, some filtering and sorting options to help you find particular keys, and some contextual menu actions. It also supports drag and drop actions and double-clicking a key is the fastest way to insert a reference.

- **Components** (**on page 2670**) - Displays all the *reusable components* found in the *root map* (**on page 2799**) and provides ways to easily insert them as content references or content key references. To determine which components to display in this tab, Oxygen XML Author looks for any *topicref* in the *root map* (**on page 2799**) that is marked as *resource-only* and then looks for elements with an assigned `@id` attribute value. This tab includes a search field, some filtering options, and some simple links and contextual menu actions to quickly insert references or open their source file. It also supports drag and drop and double-clicking actions.

**Keys Tab**

The **DITA Reusable Components** view collects all the *keys* that are defined in the current *root map* (**on page 2799**) and displays them in the **Keys** tab. This tab has two view modes. The default **tiles** style view mode and a **table** style view mode.

**Tiles Mode**

The default **tiles** mode displays the keys as blocks (cards). The advantage of this display mode is that more information about each particular key can be seen even when the view is sized with a small
width. Each block (card) displays the name of the key (the value of the `keys` attribute), followed by its description and/or `href` value, followed by the name of the DITA map file where the key is defined.

Figure 627. DITA Reusable Components View - Keys Tab (Default tiles mode)

![DITA Reusable Components View - Keys Tab (Default tiles mode)](image)

**Table Mode**

You can switch to a table style display mode by selecting the **Table mode** toggle action from the 📚 **Settings** menu. The advantage of this display mode is that more keys can be listed at once. In this mode, keys that are defined with a text value in the `navtitle` or `keyword` element have that value listed in the **Description** column, while keys that are defined with a value in an `href` attribute have that href value listed in the **Href** column.

Figure 628. DITA Reusable Components View - Keys Tab (Table mode)

![DITA Reusable Components View - Keys Tab (Table mode)](image)

Both display modes in the **Keys** tab include a variety of features and options:

**Search Filter**

...
You can enter text in the filter field at the top of this tab to filter the list and search for specific keys.

**Sorting**

*Tiles Mode:* In the default *tiles* display mode, to sort the keys alphabetically in ascending order, select *Sort by key name* from the *Settings* menu.

*Table Mode:* In the *table* display mode, the following columns can be sorted by clicking on the heading:

- **Key** - The name of the key (the value of the `keys` attribute).
- **Description** - The description of the key that is obtained from its definition. Keys that are defined with a text value in the `navtitle` or `keyword` element have that value listed in this column.
- **Href** - Keys that are defined with a value in an `href` attribute have that href value listed in this column.
- **Definition Location** - The name of the *DITA map (on page 2793)* where the key is defined.

**Double-Click Mechanism**

You can double-click any key listed in this tab to insert a key reference at the current cursor position or surrounding the current selection.

- If the selected key points to an `href` value, it is inserted as a *cross reference link* (*xref* (on page 2675)).
- If the selected key is a reference to an image, it is inserted as an *image* element.
- If the selected key does not have an associated `href`, it is inserted as a *variable reference* (*ph*) (on page 2660).

**Drag and Drop Mechanism**

You can drag a key from this tab and drop it in the main editor to insert a key reference at the current cursor position.

- If the selected key points to an `href` value, it is inserted as a *cross reference link* (*xref* (on page 2675)).
- If the selected key is a reference to an image, it is inserted as an *image* element.
- If the selected key does not have an associated `href`, it is inserted as a *variable reference* (*ph*) (on page 2660).

**Contextual Menu Actions**

- **Insert as Link**
Inserts a cross reference link (xref) (on page 2675) to the selected key at the current cursor position or surrounding the current selection.

**Insert as Variable**
Inserts a variable reference (ph) (on page 2660) to the selected key at the current cursor position or surrounding the current selection. However, if the selected key is a reference to an image, this action inserts the key reference in an image element.

**Insert as Keyref**
Presents a submenu with all the elements that can be inserted at the current cursor position. Selecting an element will insert that element at the current cursor position or surrounding the current selection with a keyref attribute and its value set to the selected key.

**Rename Key**
Opens a refactoring wizard (on page 1083) where you can easily rename the key and define the scope of the operation. It also updates all references to it.

**Notes:**
- This action does not work on DITA 1.3 key scopes.
- This action is only available if the DITA map opened in the DITA Maps Manager is also selected as the Root map.

**Go to Definition**
Opens the DITA map where the key is defined.

**Search References**
Searches for all references to the selected key in the entire DITA map structure.

**Group by Definition Location (Available in Table mode only)**
A toggle action that can be used to group (and sort) all the keys based upon the value in the Definition Location column.

**Settings Menu**
This menu includes the following options:

**Filtering Options**
- **Show all** - Shows all defined keys found in the current root map (on page 2799).
• **Show only variables** - Filters the keys to show only those defined as variable references *(on page 2660).*
• **Show only maps and topics** - Filters the keys to show only those that reference DITA maps or topics.
• **Show only multimedia resources** - Filters the keys to show only those that reference multimedia resources (such as images).
• **Show only external resources** - Filters the keys to show only those that reference external resources (such as web links).

**Sort by key name (Available in Tiles mode only)**

Sorts the keys alphabetically in ascending order.

**Table mode**

A toggle action that switches between the table and tiles display modes.

**Components Tab**

The **DITA Reusable Components** view collects all the topics from the current root map *(on page 2799)* that are marked as resource-only, then collects the reusable components from those topics, and displays them in the Components tab. To set a topic as resource-only, the topicref in the DITA map file needs to have a processing-role attribute set like this:

```xml
<topicref href="topics/randomize-xml-content.dita" processing-role="resource-only"/>
```

The DITA Reusable Components view considers topic references that contain processing-role="resource-only" to be candidates to contain reusable components. The reusable components inside these topics are collected from all elements that have an ID specified. These reusable components are displayed in the Components tab along with the file name and the specific names of the elements that contain an ID attribute.

Figure 629. DITA Reusable Components View - Components Tab
The **Components** tab includes the following features and options:

**Search Filter**

You can enter text in the filter field at the top of this tab to filter the list and search for specific content inside the list of reusable components. This field supports many of the [Lucene-based search patterns](https://www.lucene.apache.org/core/facets/searchpatterns.html), such as wildcards (\* , ?), boolean operators (AND, OR, NOT), fuzzy searches (~), boosting searches (^), and more.

**Settings Menu**

This menu includes the following options:

**Compact Mode**

You can use this toggle action to switch the display for the **Components** tab to a compact visualization mode. When switched to **Compact mode**, fewer details are shown for each component, but more components are displayed in the view.

**Reindex**

You can use this action force a re-indexing of the reusable components.

**Show Elements of Type**

You can use this drop-down list to select specific types of elements to be displayed in the list of components. This can help you narrow down the list of possible source elements that you can select.

**Source File(s)**
You can use this combo box to search for specific source files (the topics that contain reusable components) or select a file from its drop-down list. You can also use wildcards (such as * or ?) in this field.

**Double-Click Mechanism**

You can double-click any reusable component listed in preview window in this tab to insert it as a content reference or content key reference at the current cursor position or replace the current selection.

- If the parent topic of the selected component has a key defined, it is inserted as a content key reference (conkeyref) (on page 2642).
- If the parent topic of the selected component does not have a key defined, it is inserted as a content reference (conref) (on page 2640).

**Drag and Drop Mechanism**

You can drag a reusable component from the preview window in this tab and drop it in the main editor to insert a content reference or content key reference at the current cursor position.

- If the parent topic of the selected component has a key defined, it is inserted as a content key reference (conkeyref) (on page 2642).
- If the parent topic of the selected component does not have a key defined, it is inserted as a content reference (conref) (on page 2640).

**Hover and Click Actions**

If you hover over a component shown in the preview window, you have access to the following link actions:

- **Insert**

  Inserts the component as a content reference or content key reference at the current cursor position or replaces the current selection. If the parent topic has a key defined, it is inserted as a content key reference (conkeyref) (on page 2642). Otherwise, it is inserted as a content reference (conref) (on page 2640).

- **Open**

  Opens the source file that contains the reusable component.

**Contextual Menu Actions**

- **Insert Content Reference**
Inserts the component as a **content reference (conref)** *(on page 2640)* at the current cursor position or replaces the current selection.

**Insert Content Key Reference**

Inserts the component as a **content key reference (conkeyref)** *(on page 2642)* at the current cursor position or replaces the current selection. This action is only available if the parent topic has a key defined.

**Go to Definition**

Opens the source file that contains the reusable component.

**Search References**

Searches for all references to the selected component in the entire **DITA map** *(on page 2793)* structure.

**Linking in DITA**

DITA provides support for various types of linking between topics, some of which is automated, while others are specified by the author. Oxygen XML Author provides support for all forms of linking in DITA.

**Linking Between Parent, Child, and Sibling Topics**

A **DITA map** *(on page 2793)* creates a hierarchical relationship between topics. That relationship map expresses a narrative flow from one topic to another, or it may be used as a classification system.
to help the reader find topics based on their classification, without creating a narrative flow. Since there may be various types of relationships between topics in a hierarchy, you may want to create links between topics in a variety of ways. For instance, if your topics are supposed to be organized into a narrative flow, you may want to have links to the next and previous topics in that flow. If your topics are part of a hierarchical classification, you may want links from parent to child topics, and vice versa, but not to the next and previous topics.

Parent, child, and sibling links are created automatically by the DITA output transformations (and may differ between various output formats). The kinds of links that are created are determined by the DITA collection-type attribute (on page 2543).

In-Line Linking in the Content of a Topic

DITA supports linking within the text of a topic using the xref element. The destination of the link can be expressed directly using the href attribute or indirectly using the keyref attribute. If you use the keyref attribute, you link to a key rather than directly to a topic. That key is then assigned to a topic in a map that includes that topic. This means that you can change the destination that a key points to by editing the key definition in the map or by substituting another map in the build.

Linking Between Related Topics

In addition to the relationships between topics that expressed by their place in the hierarchy of a map, a topic may be related to other topics in various ways. For instance, a task topic may be related to a concept topic that gives the background of the task, or to a reference topic that provides data needed to complete the task. Task topics may also be related to other tasks in a related area, or concepts to related concepts.

Typically, they are grouped in a list at the end of the topic, although this depends on the behavior of the output transformation. DITA provides two mechanisms for expressing relationships between topics at the topic level: the Related Links section of a topic and relationship tables in maps. To add related links, select Related Link to Topic, Related Link to File, or Related Link to Web Page from the Link drop-down menu from the toolbar (or the Link submenu in the contextual menu or DITA menu).

Tip: You can use the Find Similar Topics action that available in the DITA menu to quickly find related topics that can be added as related links. It opens the Open/Find Resource view and performs a search using text content from the <title>, <shortdesc>, <keyword>, and <indexterm> elements.

Managing Links

Links can break for a variety of reasons. The topic that a link points to may be renamed or removed. A topic may be used in a map that does not include a linked topic. A topic or a key may not exist in a
map when a particular profile is applied. The DITA Maps Manager (on page 2503) provides a way to validate all the links in the documents that are included in the map (on page 2549). This can include validating all the profiling conditions that are applied.

Hierarchical Linking in DITA Maps

To create hierarchical linking between the topics in a DITA map (on page 2793), you set the appropriate value of the collection-type attribute on the map. See the DITA documentation for the meaning of each of the values of the collection-type attribute.

Note: Publishing scripts determine when and how to create hierarchical links. The collection-type attribute does not force a particular style of linking. Instead, it declares what the nature of the relationship is between the topics. The publishing scripts use that information to determine how to link topics. Scripts for different types of media might make the determination depending on what is appropriate for the particular type of media. You can provide additional instructions to the scripts using the linking attribute.

To add the collection-type to an item in a map:

1. Right-click the topic and choose Edit Properties. The Edit Properties dialog box is displayed.
2. In the Attributes tab, select the appropriate value from the Collection type drop-down list.
3. You can use the Other attributes table to add a value to the linking attribute.

Linking in DITA Topics

Direct Links

Inline links can be created DITA topics using the xref element. The destination of the link can be expressed directly by using the href attribute and the target can be another topic or a specific element within the other topic, another location within the same topic, a file, or a web link. You can also create direct related links to topics, files, or websites in a DITA topic using the related-links element.

Indirect Links Using Keys

The destination of the link can also be expressed indirectly by using keys (on page 2628) to create either inline links or related links (with the keyref attribute). By using keys, you avoid creating a direct dependency between topics. This makes links easier to manage and can make it easier to reuse topics in various publications. It can also be helpful in verifying the completeness of a publication, by ensuring that a publication map provides a key definition for every key reference used in the content.
Links based on keys require two pieces:

- Key Definition - Assigns a key to a topic so that other topics can link to it. For more information, see Defining Keys in DITA Maps (on page 2537).
- Key Reference - Created in an xref element and specifies the key to link to.

The key reference points to a key definition, and the key definition points to a topic. Key definitions are created in maps, as an element on the topicref element that points to a topic. This allows you to assign a particular key to one topic in one map and to another topic in another map. When a topic that links to that key is used in each of these maps, the links work correctly in both maps.

Inserting a Link in Oxygen XML Author

To insert a link in Author mode (on page 388), use the actions available in the Link drop-down menu from the toolbar (or the Link submenu in the contextual menu or DITA menu). You can choose between the following types of inline links:

**Cross Reference**

Opens the Cross Reference (xref) dialog box (on page 2678) that allows you to insert a cross reference link to a target DITA resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. Once the target resource has been selected, you can also target specific elements within that resource. Depending on the context where it is invoked, the action inserts one of the following two elements:

- xref - Used to link to other topics or another location within the same topic and points to the target using the href or keyref attribute.
- fragref - A logical reference to a fragment element within a syntax diagram and points to the target using the href or keyref attribute.

**File Reference**

Opens a dialog box that allows you to insert a link to a target non-DITA file resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. It inserts an xref element with either an href attribute or a keyref attribute. If you select Location for the target, the link is expressed in an href attribute. If you select Key for the target, keys will be used to express the link in a keyref attribute. You can select a key from the drop-down list or click the Choose Key Reference button to use the Choose Key dialog box (on page 2679).

**Web Link**
Opens a dialog box that allows you to insert a link to a target web-related resource at the current location within a document. The target resource can be a URL or a key that is already defined in your DITA map structure. It inserts an xref element with either an href attribute or a keyref attribute. If you select URL for the target resource, the link is expressed in an href attribute. If you select Key for the target, keys will be used to express the link in a keyref attribute. You can select a key from the drop-down list or click the Choose Key Reference button to use the Choose Key dialog box (on page 2679).

Related Link to Topic

Opens the Cross Reference (xref) dialog box (on page 2678) that allows you to insert a link to a target DITA resource in a related links section that is typically at the bottom of your topic (although this depends on the behavior of the output transformation). The target resource can be the location of a file or a key that is already defined in your DITA map structure. Once the target resource has been selected, you can also target specific elements within that resource. If a related links section does not already exist, this action creates one. Specifically, it inserts a link element inside a related-links element.

Tip: You can use the Find Similar Topics action that available in the DITA menu to quickly find related topics that can be added as related links. It opens the Open/Find Resource view and performs a search using text content from the <title>, <shortdesc>, <keyword>, and <indexterm> elements.

Related Link to File

Opens a dialog box that allows you to insert a link to a target non-DITA file resource in a related links section that is typically at the bottom of your topic (although this depends on the behavior of the output transformation). The target resource can be the location of a file or a key that is already defined in your DITA map structure. If a related links section does not already exist, this action creates one. Specifically, it inserts a link element inside a related-links element. If you select Location for the target, the link is expressed in an href attribute. If you select Key for the target, keys will be used to express the link in a keyref attribute. You can select a key from the drop-down list or click the Choose Key Reference button to use the Choose Key dialog box (on page 2679).

Related Link to Web Page

Opens the Web Link dialog box that allows you to insert a link to a target web-related resource in a related links section that is typically at the bottom of your topic (although this depends on the behavior of the output transformation). The target resource can be a URL or a key that is already defined in your DITA map structure. If a related links section does not already exist, this action creates one. Specifically, it inserts a link
element inside a `related-links` element. If you select `URL` for the target resource, the link is expressed in an `href` attribute. If you select `Key` for the target, keys will be used to express the link in a `keyref` attribute. You can select a key from the drop-down list or click the `Choose Key Reference` button to use the `Choose Key` dialog box (on page 2679).

**Cross Reference (xref) Dialog Box**

The Cross Reference (xref) dialog box is displayed when you insert a Cross Reference or Related Link to Topic (from the Link drop-down menu). It allows you to insert a link to a target resource at the current location within a document (for a Cross Reference link) or in a related links section (for a Related Link to Topic). The target resource can be the location of a file or a key that is already defined in your DITA map structure. Once the target resource has been selected, you can also target specific elements within that resource.

Figure 630. Cross Reference (xref) Dialog Box

This dialog box includes the following sections and fields:

**Choose the Target Resource Section**
Location

If you select **Location** for the target, the link is expressed in an `href` attribute.

Key

If you select **Key** for the target, keys will be used to express the link in a `keyref` attribute. You can use the [Choose Key Reference](on page 2679) button to open the **Choose Key** dialog box that allows you to select one from a list of all the keys that are gathered from the root map ([on page 2799](on page 2679)) (you can also select one from the drop-down list in the **Key** field).

Tip: You can also use the **DITA Reusable Components** view ([on page 2666](on page 2666)) for similar purposes.

Figure 631. Choose Key Dialog Box

The **Choose Key** dialog box includes the following:

- **Change Root Map** - Opens a small dialog box that allows you to select a root map ([on page 2520](on page 2520)).
- **Search Filter** - You can enter text in the filter field at the top of the dialog box to filter the list and search for specific keys.
- **Sortable Columns** - The dialog box includes the following columns that can be sorted by clicking on the heading:
  - **Key** - The name of the key (the value of the *keys* attribute).
  - **Description** - The description of the key that is obtained from its definition. Keys that are defined with a text value in the *navtitle* or *keyword* element have that value listed in this column.
  - **Href** - Keys that are defined with a value in an *href* attribute have that href value listed in this column.
Definition Location - The name of the DITA map (on page 2793) where the key is defined.

Group by Definition Location - A contextual menu action that can be used to group (and sort) all the keys based upon the value in the Definition Location column.

Select the Target Element Section

This section can be used to target a specific element inside the target resource.

Show elements of type

You can use this drop-down list to select specific types of elements to be displayed in the subsequent table. This can help you narrow down the list of possible source elements that you can select.

Text Filter Field

You can also use the text filter field to narrow down the list of possible source elements to be displayed in the subsequent table.

Element Table

Presents all the element IDs defined in the source topic. Use this table to select the Target ID of the element that you want to reference.

Preview Pane

Displays the content that will be referenced.

Source Pane

Displays the XML source code of the element to be referenced.

Once you click Insert or Insert and close, the configured cross reference is inserted into your document.

Tip: You can easily insert multiple cross references by keeping the dialog box opened, using the Insert button.

Using Copy/Paste Actions to Insert a Cross Reference

Oxygen XML Author also includes support for inserting cross references with simple copy/paste actions. The copied content must be an entire DITA XML element with an ID attribute or a topicref. Also, the location in the document where you paste the link must be valid, although as long as the Smart paste and drag and drop option (on page 136) is selected in the Schema Aware preferences page, if you try to paste it in an invalid location, Oxygen XML Author will attempt to place it in a valid location, and may prompt you with one or more choices for where to place it. You can paste the link as a cross reference with the link expressed in an href attribute or in a keyref attribute.
To insert a cross reference link (expressed in an `href` attribute) using copy/paste actions, follow these steps:

1. Copy an entire DITA element that has an ID attribute assigned to it or a `topicref`.
2. Place the cursor at a location, where you want to insert the link.
3. Select the Paste as Link action from the Paste Special submenu from the contextual menu.

To insert a cross reference link (expressed in a `keyref` attribute) using copy/paste actions, follow these steps:

1. In the DITA Maps Manager view (on page 2503), make sure that the Root map combo box (on page 2508) points to the correct map that stores the keys.
2. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the DITA Maps Manager (on page 2503), select Edit Properties, and enter a value in the Keys field.
3. Copy an entire DITA element that has an ID attribute assigned to it from a topic with an assigned key, or a `topicref` from a DITA map.
4. Place the cursor at a location, where you want to insert the link.
5. Select the Paste as Link (keyref) action from the Paste Special submenu from the contextual menu.

Linking with Relationship Tables in DITA

A relationship table is used to express relationships between topics outside of the topics themselves. The DITA publishing scripts can then create links between related topics when the content is published.

The reason for using a relationship table is to help make topics easier to reuse. If a topic links directly to another topic, this creates a dependency between the topics. If one topic is reused in a publication where the other is not used, the link is broken. By defining relationships between topics in a relationship table, you avoid creating this dependency.
To create an appropriate set of links between topics in multiple publications, you can create a separate relationship table for each publication. If you are creating multiple publications by applying profiling conditions to a single map, you can also profile your relationship table.

To create a relationship table, follow these steps:

1. If the map is currently open in the **DITA Maps Manager (on page 2503)**, double-click the map icon () to open the map in **Author** mode. If it opens in **Text** mode, click **Author** at the bottom left to switch to **Author** mode.

2. Move the insertion point inside the **map** root element (usually **map**, but it might be **bookmark**, or another specialization of the **map** element). The easiest way to do this is to click below the title of the map in the editor and then press the up arrow once. Confirm that you are inside the **map** root element by checking the breadcrumbs at the top left of the editor window. You should only see the name of the **map** root element.

3. Select the **Insert Relationship Table** action on the toolbar or from the **Relationship Table** submenu of the contextual menu. The **Insert Relationship Table** dialog box is displayed.

4. Set the number of rows, the number of columns, a table title (optional), and select whether or not you want a table header. Click **Insert**.

5. Enter the type of the topics in the header of each column.

   The header of the table (the **relheader** element) already contains a **recolspec** element for each table column. You should set the value of the attribute **type** of each **recolspec** element to a value such as **concept**, **task**, or **reference**. When you click in the header cell of a column (that is a **recolspec** element), you can see all the attributes of that **recolspec** element, including the **type** attribute in the **Attributes view (on page 412)**. You can edit the attribute type in this view.

6. To insert a topic reference in a cell, place the cursor in a table cell and select **Insert Reference (on page 2562)** from the contextual menu or the **DITA Map** toolbar.

7. To add a new row to the table or remove an existing row use **Insert Relationship Row**/**Delete Relationship Row** from the contextual menu or the **DITA Map** toolbar.

8. To add a new column to the table or remove an existing column, use **Insert Relationship Column**/**Delete Relationship Column** contextual menu or the **DITA Map** toolbar. If you double-click the relationship table (or select it and press **Enter**, or choose **Open** from the contextual menu) the **DITA map** is opened in the editor with the cursor positioned inside the corresponding relationship table.
9. To add topic references to your relationship table, drag and drop topics from the DITA Maps Manager (on page 2503) or the Project (on page 320) view into the appropriate cell in the relationship table. See the DITA documentation for a full explanation of the relationship table format and its options. Note that you can change all the selections that you make here later by using the actions on the toolbar (or in the Relationship Table submenu of the contextual menu) or by editing the underlying XML in Text mode.

10. Save the DITA map. Relationship tables are also displayed in the DITA Maps Manager view (on page 2503), along with the other elements in its DITA map.

Figure 632. Relationship Table

You can open the DITA map to edit the relationship table by doing one of the following:

- Double-click the appropriate relationship table in the DITA Maps Manager (on page 2503).
- Select the relationship table in the DITA Maps Manager (on page 2503) and press Enter.
- Select Open from the contextual menu of the relationship table in the DITA Maps Manager (on page 2503).

Publishing DITA Output

As a structured writing format, DITA produces structured content (content that is annotated with specific structural and semantic information rather than with formatting information). To create a publication, your DITA map (on page 2793) and its associated topics must be processed by a transformation script. That script is responsible for how the structural and semantic information in the DITA files is converted into formatting information for display.

Oxygen XML Author publishes DITA content to various output sources using a bundled version of the DITA Open Toolkit. The DITA OT is an open-source publishing engine that can publish DITA content to various output sources such as XHTML, PDF, or Windows Help (CHM). Since it has a plugin-based architecture, it can be extended with extra plugins that either define new formats for conversion or customize an existing conversion format. You can run the DITA-OT from Oxygen XML Author using a
transformation scenario or you can run it directly from a command line: http://www.dita-ot.org/dev/topics/building-output.html.

The DITA-OT that comes bundled with Oxygen XML Author contains more plugins than the standard DITA-OT that can be downloaded from their official website. For example, it contains pre-installed plugins for converting DITA content to Word, EPUB, WebHelp, or to publish to PDF using CSS to customize the output: http://blog.oxygenxml.com/2017/03/useful-dita-ot-plugins.html.

DITA Map Transformation Scenarios

Built-in transformation scenarios allow you to transform DITA maps (on page 2793) to a variety of outputs, such as WebHelp, PDF, ODF, XHTML, EPUB, CHM, Kindle, and MS Word. Oxygen XML Author also includes a special Run DITA-OT Integrator (on page 1283) that can be used to integrate a DITA-OT plugin and a DITA Map Metrics Report transformation that generates a statistics report for your DITA map. All of them are listed in the DITA Map section in the Configure Transformation Scenario(s) dialog box (on page 1378).

A variety of transformations scenarios are available for DITA maps (on page 2793):

• Built-in transformation scenarios allow you to transform a DITA map to a variety of outputs, such as WebHelp, PDF, ODF, XHTML, EPUB, CHM, Kindle, and MS Word.
• Run DITA-OT Integrator (on page 1283) - Use this transformation scenario if you want to integrate a DITA-OT plugin (on page 2768). This scenario runs an Ant task that integrates all the plugins from the DITA-OT/plugins directory.
• DITA Map Metrics Report - Use this type of transformation scenario if you want to generate a DITA map statistics report. It contains information such as:
  ◦ The number of processed maps and topics.
  ◦ Content reuse percentage.
  ◦ Number of elements, attributes, words, and characters used in the entire DITA map structure.
  ◦ DITA conditional processing attributes used in the DITA maps.
  ◦ Processing instructions.
  ◦ External links.
  ◦ All @outputclass attribute values gathered from the DITA project.

⚠️ Important: If you have cross references that point to content outside the scope of the DITA map, that referenced content will not be counted. For example, if you have links to topics that are not included in the DITA map hierarchy, the content in those topics is ignored when generating the statistics.
DITA Map to WebHelp Responsive Transformation

DITA content can be transformed into several types of WebHelp Responsive systems (with or without a feedback section). The WebHelp Responsive layout and features (on page 1474) are designed to adapt to any device and screen size to provide an optimal viewing and interaction experience. Oxygen XML Author also provides numerous possibilities for customizing the WebHelp Responsive output (on page 1551).

WebHelp Responsive Transformation Scenario

To publish a DITA map (on page 2793) as WebHelp Responsive output, follow these steps:

1. Select the Configure Transformation Scenario(s) action from the DITA Maps Manager (on page 2503) toolbar.
2. Select the DITA Map WebHelp Responsive scenario from the DITA Map section.
3. If you want to configure the transformation, click the Edit button.

Step Result: This opens an Edit scenario configuration dialog box that allows you to configure various options in the following tabs:

- **Templates Tab (on page 2711)** - This tab contains a set of built-in publishing templates (on page 1508) that you can use for the layout of your WebHelp system output. You can also create your own publishing templates or edit existing ones (on page 1551).
- **Parameters Tab (on page 2717)** - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the Parameters section (on page 1263) below for details about the most commonly used parameters for WebHelp Responsive transformations.
- **Filters Tab (on page 2719)** - This tab allows you to filter certain content elements from the generated output.
- **Advanced Tab (on page 2720)** - This tab allows you to specify some advanced options for the transformation scenario.
- **Output Tab (on page 2722)** - This tab allows you to configure options that are related to the location where the output is generated.

4. Click Apply associated to process the transformation.
When the **DITA Map WebHelp Responsive** transformation is complete, the output is automatically opened in your default browser.

### WebHelp Responsive with Feedback Transformation Scenario

To publish a *DITA map* (on page 2793) as a **WebHelp Responsive with Feedback** system, follow these steps:

1. Select the **Configure Transformation Scenario(s)** action from the **DITA Maps Manager** (on page 2503) toolbar.  
2. Select the **DITA Map WebHelp Responsive with Feedback** scenario from the **DITA Map** section.  
3. If you want to configure the transformation, click the **Edit** button.

**Step Result:** This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:

- **Templates Tab** (on page 2711) - This tab contains a set of built-in publishing templates (on page 1508) that you can use for the layout of your WebHelp system output. You can also create your own publishing templates or edit existing ones (on page 1551).
- **Parameters Tab** (on page 2717) - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the Parameters section (on page 1263) below for details about the most commonly used parameters for WebHelp Responsive transformations.
- **Filters Tab** (on page 2719) - This tab allows you to filter certain content elements from the generated output.
- **Advanced Tab** (on page 2720) - This tab allows you to specify some advanced options for the transformation scenario.
- **Output Tab** (on page 2722) - This tab allows you to configure options that are related to the location where the output is generated.

4. Click **Apply associated** to begin the transformation.

5. Enter the documentation product ID (value for the `webhelp.product.id` parameter) and the documentation version (value for the `webhelp.product.version` parameter).

When the **DITA Map WebHelp Responsive with Feedback** transformation is complete, your default browser opens the **installation.html** file. This file contains information about the output location, system requirements, installation instructions, and deployment of the output. Follow the instructions to complete the system deployment (on page 1489).
Parameters for Customizing WebHelp Responsive Output

To customize a transformation scenario, you can edit various parameters, including the following most commonly used ones:

**default.language**

This parameter is used if the language is not detected in the DITA map. The default value is `en-us`.

**clean.output**

Deletes all files from the output folder before the transformation is performed (only `no` and `yes` values are valid and the default value is `no`).

**editlink.remote.ditamap.url**

Use this parameter in conjunction with `editlink.web.author.url` to add an *Edit* link next to the topic title in the WebHelp output. When a user clicks the link, the topic is opened in Oxygen XML Web Author where they can make changes that can be saved to a file server. The value should be set as the custom URL of the main DITA map. For example, a GitHub custom URL might look like this: `https://get_file_content/ oxyengxml/userguide/master/UserGuide.ditamap`.

**editlink.web.author.url**

This parameter needs to be used in conjunction with `editlink.remote.ditamap.url` to add an *Edit* link next to the topic title in the WebHelp output. When a user clicks the link, the topic is opened in Oxygen XML Web Author where they can make changes that can be saved to a file server. The value should be set as the URL of the Web Author installation. For example: `https://www.oxygenxml.com/oxygen-xml-web-author/`.

**editlink.present.only.path.to.topic**

When this parameter is set to "true", the DITA topic path is displayed to the right of each topic title in the WebHelp Responsive output. Also, when this parameter is used, the `editlink.remote.ditamap.url` and `editlink.web.author.url` parameters are ignored.

**fix.external.refs.com.oxygenxml** (Only supported when the DITA OT transformation process is started from Oxygen XML Author)

The DITA Open Toolkit usually has problems processing references that point to locations outside of the directory of the processed DITA map. This parameter is used to specify whether or not the application should try to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content. Allowed values: `true` or `false` (default).

**force.unique**
When set to `true` (default value), the transformation will be forced to create unique output files for each instance of a resource when a map contains multiple references to a single topic.

**use.stemming**

Controls whether or not you want to include stemming search algorithms into the published output (default setting is `false`).

**webhelp.custom.resources**

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

**webhelp.favicon**

The file path that points to an image to be used as a favicon in the WebHelp output.

**webhelp.reload.stylesheet**

Set this parameter to `true` if you have out of memory problems when generating WebHelp. It will increase processing time but decrease the memory footprint. The default value is `false`.

**webhelp.search.custom.excludes.file**

The path of the file that contains name patterns for HTML files that should not be indexed by the WebHelp search engine. Each exclude pattern must be on a new line. The patterns are considered to be relative to the output directory, and they accept wildcards such as `*` (matches zero or more characters) or `?` (matches one character). For more information about the patterns, see [https://ant.apache.org/manual/dirtasks.html#patterns](https://ant.apache.org/manual/dirtasks.html#patterns).

**webhelp.search.japanese.dictionary**

The file path of the dictionary that will be used by the Kuromoji morphological engine for indexing Japanese content in the WebHelp pages. The encoding for the dictionary must be `UTF8`.

**webhelp.search.enable.pagination**

Specifies whether or not search results will be displayed on multiple pages. Allowed values are `yes` or `no`.

**webhelp.search.page.numberOfItems**

Specifies the number of search results items displayed on each page. This parameter is only used when the `webhelp.search.enable.pagination` parameter is enabled.

**webhelp.search.ranking**

If this parameter is set to `false` then the 5-star rating mechanism is no longer included in the search results that are displayed on the Search tab (default setting is `true`).
webhelp.show.changes.and.comments

When set to yes, user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is no.

webhelp.sitemap.base.url

Base URL for all the loc elements in the generated sitemap.xml file. The value of a loc element is computed as the relative file path from the href attribute of a topicref element from the DITA map, appended to this base URL value. The loc element is mandatory in sitemap.xml. If you leave this parameter set to its default empty value, then the sitemap.xml file is not generated.

webhelp.sitemap.change.frequency

The value of the changefreq element in the generated sitemap.xml file. The changefreq element is optional in sitemap.xml. If you leave this parameter set to its default empty value, then the changefreq element is not added in sitemap.xml. Allowed values: <empty string> (default), always, hourly, daily, weekly, monthly, yearly, never.

webhelp.sitemap.priority

The value of the priority element in the generated sitemap.xml file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The priority element is optional in sitemap.xml. If you leave this parameter set to its default empty value, then the priority element is not added in sitemap.xml.

Parameters Specific to WebHelp Responsive Output

webhelp.default.collection.type.sequence

Specifies if the sequence value will be used by default when the collection-type attribute is not specified. This option is helpful if you want to have Next and Previous navigational buttons generated for all HTML pages. Allowed values are no (default) and yes.

webhelp.enable.search.autocomplete

Specifies if the Autocomplete feature is enabled in the WebHelp search text field. The default value is yes.

webhelp.fragment.after.body

In the generated output it displays a given XHTML fragment after the page body. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.logo_and_title
In the generated output it displays a given XHTML fragment after the logo and title. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.main.page.search

In the generated output it displays a given XHTML fragment after the search field. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.toc_or_tiles

In the generated output it displays a given XHTML fragment after the table of contents or tiles in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.top_menu

In the generated output it displays a given XHTML fragment after the top menu. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.body

In the generated output it displays a given XHTML fragment before the page body. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.logo_and_title

In the generated output it displays a given XHTML fragment before the logo and title. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.main.page.search

In the generated output it displays a given XHTML fragment before the search field. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.toc_or_tiles

In the generated output it displays a given XHTML fragment before the table of contents or tiles in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.top_menu

In the generated output it displays a given XHTML fragment before the top menu. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.
webhelp.fragment.footer

In the generated output it displays a given XHTML fragment as the page footer. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.head

In the generated output it inserts a given XHTML fragment in the <head> element. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.welcome

In the generated output it displays a given XHTML fragment as a welcome message (or title). The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.merge.nested.topics.related.links

Specifies if the related links from nested topics will be merged with the links in the parent topic. Thus the links will be moved from the topic content to the related links component and all of the links from the same group (for example, Related Tasks, Related References, Related Information) are merged into a single group. The default value is yes.

webhelp.search.stop.words.exclude

Specifies a list of words that will be excluded from the default list of stop words that are filtered out before the search processing. Use comma separators to specify more than one word (for example: if, for, is).

webhelp.show.breadcrumb

Specifies if the breadcrumb component will be presented in the output. The default value is yes.

webhelp.show.child.links

Specifies if child links will be generated in the output for all topics that have subtopics. The default value is no.

webhelp.show.indexterms.link

Specifies if an icon that links to the index will be presented in the output. The default value is yes.

webhelp.show.main.page.tiles

Specifies if the tiles component will be presented in the main page of the output. For a tree style layout, this parameter should be set to no.

webhelp.show.main.page.toc
Specifies if the table of contents will be presented in the main page of the output. The default value is \textit{yes}.

\texttt{webhelp.show.navigation.links}

Specifies if navigation links will be presented in the output. The default value is \textit{yes}.

\texttt{webhelp.show.print.link}

Specifies if a print link or icon will be presented within each topic in the output. The default value is \textit{yes}.

\texttt{webhelp.show.related.links}

Specifies if the related links component will be presented in the WebHelp Responsive output. The default value is \textit{yes}. The \texttt{webhelp.merge.nested.topics.related.links} parameter can be used in conjunction with this one to merge the related links from nested topics into the links in the parent topic.

\texttt{webhelp.show.publication.toc}

Specifies if a table of contents will be presented on the left side of each topic in the output. The default value is \textit{yes}.

\texttt{webhelp.show.topic.toc}

Specifies if a topic table of contents will be presented on the right side of each topic in the output. This table of contents contains links to each \texttt{<section>} within the current topic that contains an \texttt{@id} attribute and the section corresponding to the current scroll position is highlighted. The default value is \textit{yes}.

\texttt{webhelp.show.top.menu}

Specifies if a menu will be presented at the topic of the main page in the output. The default value is \textit{yes}.

\texttt{webhelp.publication.toc.hide.chunked.topics}

Specifies if the table of contents will contain links for \textit{chunked} topics. The default value is \textit{yes}.

\texttt{webhelp.publication.toc.links}

Specifies which links will be included in the table of contents. The possible values are:

- \texttt{chapter} (default) - The TOC will include links for the current topic, its children, its siblings, and its direct ancestor (including the direct ancestor's siblings), and the parent chapter.
- \texttt{topic} - The TOC will only include links for the current topic and its direct children.
- \texttt{all} - The TOC will include all links.

\texttt{webhelp.publication.toc.tooltip.position}
By default, if a topic contains a `shortdesc` element, its content is displayed in a tooltip when the user hovers over its link in the table of contents. This parameter controls whether or not this tooltip is displayed and its position relative to the link. The possible values are:

- **left** (default)
- **right**
- **top**
- **bottom**
- **hidden** - The tooltip will not be displayed.

**webhelp.top.menu.depth**

Specifies the maximum depth level of the topics that will be included in the top menu. The default value is `3`. A value of `0` means that the menu has unlimited depth.

**webhelp.topic.collapsible.elements.initial.state**

Specifies the initial state of collapsible elements (tables with titles, nested topics with titles, sections with titles, index term groups). The possible values are **collapsed** or **expanded** (default value).

**Related Information:**

- Customizing the WebHelp Responsive Output (on page 1551)
- WebHelp Responsive Output Layout and Features (on page 1474)

**DITA Map to WebHelp Classic Transformation**

DITA content can be transformed into several types of WebHelp Classic systems (with or without a feedback section). The WebHelp Classic layout and features (on page 1389) are designed for desktop systems and include a familiar classical style. Oxygen XML Author also provides numerous possibilities for customizing the WebHelp Classic output (on page 1422).

**WebHelp Classic Transformation Scenario**

To publish a DITA map (on page 2793) as a WebHelp Classic system, follow these steps:

1. Select the **Configure Transformation Scenario(s)** action from the DITA Maps Manager (on page 2503) toolbar.
2. Select the DITA Map WebHelp Classic scenario from the DITA Map section.
3. If you want to configure the transformation, click the Edit button.

**Step Result:** This opens an Edit scenario configuration dialog box that allows you to configure various options in the following tabs:

- **Skins Tab (on page 2709)** - This tab contains a set of built-in skins that you can use for the layout of your WebHelp system output.
- **Parameters Tab (on page 2717)** - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the Parameters section (on page 1272) below for details about the most commonly used parameters for WebHelp Responsive transformations.
- **Filters Tab (on page 2719)** - This tab allows you to filter certain content elements from the generated output.
- **Advanced Tab (on page 2720)** - This tab allows you to specify some advanced options for the transformation scenario.
- **Output Tab (on page 2722)** - This tab allows you to configure options that are related to the location where the output is generated.

4. Click **Apply associated** to process the transformation.

When the DITA Map WebHelp Classic transformation is complete, the output is automatically opened in your default browser.

### WebHelp Classic with Feedback Transformation Scenario

To publish a DITA map (on page 2793) as a WebHelp Classic with Feedback system, follow these steps:

1. Select the Configure Transformation Scenario(s) action from the DITA Maps Manager (on page 2503) toolbar.
2. Select the DITA Map WebHelp Classic with Feedback scenario from the DITA Map section.
3. If you want to configure the transformation, click the Edit button.

**Step Result:** This opens an Edit scenario configuration dialog box that allows you to configure various options in the following tabs:

- **Skins Tab (on page 2709)** - This tab contains a set of built-in skins that you can use for the layout of your WebHelp system output.
- **Parameters Tab (on page 2717)** - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the Parameters section (on page 1272) below for details about the most commonly used parameters for WebHelp Responsive transformations.
- **Filters Tab (on page 2719)** - This tab allows you to filter certain content elements from the generated output.
• **Advanced Tab (on page 2720)** - This tab allows you to specify some advanced options for the transformation scenario.

• **Output Tab (on page 2722)** - This tab allows you to configure options that are related to the location where the output is generated.

4. Click **Apply associated** to begin the transformation.

5. Enter the documentation product ID (value for the `webhelp.product.id` parameter) and the documentation version (value for the `webhelp.product.version` parameter).

When the **DITA Map WebHelp Classic with Feedback** transformation is complete, your default browser opens the `installation.html` file. This file contains information about the output location, system requirements, installation instructions, and deployment of the output. Follow the instructions to complete the system deployment (on page 1489).

For more information about the feedback-enabled WebHelp system, watch our video demonstration:

[https://www.youtube.com/embed/eoQ2uxHvppE](https://www.youtube.com/embed/eoQ2uxHvppE)

**Parameters for Customizing WebHelp Classic Output**

To customize a transformation scenario, you can edit various parameters, including the following most commonly used ones:

**default.language**

This parameter is used if the language is not detected in the **DITA map**. The default value is `en-us`.

**clean.output**

Deletes all files from the output folder before the transformation is performed (only `no` and `yes` values are valid and the default value is `no`).

**fix.external.refs.com.oxygenxml** (Only supported when the DITA OT transformation process is started from Oxygen XML Author)

The DITA Open Toolkit usually has problems processing references that point to locations outside of the directory of the processed **DITA map**. This parameter is used to specify whether or not the application should try to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content. Allowed values: `true` or `false` (default).

**force.unique**

When set to `true` (default value), the transformation will be forced to create unique output files for each instance of a resource when a map contains multiple references to a single topic.
use.stemming

Controls whether or not you want to include stemming search algorithms into the published output (default setting is \textit{false}).

\textbf{webhelp.body.script}

URL value that specifies the location of a well-formed XHTML file containing the custom script that will be copied in the \texttt{<body>} section of every WebHelp page.

\textbf{webhelp.copyright}

Adds a small copyright text that appears at the end of the \textbf{Table of Contents} pane.

\textbf{webhelp.custom.resources}

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

\textbf{webhelp.favicon}

The file path that points to an image to be used as a \textit{favicon} in the WebHelp output.

\textbf{webhelp.footer.file}

Path to an XML file that includes the footer content for your WebHelp output pages. You can use this parameter to integrate social media features (such as widgets for Facebook™, Twitter™, Google Analytics, or Google+™). The file must be well-formed, each widget must be in separate \texttt{div} or \texttt{span} element, and the code for each \texttt{script} element is included in an XML comment (also, the start and end tags for the XML comment must be on a separate line). The following code exert is an example for adding a Facebook™ widget:

\begin{verbatim}
<div id="facebook">
  <div id="fb-root"/>
  <script>
    !-- (function(d, s, id) { var js, fjs = d.getElementsByTagName(s)[0];
      if (d.getElementById(id)) return;
      js = d.createElement(s); js.id = id;
      js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
      fjs.parentNode.insertBefore(js, fjs); }
    (document, 'script', 'facebook-jssdk'));
  </script>
  <div data-share="true" data-show-faces="true" data-action="like"
    data-layout="standard" class="fb-like"/>
</div>
\end{verbatim}

\textbf{webhelp.footer.include}
Specifies whether or not to include footer in each WebHelp page. Possible values: yes, no. If set to no, no footer is added to the WebHelp pages. If set to yes and the webhelp.footer.file parameter has a value, then the content of that file is used as footer. If the webhelp.footer.file has no value then a default Oxygen footer is inserted in each WebHelp page.

webhelp.google.search.results

A file path that specifies the location of a well-formed XHTML file containing the Google Custom Search Engine element gcse:searchresults-only. You can use all supported attributes for this element. It is recommended to set the linkTarget attribute to frm for frameless (iframe) version of WebHelp or to contentWin for the frameset version of WebHelp. The default value for this attribute is _blank and the search results will be loaded in a new window. If this parameter is not specified, the following code will be used:

```xml
<gcse:searchresults-only linkTarget="frm"></gcse:searchresults-only>
```

webhelp.google.search.script

A file path that specifies the location of a well-formed XHTML file containing the Custom Search Engine script from Google.

webhelp.head.script

URL value that specifies the location of a well-formed XHTML file containing the custom script that will be copied in the <head> section of every WebHelp page.

webhelp.logo.image.target.url

Specifies a target URL that is set on the logo image. When you click the logo image, you will be redirected to this address.

webhelp.logo.image

Specifies a path to an image displayed as a logo in the left side of the output header.

webhelp.reload.stylesheet

Set this parameter to true if you have out of memory problems when generating WebHelp. It will increase processing time but decrease the memory footprint. The default value is false.

webhelp.search.custom.excludes.file

The path of the file that contains name patterns for HTML files that should not be indexed by the WebHelp search engine. Each exclude pattern must be on a new line. The patterns are considered to be relative to the output directory, and they accept wildcards such as `*` (matches zero or more characters) or `?` (matches one character). For more information about the patterns, see https://ant.apache.org/manual/dirtasks.html#patterns.

webhelp.search.japanese.dictionary
The file path of the dictionary that will be used by the Kuromoji morphological engine for indexing Japanese content in the WebHelp pages. The encoding for the dictionary must be UTF8.

**webhelp.search.ranking**

If this parameter is set to `false` then the 5-star rating mechanism is no longer included in the search results that are displayed on the Search tab (default setting is `true`).

**webhelp.show.changes.and.comments**

When set to `yes`, user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is `no`.

**webhelp.sitemap.base.url**

Base URL for all the `loc` elements in the generated `sitemap.xml` file. The value of a `loc` element is computed as the relative file path from the `href` attribute of a `topicref` element from the DITA map, appended to this base URL value. The `loc` element is mandatory in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `sitemap.xml` file is not generated.

**webhelp.sitemap.change.frequency**

The value of the `changefreq` element in the generated `sitemap.xml` file. The `changefreq` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `changefreq` element is not added in `sitemap.xml`. Allowed values: `<empty string>` (default), `always`, `hourly`, `daily`, `weekly`, `monthly`, `yearly`, `never`.

**webhelp.sitemap.priority**

The value of the `priority` element in the generated `sitemap.xml` file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The `priority` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `priority` element is not added in `sitemap.xml`.

DITA Map to PDF - based on HTML5 and CSS Transformation

Oxygen XML Author includes a built-in DITA Map PDF - based on HTML5 & CSS transformation scenario based on a DITA-OT CSS-based PDF Publishing plugin that converts DITA maps to PDF using a CSS-based processing engine and an HTML5 intermediate format. Oxygen XML Author comes bundled with a built-in CSS-based PDF processing engine called Oxygen PDF Chemistry. Oxygen XML Author also supports some third-party processors.

For those who are familiar with CSS, this makes it very easy to style and customize the PDF output of your DITA projects without having to work with xsl:fo customizations. This transformation also includes some built-in publishing templates that you can use for the layout of your PDF output and you can create your own templates or edit existing ones.

The following CSS-based PDF processors can be used:

- **Oxygen PDF Chemistry** - A built-in processor that is bundled with Oxygen XML Author. For more information, see the Oxygen PDF Chemistry User Guide. This is the supported processor.
- **Prince Print with CSS** (not included in the Oxygen XML Author installation kit) - A third-party component that needs to be purchased from [http://www.princexml.com](http://www.princexml.com).
- **Antenna House Formatter** (not included in the Oxygen XML Author installation kit) - A third-party component that needs to be purchased from [http://www.antennahouse.com/antenna1/formatter/](http://www.antennahouse.com/antenna1/formatter/).

How to Create the Transformation Scenario

To create a DITA Map PDF - based on HTML5 & CSS transformation scenario, follow these steps:

1. Click the Configure Transformation Scenario(s) button from the DITA Maps Manager (on page 2503) toolbar.
2. Select DITA Map PDF - based on HTML5 & CSS.
3. If you want to configure the transformation, click the Edit button.

**Step Result:** This opens an Edit scenario configuration dialog box that allows you to configure various options in the following tabs:

- **Templates Tab** (on page 2711) - This tab contains a set of built-in publishing templates that you can use for the layout of your WebHelp system output. You can also create your own publishing templates by saving one from the gallery and changing it.
- **CSS Processor Tab** - This is where you choose the processor type. You can select between Oxygen PDF Chemistry, Prince XML, or Antenna House.
- **Parameters Tab** (on page 2717) - This tab includes numerous parameters that can be set to customize your WebHelp system output.
• **Filters Tab (on page 2719)** - This tab allows you to filter certain content elements from the generated output.

• **Advanced Tab (on page 2720)** - This tab allows you to specify some advanced options for the transformation scenario.

• **Output Tab (on page 2722)** - This tab allows you to configure options that are related to the location where the output is generated.

4. In the **Parameters** tab, configure any of the following parameters (if applicable):

   • **args.css** - Specifies a path to a custom CSS to be used in addition to those specified in the publishing template. The files must have URL syntax and be separated using semicolons. Also, the `dita.css.list` parameter must be left empty to use these files in addition to the selection in the **Styles** drop-down menu.

   • **css.processor.path.chemistry** (if you are using the Oxygen PDF Chemistry processor) - Specifies the path to the Oxygen PDF Chemistry executable file that will be run to generate the PDF. If this parameter is not set, the transformation will use the processor specified in the **CSS-based Processors** preferences page (on page 210).

   • **css.processor.path.prince** (if you are using the Prince Print with CSS processor) - Specifies the path to the Prince executable file that will be run to produce the PDF. If you installed Prince using its default settings, you can leave this blank.

   • **css.processor.path.antenna-house** (if you are using the Antenna House Formatter processor) - Specifies the path to the Antenna House executable file that will be run to produce the PDF. If you installed Antenna House using its default settings, you can leave this blank.

   • **show.changes.and.comments** - When set to **yes**, user comments, replies to comments, and tracked changes are published in the PDF output. The default value is **no**.

   • **figure.title.placement** - Controls the position of the figure title relative to the image. Allowed values are "top" and "bottom", "top" is the default

5. Click **OK** and run the transformation scenario.

---

**Customizing the Output**

For information about customizing the output, see **CSS-based DITA to PDF Customization (on page 1629)**.

DITA Map to PDF - based on DITA and CSS (WYSIWYG) (Deprecated)

⚠️ **Attention:** This transformation scenario was deprecated starting with version 21.0. If you have configured scenarios associated to your project based on this transformation scenario, you will still be able to use them, but for new transformations, it is recommended to use the **DITA Map PDF - based on HTML5 & CSS** transformation scenario (on page 1275) instead.

Oxygen XML Author includes a built-in **DITA Map to PDF - based on DITA & CSS (WYSIWYG)** transformation scenario based on a **DITA-OT CSS-based PDF Publishing plugin** that convert DITA maps to PDF using a CSS-based processing engine. Oxygen XML Author also comes bundled with a built-in CSS-based PDF processing engine called **Oxygen PDF Chemistry**. For those who are familiar with CSS, this makes it very easy to style and customize the PDF output of your DITA projects without having to work with **xsl:fo** customizations. Oxygen XML Author also supports some third-party processors.

The following processors are supported:

- **Oxygen PDF Chemistry** - A built-in processor that is bundled with Oxygen XML Author. For more information, see the **Oxygen PDF Chemistry User Guide**.
- **Prince XML** (not included in the Oxygen XML Author installation kit) - A third-party component that needs to be purchased from [http://www.princexml.com](http://www.princexml.com).
- **Antenna House Formatter** (not included in the Oxygen XML Author installation kit) - A third-party component that needs to be purchased from [http://www.antennahouse.com/antenna1/formatter/](http://www.antennahouse.com/antenna1/formatter/).

**DITA Map to PDF - based on DITA and CSS (WYSIWYG) Transformation Scenario**

To create a **DITA Map to PDF - based on DITA & CSS (WYSIWYG)** transformation scenario, follow these steps:

1. Click the Configure Transformation Scenario(s) button from the **DITA Maps Manager** (on page 2503) toolbar.
2. Select **DITA Map to PDF - based on DITA & CSS (WYSIWYG)**.
3. If you want to configure the transformation, click the **Edit** button.
**Step Result:** This opens an *Edit scenario* configuration dialog box that allows you to configure various options in the following tabs:

- **CSS Processor** Tab - This is where you choose the processor type. You can select between *Oxygen PDF Chemistry*, *Prince XML*, or *Antenna House*.
- **Parameters** Tab *(on page 2717)* - This tab includes numerous parameters that can be set to customize your WebHelp system output.
- **Filters** Tab *(on page 2719)* - This tab allows you to filter certain content elements from the generated output.
- **Advanced** Tab *(on page 2720)* - This tab allows you to specify some advanced options for the transformation scenario.
- **Output** Tab *(on page 2722)* - This tab allows you to configure options that are related to the location where the output is generated.

4. In the **Parameters** tab, configure any of the following parameters (if applicable):

- **args.css** - Specifies a path to a *custom CSS* *(on page 1657)* to be used in addition to those specified in the *dita.css.list* parameter OR in addition to the CSS that is currently selected in the *Styles* drop-down menu. The files must have URL syntax and be separated using semicolons. Also, the *dita.css.list* parameter must be left empty to use these files in addition to the selection in the *Styles* drop-down menu.

- **dita.css.list** - Specifies a list of CSS URLs to be used by the PDF processor (instead of the default CSS files). The files must have URL syntax and be separated using semicolons. If the value is empty, the CSS associated with the current selection from the *Styles* drop-down menu is used.

- **css.processor.path.chemistry** *(if you are using the Oxygen PDF Chemistry processor)* - Specifies the path to the *Oxygen PDF Chemistry* executable file that will be run to generate the PDF. If this parameter is not set, the transformation will use the processor specified in the CSS-based Processors preferences page *(on page 210)*.

- **css.processor.path.prince** *(if you are using the Prince Print with CSS processor)* - Specifies the path to the Prince executable file that will be run to produce the PDF. If you installed Prince using its default settings, you can leave this blank.

- **css.processor.path.antenna-house** *(if you are using the Antenna House Formatter processor)* - Specifies the path to the Antenna House executable file that will be run to produce the PDF. If you installed Antenna House using its default settings, you can leave this blank.

- **show.changes.and.comments** - When set to *yes*, user comments, replies to comments, and *tracked changes* are published in the PDF output. The default value is *no*.

- **figure.title.placement** - Controls the position of the figure title relative to the image. Allowed values are "top" and "bottom", "top" is the default

5. Click **OK** and run the transformation scenario.
Customizing the Output

The DITA-OT CSS-based PDF Publishing plugin makes it very easy to style and customize the PDF output of your DITA projects without having to work with xsl:fo customizations. You can style the PDF output by simply using a custom CSS to change the styling and then re-running the transformation scenario until you get the desired result.

For more information about customizing the output, see: CSS-based DITA to PDF Customization (on page 1629).

Changing the Style of an Element

To change the style of a particular element, you need to create an additional CSS file that will store the customization rules. Once you have created this file, you need to instruct the editor how to use this additional CSS. This can be done in two ways:

- Specify the path to your custom CSS using the args.css parameter:
  1. Edit a DITA Map to PDF - based on DITA & CSS (WYSIWYG) transformation scenario.
  2. In the Parameters tab, specify the path to your custom CSS files in the args.css parameter.
  3. Click OK and run the transformation scenario.

  This method is appropriate if you just want to apply the styling customization to the output.

- Create an alternate CSS for the DITA document type:
  1. Follow the procedure for adding an alternate CSS file in Customizing Author Mode Using CSS Files Associated with a Framework (on page 1917).
  2. Once you have configured your CSS as an additional layer, you can select it from the Styles drop-down menu (on the toolbar) (on page 1919).
  3. Run the DITA Map to PDF - based on DITA & CSS (WYSIWYG) transformation scenario and the customization rules from the additional CSS will be visible in the produced PDF.

  This method allows you to have many customization CSS files and simply select the one that you need at any time for both the output and the rendering in Author mode.

Related Information:

- Configuring and Managing Multiple CSS Styles for a Framework (on page 1919)
Creating a DITA Map to PDF - based on XSL-FO Transformation Scenario

To create a *DITA Map to PDF - based on XSL-FO* transformation scenario, follow these steps:

1. Click the "Configure Transformation Scenario(s)" button from the *DITA Maps Manager* (on page 2503) toolbar.
2. Select *DITA Map PDF - based on XSL-FO* and click the Edit button (or use the Duplicate button if your framework (on page 2794) is read-only).
3. Use the various tabs to configure the transformation scenario. In the Parameters tab, you can use a variety of parameters to customize the output. For example, the following parameters are just a few of the most commonly used ones:
   - `show.changes.and.comments` - If set to `yes`, user comments, replies to comments, and tracked changes are published in the PDF output.
   - `customization.dir` - Specifies the path to a customization directory.
   - `editlink.remote.ditamap.url` - When this parameter is set to "true", the DITA topic path is displayed to the right of each topic title in the PDF output.
4. Click OK and then the Apply Associated button to run the transformation scenario.

Related Information:

- XSL FO-based DITA to PDF Customization (on page 1783)
That is used by the transformation scenario as a template to generate the final Word document.

Tip: You can make general modifications to the **Normal.docx** template file to alter the published output.

### Configuring the Transformation Scenario

To configure an **DITA Map to MS Office Word** transformation scenario, follow these steps:

1. Open the DITA map in the **DITA Maps Manager (on page 2503)**.
2. Click the 🔄 **Configure Transformation Scenario(s)** button from the **DITA Maps Manager (on page 2503)** toolbar.
3. Select **DITA Map MS Office Word**.
4. For advanced customizations, in the **Parameters** tab you can use any of the following parameters that are unique to this transformation scenario to specify paths to files that affect the output in various ways:
   - `dotx.file` - Specifies the path to a Word template file (.docx) that will be used in the transformation to generate the final Word document. Set this parameter if you want to use a different template file other than the **Normal.docx** file that is used by default.
   - `document.flat.xsl` - Specifies the path to a pre-process clean-up stylesheet.
   - `core.xsl` - Specifies the path to a core metadata stylesheet.
   - `custom.xsl` - Specifies the path to a custom metadata stylesheet.
   - `document.xsl` - Specifies the path to a main document stylesheet.
   - `comments.xsl` - Specifies the path to a comments stylesheet.
   - `numbering.xsl` - Specifies the path to a list and title numbering stylesheet.
   - `footnotes.xsl` - Specifies the path to a footnote stylesheet.
   - `document.xml.xsl` - Specifies the path to a document relations metadata stylesheet.
   - `inkscape.exec` - Specifies the path to an Inkscape (open-source vector graphics editor) executable file.
5. Click **OK** and run the transformation scenario.

**Result:** The result of the transformation will automatically be opened in your system's default word processing application (such as Microsoft Word).

**Related Information:**

- [Editing a Transformation Scenario (on page 1374)](OXYGEN_INSTALL_DIR)/frameworks/dita/DITA-OT3.x/plugins/com.elovirta.ooxml/resources)
DITA Map to CHM (Compiled HTML Help) Transformation

To perform a Compiled HTML Help (CHM) transformation, Oxygen XML Author needs Microsoft HTML Help Workshop to be installed on your computer. Oxygen XML Author automatically detects HTML Help Workshop and uses it.

**Note:** HTML Help Workshop might fail if the files used for transformation contain accents in their names, due to different encodings used when writing the .hhp and .hhc files. If the transformation fails to produce the CHM output but the .hhp (HTML Help Project) file is already generated, you can manually try to build the CHM output using HTML Help Workshop.

### Changing the Output Encoding

Oxygen XML Author uses the `htmlhelp.locale` parameter to correctly display specific characters of different languages in the output of the Compiled HTML Help (CHM) transformation. By default, the DITA Map CHM transformation scenario that comes bundled with Oxygen XML Author has the `htmlhelp.locale` parameter set to `en-US`.

To customize this parameter, follow this procedure:

1. Use the `Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on OS X))` action from the toolbar or the Document > Transformation menu.
2. Select the DITA Map CHM transformation scenario and click the Edit button.
3. In the Parameter tab, search for the `htmlhelp.locale` parameter and change its value to the desired language tag.

**Note:** The format of the `htmlhelp.locale` parameter is `LL-CC`, where `LL` represents the language code (`en`, for example) and `CC` represents the country code (`us`, for example). The language codes are contained in the ISO 639-1 standard and the country codes are contained in the ISO 3166-1 standard. For further details about language tags, go to [http://www.rfc-editor.org/rfc/rfc5646.txt](http://www.rfc-editor.org/rfc/rfc5646.txt).

DITA Map to Kindle Transformation

Oxygen XML Author requires KindleGen to generate Kindle output from DITA maps (on page 2793). To install KindleGen for use by Oxygen XML Author, follow these steps:
1. Go to www.amazon.com/kindleformat/kindlegen and download the zip file that matches your operating system.
2. Unzip the file on your local disk.
3. Start Oxygen XML Author and open a DITA map in the DITA Maps Manager view (on page 2503).
4. Click the Configure Transformation Scenario(s) button.
5. Select the DITA Map Kindle transformation and press the Edit button to edit it.
6. Go to Parameters tab and set the kindlegen.executable parameter as the path to the KindleGen directory.
7. Accept the changes.

Running a DITA Transformation Scenario

To select and run a transformation scenario on your DITA map, follow these steps:

1. Click the Configure Transformation Scenario(s) button on the DITA Maps Manager toolbar (on page 2505). The Configure Transformation Scenario(s) dialog box (on page 1378) appears. This dialog box lists all the transformation scenarios that have been configured in your project. Oxygen XML Author provides a default set of transformation scenarios, but the people in charge of your DITA system may have provided others that are specifically configured for your needs.
2. Select the transformation scenario you want to run and click Apply Associated. The transformation scenario runs in the background. You can continue to work in Oxygen XML Author while the transformation is running. If there are errors or warnings, Oxygen XML Author displays them when the transformation is complete. If the transformation is successful, Oxygen XML Author opens the output in the appropriate application.
3. To rerun the same scenario again, click the Apply Transformation Scenario(s) button.

Creating or Editing a DITA OT Transformation

Creating a DITA OT Transformation Scenario

To create a DITA OT Transformation scenario, use one of the following methods:

• Use the Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on OS X)) action from the DITA Maps Manager toolbar, main toolbar, or the Document > Transformation menu. Then click the New button and select DITA OT Transformation.
• Go to Window > Show View and select Transformation Scenarios to display this view. Click the + New Scenario drop-down menu button and select DITA OT Transformation.
Both methods open the **DITA Transformation Type** dialog box that presents the list of possible outputs.

**Figure 633. DITA Transformation Type Dialog Box**

Select the desired type of output and click **OK**. This opens the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario and the following **Storage** options:

- **Project Options (on page 2798)** - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.

- **Global Options (on page 2795)** - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation. Some of these tabs are only available for certain output types (for example, a **Skins** tab is only available for **WebHelp Classic** and **WebHelp Classic with Feedback** output types, a **Templates** tab is available only for **WebHelp Responsive** and **WebHelp Responsive with Feedback**, and a **FO Processor** tab is available for PDF output).

**Editing a DITA OT Transformation Scenario**

Editing a transformation scenario is useful if you need to configure some of its parameters.
To configure an existing transformation scenario, follow these steps:

1. Select the **Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on OS X))** action from the DITA Maps Manager toolbar, main toolbar, or the Document > Transformation menu.

   **Step Result:** The **Configure Transformation Scenario(s)** dialog box (on page 1378) is opened.

2. Select the particular transformation scenario and click the Edit button at the bottom of the dialog box or from the contextual menu.

   **Note:** Since transformation scenarios that are associated with built-in frameworks (on page 2794) are read-only, these scenarios will prompt you to use the Duplicate button and then edit the duplicated scenario (on page 1376).

**Result:** This will open an Edit scenario configuration dialog box (on page 1374) that contains several tabs that allow you to configure the options that control the transformation. Some of these tabs are only available for certain output types (for example, a Skins tab is only available for WebHelp Classic and WebHelp Classic with Feedback output types, a Templates tab is available only for WebHelp Responsive and WebHelp Responsive with Feedback, and a FO Processor tab is available for PDF output).

**Related Information:**

**Skins Tab (DITA OT Transformations)**

When you create a new transformation scenario (on page 1292) or edit an existing one (on page 1374), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The Skins tab is available for DITA OT transformations with WebHelp Classic or WebHelp Classic with Feedback output types and it provides a set of built-in skins that you can use as a base for your WebHelp system output.
A skin is a collection of CSS properties that can alter the look of the output by changing colors, font types, borders, margins, and paddings. This allows you to rapidly adapt the look and feel of your output.

Figure 634. Skins Tab

The Skins tab includes the following sections:

**Built-in Skins**

This section presents the built-in skins that are included in Oxygen XML Author. The built-in skins cover a wide range of chromatic themes, ranging from a very light one to a high-contrast variant. To see how the skin looks when applied on a sample documentation project that is stored on the Oxygen XML Author website, press the online preview link.

**Custom Skins**

You can use this section to customize the look of the output.

**CSS File**

You can set this field to point to a custom CSS stylesheet or customized skin. A custom CSS file will overwrite a skin selection.

**Note:** The output can also be styled by setting the args.css parameter in the Parameters tab. The properties taken from the stylesheet referenced in this parameter take precedence over the properties declared in the skin set in the Skins tab.
Create custom skin

Use this link to open the **WebHelp Skin Builder** *(on page 1422)* tool.

Templates Tab (DITA OT Transformations)

When you create a new transformation scenario *(on page 1292)* or edit an existing one *(on page 1374)*, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Templates** tab is available for DITA OT transformations with **WebHelp Responsive**, **WebHelp Responsive with Feedback**, or **PDF - based on HTML5 & CSS** output types and it provides a set of built-in publishing templates *(on page 1508)*. You can use one of them to publish your documentation or as a starting point for a new publishing template.

Figure 635. Templates Tab

Filtering and Previewing Templates

You can click on the tags at the top of the pane to filter the templates and narrow your search. Each built-in template also includes an **Online preview** icon in the bottom-right corner that opens a webpage in your default browser providing a sample of how the main page will look when that particular template is used to generate the output.
Built-in Templates Locations

Oxygen XML Author scans the following locations to find the built-in templates to display in the dialog box:

- **WebHelp Responsive Templates** - All built-in WebHelp Responsive publishing templates are stored in the following directory: `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/templates`.
- **PDF - based on HTML5 & CSS** - All built-in PDF publishing templates are stored in the following directories:
  - `DITA-OT-DIR/plugins/com.oxygenxml.pdf.css/templates`
  - `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/templates`

Custom Templates Locations

Oxygen XML Author scans the locations specified in the DITA > Publishing preferences page (on page 218) to find custom templates to display in the dialog box. You can access that preferences page directly from the Template tab by clicking on the Configure Publishing Templates Gallery link.

Selecting Custom Templates

Once you are finished configuring your template, you can click the Choose Custom Publishing Template link to select your template.

You can also add your custom templates (on page 1554) to the list of templates displayed in the Templates tab. To do this, store them in a directory, then click the Configure Publishing Templates Gallery link to open the DITA > Publishing preferences page (on page 218) where you can add that directory to the list. All the templates contained in your template directory will be displayed in the preview pane along with all the built-in templates.

Save Template As Button

You can use the Save template as button (at the bottom-left of the transformation dialog box) to export the currently selected template into a new template package that can be used as a starting point to create your own custom template (on page 1645). Clicking this button will open a template package configuration dialog box (on page 1324) that contains some options and displays the parameters that will be exported to your template package.
Template Errors

When the Templates tab is opened, all templates (built-in and custom) are loaded and validated. Specifically, certain elements in the template descriptor file are checked for validity. If errors are encountered that prevents the template from loading, the following message will be displayed toward the bottom of the dialog box:

If you click the More details link, a window will open with more information about the encountered error. For example, it might offer a hint for which element is missing from the expected descriptor file structure.

Also, if a template could be loaded, but certain elements could not be found in the descriptor file, a warning icon (⚠️) will be displayed on the template's image (in the Templates tab of the transformation dialog box). For example, this happens if a valid preview-image element cannot be found.

Sharing Publishing Template

To share a publishing template with others, following these steps:

1. Copy your template in a new folder.
2. Go to Options > Preferences > DITA > Publishing (on page 218) and add that new folder to the list.
3. Switch the option as the bottom of that preferences page to Project Options.
4. Share your project file (.xpr).

For more information about customizing publishing templates, watch our video demonstration:

https://www.youtube.com/embed/zNmXfKWXwO8

Related Information:

- Publishing Templates (on page 1508)
- Publishing Template Package Contents for PDF Customizations (on page 1639)
- Publishing Template Package Contents for WebHelp Responsive Customizations (on page 1511)
Template Package Configuration Dialog Box

The **Save template as** button (at the bottom-left of the transformation dialog box for **WebHelp Responsive** or **PDF - based on HTML5 & CSS** transformations) can be used to export the currently selected template into a new template package that can be used as a starting point to create your own custom template (on page 1645). The result will be a ZIP archive that contains a template descriptor file and other resources (such as CSS files) that were attached to the selected template.

Clicking the **Save template as** button opens a template package configuration dialog box contains the following options and components:

**Name**

Required field used to specify the name for the new template. This will become the text value of the `name` element in the template descriptor file. This information is displayed as the name of the template in the transformation scenario dialog box.

**Description**

Optional field used to specify a template description. This will become the text value of the `description` element in the template descriptor file. This information is displayed when the user hovers over the template in the transformation scenario dialog box.

**Parameter Table**

This table displays the parameters that will be exported. Only relevant parameters are exported. The parameters and their values will be inserted in the `parameters` section of the template descriptor file. If any of the parameter values point to a file path that references a template resource (such as CSS files, custom HTML fragments, images), those resources will automatically be copied to the new template package and their references will be changed accordingly.

**Note:** Additional resources that are referenced in CSS files or other resources will not be copied to the new template package, so you will need to copy them manually and update their references in the template descriptor file.

**Include WebHelp Customization**

The same publishing template package can contain both a WebHelp Responsive and PDF customization and you can use the same template in both types of transformations [**DITA Map WebHelp Responsive** (on page 1261) or **DITA Map to PDF - based on HTML5 & CSS** (on page 1275)]. This option specifies that the custom template will include a WebHelp Responsive customization.

**Include HTML Page Layout Files**

For **WebHelp Responsive** customizations, select this option if you want to copy the default **HTML Page Layout Files** (on page 1525) into your
template package. They are helpful if you want to change the structure of the generated HTML pages.

Include PDF Customization

The same publishing template package can contain both a WebHelp Responsive and PDF customization and you can use the same template in both types of transformations (DITA Map WebHelp Responsive (on page 1261) or DITA Map to PDF - based on HTML5 & CSS (on page 1275)). This option specifies that the custom template will include a PDF customization.

Save as

Use this field to specify the name and path of the ZIP file where the template will be saved.

Figure 636. Template Package Configuration Dialog Box

FO Processor Tab (DITA OT Transformations)

When you create a new transformation scenario (on page 1292) or edit an existing one (on page 1374), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The FO Processor tab is available for DITA OT transformations with a PDF output type.

This tab allows you to select an FO Processor to be used for the transformation.

Figure 637. FO Processor Configuration Tab

You can choose one of the following processors:

**Apache FOP**

The default processor that comes bundled with Oxygen XML Author.

**XEP**

The RenderX XEP processor. If XEP is already installed, Oxygen XML Author displays the detected installation path under the drop-down menu. XEP is considered installed if it was detected in one of the following sources:

- XEP was configured as an external FO Processor in the FO Processors option page (on page 206).
- The system property com.oxygenxml.xep.location was set to point to the XEP executable file for the platform (for example: xep.bat on Windows).
- XEP was installed in the DITA-OT-DIR/plugins/org.dita.pdf2/lib directory of the Oxygen XML Author installation directory.

**Antenna House**
The Antenna House (AH Formatter) processor. If Antenna House is already installed, Oxygen XML Author displays the detected installation path under the drop-down menu. Antenna House is considered installed if it was detected in one of the following sources:

- Environment variable set by Antenna House installation (the newest installation version will be used).
- Antenna House was added as an external FO Processor in the Oxygen XML Author preferences pages.

To further customize the PDF output obtained from the Antenna House processor, follow these steps:

1. **Edit** the transformation scenario.
2. Open the **Parameters tab** *(on page 2717)*.
3. Add the `env.AXF_OPT` parameter and point to the Antenna House configuration file.

### Related Information:

- FO Processors Preferences *(on page 206)*
- XSL-FO (Apache FOP) Processor for Generating PDF Output *(on page 1354)*

### Parameters Tab (DITA OT Transformations)

When you **create a new transformation scenario** *(on page 1292)* or **edit an existing one** *(on page 1374)*, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Parameters** tab allows you to configure the parameters sent to the DITA-OT build file.

The table in this tab displays all the parameters that the DITA-OT documentation specifies as available for each chosen type of transformation (for example, XHTML or PDF), along with their description and current values. You can find more information about each parameter in the DITA OT Documentation. You can also add, edit, and remove parameters, and you can use the text box to filter or search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

Depending on the type of a parameter, its value can be one of the following:

- A simple text field for simple parameter values.
- A combo box with some predefined values.
• A file chooser and an editor variable (on page 266) selector to simplify setting a file path as the value of a parameter.

**Note:** To input parameter values at runtime, use the ask editor variable (on page 267) in the Value column.

Below the table, the following actions are available for managing parameters:

**New**

Opens the Add Parameter dialog box that allows you to add a new parameter to the list. You can specify the Value of the parameter by using the Insert Editor Variables (on page 266) button or the Browse button.

**Unset**

Resets the selected parameter to its default value. Available only for edited parameters with set values.

**Edit**

Opens the Edit Parameter dialog box that allows you to change the value of the selected parameter or its description.

**Delete**

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

**Parameters Contributed by an Oxygen Publishing Template**

Transformation parameters that are defined in an Oxygen Publishing Template (on page 1637) descriptor file are displayed in italics. After creating a publishing template (on page 1645) and adding it to the templates gallery (on page 1554), when you select the template in the Templates tab (on page 2711), the Parameters tab will automatically be updated to include the parameters defined in the template descriptor file.

**Related Information:**

• DITA Open Toolkit Documentation
Feedback Tab (DITA OT Transformations)

When you create a new transformation scenario (on page 1292) or edit an existing one (on page 1374), a configuration dialog box allows you to customize the transformation with various options in several tabs.

⚠️ Attention: This tab is for a feature that has not yet been implemented. To check the progress of the feature, see https://feedback.oxygenxml.com/.

The Feedback tab is available for the WebHelp Responsive transformation type and can be used to connect the published WebHelp Responsive output to an Oxygen Feedback server to provide a comment section in the output where users can offer feedback and ask questions.

When you configure the Oxygen Feedback server, you will retrieve an HTML fragment during site creation procedure. Click the Edit button at the bottom-right of this tab to open a dialog box where you will paste the HTML fragment (using keyboard shortcut keys or contextual menu actions).

Filters Tab (DITA Transformations)

When you create a new transformation scenario (on page 1292) or edit an existing one (on page 1374), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The Filters tab allows you to add filters to remove certain content elements from the generated output.

Figure 638. Edit Filters Tab
You can choose one of the following options to define filters:

**Use DITAVAL file**

If you already have a DITAVAL file associated with the DITA map (on page 2793), you can specify the file to be used when filtering content. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 266) button, or the browsing actions in the Browse drop-down list. You can find out more about constructing a DITAVAL file in the DITA Documentation.

⚠️ Attention: If a filter file is specified in the args.filter parameter (in the Parameters tab (on page 2717)), that file takes precedence over a DITAVAL file specified here.

**Use profiling condition set**

Sets the profiling condition set (on page 2746) that will be applied to your transformation.

**Exclude from output all elements with any of the following attributes**

By using the New, Edit, or Delete buttons at the bottom of the pane, you can configure a list of attributes (name and value) to exclude all elements that contain any of these attributes from the output.

Advanced Tab (DITA OT Transformations)

When you create a new transformation scenario (on page 1292) or edit an existing one (on page 1374), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The Advanced tab allows you to specify advanced options for the transformation scenario.

Figure 639. Advanced Settings Tab
You can specify the following parameters:

**Custom build file**

If you use a custom DITA-OT build file, you can specify the path to the customized build file. If empty, the build.xml file from the dita.dir parameter that is configured in the Parameters tab (on page 2717) is used. You can specify the path by using the text field, the **Insert Editor Variables** (on page 266) button, or the **Browse** button.

**Build target**

Optionally, you can specify a build target for the build file. If no target is specified, the default `init` target is used.

**Additional arguments**

You can specify additional command-line arguments to be passed to the transformation (such as `-verbose`).

**Ant Home**

You can choose between the default or custom Ant installation to run the transformation. The default path can be configured in the Ant preferences page (on page 211).

**Java Home**
You can choose between the default or custom Java installation to run the transformation. The default path is the Java installation that is used by Oxygen XML Author.

**Note:** It may be possible that the used Java version is incompatible with the DITA Open Toolkit engine. For example, DITA-OT 2.0 and newer requires Java 1.7 or newer. Thus, if you encounter related errors running the transformation, consider installing a Java VM that is supported by the DITA OT publishing engine and using it in the Java Home text field.

**JVM Arguments**

This parameter allows you to set specific parameters for the Java Virtual Machine used by Ant. For example, if it is set to `-Xmx384m`, the transformation process is allowed to use 384 megabytes of memory. When performing a large transformation, you may want to increase the memory allocated to the Java Virtual Machine. This will help avoid Out of Memory error messages (`OutOfMemoryError`).

**Libraries**

By default, Oxygen XML Author adds libraries (as high priority) that are not transformation-dependent and also patches for certain DITA Open Toolkit bugs. You can use this button to specify additional libraries (`JAR (on page 2795)` files or additional class paths) to be used by the transformer.

**Tip:** You can specify the path to the additional libraries using wildcards (for example, `${oxygenHome}/lib/*.jar`).

**Output Tab (DITA OT Transformations)**

When you create a new transformation scenario (on page 1292) or edit an existing one (on page 1374), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Output** tab allows you to configure options that are related to the location where the output is generated.

Figure 640. Output Settings Tab
You can specify the following parameters:

**Base directory**

All the relative paths that appear as values in parameters are considered relative to the base directory. The default value is the directory where the transformed map is located. You can specify the path by using the text field, the Insert Editor Variables (on page 266) button, or the Browse button.

**Temporary files directory**

This directory is used to store pre-processed temporary files until the final output is obtained. You can specify the path by using the text field, the Insert Editor Variables (on page 266) button, or the Browse button.

**Output directory**

The folder where the content of the final output is stored. You can specify the path by using the text field, the Insert Editor Variables (on page 266) button, or the Browse button.

**Note:** If the DITA map (on page 2793) or topic is opened from a remote location or a ZIP file, the parameters must specify absolute paths.

**Open in Browser/System Application**
If selected, Oxygen XML Author automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows PDF files are often opened in Acrobat Reader).

**Note:** To set the web browser that is used for displaying HTML/XHTML pages, go to **Options > Preferences > Global**, and set it in the **Default Internet browser** field.

- **Output file** - When **Open in Browser/System Application** is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When **Open in Browser/System Application** is selected, you can use this option to open the file specified in this field at the end of the transformation.
  
  You can specify the path by using the text field, the 📀 **Insert Editor Variables** (on page 266) button, or the ➡️ **Browse** button.

**Open in editor**

When this is option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

At the bottom of the pane there is a link to the **Console options** (on page 218) preferences page that contains options to control the display of the console output received from the publishing engine.

**Customizing DITA Transformations**

You can customize the appearance of any of the output types by customizing the output transformations. There are several ways to do this:

- Most transformations are configurable by passing parameters to the transformation script. Oxygen XML Author allows you to set parameters (on page 2717) on a transformation scenario and you can save and share them with others (on page 1384). You can also use the **$${ask}$$ editor variable (on page 267) in the **Parameters** tab to instruct Oxygen XML Author to prompt you for a particular parameter whenever a transformation scenario is run. You can set up multiple transformation scenarios for a given output type, allowing you to maintain several customized transformation scenarios for multiple types of output configurations.
- If you want to customize an output in a way not supported by the built-in customization options, you can create a modified version of the transformation code and execute it using a custom build file (on page 2726). Sometimes the transformation code exports specific forms of extensions or customizations. You should consult the DITA Open Toolkit for the transformation type that you are interested in to see what customization options are supported.
• You can also write your own transformation code (and execute it using a custom build file (on page 2726)) to produce a type of output not supported by the DITA Open Toolkit. You can create Oxygen XML Author transformation scenarios to run these scripts once they are complete.

There are also many other ways to customize specific types of output generated from DITA transformations:

• **WebHelp** - For information about customizing WebHelp output, see the WebHelp Output section (on page 1388).
• **PDF** - For information about customizing PDF output generated from DITA content, see XSL FO-based DITA to PDF Customization (on page 1783).

**Publishing Customizations**

Some customizations (usually for HTML-based output), can be made simply by creating a custom CSS and they do not involve modifying the DITA-OT engine in any way. Instead, most customizations involve adding a new plugin to the DITA-OT. Here are some best practices to follow before beginning your customization:

1. Copy the bundled DITA-OT folder (usually OXYGEN_INSTALL_DIR\frameworks\dita\DITA-OT3.x) to a location where you have full write access so that you have the ability to install new DITA-OT plugins (on page 2768).
2. Go to Options > Preferences > DITA, select Custom for the DITA Open Toolkit option and set the Location to be the path to the location where you copied the bundled DITA-OT folder. This will allow you to upgrade the version of Oxygen XML Author at anytime without affecting the publishing system.
3. Share that external DITA-OT folder with the rest of the team. If you are using a repository (such as Subversion or Git), you can commit the entire modified DITA-OT publishing engine as part of your project. This will allow everyone in your team to use the official changes that you made. This will also allow you to set up some kind of automatic publishing system using an open-source integration server (such as Travis CI or Jenkins).

**Customizing XHTML-based Output**

XHTML-based output can be modified by using a custom CSS stylesheet to override various styles. If you edit an XHTML transformation scenario (on page 2707), there is a parameter called args.css that can be set to point to your custom CSS and a parameter called args.copy.css that can be set to yes to copy the CSS to the output folder.

You can also create plugins to customize the XHTML-based output by adding an extra XSLT stylesheet. For for information, see: http://blog.oxygenxml.com/2013/12/creating-simple-dita-open-
A list with all DITA-OT XSLT extension points can be found here: http://www.dita-ot.org/dev/extension-points/plugin-extension-points-xslt-import.html.

**Customizing WebHelp-based Output**

The DITA-OT that comes bundled in Oxygen XML Author includes specific plugins that provide the ability to publish DITA content to WebHelp Classic (on page 1389) and WebHelp Responsive (on page 1473) output.

For information about customizing WebHelp Classic output, see Customizing WebHelp Classic Output (on page 1422).

For information about customizing WebHelp Responsive output, see Customizing the WebHelp Responsive Output (on page 1551).

**Customizing PDF-based Output**

DITA to PDF output can be customized either by creating a PDF customization folder (in this case, the DITA OT folder will not be modified at all) or by creating a PDF customization plugin. For information about customizing DITA to PDF output, see XSL FO-based DITA to PDF Customization (on page 1783).

There is also a book called DITA For Print that contains details about how to customize various aspects.

**Customizing PDF Output with CSS**

Oxygen XML Author also includes a transformation scenario called DITA Map PDF - based on HTML5 and CSS (on page 1275) that is based on a DITA-OT CSS-based PDF Publishing plugin that allows you to convert DITA maps (on page 2793) to PDF using a CSS layout processor. For those who are familiar with CSS, this makes it very easy to style and customize the PDF output of your DITA projects without having to work with xsl:fo customizations. For more information about customizing PDF output using this transformation scenario, see Customization CSS (on page 1657).

**Related Information:**

- DITA Open Toolkit Documentation

Using a Custom Build File

You can use a Custom Build File to customize transformation scenarios.
To use a custom build file in a DITA-OT transformation, follow these steps:

1. Use the Configure Transformation Scenario(s) action to open the Configure Transformation Scenario(s) dialog box (on page 1378).
2. Select the transformation scenario and click Edit.
3. Go to the Advanced (on page 2720) tab and change the Custom build file path to point to the custom build file.

As an example, if you want to call a custom script before running the DITA OT, your custom build file would have the following content:

```xml
<project basedir="." default="dist">
<!--The DITA OT default build file-->
<import file="build.xml"/>

<target name="dist">
<!-- You could run your script here -->
<!--Call the DITA OT default target-->
<antcall target="init"/>
</target>
</project>
```

**Note:** If you use the built-in Ant 1.9.8 build tool that comes bundled with Oxygen XML Author, it is located in the 

```
{OXYGEN_INSTALL_DIR}/tools/ant
directory. Any additional libraries for Ant must be copied to the Oxygen XML Author Ant lib directory.
```

Adding a Watermark in DITA Map to XHTML Output

To add a watermark to the XHTML output of a DITA map (on page 2793) transformation, follow these steps:

1. Create a custom CSS stylesheet that includes the watermark image, as in the following example:

   ```css
   body {
       background-image: url(MyWatermarkImage.png);
   }
   ```

2. Edit a DITA Map XHTML transformation scenario and in the Parameters tab set the value of the args.css parameter as the path to your watermark image.

3. Set the value of the args.copycss parameter to yes.
4. Apply the transformation scenario.

5. Copy the watermark image in the output directory of the transformation scenario, next to the CSS file created in step 1.

Related Information:
- Adding a Watermark to PDF Output (on page 1788)

Adding Syntax Highlights for Codeblocks in the Output

Syntax Highlighting makes it easier to read the semantics of the structured content by displaying each type of code (language) in different colors and fonts. Oxygen XML Author provides the ability to add syntax highlights in codeblocks for DITA to PDF or HTML-based output through the use of the @outputclass attribute and a variety of predefined values are available.

To provide syntax highlighting in the codeblocks that appear in the output, add the @outputclass attribute on the <codeblock> element and set its value to one of the predefined language values. The Content Completion Assistant offers a list of the possible values when adding the @outputclass attribute in Text mode but there are also two very simple ways to set the value in Author mode:

- Select the <codeblock> element in the editor and in the Attributes view, click on the Value cell for the outputclass attribute and select one of the predefined values (for example, language-xml).
- Select the <codeblock> element in the editor and use the Alt + Enter keyboard shortcut to open the in-place attributes editor window. Then select one of the predefined values from the Value drop-down menu.

The predefined values that can be selected are:

- language-bourne
- language-c
- language-cpp
- language-csharp
- language-css
- language-ini
- language-java
- language-javascript
- language-json
- language-lua
- language-perl
Attention: It is recommended that you do not add inline elements in the codeblocks when using this `@outputclass` attribute, as it may lead to improper highlighting.

Example:

This codeblock:

```
<codeblock outputclass="language-xml">
<p>This code is an example of how to use a coderef.</p>
<codeblock><coderef href="MyExternalCode.xsl"/></codeblock>
</codeblock>
```

would look like this in the output:

```
<p>This code is an example of how to use a coderef.</p>
<codeblock><coderef href="MyExternalCode.xsl"/></codeblock>
```

Troubleshooting DITA Transformation Problems

This section contains some topics to help you troubleshoot DITA transformation issues.

DITA Map Transformation Fails (Cannot Connect to External Location)

Problem

*DITA map (on page 2793)* transformation fails because it cannot connect to an external location.

Solution

The transformation is run as an external Ant process so you can continue using the application as the transformation unfolds. All output from the process appears in the DITA Transformation tab.

The HTTP proxy settings are used for the Ant transformation, so if the transformation fails because it cannot connect to an external location, you can check the the Proxy preferences page (on page 244)
DITA Map WebHelp Transformation Fails (Duplicate Topic References Found)

**Problem**

DITA Map WebHelp transformation fails with a message that indicates duplicate topic references were found.

**Cause**

By default the WebHelp transformation uses the `force-unique` parameter set to `true` to force the transformation to create unique output files for each instance of a resource when a map contains multiple references to a single topic. However, there are cases when this feature does not work as expected and the duplicate topic references are not handled properly.

**Solution**

To solve this issue, you should manually set a unique `copy-to` attribute on any duplicate topic reference that was not handled automatically by DITA-OT:

```xml
<map>
  ...
  <topicref href="../topics/MyTopic.dita"/>
  ...
  <topicref href="../topics/MyTopic.dita" copy-to="../topics/MyTopic-2.dita"/>
</map>
```

DITA OT Transformation Takes a Long Time to Process

**Problem**

A DITA transformation takes an extremely long time to process (over an hour, for example).

**Cause**

Large delays in DITA OT processing are usually caused by intensive disk operations, CPU usage, or connections to remote websites. The DITA OT processing is very disk-intensive, each stage takes the entire content from the transformation temporary files folder, reads it, modifies it, and then writes it back.
Solution

There are several things you can try to troubleshoot this problem:

- If you are using a shared or remote drive, it is recommended to specify a local drive for the output and temporary files directory (edit the transformation scenario and in the Output tab, select a local directory for Temporary files directory and Output directory).
- If you want to test if the publishing has a problem downloading remote resources, you could disable the network adapter on the computer and then try to publish. The purpose is to see if the publishing finishes without any reported error about obtaining a certain HTTP resource.
- Using DTDs instead of XML Schemas is faster. This is because of a default transformation parameter called args.grammar.cache that only works for DTD-based DITA topics.
- You can increase the memory available to Oxygen XML Author (on page 2460). Sometimes, just increasing the amount of memory available to the DITA OT process may be enough to lower the time necessary for the publishing to run.
- You can enable some logging to help you determine which stage in the process is taking a long time. Edit the transformation scenario and in the Advanced tab, enter logger org.apache.tools.ant.listener.ProfileLogger in the Additional arguments field. Then go to Options > Preferences > DITA > Logging and select Always for the Show console output option.
- You could try disabling antivirus applications since the publishing process is very disk intensive and certain antivirus application might slow down the process.
- If the published DITA map is part of a larger DITA project with lots of maps and topics, references from topics in the current map to topics in other sub-projects might result in problems resolving those references. You could look in the output folder to see if the number of HTML documents match the number of DITA topics in your map.

DITA PDF Transformation Fails

Problem

The DITA to PDF transformation fails.

Cause

To generate the PDF output, Oxygen XML Author uses the DITA Open Toolkit. This process sometimes results in errors. For information about some of the most common errors, see DITA PDF Processing Common Errors (on page 2474).
Solution

If your transformation fails, you can detect some of the problems that caused the errors by running the Validate and Check for Completeness action (on page 2549). Depending on the options you select when you run it, this action reports errors such as topics referenced in other topics but not in the DITA map (on page 2793), broken links, and missing external resources.

You can analyze the Results tab of the DITA transformation and search for messages that contain text similar to [fop] [ERROR]. If you encounter this type of error message, edit the transformation scenario you are using and set the clean.temp parameter to no and the retain.topic.fo parameter to yes. Run the transformation, go to the temporary directory of the transformation, open the topic.fo file and go to the line indicated by the error. Depending on the XSL FO context try to find the DITA topic that contains the text that generates the error.

If none of the above methods helps you, go to Help > About > Components > Frameworks and check what version of the DITA Open Toolkit you are using. Copy the whole output from the DITA OT console output and either report the problem on the DITA User List or send it to support@oxygenxml.com.

Related Information:

• How to Enable Debugging for FO Processor Transformations (on page 1358)

DITA PDF Processing Common Errors

There are cases when the PDF processing fails when trying to publish DITA content to a PDF file. This topic lists some of the common problems and possible solutions.

Problem: Cannot Save PDF

The FO processor cannot save the PDF at the specified target. The console output contains messages like this:

[fop] [ERROR] Anttask - Error rendering fo file:
C:\samples\dita\temp\pdf\oxygen_dita_temp\topic.fo
<Failed to open C:\samples\dita\out\pdf\test.pdf>
Failed to open samples\dita\out\pdf\test.pdf

............
[fop] Caused by: java.io.FileNotFoundException:
C:\Users\default\Desktop\bev\out\pdf\test.pdf
(The process cannot access the file because it is being used by another process)
Solution: Cannot Save PDF

Such an error message usually means that the PDF file is already opened in a PDF reader application. The solution is to close the open PDF before running the transformation.

Problem: Table Contains More Cells Than Defined in Colspec

One of the DITA tables contains more cells in a table row than the defined number of `colspec` elements. The console output contains messages like this:

```
[fop] [ERROR] Anttask - Error rendering fo file:
D:\projects\eXml\samples\dita\flowers\temp\pdf\oxygen_dita_temp\topic.fo
<net.sf.saxon.trans.XPathException: org.apache.fop.fo.ValidationException:
The column-number or number of cells in the row overflows the number of fo:table-columns specified for the table.
(See position 179:-1)>net.sf.saxon.trans.XPathException:
org.apache.fop.fo.ValidationException: The column-number or number of cells in the row overflows the number of fo:table-columns specified for the table.
(See position 179:-1)
[fop] at org.apache.fop.tools.anttasks.FOPTaskStarter.renderInputHandler
(Fop.java:657)
[fop] at net.sf.saxon.event.ContentHandlerProxy.startContent
(ContentHandlerProxy.java:375)
............
[fop] D:\projects\samples\dita\flowers\temp\pdf\oxygen_dita_temp\topic.fo ->
D:\projects\samples\dita\flowers\out\pdf\flowers.pdf
```

Solution: Table Contains More Cells Than Defined in Colspec

To resolve this issue, correct the `colspec` attribute on the table that caused the issue. To locate the table that caused the issue:

1. Edit the transformation scenario and set the parameter `clean.temp` to `no`.
2. Run the transformation, open the `topic.fo` file in Oxygen XML Author, and look in it at the line specified in the error message (See position 179:-1).
3. Look around that line in the `XSL-FO` file to find relevant text content that you can use (for example, with the Find/Replace in Files action in the DITA Maps Manager view (on page 2503)) to find the original DITA topic for which the table was generated.
Problem: Broken Link

There is a broken link in the generated XSL-FO file. The PDF is generated but contains a link that is not working. The console output contains messages like this:

```
```

Solution: Broken Link

To resolve this issue:

1. Use the Validate and Check for Completeness action available in the DITA Maps Manager view (on page 2503) to find such problems.
2. If you publish to PDF using a DITAVAL filter, select the same DITAVAL file in the DITA Map Completeness Check dialog box.
3. If the Validate and Check for Completeness action does not discover any issues, edit the transformation scenario and set the clean.temp parameter to no.
4. Run the transformation, open the topic.fo file in Oxygen XML Author, and search for the unresolved ID references (for example: unique_4_Connect_42_wrongID).
5. Look in the XSL-FO file to find relevant text content that you can use (for example, with the Find/Replace in Files action in the DITA Maps Manager view (on page 2503)) to find the original DITA topic for which the table was generated.

Related Information:

- How to Enable Debugging for FO Processor Transformations (on page 1358)

DITA to CHM Transformation Fails - Cannot Open File

Problem

The DITA to CHM transformation fails with the following error: [exec] HHC5010: Error: Cannot open "fileName.chm". Compilation stopped.

Cause

This error occurs when the CHM output file is opened and the transformation scenario cannot rewrite its content.
Solution

To solve this issue, close the CHM help file and run the transformation scenario again.

Tip: It is a good practice to validate the DITA map (on page 2793) before executing the transformation scenario. To do so, run the Validate and Check for Completeness action (on page 2549). Depending on the selected options, this action reports errors, such as topics referenced in other topics (but not in the DITA map), broken links, and missing external resources.

Related Information:

- DITA Map to CHM (Compiled HTML Help) Transformation (on page 1282)

DITA to CHM Transformation Fails - Compilation Failed

Problem

The DITA to CHM transformation fails with the following error: [exec] HHC5003: Error: Compilation failed while compiling fileName.

Cause 1

One possible cause for this error is that the processed file does not exist.

Solution 1

To solve this issue, fix the file reference before executing the transformation scenario again.

Cause 2

Another possible cause for this error is that the processed file has a name that contains space characters.

Solution 2

To solve the issue, remove any spacing from the file name and run the transformation scenario again.

Tip: It is a good practice to validate the DITA map (on page 2793) before executing the transformation scenario. To do so, run the Validate and Check for Completeness action (on page 2549). Depending on the selected options, this action reports errors, such as topics referenced in other topics (but not in the DITA map), broken links, and missing external resources.
Depending on the selected options, this action reports errors, such as topics referenced in other topics (but not in the DITA map), broken links, and missing external resources.

Related Information:

- DITA Map to CHM (Compiled HTML Help) Transformation (on page 1282)

Solving DITA Transformation Errors

If a DITA transformation results in errors or warnings, the information is displayed in the message panel at the bottom of the editor. The information includes the severity, description of the problem, the name of the resource, and the path of the resource.

To help prevent and solve DITA transformation problems, follow these steps:

1. Validate the DITA map (on page 2549) by using the Validate and Check for Completeness action that is available on the DITA Maps Manager (on page 2503) toolbar and in the DITA Maps menu.
2. If this action results in validation errors, solve them prior to executing the transformation. Also, you should pay attention to the warning messages because they may identify problems in the transformation.
3. Run the DITA transformation scenario (on page 1319).
4. If the transformation results in errors or warnings, they are displayed in the Results panel (on page 343) at the bottom of the editor. The following information is presented to help you troubleshoot the problems:
   - **Severity** - The first column displays the following icons that indicate the severity of the problem:
     - Informational - The transformation encountered a condition of which you should be aware.
     - Warning - The transformation encountered a problem that should be corrected.
     - Error - The transformation encountered a more severe problem, and the output is affected or cannot be generated.
   - **Info** - You can click the See More icon to open a web page that contains details about DITA-OT error messages.
   - **Description** - A description of the problem.
   - **Resource** - The name of the transformation resource.
   - **System ID** - The path of the transformation resource.
5. Use this information or other resources from the online DITA-OT community to solve the transformation problems before re-executing the transformation scenario.
6. If you need to contact the Oxygen technical support team, they will need you to send the entire transformation scenario execution log. To obtain it:
   a. Go to the Options > Preferences > DITA preferences page and set the Show console output option to Always.
   b. Execute the transformation scenario again. The console output messages are displayed in the DITA OT view.
   c. Copy the entire log, save it in a text file, then send it to the Oxygen technical support team.
   d. After your issue has been solved, go back to the Options > Preferences > DITA preferences page and set the Show console output option to When build fails.

Related Information:

- Troubleshooting DITA Transformation Problems (on page 2729)

DITA Profiling / Conditional Text

DITA offers support for conditionally profiling content by using profiling attributes. With Oxygen XML Author, you can define values for the DITA profiling attributes and they can be easily managed to filter content in the published output. You can switch between profile sets to see how the edited content looks like before publishing. The profiling configuration can also be shared between content authors through the project file and there is no need for coding or editing configuration files.

Oxygen XML Author includes a Profiling/Conditional Text preferences page (on page 142) where you can create and manage profiling attributes and condition sets. Oxygen XML Author also offers convenient support for customizing and controlling profiling attribute values with a subject scheme (on page 2755) or DITAVAL file (on page 2760).

Profiling Attributes

You can profile content elements or map elements by adding one or more of the default DITA profiling attributes (product, platform, audience, rev, props, and otherprops). You can also create your own custom profiling attributes and profiling condition sets. The profiling attributes may contain one or more tokens that represent conditions to be applied to the content when a publication is built.

For example, you could define a section of a topic that would only be included for a publication related to the Windows platform by adding the platform profiling attribute:

```xml
<section platform="windows">
```
For information about creating and editing profiling attributes, see Creating and Editing Profiling Attributes in DITA (on page 2738) (for information about sharing them, see Sharing Profiling Attribute Configurations (on page 2741)).

Profiling Conditions

DITA allows you to conditionally profile parts of a topic so that certain parts of the topic are displayed when certain profiling conditions are set. Profiling conditions can be set both within topics and in maps. When set in a topic, they allow you to suppress an element (such as paragraph), step in a procedure, item in a list, or even a phrase within a sentence. When set in a map, they allow you to suppress an entire topic or group of topics. You can then create a variety of publications from a single map by applying profiling conditions to the build.

For information about creating and editing condition sets, see Creating and Editing Profiling Condition Sets in DITA (on page 2744) (for information about sharing them, see Sharing Condition Set Configurations (on page 2746)).

For more information about DITA profiling, watch our video demonstration:

https://www.youtube.com/embed/Gfyd4TkRQAw

Creating and Editing Profiling Attributes in DITA

You can filter DITA content or the structure of a document by using profiling attributes or profiling conditions sets (on page 2744).

Defining Profiling Attributes for DITA Content

To create or edit profiling attributes for filtering DITA content, follow these steps:

1. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Edit modes > Author > Profiling / Conditional Text.

   Information: The Profiling Attributes section (on page 143) is used to define the attributes and their values. For DITA documents, the default attributes are included (audience, platform, product, props, otherprops, and rev), but if a Subject Scheme Map (on page 2755) is used for profiling your content, you will see the attributes defined in your subject scheme map instead.

2. To add new attributes and values, click the New button at the bottom of the Profiling Attributes table. To customize existing attributes and their values, select an attribute and click the Edit button.

   Step Result: In either case, this opens a Profiling Attribute configuration dialog box where you can define attributes that exist in your schema.
The following options are available in this dialog box:

**Document type**

Select the document type (*framework (on page 2794)*).

ℹ️ **Tip:** You can use the * or ? wildcards in this combo box. For example, DITA* would match any document type that starts with "DITA". You can also specify multiple document types by using commas to separate them.

**Attribute name**

The name of the profiling attribute.

**Display name**

This optional field is used for descriptive rendering in profiling dialog boxes.

**Attribute Values Table**

This table displays information about the values for the profiling attribute. You can configure them by using the buttons at the bottom of the table (*New, Edit, Delete*).

The columns are as follows:

- **Value** - The attribute value. You can also define profiling attribute groups using the following format: ParentAttrValue(SubAttrValue1 SubAttrValue2). For more information, see Conditional Profiling Attribute Groups (*on page 2754*).
- **Label** - You can specify a label for the attribute value that will be rendered as its name in various components in Author mode (*Edit Profiling Attributes* dialog...
box (on page 2741), Condition Set dialog box (on page 2744), Profiling tab in the Edit Properties dialog box (on page 2545), DITA Maps Manager (on page 2503). If the Label is not specified, the Value will be used as its rendered name.

- Description - A description for the attribute value that will be displayed in this table.

Single value

Select this option if you want the attribute to only accept a single value.

Multiple values separated by

Select this option if you want the attribute to accept multiple values, and you can choose the type of delimiter to use. You can choose between space, comma, and semicolon, or you can enter a custom delimiter in the text field. A custom delimiter must be supported by the specified document type. For example, the DITA document type only accepts spaces as delimiters for attribute values.

3. After defining or configuring the attributes and their values according to your needs, click OK to confirm your selections and close the Profiling Attributes configuration dialog box.

4. Click Apply to save the changes.

Result: You should see your changes in the Profiling Attribute table.

You can also use the Profiling Condition Sets section to apply more complex filters on your DITA content.

Adding Profiling Attribute Values Directly in a Document

You can add values directly to the existing profiling attributes in a document using the In-Place Attributes Editor (on page 857) in Author mode, the Attributes view (on page 412), or in the source code in Text mode. However, this just adds them to the document and does not change the conditional text configuration. If you invoke the Edit Profiling Attributes action (from the contextual menu in Author mode) on the new value, the Profiling Values Conflict dialog box will appear and it includes an Add these values to the configuration action that will automatically add the new value to the particular profiling attribute. It also includes an Edit the configuration action that opens the Profiling / Conditional Text preferences page (on page 142) where you can edit the profiling configuration.

Note: If the Allow contributing extra profiling attribute values (on page 144) option is not selected in the Profiling / Conditional Text preferences page, the Profiling Values Conflict dialog box will never appear, so this automatically adding value not be possible.

Figure 642. Profiling Values Conflict Dialog Box
Sharing Profiling Attribute Configurations

Your profiling configuration can be shared with other users through a project file. If you select Project Options (on page 2798) at the bottom of the Profiling/Conditional Text preferences page, your configuration is stored in the project file and can be shared with others. For instance, if your project file is saved on a version control system (such as SVN, CVS, or Source Safe) or in a shared folder, your team will have the same option configuration that you stored in the project file.

For more information about sharing project files, see Sharing a Project - Team Collaboration (on page 666).

Applying Profiling Attributes in DITA

Profiling attributes are applied on element nodes. You can apply profiling attributes on a text fragment (it will automatically be wrapped into a phrase-type element), on a single element, or on multiple elements at the same time. If there is no selection in your document, the profiling attributes are applied on the element at the cursor position.

You can apply defined DITA profiling attributes (on page 2738) as follows:

**DITA Topics**

To profile DITA topics, right-click a topic reference in the DITA Maps Manager (on page 2503), select Edit Properties from the contextual menu, go to the Profiling tab, and select the appropriate values.

**DITA Content**

To profile DITA content in Author mode, highlight the content and select Edit Profiling Attributes from the contextual menu and select the appropriate values in the Edit Profiling Attributes dialog box.

**DITA Elements**

To profile specific XML elements in Author mode, position the cursor inside the element, right-click, select Edit Profiling Attributes (you can also right-click the element in the breadcrumb (on page 849) or Outline (on page 334) view), and select the appropriate values in the Edit Profiling Attributes dialog box. You can also use the Attributes view (on page 412) to set the profiling attributes on the element at the current cursor position.

![Edit Profiling Attributes Dialog Box](image)

Figure 643. Edit Profiling Attributes Dialog Box
The profiling attributes, and their potential values, that appear in this dialog box depend on what has been configured in Oxygen XML Author. If you have a large list of profiling attributes, you can use the text filter field to search for attributes or values, and you can expand or collapse attributes by using the ▼ Expand All/ □ Collapse All buttons to the right of the text filter or the arrow button to the left of the profiling attribute name.

The attributes and values that appear in the dialog box are determined as follows:

- If your root map (on page 2799) references a DITA subject scheme map (on page 2799) that defines values for the profiling attributes (on page 2755), those values are used. Oxygen XML Author collects all the profiling values from the subject scheme map that is referenced in the map that is currently opened in the DITA Maps Manager (on page 2503) (or set as the root map (on page 2520)). In the image above (on page 2742) (taken from the Oxygen XML Author documentation project), you see values for eight products. They are the only values that are defined in the subject scheme map and thus, are the only ones that appear in the dialog box.
- If you have defined profiling attribute values (on page 2738) for the DITA document type in the Profiling/Conditional Text preferences page (on page 142) and you store them at project-level (on page 2798), those values are displayed in the dialog box.
- If you have defined profiling attribute values (on page 2738) for the DITA document type in the Profiling/Conditional Text preferences page (on page 142) and you store them at global-level (on page 2795), those values are displayed in the dialog box.
- If you have defined profiling attribute values (on page 2738) for the DITA document type in the Profiling/Conditional Text preferences page (on page 142), those values are displayed in the dialog box.
- Otherwise, a generic default set of profiling attributes and values are available.

The attribute names and values selected in the Edit Profiling Attributes dialog box are set on the elements contained in the profiled fragment. If you only select a fragment of content (rather than the entire element), this fragment is wrapped in phrase-type elements in which the profiling attributes are set.

If the Show Profiling Attributes option (on page 923) (available in the □ Profiling / Conditional Text toolbar menu) is selected, a green border is painted around profiled text in the Author mode and all profiling attributes set on the current element are listed at the end of the highlighted block. To edit the attributes of a profiled fragment, click one of the listed attribute values. A form control pops up and allows you to add or remove attribute values.

Figure 644. Profiling Attribute Value Form Control Pop Up
Creating and Editing Profiling Condition Sets in DITA

Multiple profiling attributes can be aggregated into a profiling condition set that allows you to apply more complex filters on the document content. In DITA, profiling conditions can be set within both topics and in maps. When set in a topic, you can filter an element (such as paragraph), step in a procedure, item in a list, or even a phrase within a sentence. When set in a map, you can filter an entire topic or group of topics.

Creating Profiling Condition Sets

To create a new profiling condition set, follow these steps:

1. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Edit modes > Author > Profiling/Conditional Text.

Information: The Profiling Condition Sets section (on page 144) is used to define condition sets.
2. To add new condition set, click the **New** button at the bottom of the **Profiling Condition Sets** table. To customize existing condition sets, select an existing condition set and click the **Edit** button.

**Step Result:** In either case, this opens a **Condition Set** configuration dialog box where you can define attributes that exist in your schema.

**Figure 645. Condition Set Configuration Dialog Box**

![Condition Set Configuration Dialog Box](image)

The following options are available in this dialog box:

**Name**

The name of the new condition set.

**Document type**

Select the document type (**framework (on page 2794)**) for which you have defined profiling attributes.

**Use DITAVAL file**

For DITA projects, select this option if you want the **Profiling Condition Set** to reference a **DITAVAL file (on page 2760)**. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables (on page 266)** button, or the browsing actions in the **Browse** drop-down list.

**Include the content matching the following conditions**
You can select this option to define the combination of attribute values for your condition set by selecting the appropriate checkboxes for the values you want to be included in this particular condition set. If you have defined a lot of profiling attributes, you can use the filter text field to search for specific conditions.

**Shortcut key**

You can click the Choose button to open a dialog box that allows you to define a shortcut key for this particular condition set. You can then use that shortcut key anytime you want to select this condition set to filter content.

3. After defining or configuring the condition sets according to your needs, click **OK** to confirm your selections and close the Condition Set configuration dialog box.

4. Click **Apply** to save the condition set.

**Result:** All saved profiling condition sets are available in the Profiling / Conditional Text toolbar drop-down menu (*on page 922*).

### Sharing Condition Set Configurations

Your condition set configuration can be shared with other users through a project file. If you select **Project Options (*on page 2798)* **at the bottom of the Profiling/Conditional Text preferences page, your configuration is stored in the project file and can be shared with others. For instance, if your project file is saved on a version control system (such as SVN, CVS, or Source Safe) or in a shared folder, your team will have the same option configuration that you stored in the project file.

For more information about sharing project files, see **Sharing a Project - Team Collaboration (*on page 666)*.

**Related Information:**

- **Applying Profiling Condition Sets in DITA (*on page 2746)*
- **Creating and Editing Profiling Attributes in DITA (*on page 2738)*

- **Customizing Colors and Styles for Rendering Profiling in Author Mode (*on page 2752)*
Applying Profiling Condition Sets in DITA

All defined Profiling Condition Sets (on page 2744) are available as shortcuts in the Profiling / Conditional Text toolbar menu (on page 922). Select a menu entry to apply the condition set. The filtered content is then grayed-out in the Author mode, Outline view (on page 334), and DITA Maps Manager view (on page 2503). Your selection will also be used as the default condition set (on page 2763) in transformation scenarios (this can be changed in the Filters tab). An element is filtered-out when one of its attributes is part of the condition set and its value does not match any of the values covered by the condition set.

EXAMPLE:

Suppose that you have the following document:

```xml
<Spray painting>
  Short Description: When paint is applied using a spray nozzle, it is referred to as spray painting.
  Context:
  The garage is a good place to spray paint.

  Step 1
  Move the car out of the garage to avoid getting paint on it. Audience [novice]

  Step 2
  Place newspaper, cardboard, or a drop-cloth on the garage floor. Audience [expert]

  Step 3
  Place the object to be painted on the covered area. Audience [expert] Other [prop2]

  Step 4
  Follow the directions on the paint can to paint the object. Audience [expert] Other [prop1]

  Step 5
  Let the paint dry thoroughly before you move the object. Audience [novice] Other [prop1]
</Spray painting>
```

If you apply the following condition set, it means that you want to filter out the content to only include content profiled with the expert value for the @audience attribute and content that has the prop1 value for the @other attribute.
This is how the document looks in **Author** mode after you apply the condition set:

`Spray painting`

*Short Description:* When paint is applied using a spray nozzle, it is referred to as spray painting.

*Context:*

The garage is a good place to spray paint.

**Step 1**

Move the car out of the garage to avoid getting paint on it. **Audience [novice]**

**Step 2**

Place newspaper, cardboard, or a drop-cloth on the garage floor. **Audience [expert]**

**Step 3**

Place the object to be painted on the covered area. **Audience [expert] Other [prop2]**

**Step 4**

Follow the directions on the paint can to paint the object. **Audience [expert] Other [prop1]**

**Step 5**

Let the paint dry thoroughly before you move the object. **Audience [novice] Other [prop1]**

**Related Information:**

Showing and Filtering Profiled Content in DITA

You can visualize the effect of profiling content by using the profiling tools in the Profiling/Conditional Text drop-down menu that is located on the DITA Maps Manager toolbar and on the main toolbar. This drop-down menu includes the following filtering options:

**Show Profiling Colors and Styles**

Select this option to show colors and styles for profiled content in Author mode and the DITA Maps Manager. You can configure the colors and styles or specify whether or not this option is selected by default in the Profiling/Conditional Text > Colors and Styles preferences page.

**Show Profiling Attributes**

Select this option to display the values of the profiling attributes at the end of profiled content in Author mode and next to the nodes in the DITA Maps Manager. You can specify whether or not this option is selected by default in the Profiling/Conditional Text > Attributes Rendering preferences page.

**Show Excluded Content**

Controls whether the content filtered out by a particular condition set is hidden or grayed-out in Author mode, the DITA Maps Manager, and the Outline view. When this option is selected and a condition set is selected in this drop-down menu, the filtered content is grayed-out. If this option is not selected and a condition set is selected in this drop-down menu, the filtered content is hidden. You can specify whether or not this option is selected by default in the Profiling/Conditional Text preferences page.

**Choose Condition Set (Available if more than 15 condition sets are defined)**

This option is available if you have more than 15 conditions sets defined. It opens a dialog box that makes it easier to find and select condition sets that are not displayed in this drop-down menu.

**List of Defined Condition Sets**
Up to 15 defined condition sets are listed and you can toggle each one of them on to filter the content in Author mode and the DITA Maps Manager (on page 2503) to only show content that will appear in the output for that particular condition set. If there are more than 15 defined condition sets, the rest of them can be accessed in the More submenu or by using the Choose Condition Set option (on page 2749) to access a dialog box that presents all of them.

**Profiling Settings**

Opens the Profiling/Conditional Text preferences page (on page 142) where you can add and edit profiling attributes and condition sets.

Figure 646. Example: Profiling Controls in Author Mode

If the Show Profiling Attributes option is selected, a green border is painted around profiled text in the Author mode. Also, all profiling attributes set on the current element are listed at the end of the highlighted block and in its tooltip message. To edit the attributes of a profiled fragment, click one of the listed attribute values. A form control pops up and allows you to add or remove attribute values.

Figure 647. Profiling Attribute Value Form Control Pop Up
Also, the following icons are used to mark profiled and non-profiled topics in the **DITA Maps Manager**:

- **-** - The topic contains profiling attributes.
- **○** - The topic inherits profiling attribute from its ancestors.
- **□** - The topic contains and inherits profiling attributes.
- **(dash)** - The topic neither contains, nor inherits profiling attributes.

**Figure 648. Rendering Profiled Topics in DITA Maps Manager**

**Related Information:**

Customizing Colors and Styles for Rendering Profiling in Author Mode

By applying profiling colors and styles, you can mark profiled content in **Author** mode and the **DITA Maps Manager** so that you can instantly spot differences between multiple variants of the output. This allows you to preview the content that will go into the published output. The excluded text is grayed-out or hidden in **Author** mode and excluded nodes are grayed-out or hidden in the **DITA Maps Manager**.

Figure 649. Example: Profiling Colors and Styles in Author Mode

Choosing the right style for a specific profiling attribute is a matter of personal taste, but be aware of the following:

- If the same block of text is profiled with two or more profiling attributes, their associated styles combine. Depending on the styling, this might result in an excessively styled content that may prove difficult to read or work with.
- It is recommended that you only profile the differences. There is no need to profile common content, since excessive profiling can visually pollute the document.
- A mnemonic associated with a style will help you instantly spot differences in the types of content.

**Styling Profiling Attribute Values**

To set colors and styles for profiling attribute values, follow these steps:
1. Select the **Show Profiling Colors and Styles** option *(on page 922)* from the *Profiling / Conditional Text* toolbar drop-down menu.

2. Select **Profiling Settings** *(on page 923)* from the *Profiling / Conditional Text* toolbar drop-down menu. This is a shortcut to the *Profiling/Conditional Text* preferences page *(on page 142)*.

3. Go to the **Colors and Styles preferences page** *(on page 144)* to configure the colors and styling for the profiling attributes.

4. Go to the **Attributes Rendering preferences page** *(on page 146)* to configure how you want the profiling attributes to appear in Oxygen XML Author.

**Result:** The styling is now applied in the Author editing mode, the Outline view *(on page 334)*, and in the DITA Maps Manager view *(on page 2503)*. Also, to help you more easily identify the profiling you want to apply in the current context, the styling is applied in the Edit Profiling Attributes dialog box *(on page 912)* and in the inline form control pop-up that allows you to quickly set the profiling attributes.

![Figure 650. Profiling Attribute Value Form Control Pop Up](image)

**Alternate Method with a DITAVAL File:** If you are using a DITAVAL filter file to control the filtering of profiled content in DITA topics, you can use a flag filter to define the colors and styles that will be used when rendering the profiling. For detailed information about this alternate method, see the procedure in the Styling the Rendering of Profiled Content Using a DITAVAL File *(on page 2762)* topic.

Conditional Profiling Attribute Groups

Overview

Conditional processing attributes can be specified using grouped values. Groups organize the attributes into subcategories. This is intended to support situations where an attribute applies to multiple specialized subcategories. For example, suppose a company needs to filter content for several internal teams (operations and support) and they use the @audience attribute with the values ops and support, but the Support team has several levels of personnel (L1, L2, and L3). They could use a group to define the levels (L1, L2, and L3) as subcategories for the support value. Using groups for these subcategories allows each category to be processed independently.

A major advantage is that you do not need to add new profiling attributes using a DTD specialization. You can re-use existing DITA profiling attributes (such as @product, @audience, @otherprops) and specify multiple attribute subcategories.

Creating a Conditional Profiling Attribute Group

To create a group in Oxygen XML Author:

1. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Edit modes > Author > Profiling / Conditional Text.
2. To add new attributes and values, click the New button at the bottom of the Profiling Attributes table. To customize existing attributes and their values, select an attribute and click the Edit button.

   **Step Result:** In either case, this opens a Profiling Attribute configuration dialog box where you can define attributes that exist in your schema.

3. Specify the appropriate values for the Document type, Attribute name, and Display name.

   For information about the Profiling Attribute configuration dialog box, see Defining Profiling Attributes for DITA Content (on page 2738).

4. Click the New button at the bottom of the attribute values table.
5. In the Value field of the resulting dialog box, define groups using the following format:

   ParentAttrValue(SubAttrValue1 SubAttrValue2).

   For example:

   support(L1 L2 L3)

6. Click OK and Apply to save and apply the changes.
Using Conditional Groups in Conjunction with a DITAVAL File

You can use groups to customize a hierarchy of profiling attribute values and then use it in conjunction with a DITAVAL file to filter or flag (on page 2760) the values. For example, suppose the company described in the example in the Overview section (on page 2754) needed to generate content for the Support team, but only for L1 and L2 support personnel. The DITAVAL file could look like this:

```xml
<val>
  <prop action="include" att="support" val="L1"/>
  <prop action="include" att="support" val="L2"/>
  <prop action="exclude" att="support" val="L3"/>
</val>
```

That DITAVAL file could then be used for a condition set (on page 2744) to filter content in Author mode or during the transformation stage to filter content in the output (on page 2763) and content profiled with the L1 and L2 values would be included while content with the L3 value would be excluded.

This example company could also have another DITAVAL file for filtering out all content profiled for any of the three subcategories (L1, L2, L3) by simply excluding the support value (since L1, L2, and L3 are subcategories of it).

```xml
<val>
  <prop action="exclude" att="support"/>
</val>
```

For more information about creating conditional profiling attribute groups, watch our video demonstration:

https://www.youtube.com/embed/YRi9XPK6CcY

Customizing Profiling Values with a Subject Scheme Map

Overview

A subject scheme map (on page 2799) allows you to create and manage custom profiling values in DITA documents without having to write a DITA specialization. Ultimately, this allows you to filter and flag content in Author mode or in transformed output.

Subject scheme maps use key definitions to define a collection of profiling values. You can also use subject scheme maps to filter out (reject) the values for certain attributes so that you only see the attributes or values that you want to use in Author mode or the transformed output.

The highest level of map (main DITA map (on page 2799)) that uses the set of profiling values must reference the subject scheme map where the profiling values are defined and the type attribute needs to be set to subjectScheme for the reference, as in the following example:

```xml
<topicref href="test.ditamap" format="ditamap" type="subjectScheme"/>
```

Advantages of Using a Subject Scheme Map

The advantages of using a subject scheme to control profiling attribute values include:

- You can create a hierarchy of profiling attribute values and use a DITAVAL file to filter or flag the tree of values.
- You can share the subject scheme files with others without having to share preferences or the entire project.
- The subject scheme offers validation support so you are notified if an undefined value is used.

Creating a Subject Scheme Map

To create and configure a subject scheme map, follow this procedure:

1. Use the New Document wizard (on page 619) to create a new Subject Scheme document (Framework templates > DITA Map > map > Subject Scheme).
2. Use the controls in Author mode to define the hierarchical tree of values for your subject scheme (see the Author mode example below (on page 2758)) or switch to Text mode and define it there if you prefer (see the Text mode example below (on page 2758)).

Note: The pre-defined subject scheme template includes Navigation Titles (navtitle element). This element is not required, but if you use it, the text that you enter for the navtitle will be used (instead of the name of the value) in the various places where profiling attributes are presented in Oxygen XML Author (on page 2759). An example of when this might be helpful is if
you want to use abbreviations for the name of a value, but you want to see its full name in Oxygen XML Author.

3. Bind the particular attribute to the key you define for the tree of values using the `<attributedef>` and `<subjectdef>` elements inside the `<enumerationdef>` element. Notice that in the examples below (on page 2758), the `audience` attribute is bound to the `audienceKey` value.

**Tip:** By default, attributes can accept multiple values, but you can use `outputclass="single_value"` to specify that a certain attribute only accepts a single value at a time and the attribute will be presented in Oxygen XML Author with radio buttons instead of checkboxes. For example:

```xml
<enumerationdef outputclass="single_value">
  <attributedef name="audience"/>
  <subjectdef keyref="audienceKey"/>
</enumerationdef>
```

4. If you want to filter out (reject) values for certain attributes, bind the attributes to a blank value (as you see for the `props` and `otherprops` attributes in the examples below (on page 2758)). This means that those attributes will not appear in the various places where profiling attributes are presented in Oxygen XML Author (on page 2759).

5. Save your `subject scheme` file.

6. Reference your `subject scheme` in the highest level of map (main DITA map (on page 2799)) that will use the set of profiling values and set its type to `subjectScheme`. The easiest way to do this is:
   a. With your `subject scheme` file opened in the editor, go to the DITA Maps Manager view, right-click the main DITA map, and select Append Child > Reference to the currently edited file.
   b. In the Insert Topic Reference dialog box, go to the Attributes tab and in the Type field, enter or select `subjectScheme`.
   c. Click the Insert and Close button and save your main DITA map.

**Using a Subject Scheme in Conjunction with a DITAVAL File**

You can use a subject scheme to customize a hierarchy of profiling attribute values and then use it in conjunction with a DITAVAL file to filter or flag (on page 2760) the entire tree of values. For example, suppose one of the values for the `audience` attribute in a hierarchical subject scheme is `surgeon` and it has two subordinate values of `neuro-surgeon` and `plastic-surgeon` (see the examples below on page 2758). You could create a DITAVAL file with the following content:

```xml
<val>
  <prop action="exclude" att="audience" val="surgeon"/>
</val>
```
That DITAVAL file could then be used for a **condition set (on page 2744)** to filter content in **Author** mode or during the transformation stage to **filter content in the output (on page 2763)** and the `neuro-surgeon` and `plastic-surgeon` values would be excluded by the filter since the subject scheme defines them as subordinate values of the `surgeon` value.

**Example: Subject Scheme Map that Defines Custom Values for the Audience Attribute**

This example uses typical audience values for medical personnel (therapist, oncologist, physicist, radiologist, surgeon, and so on). The **audience** attribute is bound to the `audienceKey` value (which defines the tree of values). You can also see that it filters out all possible values for other attributes (props and otherprops) so that they won't be available in the various places where profiling attributes are presented in Oxygen XML Author (on page 2759).

**Example using Author mode controls:**

Figure 651. Subject Scheme Author Mode Controls

**Example code in Text mode:**
<subjectScheme>
<!-- A scheme that defines audience user values -->
<subjectdef keys="audienceKey">
  <subjectdef keys="therapist"/>
  <subjectdef keys="oncologist"/>
  <subjectdef keys="physiciat"/>
  <subjectdef keys="radiologist"/>
  <subjectdef keys="surgeon"/>
  <subjectdef keys="neuro-surgeon"/>
  <subjectdef keys="plastic-surgeon"/>
</subjectdef>
<!-- Binding the audience attribute to the values defined in the key -->
<enumerationdef>
  <attributedef name="audience"/>
  <subjectdef keyref="audienceKey"/>
</enumerationdef>

<!-- Reject all possible values for other profiling attributes-->
<enumerationdef>
  <attributedef name="props"/>
  <subjectdef/>
</enumerationdef>
<enumerationdef>
  <attributedef name="otherprops"/>
  <subjectdef/>
</enumerationdef>
</subjectScheme>

Where the Profiling Attributes are Available in Oxygen XML Author

When you edit a DITA topic in the Text or Author mode, Oxygen XML Author collects all the profiling values from the subject scheme map (on page 2799) that is referenced in the map that is currently opened in the DITA Maps Manager (on page 2503) (or set as the root map (on page 2520)). The values of profiling attributes defined in a Subject Scheme Map are available in the following places in Oxygen XML Author (regardless of their mapping in the Profiling/Conditional Text preferences page (on page 142)):

- The Profiling tab of the Edit Properties dialog box (on page 2545).
- The Edit Profiling Attribute dialog box (on page 2742).
• The inline profiling controls in **Author mode** *(on page 2750)*.
• The proposals for the attribute values in the **Content Completion Assistant** *(on page 2792)*.

For more information about using a DITA subject scheme map, watch our video demonstration:

https://www.youtube.com/embed/RgkVRg6k6zo

**Related Information:**

• Filtering Profiling Values with a DITAVAL File *(on page 2760)*
• DITA 1.3 Specifications: Subject Scheme Maps

---

**Filtering Profiling Values with a DITAVAL File**

You can use a DITAVAL filter file to control the filtering or flagging of profiled content or to identify which values are to be used for conditional processing during a particular output.

**DITAVAL Filtering Use-Case**

Suppose that a medical publication uses the `audience` attribute to profile the content for the following types of users: *therapist*, *physician*, and *surgeon*. Suppose that in the output, you want to exclude any content that is profiled as `surgeon` value for the `audience` attribute.

You could use a DITAVAL filter file to exclude anything that is profiled as `surgeon`:

```xml
<val>
  <prop action="exclude" att="audience" val="surgeon"/>
</val>
```

If you then transform the main DITA map *(on page 2793)* and specify the DITAVAL filter file in the transformation scenario, the output will exclude anything that is profiled as `surgeon`.

**DITAVAL Filter File Editor in Author Mode**

The **Author** editing mode in Oxygen XML Author offer a simple and intuitive editor for creating or modifying DITAVAL files. It provides a series of drop-down menus and text fields that allow you to easily define the filters.

Figure 652. DITAVAL File Editor in Author Mode
Use the +... button to display a drop-down list that contains elements that you can add at that particular location in the DITAVAL file. Clicking this button at the top (next to the DITAVAL FILTER File title, allows you to insert the following elements:

- **Style Conflict** - Inserts a `style-conflict` element that declares behavior to be used when one or more flagging methods collide on a single content element. You can use the simple drop-down menus to select values for the `foreground-conflict-color` and `background-conflict-color` attributes.

- **Filter** - Inserts a `prop` element that identifies an attribute to apply a filtering action on. The possible actions that you can select are `include`, `exclude`, `passthrough`, and `flag`. If you select the `flag` action, you can use the drop-down menus to select values for the `style`, `color`, and `background` attributes.

- **Flag** - Inserts a `revprop` element that identifies a value in the `rev` attribute that should be flagged in some manner. The allows actions are `include`, `passthrough`, and `flag`. If you select the `flag` action, you can use the drop-down menus to select values for the `style`, `color`, `background`, and `changebar` attributes.

See the DITAVAL Element Specifications for more details about the allowed filters and flags.

**How to Create a DITAVAL Filter File**

To create a DITAVAL filter file, follow these steps:

1. Go to **File > New**.
2. Scroll to the **Framework templates > DITAVAL** folder.
3. Select the **Filter** template file and click **Create**.
4. Define your filters in the DITAVAL file (in **Text** or **Author** mode).
5. Save the DITAVAL file.
Result: The DITAVAL filter file can now be used for all of the following:

- To apply a reference to the DITAVAL file in a Profiling Condition Set using the Use DITAVAL File option in the Condition Set configuration dialog box (on page 2744).
- You can use the Import from DITAVAL option (on page 143) in the Profiling/Conditional Text preferences page (on page 142) to use the DITAVAL file to define profiling attributes.
- You can use the DITAVAL file to apply the filters to the output by specifying the DITAVAL file in the transformation scenario (on page 2720).
- You can use the filter file in the DITA Map Completeness Check dialog box (on page 2550) when validating your DITA map (on page 2793).
- DITAVAL files are also used when working with the DITA 1.3 Branch Filtering mechanism. For more details, see: Working with DITA 1.3 Branch Filtering (on page 2664).
- You can define the colors and styles to be used for rendering profiled condition sets (on page 2762) in Author mode and the DITA Maps Manager (on page 2503) view by using a Flag filter in the DITAVAL file.

Related Information:

- DITAVAL Element Specifications
- Working with DITA 1.3 Branch Filtering (on page 2664)
- Customizing Profiling Values with a Subject Scheme Map (on page 2755)
- Styling the Rendering of Profiled Content Using a DITAVAL File (on page 2762)
- Conditional Profiling Attribute Groups (on page 2754)

Styling the Rendering of Profiled Content Using a DITAVAL File

If you are using a DITAVAL filter file to control the filtering of profiled content, you can define the colors and styles to be used for rendering profiled condition sets in Author mode and the DITA Maps Manager (on page 2503) by defining the styles in a flag filter that is set in a DITAVAL filter file.

How to Define a Flag for a Condition Set in a DITAVAL Filter File

To define the colors and styles to be used for rendering profiled condition sets by using a flag filter in a DITAVAL filter file, follow these steps:
1. Create or edit your DITAVAL file (on page 2761) to define your profiling condition set (on page 2744).
2. In Author mode, define the filters for your condition set (on page 2760).
3. Select Flag from the drop-down menu on in a particular Filter or Flag Revision to present additional drop-down menus that allow you to configure the colors and styles for the particular condition set.
4. Save the DITAVAL file.

**Result:** Test your changes by opening profiled content in Author mode or the DITA Maps Manager (on page 2503) and use the options in the Profiling / Conditional Text drop-down menu to see how the changes in your DITAVAL flag are rendered.

**EXAMPLE:**

Using a Flag on a Filter to define the styling for a condition set like this:

![DITAVAL Filter file](image)

will render the styling of the profiled content in Author mode to look like this:

![Shortcut Keys](image)

and will render the styling in the DITA Maps Manager view (on page 2503) to look like this:

Related Information:

- Filtering Profiling Values with a DITAVAL File (on page 2760)
Publishing Profiled DITA Content

You can create a variety of publications or versions of your documentation from a single map by applying profiling conditions to the build.

Oxygen XML Author includes preconfigured transformation scenarios for DITA. By default, these scenarios take the current profiling condition set (on page 2746) into account during the transformation, as defined in the Filters tab (on page 2719) when creating a DITA transformation (on page 1319). You can also specify a DITAVAL file (on page 2760) that defines filters for your profiled content.

Figure 653. Profiling Option in the Filters Tab (DITA OT Transformations)

DITA Open Toolkit Support

The DITA Open Toolkit is an open-source publishing engine that can generate various output formats (for example, HTML, PDF, CHM) from DITA content. Oxygen XML Author includes support for the DITA Open Toolkit. This section includes information about how to install and create a DITA OT plugin (on page 2797), and how to use an external instance of the DITA Open Toolkit.

Related Information:

- DITA Open Toolkit Documentation

DITA-OT Plugins

The architecture of the DITA Open Toolkit publishing engine is plugin-based. A plugin can add support for publishing DITA content as a new format or for customizing an existing output format. The DITA Open Toolkit bundled with Oxygen XML Author already has lots of plugins pre-installed but you can also install additional plugins (on page 2797) or create your own.
Creating a DITA OT Plugin

Oxygen XML Author provides the ability to install additional DITA Open Toolkit plugins (on page 2768) that can be found from various sources (for example, Oxygen’s public GitHub repository includes some DITA-OT plugins). It is also possible to create your own plugin.

To create a DITA-OT plugin, follow these steps:

1. Create a new folder in the plugins folder located in your DITA OT directory (for example, if you are using DITA 3.3.1, the path would look like this: \[OXYGEN_INSTALL_DIR\]/frameworks/dita/DITA-OT3.x/plugins/MyNewPlugin).
2. Create a plugin.xml file in that same folder. This file will contain the extension points for the plugin. For example, references to the XSLT stylesheets that will be used to style the output.

   Note: You can easily create this file by using the DITA OT Plugin new document template that is included in Oxygen XML Author (from the New document wizard (on page 619) you can find this template in Framework templates > DITA > plugin.

   Example:

   ```xml
   <plugin id="org.metadita.specialization.music">
     <feature extension="dita.specialization.catalog.relative"
               file="catalog-dita.xml"/>
     <feature extension="dita.xsl.xhtml" file="xsl/music2xhtml.xsl"/>
   </plugin>
   ```

   Tip: Oxygen XML Author includes special editing support when adding extension points in the plugin.xml file. If you place the cursor in the value of the @extension attribute and press Ctrl + Space, a list of possible extension points is presented with links to the DITA-OT documentation. For more information about extension points that are available to use in the plugin.xml file, see: http://www.dita-ot.org/dev/extension-points/extension-points-by-plugin.html.

3. Install the newly created DITA-OT plugin (on page 2768) by running the built-in transformation scenario called Run DITA-OT Integrator (on page 1283) from the Apply Transformation Scenario(s) (on page 1259) or Configure Transformation Scenario(s) dialog box (on page 1378).

   Note: If the integrator is not visible, select the Show all scenarios option in the Settings drop-down menu.

You can share your new plugin with other users who have the same DITA-OT distribution by sending them your newly created folder along with the installation instructions (on page 2768).

Related Information:
Example: Creating a DITA OT Plugin for Embedding Video Resources

To offer a detailed example of the steps required to create a new DITA Open Toolkit plugin (on page 2797), this topic uses an example of creating an XSLT customization plugin that provides support for referencing video and audio content using the DITA object element and then publishing to HTML and PDF output formats. This plugin (com.oxygenxml.media) is available in the DITA Open Toolkit distribution that comes bundled with the latest version of Oxygen XML Author, but these instructions show you how you could create it if it were not included.

The following procedure is meant to help you with creating the plugin:

1. Create a folder for your plugin in the DITA OT plugins folder (DITA-OT-DIR/plugins/).
2. Create a plugin.xml file (in the same plugin folder) that contains the extension points of the plugin.

   Note: You can easily create this file by using the DITA OT Plugin template that is included in Oxygen XML Author (from the New document wizard (on page 619) you can find this template in Framework templates > DITA > plugin).

   **Example: Media Plugin File**

   ```xml
   <plugin id="com.oxygenxml.media">
     <feature extension="package.support.name" value="Oxygen XML Editor Support"/>
     <feature extension="package.support.email" value="support@oxygenxml.com"/>
     <feature extension="package.version" value="21.0"/>
     <feature extension="dita.xsl.xhtml" value="xhtmlMedia.xsl" type="file"/>
     <feature extension="dita.xsl.xslfo" value="pdfMedia.xsl" type="file"/>
   </plugin>
   ``

   The most important extensions in it are the references to the XSLT stylesheets that will be used to style the HTML and PDF outputs.

   You can find other DITA OT plugin extension points here: [http://www.dita.ot.org/dev/extension-points/extension-points-by-plugin.html](http://www.dita.ot.org/dev/extension-points/extension-points-by-plugin.html).
3. Create an XSLT stylesheet to customize the output types. In this example, to customize the HTML output, it is necessary to create an XSLT stylesheet called `xhtmlMedia.xsl` (in the same plugin folder).

   **Tip:** You can use the Find/Replace in Files action (on page 687) to find an XSLT stylesheet with content that is similar to the desired output and use it as a template to overwrite parts of your stylesheet. For example, suppose you want to overwrite HTML content produced from a DITA codeblock element. Since a DITA object element has the class attribute value `- topic/object`, you can take part of the class attribute value (`topic/object`) and search the DITA OT resources for a similar stylesheet. The search might find the XSLT stylesheet DITA-OT-DIR/plugins/org.dita.xhtml/xsl/xslhtml/xsl/xslhtml/dita2htmlImpl.xsl.

You can use it as a starting point to overwrite the `xhtmlMedia.xsl` stylesheet. For example, the results might be:

```xml
<xsl:template
    match="*[contains(@class, ' topic/object ')][contains(@outputclass, 'video')]">
    <video class="embed-responsive-item">
        <xsl:call-template name="commonattributes"/>
        <xsl:call-template name="setidaname"/>
        <xsl:call-template name="copySource"/>
    </video>
</xsl:template>
```

4. Create additional XSLT stylesheets to customize all other desired output types. In this example, to customize the PDF output it is necessary to create an XSLT stylesheet called `pdfMedia.xsl` (in the same plugin folder).

In this case, you might find an appropriate XSLT stylesheet called DITA-OT-DIR/plugins/org.dita.pdf2/xsl/fo/topic.xsl to use as a starting point to overwrite the `pdfMedia.xsl` stylesheet, with results looking something like this:

```xml
<!--Treat video, audio or iframe objects as links-->
<xsl:template
    match="*[contains(@class, ' topic/object ')][@outputclass = 'video']">
    <xsl:variable name="target" select="@data"/>
    <xsl:variable name="baseDir">
        <xsl:call-template name="substring-before-last">
            <xsl:with-param name="text" select="@xtrf"/>
            <xsl:with-param name="delim" select="'/'"></xsl:with-param>
        </xsl:call-template>
    </xsl:variable>
</xsl:template>
```
5. To install the created *plugin* in the DITA OT, run the built-in transformation scenario called **Run DITA-OT Integrator** (*on page 1283*) by executing it from the **Apply Transformation Scenario(s)** dialog box (*on page 1259*). If the integrator is not visible, select the **Show all scenarios** option that is available in the **Settings** drop-down menu. For more information, see **Installing a DITA-OT Plugin** (*on page 2768*).

**Results of running the integrator using the media plugin example:**

XSLT content is applied with priority when publishing to both HTML and PDF outputs.

a. For the HTML output, in the XSLT stylesheet *DITA-OT-DIR/plugins/org.dita.xhtml/xsl/dita2html-base.xsl*, a new import automatically appeared:

   ```xml
   <xsl:import href="../plugins/com.oxygenxml.media/xhtmlMedia.xsl"/>
   
   This import is placed after all base imports and thus has a higher priority. For more information about imported template precedence, see: [http://www.w3.org/TR/xslt#import](http://www.w3.org/TR/xslt#import).
   
   b. Likewise, for the PDF output, in the top-level stylesheet *DITA-OT-DIR/plugins/org.dita.pdf2/xsl/fo/topic2fo_shell_fop.xsl*, a new import statement appeared:

   ```xml
   <xsl:import href="../../../com.oxygenxml.media/pdfMedia.xsl"/>
   
   Now, you can distribute your *plugin* folder to anyone that has a DITA OT installation along with some simple installation notes. Your customization will work provided the templates you are overwriting have not changed from one DITA OT distribution to the other.

**Related Information:**

- DITA Open Toolkit Documentation
Installing a DITA-OT Plugin

Oxygen XML Author comes bundled with various DITA-OT plugins (on page 2797), but the architecture of the DITA Open Toolkit also allows you to install additional plugins that can be found from various sources (for example, Oxygen’s public GitHub repository includes some DITA-OT plugins).

⚠️ Warning: Oxygen XML Author has only been tested with DITA-OT plugins that come bundled with the product. Be aware that installing additional plugins or modifying the bundled plugins may affect the default functionality of the application.

### Installing a DITA-OT Plugin

To install a DITA-OT plugin, following this procedure:

1. Copy the additional plugin to the location of the DITA OT version you are using (by default, DITA-OT-DIR\plugins directory).

   ✔️ Note: If the plugin is only supported in DITA-OT 3.3.1 version, make sure that you copy the plugin to the [OXYGEN_INSTALL_DIR]/frameworks/dita/DITA-OT3.x directory.

2. Select the ⚙ Configure Transformation Scenario(s) (on page 1378) action from the DITA Maps Manager toolbar (you could also use the same action on the main toolbar or open the Transformation Scenarios view (on page 1384)).

3. Select the Run DITA-OT Integrator transformation scenario (on page 1283). If the integrator is not visible, select the Show all scenarios option that is available in the 🌐 Settings drop-down menu.

   ⚠️ Important: The folder where the DITA OT is located needs to have full write access permissions set to it. For example, in Windows, if you are integrating plugins in the DITA OT folder bundled with Oxygen XML Author and your application is installed in the Program Files folder, you can start the Oxygen XML Author main executable with administrative rights for the integrator process to be able to modify resources in the DITA OT folder.

4. Apply the scenario (on page 1377).

5. Check the Results panel at the bottom of the application to make sure the build was successful.

   ✔️ Note: Starting with version 17.0, if the DITA-OT plugin declares a transtype (transformation type), Oxygen XML Author detects that transformation type declaration from the DITA OT plugin and presents descriptions in the DITA Transformation Type dialog box (on page 1319). Oxygen XML Author also shows the contributed parameters from the plugin in the transformation scenario's Parameters tab (on page 2717).

   ⚠️ Tip: You can declare the transformation type and allowed parameters by following the procedure found in: Defining the Transformation Type and Allowed Parameters in a DITA-OT Plugin (on page 2770).
Defining the Transformation Type and Allowed Parameters in a DITA-OT Plugin

Custom DITA-OT plugins may contribute new transformation types (transtypes) and each transtype may have a set of allowed configuration parameters. If a DITA-OT plugin declares a transtype, Oxygen XML Author detects that transformation type declaration and presents descriptions in the DITA Transformation Type dialog box (on page 1319) and the contributed parameters in the transformation scenario's Parameters tab (on page 2717).

To define a transformation type and its contributed parameters in a DITA-OT plugin, follow this procedure:

1. If you have not already done so, create a DITA-OT plugin.xml file (on page 2764) (you can easily create this file by using the DITA OT Plugin new document template in the New document wizard (on page 619)).
2. In the plugin.xml file, define the transformation type details by using the <transtype> element to specify a name, description, and the transtype it extends.

```xml
<transtype name="xhtml" extends="base-html" desc="HTML">
</transtype>
```
3. Define allowed parameters by using the <param> element to specify the name, description, and information about the default and allowed set of values. For more information, see: https://www.dita-ot.org/3.1/topics/plugin-configfile.html.

```xml
<param name="args.indexshow" desc="Specifies whether to show the index" type="enum">
    <val>yes</val>
    <val default="true">no</val>
</param>
```
Depending on the type declared for a parameter, Oxygen XML Author will help you pick values for each parameter edited in the Parameters tab of the transformation scenario dialog box. For example, for parameters of type "enum", Oxygen XML Author will present a combo box for choosing the proper value for the parameter.

4. Extend various extension points in your plugin.xml. For more information, see: https://www.dita-ot.org/3.1/extension-points/plugin-extension-points.html.

5. Install the plugin (on page 2768).

Note: If the plugin is installed using an external command line, you may need to restart Oxygen XML Author to properly re-detect the newly contributed transtypes and parameters.

Complete plugin.xml example:

```
<plugin id="com.oxygenxml.pdf.prince">
  <!-- extensions -->
  <feature extension="dita.conductor.transtype.check" value="pdf-prince" type="txt"/>
  <feature extension="dita.conductor.target.relative" value="integrator.xml" type="file"/>
  <feature extension="dita.transtype.print" value="pdf-prince"/>
  <transtype name="pdf-prince" extends="commons" desc="PDF (Prince XML)">
    <param name="princeExecPath" type="file" desc="Path to the Prince executable"/>
  </transtype>
</plugin>
```

For more information, watch this DITA-OT Day 2015 presentation:

https://www.youtube.com/embed/LcrR0YUFiQ4

Built-in Third-Party DITA Open Toolkit Plugins

The DITA Open Toolkit 3.3.1 distribution that is bundled with Oxygen XML Author includes some pre-installed third-party open-source plugins (on page 2797) that add extra publishing formats and functionality.

The plugins that come bundled with Oxygen XML Author include:

- **DITA For Publishers** - These plugins allow DITA content to be published to additional formats, such as EPUB 2.0 and Kindle.
- **DITA to Word** - This plugin allows users to publish DITA content to MS Word.
- **DITA Community** - These plugins allow support for DITA 1.3 with embedded or referenced MathML and SVG images.
Using an External DITA Open Toolkit in Oxygen XML Author

Oxygen XML Author comes bundled with a DITA Open Toolkit, located in the `DITA-OT-DIR` directory. Starting with Oxygen XML Author version 17, if you want to use an external DITA OT for all transformations and validations, you can open the Preferences dialog box (Options > Preferences) (on page 79) and go to the DITA page (on page 214), where you can specify the DITA OT to be used. Otherwise, to use an external DITA Open Toolkit, follow these steps:

1. Edit your transformation scenarios and in the Parameters tab change the value for the `dita.dir` parameter to point to the new directory.
2. To make changes in the libraries that come with the DITA Open Toolkit and are used by the Ant process, go to the Advanced tab, click the Libraries button and deselect Allow Oxygen to add high priority libraries to classpath.
3. If there are also changes in the DTDs and you want to use the new versions for content completion and validation, go to the Document Type Association preferences page (on page 92), edit the DITA and DITA Map document types and modify the catalog entry in the Catalogs tab to point to the custom catalog file `catalog-dita.xml`.

- Editing a Transformation Scenario (on page 1374)
- Creating New Transformation Scenarios (on page 1292)
- DITA Open Toolkit Documentation

DITA Specialization Support

DITA is designed to let you design new markup and new document types that allow any general-purpose DITA processor to process documents that use the new markup. This in turn enables blind interchange of DITA documents from any source. In particular, in the context of a map, you can combine topics of any type and get usable results from any general-purpose DITA processor. Specialization is the one truly unique and distinguishing aspect of DITA. Even if you have no use for any aspect of DITA modularity or reuse, you still have a use for specialization simply because it enables reliable interchange in a way that no other XML application does.

For detailed information and step-by-step tutorials about DITA specializations, see DITA 4 Practitioners: DITA Configuration and Specialization Tutorials.
In addition, the topics in this section contain information about using DITA specializations in Oxygen XML Author.

Integrating a DITA Specialization

A DITA specialization can have its document type defined with any of the following::

- **DTD** - For configuration and specialization tutorials, see http://dita4practitioners.github.io/dita-specialization-tutorials/.
- **XSD** - For configuration and specialization tutorials, see http://dita4practitioners.github.io/dita-specialization-tutorials/.
- **Relax NG** - For more information, see the following presentation: Creating DITA-OT Constraint/Specialization Plugins. For Relax NG coding requirements, see https://www.oxygenxml.com/dita/1.3/specs/archSpec/base/relax-ng-requirements.html.

A DITA specialization may optionally include specialized processing, that is new XSLT template rules that match the extension part of the `class` attribute values of the new elements, and thus extend the default processing available in the DITA Open Toolkit.

To integrate a DITA specialization into Oxygen XML Author, use one of the following methods:

**DITA-OT Plugin Method**

If the DITA specialization is available as a DITA Open Toolkit plugin, follow this procedure:

1. Copy the additional plugin to the location of the DITA OT version you are using (by default, DITA-OT-DIR\plugins directory).

   ☢ **Important:** The application needs to have full write access permissions to the DITA OT directory.

2. If Oxygen XML Author was installed in the default location, you may need to restart and run it as an administrator.

3. Select the Configure Transformation Scenario(s) (on page 1378) action from the DITA Maps Manager toolbar (you could also use the same action on the main toolbar or open the Transformation Scenarios view (on page 1384)).

4. Select the Run DITA-OT Integrator transformation scenario (on page 1283).  

   ☑ **Tip:** If you don't see that scenario in the Configure Transformation Scenario(s) (on page 1378) dialog box or Transformation Scenarios view (on page 1384), click the Settings button and select the Show all scenarios option, but don't forget to change it back to Show only the scenarios available for the editor after you are finished with this procedure.

5. Apply the scenario (on page 1377).
6. Check the **Results** panel at the bottom of the application to make sure the build was successful.
7. Restart Oxygen XML Author with your normal permissions.

**Tip:** Oxygen XML Author detects new document templates *(on page 626)* contributed by the DITA OT plugin as long as you do the following:

1. Create a new folder called **template_folders** inside the `DITA-OT-DIR\plugins` directory.
2. Create one or more subfolders inside the **template_folders** directory that contain the new document templates. The new document templates found in those subfolders will be available in the **New** document wizard.

### Alternative Methods

If the DITA specialization is not available as a DITA OT plugin, you have the following options:

- If the DTDs that define the extension elements are located in a folder outside the DITA Open Toolkit folder, add new rules to the DITA OT catalog file. These rules are meant for resolving the DTD references from the DITA files that use the specialized elements to that folder. This allows for correct resolution of DTD references to your local DTD files and is needed for both validation and transformation of the **DITA maps** or topics. The DITA OT catalog file is called `catalog-dita.xml` and is located in the root folder of the DITA Open Toolkit.
- If there is specialized processing provided by XSLT stylesheets that override the default stylesheets from DITA OT, these new stylesheets must be called from the DITA OT Ant build scripts.

**⚠️ Important:** If you are using DITA specialization elements in your DITA files, it is recommended that you activate the **Enable DTD/XML Schema processing in document type detection** option in the **Document Type Association** preferences page *(on page 92)*.
- You could create your own document templates *(on page 626)*, store them in a custom directory, then add that directory to the list of template directories that Oxygen XML Author uses by adding the directory to the list in the **Document Templates Preferences** *(on page 122)* page.

### Related Information:

- DITA Configuration and Specialization Tutorials
Editing DITA Map Specializations

In addition to recognizing the default DITA map (on page 2793) formats (map and bookmap), the DITA Maps Manager view (on page 2503) can also be used to open and edit specializations of DITA maps.

All advanced editing actions available for the map (such as insertion actions or editing properties) allow you to specify the element in an editable combo box. The elements that initially appear in the combo box are all the elements that are allowed to appear at the insert position for the given specialization.

The topic titles rendered in the DITA Maps Manager view (on page 2503) are collected from the target files by matching the class attribute and not a specific element name.

When editing DITA specializations of maps in the main editor, the insertions of topic reference, topic heading, topic group and conref actions should work without modification. For the table actions, you have to modify each action manually to insert the correct element name at the cursor position. You can go to the DITA Map document type from the Document Type Association preferences page (on page 92) and edit the table actions to insert the element names as specified in your specialization. See Creating/Extending a Custom Framework (on page 1893) for more details.

Related Information:

- DITA Configuration and Specialization Tutorials
- Integrating a DITA Specialization (on page 2773)

Editing DITA Topic Specializations

In addition to recognizing the default DITA topic formats, topic specializations can also be edited in Author mode.

The content completion should work without additional modifications and you can choose the tags that are allowed at the cursor position.

The CSS styles used for rendering the elements should also work on the specialized topics without additional modifications.

The toolbar/menu actions should be customized to insert the correct element names. You can go to the DITA document type from the Document Type Association preferences page (on page 92) and edit the actions to insert the element names, as specified in your specialization. See Creating/Extending a Custom Framework (on page 1893) for more details.
Translating DITA Projects Overview

This topic contains some general information about translating DITA content and is meant to help those who do not store their DITA projects through a Content Management System (CMS) or other type of service that already includes their own translation support.

Choosing a Translation Agency

To minimize translation costs, it is recommended to choose a translation agency that is able to handle DITA content directly, without requiring you to convert the content to some intermediary format. This means that you benefit from the DITA reusable content features (on page 2633).

If you plan to translate your DITA project, it is also recommended that you contact a DITA-aware translation agency as early in your process as possible because translation agencies who translate DITA content directly usually need to have a preliminary discussion about how your project is structured, which terms need to be skipped when translating, how various measuring units are translated, how content is reused, your metadata strategy, and how screenshots are handled. Those discussions may influence the way that you organize and write your DITA content.

**Note:** If your translation agency does not directly handle DITA content, there are commercial tools that can be used to convert DITA to XLIFF (for example, [https://www.maxprograms.com/products/fluenta.html](https://www.maxprograms.com/products/fluenta.html)).

Optimizing Content for Translation

In general, there are three main principles to take into account when writing DITA content that will be translated:

1. Use a controlled vocabulary (for example, the Simplified Technical English vocabulary).
2. Avoid reusing inline elements other than product names. The following DITA Users List discussion describes the reasons for this: [https://lists.oasis-open.org/archives/dita/201301/msg00029.html](https://lists.oasis-open.org/archives/dita/201301/msg00029.html).
3. Avoid profiling/filtering content at inline level, for similar reasons.
**General DITA Project Structure**

It is usually considered best practice to organize your DITA maps/topics in a separate folder for each language. One folder that contains the English version of all of your DITA resources and a separate folder for each of the other languages you will translate with equivalent DITA resources translated in that specific language.

**General Translation Workflow**

When translating DITA content, the most common workflow involves these steps:

1. Create your content in the primary language.
2. Before each release, you gather all the DITA files that have been changed and need to be translated. The DITA Translation Package Builder Add-on *(on page 2252)* could be handy for this.
3. Send a copy of the relevant DITA files to the translation agency (known also as "localization service provider").
4. Receive translated DITA content back from the translation agency and integrate it in each language-specific project folder *(on page 2777)*.

**Publishing Translated Content**

All of your translated DITA maps and topics should have the `xml:lang` attribute set with the appropriate value on the root element. Along with the actual translated content, the published output may also contain various static text (such as the word Table followed by the table number, Figure following by the number, or Note appearing before the content of each DITA `<note>` element). The DITA Open Toolkit includes support for various languages for HTML-based output and PDF-based output. You can also add support for other languages: Globalizing DITA Content: Customizing Generated Text. For information about how to add a new language to the Oxygen WebHelp Responsive output, see Adding a New Language *(on page 1591)*.

**Liability**

Translation agencies usually do not assume any liability for incorrectly translated content. If possible, it is recommended to have someone who is familiar with the particular language be responsible for reviewing and accepting the translated content. For example, if your company has regional headquarters located in various countries, perhaps someone from each headquarters could review the translated content.

**Other Resources**

Here are some links to other resources that might help you with translating DITA projects:
Master Files Support in DITA

Oxygen XML Author includes a feature that allows you to define Master Files (on page 2796) at project level. This feature is typically used in Oxygen XML Author for XML documents to determine the context for operations such as validation, content completion, refactoring, searches, or displaying components collected from various modules. For DITA projects, this feature has a more limited purpose in Oxygen XML Author since it is mainly used to provide the means for updating references to moved or renamed resources.

Since you can move or rename DITA resources (such as topics and maps) in the DITA Maps Manager (on page 2503), the root map (on page 2799) is used as the scope to update all the references to the moved or renamed resources. However, you do not have this option for non-DITA resources (such as folders, images, HTML files, audio, video, text files, Markdown documents) since they do not appear in the DITA Maps Manager. Also, when moving DITA resources in the DITA Maps Manager, you have to do it one at a time.

You can use the Master Files support in DITA to update all the references to moved or renamed resources in the scope of the Master Files, and since the root map (on page 2799) will be set as the Master File, you achieve the same result as if you were moving or renaming them in the DITA Maps Manager. It also allows you to move multiple DITA resources (or entire folders) at once in the Project view (on page 320), instead of the DITA Maps Manager, while still giving you the option of updating all the references.

How to Enable Master Files Support in DITA

To use the Master Files support in DITA, follow these steps:

1. Go to the Project view (on page 320) and enable Master Files support with one of the following methods:
   - Select Enable Master Files Support from the Settings menu in the top-right corner.
   - Select Enable Master Files Support from the contextual menu of the project root folder. If a disabled Master Files folder exists, you can also select that option from its contextual menu.
   - Click the Enable button in the tooltip located at the bottom. This tooltip window is displayed when the Master Files support is disabled. Clicking the Read more link takes you to the user guide. Clicking the Enable button opens the Enable Master Files dialog box. This dialog box contains general information about the Master Files Support and allows you to enable it.
Warning: Once you close this window tip, Oxygen XML Author hides it for all projects. You can make the window tip reappear by resetting Oxygen XML Author to its default settings (on page 257). However, doing so will result in you losing your customized options.

2. Add the main DITA map (root map) (on page 2799) to the Master Files folder by doing one of the following:
   - Right-click the project root folder and select Detect Master Files.
   - Right-click the Master Files folder and select Detect Master Files from Project.
   - If you enabled the Master Files support from the tooltip at the bottom of the Project view, you can also use the Detect and Enable button in the resulting dialog box to detect the master files from the current project.
   - Manually add the root map (on page 2799) to the Master Files folder by doing one of the following:
     - Right-click a file from your project and select Add to Master Files from the contextual menu (or simply drag and drop it into the Master Files folder).
     - Select Add Files or Add Edited File from the contextual menu of the Master Files folder.

Tip: You can set multiple maps in the Master Files folder and all of them will automatically be added to the list of root maps you can select from the drop-down menu in the DITA Maps Manager toolbar (on page 2508).

Moving or Renaming Non-DITA Resources and Updating the References to Them

With the Master Files support enabled, you can move or rename non-DITA resources (such as folders, images, HTML files, audio, video, text files, Markdown documents) or move multiple normal DITA resources (or entire folders) in the Project view (on page 320) and Oxygen XML Author will offer the option of updating all the references to the moved or renamed resources in the scope of the Master Files (in this case, the main DITA map (root map) (on page 2799)).

To move or rename non-DITA resources (or move multiple DITA resources) and update the references to them, follow these steps:

1. Enable Master Files support and add your root DITA map (on page 2799) to the Master Files folder as described in the How to Enable Master Files Support in DITA (on page 2778) section above.
2. Go to the Project view (on page 320), and use one of the following methods to move or rename the resources:

   Moving Resources

   To move resources in the Project view (on page 320), do one of the following:
- Simply drag and drop the resource to the new location in the tree structure (the **Enable drag-and-drop in Project view** option must be selected in the **View preferences page (on page 249)**).
- Use the **Cut**, **Copy**, and **Paste** actions from the contextual menu.
- Right-click the resource and select **Refactoring > Move resource** action from the contextual menu. Note that this method also allows you to specify a new name and destination path in the **Move resource** dialog box.

**Result:** In all cases, a **Move resource** dialog box will be presented.

### Renaming Resources

To rename resources in the **Project view (on page 320)**, do one of the following:

- Select the resource and press **F2**, or simply left-click again, until the in-place editor allows you to change the file name.
- Right-click the resource and select **Rename** or **Refactoring > Rename resource**.

**Result:** In all cases, a **Rename resource** dialog box will be presented.

3. Make sure the **Update references of the moved resource(s)** option is selected in the resulting **Move** or **Rename** dialog box and keep the scope as **master files** to make sure all the references to the moved or renamed resource are updated.

### DITA Resource Hierarchy/Dependencies View

The **Resource Hierarchy/Dependencies** view displays the hierarchy or dependencies for an XML document. For DITA resources, it will only show direct references, so resources that are indirectly referenced through keys are not presented in the hierarchy or dependencies tree.

To see the hierarchy or dependencies for a DITA resource (maps or topics), right-click a resource in the **Project view (on page 320)** and either select **Resource Hierarchy** or **Resource Dependencies**.

If you want to view the dependencies for a media resource (such as images) directly referenced in a DITA topic, click the **Show Dependencies** button on the toolbar of the **Resource Hierarchy/Dependencies** view, select the **All files** filter in the file browser, find the particular resource, and double-click it.

**Figure 654. Resource Hierarchy/Dependencies View**
The following actions are available on the toolbar of the **Resource Hierarchy/Dependencies** view:

- **Refresh**
  Refreshes the Hierarchy/Dependencies structure.

- **Stop**
  Stops the hierarchy/dependencies from computing.

- **Show Hierarchy**
  Compute the hierarchy structure.

- **Show Dependencies**
  Compute the dependencies structure.

- **Configure dependencies search scope**
  Allows you to configure a scope to compute the dependencies structure. You can restrict the scope to the current project or to one or multiple **working sets (on page 2800)**. If the **Use only Master Files, if enabled** checkbox is selected, the scope of the search is restricted to the **Master Files directory (on page 2778)**.

- **History**
  Provides access to the list of previously computed dependencies. Use the **Clear history** button to remove all items from this list.

The contextual menu for a resource listed in the **Resource Hierarchy/Dependencies** view contains the following actions:

- **Open**
Opens the resource. You can also double-click a resource in the Hierarchy/Dependencies structure to open it.

**Go to reference**

Opens the source document where the resource is referenced.

**Copy location**

Copies the location of the resource.

**Move resource**

Opens the Move resource dialog box where the following fields are available:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - As long as Master Files support is enabled (on page 2778), you can select this option to update the references to the resource you are moving, in accordance with the new location and name. A Preview option is available that allows you to see what will be updated before selecting Move to process the operation.

**Rename resource**

Opens the Rename resource dialog box where the following fields are available:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references of the renamed resource(s)** - As long as Master Files support is enabled (on page 2778), you can select this option to update the references to the resource you are renaming. A Preview option is available that allows you to see what will be updated before selecting Rename to process the operation.

**Show Resource Hierarchy**

Shows the hierarchy for the selected resource.

**Show Resource Dependencies**

Shows the dependencies for the selected resource.

**Add to Master Files**

Adds the currently selected resource in the Master Files directory.

**Expand All**
Expands all the children of the selected resource from the Hierarchy/Dependencies structure.

**Collapse All**

Collapses all children of the selected resource from the Hierarchy/Dependencies structure.

**Tip:** When a recursive reference is encountered in the Hierarchy view, the reference is marked with a special icon.

**Metadata**

Metadata is a broad concept that describes data that explains or identifies other data. Metadata can be used for many purposes, from driving automation of document builds to enabling authors and readers to find content more easily. DITA provides numerous types of metadata, each of which is used and created differently. Some of the most important forms of metadata in DITA are topic and taxonomy.

**Topic Metadata**

Topic metadata describes the topic and what it is about. Topic metadata can be inserted in the `prolog` element of a topic or inside the `topicref` element that points to a topic from a map. In other words, metadata about the topic can be asserted by the topic itself, or can be assigned to it by the map that includes it in the build. This allows multiple maps to assign different metadata to the same topic. This may be appropriate when you want to describe a topic differently in various documents.

**Taxonomy and Subject Scheme**

A taxonomy is a controlled vocabulary. It can be used to standardize how many things in your content and metadata are named. This consistency in naming can help ensure that automated processes work correctly, and that consistent terminology is used in content, and in metadata. In DITA, taxonomies are created using `subject scheme maps` (on page 2799). When you are authoring, many of the values you choose from have been defined in `subject scheme maps`.

**Migrating MS Office Documents to DITA**

Oxygen XML Author integrates the entire DITA for Publishers plugins suite and provides some possibilities for migrating content from Microsoft Office® (and other Office-type formats) to DITA. There are also possibilities for migrating various other types of formats. For more information, see Migrating Various Document Formats to DITA (on page 2786).
Migration from Office-type formats to XML is rarely perfect and manual changes may need to be made to the converted content, but the methods described below should help you find the best approach for your particular case.

Method 1 (Single Document)

1. Open the document in MS Office (or other similar application), select all the content, and copy it.
2. Open Oxygen XML Author and create a new DITA topic.
3. Paste the selected content in Author mode. The Smart Paste functionality (on page 860) will attempt to convert the content to DITA.

Method 2 (Single Document)

1. Save your document as HTML.
2. Once you have converted it to HTML, you have several possibilities:
   - In Oxygen XML Author, select File > Import > HTML File to import it as XHTML. Then, open the XHTML in Oxygen XML Author and use one of the XHTML to DITA Transformation Scenarios (on page 1223) to convert the content to DITA.
   - Open the HTML file in any Web browser, select all of its content, and copy it. Then, open Oxygen XML Author, create a new DITA topic and paste the selected content in Author mode. The Smart Paste functionality (on page 860) will attempt to convert the HTML content to DITA.

Method 3 (Single Document)

1. Open the document in the free LibreOffice application and save it as DocBook.
3. Run the built-in transformation scenario called DocBook to DITA (on page 1289).
4. You may need to make some manual adjustments for elements that couldn't be mapped.

Method 4 (Single Document)

1. Save the document in the MS Word DOCX format.
2. Open it in the Archive Browser view (on page 1807) in Oxygen XML Author and then open the document.xml file contained in the archive.
3. Run the built-in transformation scenario (on page 2707) called DOCX DITA. This scenario runs a build file over the DOCX archive and should produce a DITA project that contains a DITA map and multiple topics.
4. You may need to do some manual reconfiguration to map DOCX styles to DITA content.
Method 5 (Multiple Documents)

1. Use a tool to convert the documents to DocBook. For example, Pandoc is a free document converter engine that can convert DOCX documents to DocBook and according to Pandoc's manual, you can specify multiple input files and use wildcards in the commands.
2. Save the newly converted DocBook documents somewhere in your project.
3. Perform a batch transformation (on page 1382) on all the newly converted DocBook documents:
   a. Select all the DocBook documents in the Project view (on page 320).
   b. Right-click the selected files and choose Transform > Configure Transformation Scenario(s).
   c. Apply the built-in transformation scenario called DocBook to DITA (on page 1289).
4. You may need to make some manual adjustments in the resulting documents for elements that couldn't be mapped.

Method 6 (Multiple Documents)

1. Use a tool to convert the documents to HTML or Markdown. For example, Pandoc is a free document converter engine that can convert DOCX documents to those formats.
2. Use Oxygen's Batch Converter add-on (on page 2248) to convert the documents to DITA.
3. You may need to make some manual adjustments in the resulting documents for elements that couldn't be mapped.

Migrating Excel and Other Types of Spreadsheets to DITA

There are two possibilities for converting Microsoft Excel (or other similar types of documents) to DITA:

- Copy the spreadsheet content and paste it in an opened DITA topic in Author mode. The Smart Paste functionality (on page 860) will attempt to convert the content to DITA.
- Use Oxygen's Batch Converter add-on (on page 2248) to convert one or more spreadsheet documents to DITA.

Related Information:

- Migrating Various Document Formats to DITA (on page 2786)
- Smart Paste Mechanism (on page 860)
Migrating Various Document Formats to DITA

When organizations decide to use DITA for structuring, developing, managing, or publishing content, they usually already have content written in other formats and need to convert it to DITA. There are a variety of possibilities for a conversion to DITA, depending on the original format of the content.

Migration from other formats to DITA is rarely perfect and manual changes may need to be made to the converted content, but the methods described below should help you find the best approach for your particular case.

**Migrating Microsoft Office and Other Similar Types of Documents to DITA**

There are various possibilities for migrating content from Microsoft Office® (and other Office-type formats) to DITA. For details, see Migrating MS Office Documents to DITA (on page 2783).

**Migrating DocBook Content to DITA.**

Since DocBook content is already in XML format, migrating it to DITA is more straightforward than with other non-XML formats:

1. Convert the DocBook content to a single large DITA composite file by performing a batch transformation (on page 1382) on all the DocBook documents:
   a. Select all the DocBook documents in the Project view (on page 320).
   b. Right-click the selected files and choose Transform > Configure Transformation Scenario(s).
   c. Apply the built-in transformation scenario called DocBook to DITA (on page 1289).
2. You may need to make some manual adjustments in the resulting documents for elements that couldn't be mapped.

**Tip:** There is also a utility XSLT stylesheet available on the Oxygen XML GitHub account that can be used convert a DITA composite file to a DITA map with separate DITA topic files. It can be found here: https://github.com/oxygenxml/old-userguide-docbookbased/blob/master/split-DITA-topic.xsl.
Migrating Google Docs to DITA

There are several possibilities to convert Google Docs to DITA:

- Copy the content from Google Docs and paste it in an opened DITA topic in Author mode. The Smart Paste functionality (on page 860) will attempt to convert the content to DITA.
- Save the Google document as OpenDocumentFormat (ODF), then open it in the free LibreOffice application and save it as DocBook. Next, open the DocBook document in Oxygen XML Author and run the built-in transformation scenario called DocBook to DITA (on page 1289).
- If you want to convert multiple Google documents at once, save the documents as HTML, then use Oxygen's Batch Converter add-on (on page 2248) to convert the documents to DITA.

In all cases, you may need to make some manual adjustments in the resulting documents for elements that couldn't be mapped.

Migrating Markdown Content to DITA

There are several possibilities to convert Markdown content to DITA:

- The DITA Open Toolkit publishing engine bundled with Oxygen XML Author allows you to reference Markdown files directly in a DITA map and either publish them directly or export the Markdown files to DITA one by one. For details, see Working with Markdown Documents in DITA (on page 1138).
- If you want to convert multiple Markdown files at once, you can use Oxygen's Batch Converter add-on (on page 2248) to convert the documents to DITA.

Migrating HTML Content to DITA

There are several possibilities to convert HTML content to DITA:

- Copy the HTML content and paste it in an opened DITA topic in Author mode. The Smart Paste functionality (on page 860) will attempt to convert the content to DITA.
- Convert the HTML file to XHTML by selecting File > Import > HTML File. Then, open the XHTML file and use one of the XHTML to DITA Transformation Scenarios (on page 1223) to convert the content to DITA.
- If you want to convert multiple HTML files at once, you can use Oxygen's Batch Converter add-on (on page 2248) to convert the documents to DITA.
Migrating Unstructured FrameMaker to DITA

There is a FrameMaker plugin that can be used for this type of conversion: http://leximation.com/tools/info/fm2dita.php.

Migrating MadCap Content to DITA

Some recent MadCap versions seem to have facilities to export content directly to DITA. Otherwise, you will need to convert XHTML content to DITA with a custom XSLT stylesheet to preserve variable references.

Migrating Other Formats to DITA

You may find third-party applications (such as Pandoc) that can convert your content to HTML or to some kind of XML format like DocBook. Once you have HTML or DocBook content, you can convert them to DITA using one of the methods described above.

DITA 1.3 Support

Starting with version 17.1, Oxygen XML Author includes support for some DITA 1.3 features.

The Oxygen XML Author publication of the full DITA 1.3 specifications can be found at https://www.oxygenxml.com/dita/1.3/specs/index.html#introduction/dita-release-overview.html.

The following table is a list of DITA 1.3 features and their implementation status in Oxygen XML Author:

<table>
<thead>
<tr>
<th>Feature</th>
<th>Editing</th>
<th>Publishing [DITA Open Toolkit 3.3.1 is used]</th>
</tr>
</thead>
<tbody>
<tr>
<td>DITA 1.3 DTD, XML Schema, and Relax NG-based maps/topics/tasks/references, etc.</td>
<td>New DITA 1.3 document templates. By default, DITA topics and maps that do not specify version in the DOCTYPE declaration are also considered to be DITA 1.3</td>
<td>N/A</td>
</tr>
<tr>
<td></td>
<td>Specific annotations presented in the content completion assistance window and documentation tooltips for all new DITA 1.3 elements</td>
<td></td>
</tr>
<tr>
<td>Feature</td>
<td>Editing</td>
<td>Publishing [DITA Open Toolkit 3.3.1 is used]</td>
</tr>
<tr>
<td>---------------------------------------------</td>
<td>-------------------------------------------------------------------------</td>
<td>---------------------------------------------</td>
</tr>
<tr>
<td>Learning Object and Group maps</td>
<td>New document templates</td>
<td>No specific support implemented</td>
</tr>
<tr>
<td>Troubleshooting specialization</td>
<td>Create and edit new troubleshooting topics</td>
<td>No specific support implemented</td>
</tr>
<tr>
<td>XML markup domain</td>
<td>Validation and Content Completion</td>
<td>Special rendering in PDF and XHTML-based outputs</td>
</tr>
<tr>
<td>Equation and MathML domain</td>
<td>Validation and content completion</td>
<td>Special rendering in PDF and XHTML-based outputs</td>
</tr>
<tr>
<td>SVG domain</td>
<td>Validation and content completion</td>
<td>Special rendering in PDF and XHTML-based outputs</td>
</tr>
<tr>
<td>Other new DITA 1.3 elements (div, strike-through, overline, etc)</td>
<td>Validation and Content Completion</td>
<td>Special rendering in PDF and XHTML-based outputs</td>
</tr>
<tr>
<td>Release management domain</td>
<td>Validation and Content Completion</td>
<td>No specific support implemented</td>
</tr>
<tr>
<td>Scoped keys (on page 2663)</td>
<td>Define key scopes</td>
<td>Partially implemented (Various issues may still be encountered)</td>
</tr>
<tr>
<td></td>
<td>Validate and check for completeness</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Resolve keyrefs and conkeyrefs taking key scopes into account</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Key scope information is displayed in a tooltip when hovering over an item in the DITA Maps Manager</td>
<td></td>
</tr>
<tr>
<td>Branch filtering (on page 2664)</td>
<td>Display, create, and edit ditavalref elements</td>
<td>Partially implemented (Various issues may still be encountered)</td>
</tr>
<tr>
<td>Key-based cross deliverable addressing</td>
<td>Special display for references to DITA maps with scope=&quot;peer&quot; and a defined keyscope</td>
<td>Not implemented.</td>
</tr>
<tr>
<td>Feature</td>
<td>Editing</td>
<td>Publishing</td>
</tr>
<tr>
<td>---------</td>
<td>---------</td>
<td>------------</td>
</tr>
<tr>
<td>Shorthand to address syntax that identifies elements in the same topic</td>
<td>Properly resolved for validation, links, and conrefs</td>
<td>Implemented</td>
</tr>
<tr>
<td>Various table attributes (orientation, rotation, scope, and headers on cells)</td>
<td>Not implemented in the Table Properties action support. However, attributes can be changed from the Attributes view</td>
<td>Not implemented</td>
</tr>
<tr>
<td>New Map topicref attributes (cascade, deliveryTarget)</td>
<td>Allow setting new attributes, propose proper values for them</td>
<td>Implemented</td>
</tr>
</tbody>
</table>

Related Information:

- Watch our DITA 1.3 video tutorial for more information about key scopes and branch filtering.
Active Cell

*Active cell* refers to the selected cell where data is entered when you begin typing. Only one cell is active at a time. The *active cell* is bounded by a heavy border.

Alternate CSS Style

The *Alternate CSS Style* refers to the choices in the bottom half of *Styles* drop-down menu (on the toolbar) that makes it easy to apply style changes to your documents as they appear in *Author* mode and the output without having to edit the CSS stylesheets. By default, the *alternate styles* are applied like layers, they are merged sequentially with the *main CSS style* (*on page 2796*), and you can activate any number of them. However, if you deselect the *Enable multiple selection of alternate CSSs option* (*on page 101*) in the *CSS* subtab of the *Document Type* configuration dialog box (*on page 94*), the *alternate styles* are treated like *main CSS styles* (*on page 2796*) and you can only select one at a time.

For more information, see *Configuring and Managing Multiple CSS Styles for a Framework* (*on page 1919*).

Anchor

An *Anchor* is used in various types of links to take the user to a specific location within the target document. It is designated in a URL or in the value of the *href* attribute with a # symbol followed by the anchor that is defined in a target ID (for example, *href="MyTopic.dita#anchor"*).

Apache Ant

*Apache Ant* (Another Neat Tool) is a software tool for automating software build processes.
Block Element

A block element is intended to be visually separated from its siblings, usually vertically. For instance, paragraphs and list items are block elements. It is distinct from an inline element, which has no such separation.

Bookmap

A bookmap is a specialized DITA map used for creating books. A bookmap supports book divisions such as chapters and book lists such as indexes.

Callout

A callout is a string of text inside a graphic and is connected to a specific location in a document by a line. Oxygen XML Author uses callouts to present comments and other types of review modifications.

Canonicalize

To canonicalize something means to convert it to a standard format that everyone generally uses. When using the term with regard to XML, it refers to the process of converting data that has more than one possible representations into a standardization that conforms to the specification of an XML document or document subset. It is helpful for applications that require the ability to test whether or not the content of an XML document or subset has been changed.

Content Completion Assistant

The Content Completion Assistant refers to a very helpful mechanism in Oxygen XML Author that offers a list of proposed items that could be inserted at the current location, depending on the current context, editing mode, and type of document. It also tries to determine the most logical choice in the current editing context and displays that proposal at the beginning of the list.

For more information about this feature and how to invoke it, depending on your editing context, see the following:

- Content Completion Assistant in Author Mode (on page 863)
- Content Completion Assistant in Text Mode (on page 786)
- Content Completion Assistant in Grid Mode (on page 833)
- Content Completion in CSS Stylesheets (on page 1105)
- Content Completion in LESS Stylesheets (on page 1110)
- Content Completion in JavaScript Documents (on page 1115)
Dockable

A **Dockable** window is one that can be moved and resized, and either floated or pinned to a location, allowing you to configure the workspace according to your preferences.

Document Fragment

A **document fragment** represents a portion of an XML document's tree of nodes or content.

Document Type Association

In general terms, a **Document Type Association** is a set of rules that associate a document type with a [framework](on page 2794). In Oxygen XML Author, **Document Type Association** also specifically refers to a preferences page (on page 92) where you can create new custom frameworks or edit existing ones. Note that frameworks (document types) that come built-in with Oxygen XML Author are read-only, but you can **Extend** (on page 93) or **Duplicate** (on page 92) them to configure them as custom frameworks.

DITA Map

A **DITA map** is a component of the DITA framework (on page 2794) that provides the means for a hierarchical collection of DITA topics that can be processed to form an output. Maps do not contain the content of topics, but only references to them. These are known as topic references. Usually the maps are saved on disk or in a CMS with the extension .ditamap.

Maps can also contain relationship tables that establish relationships between the topics contained within the map. Relationship tables are also used to generate links in your published document.

You can use your map or **bookmap** (on page 2792) to generate a deliverable using an output type such as XHTML, PDF, HTML Help, or Eclipse Help.

DITA Open Toolkit

**DITA Open Toolkit** is an open-source publishing engine for content authored in the Darwin Information Typing Architecture. It is a vendor-independent, open-source implementation of the DITA standard, released under the Apache License, Version 2.0.

The toolkit supports all versions of the OASIS DITA specification, including 1.0, 1.1, 1.2, and 1.3.
DITA-OT

Related Information:

• http://www.dita.ot.org/

DITA-OT-DIR

**DITA_OT_DIR** refers to the default directory that is specified for your DITA Open Toolkit distribution in the Options > Preferences > DITA preferences page (on page 214).

For example, if you are using DITA OT 3.3.1 that comes bundled with Oxygen XML Author, the default directory is: `[OXYGEN_INSTALL_DIR]/frameworks/dita/DITA-OT3.x`. You can also specify a custom directory.

Foldable Element

A **foldable element** refers to elements that can be collapsed and expanded in Oxygen XML Author. Foldable elements are marked with a small triangle (``/``) on the left side of the editor panel and you can use that triangle to quickly collapse or expand them. This feature is helpful when you are working with large documents and you want to temporarily hide blocks of content. You can right-click the triangle to access additional collapse and expand actions (Collapse Other Folds, Collapse Child Folds, Expand Child Folds, Expand All).

Framework

A **framework** refers to a package that contains resources and configuration information to provide ready-to-use support for an XML vocabulary or document type. A framework is associated to an XML document type according to a set of rules. It also includes a variety of settings that improve editing capabilities for its particular file type. Oxygen XML Author includes a **Document Type Configuration Dialog Box (on page 94)** that allows you to define the set of rules and customize various authoring mechanisms for new or existing frameworks.

For advanced details about customizing your own framework, see the Creating and Configuring Custom Frameworks (on page 1893) section.
Global Options

*Global Options* refers to the storage option *(on page 255)* in the Oxygen XML Author preference pages *(Options > Preferences)*. If you select *Global Options* *(on page 255)*, the options in that particular preferences page are stored locally on your computer and are not accessible to other users (unless you export them into an XML options file *(on page 256)* that can then be shared).

IDML

*IDML* is an abbreviation for Adobe InDesign Markup files.

Inline Element

An *inline element* is intended to be displayed in the same line of text as its siblings or the surrounding text. For instance, strong and emphasis in HTML are *inline elements*. It is distinct from a *block element*, which is visually separated from its siblings.

Java Archive

*Java Archive (JAR)* is an archive file format. *JAR* files are built on the ZIP file format and have the *.jar* file extension. Computer users can create or extract *JAR* files using the `jar` command or an archive tool.

Key Space

The concept of a *Key Space* in DITA refers to a set of all possible keys that can be used in a *DITA map* structure. A *Key Space* is established when a *root map* *(on page 2799)* defines a set of effective key bindings. When Oxygen XML Author processes key references, it determines the effective binding of a given key to a resource in the context of the specified *root map* *(on page 2520)*.

Keystore

A *Keystore* is an encrypted file that contains private keys and certificates. There are two types of keystores that are supported in Oxygen XML Author:

- Java Key Store (JKS)
- Public-Key Cryptography Standards version 12 (PKCS-12)
Main CSS Style

The **Main CSS Style** refers to the selection in the top half of the **Styles** drop-down menu (on the toolbar) that makes it easy to quickly change the look of your documents as they appear in **Author** mode and the output without having to edit the CSS stylesheets. The *main CSS* applies to the whole document and you can also select one or more *alternate styles* *(on page 2791)* (listed in the bottom half of the drop-down menu) that behave like layers and are merged sequentially with the *main CSS style*.

For more information, see **Configuring and Managing Multiple CSS Styles for a Framework** *(on page 1919)*.

Master File

A **Master File** typically refers to the root of an imported or included tree of modules and this support helps you simplify the configuration and development of XML projects. For more information, see the **Master Files Support** *(on page 669)* section.

Named User

**Named User** is defined as an individual full or part-time employee who is authorized by **You** (the individual or entity who owns the rights for Oxygen XML Author) to use the software regardless of whether or not the individual is actively using the software at any given time. To avoid any doubt, **Named User** licenses cannot be shared among multiple individuals and separate **Named User** licenses must be purchased for each individual user.

A **Named User** license may not be reassigned to another employee except in the following circumstances:

- (a) Upon termination of the **Named User’s** employment with your company.
- (b) Permanent reassignment of a **Named User** to a position that does not involve the use of the Software.

For example, suppose Jane has been assigned an **Oxygen** license and she leaves your company. When she leaves, you can simply reassign her license to John, her replacement. In the event that you do reassign the **Named User** license in accordance with the restrictions above, you do not need to notify Syncro of such a reassignment.

**Note:** This definition is taken from the Oxygen XML Author **End User License Agreement**.
Oxygen Publishing Template

Oxygen Publishing Template defines all the aspects related with the look and feel (layout and styles) for the WebHelp Responsive output.

The template is self-contained and packed as a ZIP archive making it easy to share with others. It represents the main method for customizing the WebHelp Responsive output.

Related Information:

- Publishing Template Package Contents for WebHelp Responsive Customizations (on page 1511)

Perspective

In Oxygen XML Author, a perspective refers to an interface layout geared towards a specific editing environment. Each perspective includes a unique set of interface objects, toolbars, views, and features. You can change the perspective by selecting the respective icon ( ) in the top-right corner of Oxygen XML Author or by selecting the perspective from the Window > Open Perspective menu.

The perspectives that are available in Oxygen XML Author are:

- Editor (on page 285) - The most commonly used perspective and it is used to edit XML documents.
- Database (on page 287) - Used to browse and manage databases.

Plugin

A plugin (also referred to as add-on or extension) is a component that adds specific features to an existing application. Oxygen XML Author supports plugins to enable numerous customizations.

For more information, see the following topics:

- Installing and Updating Add-ons (on page 75)
- Automatic and Manual Methods for Installing Plugins (on page 2153)
- Packing and Deploying Plugins as Add-ons (on page 2183)
- Add-ons Preferences (on page 91)
Pretty-Print

*Pretty-print* refers to formatting and indenting the source code in *Text* mode to make the content easier to view and analyze. The formatting actions that are available in Oxygen XML Author include:

- Format and Indent Element - Available in the *Source* submenu of the contextual menu for the current element.
- Format and Indent - Available on the toolbar for the entire currently opened document.
- Format and Indent Files - Available in the contextual menu of the *Project view* (on page 320) for one or more selected files.

Project Options

*Project Options* refers to the storage option (on page 255) in the Oxygen XML Author preference pages (Options > Preferences). If you select *Project Options* (on page 256), the options in that particular preferences page are stored at project level in the project file (*xpr*), which can easily be shared with other users (on page 256).

QName

*QName* stands for "qualified name" and defines a valid identifier for elements and attributes. *QNames* are used as URI references to reference particular elements or attributes within XML documents.

Quick Assist

The *Quick Assist* feature gives you easy access to some of the most commonly used actions for the specific type of document you are editing. If one or more actions are available in the current context, they are accessible via a yellow bulb help (♀) placed at the current line in the stripe on the left side of the editor in *Text* mode. You can also invoke the quick assist menu by using the *Alt + 1* (*Meta + Alt + 1* on Mac OS X) keyboard shortcuts.

Quick Fix

The *Quick Fix* support in Oxygen XML Author helps you resolve errors that appear in an XML document by offering proposals to fix problems such as missing required attributes or invalid
elements. Quick Fixes are available in Text mode and Author mode and they can be presented and activated in several ways.

- When hovering over an area of text where a validation error or warning occurs, the Quick Fix proposals can be presented as links in a tooltip pop-up window.
- When hovering over an error or warning in Author mode, the Quick Fix proposals are presented in a small drop-down menu.
- If you place the cursor in the highlighted area where a validation error or warning occurs, a Quick Fix icon (균) is displayed in the stripe on the left side of the editor. Clicking that icon will allow you select from the available proposals.
- If you place the cursor in the highlighted area where a validation error or warning occurs, you can also access the Quick Fix menu by pressing Alt + 1 (Command + Alt + 1 on OS X) on your keyboard.

Root Map

A Root Map (or master map) specifies a DITA map (on page 2793) that defines a hierarchical structure of submaps that are contained within the root map. Essentially, the root map defines a scope and provides the mechanism to allow your defined keys to be propagated throughout the entire map structure (this mechanism is also known as a key space (on page 2795)).

In Oxygen XML Author, the DITA Maps Manager includes an option on its toolbar where you can easily specify the root map (on page 2508), but there are also several other ways to select or change the root map (on page 2520).

Space-Preserved Element

A spaced-preserved element refers to elements that require white spaces and line endings to be preserved (for example, DITA codeblock and pre elements).

Subject Scheme Map

A Subject Scheme Map allows you to create custom controlled attribute values and to manage metadata. Subject scheme maps use a key definition to define a collection of controlled values rather than a collection of topics. The highest level of map that uses the set of controlled values must reference the subject scheme map in which those controlled values are defined.

A controlled value is a keyword that can be used as a value in a metadata attribute. For example, the @audience metadata attribute may take a value that identifies the user group associated with a particular content unit (for medical equipment, that might include therapist, oncologist, surgeon,
radiologist, and so on). In a *subject scheme map*, you can define a list of these audience values and you can then use these values to profile your content. For more information, see Customizing Profiling Values with a Subject Scheme Map (*on page 2755*).

**Track Changes**

The *Track Changes* feature allows you to review changes that you or other authors have made and then accept or reject them. You can also manage the visualization mode of the tracked changes, add comments to changes, and mark them as being done. These actions are easily accessible from contextual menus, the toolbar, or the **Review view** (*on page 906*).

For more information about this feature, see Managing Tracked Changes (*on page 885*).

**WebHelp Output Directory**

*WebHelp_OUTPUT_DIR* refers to the output directory where WebHelp transformation files will be generated.

The output directory can be specified using the **Output Directory** text field in the **Output** tab of the transformation scenario dialog box.

When running the WebHelp transformation from a command line, the output directory can be specified using the `-o` or `--output` option.

**Working Set**

A *Working Set* refers to a set of files that will be used for the scope of search and refactoring operations. Many of the search and refactoring wizards include a step where you can specify the scope for the operation and you can choose one or more *working sets* to restrict the scope to that specified set of files.

**XML Catalog**

An *XML Catalog* maps a system ID or a URI reference for a resource (stored either remotely or locally) to a local copy of the same resource. Whenever XML processing relies on external resources (such as referenced schemas and stylesheets), the use of an *XML Catalog* becomes a necessity when Internet access is not available or the connection is slow.
Oxygen XML Author includes default global catalogs as well as default catalogs for each of the built-in frameworks (on page 2794), and you can also create your own. Oxygen XML Author uses these XML Catalogs to resolve references for document validation and transformations. For more information, see Working with XML Catalogs (on page 1064).
